

Aastra 6700i, 6800i, and 9000i Series SIP IP Phones

Administrator Guide

Release 3.3.1 SP3

Software License Agreement

Aastra, hereinafter known as "Seller", grants to Customer a personal, worldwide, non-transferable, non-sublicenseable and non-exclusive, restricted use license to use Software in object form solely with the Equipment for which the Software was intended. This Product may integrate programs, licensed to Aastra by third party Suppliers, for distribution under the terms of this agreement. These programs are confidential and proprietary, and are protected as such by copyright law as unpublished works and by international treaties to the fullest extent under the applicable law of the jurisdiction of the Customer. In addition, these confidential and proprietary programs are works conforming to the requirements of Section 401 of title 17 of the United States Code. Customer shall not disclose to any third party such confidential and proprietary programs and information and shall not export licensed Software to any country except in accordance with United States Export laws and restrictions.

Customer agrees to not reverse engineer, decompile, disassemble or display Software furnished in object code form. Customer shall not modify, copy, reproduce, distribute, transcribe, translate or reduce to electronic medium or machine readable form or language, derive source code without the express written consent of the Seller and its Suppliers, or disseminate or otherwise disclose the Software to third parties. All Software furnished hereunder (whether or not part of firmware), including all copies thereof, are and shall remain the property of Seller and its Suppliers and are subject to the terms and conditions of this agreement. All rights reserved.

Customer's use of this software shall be deemed to reflect Customer's agreement to abide by the terms and conditions contained herein. Removal or modification of trademarks, copyright notices, logos, etc., or the use of Software on any Equipment other than that for which it is intended, or any other material breach of this Agreement, shall automatically terminate this license. If this Agreement is terminated for breach, Customer shall immediately discontinue use and destroy or return to Seller all licensed software and other confidential or proprietary information of Seller. In no event shall Seller or its suppliers or licensors be liable for any damages whatsoever (including without limitation, damages for loss of business profits, business interruption, loss of business information, other pecuniary loss, or consequential damages) arising out of the use of or inability to use the software, even if Seller has been advised of the possibility of such damages.

Preface

This **SIP IP Phone Administrator Guide** provides information on the basic network setup, operation, and maintenance of the Aastra 6700i (6730i, 6731i, 6735i, 6737i, 6753i, 6755i, 6757i, and 6757i CT), 6800i (6863i, 6865i, and 6867i), and 9000i (9143i, 9480i, 9480i CT) Series SIP IP Phones. It also includes details on the functionality and configuration of the IP phones.

Notes:

- Features, characteristics, requirements, and configuration that are specific to a particular IP phone model are indicated where required in this guide.
- This guide will be updated periodically with new and/or updated information. For details on what features have been added or updated, please refer to the **Aastra <Model/Series-Specific> SIP IP Phone Release Notes**.

Audience

This guide is for network administrators, system administrators, developers and partners who need to understand how to operate and maintain the IP phone on a SIP network. It also provides some user-specific information.

This guide contains information that is at a technical level, more suitable for system or network administrators. Prior knowledge of IP Telephony concepts is recommended.

Documentation

The IP phone documentation suite consists of the following:

- **Aastra <Model-Specific> SIP IP Phone Installation Guide** – contains installation and set-up instructions, information on general features and functions, and basic options list customization. Included with the phone.
- **Aastra Models 6700i, 6800i, and 9000i Series SIP IP Phone Administrator Guide** – explains how to set the phone up on the network, as well as advanced configuration instructions for the SIP IP phone. This guide contains information that is at a technical level more suitable for a system or network administrator.
- **Aastra <Model-Specific> SIP IP Phone User Guides** – explains the most commonly used features and functions for an end user.
- **Aastra <Model/Series-Specific> SIP IP Phone Release Notes** – provides new features and documents issues resolved for the SIP IP phones.

This Administrator Guide complements the **Aastra <Model-Specific> Installation Guide**, the **Aastra <Model-Specific> SIP IP Phone User Guides**, and the **Aastra <Model/Series-Specific> SIP IP Phone Release Notes**.

Chapters and Appendices in this Guide

This guide contains the following chapters and appendices:

Chapter 1

Overview

About this Chapter

This chapter briefly describes the IP Phone Models, and provides information about installing the IP phone firmware. It also describes the firmware and configuration files that the IP phone models use for operation.

Topics

This chapter covers the following topics:

Topic	Page
IP Phone Models	page 1-2
Optional Accessories	page 1-4
Model 6730i IP Phone	page 1-7
Model 6731i IP Phone	page 1-10
Model 6735i IP Phone	page 1-13
Model 6737i IP Phone	page 1-16
Model 6739i IP Phone	page 1-28
Model 6753i IP Phone	page 1-22
Model 6755i IP Phone	page 1-25
Model 6757i and 6757i CT IP Phones	page 1-28
Model 6863i IP Phone	page 1-33
Model 6865i IP Phone	page 1-35
Model 6867i IP Phone	page 1-38
Model 9143i IP Phone	page 1-41
Model 9480i and 9480i CT IP Phones	page 1-44
Firmware Installation Information	page 1-49
Installation Considerations	page 1-49
Installation Requirements	page 1-49
Configuration Server Requirement	page 1-49
Firmware and Configuration Files	page 1-50
Configuration File Precedence	page 1-51
Installing the Firmware/Configuration Files	page 1-51
Multiple Configuration Server Support	page 1-52

IP Phone Models

Description

All Aastra SIP IP Phone Models communicate over an IP network allowing you to receive and place calls in the same manner as a regular business telephone.

All phone models support the Session Initiation Protocol (SIP). The 9480i CT and 6757i CT offers the base phone along with a cordless extension.

References

For more information about the features and installation requirements, see the ***SIP IP Phone Installation Guide*** for your specific model.

The following illustrations show the types of IP Phone Models.

9480i CT

Optional Accessories

6700 Series

The following are optional accessories specifically for the 6700i Series IP Phones.

6700i Wall Mount Kit

The following are optional accessories specifically for the 6731i, 6735i, 6737i, and 6739i IP Phones.

Power Adapter

The following are optional accessories specifically for the 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, and 6757i CT IP Phones.

**M670i Expansion Module
for 6735i, 6737i, 6739i, 6753i, 6755i,
6757i, and 6757i CT**

**M675i Expansion Module
for 6735i, 6737i, 6739i, 6755i, 6757i,
and 6757i CT**

The M670i module adds 36 additional softkeys to the IP phone models 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, and 6757i CT. The M670i provides paper labels for each softkey. Up to 3 modules can be daisy-chained to provide up to 108 additional softkeys for the phone when powered via the 48V AC adapter.

The M675i module adds 60 additional softkeys to the IP phone models 6735i, 6737i, 6739i, 6755i, 6757i, and 6757i CT (using the 3 function keys on the bottom right of the unit). The M675i module provides an LCD screen for displaying softkey labels. Up to 3 modules can be daisy-chained to provide up to 180 additional softkeys for the phone when powered via the 48V AC adapter.

Refer to the table below for additional daisy-chaining information.

M670i/M675i Expansion Modules Daisy-Chaining Support

IP Phone Model	Maximum Number of Daisy-Chained Modules When Powered Via 48V AC Adapter	Maximum Number of Daisy-Chained Modules When Powered Via PoE	PoE Class
6730i	0	N/A	No PoE Support
6731i	0	0	Class 1 (<3.84W)
6735i	3	1	Class 2 (< 6.49W)
6737i	3	1	Class 2 (< 6.49W)
6739i	3	0	Class 0 (< 12.94W)
6753i	3	3	Class 0 (< 12.94W)
6755i	3	3	Class 0 (< 12.94W)
6757i	3	3	Class 0 (< 12.94W)
6757i CT	3	3	Class 0 (< 12.94W)

Note:

Daisy-chaining M670i modules with M675i modules is supported for all IP phone models except the 6753i (the 6753i only supports the M670i expansion module).

Reference

For more information about installing the 6700i Wall Mount Kit and setting up and using the expansion modules, see the **6700i Wall Mount Kit Installation Guide**, your <Model-Specific> **Installation Guide**, as well as your <Model-Specific> **IP Phone User Guide**.

6800i Series

The following are optional accessories specifically for the 6800i Series IP Phones.

6800i Wall Mount Kit

Power Adapter

The following are optional accessories specifically for the 6865i and 6867i IP Phones.

M680i Expansion Module

The M680i module adds 16 additional softkeys to the 6865i and 6867i IP phones and provides paper labels for each softkey. Up to 3 modules can be daisy-chained to provide up to 48 additional softkeys for the phone. No separate power adaptor is required as the M680i is powered by the respective IP phone.

M680i Expansion Modules Daisy-Chaining Support

IP Phone Model	Maximum Number of Daisy-Chained Modules When Powered Via 48V AC Adapter	Maximum Number of Daisy-Chained Modules When Powered Via PoE	PoE Class
6865i	3	3	Class 2 (< 6.49W)
6867i	3	3	Class 2 (< 6.49W) without modules. Dynamically switches to Class 3 (< 12.95W) when modules are attached.

M680i Software Upgrades

The M680i does not require a separate firmware package. M680i software is embedded within the respective phone's firmware package.

When the M680i is connected and is powered up, the LED corresponding to the second button on the module will turn solid red and the module will check to see if an upgrade is required. If it does not have the latest software, the module will upgrade itself using the phone's embedded firmware. This process will take approximately 10 seconds, in which case the LED corresponding to the second button on the M680i will stay solid red for the duration. If the upgrade is successful, the LED will turn green. If the LED stays solid and red for longer than 10 seconds, the upgrade may have failed. In such scenarios, unplug and reattach the power source from the phone to attempt the upgrade again.

As software upgrades are performed one at a time, each additional M680i connected increases the approximate upgrade time by 10 seconds (e.g. three connected M680i expansion modules will take approximately 30 seconds to upgrade).

Reference

For more information about installing the 6800i Wall Mount Kit and setting up and using the M680i expansion module, see the **6800i Wall Mount Kit Installation Guide**, the **M680i Expansion Module Installation Guide**, **M680i Expansion Module Quick Start Guide**, your <Model-Specific> **Installation Guide**, as well as your <Model-Specific> **IP Phone User Guide**.

Model 6730i IP Phone

This section provides brief information about the Model 6730i IP Phone. It includes a list of features and describes the hard keys on the 6730i. The 6730i is available with a symbol keypad or a text keypad.

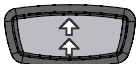

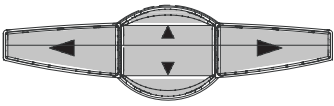

6730i with Symbol or Text Keys

6730i Phone Features (Symbol and Text)

- 3-line LCD screen
- 8 programmable top keys
- Press-and-hold speed dial key configuration feature
- Supports up to 6 call lines with LEDs
- Full-duplex speakerphone for handsfree calls
- Headset mode support (via handset jack)
- AC power adapter (included)
- Enhanced busy lamp fields*
- Set paging*

*Availability of feature dependant on your phone system or service provider.

6730i Symbol and Text Key Descriptions*

Symbol Keys	Text Keys	Key Description
		Hold key - Places an active call on hold. To retrieve a held call, press the call appearance button beside the light that is flashing.
		Redial key - Redials up to 100 previously dialed numbers. Pressing the Redial key twice redials the last dialed number.
		Goodbye key - Ends an active call. The Goodbye key also exits an open list, such as the Options List, without saving changes.
		Volume control key - Adjusts the volume for the handset, ringer, and handsfree speaker.
		Navigation keys - Pressing the UP and DOWN arrow keys lets you view different status and text messages on the LCD display (if there is more than 1 line of status/text messages). These keys also let you scroll through menu selections, such as the Options List, and scroll through a remote number that is displayed on the phone. Users can press the scrolling DOWN navigation key to view the rest of the phone number content. Pressing the LEFT and RIGHT arrow keys lets you view the different line/call appearances. While in the Options List, these keys allow you to exit or enter the current option. When you are editing entries on the display, pressing the LEFT arrow key works as a backspace instead of a moving cursor. the LEFT arrow key erases the digit/character at the cursor location including the dot/decimal. The RIGHT arrow key sets the option.
		Speaker key - Transfers the active call to the speaker, allowing handsfree use of the phone. Switched between headset and speaker depending on audio mode setting.
		Options key - Accesses services and options to customize your phone. Your System Administrator may have already customized some of your settings.
		Callers List key - Accesses the last 200 calls received.
		Conference key - Begins a conference call with the active call.
		Transfer key - Transfers the active call to another number.

Symbol Keys	Text Keys	Key Description
 	 	<p>Line/Call Appearance keys - Connect you to a line or call. The Aastra 6730i IP phone supports 2 line keys, each with LED indicator lights. Additional lines (up to 6 in total) can be added to the programmable keys.</p>
 1  2  3  4	 5  6  7  8	<p>Programmable keys - 8 Top Keys - all 8 keys are programmable. Keys 5 and 6 are designated as the SAVE and DELETE keys, respectively. These keys must be made configurable by the System Administrator before they can be changed.</p> <p>The following are the default functions for the programmable keys on the 6730i IP phone:</p> <p>1 - None 2 - None 3 - None 4 - None 5 - SAVE - Allows you to save numbers (preconfigured) and/or names to the Directory. Using this key, you enter the number, name, and line (or speed dial key) to record in the Directory List. 6 - DELETE - Allows you to delete entries (preconfigured) from the Directory List and Callers List. (Must enter the Directory or Callers list and select an entry, then press twice to delete entry). 7 - DIRECTORY - Displays up to 200 names (preconfigured) and phone numbers (stored in alphabetical order) 8 - SERVICES - Accesses enhanced features (preconfigured) and services through the Services menu.</p> <p>Note: For more information about configuring the programmable keys 1 through 8 to perform specific functions, see Chapter 5, "Configuring Operational Features" the section, "Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys" on page 5-104.</p>

*See the *Aastra Model 6730i IP Phone User Guide* for more information about each of these keys.

Model 6731i IP Phone

This section provides brief information about the Model 6731i IP Phone. It includes a list of features and describes the hard keys on the 6731i. The 6731i is available with a symbol keypad or a text keypad.

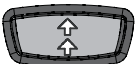

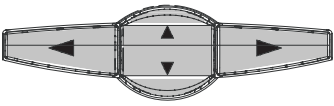

6731i with Symbol or Text Keys

6731i Phone Features (Symbol and Text)

- 3-line LCD screen
- 8 programmable top keys
- Press-and-hold speed dial key configuration feature
- Supports up to 6 call lines with LEDs
- Full-duplex speakerphone for handsfree calls
- Headset mode support (via handset jack)
- Built-in two-port, 10/100 Ethernet ports - lets you share a connection with your computer
- Inline power support (based on 802.3af standard) which eliminates power adapters
- AC power adapter (optional equipment - not included)
- Enhanced busy lamp fields*
- Set paging*

*Availability of feature dependant on your phone system or service provider.

6731i Symbol and Text Key Descriptions*

Symbol Keys	Text Keys	Key Description
		Hold key - Places an active call on hold. To retrieve a held call, press the call appearance button beside the light that is flashing.
		Redial key - Redials up to 100 previously dialed numbers. Pressing the Redial key twice redials the last dialed number.
		Goodbye key - Ends an active call. The Goodbye key also exits an open list, such as the Options List, without saving changes.
		Volume control key - Adjusts the volume for the handset, ringer, and handsfree speaker.
		<p>Navigation keys - Pressing the UP and DOWN arrow keys lets you view different status and text messages on the LCD display (if there is more than 1 line of status/text messages). These keys also let you scroll through menu selections, such as the Options List, and scroll through a remote number that is displayed on the phone. Users can press the scrolling DOWN navigation key to view the rest of the phone number content.</p> <p>Pressing the LEFT and RIGHT arrow keys lets you view the different line/call appearances. While in the Options List, these keys allow you to exit or enter the current option.</p> <p>When you are editing entries on the display, pressing the LEFT arrow key works as a backspace instead of a moving cursor. the LEFT arrow key erases the digit/character at the cursor location including the dot/decimal. The RIGHT arrow key sets the option.</p>
		Speaker key - Transfers the active call to the speaker, allowing handsfree use of the phone. Switched between headset and speaker depending on audio mode setting.
		Options key - Accesses services and options to customize your phone. Your System Administrator may have already customized some of your settings.
		Callers List key - Accesses the last 200 calls received.
		Conference key - Begins a conference call with the active call.
		Transfer key - Transfers the active call to another number.

Symbol Keys	Text Keys	Key Description
 	 	<p>Line/Call Appearance keys - Connect you to a line or call. The Aastra 6731i IP phone supports 2 line keys, each with LED indicator lights. Additional lines (up to 6 in total) can be added to the programmable keys.</p>
   	   	<p>Programmable keys - 8 Top Keys - all 8 keys are programmable. Keys 5 and 6 are designated as the SAVE and DELETE keys, respectively. Using this key, you enter the number, name, and line (or speed dial key) to record in the Directory List. 6 - DELETE - Allows you to delete entries (preconfigured) from the Directory List and Callers List. (Must enter the Directory or Callers list and select an entry, then press twice to delete entry). 7 - DIRECTORY - Displays up to 200 names (preconfigured) and phone numbers (stored in alphabetical order) 8 - SERVICES - Accesses enhanced features (preconfigured) and services through the Services menu.</p> <p>Note: For more information about configuring the programmable keys 1 through 8 to perform specific functions, see Chapter 5, "Configuring Operational Features" the section, "Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys" on page 5-104.</p>

*See the [Aastra Model 6731i IP Phone User Guide](#) for more information about each of these keys.

Model 6735i IP Phone

This section provides brief information about the Model 6735i IP Phone. It includes a list of features, and describes the hard keys, default programmable keys, and default softkeys on the 6735i. The 6735i is available with a symbol keypad or a text keypad.

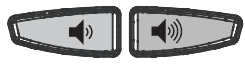

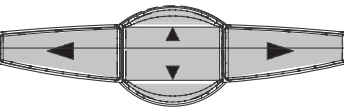

6735i with Symbol or Text Keys

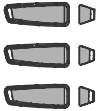

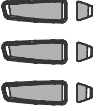

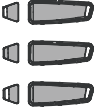

6735i Phone Features (Symbol and Text)

- 8-line graphical LCD screen (144 x 75 pixels) with white backlight
- 12 programmable keys
 - 6 programmable hard keys on the top
 - 6 programmable state-based softkeys on the bottom
- 4 call appearance lines with LEDs
- Press-and-Hold speed dial key configuration feature
- Supports up to 9 call lines
- Full-duplex speakerphone for handsfree calls
- Headset support (modular connector)
- Built-in-two-port, 10/100/1000 Ethernet switch - lets you share a connection with your computer.
- Inline power support (based on 802.3af standard) which eliminates power adapters.
- Enhanced busy lamp fields*
- Set paging*

*Availability of feature dependant on your phone system or service provider.

6735i Symbol and Text Key Descriptions*

Symbol Keys	Text Keys	Key Description
		Goodbye key - Ends an active call. The Goodbye key also exits an open list, such as the Options List, without saving changes.
		Options key - Accesses options to customize your phone. Your System Administrator may have already customized some of your settings. Check with your System Administrator before changing the administrator-only options.
		Hold key - Places an active call on hold. To retrieve a held call, press the call appearance button beside the light that is flashing.
		Redial key - Redials up to 100 previously dialed numbers. Pressing the Redial key twice simultaneously redials the last dialed number.
		Volume control key - Adjusts the volume for the handset, headset, ringer, and handsfree speaker.
		Line/Call Appearance key - Connects you to a line or call. The Astra 6735i IP phone supports up to 4 line keys.
		
		
		
		Handsfree key - Activates Handsfree for making and receiving calls without lifting the handset. When the audio mode option is set, this key is used to switch between a headset and the handsfree speakerphone.
		Mute key - Mutes the microphone so that your caller cannot hear you (the light indicator flashes when the microphone is on mute).
		Navigation keys - Pressing the UP and DOWN arrow keys lets you view different status and text messages on the LCD display (if there is more than 1 line of status/text messages). These keys also let you scroll through menu selections, such as the Options List, and scroll through a remote number that is displayed on the phone. Users can press the scrolling DOWN navigation key to view the rest of the phone number content. Pressing the LEFT and RIGHT arrow keys lets you view the different line/call appearances. While in the Options List, these keys allow you to exit or enter the current option. When you are editing entries on the display, pressing the LEFT arrow key erases the character on the left; pressing the RIGHT arrow key sets the option.

Symbol Keys	Text Keys	Key Description
		<p>Programmable keys - 6 Top keys: programmable hard keys (up to 6 programmable functions)</p> <p>By default, the top keys 1 through 4 are assigned as Services, Directory, Callers List, and Intercom, respectively. Keys 5 and 6 have no assigned functions. All 6 keys are programmable and can be assigned to perform specific functions.</p> <p>The following are the default functions for the programmable keys on the 6735i IP phone:</p> <p>1 - SERVICES -Accesses enhanced features and services such as XML applications and voicemail, provided by third parties. 2 - DIRECTORY - Displays up to 200 names and phone numbers (stored in alphabetical order). 3 - CALLERS LIST - Accesses the last 200 calls received. 4 - ICOM - Accesses another extension on the network. 5 - None 6 - None</p> <p>Note: For more information about configuring the programmable keys 1 through 6 to perform specific functions, see Chapter 5, "Configuring Operational Features" the section, "Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys" on page 5-104.</p>
		<p>Softkeys - 6 Bottom keys: programmable state-based softkeys (up to 20 programmable functions).</p> <p>By default, the bottom softkeys 2 through 6 have no assigned functions. You can configure all 6 bottom softkeys to perform specific functions on the 6735i IP phone. However, after you lift the handset, there are specific static softkeys that display that cannot be changed. These are as follows:</p> <p>1 - DIAL - Allows you to dial out on the phone. 2 - CONF - Begins a conference call with the active phone. 3 - XFER - Transfers the active call to another number.</p> <p>Note: For more information about configuring softkeys 1 through 6 to perform specific functions, see Chapter 5, "Configuring Operational Features" the section, "Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys" on page 5-104.</p>

*See the **Aastra Model 6735i IP Phone User Guide** for more information about each of these keys.

Model 6737i IP Phone

This section provides brief information about the 6737i IP Phone. It includes a list of features, and describes the hard keys and default softkeys on the 6737i. The 6737i is available with a symbol keypad or a text keypad.

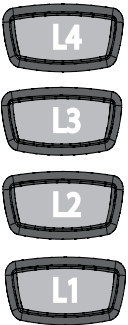

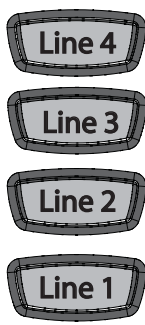

6737i with Symbol or Text Keys

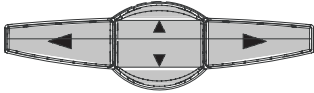

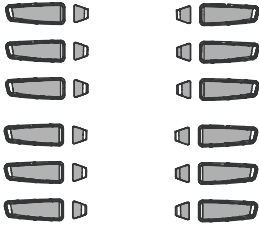

6737i Phone Features (Symbol and Text)

- 11-line graphical LCD screen (144 x 128 pixels) with white backlight
- 12 multi-functional softkeys
 - 6 Top Keys: programmable static softkeys
 - 6 Bottom Keys: programmable state-based softkeys
- 4 call appearance lines with LEDs
- Press-and-Hold speed dial key configuration feature
- Supports up to 9 call lines
- Full-duplex speakerphone for handsfree calls
- Headset support (modular connector)
- Built-in-two-port, 10/100/1000 Ethernet switch - lets you share a connection with your computer.
- Inline power support (based on 802.3af standard) which eliminates power adapters.
- Enhanced busy lamp fields*
- Set paging*

*Availability of feature dependant on your phone system or service provider.

6737i Symbol and Text Key Descriptions*

Symbol Keys	Text Keys	Key Description
		Goodbye key - Ends an active call. The Goodbye key also exits an open list, such as the Options List, without saving changes.
		Options key - Accesses options to customize your phone. Your System Administrator may have already customized some of your settings. Check with your System Administrator before changing the administrator-only options.
		Hold key - Places an active call on hold. To retrieve a held call, press the call appearance button beside the light that is flashing.
		Redial key - Redials up to 100 previously dialed numbers. Pressing the Redial key twice simultaneously redials the last dialed number.
		Volume control key - Adjusts the volume for the handset, headset, ringer, and handsfree speaker.
		Line/Call Appearance key - Connects you to a line or call. The Aastra 6737i IP phone supports up to 4 line keys.
		Handsfree key - Activates Handsfree for making and receiving calls without lifting the handset. When the audio mode option is set, this key is used to switch between a headset and the handsfree speakerphone.
		Mute key - Mutes the microphone so that your caller cannot hear you (the light indicator flashes when the microphone is on mute).

You can configure all 6 bottom softkeys to perform specific functions on the 6737i IP phone. However, after you lift the handset, there are specific static softkeys that display that cannot be changed. These are as follows:</p> <p>7 - DIAL - Allows you to dial out on the phone.</p> <p>8 - CONF - Begins a conference call with the active phone.</p> <p>9 - XFER - Transfers the active call to another number.</p> <p>Note: For more information about programming the softkeys to perform specific functions, see Chapter 5, "Configuring Operational Features" the section, "Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys" on page 5-104.</p>

*See the [Aastra Model 6737i IP Phone User Guide](#) for more information about each of these keys.

Model 6739i IP Phone

This section provides brief information about the Model 6739i IP Phone. It includes a list of features and describes the hard keys on the 6739i. The 6739i is available with a symbol keypad or a text keypad.

6739i with Symbol or Text Keys

6739i Phone Features (Symbol and Text)

- Large 5.7" full VGA (640x480) color touch screen display and backlight
- Advanced and expandable Executive Level SIP Phone
- Intuitive graphical user interface and navigation menus
- Two built-in 10/100/1000 Gigabit Ethernet switch ports - lets you share a connection with your computer.
- Inline power support (based on 802.3af Power-over-Ethernet (PoE) standard) which eliminates power adapters
- Built-in Bluetooth technology for headset support
- Existing 675xi Expansion Module support
- USB port support (for future use)
- Aastra Hi-Q Audio™ Technology
- Full-duplex speakerphone for handsfree calls
- Additional headset connection options: modular RJ jack, built-in EHS/DHSG port (refer to the *IP Phone 6739i Installation Guide* for information on installing a DHSG headset on your phone.)
- Up to 9 lines with 3 call appearance lines with multi-proxy support
- Up to 55 programmable softkeys
- Picture ID feature (during calls and in the Directory, Callers List, and Redial List)
- XML support for productivity-enhancing applications
- AC power adapter (sold separately)

6739i Symbol and Text Key Descriptions*

The following table identifies the keys on the key panel of your 6739i IP phone that you can use for handling calls. Your phone may contain symbol keys or text keys, depending on which Model 6739i phone you purchased.

Symbol Keys	Text Keys	Key Description
		Options Key - Accesses options to customize your phone. Your System Administrator may have already customized some of your settings. Check with your System Administrator before changing the administrator-only options.
		Callers List Key - Accesses a list of calls received by the phone.
		Directory Key - Accesses a directory of names and phone numbers (stored in alphabetical order).
		Services Key - Accesses enhanced features and services set up by your System Administrator.
		Conference Key - Begins a conference call with the active call.
		Transfer Key - Transfers the active call to another number.
		Hold Key - Places an active call on hold. To retrieve a held call, press the call appearance button beside the light that is flashing or press the Hold key again.
		Redial Key - Redials previously dialed numbers. Also accesses a Redial List of up to 100 stored numbers that called your phone.
		Goodbye Key - Ends an active call. The Goodbye key also exits an open list, such as the Options List.
		Messages Key - Accesses your phone's voice mailbox to retrieve and listen to stored messages.

Symbol Keys	Text Keys	Key Description
		Line/Call Appearance Keys - Connect you to a line or call. The Aastra 6739i IP phone supports 3 line call appearance keys.
		
		
		Speakerphone/Headset Key - Activates handsfree for making and receiving calls without lifting the handset. When the audio mode option is set, this key is used to switch between a headset and the handsfree speakerphone.
		Volume Control Key - Adjusts the volume for the handset, headset, ringer, and handsfree speaker.
		Mute key - Mutes the microphone so that your caller cannot hear you (the light indicator flashes when the microphone is on mute).

*See the [Aastra Model 6739i IP Phone User Guide](#) for more information about each of these keys.

Model 6753i IP Phone

This section provides brief information about the Model 6753i IP Phone. It includes a list of features, and describes the hard keys and default programmable keys on the 6753i. The 6753i is available with a symbol keypad or a text keypad.

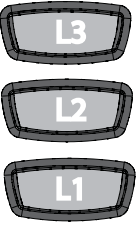

6753i with Symbol or Text Keys

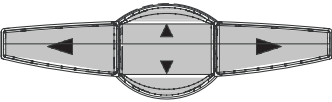

6753i Phone Features (Symbol and Text)

- 3-line LCD screen
- 6 programmable top keys
- 3 call appearance lines with LEDs
- Press-and-Hold speed dial key configuration feature
- Supports up to 9 call lines
- Full-duplex speakerphone for handsfree calls
- Headset support (modular connector)
- Built-in two-port, 10/100 Ethernet ports - lets you share a connection with your computer
- Inline power support (based on 802.3af standard) which eliminates power adapters.
- AC power adapter (included)

*Availability of feature dependant on your phone system or service provider.

6753i Symbol and Text Key Descriptions*

Symbol Keys	Text Keys	Key Description
		Goodbye key - Ends an active call. The Goodbye key also exits an open list, such as the Options List, without saving changes.
		Options key - Accesses options to customize your phone. Your System Administrator may have already customized some of your settings. Check with your System Administrator before changing the administrator-only options.
		Hold key - Places an active call on hold. To retrieve a held call, press the call appearance button beside the light that is flashing.
		Redial key - Redials up to 100 previously dialed numbers. Pressing the Redial key twice simultaneously redials the last dialed number.
		Volume control key - Adjusts the volume for the handset, headset, ringer, and handsfree speaker.
		Line/Call Appearance key - Connects you to a line or call. The Aastra 6753i IP phone supports up to 3 line keys.
		Handsfree key - Activates Handsfree for making and receiving calls without lifting the handset. When the audio mode option is set, this key is used to switch between a headset and the handsfree speakerphone.
		Mute key - Mutes the microphone so that your caller cannot hear you (the light indicator flashes when the microphone is on mute).

Symbol Keys	Text Keys	Key Description
		<p>Navigation keys - Pressing the UP and DOWN arrow keys lets you view different status and text messages on the LCD display (if there is more than 1 line of status/text messages). These keys also let you scroll through menu selections, such as the Options List, and scroll through a remote number that is displayed on the phone. Users can press the scrolling DOWN navigation key to view the rest of the phone number content.</p> <p>Pressing the LEFT and RIGHT arrow keys lets you view the different line/call appearances. While in the Options List, these keys allow you to exit or enter the current option.</p> <p>When you are editing entries on the display, pressing the LEFT arrow key works as a backspace instead of a moving cursor. The LEFT arrow key erases the digit/character at the cursor location including the dot/decimal. The RIGHT arrow key sets the option.</p>
		<p>Programmable keys - 6 Top Keys - all 6 keys are programmable. Keys 1 and 2 are designated as the SAVE and DELETE keys, respectively. These keys are locked but can be unlocked and made configurable if required by the System Administrator.</p> <p>The following are the default functions for the programmable keys on the 6753i IP phone:</p> <ol style="list-style-type: none"> 1 - SAVE - Allows you to save numbers and/or names to the Directory. Using this key, you enter the number, name, and line (or speed dial key) to record in the Directory List. 2 - DELETE - Allows you to delete a single entry or all entries from the Directory List and Callers List. 3 - DIRECTORY - Displays up to 200 names and phone numbers (stored in alphabetical order). 4 - CALLERS LIST - Accesses the last 200 calls received. 5 - TRANSFER - Transfers the active call to another number. 6 - CONFERENCE - Begins a conference call with the active call. <p>Notes:</p> <ul style="list-style-type: none"> • For more information about programming the SAVE and DELETE keys, see “Locking/Unlocking the SAVE and DELETE keys” on page 5-51. • For more information about configuring keys 1 through 6 to perform specific functions, see Chapter 5, “Configuring Operational Features” the section, “Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys” on page 5-104.

*See the *Aastra Model 6753i IP Phone User Guide* for more information about each of these keys.

When you are editing entries on the display, pressing the LEFT arrow key erases the character on the left; pressing the RIGHT arrow key sets the option.</p>
<p>Xfer</p> 	<p>Transfer key - Transfers an active call to another number.</p>
<p>Conf</p> 	<p>Conference key - Begins a conference call with the active call.</p>

Keys	Key Description
Icom 	Icom key - Begins an intercom call to a remote extension and answers incoming intercom calls. The 9480i and 9480i CT IP Phones also have default softkey 4 configured as Icom .
Services 	Services key - Displays a list of Services available to your phone, if specific services have been configured. The available Aastra services include Directory & Callers Log. The 9480i and 9480i CT IP Phones also have default softkey 1 configured as Services . Note: Availability of the services feature is dependant on your phone system and/or service provider.
	Softkeys - 6 state-based softkeys on the 9480i and 9480i CT IP Phones. When you pick up the handset, the following displays on key 1: Dial - After entering a phone number from the keypad, you can press the Dial softkey to immediately dial the number. Note: For more information about configuring softkeys 1 through 6 to perform specific functions, see Chapter 5, "Configuring Operational Features" the section, "Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys" on page 5-104.

*See the [Aastra 9480i and 9480i CT User Guides](#) for more information about each of these keys.

9480i CT Cordless Handset Features

- 5-line backlit display screen
- 2 multi-functional softkeys
- Programmable function key supports up to 14 functions
- Vibration Alerter
- Headset Jack
- Desk charging stand

9480i CT Cordless Handset Key Descriptions*

Function #	Function Description
1	Receiver
2	Volume key During Ringing: Adjusts ringer volume During a call: Adjusts receiver volume During text mode (not in a call): Moves cursor right/left
3	Display
4	Features f Key List Access key to the programmed Feature Key List Scrolls up when in the various lists Adds a space during editing
5	Softkeys Activates feature or option shown on the display above the keys
6	Call key Used to obtain dial tone Also used as a Hold key
7	Dial Pad
8	Mute Key When used, prevents the caller from hearing you
9	Headset Jack
10	Status Light
11	Release key To end calls and go on hook Exits Menu and the various lists
12	Menu Key Access key to the different Options Scrolls down when in the various lists Used as Backspace during editing
13	Redial Key Displays the last 10 numbers dialed
14	Charging Jack
15	Charging Contacts
16	Microphone

*See the [Aastra Model 9480i CT IP Phone User Guide](#) for more information about each of these keys.

Firmware Installation Information

Description

The firmware setup and installation for the IP phone can be done using any of the following:

- Phone User Interface via the keypad (Phone UI)
- Astra Web-based user interface (Aastra Web UI)

When the IP phone is initialized for the first time, DHCP is enabled by default. Depending on the type of configuration server setup you may have, the IP phone may download a firmware version automatically, or you may need to download it manually.

Installation Considerations

The following considerations must be made before connecting the IP phone to the network:

- If you are planning on using dynamic IP addresses, make sure a DHCP server is enabled and running on your network.
- If you are not planning on using dynamic IP addresses, see Chapter 4, the section, “[Configuring Network Settings Manually](#)” on [page 4-18](#) for manually setting up an IP address.

To install the IP phone hardware and cabling, refer to the <Model-Specific> **SIP IP Phone Installation Guide**.

Installation Requirements

The following are general requirements for setting up and using your SIP IP phone:

- SIP-based IP PBX system or network installed and running with a SIP account created for the IP phone
- Access to a Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), Hypertext Transfer Protocol (HTTP) server, or Hyper Text Transfer Protocol over Secure Sockets Layer (SSL) (HTTPS)
- Ethernet/Fast Ethernet LAN (10/100 Mb) (Gigabit Ethernet LAN [1000 Mbps] recommended for Gigabit Ethernet compliant phones)
- Category 5/5e straight through cabling (Category 6 straight-through cabling recommended for Gigabit Ethernet compliant phones)
- Power source
 - For Ethernet networks that supply inline power to the phone (IEEE 802.3af) use an Ethernet cable to connect from the phone directly to the network for power (no 48V AC power adapter required if using Power-over-Ethernet [PoE])
 - For Ethernet networks that DO NOT supply power to the phone:
Use the respective power adaptor to connect from the DC power port on the phone to a power source
or
Use a PoE power injector or a PoE switch

Configuration Server Requirement

A basic requirement for setting up the IP phone is to have a configuration server. The configuration server allows you to:

- Store the firmware images that you need to download to your IP phone
- Stores configuration files for the IP phone

Reference

To set the protocol for your configuration server, see [Chapter 4, “Configuring Network and Session Initiation Protocol \(SIP\) Features”](#), the section, “[Configuring the Configuration Server Protocol](#)” on [page 4-87](#).

To update the firmware on your phone, see [Chapter 8, “Upgrading the Firmware”](#).

Firmware and Configuration Files

Description

By default on startup, the phone downloads its firmware and configuration files from the configuration server you have set; or you can manually download the firmware from the configuration server. The phone supports TFTP, FTP, HTTP and HTTPS configuration servers.

Note:

Automatic download is dependant on your configuration server setup. For more information about manual and automatic download of firmware, see [Chapter 8, "Upgrading the Firmware."](#) For more information on changing the download protocol on your phone, see [Chapter 4, the section, "Configuring the Configuration Server Protocol"](#) on page 4-87.

The IP Phone firmware file (.st) include all the necessary files you need for your phone.

The firmware consists of the following file:

- **<phone model>.st** - This file contains information about the specific IP Phone model and contains the language packs to load to the phone.

The configuration files consist of three files called:

- **aastra.cfg** - This file contains configuration information about the IP Phone.
- **<model>.cfg** (for example, 6757i.cfg) - This file contains model specific information, where "model" should be the same string that is used for the model name (e.g. 6730i.cfg, 6731i.cfg, 6735i.cfg, 6737i.cfg, 6739i.cfg, 6753i.cfg, 6755i.cfg, 6757i.cfg, 6757iCT.cfg, 6863i.cfg, 6865i.cfg, 6867i.cfg, 9143i.cfg, 9480i.cfg, 9480iCT.cfg).
- **<MAC>.cfg** (for example, 00085D1610DE.cfg) - This file contains configuration information about the IP Phone.

The following table provides the files that the phone requests from the configuration server during bootup of the phone:

IP Phone Model	Associated Firmware	Configuration Files	Language Files
9143i	9143i.st	aastra.cfg	lang_cs.txt (Czech - UTF-8) lang_cs_op.txt (Czech - ASCII)
9480i	9480i.st	<model>.cfg	lang_ct.txt (Catalan)
9480i CT	9480iCT.st	(for example, 6757i.cfg)	lang_ct_va.txt (Valencian) lang_cy.txt (Welsh)
6730i	6730i.st		lang_de.txt (German)
6731i	6731i.st	<MAC>.cfg (for example, 00085D1610DE.cfg)	lang_da.txt (Danish) lang_es.txt (Spanish)
6735i	6735i.st		lang_es_mx.txt (Mexican Spanish)
6737i	6737i.st		lang_fi.txt (Finnish)
6739i	6739i.st		lang_fr.txt (French)
6753i	53i.st		lang_fr_ca.txt (Canadian French)
6755i	55i.st		lang_it.txt (Italian) lang_nl.txt (Dutch)
6757i	57i.st		lang_nl_nl.txt (Dutch - Netherlands)
6757i CT	57iCT.st		lang_no.txt (Norwegian) lang_pl.txt (Polish - ASCII)
6863i	6863i.st		lang_pl_pl.txt (Polish - UTF-8)
6865i	6865i.st		lang_pt.txt (Portuguese)
6867i	6867i.st		lang_pt_br.txt (Brazilian Portuguese) lang_ro.txt (Romanian)
			lang_ru.txt (Russian)
			lang_sk.txt (Slovak - UTF-8)
			lang_sk_op.txt (Slovak - ASCII)
			lang_sv.txt (Swedish)
			lang_tr.txt (Turkish)

Reference

For more information about loading language files and using the various languages on the IP phone, see Chapter 5, the section, “Language” on page 5-38.

Configuration File Precedence

Aastra IP phones can accept three sources of configuration data:

- The server configuration most recently downloaded/cached from the configuration server files, *aastra.cfg/<model>.cfg/<mac>.cfg* (or the *aastra.tuz/<model>.tuz/<mac>.tuz* encrypted equivalents)
- Local configuration changes stored on the phone that were entered using either the IP phone UI or the Aastra Web UI

If the same parameter appears more than once in the above configuration files, the last parameter/value read will be used (i.e., the following precedence rules will apply):

- Settings in the *<model>.cfg* file can overwrite *aastra.cfg* settings
- Settings in the *<mac>.cfg* file can overwrite *<model>.cfg* settings

In the event of conflicting values set by the different methods, values are applied in the following sequence:

1. Default values hard-coded in the phone software
2. Values downloaded from the configuration server
3. Values stored locally on the phone

The last values to be applied to the phone configuration are the values that take effect.

For example, if a parameter's value is set in the local configuration (via Aastra Web UI or IP phone UI) and the same value was also set differently in one of the *aastra.cfg/<model>.cfg/<mac>.cfg* files on the configuration server, the local configuration value is the value that takes effect because that is the last value applied to the configuration.

Installing the Firmware/Configuration Files

The following procedure describes how to install the firmware and configuration files.

1. If DHCP is disabled, manually enter the configuration server's IP address. For details on manually setting DHCP, see Chapter 4, the section “DHCP” on page 4-3.
2. Copy the firmware file *<phone model>.st* to the root directory of the configuration server. The IP phone accepts the new firmware file only if it is different from the firmware currently loaded on the IP phone.
Note:
The *<phone model>* attribute is the IP phone model (i.e., 9143i.st, 9480i.st, 9480iCT.st, 6730i.st, 6731i.st, 6735i.st, 6737i.st, 6739i.st, 51i.st, 53i.st, 55i.st, 57i.st, 57iCT.st).
3. Copy the Aastra configuration files (*aastra.cfg*, *<model>.cfg*, and *<mac>.cfg*) to the root directory of the configuration server.
Note:
The *<mac>* attribute represents the actual MAC address of your phone (i.e. *00085D030996.cfg*).
The *<model>* represents a specific model of phone. (i.e., *6757i.cfg*).
4. **Note:**
Restart the IP phone as described in Chapter 3, “Restarting Your Phone” on page 3-11.

Multiple Configuration Server Support

An Administrator has the option of specifying whether the phones get their firmware file, directory files, language packs, TLS certificate files, 802.1x certificate files, and HTTPS files from the original configuration server or from another server in the network. This feature allows you to specify the URL of other servers from which the phone can get this information.

Firmware Files and Multiple Configuration Servers

The firmware file for the phones can be downloaded from the original configuration server or from another server specified by a URL. You can specify a valid full or partial URL (server IP address) from which the phones get the firmware using a new parameter called, **"firmware server"** in the configuration files. If a *full URL* is specified for this parameter, the phones in the network get the *security.tuz*, *aastra.cfg*, *<model>.cfg*, and *<mac>.cfg* files from the original configuration server, and the firmware files from the server specified in the URL.

When the **"firmware server"** parameter specifies a *partial URL* path, the configuration server that is linked to the partial path is used to load the firmware.

For example,

```
firmware server: /path
```

When there is no **"firmware server"** parameter (or if it is empty), the original configuration server is used to load the firmware.

Note:

The default method for the download of all files and firmware to the phones is from the original configuration server. The Administrator must **specify a correct full or partial server URL** for the phones to get their firmware information from that server. If the URL is incorrect, no firmware download occurs to the phones from the specified server.

Examples

To download all configuration and firmware files from the original configuration server:

```
firmware server:
```

Leaving this parameter blank downloads all configuration and firmware files from the original configuration server.

To download all firmware files from another specified server:

```
firmware server: tftp://10.30.102.158/test1
```

The above example uses TFTP to download all firmware files that exist in the "test1" directory on the specified server, to the phone.

Note:

Specifying the download of a **".st"** file is not supported. For example, the following filename should NEVER be entered as a value string for the **"firmware server"** parameter:

```
firmware server: tftp://10.30.102.158/test1/57i.st
```

To download a partial from another specified server:

```
firmware server: /path
```

The above example uses the configuration server that is linked to the partial path to load the firmware.

Specifying a Server to Download Firmware Files

You can use the following parameter to specify a server other than the original configuration server from which the phones get their firmware:

- **firmware server**

Configuration Files

For the specific parameter(s) you can set in the configuration files, see Appendix A, the section, “Multiple Configuration Server Settings” on page A-24.

Directory Files, Language Packs, TLS Certificates, 802.1x Certificates, HTTPS Files and Multiple Configuration Servers

The directory files, language packs, TLS certificate files, 802.1x certificate files, and HTTPS files can also be downloaded to the phone from a server other than the configuration server. For each of these types of files, you can specify a URL (server IP address) from which the phone gets these files. You can use existing parameters on the phone to specify the URL. For applicable parameters, see “Specifying a Server Using Existing Parameters on the IP Phones” on page 1-54.

The following table specifies the files that the original configuration server downloads, and the files that another server can download to the phone.

Files always downloaded from original configuration server are, by order:	All files that can be downloaded from original configuration server OR another specified server are, by order:
security.tuz aastra.cfg/aastra.tuz <model>.cfg/<model>.tuz <mac>.cfg/<mac>.tuz	Directory Files <ul style="list-style-type: none"> • directory 1 • directory 2 Language Pack Files <ul style="list-style-type: none"> • language 1 • language 2 • language 3 • language 4 Transport Layer Security (TLS) Certificate Files <ul style="list-style-type: none"> • sips root and intermediate certificates • sips local certificate • sips private key • sips trusted certificates 802.1x Security Authentication Certificate Files <ul style="list-style-type: none"> • 802.1x root and intermediate certificates: • 802.1x local certificate: • 802.1x trusted certificates HTTPS Files <ul style="list-style-type: none"> • https user certificates

Specifying a Server Using Existing Parameters on the IP Phones

The following table provides the parameters on the phone that you can use to download directory files, language packs, TLS certificates, 802.1x certificates, and HTTPS files from the original configuration server OR from another server in the network.

Type of File	Parameters that support the Multiple Configuration Server feature are:
Directory Files	directory 1: directory 2:
Language Pack Files	language 1: language 2: language 3: language 4: Valid files names you can specify for languages are: lang_cs.txt (Czech - UTF8) lang_cs_op.txt (Czech - ASCII) lang_ct.txt (Catalan) lang_ct_va.txt (Valencian) lang_cy.txt (Welsh) lang_de.txt (German) lang_da.txt (Danish) lang_es.txt (Spanish) lang_es_mx.txt (Mexican Spanish) lang_fi.txt (Finnish) lang_fr.txt (French) lang_fr_ca.txt (Canadian French) lang_it.txt (Italian) lang_nl.txt (Dutch) lang_nl_nl.txt (Dutch - Netherlands) lang_no.txt (Norwegian) lang_pl.txt (Polish - ASCII) lang_pl_pl.txt (Polish - UTF8) lang_pt.txt (Portuguese) lang_pt_br.txt (Brazilian Portuguese) lang_ro.txt (Romanian) lang_ru.txt (Russian) lang_sk.txt (Slovak - UTF8) lang_sk_op.txt (Slovak - ASCII) lang_sv.txt (Swedish) lang_tr.txt (Turkish)
Transport Layer Security (TLS) Certificate Files	sips root and intermediate certificates: sips local certificate: sips private key: sips trusted certificates:
802.1x Security Authentication Certificate Files	802.1x root and intermediate certificates: 802.1x local certificate: 802.1x trusted certificates:
HTTPS Files	https user certificates

Reference

For more information on each of these parameters, refer to [Appendix A, "Configuration Parameters."](#)

Examples

Phone Directory Files

The following example downloads no directory:

```
directory 1:
```

The following example downloads a company directory from the original configuration server:

```
directory 1:companylist.csv
```

The following example downloads a company directory file from the specified server in the “path” directory:

```
directory 1: tftp://10.30.102.158/path/companylist.csv
```

Note:

To download a specific file, the string value **MUST HAVE A FILENAME** at the end of the string. For example:

```
directory 1: tftp://10.30.102.158/path/companylist.csv
```

where “**path**” is the directory and “**companylist.csv**” is the filename. If you do not specify a filename, the download fails.

Language Pack Files

The following example downloads no language pack file:

```
language 1:
```

The following example downloads the German language pack to the phones from the original configuration server:

```
language 1: lang_de.txt
```

The following example uses FTP to download the firmware file “lang_de.txt” (German language pack) from the “path” directory on server 1.2.3.4 using port 50:

```
language 1:ftp://admin:admin!@1.2.3.4:50/path/lang_de.txt
```

Transport Layer Security (TLS) Certificate Files

The following example downloads no local certificate file:

```
sips local certificate:
```

The following example downloads the local certificate file from the original configuration server.

```
sips local certificate: phonesLocalCert.pem
```

The following example uses FTP to download the firmware file “phonesLocalCert.pem” (local certificate file) from the “path” directory on server 1.2.3.4 using port 50.

```
sips local certificate:ftp://admin:admin!@1.2.3.4:50/path/phonesLocalCert.pem
```

802.1x Security Authentication Certificate Files

The following example downloads no 802.1x local certificate file:

```
802.1x local certificate:
```

The following example downloads the 802.1x local certificate for the phone from the original configuration server.

```
802.1x local certificate: 8021xlocalCert.pem
```

The following example uses FTP to download the firmware file “8021xlocalCert.pem” (802.1x local certificate file) from the “path” directory on server 1.2.3.4 using port 50.

```
802.1x local certificate:ftp://admin:admin!@1.2.3.4:50/path/8021xlocalCert.pem
```

HTTPS User Certificate Files

The following example downloads no HTTPS user certificate files:

```
https user certificates:
```

The following example downloads the HTTPS user certificates for the phone from the original configuration server.

```
https user certificates: trustedCerts.pem
```

The following example uses FTP to download the firmware file “user.crt.pem” (https user certificate file) from the “test1” directory on server 12.43.33.234 using port 50.

```
https user certificates: ftp://test:password@12.43.33.234:50/test1/user.crt.pem
```

Chapter 2

Configuration Interface Methods

About this Chapter

This chapter describes the methods you, as an Administrator, can use to configure the IP phones.

Note:

Features, characteristics, requirements, and configuration that are specific to a particular phone model are indicated where required in this guide.

Topics

This chapter covers the following topics:

Topic	Page
Configuration Methods	page 2-2
IP Phone UI	page 2-2
Aastra Web UI	page 2-6
Configuration Files (Administrator Only)	page 2-14

Configuration Methods

Description

You can use the following to setup and configure the IP phone:

- IP phone UI
- Aastra Web UI
- Configuration files

Note:

Not all parameters are available from all three methods. For more information about configuring the phone, see [Chapter 4](#), [Chapter 5](#), and [Chapter 6](#).

The following paragraphs describe each method of configuring the IP Phone.

IP Phone UI

The IP Phone User Interface (UI) provides an easy way to access features and functions for using and configuring the IP phone. Access to specific features and functions are restricted to the Administrator. A User can configure a subset of these features and functions. Users of the IP phones should see their <Model-Specific> **IP Phone User Guide** for available features and functions.

Reference

Refer to [Chapter 1](#), the section “[IP Phone Models](#)” on [page 1-2](#) for keys specific to your phone model.

For more information about using the hard keys on each phone, see [Chapter 5](#), the section, “[Locking IP Phone Keys](#)” on [page 5-49](#).

For more information about the softkeys/programmable keys, see [Chapter 5](#), the section, “[Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys](#)” on [page 5-104](#).

Options Key

The Options key allows you to access the "Options List" on the IP phone. Accessible options in this list are for both User and Administrator use. The Administrator must enter a password for administrator options.

Note:

An Administrator can apply a simplified options menu to the IP phones. An Administrator can also enable and disable the use of an Administrator password protection in the IP phone UI. These features are configurable using the configuration files only. For more information about these features, see [Chapter 3](#), the section, “[Simplified IP Phone UI Options Menu](#)” on [page 3-4](#), and [Chapter 5](#), the section, “[Administrator Passwords](#)” on [page 5-7](#).

This document describes the administrator options only. For a description of the user options in the "Options List", see your <Model-Specific> **IP Phone User Guide**.

The following illustrations indicate the location of the Options Key on each phone model.

Options Key

9143i

9480i/9480i CT

Options Key

9480i CT Handset

Using the Options Key

1. Press the **Options** key on the phone to enter the Options List.
2. Use the 5 and 2 to scroll through the list of options.
3. On 3-line LCD phones:
To select an option, press the **Enter** softkey, the  button (if applicable), or select the number on the keypad that corresponds to the option in the Option List.

On 8 and 11-line LCD phones:
To select an option, press the **Select** softkey, press 4, or select the number on the keypad that corresponds to the option in the Option List.
4. On 3-line LCD phones:
Use the **Set** softkey after making a change to an option, to save the change.

On 8 and 11-line LCD phones:
Use the **Change** softkey to change a selected option.
5. Press the **Done** softkey at any time to save the changes and exit the current option.
6. Press the **Cancel** softkey, press 3, press , or press  any time to exit without saving changes.

From the CT handsets:

1. Press the **Å** key to enter the Options List when the phone is not in use.
2. Use the scroll keys **Å** and **Ÿ** to scroll the options.
3. To select and change an option, press the **Γ** keys.
4. Press **y** when done.

Using the Options Key on the 6739i

1. Press the  key on the phone to enter the Options List. A list of buttons display.
 2. Press an option button to display a list of additional options.
 3. Press a button to display the values for a selection or to display additional options.
 4. Press a value to set the option on your phone.
 5. Press the  to return to the previous screen.
 6. Press the  button or the  button at any time to return to the idle screen.
-

Using the Options Key on the 6867i

1. Press the  key on the phone to enter the Options List.
 2. Use the 3 and 4 to scroll through the list of options.
 3. To select an option, press the  button or **Select** softkey.
 4. Change your desired settings and use the  button or **Save** softkey to apply and save your changes.
 5. Press the  key or the  key at any time to return to the idle screen.
-

Aastra Web UI

An administrator can setup and configure the IP phone using the **Aastra Web UI**. The **Aastra Web UI** supports Internet Explorer and Gecko engine-based browsers like Firefox, Mozilla or Netscape.

Note:

An Administrator can enable or disable the Aastra Web UI for a single phone or all phones in a network. For more information about enabling/disabling the Aastra Web UI, see ["Enabling/Disabling the Aastra Web UI"](#) on page 2-14.

HTTP/HTTPS Support

The Aastra Web UI supports both Hypertext Transfer Protocol (HTTP) and Hypertext Transfer Protocol over Secure Socket Layer (HTTPS) client and server protocols.

HTTP is the set of rules for transferring files (text, graphic images, sound, video, and other multimedia files) over the Internet. When you open your Web browser, you are indirectly making use of HTTP. HTTP is an application protocol that runs on top of the TCP/IP suite of protocols (the foundation protocols for the Internet).

HTTPS is a Web protocol that encrypts and decrypts user page requests as well as the pages that are returned by the Web server. HTTPS uses Secure Socket Layer (SSL) or Transport Layer Security (TLS) as a sublayer under its regular HTTP application layering. SSL is a commonly-used protocol for managing the security of a message transmission on the Internet. It uses a 40-bit key size for the RC4 stream encryption algorithm, which is considered an adequate degree of encryption for commercial exchange. TLS is a protocol that ensures privacy between communicating applications and their users on the Internet. When a server and client communicate, TLS ensures that no third party may eavesdrop or tamper with any message. TLS is the successor to SSL.

Note:

HTTPS uses port 443 instead of HTTP port 80 in its interactions with the TCP/IP lower layer. Both the HTTP and HTTPS port numbers are configurable using the configuration files, the IP Phone UI, the Aastra Web UI and DHCP Option 66. For more information about configuring these ports, see Chapter 4, the section, “[Configuring the Configuration Server Protocol](#)” on page 4-87.

HTTP/HTTPS Client and Server Support

The Aastra IP phones allow for HTTP request processing and associated data transfers to perform over a secure connection (HTTPS). The IP phones support the following:

- Transfer of firmware images, configuration files, script files, and web page content over a secure connection.
- Web browser phone configuration over a secure connection
- TLS 1.0 or SSL 3.0 methods for both client and server

HTTPS Client

When an HTTPS client opens and closes its TCP socket, the SSL software respectively handshakes upon opening and disconnects upon closing from the HTTPS server. The main HTTPS client functions are:

- Downloading of configuration files and firmware images
- Downloading of script files based on an “HTTPS://” URL supplied by a softkey definition

HTTPS Server

The HTTPS server provides HTTP functionality over secure connections. It coexists with the HTTP server but has its own set of tasks. The main HTTPS server functions are:

- Delivery of web page content to a browser client over a secure connection
- Execution of HTTP GET and POST requests received over a secure connection

Non-Blocking HTTP Connections

The IP Phones support a non-blocking HTTP connection feature. This feature allows the user to continue using the phone when there is a delay during an HTTP connection while the phone is waiting for the HTTP server to respond. This feature also allows a user to abort the connection and perform other operations on the phone (which will abort the HTTP connection automatically). A user can also abort the HTTP loading by pressing the GOODBYE key while the phone is displaying “Loading Page.....”.

Note:

This feature impacts only the HTTP calls triggered by a phone key (softkey or programmable key); the HTTP calls performed by action URIs are still blocking.

Authentication Support for HTTP/HTTPS Download Methods for Broadsoft Client Management System (CMS)

The IP Phones have authentication support as referenced in RFC 2617 when using HTTP or HTTPS as download protocols. If a 5i Series phone is challenged by an HTTP or HTTPS server when the server attempts to download the *aastra.cfg* file, the phone automatically sends "aastra" as the default Username and Password back to the server. For more information about this feature, see Chapter 5, the section, ["Authentication Support for HTTP/HTTPS Download Methods, used with Broadsoft Client Management System \(CMS\)"](#) on page 5-272.

Using HTTPS via the Aastra Web UI

HTTPS is enabled by default on the IP phones. When you open a browser window and enter an IP address or host name for a phone using HTTP, a server redirection occurs which automatically converts an HTTP connection to an HTTPS connection. After the redirection, a "Security Alert" certificate window displays alerting the user that information exchanged with the phone cannot be viewed or changed by others. Accepting the certificate then forwards you to the phone's Web UI.

Notes:

- The private key and certificate generate outside the phone and embed in the phone firmware for use by the HTTPS server during the SSL handshake.
- Using the configuration files, the IP phone UI, or the Aastra Web UI, you can configure the following regarding HTTPS:
 - Specify HTTPS security client method to use (TLS 1.0 or SSL 3.0)
 - Enable or disable HTTP to HTTPS server redirect function
 - HTTPS server blocking of XML HTTP POSTS to the phone

Reference

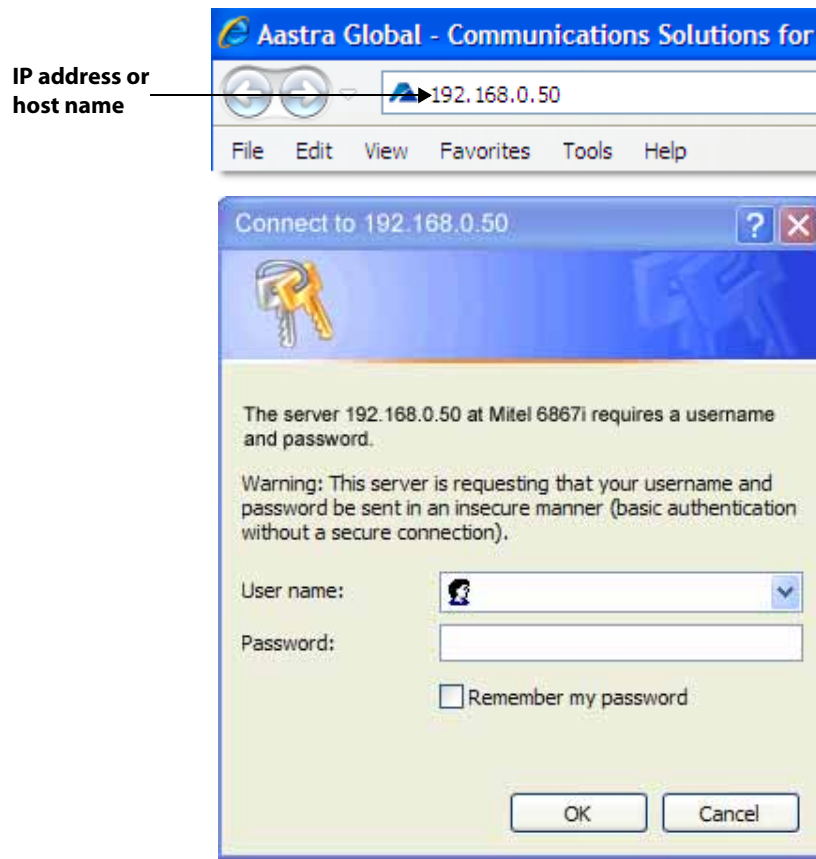

For more information on configuring the HTTPS protocol, see Chapter 4, the sections:

- ["Configuring the Configuration Server Protocol"](#) on page 4-87
- ["HTTPS Client/Server Configuration"](#) on page 4-33

Accessing the Aastra Web UI

Use the following procedure to access the Aastra Web UI.

1. Open your web browser and enter the phone's IP address or host name into the address field. The following is an example of the Login screen that displays.

2. Enter your username and password and click **OK**.

Note:

For an administrator, the default username is “**admin**” and the password is “**22222**”.
 For a user, the default username is “**user**” and the password field is left blank.
 The IP phones accept numeric passwords only.

The Status window displays for the IP phone you are accessing. The following illustration is an example of a Status screen for the 6867i IP phone.

3. You can logout of the Aastra Web UI at any time by clicking **Log Off**.

Depending on the model phone you are accessing, the following categories display in the side menu of the Aastra Web UI: **Status, Operation, Basic Settings, Advanced Settings**.

Note:

Programmable Keys apply to the 9143i, 6730i, 6731i, 6735i, 6753i, 6755i, 6863i, and 6865i. Softkeys apply to the 9480i, 9480i CT, 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT, and 6867i. Expansion Modules apply to the 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, 6757i CT, 6865i, and 6867i only.

Status

The **Status** section displays the network status and the MAC address of the IP phone. It also displays hardware and firmware information about the IP phone. The status window also displays the SIP Account information for each account on the phone. The information in the Status window is read-only.

Operation

The **Operation** section provides the following options:

Heading	Description
User Password	Allows you to change user password. (Applicable to User and Administrator)
Phone Lock	Allows you to assign an emergency dial plan to the phone, lock the phone to prevent any changes to the phone and to prevent use of the phone, and reset the user password. Note: You can also configure a softkey to use for locking/unlocking the phone. (Applicable to User and Administrator)
Softkeys and XML	9480i/9480i CT - 6 state-based, multi-functional softkeys 6735i - 6 Bottom, state-based, multi-functional softkeys 6737i - 6 Top, multi-functional, static softkeys / 6 Bottom, state-based, multi-functional softkeys 6755i - 6 Bottom, state-based, multi-functional softkeys 6739i - 55 state-based, multi-functional softkeys 6757i/6757i CT - 6 Top, multi-functional, static softkeys / 6 Bottom, state-based, multi-functional softkeys 6867i - 6 Top, multi-functional, static softkeys / 4 Bottom, state-based, multi-functional softkeys (Applicable to User and Administrator)
Programmable Keys	9143i - 7 multi-functional programmable keys 6730i - 8 Top, multi-functional programmable keys 6731i - 8 Top, multi-functional programmable keys 6735i - 6 Top, multi-functional programmable keys 6753i - 6 Top, multi-functional, programmable keys 6755i - 6 Top multi-functional, programmable keys 6863i - 3 multi-functional, programmable keys 6865i - 8 multi-functional, programmable keys (Applicable to User and Administrator)
Expansion Module <N>	The M670i has up to 36 configurable keys. The M675i has up to 60 configurable keys. The M680i has up to 16 configurable keys. You can have up to 3 expansion modules attached to a single phone allowing you to configure keys for Expansion Module 1, Expansion Module 2, and Expansion Module 3. See your <Model-Specific> IP Phone User Guide for applicable expansion modules for your model phone. Note: Expansion Modules apply to the 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, 6757i CT, 6865i, and 6867i only. (Applicable to User and Administrator)
Handset Keys (9480i CT and 6757i CT only)	Allows you to configure up to 15 softkeys on the handset. (Applicable to User and Administrator)
Keypad Speed Dial	Allows you to configure up to 9 speed dial keys. These fields map to the keypad digits 1 through 9 on the phone. You can also configure additional speed dials on the programmable keys, softkeys and expansion modules. See your <Model-Specific> IP Phone User Guide for more information about this feature. (Applicable to User and Administrator)
Directory	Allows you to copy the Callers List and Directory List from your IP phone to your PC. (Applicable to User and Administrator)
Reset	Allows you to restart the IP phone when required. (Applicable to User and Administrator). This setting also allows you to set the IP phone back to its factory default settings or remove the local configuration. (Applicable Administrator only)

Basic Settings

The **Basic Settings** section provides the following options:

Heading	Description
Preferences	<p>Allows you to set the following General specifications on the IP phone.</p> <ul style="list-style-type: none">• Local Dial Plan (Admin Only)• Send Dial Plan Terminator (Admin Only)• Digit Timeout (Admin Only)• Park Call• Pick Up Parked Call• Display DTMF Digits• Play Call Waiting Tone• Stuttered Dial Tone• XML Beep Support• Status Scroll Delay (seconds)• Switch UI Focus to Ringing Line• Call Hold Reminder During Active Calls• Call Hold Reminder• Call Waiting Tone Period• Preferred Line• Preferred Line Timeout (seconds)• Goodbye Key Cancels Incoming Call• Message Waiting Indicator Line• DND Key Mode• Call Forward Key Mode <p>This section also allows you to set:</p> <ul style="list-style-type: none">• Outgoing Intercom Settings (Admin Only; Administrator can enable these for a User if required)• Incoming Intercom Settings• Group Paging RTP Settings• Key Mapping (Admin Only)• Ring Tones• Priority Alert Settings (Admin Only)• Directed Call Pickup Settings (Admin Only)• Auto Call Distribution Settings (Admin Only)• Time and Date Settings• Language Settings (Only the Admin can specify the language pack names to load to the phone). Both the Admin and User can select the language type to display for the Web UI.
Account Configuration	<p>Allows you to configure DND (Do Not Disturb) and/or Call Forwarding by specific account or by all accounts. Also allows you to enable/disable specific states for each account, specify different phone numbers for call forwarding, and specify number of rings for a “No Answer” state.</p>

Advanced Settings (Applicable to Administrator Only)

The **Advanced Settings** section provides the following options:

Heading	Description
Network	Allows you to set Basic Network Settings, Advanced Network Settings, HTTPS Settings, Type of Service DSCP, and VLAN settings.
Global SIP	Allows you to set global Basic SIP Authentication Settings, Basic SIP Network Settings, Advanced SIP Settings, Real-time Transport Protocol (RTP) settings, Codec Preference List Settings, and Autodial Settings that apply to all lines on the IP phone.
Lines 1 through 9	Allows you to set per-line Basic SIP Authentication Settings, Basic SIP Network Settings, Advanced SIP Settings, Real-time Transport Protocol (RTP) settings, and Autodial Settings that apply to specific lines on the IP phone.
Action URI	Allows an administrator to specify a uniform resource identifier (URI) that triggers a GET when certain events occur. An Administrator can also specify a URI to be called, enable polling for the URI, and specify the interval between polls. (Applicable to Administrator Only)
Configuration Server	Allows you to set the protocol to use on the configuration server (TFTP (default), FTP, HTTP, or HTTPS), configure automatic firmware and configuration file updates, enable/disable auto-resync, and assign an XML push server list. (Applicable to Administrator Only)
Firmware Update	Allows you to manually perform a firmware update on the IP phone from the configuration server using any of the IP Phones supported protocols. (Applicable to Administrator Only)
TLS Support	Allows you to specify SIP Root and Intermediate Certificate files, local certificate files, private key filename, and/or trusted certificate filename to use when the phone uses the TLS transport protocol to setup a call. (Applicable to Administrator Only)
802.1x Support	Allows you to enable/disable the 802.1x Protocol (Extensible Authentication Protocol (EAP)) to use on the IP phones for authentication purposes. Applicable choices are EAP-MD5 or EAP-TLS. (Applicable to Administrator Only)
Troubleshooting	Allows you to perform troubleshooting tasks whereby the results can be forwarded to Aastra Technical Support for analyzing and troubleshooting. Also displays error messages if applicable. Note: You can also specify whether a user can upload system information automatically or manually by configuring a parameter in the configuration files. For more information on this feature, see Chapter 9 , the section "Configuration and Crash File Retrieval" on page 9-9. (Applicable to Administrator Only)

Enabling/Disabling the Aastra Web UI

The Aastra Web UI is enabled by default on the IP phones. A System Administrator can disable the Aastra Web UI on a single phone or on all phones if required using the configuration files.

System Administrators can also disable Users ability to login to the Aastra Web UI. With the Aastra Web UI disabled, users will still be able to lock/unlock the phone with a PIN from the IP Phone. Administrators can disable the user Web UI using the configuration file. System Administrators have the option to either disable the Web UI for both the Administrator and User, enable for both the Administrator and User, or enable the Web UI only for the Administrator. Use the following procedure to enable and disable the Aastra Web UI.

To Disable the Aastra Web UI:

Configuration Files

1. Using a text-based editing application, open the `<mac>.cfg` file if you want to disable the Web UI on a single phone. Open the `aastra.cfg` file to disable the Web UI on all phones
2. Enter the following parameter:

```
web interface enabled: 0
```

Note:
A value of zero (0) disables the Web UI on the phone for Administrators and Users. A value of (1) enables the Web UI for Administrators and Users. A value of (2) enables the Web UI for administrators only.
3. Save the changes and close the `<model>.cfg`, `<mac>.cfg` or the `aastra.cfg` file.
4. Restart the phone to apply the changes. The Aastra Web UI is disabled for a single IP phone or for all phones.

Configuration Files (Administrator Only)

A system administrator can enter specific parameters in the configuration files to configure the IP phones. All parameters in configuration files can only be set by an administrator.

You can enter specific configuration parameters in either of the following configuration files:

- `aastra.cfg`
- `<model>.cfg`
- `<mac>.cfg`

References

For information about configuration file precedence, see [Chapter 1, "Overview."](#)

For a description of each configuration file parameter, see [Appendix A, "Configuration Parameters."](#)

Using the Configuration Files

When you use the configuration files to configure the IP phones, you must use a text-based editing application to open the configuration file (`aastra.cfg`, `<model>.cfg`, or `<mac>.cfg`).

Use the following procedure to add, delete, or change parameters and their settings in the configuration files.

Note:

Apply this procedure wherever this Administrator Guide refers to configuring parameters using the configuration files.

Configuration Files

1. Using a text-based editing application, open the configuration file for the phone, for which you want to configure the directory list (either `aastra.cfg`, `<model>.cfg`, `<mac>.cfg` or all three).
2. Enter the required configuration parameters followed by the applicable value. For example,

```
directory 1: company_directory
directory 2: my_personal_directory
```
3. Save the changes and close the configuration file.
4. If the parameter requires the phone to be restarted in order for it to take affect, use the IP Phone UI or the Aastra Web UI to restart the phone.

Locking Parameters in the Configuration File

The IP Phones allow you to lock individual configuration parameters to prevent an end user from changing the configuration on the phone. This feature allows service providers to prevent the end-user from changing the values of specific parameters that would affect the service they provide.

An Administrator can lock parameters on the phone by placing an **exclamation mark (!)** before the parameter in the configuration file. For example,

```
!admin password: 22222
!emergency dial plan: 911|999
```

You can lock parameters on the phone using the configuration files. Once the parameters are locked, they cannot be changed at all during the phones run-time. The parameters appear as read-only when accessing the Aastra Web UI and the IP Phone UI. In the Aastra Web UI, they appear grayed out. In the IP Phone UI the ability to change the parameters is removed. In addition, when parameters are locked, they cannot be changed via XML.

Notes:

- The “parameter locking” feature applies to Release 2.4 and up. Any phones that have a previous release loaded on the phone will not be able to use the locking functionality in the configuration file.
- Any parameter duplicated in the `<model>.cfg` from the `aastra.cfg` is overwritten by the locking status and the value of the parameter found in the `<model>.cfg` file. Parameters in the `<mac>.cfg` file overwrite parameters in the `<model>.cfg` and `aastra.cfg` files.

Limitations

- A User possessing the Administrator password can bypass the locking of configuration server details by defaulting the phone.
- Softkeys can be locked and unlocked via XML in Release 3.3.1 and up using the **AastralIPPhoneConfiguration** object and **softkeyN locked** parameter (for more information about using the **AastralIPPhoneConfiguration** object, contact Aastra Customer Support regarding the **Aastra XML Development Guide**). All other parameters cannot be locked or unlocked using XML.
- Configuration files that include locked parameters are not backwards compatible.

Overwriting Parameters with Defaults in the Configuration Files

An Administrator can specify a “^” (caret character) before a configuration parameter in the `aastra.cfg`, `<model>.cfg`, and `<mac>.cfg` configuration files, which allows the parameter to be overwritten and reset back to a specified value. This can be convenient when changes are made by a user to specific parameters on the phone locally (via Aastra Web UI or IP Phone UI), and the Administrator wants to set the parameters back to the default values using the configuration files.

As an example, the following table describes how the parameter “**sip proxy ip**” is handled by the phone during phone bootup when either the “^” (default parameter) is used or the “!” (locked parameter) is used.

IF	THEN
new <mac>.cfg file is loaded to the phone with “ ^sip proxy ip ” and any other parameter(s) from the file specifying a “^”	the “ ^sip proxy ip ” and any other “^” parameters are overwritten if previously changed by the user.
new <model>.cfg file is loaded to the phone with “ ^sip proxy ip ” and any other parameter(s) from the file specifying a “^”	the “ ^sip proxy ip ” and any other “^” parameters are overwritten if previously changed by the user.
new <i>aastra.cfg</i> file is loaded to the phone with “ ^sip proxy ip ” and any other parameter(s) from the file specifying a “^”	the “ ^sip proxy ip ” and any other “^” parameters are overwritten if previously changed by the user.
the first instance is “ ^sip proxy ip ” and second instance is “ !sip proxy ip ” in the <i>aastra.cfg</i> , <model>.cfg, and/or <mac>.cfg file,	the value for the second instance of the parameter (“ !sip proxy ip ”) overwrites to the <i>aastra.cfg</i> , <model>.cfg, and/or <mac>.cfg files previously on the phone.

Notes:

- XML reboots take precedence over *server.cfg* values. Therefore, “^” parameters are ignored in the *aastra.cfg* file during XML reboots.
- If a parameter has both a “^” and a “!” preceding the same parameter (i.e., `^!sip proxy ip: pbx.company.com`), then the parameter is ignored and NOT overwritten.

Example 1

The following example illustrates the use of the “^” in the configuration files.

aastra.cfg

```
^sip proxy ip: pbx.company.com
^sip proxy port: 5060
^sip registrar ip: pbx.company.com
^sip registrar port: 5060
```

In the above example, if an Administrator indicates the “^” before the parameters in the *aastra.cfg* file, and then loads the *aastra.cfg* file to the phone, these four parameters are reset to their default values, even if the parameters were previously changed on the phone.

Example 2

The following example illustrates the use of the “^” and “!” in the configuration files.

aastra.cfg

```
^sip proxy ip: pbx.company.com
^sip proxy port: 5060
^sip registrar ip: pbx.company.com
^sip registrar port: 5060
```

<model>.cfg

```
!sip proxy ip: pbx.aastra.com //this parameter is locked
!sip proxy port: 5062 //this parameter is locked
!sip registrar ip: pbx.aastra.com //this parameter is locked
!sip registrar port: 5062 //this parameter is locked
```

<mac>.cfg

```
sip proxy port: 5064 //this parameter is unlocked
sip registrar port: 5064 //this parameter is unlocked
```

With this configuration, on the Web UI, the "**sip proxy ip**" and "**sip registrar ip**" parameters cannot be modified (they are grayed out), and the value is "pbx.aastra.com" since **<model>.cfg** has overwritten **aastra.cfg**.

The "**sip proxy port**" and "**sip registrar port**" parameters can be modified through Web UI because **<mac>.cfg** has overwritten **<model>.cfg** and **aastra.cfg**. On the Web UI, the value for these parameters is 5064.

Configuration Server Redundancy via DNS A Records

The phone sends a DNS query and in the DNS response, it accepts the first server IP address and contacts that server, ignoring any additional IP addresses in the response. This allows service providers to manage load balancing (via the DNS server putting different records first on each request), but does not provide redundancy.

The phones also provide support of multiple IP addresses being returned for the DNS lookup for server redundancy via multiple DNS A record entries. The phone tries to contact the first server address it receives, but if this fails, it now tries to contact the second server address, etc.

This feature supports all the download protocols (TFTP, FTP, HTTP, and HTTPS).

Notes:

- Once the phone has failed over to a redundant server, it continues to use that server for all other server-related processes on the phone (i.e., firmware upgrades from the Web UI, boot-up process, etc.).
- If a server fails while downloading a file(s) to the phone, the phone performs the discovery process of finding a redundant server that is available. When the boot is complete on the redundant server, the phone tries to download the file(s) again from the previous server. The check-sync process also performs the same way when a server fails.
- The "**Skip**" softkey displays in the event of a network outage, the user can skip the configuration download and continue the boot.
- All server failovers and failed server IP addresses are logged in the "Error Messages" page on the IP Phone UI at *Options->Phone Status->Error Messages*.

Limitation

In certain cases, the TFTP Protocol cannot distinguish between "server down" and "no file on server" error messages; therefore, the failover in these instances may fail.

Chapter 3

Administrator Options

About this Chapter

The IP phones provide specific options on the IP Phone that only an Administrator can access. These options are password protected and allow an Administrator to change or set features and configuration information as required. For all models, an Administrator can use the IP Phone UI, the Aastra Web UI, or the configuration files to enter and change values.

Note:

Specific options are configurable only via the IP Phone UI, and/or Aastra Web UI, and/or configuration files.

This chapter provides information about the available Administrator options.

Topics

This chapter covers the following topics:

Topic	Page
Administrator Level Options	page 3-2
IP Phone UI Options	page 3-2
Aastra Web UI Options	page 3-6
Configuration File Options	page 3-8
Phone Status	page 3-8
Restarting Your Phone	page 3-11
Set Phone to Factory Defaults/Erase Local Configuration	page 3-13
Basic Settings	page 3-16
Account Configuration	page 3-27
Network Settings	page 3-27
Line Settings	page 3-44
Softkeys, Programmable Keys, Expansion Module Keys	page 3-45
Action URI	page 3-46
Configuration Server Settings	page 3-47
Firmware Update Features	page 3-51
TLS Support	page 3-51
802.1x Support	page 3-54
Troubleshooting	page 3-55

Administrator Level Options

Description

There are options on the IP phone that both a User and Administrator can access. However, there are specific options that an Administrator can access only. These options allow the Administrator to configure and manage local and/or remote IP phones in a network.

An Administrator can access and manage these options using the IP Phone UI, the Aastra Web UI, or the configuration files.

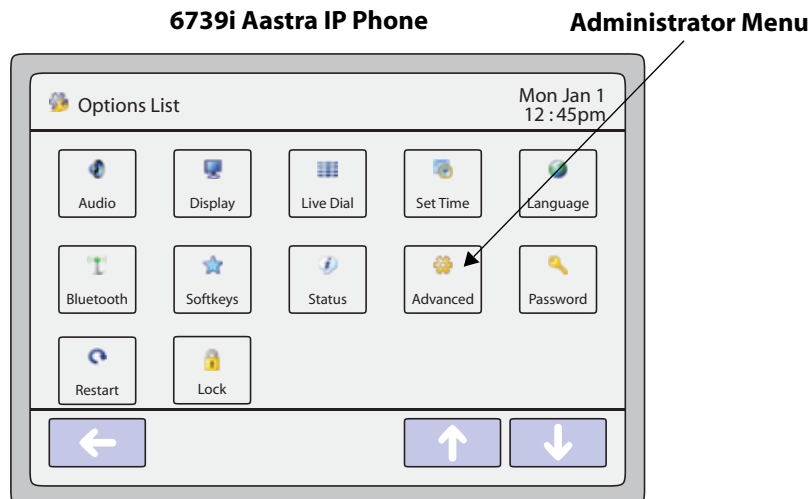

IP Phone UI Options

Using the IP Phone UI, you can access the Administrator options at **Options->Admin Menu** using the default password of "22222"

The following are administrator options in the "Options List" on all IP phones EXCEPT the 6739i and 6867i:

- **Administrator Menu**
 - Configuration Server
 - SIP Settings
 - Network Settings
 - Factory Default
 - Erase Local Config

The 6739i uses graphical icons to display the Administrator (Advanced) options on the 6739i phone, as shown in the following illustration.

The 6867i has an “Advanced” softkey, which when pressed gives access to the Administrator options.

The following are administrator options in the "Options List" on the 6739i and 6867i:

- **Advanced Menu**
 - Configuration Server
 - SIP Settings
 - Network Settings
 - Reset (includes options for “Erase Local Config” and “Factory Default”)

Note:

An administrator has the option of enabling and disabling the use of password protection on the IP phone UI for all model phones. This is configurable using the configuration files only. For more information about this feature, see Appendix A, the section “Password Settings” on page A-14

References

For information about all other user options in the “Options Menu”, see your <Model-Specific> **IP Phone User Guide**.

For procedures on configuring Administrator Options on the IP phone via the IP phone UI, see:

- Chapter 4, “Configuring Network and Session Initiation Protocol (SIP) Features”
- Chapter 5, “Configuring Operational Features”
- Chapter 6, “Configuring Advanced Operational Features”

Simplified IP Phone UI Options Menu

An Administrator can replace the existing options menu on the Phone UI with a more simplified options menu. In the configuration files, the **“options simple menu”** parameter allows you to display either the full menu (if set to 0), or the simplified menu (if set to 1). The following table illustrates the differences between the full menu and the simplified menu.

Note:

When setting the **“options simple menu”** parameter, the menu changes in the Phone UI only. The Aastra Web UI is not affected.

For all model phones EXCEPT the 6739i and 6867i:

Full Options Menu	Simplified Options Menu
Call Forward	Call Forward
Preferences	Preferences
Phone Status	Phone Status
Password	Removed
Administrator Menu	Removed
Restart Phone	Accessible through Phone Status
Phone Lock	Phone Lock

For the 6739i:

Full Options Menu	Simplified Options Menu
Audio	Audio
Display	Display
Set Time	Removed
Language	Removed
Bluetooth	Bluetooth
Softkeys	Removed
Status	Status
Advanced	Removed
Password	Removed
Restart	Accessible through Status
Lock	Lock

For the 6867i:

Full Options Menu	Simplified Options Menu
Language	Removed
Time and Date	Removed
Call Forward	Call Forward
Lock	Lock (Password Sub-Option Removed)
Status	Status
Audio	Audio
Display	Display
Dialpad	Removed
Restart	Restart

Warning!

When using the simplified menu, you cannot change the Network settings from the IP Phone UI. If the network settings become misconfigured, you must “factory default” the phone and use the full menu to recover the network settings from the Phone UI **OR** use the Aastra Web UI to configure the network settings.

Configuring the Simplified IP Phone UI Options Menu

You can enable the simplified IP Phone UI Options menu using the configurations files only.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Simplified IP Phone UI Options Menu” on [page A-7](#).

Aastra Web UI Options

An Administrator can configure specific options using the Aastra Web UI. These options display after an Administrator logs into the Web UI using a Web browser and entering the Admin username and password at the login prompt (The default username is "**admin**" and the default password is "**22222**". The IP phones accept numeric passwords only.) The column on the left side of the screen indicates the configurable options. A User has limited configuration options as shown in the following illustrations.

Configuration File Options

An Administrator can enter specific parameters in the configuration files to configure the IP phones. All parameters in configuration files can only be set by an administrator.

References

For a procedure on using the configuration files, see [Chapter 2](#), the section, “[Configuration Files \(Administrator Only\)](#)” on [page 2-1](#).

For a description of each parameter you can enter in the configuration files, see [Appendix A](#), “[Configuration Parameters](#).”

Phone Status

The **Phone Status** on the IP Phone displays the network status and firmware version of the IP phone.

You can display phone status using the IP phone UI or the Aastra Web UI.

Phone Status via IP Phone UI

In the IP phone UI, the Phone Status options are available to the user and the administrator and do not require a password entry.

Phone Status All IP Phones Except the 6739i and 6867i

- **IP&MAC Addresses**
 - Displays the IP address and MAC address of the phone.
- **LAN Port**
 - Displays the Link State, Negotiation Method, Speed, and Duplex Method that the phone uses on its LAN port.
- **PC Port**
 - Displays the Link State, Negotiation Method, Speed, and Duplex Method that the phone uses on its PC Port.
- **Firmware Info**
 - Displays information about the firmware and boot version that is currently installed on the IP phone.
- **Error Messages**
 - Displays any error messages that occurred during the phone’s last reboot.

Phone Status for 6739i IP Phone

- **Firmware**
 - Displays information about the firmware and boot version that is currently installed on the IP phone.
- **Network**
 - **IP&MAC Addresses**
 - Displays the IP address and MAC address of the phone.
 - **LAN Port**
 - Displays the Link State, Negotiation Method, Speed, and Duplex Method that the phone uses on its LAN port.
 - **PC Port**
 - Displays the Link State, Negotiation Method, Speed, and Duplex Method that the phone uses on its PC Port.
- **Error Msg**
 - Displays any error messages that occurred during the phone’s last reboot.

Phone Status for 6867i IP Phone

- **Firmware Info**
 - Displays information about the firmware and boot version that is currently installed on the IP phone.
- **Network**
 - **IP Address**
 - Displays the IP address of the phone.
 - **MAC Address**
 - Displays the MAC address of the phone.
 - **LAN Port**
 - Displays the Link State, Negotiation Method, Speed, and Duplex Method that the phone uses on its LAN port.
 - **PC Port**
 - Displays the Link State, Negotiation Method, Speed, and Duplex Method that the phone uses on its PC Port.
- **Storage**
 - Displays the number of Directory, Callers, and Redial List entries saved on the phone.
- **Error Messages**
 - Displays any error messages that occurred during the phone’s last reboot.

Phone Status via Aastra Web UI

The first screen that displays after logging into the Aastra Web UI for a phone is the Status screen. This screen also displays when selecting **Status->System Information**. The information on this screen is available to the user and the administrator as read-only.

The screenshot shows the MITEL 6867i IP Phone Status page. The left sidebar contains navigation options like System Information, Operation, Basic Settings, and Advanced Settings. The main content area displays the following information:

System Information

Network Status

Attribute	LAN Port	PC Port
Link State	Up	Down
Negotiation	Auto	Auto
Speed	100Mbps	10Mbps
Duplex	Full	Half

Hardware Information

Attribute	Value
MAC Address	00-11-22-33-44-55
Platform	6867i Revision 0

Firmware Information

Attribute	Value
Firmware Version	3.3.1.5014
Firmware Release Code	SIP
Boot Version	1.0.0.0
Date/Time	May 4 2013 03:27:15

SIP Status

Line	SIP Account	Status	Backup Registrar Used?
1	650@proxy.com:5060	Registered	Yes
2	651@proxy.com:5060	Registered	Yes
3	653@proxy.com:5060	Registered	Yes
4	654@proxy.com:5060	401	No

The following is a description of the information on the Status screen:

- **Network Status**
 - Displays the network status of the Ethernet ports at the back of the phone. You can also view the phone's IP and MAC addresses. Information in this field includes Link State, Negotiation, Speed, and Duplex for Port 0 and Port 1.
- **Hardware Information**
 - Displays the current IP phone platform and the revision number.
- **Firmware Information**
 - Displays information about the firmware that is currently installed on the IP phone. Information in this field includes Firmware Version, Firmware Release Code, Boot Version, Release Date/Time.
- **SIP Status**
 - Displays information about the SIP registration status of the phone. If there are accounts configured on the IP Phone, their SIP status displays in this field. All model phones display the status of up to 9 lines.

The following table describes the status conditions that can display for an account(s).

Status Condition	Description								
Registered	<p>Displays this status on accounts that HAVE been registered with the SIP proxy server.</p> <p>Example:</p> <table border="1"> <thead> <tr> <th>Line</th> <th>SIP Account</th> <th>Status</th> <th>Backup Registrar Used?</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>650@proxy.com:5060</td> <td>Registered</td> <td>Yes</td> </tr> </tbody> </table> <p>where Account Number is "1" SIP Account is "650@proxy.com" on port "5060" Status is "Registered" Backup registrar is used ("Yes")</p>	Line	SIP Account	Status	Backup Registrar Used?	1	650@proxy.com:5060	Registered	Yes
Line	SIP Account	Status	Backup Registrar Used?						
1	650@proxy.com:5060	Registered	Yes						
SIP Error Number	<p>Displays on accounts when registration fails with the SIP proxy server.</p> <p>Example:</p> <table border="1"> <thead> <tr> <th>Line</th> <th>SIP Account</th> <th>Status</th> <th>Backup Registrar Used?</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>653@proxy.com:5060</td> <td>401</td> <td>No</td> </tr> </tbody> </table> <p>where Account Number is "4" SIP Account is "653@proxy.com" on port "5060" Status is "401" - Unregistered if SIP registration fails. Backup registrar is used ("No")</p>	Line	SIP Account	Status	Backup Registrar Used?	4	653@proxy.com:5060	401	No
Line	SIP Account	Status	Backup Registrar Used?						
4	653@proxy.com:5060	401	No						

Note:

The IP Phones can register with multiple server using the same user name. So the SIP Status information on the Status screen may display the same account with different registrar and proxy IP addresses. For more information, see

Restarting Your Phone

As System Administrator, there may be times when you need to restart a phone. The Restart option allows you reboot the phone when required. A reset may be necessary when:

- There is a change in your network, **OR**
- To re-load modified configuration files, **OR**
- If the settings for the IP phone on the IP PBX system have been modified.

You can restart the phone using the IP Phone UI or the Aastra Web UI.

Restarting the Phone Using the IP Phone UI

IP Phone UI

1. Press the **Options** key on the phone to enter the Options List.
2. Select **Restart Phone**.
3. For 3-Line LCD Displays:
Press **#** to confirm.

Note:

To cancel the Restart, press the **3** key.

For 8 and 11-Line LCD Displays:

Press **Restart**.

Note:

To cancel the Restart, press **Cancel**.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Restart** button. A "Restart the Phone?" prompt displays.
3. Press **Yes** to restart the phone, or **No** to cancel the restart function.

For the 6867i:

1. Press the **Options** key on the phone to enter the Options List.
2. Navigate to the **Restart** option and press the  button or **Select** softkey. A "Restart Phone?" prompt displays.
3. Select **Yes** using the  button or press the **Restart** softkey to restart the phone. Press **No** using the  button or the **Cancel** softkey to cancel the restart function.

Restarting the Phone Using the Aastra Web UI

Aastra Web UI

1. Click on **Operation->Reset->Phone**.

2. Click **Restart** to restart the phone.

Set Phone to Factory Defaults/Erase Local Configuration

You can set phones to their factory default setting or remove a local phone's configuration using the IP Phone UI or the Aastra Web UI.

Setting Factory Defaults on the Phone

Factory default settings are the settings that reside on the phone after it has left the factory. The factory default settings on the phone sets the factory defaults for all of the settings in the *aastra.cfg*, *<model>.cfg*, *<mac>.cfg*, and local configuration. Performing this action results in losing all user-modified settings. You can reset a phone to factory defaults using the IP Phone UI or the Aastra Web UI.

Setting Factory Defaults Using the IP Phone UI

IP Phone UI

1. Press the **Options** key on the phone to enter the Options List.
2. Select **Administrator Menu** and enter your Administrator Password (default is **22222**).
3. Select **Factory Default**.
4. **For 3-Line LCD Displays:**
The "Restore Defaults?" prompt displays.
Press # to confirm.

For 8 and 11-Line LCD Phones:
The "Reset phone to factory defaults?" prompt displays.
Press **Default** to confirm.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** button. A keyboard displays.
3. Enter the Administrator password using the keyboard, and press **<Enter>**. Default is "22222".
4. Press the **Reset** button. A "Reset Configuration?" prompt displays.
5. Press the **Factory Default** button.
The phone immediately resets to factory defaults and the phone reboots.

For the 6867i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password and press **Enter**. Default is "22222".
4. Navigate to the **Reset** option and press the  button or **Select** softkey.
5. Select **Factory Default** using the  button or press the **Select** softkey.
The phone immediately resets to factory defaults and the phone reboots.

Settings Factory Defaults Using the Aastra Web UI

Aastra Web UI

1. Click on **Operation->Reset->Current Settings**.

2. In the "**Restore to Factory Defaults**" field, click **Restore**.

This restores all factory defaults, and removes any saved configuration and directory list files.

Erasing the Phone's Local Configuration

You can reset the IP Phone's local configuration if required. The local configuration is the last updated configuration you performed using the IP Phone UI or the Aastra Web UI. Performing this action results in losing all recently user-modified settings. For more information about local configuration, see Chapter 1, the section, "[Configuration File Precedence](#)" on page 1-51.

Erasing the Phone's Local Configuration Using the IP Phone UI

IP Phone UI

1. Press the **Options** key on the phone to enter the Options List.
2. Select **Administrator Menu** and enter your Administrator Password (default is **22222**).
3. Select **Erase Local Config**.
4. **For 3-Line LCD Displays:**
The "*Erase local config?*" prompt displays.
Press **#** to confirm.

For 8 and 11-Line LCD Displays:
The "*Erase local config?*" prompt displays.
Press **Erase** to confirm.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** button. A keyboard displays.
3. Enter the Administrator password using the keyboard, and press **<Enter>**. Default is "**22222**".
4. Press the **Reset** button. A "Reset Configuration?" prompt displays.
5. Press the **Erase Local Cfg** button.
The phone immediately erases the local configuration on the phone and the phone reboots.

For the 6867i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password and press **Enter**. Default is "**22222**".

IP Phone UI

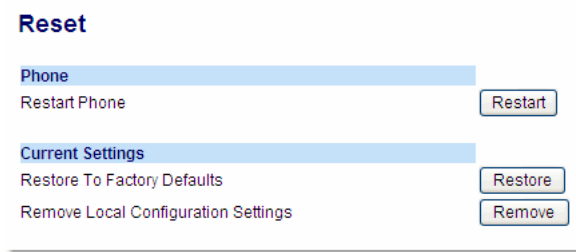

4. Navigate to the **Reset** option and press the  button or **Select** softkey.
5. Select **Erase Local Cfg.** using the  button or press the **Select** softkey.
The phone immediately erases the local configuration on the phone and the phone reboots.

Erasing the Phone's Local Configuration Using the Aastra Web UI

Aastra Web UI

1. Click on **Operation->Reset->Current Settings.**

2. In the "**Remove Local Configuration Settings**" field, click **Remove**.
This removes the last customized configuration settings made on the phone.

Basic Settings

An Administrator has access to specific Basic Setting options to configure and manage the IP Phone in the network. The following sections identify the options available to an Administrator only, or where indicated, to a User and Administrator. These tables also identify whether you can configure them using the Aastra Web UI, IP Phone UI, or the configuration files.

General Settings

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Local Dial Plan	sip dial plan	A dial plan that describes the number and pattern of digits that a user dials to reach a particular telephone number. Dial Plan field accepts up to 512 characters. For more information on this feature, see “Local Dial Plan” on page 5-52.
Send Dial Plan Terminator	sip dial plan terminator	Specifies whether or not pressing the hash/pound (i.e. "#") key, while performing an outgoing call on an open line, should be sent as %23 to the proxy in the dial string or if the key should be used as a dial plan terminator (i.e. dials out the call immediately). For more information on this feature, see “SIP Dial Plan Terminator” on page 5-53.
Digit Timeout	sip digit timeout	Represents the time, in seconds, to configure the timeout between consecutive key presses. For more information on this feature, see “Digit Timeout” on page 5-53.
Park Call	sip lineN park pickup config	The parking of a live call to a specific extension. Note: This option can be set by both Users and Administrators. This feature on the Basic Preferences screen is available on all phones EXCEPT the 9143i, 6753i, 6863i, and 6865i. To configure the Park feature on a key, see Chapter 5, the section, “Park/Pick Up Static and Programmable Configuration” on page 5-177.
Pick Up Parked Call	sip lineN park pickup config	Picking up a parked call at the specified extension. Note: This option can be set by both Users and Administrators. This feature on the Basic Preferences screen is available on all phones EXCEPT the 9143i, 6753i, 6863i, and 6865i. To configure the Pickup feature on a key, see Chapter 5, the section, “Park/Pick Up Static and Programmable Configuration” on page 5-177.
N/A	suppress dtmf playback	Enables and disables suppression of DTMF playback when a number is dialed from the softkeys or programmable keys. For more information on this feature, see “Suppressing DTMF Playback” on page 5-55.
Display DTMF Digits	display dtmf digits	Enables and disables the display of DTMF digits on the IP phone display during a connected state. Note: This option can be set by both Users and Administrators. For more information on this feature, see “Display DTMF Digits” on page 5-55.
Play Call Waiting Tone	call waiting tone	Enable or disables the playing of a call waiting tone when a caller is on an active call and a new call comes into the phone. Note: This option can be set by both Users and Administrators. For more information on this feature, see “Call Waiting Tone” on page 5-58.
Stuttered Dial Tone	stutter disabled	Enable or disables the playing of a stuttered dial tone when there is a message waiting on the IP phone. Note: This option can be set by both Users and Administrators. For more information on this feature, see “Stuttered Dial Tone” on page 5-61.

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
XML Beep Support	xml beep notification	Enables or disables the playing of a beep to indicate a status on the phone. When the phone receives a status message, the BEEP notifies the user that the message is displaying. For more information on this feature, see "XML Beep Support" on page 5-62.
Note: This option can be set by both Users and Administrators.		
Status Scroll Delay (seconds)	xml status scroll delay	Allows you to set the time delay, in seconds, between the scrolling of each status message on the phone. For more information on this feature, see "Status Scroll Delay" on page 5-63.
Note: This option can be set by both Users and Administrators.		
Switch UI Focus to Ringing Line	switch focus to ringing line	Enables or disables whether or not the UI focus is switched to a ringing line while the phone is in the connected state. For more information on this feature, see "Switch Focus to Ringing Line" on page 5-64.
Note: This option can be set by both Users and Administrators.		
Call Hold Reminder During Active Calls	call hold reminder during active calls	Enables or disables the ability for the phone to initiate a continuous reminder tone on the active call when another call is on hold. When this feature is disabled, a ring splash is heard when the active call hangs up and there is still a call on hold. For more information on this feature, see "Call Hold Reminder During Active Calls" on page 5-65.
Note: This option can be set by both Users and Administrators.		
Call Hold Reminder	call hold reminder	Enables or disables the reminder ring splash timer to start as soon as you put a call on hold (even when no other calls are active on the phone). When enabled, the phone initiates a reminder ring splash periodically for the single call on hold. When disabled, no reminder ring splash is audible. For more information on this feature, see "Call Hold Reminder (on Single Hold)" on page 5-66.
Note: This option can be set by both Users and Administrators.		
	call hold reminder timer	Specifies the time delay, in seconds, that a ring splash is heard on an active call when another call was placed on hold. For example, if a call comes into Line 1, and then a call comes into Line 2 and you answer Line 2, Line 1 is automatically placed on hold. While on the active Line 2, after 7 seconds, a ring splash audio sounds on the line reminding you that the call on Line 1 is still on hold. This timer begins to increment after Line 2 is answered. Notes: <ul style="list-style-type: none"> • This parameter is used with the "call hold reminder frequency" parameter. • You must enable this "call hold reminder timer" parameter for it to work. • A value of "0" disables the call hold reminder feature. For more information on this feature, see "Call Hold Reminder Timer & Frequency" on page 5-67.
	call hold reminder frequency	Specifies the time interval, in seconds, between each ring splash sound on the active line. For example, if a call comes into Line 1, and then a call comes into Line 2 and you answer Line 2, Line 1 is automatically placed on hold. While on the active Line 2, after 7 seconds, a ring splash audio sounds on the line reminding you that the call on Line 1 is still on hold (determined by the "call hold reminder timer" parameter), and then the ring splash is heard again after 60 seconds (determined by this parameter). Notes: <ul style="list-style-type: none"> • You must enable the "call hold reminder" and/or "call hold reminder during active calls" parameter(s), and the "call hold reminder timer" parameter, for this parameter to work. • A value of "0" prevents additional rings. For more information on this feature, see "Call Hold Reminder Timer & Frequency" on page 5-67.
	Note: This option can be set by an Administrator only.	

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Call Waiting Tone Period Note: This option can be set by an Administrator only.	call waiting tone period	Specifies the time period, in seconds, that the call waiting tone is audible on an active call when another call comes in. When enabled, the call waiting tone plays at regular intervals for the amount of time set for this parameter. For example, if set to "30" the call waiting tone plays every 30 seconds. When set to "0", the call waiting tone is audible only once on the active call. For more information on this feature, see "Call Waiting Tone Period" on page 5-59.
Preferred Line Note: This option can be set by both Users and Administrators.	preferred line	Specifies the preferred line to switch focus back to when incoming or outgoing calls end on the phone. For more information on this feature, see "Preferred Line and Preferred Line Timeout" on page 5-68.
Preferred Line Timeout (seconds) Note: This option can be set by both Users and Administrators.	preferred line timeout	Specifies the time, in seconds, that the phone switches back to the preferred line after a call (incoming or outgoing) ends on the phone, or after a duration of inactivity on an active line. For more information on this feature, see "Preferred Line and Preferred Line Timeout" on page 5-68.
Goodbye Key Cancels Incoming Call Note: This option can be set by both Users and Administrators.	goodbye key cancels incoming call	Enable or disables the behavior of the Goodbye Key on the IP phone. For more information on this feature, see "Goodbye Key Cancels Incoming Call" on page 5-69.
Message Waiting Indicator Line Note: This option can be set by both Users and Administrators.	mwi led line	Allows you to enable the Message Waiting Indicator (MWI) on a single line or on all lines on the phone. For example, if you set this parameter to 3, the LED illuminates if a voicemail is pending on line 3. If you set this parameter to 0, the LED illuminates if a voicemail is pending on any line on the phone (lines 1 through 9). For more information on this feature, see "Message Waiting Indicator Line" on page 5-71.
DND Key Mode Note: This option can be set by both Users and Administrators.	dnd key mode	Allows you to configure the DND mode to use on the phone (Account, Phone, Custom) when the DND key is pressed. You can configure DND for all accounts or a specific account. For more information on this feature, see "DND Key Mode" on page 5-73. Also see Chapter 5 , the section, "Do Not Disturb (DND)" on page 5-154.
Call Forward Key Mode Note: This option can be set by both Users and Administrators.	call forward key mode	Allows you to configure the Call Forward mode to use on the phone (Account, Phone, or Custom). You can configure Call Forward for all accounts or a specific account. For more information on this feature, see "Call Forward Mode" on page 5-75. Also see Chapter 5 , the section, "Call Forwarding" on page 5-190.
N/A	use lldp elin	Enables or disables the use of an Emergency Location Identification Number (ELIN) received from LLDP as a caller ID for emergency numbers. Caution: In Release 2.3 and later, LLDP is enabled by default. If LLDP is enabled on your network, the phones may come up with different network settings. For more information on this feature, see "Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) and Emergency Location Identification Number (ELIN)" on page 5-77.

Incoming/Outgoing Intercom Calls

The Incoming/Outgoing Intercom Call settings on the IP Phone specify whether the IP phone or the server is responsible for notifying the recipient that an Intercom call is being placed. These settings also specify the prefix code for server-side Intercom calls, and specifies the configuration to use when making the Intercom call.

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Incoming Intercom Settings (all models)		
Auto-Answer	sip allow auto answer	Enables or disables the IP phone to allow automatic answering for an Intercom call. If auto-answer is enabled on the IP phone, the phone plays a tone to alert the user before answering the intercom call. If auto-answer is disabled, the phone treats the incoming intercom call as a normal call. Note: This option can be set by both Users and Administrators. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Microphone Mute	sip intercom mute mic	Enables or disables the microphone on the IP phone for Intercom calls made by the originating caller. Note: This option can be set by both Users and Administrators. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Play Warning Tone	sip intercom warning tone	Enables or disables a warning tone to play when the phone receives an incoming intercom call on an active line. Note: This option can be set by both Users and Administrators. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Allow Barge In	sip intercom allow barge in	Enable or disables how the phone handles incoming intercom calls while the phone is on an active call. Note: This option can be set by both Users and Administrators. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Outgoing Intercom Settings (8, 11-Line LCD, and 6739i and 6867i phones)		
Type	sip intercom type	Determines whether the IP phone or the server is responsible for notifying the recipient that an Intercom call is being placed. Applicable settings are Phone-Side, Server-Side, OFF. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Prefix Code	sip intercom prefix code	The prefix to add to the phone number for server-side outgoing Intercom calls. This parameter is required for all server-side Intercom calls. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Line	sip intercom line	Specifies the line for which the IP phone uses the configuration from, when making the Intercom call. The IP phone uses the first available line for physically making the call but uses the configuration from the line you set for this parameter. Note: The <i>"sip intercom type"</i> parameter must be set with the Server-Side option to enable the <i>"sip intercom line"</i> parameter. For more information on this feature, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.

Group Paging RTP Settings

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Paging Listen Addresses	paging group listening	Allows you to specify up to 5 listening multicast addresses to send/receive a Real Time Transport Protocol (RTP) stream to/from these pre-configured multicast addresses without involving SIP signaling.
Note: This option can be set by both Users and Administrators.		For more information on this feature, see “Group Paging RTP Settings” on page 5-82.

Key Mapping

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Map Redial Key To	map redial key to	<p>Sets the Redial key as a Speeddial key if a value is entered for this parameter. If you leave this parameter blank, the Redial key returns to its original functionality.</p> <p>Note: If you configure the Redial key for speeddialing on the 9480i CT or 6757i CT Base Stations, the Redial key on the 9480i CT and 6757i CT handsets retain their original functionality. The Redial key on the handset is not configured for speed dial.</p> <p>For more information on this feature, see “Speeddial Key Mapping” on page 5-84.</p>
Map Conf Key To	map conf key to	<p>Sets the Conf key as a Speeddial key if a value is entered for this parameter. If you leave this parameter blank, the Conf key returns to its original functionality.</p> <p>Note: If you configure the Conf key for speeddialing on the 9480i CT or 6757i CT Base Stations, the Conf key on the 9480i CT and 6757i CT handsets retain their original functionality. The Conf key on the handset is not configured for speeddial.</p> <p>For more information on this feature, see “Speeddial Key Mapping” on page 5-84.</p>
NA	map redial as dtmf	<p>The “Redial” key remappings has the same behavior as the “Speed Dial” key when the phone is idle. During an active call the phone will send the custom number as DTMF using the phone configured DTMF method (inbound vs out-of-band RFC2833 vs SIP INFO).</p> <p>When a user presses the Redial key, the mapped number will be sent out as DTMF during an active call if the current “map redial key to” parameter is configured to a number and the “map redial as dtmf” parameter is set to “1”.</p> <p>For more information on this feature, see “Speeddial Key Mapping” on page 5-84.</p>
NA	Map redial as conf	<p>The “Redial” key remappings has the same behavior as the “Speed Dial” key when the phone is idle. During an active call the phone will send the custom number as DTMF using the phone configured DTMF method (inbound vs out-of-band RFC2833 vs SIP INFO).</p> <p>When a user presses the Conf key, the mapped number will be sent out as DTMF during an active call if the current “map conf key to” parameter is configured to a number and “map conf as dtmf” parameter is set to “1”.</p> <p>For more information on this feature, see “Speeddial Key Mapping” on page 5-84.</p>

Ring Tones

Parameter in IP Phone UI	Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Tone Set	Tone Set	tone set	Globally sets a tone set for a specific country Note: This option can be set by both Users and Administrators. For more information on this feature, see "Ring Tones and Tone Sets" on page 5-87.
Ring Tone	Global Ring Tone	ring tone	Globally sets the type of ring tone on the IP phone. Ring tone can be set to one of six distinct rings. Note: This option can be set by both Users and Administrators. For more information on this feature, see "Ring Tones and Tone Sets" on page 5-87.
N/A	LineN Note: This option can be set by both Users and Administrators.	lineN ring tone	Sets the type of ring tone on the IP phone on a per-line basis. Ring tone can be set to one of six distinct rings. For more information on this feature, see "Ring Tones and Tone Sets" on page 5-87.

Priority Alerting Settings

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Enable Priority Alerting	priority alerting enabled	Enables and disables distinctive ringing on the IP phone for incoming calls and call-waiting calls. For more information on this feature, see "Priority Alerting" on page 5-92.
Group	alert group	When an "alert group" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone. For more information on this feature, see "Priority Alerting" on page 5-92.
External	alert external	When an "alert external" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone. For more information on this feature, see "Priority Alerting" on page 5-92.
Internal	alert internal	When an "alert-internal" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone. For more information on this feature, see "Priority Alerting" on page 5-92.
Emergency	alert emergency	When an "alert emergency" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone. For more information on this feature, see "Priority Alerting" on page 5-92.
Priority	alert priority	When an "alert priority" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone. For more information on this feature, see "Priority Alerting" on page 5-92.

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Auto Call Distribution	alert auto call distribution	<p>When an "alert-acd" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.</p> <p>For more information on this feature, see "Priority Alerting" on page 5-92.</p>
Community 1 through Community 4	alert community 1 alert community 2 alert community 3 alert community 4	<p>When an "alert community-#" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone. Available Bellcore tones are:</p> <ul style="list-style-type: none">• 0 - Normal ringing (default)• 1 - Bellcore-dr2• 2 - Bellcore-dr3• 3 - Bellcore-dr4• 4 - Bellcore-dr5• 5 - Silent <p>For more information on this feature, see "Priority Alerting" on page 5-92.</p>

Directed Call Pickup

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Directed Call Pickup	directed call pickup	Enables or disables the use of "directed call pickup" feature. For more information on this feature, see "Directed Call Pickup (BLF or XML Call Interception)" on page 5-98.
Directed Call Pickup Prefix	directed call pickup prefix	Allows you to specify a prefix to use for "directed call pickup" that you can use with a BLF or BLF List softkey. For more information on this feature, see "Directed Call Pickup (BLF or XML Call Interception)" on page 5-98.
Play a Ring Splash	play a ring splash	Enables or disables the playing of a short "ring splash tone" when there is an incoming call on the BLF monitored extension. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.
N/A	prgkeyN ring splash	Controls the ring splash alert pattern per programmable key. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.
N/A	softkeyN ring splash	Controls the ring splash alert pattern per softkey. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.
N/A	topsoftkeyN ring splash	Controls the ring splash alert pattern per top softkey. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.
N/A	expmodX keyN ring splash	Controls the ring splash alert pattern per expansion module key. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.
N/A	ring splash delay	Indicates the delay (seconds) between rings. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.
N/A	ring splash volume	Indicates the volume of the ring splash. For more information on this feature, see "Ring Signal Type for BLF" on page 5-133.

Auto Call Distribution (ACD) Settings

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Auto Available	acd auto available	Enables or disables the use of the ACD Auto-Available Timer. For more information on this feature, see "Automatic Call Distribution (ACD) (for Sylanro Servers)" on page 5-147.
Auto Available Timer	acd auto available timer	Specifies the length of time, in seconds, before the IP phone status switches back to "available." For more information on this feature, see "Automatic Call Distribution (ACD) (for Sylanro Servers)" on page 5-147.

Time and Date

Parameter in IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Time Format	Time Format	time format	This parameter changes the time to 12 hour or 24 hour format. Use "0" for the 12 hour format and "1" for the 24 hour format. For more information on this feature, see "Time and Date" on page 5-15.
Note: This option can be set by both Users and Administrators.			
Date Format	Date Format	date format	This parameter allows the user to change the date to various formats. For more information on this feature, see "Time and Date" on page 5-15.
Note: This option can be set by both Users and Administrators.			
Time Zone	N/A	time zone name	This parameter allows you to set the time zone code or customize the time zone for their area as required. For more information on this feature, see "Time Zone & DST" on page 5-15.
Note: This option can be set by both Users and Administrators.		Custom Parameters: <ul style="list-style-type: none"> • time zone minutes • dst minutes • dst [start end] relative date • dst start month • dst end month • dst start week • dst end week • dst start day • dst end day • dst start hour • dst end hour 	
Time Servers	NTP Time Servers	time server disabled	This parameter allows you to enable or disable the Network Time Server (NTP) to set the time on the phone. For more information on this feature, see "Time Servers" on page 5-24.
Note: This option can be set by both Users and Administrators.			
Time Server 1	Time Server 1	time server1	This parameter allows you to set the IP address of Time Server 1 in dotted decimal format. For more information on this feature, see "Time Servers" on page 5-24.
Note: This option can be set by both Users and Administrators.			
Time Server 2	Time Server 2	time server2	This parameter allows you to set the IP address of Time Server 2 in dotted decimal format. For more information on this feature, see "Time Servers" on page 5-24.
Note: This option can be set by both Users and Administrators.			
Time Server 3	Time Server 3	time server3	This parameter allows you to set the IP address of Time Server 3 in dotted decimal format. For more information on this feature, see "Time Servers" on page 5-24.
Note: This option can be set by both Users and Administrators.			

Live Dialpad

Parameter in IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Live Dialpad	N/A	live dialpad	This parameter turns the "Live Dialpad" feature ON or OFF. For more information on this feature, see " Live Dialpad " on page 5-37 .

Note:
This option can be set by a User via the IP Phone UI and by an Administrator via the IP Phone UI and the configuration files.

Language

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
N/A	language	<p>The language you want to display for the IP Phone UI.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • 0 (English) is default • 1-4 <p>The values 1-4 are dependent on the "language N" parameter. For example, if "language 1: lang_fr.txt", then "language: 1" would set the IP Phone UI language to French.</p> <p>Note: All languages may not be available for selection. The available languages are dependant on the language packs currently loaded to the IP phone. For more information about loading language packs, see "Loading Language Packs" on page 5-38.</p> <p>For more information on specifying a language to use on the IP Phone, see "Specifying the Screen Language to Use" on page 5-40.</p>
Webpage Language	web language	<p>The language you want to display for the Aastra Web UI.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • 0 (English) is default • 1-4 <p>The values 1-4 are dependent on the "language N" parameter. For example, if "language 1: lang_fr.txt", then "language: 1" would set the webpage language to French.</p> <p>Note: All languages may not be available for selection. The available languages are dependant on the language packs currently loaded to the IP phone. For more information about loading language packs, see "Loading Language Packs" on page 5-38.</p>

Note:
This option can be set by both Users and Administrators.

Parameter in Aastra Web UI	Parameter in Configuration Files	Description
Input Language	input language	<p>Allows you to specify the language to use for inputs on the IP Phone. Entering a language value for this parameter allows users to enter text and characters in the IP Phone UI, Aastra Web UI, and in XML applications via the keypad on the phone, in the language(s) specified.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • English • French • Français • German • Deutsch • Italian • Italiano • Spanish • Español • Portuguese • Português • Russian • Русский • Nordic <p>For more information on this feature, see “Specifying the Input Language to Use” on page 5-42.</p>
Language 1 thru 4	language N	<p>The language pack you want to load to the IP phone.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • lang_cs.txt (Czech - UTF8) • lang_cs_op.txt (Czech - ASCII) • lang_ct.txt (Catalan) • lang_ct_va.txt (Valencian) • lang_cy.txt (Welsh) • lang_de.txt (German) • lang_da.txt (Danish) • lang_es.txt (Spanish) • lang_es_mx.txt (Mexican Spanish) • lang_fi.txt (Finnish) • lang_fr.txt (French) • lang_fr_ca.txt (Canadian French) • lang_it.txt (Italian) • lang_nl.txt (Dutch) • lang_nl_nl.txt (Dutch - Netherlands) • lang_no.txt (Norwegian) • lang_pl.txt (Polish - ASCII) • lang_pl_pl.txt (Polish - UTF8) • lang_pt.txt (Portuguese) • lang_pt_br.txt (Brazilian Portuguese) • lang_ro.txt (Romanian) • lang_ru.txt (Russian) • lang_sk.txt (Slovak - UTF8) • lang_sk_op.txt (Slovak - ASCII) • lang_sv.txt (Swedish) • lang_tr.txt (Turkish) <p>Notes:</p> <ul style="list-style-type: none"> • The languages packs you load are dependant on available language packs from the configuration server. • You must reboot the phone to load a language pack. <p>For more information on this feature, see “Loading Language Packs” on page 5-38.</p>

Account Configuration

The IP phones have a DND and CFWD feature that allows an Administrator and User to configure “do not disturb” and “call forwarding” by account. You can set specific modes for the way you want the phone to handle DND and CFWD. The three modes you can set on the phone for these features are:

- **Account**
- **Phone**
- **Custom**

You can set the modes for DND and CFWD in the Aastra Web UI at the path *Basic Settings->Preferences->General*, or using the following parameters in the configurations files:

- **dnd key mode**
- **call forward key mode**

The following table describes the behavior of the mode settings for DND and CFWD.

Modes	DND	CFWD
Account	Sets DND for a specific account. A pre-configured DND key toggles the account in focus on the IP Phone UI, to ON or OFF.	Sets CFWD on a per account basis. Pressing a pre-configured CFWD key applies to the account in focus
Phone	Sets DND ON for all accounts on the phone. A pre-configured DND key toggles all accounts on the phone to ON or OFF.	Sets the same CFWD configuration for all accounts (All, Busy, and/or No Answer). When you configure the initial account, the phone applies the configuration to all other accounts. (In the Aastra Web UI, only the account you configured is enabled. All other accounts are grayed out but set to the same configuration.) Using the Aastra Web UI, if you make changes to that initial account, the changes apply to all accounts on the phone.
Custom	Sets the phone to display custom screens after pressing a pre-configured DND key, that list the account(s) on the phone. The user can select a specific account for DND, turn DND ON for all accounts, or turn DND OFF for all accounts	Sets CFWD for a specific account or all accounts. You can configure a specific mode (All, Busy, and/or No Answer) for each account independently or all accounts. On the 3-line LCD phones, you can set all accounts to ALL On or ALL Off . On the 8 and 11-line LCD phones, you can set all accounts to All On, All Off , or copy the configuration for the account in focus to all other accounts using a CopytoAll softkey.

References

For more information about account configuration of DND and CFWD on the IP Phones, see Chapter 5, the sections:

For DND:

- “DND Key Mode” on page 5-73.
- “Do Not Disturb (DND)” on page 5-154.

For CFWD:

- “Call Forward Mode” on page 5-75.
- “Call Forwarding” on page 5-190.

Network Settings

The following paragraphs describe the network parameters you can configure on the IP phone. Network settings are in two categories:

- Basic network settings
- Advanced network settings

Note:

Specific parameters are configurable using the Aastra Web UI only and are indicated where applicable.

Notification When Incorrect Network Settings Entered

If an Administrator enters incorrect network settings over the IP Phone UI or the Aastra Web UI, such as:

- A 0.0.0.0 entered as values for the **IP Address**, **Subnet Mask**, and **Gateway** parameters,
- **IP Address** and **Gateway** IP address parameter values entered exactly the same,
- **Gateway** IP address and the **IP address** parameter values configured not on the same subnet,

the UI will immediately notify the Administrator with a specific message that an incorrect value was entered.

Basic Network Settings

If Dynamic Host Configuration Protocol (DHCP) is enabled, the IP phone automatically configures all of the Network settings. If the phone cannot populate the Network settings, or if DHCP is disabled, you can set the Network options manually.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
DHCP	DHCP	dhcp	<p>Enables or disables DHCP. Enabling DHCP populates the required network information. The DHCP server serves the network information that the IP phone requires. If the IP phone is unable to get any required information, then you must enter it manually. DHCP populates the following network information:</p> <p>IP Address, Subnet Mask, Gateway, Domain Name System (DNS) servers, TFTP, HTTP HTTPS, and FTP servers, and Timer servers.</p> <p>Note: For DHCP to automatically populate the IP address or qualified domain name for the TFTP server, your DHCP server must support Option 66. The IP phones also support Option 60 and 43.</p> <p>For more information, see "DHCP" on page 4-3.</p>
IP Address	IP Address	ip	<p>IP address of the IP phone. To assign a static IP address, disable DHCP.</p> <p>For more information, see "Configuring Network Settings Manually" on page 4-18.</p>
Subnet Mask	Subnet Mask	subnet mask	<p>Subnet mask defines the IP address range local to the IP phone. To assign a static subnet mask, disable DHCP.</p> <p>For more information, see "Configuring Network Settings Manually" on page 4-18.</p>
Gateway	Gateway	default gateway	<p>The IP address of the network's gateway or default router IP address. To assign a static Gateway IP address, disable DHCP.</p> <p>For more information, see "Configuring Network Settings Manually" on page 4-18.</p>
Primary DNS	Primary DNS	dns1	<p>Primary DNS server IP address. For any of the IP address settings on the IP phone a domain name value can be entered instead of an IP address. With the help of the DNS servers the domain names for such parameters can then be resolved to their corresponding IP addresses.</p> <p>To assign static DNS addresses, disable DHCP.</p> <p>Note: If a host name is configured on the IP phone, you must also set a DNS.</p> <p>For more information, see "Configuring Network Settings Manually" on page 4-18.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Secondary DNS	Secondary DNS	dns2	A service that translates domain names into IP addresses. To assign static DNS addresses, disable DHCP. For more information, see “Configuring Network Settings Manually” on page 4-18.
Hostname	Hostname	hostname	Specifies the hostname DHCP Option 12 that the phone sends with the DHCP Request packet. For more information, see “Using Option 12 Hostname on the IP Phone” on page 4-10.
Ethernet	N/A		The send (TX) and receive (RX) negotiation to use on the Ethernet LAN Port and Ethernet PC Port for transmitting and receiving data over the LAN or to/from your PC, respectively. For more information on configuring the LAN and PC port negotiation, see “Configuring LAN and PC Port Negotiation” on page 4-18.
LAN Port Link	LAN Port	ethernet port 0	
PC Port Link	PC Port	ethernet port 1	<p>Note: The PC Port parameters are not applicable to the 6730i IP Phone.</p>
PC Port Enabled (3-Line LCD Phones)	PC Port PassThru Enable/Disable (3-Line LCD Phones)	pc port passthrough enabled	
Enable PassThru Port (8 , 11-Line LCD, and 6739i and 6867i Phones)	PC Port PassThru Enable/Disable (8 , 11-Line LCD, and 6739i and 6867i Phones)		

Advanced Network Settings

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
DHCP User Class	N/A	dhcp userclass	<p>Specifies the User Class DHCP Option 77 that the phone sends to the configuration server with the DHCP Request packet.</p> <p>Note: If you specify a value for this parameter, you must restart your phone for the change to take affect. Any change in its value during start-up results in an automatic reboot.</p> <p>For more information, see “Using Option 77 User Class on the IP Phone” on page 4-12.</p>
Download Options	DHCP Download Options	dhcp config option override	<p>The value specified for this parameter overrides the precedence order for determining a configuration server. Valid values are:</p> <ul style="list-style-type: none"> • -1 (Disabled - ignores all DHCP configuration options). • 0 (Any) • 43 • 66 • 159 • 160 <p>Notes:</p> <ul style="list-style-type: none"> • If the DHCP server supplies Options 159 and 160, the phones will attempt to contact the configuration server given in these options. • You must restart the IP Phone for this parameter to take affect. <p>For more information, see “Using Options 159 and 160 on the IP Phone” on page 4-13. For more information about setting DHCP download preference, see “Configuration Server Download Precedence” on page 4-15.</p>
LLDP Support	LLDP	lldp	<p>Enables or disables Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) on the IP Phone.</p> <p>Caution: In Release 2.3 and later, LLDP is enabled by default. If LLDP is enabled on your network, the phones may come up with different network settings.</p> <p>For more information on this feature, see “Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) and Emergency Location Identification Number (ELIN)” on page 5-77.</p>
N/A	LLDP Packet Interval	lldp interval	<p>The amount of time, in seconds, between the transmission of LLDP Data Unit (LLDPDU) packets. The value of zero (0) disables this parameter.</p> <p>Caution: In Release 2.3 and later, LLDP is enabled by default. If LLDP is enabled on your network, the phones may come up with different network settings.</p> <p>For more information on this feature, see “Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) and Emergency Location Identification Number (ELIN)” on page 5-77.</p>
NAT IP	NAT IP	sip nat ip	<p>IP address the network device that enforces NAT.</p> <p>For more information, see Chapter 4, “Configuring NAT Address and Port (optional)” on page 4-25.</p>
NAT SIP Port	NAT SIP Port	sip nat port	<p>Port number of the network device that enforces NAT.</p> <p>For more information, see Chapter 4, “Configuring NAT Address and Port (optional)” on page 4-25.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
NAT RTP Port	NAT RTP Port	sip nat rtp port	<p>Indicates the port through which the RTP packets are sent. This value must specify the beginning of the RTP port range on the gateway or router.</p> <p>The RTP port is used for sending DTMF tones and for the audio stream. Your network administrator may close some ports for security reasons. You may want to use this parameter to send RTP data using a different port.</p> <p>For more information, see Chapter 4, “Configuring NAT Address and Port (optional)” on page 4-25.</p>
N/A	STUN Server	sip stun ip	<p>IP address of the STUN server (also know as Simple Traversal of UDP through NAT).</p> <p>Notes:</p> <ol style="list-style-type: none"> 1. The NAT IP configuration parameters take precedence over the STUN and TURN parameters. 2. STUN does not work if the NAT device is symmetric. <p>For more information, see Chapter 4, “STUN and TURN Protocols” on page 4-29.</p>
N/A	STUN Port	sip stun port	<p>Port number of the STUN server (also know as Simple Traversal of UDP through NAT).</p> <p>Notes:</p> <ol style="list-style-type: none"> 1. The NAT IP configuration parameters take precedence over the STUN and TURN parameters. 2. STUN does not work if the NAT device is symmetric. <p>For more information, see Chapter 4, “STUN and TURN Protocols” on page 4-29.</p>
N/A	TURN Server	sip turn ip	<p>IP address of the TURN server (also known as Traversal Using Relay NAT).</p> <p>Note: The NAT IP configuration parameters take precedence over the STUN and TURN parameters.</p> <p>For more information, see Chapter 4, “STUN and TURN Protocols” on page 4-29.</p>
N/A	TURN Port	sip turn port	<p>Port number of the TURN server (also known as Traversal Using Relay NAT).</p> <p>Note: The NAT IP configuration parameters take precedence over the STUN and TURN parameters.</p> <p>For more information, see Chapter 4, “STUN and TURN Protocols” on page 4-29.</p>
N/A	TURN User ID	sip turn user	<p>Username that a user must enter when accessing an account on the TURN server.</p> <p>Note: The NAT IP configuration parameters take precedence over the STUN and TURN parameters.</p> <p>For more information, see Chapter 4, “STUN and TURN Protocols” on page 4-29.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
N/A	TURN Password	sip turn pass	<p>Password that a user must enter when accessing an account on the TURN server.</p> <p>Note: The NAT IP configuration parameters take precedence over the STUN and TURN parameters.</p> <p>For more information, see Chapter 4, “STUN and TURN Protocols” on page 4-29.</p>
N/A	Rport (RFC 3581)	sip rport	<p>Allows you to enable (1) or disable (0) the use of Rport on the IP phone.</p> <p>“Rport” in RFC 3581, allows a client to request that the server send the response back to the source IP address and the port from which the request came.</p> <p>For more information, see Chapter 4, “RPORT” on page 4-52.</p>

HTTPS Settings

Advanced Network Settings includes HTTPS settings for the IP Phones.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
HTTPS	HTTPS Server - Redirect HTTP to HTTPS	https redirect http get	<p>Allows or disallows redirection from the HTTP server to the HTTPS server.</p> <p>For more information, see Chapter 4, “HTTPS Client/Server Configuration” on page 4-33.</p>
XML HTTP POSTs	HTTPS Server - Block XML HTTP POSTs	https block http post xml	<p>Enables or disables the blocking of XML scripts from HTTP POSTs.</p> <p>Some client applications use HTTP POSTs to transfer XML scripts. The phone's HTTP server accepts these POSTs even if server redirection is enabled, effectively bypassing the secure connection. When this parameter is enabled (blocking is enabled), receipt of an HTTP POST containing an XML parameter header results in the following response: “403 Forbidden”. This forces the client to direct the POSTs to the HTTPS server through use of the “https://” URL.</p> <p>For more information, see Chapter 4, “HTTPS Client/Server Configuration” on page 4-33.</p>
Client Method	HTTPS Client Method	https client method	<p>Defines the security method that the client advertises to the server during the Secure Socket Layer (SSL) handshake. Available options are:</p> <p>TLS 1.0 - Transport Layer Security version 1 (TLS 1.0) is a protocol that ensures privacy between communicating applications and their users on the Internet. TLS is the successor to SSL.</p> <p>SSL 3.0 - Secure Socket Layer version 3 (SSL 3.0) is a commonly-used protocol for managing the security of a message transmission on the Internet.</p> <p>For more information, see Chapter 4, “HTTPS Client/Server Configuration” on page 4-33.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Cert Validation	Validate Certificates	https validate certificates	<p>Enables or disables the HTTPS validation of certificates on the phone. When this parameter is set to 1, the HTTPS client performs validation on SSL certificates before accepting them.</p> <p>Notes:</p> <ul style="list-style-type: none"> If you are using HTTPS as a configuration method, and use a self signed certificate, you must set this parameter to "0" (disabled) before upgrading to Release 2.3 or later of the IP Phones. If you are using HTTPS and the certificates are not valid or are not signed by Verisign, Thawte, or GeoTrust, Comodo, Entrust, or CyberTrust, the phones fail to download configuration files. Defining this parameter as "0" (disabled) significantly reduces security for the provisioning process to encryption only. Validation of the chain-of-trust (i.e. the originator of the files) will not be performed if this feature is disabled. Therefore, disabling HTTPS validation of certificates is only recommended for troubleshooting purposes or when self-signed certificates are in use. <p>For more information, see Chapter 4, "HTTPS Server Certificate Validation" on page 4-36.</p>
Check Expires	Check Certificate Expiration	https validate expires	<p>Enables or disables the HTTPS validation of the expiration of the certificates. When this parameter is set to 1, the HTTPS client verifies whether or not a certificate has expired prior to accepting the certificate.</p> <p>Note: If the "https validate expires" parameter is set to enable, the clock on the phone must be set for the phone to accept the certificates.</p> <p>For more information, see Chapter 4, "HTTPS Server Certificate Validation" on page 4-36.</p>
Check Hostnames	Check Certificate Hostnames	https validate hostname	<p>Enables or disables the HTTPS validation of hostnames on the phone.</p> <p>For more information, see Chapter 4, "HTTPS Server Certificate Validation" on page 4-36.</p>
N/A	Trusted Certificates Filename	https user certificates	<p>Specifies a file name for a .PEM file located on the configuration server. This file contains the User-provided certificates in PEM format. These certificates are used to validate peer certificates.</p> <p>Note: You must disable the "https validate certificates" parameter in order for the phone to accept the User-provided certificates.</p> <p>For more information, see Chapter 4, "HTTPS Server Certificate Validation" on page 4-36.</p>

Type of Service (ToS), DSCP

Advanced Network Settings include Type of Service (ToS) and Differentiated Services Code Point (DSCP) for the IP phones.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Type of Service SIP	SIP	tos sip	The Differentiated Services Code Point (DSCP) for SIP packets. For more information, see Chapter 4, "Type of Service (ToS), Quality of Service (QoS), and DiffServ QoS" on page 4-41.
Type of Service RTP	RTP	tos rtp	The Differentiated Services Code Point (DSCP) for RTP packets. For more information, see Chapter 4, "Type of Service (ToS), Quality of Service (QoS), and DiffServ QoS" on page 4-41.
Type of Service RTCP	RTCP	tos rtcp	The Differentiated Services Code Point (DSCP) for RTCP packets. For more information, see Chapter 4, "Type of Service (ToS), Quality of Service (QoS), and DiffServ QoS" on page 4-41.

VLAN

You can enable or disable VLAN and set specific VLAN IDs and priorities under Network Settings.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Global Settings			
VLAN Enable	VLAN Enable	tagging enabled	Enables or disables VLAN on the IP phones. For more information, see Chapter 4, "Virtual LAN (optional)" on page 4-41.
Other Priority	Priority, Non-IP Packet	priority non-ip	Specifies the priority value for non-IP packets. For more information, see Chapter 4, "Virtual LAN (optional)" on page 4-41.
N/A	HPQ Enable	vlan hpq	Enables or disables VLAN High Priority Queue (HPQ) on the IP phones. For more information, see Chapter 4, "Virtual LAN (optional)" on page 4-41.
LAN Port Settings (Port 0)			
Phone VLAN ID	VLAN ID	vlan id	Allows you to configure a VLAN ID that associates with the physical Ethernet Port 0 (LAN port). For more information, see Chapter 4, "Virtual LAN (optional)" on page 4-41.
SIP Priority RTP Priority RTCP Priority	SIP Priority RTP Priority RTCP Priority	tos priority map	This parameter is based on the Type of Service (ToS), Differentiated Services Code Point (DSCP) setting for SIP (tos sip parameter), RTP (tos rtp parameter) and RTCP (tos rtcp parameter). It is the mapping between the DSCP value and the VLAN priority value for SIP, RTP, and RTCP packets. You enter the tos priority map value as follows: (DSCP_1,Priority_1)(DSCP_2,Priority_2).....(DSCP_64,Priority_64) where the DSCP value range is 0-63 and the priority range is 0-7. Mappings not enclosed in parentheses and separated with a comma, or with values outside the ranges, are ignored. For more information, see Chapter 4, "Virtual LAN (optional)" on page 4-41.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
PC Port Settings (Port 1)			
PC Port VLAN ID	VLAN ID	vlan id port 1	<p>Allows you to configure a VLAN ID that associates with the physical Ethernet Port 1 (PC port).</p> <p>For more information, see Chapter 4, “Virtual LAN (optional)” on page 4-41.</p> <p>Note: The PC Port parameters are not applicable to the 6730i IP Phone.</p>
PC Port Priority	Priority	qos eth port 1 priority	<p>Specifies the priority value used for passing VLAN packets through to a PC via Port 1.</p> <p>For more information, see Chapter 4, “Virtual LAN (optional)” on page 4-41.</p>

SIP Settings

The following paragraphs describe the SIP parameters you can configure on the IP phone. SIP configuration consists of configuring:

- **Basic SIP Authentication Settings**
- **Basic SIP Network Settings**
- **Advanced SIP settings**
- **RTP Settings**
- **Autodial Settings**

Notes:

- Specific parameters are configurable on a global and per-line basis. You can also configure specific parameters using the IP Phone UI, the Aastra Web UI, or the configuration files. If you have a proxy server or have a SIP registrar present at a different location than the PBX server, the SIP parameters may need to be changed.
- The IP phones allow you to define different SIP lines with the same account information (i.e., same user name) but with different registrar and proxy IP addresses. This feature works with Registration, Subscription, and Notify processing. This feature also works with the following types of calls: incoming, outgoing, Broadsoft Shared Call Appearance (SCA), Bridged Line Appearance (BLA), conference, transfer, blind transfer.

Basic SIP Authentication Settings

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Screen Name	Screen Name (Global and Per-Line)	sip screen name (global)	Name that displays on the idle screen. Valid values are up to 20 alphanumeric characters.
		sip lineN screen name (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Screen Name 2 (Global and Per-Line)	sip screen name 2 (global)	Custom text message that displays on the idle screen. Valid values are up to 20 alphanumeric characters.
		sip lineN screen name 2 (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
User Name	Phone Number (Global and Per-Line)	sip user name (global)	User name used in the name field of the SIP URI for the IP phone and for registering the phone at the registrar. Valid values are up to 20 alphanumeric characters.
		sip lineN user name (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
Display Name	Caller ID (Global and Per-Line)	sip display name (global)	Name used in the display name field of the "From SIP" header field. Some IP PBX systems use this as the caller's ID, and some may overwrite this with the string that is set at the PBX system. Valid values are up to 20 alphanumeric characters.
		sip lineN display name (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
Auth Name	Authentication Name (Global and Per-Line)	sip auth name (global)	Authorization name used in the username field of the Authorization header field of the SIP REGISTER request. Valid values are up to 20 alphanumeric characters.
		sip lineN auth name (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
Password	Password (Global and Per-Line)	sip password (global)	Password used to register the IP phone with the SIP proxy. Valid values are up to 20 alphanumeric characters. Passwords are encrypted and display as asterisks when entering.
		sip lineN password (per-line)	<p>Note: The "mask sip password" parameter can be used to mask a user's SIP account password in the server.cfg and local.cfg files (downloaded from the IP phone's Web UI troubleshooting page for debug purposes).</p> <p>For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.</p>
N/A	BLA Number (Global and Per-Line)	sip bla number (global)	Phone number that you assign to BLA lines that is shared across all phones (global configuration) or shared on a per-line basis (per-line configuration).
		sip lineN bla number (per-line)	<p>For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.</p> <p>For more information about BLA, see Chapter 5, the section, "Bridged Line Appearance (BLA)" on page 5-166.</p>
N/A	Line Mode (Global and Per-Line)	sip mode (global)	The mode-type that you assign to the IP phone. Valid values are Generic (0), BroadSoft SCA (1), Reserved for (2), or BLA (3). Default is Generic (0).
		sip lineN mode (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Call Waiting	call waiting	Enable or disables Call Waiting on the IP Phone.
			For more information on this feature, see. "Call Waiting" on page 5-57.

Basic SIP Network Settings

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Proxy Server	Proxy Server (Global and Per-Line)	sip proxy ip (global)	IP address of the SIP proxy server. Up to 64 alphanumeric characters.
		sip lineN proxy ip (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
Proxy Port	Proxy Port (Global and Per-Line)	sip proxy port (global)	SIP proxy server's port number. Default is 0.
		sip lineN proxy port (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Backup Proxy Server (Global and Per-Line)	sip backup proxy ip (global)	The IP address of the backup SIP proxy server for which the IP phone uses when the primary SIP proxy is unavailable.
		sip lineN backup proxy ip (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Backup Proxy Port (Global and Per-Line)	sip backup proxy port (global)	The port number of the backup SIP proxy server for which the IP phone uses when the primary SIP proxy port is unavailable.
		sip lineN backup proxy port (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Outbound Proxy Server (Global and Per-Line)	sip outbound proxy (global)	Address of the outbound proxy server. All SIP messages originating from the phone are sent to this server. For example, if you have a Session Border Controller in your network, then you would normally set its address here. Default is 0.0.0.0.
		sip lineN outbound proxy (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Outbound Proxy Port (Global and Per-Line)	sip outbound proxy port (global)	The proxy port on the proxy server to which the IP phone sends all SIP messages. Default is 0.
		sip lineN outbound proxy port (per-line)	For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Backup Outbound Proxy Server (Global and Per-Line)	sip backup outbound proxy (global)	The IP address or domain name of the backup outbound SIP proxy server for which the IP phone uses when the primary SIP proxy is unavailable.
		sip lineN backup outbound proxy (per-line)	For more information, see Chapter 4, "Backup Outbound Proxy and Failover Support" on page 4-59.
N/A	Backup Outbound Proxy Port (Global and Per-Line)	sip backup outbound proxy port (global)	The backup outbound proxy port on the backup outbound proxy server to which the IP phone sends all SIP messages.
		sip lineN backup outbound proxy port (per-line)	For more information, see Chapter 4, "Backup Outbound Proxy and Failover Support" on page 4-59.
Registrar Server	Registrar Server (Global and Per-Line)	sip registrar ip (global)	IP address of the SIP registrar. Up to 64 alphanumeric characters. Enables or disables the phone to be registered with the Registrar. When Register is disabled globally, the phone is still active and you can dial using username and IP address of the phone. A message "No Service" displays on the idle screen and the LED is steady ON. If Register is disabled for a single line, no messages display and LEDs are OFF.
		sip lineN registrar ip (per-line)	

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Registrar Port	Registrar Port (Global and Per-Line)	sip registrar port (global) sip lineN registrar port (per-line)	SIP registrar's port number. Default is 0. For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Backup Registrar Server (Global and Per-Line)	sip backup registrar ip (global) sip lineN backup registrar ip (per-line)	The address of the backup registrar (typically, the backup SIP proxy) for which the IP phone uses to send <i>REGISTER</i> requests if the primary registrar is unavailable. For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Backup Registrar Port (Global and Per-Line)	sip backup registrar port (global) sip lineN backup registrar port	The backup registrar's (typically the backup SIP proxy) port number. For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Registration Period (Global and Per-Line)	sip registration period (global) sip lineN registration period (per-line)	The requested registration period, in seconds, from the registrar. For more information, see Chapter 4, "Basic SIP Settings" on page 4-55.
N/A	Conference Server URI (Global and Per-Line)	sip centralized conf (global) sip lineN centralized conf (per-line)	Globally enables or disables SIP centralized conferencing for an IP phone. For more information, see Chapter 4, "Centralized Conferencing (for Sylanro and Broadsoft Servers)" on page 5-266.

Advanced SIP Settings

In addition to the basic SIP settings, you can also configure the following advanced SIP parameters. These parameters may be configurable via the Aastra Web UI and/or the configuration files.

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Explicit MWI Subscription	sip explicit mwi subscription	If the IP phone has a message waiting subscription with the Service Provider, a Message Waiting Indicator (MWI) (LED or display icon) tells the user there is a message on the IP Phone. You can enable and disable MWI by setting this parameter to 0 (disable) or 1 (enable) in the configuration files or by checking the box for this field in the Aastra Web UI. Default is disabled. For more information, see Chapter 4, "Advanced SIP Settings (optional)" on page 4-69.
Explicit MWI Subscription Period	sip explicit mwi subscription period	The requested duration, in seconds, before the MWI subscription times out. The phone re-subscribes to MWI before the subscription period ends. For more information, see Chapter 4, "Advanced SIP Settings (optional)" on page 4-69.
N/A	sip missed call summary subscription (global) sip lineN missed call summary subscription (per-line)	Enables or disables the Missed Call Summary Subscription feature. This feature allows missed calls that have been redirected by the server, to be incremented in the missed calls indicator on the phone it was initially directed to. Default is disabled. For more information about this parameter, see Chapter 6, the section, "Missed Call Summary Subscription" on page 6-10.

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
N/A	sip missed call summary subscription period	<p>Specifies the amount of time, in seconds, that the phone uses the Missed Calls Summary Subscription feature. This parameter is always enabled with a default value of 86400 seconds. When the phone reaches the limit set for this parameter, it sends the subscription again.</p> <p>For more information about this parameter, see Chapter 6, the section, “Missed Call Summary Subscription” on page 6-10.</p>
AS-Feature-Event Subscription (Global and Per-Line)	sip as-feature-event subscription (global) sip lineN as-feature-event subscription (per-line)	<p>Enables or disables the specified line with the BroadSoft’s server-side DND, CFWD, or ACD features.</p> <p>For more information about this parameter, see Chapter 6, the section, “As-Feature-Event Subscription” on page 6-11.</p>
AS-Feature-Event Subscription Period	sip as-feature-event subscription period	<p>Specifies the amount of time, in seconds, between re-subscribing. If the phone does not re-subscribe in the time specified for this parameter, it loses subscription.</p> <p>For more information about this parameter, see Chapter 6, the section, “As-Feature-Event Subscription” on page 6-11.</p>
Send MAC Address in REGISTER Message	sip send mac	<p>Adds an "Aastra-Mac:" header to the SIP REGISTER messages sent from the phone to the call server, where the value is the MAC address of the phone.</p> <p>For more information about this parameter, see Chapter 6, the section, “TR-069 Support” on page 6-4.</p>
Send Line Number in REGISTER Message	sip send line	<p>Adds an "Aastra-Line:" header to the SIP REGISTER messages sent from the phone to the call server, where the value is the line number that is being registered.</p> <p>For more information about this parameter, see Chapter 6, the section, “TR-069 Support” on page 6-4.</p>
Session Timer	sip session timer	<p>The time, in seconds, that the IP phone uses to send periodic re-INVITE requests to keep a session alive. The proxy uses these re-INVITE requests to maintain the status of the connected sessions. See RFC4028 for details. Default is 0.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
Timer 1 and Timer 2	sip T1 timer sip T2 timer	<p>These timers are SIP transaction layer timers defined in RFC 3261. Timer 1 is an estimate, in milliseconds, of the round-trip time (RTT). Timer 2 represents the amount of time, in milliseconds, a non-INVITE server transaction takes to respond to a request.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
Transaction Timer	sip transaction timer	<p>The amount of time, in milliseconds that the phone allows the call server (registrar/proxy) to respond to SIP messages that it sends. If the phone does not receive a response in the amount of time designated for this parameter, the phone assumes the message has timed out.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Transport Protocol	sip transport protocol	<p>The protocol that the IP phone uses to send out SIP messages.</p> <p>Notes:</p> <ul style="list-style-type: none"> If you set the value of this parameter to 4 (TLS), the phone checks to see if the “sips persistent tls” is enabled. If it is enabled, the phone uses Persistent TLS on the connection. If “sips persistent tls” is disabled, then the phone uses TLS on the connection. If TLS is used, you must specify the Root and Intermediate Certificates, the Local Certificate, the Private Key, and the Trusted Certificates. If the phone uses Persistent TLS, you MUST specify the Trusted Certificates; the Root and Intermediate Certificates, the Local Certificate, and the Private Key are optional. <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
Local SIP UDP/TCP Port	sip local port	<p>Specifies the local source port (UDP/TCP) from which the phone sends SIP messages.</p> <p>Notes:</p> <ul style="list-style-type: none"> It is recommended that you avoid the conflict RTP port range in case of a UDP transport. By default, the IP phones use symmetric UDP signaling for outgoing UDP SIP messages. When symmetric UDP is enabled, the IP phone generates and listens for UDP messages using port 5060. If symmetric UDP signaling is disabled, the phone sends from random ports but it listens on the configured SIP local port. <p>For more information, see Chapter 4, “SIP and TLS Source Ports for NAT Traversal” on page 4-27.</p>
Local SIP TLS Port	sip local tls port	<p>Specifies the local source port (SIPS/TLS) from which the phone sends SIP messages.</p> <p>Notes:</p> <ul style="list-style-type: none"> It is recommended that you avoid the conflict with any TCP ports being used. For example: WebUI HTTP server on 80/tcp and HTTPS on 443/tcp. By default, the IP phones use symmetric TLS signaling for outgoing TLS SIP messages. When symmetric TLS is enabled, the IP phone uses port 5061 as the persistent TLS connection source port. When symmetric TLS signaling is disabled, the IP phone chooses a random persistent TLS connection source port for TLS messages from the TCP range (i.e. 49152...65535) after each reboot regardless of whether the parameter “sip outbound support” is enabled or disabled. <p>For more information, see Chapter 4, “SIP and TLS Source Ports for NAT Traversal” on page 4-27.</p>
Registration Failed Retry Timer	sip registration retry timer	<p>Specifies the time, in seconds, that the phone waits between registration attempts when a registration is rejected by the registrar.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
Registration Timeout Retry Timer	sip registration timeout retry timer	<p>Specifies the length of time, in seconds, that the phone waits until it re-attempts to register after a REGISTER message times out.</p> <p>If this parameter is set lower than 30 seconds, the phone uses a minimum timer of 30 seconds.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Registration Renewal Timer	sip registration renewal timer	<p>The threshold value, in seconds, prior to expiration, that the phone renews registrations. The phone will automatically send registration renewals half-way through the registration period, unless half-way is more than the threshold value.</p> <p>For example, if the threshold value is set to 60 seconds and if the registration period is 600 seconds, the renewal REGISTER message will be sent 60 seconds prior to the expiration, as half-way (600/2) > 60. If the registration period was 100 seconds, then the renewal would be sent at the half-way point as (100/2) < 60.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
N/A	sip subscription timeout retry timer	<p>Applicable for all event packages, this parameter controls how long the phone delays then retries a subscription when a SUBSCRIBE request is responded with a 408 (timeout) or 503 (service unavailable) error code.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
N/A	sip subscription failed retry timer	<p>Applicable for all event packages, this parameter controls how long the phone delays then retries a subscription when a SUBSCRIBE request is responded with error codes other than 408 (timeout) or 503 (service unavailable).</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
BLF Subscription Period	sip blf subscription period	<p>The requested duration, in seconds, before the BLF subscription times out. The phone re-subscribes to the BLF subscription service before the defined subscription period ends.</p> <p>Note: This parameter is not applicable to BLF/List subscriptions.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
ACD Subscription Period	sip acd subscription period	<p>Specifies the time period, in seconds, that the IP phone re-subscribes the Automatic Call Distribution (ACD) subscription service after a software/firmware upgrade or after a reboot of the IP phone.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
BLA Subscription Period	sip bla subscription period	<p>Specifies the amount of time, in seconds, that the phone waits to receive a BLA subscribe message from the server. If you specify zero (0), the phone uses the value specified for the BLA expiration in the subscribe message received from the server. If no value is specified, the phone uses the default value of 300 seconds.</p> <p>For more information, see Chapter 4, “Advanced SIP Settings (optional)” on page 4-69.</p>
Blacklist Duration	sip blacklist duration	<p>Specifies the length of time, in seconds, that a failed server remains on the server blacklist. The IP phone avoids sending a SIP message to a failed server (if another server is available) for this amount of time.</p> <p>For more information about Blacklist Duration, see Chapter 6, the section, “Blacklist Duration” on page 6-13.</p>

Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Whitelist Proxy	sip whitelist	<p>This parameter enables/disables the whitelist proxy feature, as follows:</p> <ul style="list-style-type: none"> Set to 0 to disable the feature. Set to 1 to enable the feature. When this feature is enabled, an IP phone accepts call requests from a trusted proxy server <i>only</i>. The IP phone rejects any call requests from an untrusted proxy server. <p>For more information about Whitelist Proxy see Chapter 6, the section, “Whitelist Proxy” on page 6-15.</p>
XML SIP Notify	sip xml notify event	<p>Enables or disables the phone to accept or reject an aastra-xml SIP NOTIFY message.</p> <p>Note: To ensure the SIP NOTIFY is coming from a trusted source, it is recommended that you enable the Whitelist feature (Whitelist Proxy parameter) on the IP phone. If enabled, and the phone receives a SIP NOTIFY from a server that is NOT on the whitelist (i.e. untrusted server), the phone rejects the message.</p> <p>For more information about XML SIP Notify see Chapter 6, the section, “XML SIP Notify Events” on page 5-256.</p>

RTP Settings

You can configure the following RTP settings.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
RTP Port Base	RTP Port	sip rtp port	<p>The RTP port is used for sending DTMF tones and for the audio stream. Your network administrator may close some ports for security reasons. You may want to use this parameter to send RTP data using a different port. Default is 3000.</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>
N/A	Force RFC2833 Out of Band DTMF	sip out-of-band dtmf	<p>Enables or disables out-of-band DTMF. Enabling this parameter forces the IP phone to use out-of-band DTMF according to RFC2833. Valid values are 0 (disabled) and 1 (enabled). Default is 1 (enabled).</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>
N/A	DTMF Method (Global and Per-Line)	sip dtmf method (global) sip lineN dtmf method (per-line)	<p>Sets the dual-tone multi-frequency (DTMF) method to use on the IP phone on a global or per-line basis. Valid values are 0 (RTP), 1 (SIP INFO), or 2 (BOTH). Default is 0 (RTP).</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>
N/A	RTP Encryption (Global and Per-Line)	sip srtp mode (global) sip lineN srtp mode (per-line)	<p>This parameter determines if SRTP is enabled on this IP phone, as follows:</p> <ul style="list-style-type: none"> If set to 0, then disable SRTP. If set to 1 then SRTP calls are preferred. If set to 2, then SRTP calls only are generated/accepted. <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>

Codec Preference List

You can configure the following codec preference list settings.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
N/A	Basic Codecs (G.711 u-Law, G.711 a-Law, G.729)	sip use basic codecs	<p>Enables or disables basic codecs. Enabling this parameter allows the IP phone to use the basic Codecs when sending/receiving RTP packets. Valid values are 0 (disabled) and 1 (enabled). Default is 0 (disabled).</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>
N/A	Customized Codec Preference List	sip customized codec	<p>Specifies a customized Codec preference list which allows you to use the preferred Codecs for this IP phone.</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>
N/A	Packetization Interval	“sip customized codec” attribute	<p>Packetization interval (ptime) is a measurement of the duration of PCM data within each RTP packet sent to the destination, and hence defines how much network bandwidth is used for transfer of the RTP stream. Enter the ptime values for the customized Codec list in milliseconds.</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>
N/A	Silence Suppression	sip silence suppression	<p>Silence suppression is enabled by default on the IP phones. The phone negotiates whether or not to use silence suppression. Disabling this feature forces the phone to ignore any negotiated value.</p> <p>For more information, see Chapter 4, “Real-time Transport Protocol (RTP) Settings” on page 4-74.</p>

Autodial Settings

You can configure the following Autodial settings.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
N/A	Autodial Number (Global and Per-Line)	sip autodial number sip lineN autodial number	<p>Globally or on a per-line basis, specifies the SIP phone number that the IP phone autodials when the handset is lifted from the phone cradle. An empty (blank) value disables autodial on the phone.</p> <p>For more information, see Chapter 4, “Autodial Settings” on page 4-84.</p>
N/A	Autodial Timeout (Global and Per-Line)	sip autodial timeout sip lineN autodial timeout	<p>Globally or on a per-line basis, specifies the time, in seconds, that the phone waits to dial a pre-configured number after the handset is lifted from the IP phone cradle.</p> <p>If this parameter is set to 0 (hotline), the phone immediately dials a pre-configured number when you lift the handset. If this parameter is set to a value greater than 0, the phone waits the specified number of seconds before dialing the pre-configured number (warmline) when you lift the handset.</p> <p>Default is 0 (hotline).</p> <p>For more information, see Chapter 4, “Autodial Settings” on page 4-84.</p>
N/A	Use Global Settings (Per-line configurations only)	N/A	<p>For each line, this parameter specifies to use the global autodial settings of “Autodial Number” and “Autodial Timeout”.</p> <p>For more information, see Chapter 4, “Autodial Settings” on page 4-84.</p>

Line Settings

An administrator can configure multiple lines on the IP phone with the same SIP network configuration (global) or a different SIP network configuration (per-line). The following table provides the number of lines available for each IP phone model.

IP Phone Model	Available Lines
9143i	9
9480i	9
9480i CT	9
6730i	6
6731i	6
6735i	9
6737i	9
6739i	9
6753i	9
6755i	9
6757i	9
6757i CT	9
6863i	2
6865i	9
6867i	9

On the IP Phones, you can configure the following on a per-line basis using the configuration files or the Aastra Web UI:

- **Basic SIP Authentication Settings**
- **Basic SIP Network Settings**
- **Advanced SIP Settings** (Missed Call Summary Subscription only)
- **RTP Settings** (DTMF Method and RTP Encryption only)
- **Autodial Settings** (On a per-line basis, you can also enable/disable the **“Use Global Settings”** parameter.)

References

For more information about configuring the features listed above on a per-line basis, see Chapter 4, the sections:

- [“Basic SIP Settings” on page 4-55](#)
- [“Advanced SIP Settings \(optional\)” on page 4-69](#)
- [“Real-time Transport Protocol \(RTP\) Settings” on page 4-74](#)
- [“Autodial Settings” on page 4-84](#)

Softkeys, Programmable Keys, Expansion Module Keys

A user or administrator can assign specific functions to softkeys, programmable keys, or expansion module keys. The available keys for configuration depend on the IP phone model as shown in the following table.

IP Phone Model	Softkeys	Expansion Module Keys	Programmable Keys
9143i	-	Not Applicable	7
9480i	6	Not Applicable	-
9480i CT	6	Not Applicable	-
6730i	-	Not Applicable	8
6731i	-	Not Applicable	8
6735i	6	36 to 108* (Model M670i) 60 to 180** (Model M675i)	6
6737i	12	36 to 108* (Model M670i) 60 to 180** (Model M675i)	-
6739i	55	36 to 108* (Model M670i) 60 to 180** (Model M675i)	-
6753i	-	36 to 108* (Model M670i)	6
6755i	6	36 to 108* (Model M670i) 60 to 180** (Model M675i)	6
6757i	12	36 to 108* (Model M670i) 60 to 180** (Model M675i)	-
6757i CT	12	36 to 108* on Base Station (Model M670i) 60 to 180** on Base Station (Model M675i)	-
6863i	-	Not Applicable	3
6865i	-	16 to 48*** (Model M680i)	8
6867i	10	16 to 48*** (Model M680i)	-

*The M670i expansion module consists of 36 softkeys. You can have up to 3 expansion modules on an IP phone totalling 108 softkeys. Valid for 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, and 6757i CT phones.

**The M675i expansion module consists of 60 softkeys. You can have up to 3 expansion modules on an IP phone totalling 180 softkeys. Valid for 6735i, 6737i, 6739i, 6755i, 6757i, and 6757i CT phones.

***The M680i expansion module consists of 16 softkeys. You can have up to 3 expansion modules on an IP phone totalling 48 softkeys. Valid for 6865i and 6867i phones.

The softkey, programmable key, or expansion module key can be set to use a specific function. Available functions depend on the IP phone model.

Reference

For more information about key functions see Appendix A, the section, “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.

For information about configuring softkeys, programmable keys, and expansion module keys, see Chapter 5, the section, “Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys” on page 5-104.

Action URI

The IP phones have a feature that allows an administrator to specify a uniform resource identifier (URI) that triggers a GET when certain XML events occur. The Action URI feature prevents the phones from hanging if the Action URIs should fail. The phones also support transparent, non-blocking, XML post execute item URIs.

The IP phone XML events that support this feature are defined in the following table.

Action URI	Description
Startup	Specifies the URI for which the phone executes a GET on when a startup event occurs.
Successful Registration	Specifies the URI for which the phone executes a GET on when a successful registration event occurs.
Registration Event	Specifies the URI for when registration events occur or when there are registration state changes.
	<p>Note: This action URI is not called when the same event is repeated (for example, a timeout occurs again when registration is already in a timeout state.)</p>
Incoming Call	Specifies the URI for which the phone executes a GET on when an incoming call event occurs.
Outgoing Call	Specifies the URI for which the phone executes a GET on when an outgoing call event occurs.
Offhook	Specifies the URI for which the phone executes a GET on when an offhook event occurs.
Onhook	Specifies the URI for which the phone executes a GET on when an onhook event occurs.
Connected	Specifies the URI for which the phone executes an HTTP GET when it goes into the “connected” state. This includes regular phone calls, intercom calls, paging calls, RTP streaming, and the playing of a WAV file. It is also triggered when the phone establishes the second leg of a 3-way call.
Disconnected	Specifies the URI that the phone executes a GET on, when it transitions from the incoming, outgoing, calling, or connected state into the idle state.
XML SIP Notify	Specifies the URI to be called when an empty XML SIP NOTIFY is received by the phone.
Poll	Specifies the URI to be called every "action uri poll interval" seconds.
Poll Interval	Specifies the interval, in seconds, between calls from the phone to the "action uri poll".

You can set these parameters using the configuration files or the Aastra Web UI.

Reference

For more information about setting the Action URIs for XML applications, see “Action URIs” on page 5-246.

XML SIP Notify Events and Action URIs

In order for an XML push to bypass the NAT/firewall, the phone supports a proprietary SIP NOTIFY event (aastra-xml) with or without XML content.

If XML content is provided in the SIP NOTIFY, it is processed directly by the phone as it is done for an XML PUSH.

Reference

For more information about enabling the XML SIP Notify on the IP Phones, see Chapter 5, the section, “XML SIP Notify Events” on page 5-256.

Polling Action URIs

Another way to reach a phone behind a NAT/firewall is to have the phone make an XML call at periodic intervals. An Administrator can use the **action uri poll** to command the phone to perform an XML call at configurable intervals.

An Administrator can specify the URI to be called and specify the interval between polls. Configuration of this feature is dynamic (no reboot required).

Reference

For more information about configuring the polling and polling interval of Action URIs, see [“Polling Action URIs”](#) on page 5-252.

Configuration Server Settings

The configuration server stores the firmware images, configuration files, and software when performing software upgrades to the IP phone. An administrator can configure the following parameters for the configuration server:

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Download Protocol Settings			
Download Protocol	Download Protocol	download protocol	<p>Protocol to use for downloading new versions of software to the IP phone. Valid values are:</p> <ul style="list-style-type: none"> TFTP FTP HTTP HTTPS <p>Note: For DHCP to automatically populate the IP address or domain name for the download servers, your DHCP server must support Option 66. The IP phones also support Option 60 and 43. For more information, see Chapter 4, the section, “DHCP” on page 4-3.</p> <p>For more information about download protocols on the IP Phone, see Chapter 4, “Configuration Server Protocol” on page 4-87.</p>
Primary TFTP	TFTP Server	tftp server	<p>The TFTP server’s IP address or qualified domain name. If DHCP is enabled and the DHCP server provides the information, this field is automatically populated. Use this parameter to change the IP address or domain name of the TFTP server. This will become effective after this configuration file has been downloaded into the phone.</p> <p>For more information, see Chapter 4, “Configuration Server Protocol” on page 4-87.</p>
Primary TFTP Path	TFTP Path	tftp path	<p>Specifies the path name for which the configuration files reside on the TFTP server for downloading to the IP Phone.</p> <p>If the IP phone’s configuration and firmware files are located in a sub-directory beneath the server’s root directory, the relative path to that sub-directory should be entered in this field.</p> <p>Note: Enter the path name in the form <i>folderX\folderX\folderX</i>. For example, <i>ipphone\6757\configfiles</i>.</p> <p>For more information, see Chapter 4, “Configuration Server Protocol” on page 4-87.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Alternate TFTP	Alternate TFTP	alternate tftp server	<p>The alternate TFTP server's IP address or qualified domain name. This will become effective after this configuration file has been downloaded into the phone.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
Alternate TFTP Path	Alternate TFTP Path	alternate tftp path	<p>Specifies the path name for which the configuration files reside on the Alternate TFTP server for downloading to the IP Phone.</p> <p>If the IP phone's configuration and firmware files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
Select TFTP	Use Alternate TFTP	use alternate tftp	<p>Enables or disables the alternate TFTP server. Valid values are "0" disabled and "1" enabled.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
FTP Server	FTP Server	ftp server	<p>The FTP server's IP address or network host name. This will become effective after this configuration file has been downloaded into the phone.</p> <p>Optional: You can also assign a username and password for access to the FTP server. See the following parameters for setting username and password.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
FTP Path	FTP Path	ftp path	<p>Specifies the path name for which the configuration files reside on the FTP server for downloading to the IP Phone.</p> <p>If the IP phone's configuration and firmware files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
FTP Username	FTP Username	ftp username	<p>The username to enter for accessing the FTP server. This will become effective after this configuration file has been downloaded into the phone.</p> <p>The IP Phones support usernames containing dots ("").</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
FTP Password	FTP Password	ftp password	<p>The password to enter for accessing the FTP server. This will become effective after this configuration file has been downloaded into the phone.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
HTTP Server	HTTP Server	http server	<p>The HTTP server's IP address. This will become effective after this configuration file has been downloaded into the phone.</p> <p>Optional: You can also assign an HTTP relative path to the HTTP server. See the next parameter (http path).</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
HTTP Path	HTTP Path	http path	<p>Specifies the path name for which the configuration files reside on the HTTP server for downloading to the IP Phone.</p> <p>If the IP phone's configuration and firmware files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
HTTP Port	HTTP Port	http port	<p>Specifies the HTTP port that the server uses to load the configuration to the phone over HTTP.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
Download Server	HTTPS Server	https server	<p>The HTTPS server's IP address. This will become effective after this configuration file has been downloaded into the phone.</p> <p>Optional: You can also assign an HTTPS relative path to the HTTPS server. See the next parameter (https path).</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
Download Path	HTTPS Path	https path	<p>Specifies the path name for which the configuration files reside on the HTTPS server for downloading to the IP Phone.</p> <p>If the IP phone's configuration and firmware files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>
Download Port	HTTPS Port	https port	<p>Specifies the HTTP port that the server uses to load the configuration to the phone over HTTP.</p> <p>For more information, see Chapter 4, "Configuration Server Protocol" on page 4-87.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
Auto-Resync Settings			
N/A	Mode	auto resync mode	<p>Enables and disables the phone to be updated automatically once a day at a specific time in a 24-hour period. This parameter works with TFTP, FTP, and HTTP servers.</p> <p>Notes:</p> <ul style="list-style-type: none"> If a user is accessing the Aastra Web UI, they are not informed of an auto-reboot. Any changes made using the Aastra Web UI or the IP phone UI are not overwritten by an auto-resync update. Auto-resync affects the configuration files only. However, the settings in the Aastra Web UI take precedence over the IP phone UI and the configuration files. The resync time is based on the local time of the IP phone. If the IP phone is in use (not idle) at the time of the resync check, the reboot occurs when the phone becomes idle. The automatic update feature works with both encrypted and plain text configuration files. <p>For more information, see Chapter 8, the section, “Using the Auto-Resync Feature” on page 8-5.</p>
N/A	Time (24-hour)	auto resync time	<p>Sets the time of day in a 24-hour period for the IP phone to be automatically updated. This parameter works with TFTP, FTP, and HTTP servers.</p> <p>Notes:</p> <ul style="list-style-type: none"> The resync time is based on the local time of the IP phone. The value of 00:00 is 12:00 A.M. When selecting a value for this parameter in the Aastra Web UI, the values are in 30-minute increments only. When entering a value for this parameter using the configuration files, the value can be entered using minute values from 00 to 59 (for example, the auto resync time can be entered as 02:56). <p>For more information, see Chapter 8, the section, “Using the Auto-Resync Feature” on page 8-5.</p>
N/A	Maximum Delay	auto resync max delay	<p>Specifies the maximum time, in minutes, the phone waits past the scheduled time before starting a checksync.</p> <p>For more information, see Chapter 8, the section, “Using the Auto-Resync Feature” on page 8-5.</p>
N/A	Days	auto resync days	<p>Specifies the amount of days that the phone waits between checksync operations.</p> <p>Note:</p> <p>A value of 0 causes the phone to checksync every time the clock reads the proper time. A value of 1 forces the phone to wait 24 hours prior to doing the first checksync.</p> <p>For more information, see Chapter 8, the section, “Using the Auto-Resync Feature” on page 8-5.</p>
XML Push Server List (Approved IP Addresses)			
N/A	XML Push Server List (Approved IP Addresses)	xml application post list	<p>The HTTP server that is pushing XML applications to the IP phone.</p> <p>For more information, see Chapter 5, the section, “XML Push Requests” on page 5-242.</p>

Firmware Update Features

The IP phones support the protocols, TFTP, FTP, HTTP or HTTPS to download configuration files and upgrade firmware to the phones from a configuration server.

You can download the firmware stored on the configuration server in one of three ways:

- Using the “**Firmware Update**” page in the Aastra Web UI at the location **Advanced Settings->Firmware Update**.
- Using the IP Phone UI or the Aastra Web UI to **restart** the phone. The phone automatically looks for firmware updates and configuration files during the boot process.
- Setting an **Auto-Resync** feature to automatically update the firmware, configuration files, or both at a specific time in a 24-hour period). (Feature can be enabled using the configuration files or the Aastra Web UI).

Reference

For more information about firmware update, see [Chapter 8, “Upgrading the Firmware.”](#)

TLS Support

The IP Phones support a transport protocol called **Transport Layer Security (TLS)** and **Persistent TLS**. TLS is a protocol that ensures communication privacy between the SIP phones and the Internet. TLS ensures that no third party may eavesdrop or tamper with any message. An Administrator can configure the following parameters for TLS Support.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
N/A	Transport Protocol	sip transport protocol	<p>Specifies the protocol that the IP phone uses to send out SIP messages. Default is UDP.</p> <p>Notes:</p> <ul style="list-style-type: none"> • If you set the value of this parameter to 4 (TLS), the phone checks to see if the “sips persistent tls” is enabled. If it is enabled, the phone uses Persistent TLS on the connection. If “sips persistent tls” is disabled, then the phone uses TLS on the connection. If TLS is used, you must specify the Root and Intermediate Certificates, the Local Certificate, the Private Key, and the Trusted Certificates. • If the phone uses Persistent TLS, you MUST specify the Trusted Certificates; the Root and Intermediate Certificates, the Local Certificate, and the Private Key are optional. <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>
N/A	N/A	sips persistent tls	<p>Enables or disables the use of Persistent Transport Layer Security (TLS).</p> <p>Persistent TLS sets up the connection to the server once and re-uses that connection for all calls from the phone. The setup connection for Persistent TLS is established during the registration of the phone. If the phones are set to use Persistent TLS, and a call is made from the phone, this call and all subsequent calls use the same authenticated connection. This significantly reduces the delay time when placing a call.</p> <p>Notes:</p> <ul style="list-style-type: none"> • There can be only one persistent TLS connection created per phone. • If you configure the phone to use Persistent TLS, you must also specify the Trusted Certificate file to use. The Root and Intermediate Certificates, Local Certificate, and Private Key files are optional. <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
NA	NA	sip persistent tls keep alive	<p>Allows you to configure the keep-alive feature for persistent TLS connections only. When this feature is configured, the phone will send keep-alive pings to the proxy server at configured intervals.</p> <p>The keep-alive feature for persistent TLS connections performs the following functionalities:</p> <ul style="list-style-type: none"> • After a persistent TLS connection is established or re-established, activate the keep-alive, which will send CRLF to peer periodically. • The phone will retry the connection automatically when a persistent TLS connection is down. • When a persistent TLS connection is re-established (primary is up or primary is down and backup is up), refresh registration of the accounts associated with the connection. • When a persistent TLS connection to primary is down, switch to backup if connection to backup is working.
NA	NA	sip send sips over tls	<p>Allows administrators the ability to manually configure the IP phones to use either the SIP or SIPS URI scheme when TLS or persistent TLS is enabled.</p> <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>
N/A	Root and Intermediate Certificates Filename	sips root and intermediate certificates	<p>Allows you to specify the SIP Root and Intermediate Certificate files to use when the phone uses the TLS transport protocol to setup a call.</p> <p>The Root and Intermediate Certificate files contain one root certificate and zero or more intermediate certificates which must be placed in order of certificate signing with root certificate being the first in the file. If the local certificate is signed by some well known certificate authority, then that authority provides the user with the Root and Intermediate Certificate files (most likely just CA root certificate).</p> <p>This parameter is required when configuring TLS (optional for Persistent TLS.)</p> <p>Note: The certificate files must use the format “.pem”. To create custom certificate files to use on your IP phone, contact Aastra Technical Support.</p> <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>
N/A	Local Certificate Filename	sips local certificate	<p>Allows you to specify the Local Certificate file to use when the phone uses the TLS transport protocol to setup a call.</p> <p>This parameter is required when configuring TLS (optional for Persistent TLS.)</p> <p>Note: The certificate file must use the format “.pem”. To create specific certificate files to use on your IP phone, contact Aastra Technical Support.</p> <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
N/A	Private Key Filename	sips private key	<p>Allows you to specify a Private Key file to use when the phone uses the TLS transport protocol to setup a call.</p> <p>This parameter is required when configuring TLS (optional for Persistent TLS.)</p> <p>Note: The key file must use the format “.pem”. To create specific private key files to use on your IP phone, contact Aastra Technical Support.</p> <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>
N/A	Trusted Certificates Filename	sips trusted certificates	<p>Allows you to specify the Trusted Certificate files to use when the phone uses the TLS transport protocol to setup a call.</p> <p>The Trusted Certificate files define a list of trusted certificates. The phone’s trusted list must contain the CA root certificates for all the servers it is connecting to. For example, if the phone is connecting to server A which has a certificate signed by CA1, and server B that has a certificate signed by CA2, the phone must have CA1 root certificate and CA2 root certificate in its Trusted Certificate file.</p> <p>This parameter is required when configuring TLS or Persistent TLS.</p> <p>Note: The certificate files must use the format “.pem”. To create custom certificate files to use on your IP phone, contact Aastra Technical Support.</p> <p>For more information, see Chapter 6, the section, “Transport Layer Security (TLS)” on page 6-16.</p>

802.1x Support

The IP phones support the IEEE 802.1x Protocol. The 802.1x Protocol is a standard for passing Extensible Authentication Protocol (EAP) over a wired or wireless Local Area Network (LAN).

The 802.1x Protocol on the IP phone facilitates media-level access control, and offers the capability to permit or deny network connectivity, control LAN access, and apply traffic policy, based on user or endpoint identity. This feature supports both the EAP-MD5 and EAP-TLS Protocols.

Note:

If configuring 802.1x using the IP Phone UI, the certificates and private keys must already be configured and stored on the phone. Use the configuration files or the Aastra Web UI to load certificates and private keys.

An Administrator can configure the following parameters for the 802.1x Protocol.

Parameter In IP Phone UI	Parameter in Aastra Web UI	Parameters in Configuration Files	Description
General			
802.1x Mode	EAP Type	eap-type	Specifies the type of authentication to use on the IP Phone. For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.
Identity	Identity	identity	Specifies the identity or username used for authenticating the phone. Note: The value you enter for this parameter also displays in the Aastra Web UI at the path Advanced Settings->802.1x Support->General->Identity For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.
EAP-MD5 Settings			
MD5 Password	MD5 Password	md5 password	Specifies the password used for the MD5 authentication of the phone. Note: The value you enter for this parameter also displays in the Aastra Web UI at the path Advanced Settings->802.1x Support->EAP-MD5 Settings->MD5 Password. The password displays as "*****". For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.
EAP-TLS Settings			
N/A	Root and Intermediate Certificates Filename	802.1x root and intermediate certificates	Specifies the file name that contains the root and intermediate certificates related to the local certificate. For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.
N/A	Local Certificate Filename	802.1x local certificate	Specifies the file name that contains the local certificate. For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.
N/A	Private Key Filename	802.1x private key	Specifies the file name that contains the private key. For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.
N/A	Trusted Certificates Filename	802.1x trusted certificates	Specifies the file name that contains the trusted certificates. For more information, see Chapter 6, the section, "802.1x Support" on page 6-20.

Troubleshooting

The Troubleshooting feature in the Aastra Web UI provides tasks that a system administrator can perform on the IP phones for troubleshooting purposes. Using this feature, a system administrator can:

- Assign an IP address and IP port to which log information will be transmitted
- Filter the logs according to severity
- Save the current local configuration file to a specified location
- Save the current server configuration file to a specified location
- Show task and stack status (including “Free Memory” and “Maximum Memory Block Size”)
- Enable/disable a WatchDog task
- View Error Messages
- Enable/disable the uploading of configuration and crash file information to a pre-defined server

Aastra Technical Support can then use the information gathered to perform troubleshooting tasks.

Reference

For more information about troubleshooting on the IP Phones, see [Chapter 9, “Troubleshooting.”](#)

Chapter 4

Configuring Network and Session Initiation Protocol (SIP) Features

About this Chapter

This chapter provides the information required to configure the Network and Global SIP features on the IP Phone. These features are password protected on the IP Phone UI and the Aastra Web UI. This chapter also includes procedures for configuring the Network and Global SIP features via the configuration files, the IP Phone UI, and the Aastra Web UI where applicable.

Note:

The IP Phone User Interface (UI) procedures in the remainder of this Guide use the keys on the 9480i, 9480i CT, 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT, 6863i, 6865i, and/or 6867i, when configuring Administrator Options. For information on using the 9143i, 6730i, 6731i, and 6753i keys to configure the Administrator Options, see Chapter 2, the section, “Using the Options Key” on page 2-5.

Topics

This chapter covers the following topics:

Topic	Page
Overview	page 4-2
Network Settings	page 4-3
Basic Network Settings	page 4-3
Advanced Network Settings	page 4-24
Global SIP Settings	page 4-55
Basic SIP Settings	page 4-55
Advanced SIP Settings (optional)	page 4-69
Real-time Transport Protocol (RTP) Settings	page 4-74
RTCP Summary Reports	page 4-84
Autodial Settings	page 4-84
Configuration Server Protocol	page 4-87
Configuring the Configuration Server Protocol	page 4-87

Overview

An administrator can configure the IP Phone Network and SIP options from the phone UI, from the **Aastra Web UI, or the configuration files**. Administrator level options are password protected in both the IP phone UI and the Aastra Web UI.

Note:

An administrator has the option of enabling and disabling the use of password protection in the IP phone UI. This is configurable using the configuration files only. For more information about this feature, see Appendix A, the section "Password Settings" on page A-14.

The procedures in this section include configuring from the IP phone UI and the Aastra Web UI. To configure the IP phones using the configuration files, see [Appendix A, "Configuration Parameters."](#)

To configure the phone using the IP phone UI, you must enter an administrator password. To configure the phone using the Aastra Web UI, you must enter an administrator username and password.

Note:

In the IP phone UI, the default password is "22222". In the Aastra Web UI, the default admin username is "Admin" and the default password is "22222".

References

For configuring the IP phone at the Asterisk IP PBX, see [Appendix B, "Configuring the IP Phone at the Asterisk IP PBX."](#)

For sample configuration files, see [Appendix C, "Sample Configuration Files."](#) These sample files include basic parameters required to register the IP phone at the PBX.

Network Settings

This section describes the basic network settings on the IP phone which include configuring for:

- DHCP
- IP Address (of phone)
- Subnet Mask (of phone)
- Gateway
- Primary DNS
- Secondary DNS
- Hostname
- LAN Port
- PC Port Pass Thru Enable/Disable
- PC Port

Basic Network Settings

DHCP

The IP phone is capable of querying a DHCP server, allowing a network administrator a centralized and automated method of configuring various network parameters for the phone. If DHCP is enabled, the IP phone requests the following network information:

- Subnet Mask
- Gateway (i.e. router)
- Domain Name System (DNS) Server
- Network Time Protocol Server
- IP Address
- TFTP Server or Alternate TFTP Server if enabled on the phone
- TFTP Path or Alternate TFTP Path if enabled on the phone
- FTP Server
- FTP Path
- HTTP Server
- HTTP Path
- HTTP Port
- HTTPS Server
- HTTPS Path
- HTTPS Port

The network administrator chooses which of these parameters (if any) are supplied to the IP phone by the DHCP server. The administrator must configure the phone manually to provide any required network parameters not supplied by the DHCP server.

Enabling/Disabling DHCP Using the Configuration Files

Use the following procedure to enable/disable DHCP on the phone using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Network Settings" on page A-8.

Enabling/Disabling DHCP Using the IP Phone UI

Use the following procedure to enable/disable DHCP on the phone using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.
Note:
The IP Phones accept numeric passwords only.
4. Select **Network Settings**.
5. Select option **DHCP**.
6. Press **Change** to set "Use DHCP?" to "Yes" (enable) or "No" (disable).
7. Press **Done** to save the changes.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "22222".
4. Press **Network**.
5. Press **DHCP Settings**.
6. In the "Use DHCP?" field, select "Enabled" to enable DHCP.
or
Press "Disabled" to disable DHCP.
7. Press the  to return to the previous screen.
8. Press the  button or the  button at any time to return to the idle screen.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **Network > Settings**.
5. In the "Use DHCP?" checkbox, press the  button to enable or disable DHCP.
6. Press the **Save** softkey.
7. Press the  button, the  button, or the **Quit** softkey to return to the idle screen.

Enabling/Disabling DHCP Using the Aastra Web UI

Use the following procedure to enable/disable DHCP using the Aastra Web UI.

**Aastra Web UI**

1. Click on **Advanced Settings->Network->Basic Network Settings**.

Network Settings

Basic Network Settings

DHCP	<input checked="" type="checkbox"/> Enabled
IP Address	<input type="text" value="192.168.0.11"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
Gateway	<input type="text" value="192.168.0.1"/>
Primary DNS	<input type="text" value="4.1.1.1"/>
Secondary DNS	<input type="text" value="4.2.2.2"/>
Hostname	<input type="text" value="53i00085D164435"/>
LAN Port	<input type="text" value="Auto Negotiation"/>
PC Port PassThru Enable/Disable	<input checked="" type="checkbox"/> Enabled
PC Port	<input type="text" value="Auto Negotiation"/>

2. Enable the "**DHCP**" field by checking the check box. (Disable this field by unchecking the box).
3. Click **Save Settings** to save your settings.

DHCP Options 60, 66, and 43 Server Configurations**Option 66**

The IP Phones support download protocols as referenced in RFC2131 and RFC1541 (TFTP, FTP, HTTP, HTTPS) to support DHCP option 66. Option 66 is part of the DHCP Offer message that the DHCP server generates to tell the phone which configuration server it should use to download new firmware and configuration files.

For DHCP to automatically populate the IP address or domain name for the servers, your DHCP server must support Option 66. Option 66 is responsible for forwarding the server's IP address or domain name to the phone automatically. If your DHCP server does not support Option 66, you must manually enter the IP address or domain name for your applicable configuration server into your IP phone configuration.

Options 60 and 43

The Aastra phones also support Option 60 and Option 43 as referenced in RFC 2132.

Option 60 (Vendor Class Identifier) provides the DHCP server with a unique identifier for each phone model. This enables a system administrator to send the phone a customized Server Configuration in option 43.

The table below lists the identifier values for each phone model.

Model	Identifier Value
9143i	AastralPPhone9143i
9480i	AastralPPhone9480i
9480i CT	AastralPPhone9480iCT
6730i	AastralPPhone6730i
6731i	AastralPPhone6731i
6735i	AastralPPhone6735i
6737i	AastralPPhone6737i

Model	Identifier Value
6739i	AastralPPhone6739i
6753i	AastralPPhone53i
6755i	AastralPPhone55i
6757i	AastralPPhone57i
6757i CT	AastralPPhone57iCT
6863i	AastralPPhone63i
6865i	AastralPPhone65i
6867i	AastralPPhone67i

Option 43 consists of the following sub-options:

Sub-Option/Code	Description
02	Configuration server (protocol, server, and path).
03	Redirection and Configuration Server (RCS) enable/disable.
08	ID string to enable the use of the VLAN identity in sub-option/code 09. Must be specified to avoid conflict with other vendors.
09	VLAN ID value.

The System administrator can use the Vendor Class Identifier to send the phone a customized Server Configuration in option 43 (Vendor-Specific information).

Note:

If Aastra IP Phones receive the server configuration from both DHCP Option 66 and DHCP Option 43, then Option 43 takes precedence over Option 66.

Using Option 43 to Customize the IP Phone

A System Administrator can customize the IP Phone(s) in the network by entering a text string in the phone’s configuration files. The following is an Option 43 example using Linux.

On the startup of the phones, when the DHCP server receives the request with the information in this example, it allows the 6757i phones to use FTP and the 6757i CT phones to use TFTP from the same server.

Linux Example

A System Administrator can enter the following in the DHCP server:

```
option space AastraIPPhone57i;
option AastraIPPhone57i.cfg-server-name code 02 = text;

option space AastraIPPhone57iCT;
option AastraIPPhone57iCT.cfg-server-name code 02 = text;

Subnet 192.168.1.0 netmask 255.255.255.0 {

class "vendor-class-57i" {
    match if option vendor-class-identifier="AastraIPPhone57i";
    vendor-option-space AastraIPPhone57i;
    option AastraIPPhone57i.cfg-server-name "ftp://username:password@10.10.10.1";
}
class "vendor-class-57iCT" {
    match if option vendor-class-identifier="AastraIPPhone57iCT";
    vendor-option-space AastraIPPhone57iCT;
    option AastraIPPhone57iCT.cfg-server-name "tftp://10.10.10.1";
}
}
```

Your DHCP server configuration file, such as the *dhcpd.conf* file, may include one of these lines to configure the configuration server protocol and the server details.

Protocol	Format	Examples
HTTP	http://<server>/<path>	option AastraIPPhone57iCT.cfg-server-name "http://192.168.1.45"; option AastraIPPhone57iCT.cfg-server-name "http://192.168.1.45/path"; option AastraIPPhone57iCT.cfg-server-name "http://httpsvr.example.com/path";
HTTPS	https://<server>/<path>	option AastraIPPhone57iCT.cfg-server-name "https://192.168.1.45"; option AastraIPPhone57iCT.cfg-server-name "https://192.168.1.45/path"; option AastraIPPhone57iCT.cfg-server-name "https://httpsvr.example.com/path";
FTP	ftp://user:password@ftpsvr	option AastraIPPhone57iCT.cfg-server-name "ftp://192.168.1.45"; option AastraIPPhone57iCT.cfg-server-name "ftp://ftpsvr.example.com"; (for anonymous user) option AastraIPPhone57iCT.cfg-server-name "ftp://userID:password@ftpsvr.example.com";
TFTP	tftp://tftpsvr	option AastraIPPhone57iCT.cfg-server-name "192.168.1.45"; option AastraIPPhone57iCT.cfg-server-name "tftpsvr.example.com"; option AastraIPPhone57iCT.cfg-server-name "tftp://tftpsvr.example.com";

Option 43 Redirection and Configuration Server (RCS) Bypass

DHCP Option 43 includes the ability to bypass contacting Astra's Redirection and Configuration Server (RCS), in addition to the previous support of setting the configuration server to contact.

A sub-option code 3 uses a boolean value (true or false) that controls whether or not the phone should contact the RCS after a factory default. If this value is set to false, the RCS is not contacted. If it is set to true or is missing, then the RCS is contacted as per previous releases. This can be used in conjunction with the existing code 2 sub-option to set the configuration server.

Configuring RCS Bypass via Option 43 on a Linux DHCP Server

The following example illustrates how to configure RCS bypass via Option 43 on a Linux DHCP server.

```
option space AastraIPPhone;
option AastraIPPhone.cfg-server-name code 02 = text;
option AastraIPPhone.contact-rcs code 03 = boolean;

Subnet 192.168.1.0 netmask 255.255.255.0 {

#The 6757i phones do not contact the RCS but use the defined FTP server for configuration
#files.
    class "vendor-class-57i" {
        match if option vendor-class-identifier="AastraIPPhone57i";
        vendor-option-space AastraIPPhone;
        option AastraIPPhone.cfg-server-name "ftp://username:password@10.10.10.1";
        option AastraIPPhone.contact-rcs false;
    }
#The 6757iCT phones do not contact the RCS.
    class "vendor-class-57iCT" {
        match if option vendor-class-identifier="AastraIPPhone57iCT";
        vendor-option-space AastraIPPhone;
        option AastraIPPhone.contact-rcs false;
    }
}
```

Using Option 120 on the IP Phone

DHCP Option 120 (as referenced in RFC 3361) allows SIP clients to locate a local SIP server (i.e. outbound proxy server) that can be used for all outbound SIP requests. Using the **"use dhcp option 120"** configuration parameter, administrators can enable support for DHCP Option 120 on the IP phones. This is particularly useful when service providers require the IP phones to use certain outbound proxy servers or Session Border Controllers (SBCs) based on geographical location and have provisioned the outbound proxy by using DHCP Option 120. The parameter is disabled by default.

Considerations

The following considerations must be taken into account when enabling support for DHCP Option 120 on the IP phones:

- If the parameter is enabled and DHCP Option 120 contains a valid value, the IP phones will use the server IP/name obtained via DHCP Option 120 as the outbound proxy for both the Global SIP and Line 1 profiles.
- If Line 2 is configured and the outbound proxy is not defined, the phone will use the outbound proxy located in the Global SIP profile.

- If Line 2 is configured with a valid outbound proxy, the phone will retain the configured Line 2 outbound proxy and ignore the Global SIP profile. This allows for Line 2 to be registered to another service with another outbound proxy if required.
- If Line 2 is configured for another service but no outbound proxy is wanted/required, administrators should not leave the outbound proxy as undefined (i.e. 0.0.0.0) as the phone will use the outbound proxy located in the Global SIP profile. Instead, administrators should specify the proxy/registrar's address as the outbound proxy.
- If the parameter is enabled, but the server does not have an outbound proxy configured, DHCP Option 120 is ignored and the phone will behave as if the parameter is disabled.
- As Option 120 does not support port numbers directly, if a non-standard port (i.e. other than 5060) is required, this must be set using the configuration parameter "**sip outbound proxy port**" or by the use of DNS SRV in which case "**sip outbound proxy port**" must be set to 0.

Enabling/Disabling DHCP Option 120 Using the Configuration Files

Use the following procedure to enable/disable DHCP Option 120 using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "DHCP Option Settings" on page A-12.

Using Option 132 (802.1P VLAN ID) and Option 43 to Transfer VLAN ID Assignment Using DHCP

There are now two ways of transporting the VLAN ID parameter in the Dynamic Host Configuration Protocol (DHCP):

- By DHCP Option 43 (vendor specific information)
- By DHCP Option 132 (802.1P VLAN ID)

When the phone receives the VLAN ID from the DHCP and the value is different from the one used by the phone to trigger the DHCP request, the phone reboots and then sends a new DHCP request in the new VLAN. The phone will remember the VLAN ID obtained by DHCP options so that on a reboot, the phone will send a DHCP request using the correct VLAN.

If using DHCP Option 43 to transfer VLAN ID assignment the following sub-options are utilized. Additionally, the corresponding rules must be followed:

Sub-Option/Code	Description	Rule
08	ID string to enable the use of the VLAN identity in sub-option/code 09. Must be specified to avoid conflict with other vendors.	Must be the 16-byte character string "Aastra{space}Telecom{space}{space}" (i.e. Aastra Telecom followed by two space characters). 16-byte hex equivalent: 4161737472612054656c656366d2020
09	VLAN ID value	Must be 4 bytes, whereas the first and second byte must be 0x00, and the third and fourth bytes encompass the VLAN ID. The valid range of the VLAN ID is 1 - 4095. For example, a VLAN ID of 100 (in dec) is 00 00 00 64 in hex.

Alternatively, administrators can use the "**dhcp option 132 vlan id enabled**" parameter to enable the VLAN ID assignment transfer using DHCP feature. Option 132 provides the same functionality as Option 43 but the data format of the VLAN ID value must be 2 bytes, whereas the first and second bytes encompass the VLAN ID (the valid range of the VLAN ID being 1 - 4095).

Precedence

- LLDP values should have precedence over the DHCP
- DHCP values should have precedence over the configuration files
- DHCP should have precedence over the Local values (configured by the Local MMI of the phone)
- DHCP Option 43 should have precedence over DHCP Option 132

Configuring Option 43 to Transfer VLAN ID Assignment on a Linux DHCP Server

The following example (covering all the phones) illustrates how to configure Option 43 to transfer VLAN ID assignment on a Linux DHCP server.

```
option space AastraIPPhone;
option AastraIPPhone.cfg-server-name      code 02 = text;
option AastraIPPhone.contact-rcs         code 03 = boolean;
option AastraIPPhone.ActivateVLANHeader   code 08 = text;
option AastraIPPhone.VLAN-ID             code 09 = unsigned integer 32;

class "AastraSIP" {
    match if ( (option vendor-class-identifier="AastraIPPhone6730i")
    or (option vendor-class-identifier="AastraIPPhone9143i")
    or (option vendor-class-identifier="AastraIPPhone9480i")
    or (option vendor-class-identifier="AastraIPPhone9480iCT")
    or (option vendor-class-identifier="AastraIPPhone6730i")
    or (option vendor-class-identifier="AastraIPPhone6731i")
    or (option vendor-class-identifier="AastraIPPhone6735i")
    or (option vendor-class-identifier="AastraIPPhone6737i")
    or (option vendor-class-identifier="AastraIPPhone6739i")
    or (option vendor-class-identifier="AastraIPPhone53i")
    or (option vendor-class-identifier="AastraIPPhone55i")
    or (option vendor-class-identifier="AastraIPPhone57i")
    or (option vendor-class-identifier="AastraIPPhone57iCT") );
    vendor-option-space AastraIPPhone;
    option AastraIPPhone.cfg-server-name "http://192.168.174.200/aastra"; # option 43
    option AastraIPPhone.contact-rcs      false; # option 43
    option AastraIPPhone.ActivateVLANHeader "Aastra Telecom "; # option 43
    option AastraIPPhone.VLAN-ID          100; # option 43
} # endClass
```

Enabling/Disabling DHCP Option 132 VLAN ID Using the Configuration Files

Use the following procedure to enable/disable DHCP Option 132 VLAN ID using the configuration files.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, "DHCP Option Settings" on [page A-12](#).

Using Option 12 Hostname on the IP Phone

If you set the phone to use DHCP Option 12, the phone automatically sends this option to the configuration server. This option specifies the hostname (name of the client). The name may or may not be qualified with the local domain name (based on RFC 2132). See RFC 1035 for character set restrictions.

Notes:

- The hostname of [<model><MAC address>] automatically populates the field on initial startup of the phone. For example, for a 6753i, the "Hostname" field is automatically populated as "53i00085D164435", where the model number is "6753i" and the MAC address is "00085D164435".
- If the configuration server sends the hostname back to the phone in a DHCP Reply Packet, the hostname is ignored.

An Administrator can change the "Hostname" for the DHCP Option 12 via the configuration files, the IP Phone UI, and the Aastra Web UI.

Configuring DHCP Option 12 Hostname on the IP Phone

Use the following procedures to configure DHCP Option 12 Hostname on the IP Phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “DHCP Option Settings” on page A-12.

IP Phone UI

1. Press **Options**, and then select **Administrator Menu**.
2. Select **Network Settings**.
3. Select **Hostname**.
4. By default, the “**Hostname**” field is automatically populated with [<Model><MAC address>] of your phone (for example, 53i00085D164435).

If you want to change the hostname, enter a hostname for your phone in the “**Hostname**” field, then press **DONE**. Valid values are up to 64 alpha-numeric characters. You can use a fully qualified domain name if required.
5. Restart the phone for the change to take affect.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is “**22222**”.
4. Press **Network**.
5. Press  to scroll to the next screen.
6. By default, the “**Hostname**” field is automatically populated with [<Model><MAC address>] of your phone (for example, 53i00085D164435).

If you want to change the hostname, press the button in the “**Hostname**” field, and enter a hostname for your phone in the text box that displays. Valid values are up to 64 alpha-numeric characters. You can use a fully qualified domain name if required.
7. Press  until the Options List screen displays.
8. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “**22222**”.
4. Select **Network > Settings**.
5. Press the down navigation key to the **Hostname** field.
6. By default, the “**Hostname**” field is automatically populated with [<Model><MAC address>] of your phone (for example, 53i00085D164435).

If you want to change the hostname, enter a hostname for your phone in the “**Hostname**” field, then press the **Save** softkey. Valid values are up to 64 alpha-numeric characters. You can use a fully qualified domain name if required.
7. Restart the phone for the change to take affect.

**Aastra Web UI**

1. Click on **Advanced Settings->Network->Basic Network Settings**.

Network Settings	
Basic Network Settings	
DHCP	<input checked="" type="checkbox"/> Enabled
IP Address	192.168.0.11
Subnet Mask	255.255.255.0
Gateway	192.168.0.1
Primary DNS	4.1.1.1
Secondary DNS	4.2.2.2
Hostname	53i00085D164435
LAN Port	Auto Negotiation
PC Port PassThru Enable/Disable	<input checked="" type="checkbox"/> Enabled
PC Port	Auto Negotiation

2. By default, the **“Hostname”** field is automatically populated with [<Model><MAC address>] of your phone (for example, 53i00085D164435).

If you want to change the hostname, enter a hostname for your phone in the **“Hostname”** field. Valid values are up to 64 alpha-numeric characters. You can use a fully qualified domain name if required.

3. Click **Save Settings** to save your changes.

Note:

Changing the **“Hostname”** field requires a reboot of your phone.

4. Click on **Operation->Reset**, and click **Restart**.

Using Option 77 User Class on the IP Phone

DHCP Option 77 User Class is sent in DHCP request packets from the phone to the configuration server. This Option 77 defines specific User Class identifiers to convey information about a phone’s software configuration or about its user’s preferences. For example, you can use the User Class option to configure all phones in the Accounting Department with different user preferences than the phones in the Marketing Department. A DHCP server uses the User Class option to choose the address pool for which it allocates an address from, and/or to select any other configuration option.

Notes:

- If the User Class is not specified (left blank) in the DHCP request packet, the phone does not send the User Class DHCP Option 77.
- Multiple User Classes inside a DHCP Option 77 are not supported.
- DHCP Option 77 may affect the precedence of DHCP Options, dependent on the DHCP Server.

An Administrator can configure the DHCP Option 77 User Class via the configuration files and the IP Phone UI.

Configuring DHCP Option 77 User Class on the IP Phone

Use the following procedures to configure DHCP Option 77 User Class on the IP Phone.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, **“DHCP Option Settings”** on [page A-12](#).

IP Phone UI

1. Press **Options**, and then select **Administrator Menu**.
2. Select **Network Settings**.
3. Select **DHCP Settings**.
4. Select **DHCP User Class**.
5. In the “**DHCP User Class**” field, enter a DHCP User Class to apply to your phones, then press **DONE**. Valid values are up to 64 alpha-numeric characters. For example, “**admin**”.
6. Restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “**22222**”.
4. Select **Network > Settings**.
5. Press the down navigation key to the **DHCP User Class** field.
6. In the “**DHCP User Class**” field, enter a DHCP User Class to apply to your phones, then press the **Save** softkey. Valid values are up to 64 alpha-numeric characters. For example, “**admin**”.
7. Restart the phone for the change to take affect.

Using Options 159 and 160 on the IP Phone

In addition to DHCP options 43 and 66 already supported on the IP Phones, the phones also support DHCP Options 159 and 160. The IP Phones use the following order of precedence when deriving the configuration server parameters: 43, 160, 159, 66.

In addition, an administrator can override this order of precedence by setting a configuration parameter called, **dhcp config option override** (configuration files), **DHCP Download Options** (Aastra Web UI), or **Download Options** (IP Phone UI). Setting this parameter results in the phone only using the chosen DHCP option and ignoring the other options.

For more information about setting DHCP download preference, see “[Configuration Server Download Precedence](#)” on page 4-15.

Note:

Administrators should review the updated IP phone DHCP option precedence order and configuration options to avoid potential impact to existing Aastra IP phone deployments.

Configuring DHCP Download Options on the IP Phones

Use the following procedures to configure DHCP Option Override on the IP Phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[DHCP Option Settings](#)” on page A-12.

IP Phone UI

1. Press **Options**, and then select **Administrator Menu**.
2. Enter you Administrator password and press **Enter**.

IP Phone UI

3. Select **Network Settings**.
4. Select **DHCP Settings**.
5. Select **Download Options**. The following list displays:
 - Any (default) - no override - uses normal precedence order of 43, 160, 159, 66.
 - Option 43
 - Option 66
 - Option 159
 - Option 160
 - Disabled (Ignores all DHCP configuration options (43, 66, 159, 160))
6. Choose an option that you want to use to override the DHCP normal precedence order, and press **Done**.
7. Restart the phone for the selection to take affect.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is **"22222"**.
4. Press **Network**.
5. Press **DHCP Settings**.
6. Press **DHCP Download Options**.
7. Select and press the **"Option 159"** or **"Option 160"** value.
8. Press  until the Options List screen displays.
9. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is **"22222"**.
4. Select **Network > Settings**.
5. Press the down navigation key to the **DHCP Download Options** field.
6. Select one of the following DHCP download options using the left and right navigation keys.
 - Any (default) - no override - uses normal precedence order of 43, 160, 159, 66.
 - Option 43
 - Option 66
 - Option 159
 - Option 160
 - Disabled (Ignores all DHCP configuration options (43, 66, 159, 160))
7. Press the **Save** softkey.
8. Restart the phone for the selection to take affect.

**Aastra Web UI**

1. Click on **Advanced Settings->Network->Advanced Network Settings**.

Advanced Network Settings	
DHCP Download Options	Any <input type="button" value="v"/>
LLDP	<input checked="" type="checkbox"/> Enabled
LLDP packet interval	<input type="text" value="30"/>
NAT IP	<input type="text" value="0.0.0.0"/>
NAT SIP Port	<input type="text" value="51620"/>
NAT RTP Port	<input type="text" value="51720"/>
STUN Server	<input type="text" value="0.0.0.0"/>
STUN Port	<input type="text" value="3478"/>
TURN Server	<input type="text" value="0.0.0.0"/>
TURN Port	<input type="text" value="3479"/>
TURN User ID	<input type="text"/>
TURN Password	<input type="text"/>
Rport (RFC 3581)	<input type="checkbox"/> Enabled

2. In the **"DHCP Download Options"** field, select an option to use to override the normal precedence order. Valid values are:
 - Any (default) - no override - uses normal precedence order of 43, 160, 159, 66.
 - Option 43
 - Option 66
 - Option 159
 - Option 160
 - Disabled (Ignores all DHCP configuration options (43, 66, 159, 160))
3. Click **Save Settings** to save your changes.
4. Click on **Operation->Reset**, and restart the phone for the changes to take affect.

Configuration Server Download Precedence

An Administrator can set the phone's download precedence to ignore DHCP, **(only during the boot when the remote configuration server is contacted)** and use the following precedence instead:

1. Configuration URI,
2. DHCP, and then
3. Direct configuration.

To configure the download precedence, you use the option value (-1) as the value for the **"dhcp config option override"** parameter in the configuration files. Setting this parameter to **"-1"** causes all DHCP configuration options to be ignored.

Configuring a Download Precedence Using the Configuration Files

Use the following procedure to configure the DHCP download precedence using the configuration files.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, **"DHCP Option Settings"** on [page A-12](#).

Configuring a Download Precedence Using the IP Phone UI

Use the following procedure to configure a download precedence using the IP Phone UI.

IP Phone UI

1. Press **Options**, and then select **Administrator Menu**.
2. Enter you Administrator password and press **Enter**.
3. Select **Network Settings**.
4. Select **DHCP Settings**.
5. Select **Download Options**.

Note:

Disabled (Ignores all DHCP configuration options (43, 66, 159, 160))

6. Select the **Disabled** option and press **Enter**.

Note:

The **Disabled** download option performs the same function as the “-1” in the configuration files (ignores DHCP options).

7. Restart the phone for the selection to take affect.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is “22222”.
4. Press **Network**.
5. Press **DHCP Settings**.
6. Press **DHCP Download Options**.
7. Select and press the **Disabled** value.

Note:

Disabled (Ignores all DHCP configuration options (43, 66, 159, 160). This option also performs the same function as the “-1” in the configuration files (ignores DHCP options).

8. Press  until the Options List screen displays.
9. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “22222”.
4. Select **Network > Settings**.
5. Press the down navigation key to the **DHCP Download Options** field.
6. Select the **Disabled** value.

Note:

Disabled (Ignores all DHCP configuration options (43, 66, 159, 160). This option also performs the same function as the “-1” in the configuration files (ignores DHCP options).

7. Press the **Save** softkey.
8. Restart the phone for the selection to take affect.

Configuring a Download Precedence Using the Aastra Web UI

Use the following procedure to configure a download precedence using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Network->Advanced Network Settings**.

Advanced Network Settings	
DHCP Download Options	Any <input type="button" value="v"/>
LLDP	<input checked="" type="checkbox"/> Enabled
LLDP packet interval	<input type="text" value="30"/>
NAT IP	<input type="text" value="0.0.0.0"/>
NAT SIP Port	<input type="text" value="51620"/>
NAT RTP Port	<input type="text" value="51720"/>
STUN Server	<input type="text" value="0.0.0.0"/>
STUN Port	<input type="text" value="3478"/>
TURN Server	<input type="text" value="0.0.0.0"/>
TURN Port	<input type="text" value="3479"/>
TURN User ID	<input type="text"/>
TURN Password	<input type="text"/>
Rport (RFC 3581)	<input type="checkbox"/> Enabled

2. In the "DHCP Download Options" field, select "Disabled" from the list of options.

Note:

In the Aastra Web UI, the "Disabled" download option performs the same function as the "-1" in the configuration files (ignores DHCP options).

3. Click **Save Settings** to save your setting.
4. Select **Operation->Reset**, and click **Restart** to reboot the phone.

Multiple DHCP Servers

The IP Phones can receive messages from multiple DHCP servers.

After the phone receives its first DHCP message, it listens for a specific time period, for more DHCP messages. If the first DHCP offer contains configuration server information (Options 43, 66, 159 or 160), then the phone times out and continues using the first DHCP offer, without listening for more DHCP offers. If the first DHCP message contains no configuration server information, the phone continues to listen for other DHCP messages. If the second DHCP message contains configuration server information and other conditions, the phone chooses the second DHCP message over the initial DHCP message.

Note:

If the **DHCP Download Options** parameter is enabled with a value (Option 43, Option 66, Option 159, or Option 160), the phone checks the override option setting before timing out.

Warning!

Users currently using multiple DHCP servers on a single network could be affected by this feature.

DNS Caching

The IP phones have the ability to cache DNS requests as referenced in RFC1035 and RFC2181. The phone caches DNS lookups according to the TTL field, so that the phone only performs another lookup for an address when the TTL expires.

Configuring Network Settings Manually

If you disable DHCP on your phone, you need to configure the following network settings manually:

- IP Address
- Subnet Mask
- Gateway
- Primary DNS
- Secondary DNS

Note:

If you disable DHCP on the phone, the phone uses the TFTP protocol as the default server protocol. If you want to specify a different protocol to use, see [“Configuration Server Protocol”](#) on page 4-87.

You can configure the network settings using the configuration files, the IP phone UI, or the Aastra Web UI.

Errors Messages Display when Incorrect Network Settings Entered

The IP Phone UI AND the Aastra Web UI immediately notify the Administrator if an incorrect value is being entered for the following network parameters in the IP Phone UI and the Aastra Web UI:

- A 0.0.0.0 entered as values for the **IP Address**, **Subnet Mask** and **Gateway** parameters
- **IP Address** and **Gateway** IP address parameter values entered exactly the same
- **Gateway** IP address and the **IP address** parameter values configured on the same subnet

If you configure the Gateway parameter and the IP Address parameter on the same subnet, the following error message displays:

“Gateway IP address and the IP address parameter values configured are not on the same subnet”.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“Network Settings”](#) on page A-8.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.
Note:
The IP Phones accept numeric passwords only.
4. Select **Network Settings**.
5. Select **IP Address** and enter the IP address of the phone.
6. Select **Subnet Mask** and enter the subnet mask.
7. Select **Gateway** and enter the gateway address.
8. Select **DNS** and enter a Primary and/or Secondary DNS server.
9. Press **Done** to save the changes.
The IP phone is manually configured.

IP Phone UI

For the 6739i:

Note:

To manually configure DHCP parameters, DHCP must be disabled on the phone.

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "22222".
4. Press **Network**.
5. Press **IP Address**, enter the IP address of your phone in the text box and press . The IP Address must be entered in the format 0.0.0.0; for example, 192.168.0.7.
6. Press the Subnet Mask button, enter the subnet mask address and press . For example, 255.255.0.0.
7. Press **Gateway**, enter the IP address of your gateway in the text box and press . The Gateway must be entered in the format 0.0.0.0; for example, 192.168.0.1.
8. If required, press the Primary DNS and/or Secondary DNS buttons, enter the IP address of these servers as applicable and press . The IP addresses must be entered in the format 0.0.0.0. The IP Phone is manually configured.

For the 6867i:

Note:

To manually configure DHCP parameters, DHCP must be disabled on the phone.

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **Network > Settings**.
5. In the **IP Address** field, enter the IP address of your phone. The IP Address must be entered in the format 0.0.0.0; for example, 192.168.0.7.
6. In the **Subnet Mask** field, enter the subnet mask address. For example, 255.255.0.0.
7. In the **Gateway** field, enter the IP address of your gateway. The Gateway must be entered in the format 0.0.0.0; for example, 192.168.0.1.
8. If required, enter the Primary DNS and/or Secondary DNS in the respective fields. The IP addresses must be entered in the format 0.0.0.0.
9. Press the **Save** softkey. The IP Phone is manually configured.

Aastra Web UI

1. Click on **Advanced Settings->Network->Basic Network Settings**.

Network Settings

Basic Network Settings

DHCP	<input checked="" type="checkbox"/> Enabled
IP Address	<input type="text" value="192.168.0.11"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
Gateway	<input type="text" value="192.168.0.1"/>
Primary DNS	<input type="text" value="4.1.1.1"/>
Secondary DNS	<input type="text" value="4.2.2.2"/>
Hostname	<input type="text" value="53i00085D164435"/>
LAN Port	<input type="text" value="Auto Negotiation"/>
PC Port PassThru Enable/Disable	<input checked="" type="checkbox"/> Enabled
PC Port	<input type="text" value="Auto Negotiation"/>

2. Enter an IP address of the phone in the **IP Address** field.
3. Enter a subnet mask in the **Subnet Mask** field.
4. Enter a gateway address in the **Gateway** field.
5. Enter a Primary DNS in the **Primary DNS** field, and/or a secondary DNS in the **Secondary DNS** field.
6. Click **Save Settings** to save your settings.

The IP phone is manually configured.

Configuring LAN and PC Port Negotiation

Ethernet is the computer networking technology for local area networks (LANs). You use the LAN Port to connect to a LAN using a twisted pair 10BASE-T cable to transmit 10BASE-T Ethernet. You use the PC Port to connect to the configuration server (your PC).

There are two Ethernet ports on the rear of the IP phones: LAN Port and PC Port. Using the Aastra Web UI, you can select the type of transmission you want these ports to use to communicate over the LAN. The IP phones support each of the following methods of transmission:

- Auto-negotiation
- Half-duplex (10Mbps, 100 Mbps, or 1000Mbps [if applicable])
- Full-duplex (10Mbps, 100 Mbps, or 1000Mbps [if applicable])

Note:

The PC Port parameters are not applicable to the 6730i IP Phone.

Auto-negotiation

Auto-negotiation is when two connected devices choose common transmission parameters. In the auto-negotiation process, the connected devices share their speed and duplex capabilities and connect at the highest common denominator (HCD). Auto-negotiation can be used by devices that are capable of different transmission rates (such as 10Mbit/sec and 100Mbit/sec [and 1000Mbit/sec for the 6739i, 6735i, 6737i, 6865i, and 6867i]), different duplex modes (half duplex and full duplex) and/or different standards at the same speed. You can set the LAN and PC Ports on the IP phones to auto-negotiate during transmission.

Half-Duplex (10Mbps, 100Mbps, or 1000Mbps)

Half-duplex data transmission means that data can be transmitted in both directions on a signal carrier, but not at the same time. For example, on a LAN using a technology that has half-duplex transmission, one device can send data on the line and then immediately receive data on the line from the same direction in which data was just transmitted. Half-duplex transmission implies a bidirectional line (one that can carry data in both directions). On the IP phones, you can set the half-duplex transmission to transmit in 10Mbps or in 100Mbps. Additionally, for the 6739i, 6735i, 6737i, 6865i, and 6867i IP phones, you can set the half-duplex transmission to transmit in 1000Mbps.

Full-Duplex (10Mbps, 100Mbps or 1000Mbps)

Full-duplex data transmission means that data can be transmitted in both directions on a signal carrier at the same time. For example, on a LAN with a technology that has full-duplex transmission, one device can be sending data on the line while another device is receiving data. Full-duplex transmission implies a bidirectional line (one that can move data in both directions). On the IP phones, you can set the full-duplex transmission to transmit in 10Mbps or in 100Mbps. Additionally, for the 6739i, 6735i, 6737i, 6865i, and 6867i IP phones, you can set the full-duplex transmission to transmit in 1000Mbps.

Configuring the LAN Port and PC Port

You can configure the Ethernet port transmission method to use on the IP phones using the configuration files, the IP Phone UI, or the Aastra Web UI.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, "Network Settings" on page A-8.

**IP Phone UI**

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.

Note:
The IP Phones accept numeric passwords only.
4. Select **Network Settings**.
5. Select **Ethernet**.
6. Select **LAN Port Link**.
7. Select a negotiation method to use on port 0 and press **Done**. Valid values are:
 - AutoNegotiation
 - Full 10Mbps
 - Full 100Mbps
 - Full 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)
 - Half 10Mbps
 - Half 100Mbps
 - Half 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)

Default is **AutoNegotiation**.

8. Select **PC Port Link**.

Note:
PC Port Link parameters are not applicable to the 6730i IP Phone.

IP Phone UI

9. Select a negotiation method to use on port 1 and press **Done**. Valid values are:
 - AutoNegotiation
 - Full 10Mbps
 - Full 100Mbps
 - Full 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)
 - Half 10Mbps
 - Half 100Mbps
 - Half 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)

Default is **AutoNegotiation**.

10. Press **Done** (3 times) to finish configuring the configuration server protocol for the IP phone.

Note:

The session prompts you to restart the IP phone to apply the configuration settings.

11. Select **Restart**.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is **"22222"**.
4. Press **Network**.
5. Press  to scroll to the next screen.

6. Press **Ethernet & VLAN**.

7. Press **LAN Port**.

8. Select a negotiation method to use on port 0. Valid values are:
 - Auto
 - Full 10Mbps
 - Full 100Mbps
 - Full 1000Mbps
 - Half 10Mbps
 - Half 100Mbps
 - Half 1000Mbps

Default is **Auto**.

9. Press .

10. Press **PC Port**.

11. Select a negotiation method to use on port 1. Valid values are:
 - Auto
 - Full 10Mbps
 - Full 100Mbps
 - Full 1000Mbps
 - Half 10Mbps
 - Half 100Mbps
 - Half 1000Mbps

Default is **Auto**.

12. Press  until the Options List screen displays.

13. Press **Restart** to restart the phone for the change to take affect.

IP Phone UI

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “**22222**”.
4. Select **Network > Ethernet Ports**.
5. With **LAN Port** highlighted, press the right navigation key and select a negotiation method to use on port 0. Valid values are:
 - AutoNegotiation
 - Full 10Mbps
 - Full 100Mbps
 - Full 1000Mbps
 - Half 10Mbps
 - Half 100Mbps
 - Half 1000MbpsDefault is **AutoNegotiation**.
6. Press the left navigation key and press down to highlight **PC Port**.
7. Select a negotiation method to use on port 1. Valid values are:
 - AutoNegotiation
 - Full 10Mbps
 - Full 100Mbps
 - Full 1000Mbps
 - Half 10Mbps
 - Half 100Mbps
 - Half 1000MbpsDefault is **AutoNegotiation**.
8. Press the **Save** softkey.
9. Restart the phone for the selection to take affect.

Aastra Web UI

1. Click on **Advanced Settings->Network->Basic Network Settings**.

Network Settings

Basic Network Settings

DHCP	<input checked="" type="checkbox"/> Enabled
IP Address	<input type="text" value="192.168.0.11"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
Gateway	<input type="text" value="192.168.0.1"/>
Primary DNS	<input type="text" value="4.1.1.1"/>
Secondary DNS	<input type="text" value="4.2.2.2"/>
Hostname	<input type="text" value="53i00085D164435"/>
LAN Port	<input type="text" value="Auto Negotiation"/>
PC Port PassThru Enable/Disable	<input checked="" type="checkbox"/> Enabled
PC Port	<input type="text" value="Auto Negotiation"/>

2. In the “**LAN Port**” field, select a negotiation method to use on port 0. Valid values are:
 - Auto Negotiation
 - Full Duplex, 10Mbps
 - Full Duplex, 100Mbps
 - Full Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)
 - Half Duplex, 10Mbps
 - Half Duplex, 100Mbps
 - Half Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)

Default is **Auto Negotiation**.

3. In the “**PC Port**” field, select a negotiation method to use on port 1. Valid values are:
 - Auto Negotiation
 - Full Duplex, 10Mbps
 - Full Duplex, 100Mbps
 - Full Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)
 - Half Duplex, 10Mbps
 - Half Duplex, 100Mbps
 - Half Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)

Default is **Auto Negotiation**.

4. Click **Save Settings** to save your settings.

Advanced Network Settings

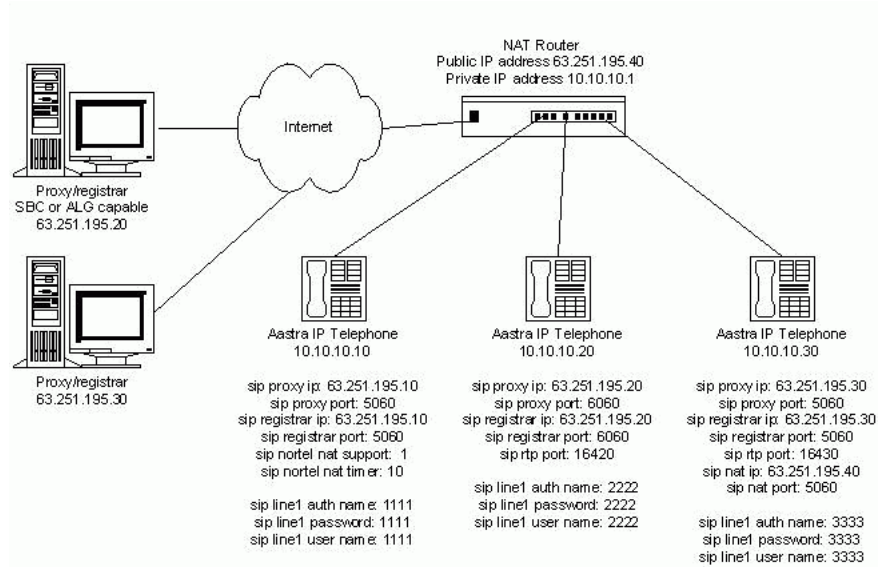

You can set advanced network settings on the IP phone such as, Network Address Translation (NAT), Network Time Protocol (NTP) Time Servers, Virtual LAN (VLAN), and Quality of Service (QoS) using the Aastra Web UI or the configuration files.

Note:

The available advanced network parameters via the IP phone UI are NAT, VLAN, and QoS only.

Network Address Translation (NAT)

The protocols used by all IP phones do not interoperate completely with Network Address Translation (NAT). For the IP Phones, specific configuration parameters allow the phone to operate while connected to a network device that enforces NAT. The following is a sample network using a NAT proxy and relevant IP phone configuration parameters.

SBC or ALG Proxy/Registrar

The phone at IP address 10.10.10.20 is configured to register with the proxy at 63.251.195.20. Because the proxy/registrar has session border control (SBC) or application layer gateway (ALG) functionality, no additional IP phone configuration is required.

Other Proxy/Registrars

The phone at IP address 10.10.10.30 is configured to register with the proxy at 63.251.195.30. Because this proxy/registrar is not a Nortel proxy and has no SBC or ALG functionality, the configuration must additionally include the "sip nat ip" and "sip nat port" settings that contain the public ip address of the NAT router and the port used for call signaling messages. This information is embedded in protocol messages to allow the proxy/registrar to reach the IP phone on the NAT router private network.

NAT Router Configuration

You must configure the NAT router to allow signaling or media packets containing the various UDP port values to flow between the private and public networks that are separated by the NAT router. In the sample network, the NAT router must not filter packets using ports 3000, 5060, 6060, 16420, and 16430.

Configuring NAT Address and Port (optional)

You can also configure a specific NAT address and port on the IP phone using the configuration files, IP Phone UI, or Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Network Address Translation \(NAT\) Settings](#)" on page A-25.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.

Note:
The IP Phones accept numeric passwords only.
4. Select **Network Settings**.
5. Select **Static NAT**.
6. Select **NAT IP**.
7. Enter a public IP address of your NAT device in dotted-decimal format.
8. Press **Done** to save the setting.
9. Select **NAT SIP Port**. Default is **51620**.
10. Enter the public SIP signaling port number of your NAT device.
11. Press **Done** to save the setting.
12. Select **NAT RTP Port**.
13. Enter the RTP Port number of your NAT device. Default is **51720**.
14. Press **Done** (4 times) to finish.

Note:
The session prompts you to restart the IP phone to apply the configuration settings.

15. Select **Restart**.

For the 6739i:

Note:
NAT is disabled by default. Use this procedure to enable NAT if required.

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "22222".
4. Press **Network**.
5. Press  to scroll to the next screen.
6. Press the **NAT Settings** button.
7. Press **Static NAT**, enter a public IP address of your NAT device, in dotted-decimal format, in the text box, and press .
8. Press **NAT SIP Port**, and enter the public SIP signaling port number of your NAT device. Default is **51620**.
9. Press **NAT RTP Port**, and enter the RTP Port number of your NAT device. Default is **51720**.
10. Press  until the Options List screen displays.
11. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

Note:
NAT is disabled by default. Use this procedure to enable NAT if required.

1. Press  on the phone to enter the Options List.

IP Phone UI

2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "**22222**".
4. Select **Network > NAT**.
5. In the **NAT IP** field, enter the public IP address of your NAT device in dotted-decimal format.
6. In the **NAT SIP Port** field, enter the public SIP signaling port number of your NAT device. Default is **51620**.
7. In the **NAT RTP Port** field, enter the RTP Port number of your NAT device. Default is **51720**.
8. Press the **Save** softkey.
9. Restart the phone for the selection to take affect.

Aastra Web UI

1. Click on **Advanced Settings->Network->Advanced Network Settings**.

Advanced Network Settings	
DHCP Download Options	Any
LLDP	<input checked="" type="checkbox"/> Enabled
LLDP packet interval	30
NAT IP	0.0.0.0
NAT SIP Port	51620
NAT RTP Port	51720
STUN Server	0.0.0.0
STUN Port	3478
TURN Server	0.0.0.0
TURN Port	3479
TURN User ID	
TURN Password	
Rport (RFC 3581)	<input type="checkbox"/> Enabled

2. Enter a NAT IP address in the "**NAT IP**" field. The value must be entered in dotted decimal format. For example, 0.0.0.0. The "NAT IP" is the public IP address of your NAT device.
3. Enter a NAT port in the "**NAT SIP Port**" field. Default is **51620**. The "NAT SIP Port" is the public SIP signaling port number of your NAT device.
4. Enter a NAT port in the "**NAT RTP Port**" field. Default is **51720**. The "NAT RTP Port" is the RTP Port number of your NAT device.
5. Click **Save Settings** to save your settings.

SIP and TLS Source Ports for NAT Traversal

A System Administrator can configure the SIP and TLS source ports on the IP Phone. Previously, the IP phone used default values (**5060** for UDP/TCP and **5061** for TLS). The two new parameters for configuring the SIP and TLS source ports are:

- **sip local port**
- **sip local tls port**

You can configure the SIP and TLS source ports using the configuration files or the Aastra Web UI. **After configuring these parameters, you must reboot the phone.**

If NAT is disabled, the port number also shows in the VIA and Contact SIP headers.

If you enable NAT, the phone uses the NAT port number (and NAT IP address) in the Via and Contact SIP headers of SIP messages, but still use the configured source port.

Note:

- By default, the IP phones use symmetric UDP signaling for outgoing UDP SIP messages. When symmetric UDP is enabled, the IP phone generates and listens for UDP messages using port 5060. If symmetric UDP signaling is disabled, the phone sends from random ports but it listens on the configured SIP local port. Refer to [Symmetric UDP Signaling on page 6-25](#) for more information.
- The IP phones also use symmetric TLS signaling for outgoing TLS SIP messages by default. When symmetric TLS is enabled, the IP phone uses port 5061 as the persistent TLS connection source port. When symmetric TLS signaling is disabled, the IP phone chooses a random persistent TLS connection source port for TLS messages from the TCP range (i.e. 49152...65535) after each reboot regardless of whether the parameter "sip outbound support" is enabled or disabled. Refer to [Symmetric TLS Signaling on page 6-25](#) for more information.

Configuring SIP and TLS Source Ports Using the Configuration Files

You use the following parameters to configure SIP and TLS ports for NAT traversal:

- **sip local port**
- **sip local tls port**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the sections:

- "Local SIP UDP/TCP Port Setting" on [page A-26](#).
 - "Local SIP TLS Port" on [page A-27](#).
-

Configuring SIP and TLS Source Ports Using the Aastra Web UI

Use the following procedure to configure SIP and TLS source ports using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	86400
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	3600
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	0
T1 Timer	0
T2 Timer	0
Transaction Timer	4000
Transport Protocol	UDP
Local SIP UDP/TCP Port	5060
Local SIP TLS Port	5061
Registration Failed Retry Timer	1800
Registration Timeout Retry Timer	120
Registration Renewal Timer	15
BLF Subscription Period	3600
ACD Subscription Period	3600
BLA Subscription Period	300
Blacklist Duration	300
Park Pickup Config	
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. The “**Local SIP UDP/TCP Port**” field has a default value of **5060**. Change this value if required to a value greater than 1024 and less than 65535.

Note:

It is recommended that you avoid the conflict RTP port range in case of a UDP transport.

3. The “**Local SIP TLS Port**” field has a default value of **5061**. Change this value if required to a value greater than 1024 and less than 65535.

Note:

It is recommended that you avoid the conflict with any TCP ports being used. For example: WebUI HTTP server on 80/tcp and HTTPS on 443/tcp.

4. Click **Save Settings** to save your changes.

STUN and TURN Protocols

The IP phones support the following audio-path NAT Traversal features:

- **Simple Traversal of User Datagram Protocol (UDP) through Network Address Translation (NAT)** or also known as **STUN** (RFC 3489)
and
- **Traversal Using Relay NAT** or also known as **TURN**

STUN is a protocol that allows the IP phones on a network to discover the presence and types of NATs and firewalls between them and the public Internet. It also provides the ability for the phones to determine the public IP addresses allocated to them by the NAT. STUN works with many existing NATs, and does not require any special behavior from them. As a result, it allows the phones to work through existing NAT infrastructures.

TURN is a protocol that governs the reception of data over a connection by a single communications device operating behind a NAT or firewall. A TURN server relays packets from an external IP address towards the IP phone only if that phone has previously sent a packet through the same TURN server to that particular external IP address.

SIP NAT IP configurations takes precedence over the STUN/TURN configurations. Typically, the STUN/TURN configuration is only used for media (RTP traffic) - not for signaling. (For signaling, you need to enable "Rport" if the NAT device does not recognize SIP. For more information about "Rport", see the section, "**RPORT**" on [page 4-52](#) of this release note.

The STUN/TURN configuration applies globally on the phone. If you configure both STUN and TURN on the phone, it discovers what type of NAT device is between the phone and the public network. If the NAT device is full cone, restricted cone, or port restricted cone, the phone uses STUN. If the NAT device is symmetric, the phone uses TURN.

If you configure STUN only, the phone uses STUN without the NAT discovery process.

Note:

STUN does not work if the NAT device is symmetric.

If you configure NAT only, the phone uses NAT and does not perform the NAT discovery process during startup. TURN is compatible with all types of NAT devices.

Limitations to Using STUN and TURN

- The Firewall type discovery process on the phone is limited to 20 seconds. If the discovery process fails, the STUN server may not be configured correctly.
- When making a new phone call, the phone limits obtaining the port from the STUN/TURN server to 5 seconds. If the call does not go through in 5 seconds, the phone makes the call using the Session Description Protocol (SDP) with a local IP:port.

An Administrator can configure a STUN and/or TURN server on the IP Phones using the configuration files or the Aastra Web UI.

Configuring STUN and TURN Servers Using the Configuration Files

Note:

The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.

Use the following parameters to configure STUN and TURN servers in your network.

- **sip stun ip**
- **sip stun port**
- **sip turn ip**
- **sip turn port**
- **sip turn user**
- **sip turn pass**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the sections:

- "[SIP STUN Parameters](#)" on [page A-27](#)
- "[SIP TURN Parameters](#)" on [page A-28](#).

Configuring STUN and TURN Servers Using the Aastra Web UI

Note:

The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.

Use the following procedure to configure STUN and TURN servers in your network using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Network->Advanced Network Settings**.

Advanced Network Settings	
DHCP Download Options	Any
LLDP	<input checked="" type="checkbox"/> Enabled
LLDP packet interval	30
NAT IP	0.0.0.0
NAT SIP Port	51620
NAT RTP Port	51720
STUN Server	0.0.0.0
STUN Port	3478
TURN Server	0.0.0.0
TURN Port	3479
TURN User ID	
TURN Password	
Rport (RFC 3581)	<input type="checkbox"/> Enabled

Configure STUN on the IP Phone

2. In the “**STUN Server**” field, enter the IP address and/or qualified domain name of the STUN server in your network. You can enter up to 2 values separated by a comma. The first value is the primary and the second value is the backup. For example:

10.50.103.12, stunbackup.aastra.com.

The STUN configuration is only used for media (RTP traffic) that goes through the server - not for signaling. (For signaling, you need to enable Rport if the NAT device does not recognized SIP).

The STUN configuration applies globally to each phone.

If you configure both STUN and TURN on the phone, it discovers what type of NAT device is between the phone and the public network. If the NAT device is full cone, restricted cone, or port restricted cone, the phone uses STUN. If the NAT device is symmetric, the phone uses TURN. If you configure STUN only, the phone uses STUN without the NAT discovery process.

Notes:

- The NAT IP configuration parameter takes precedence over the STUN parameters.
- STUN does not work if the NAT device is symmetric.

3. In the “**STUN Port**” field, enter the port number of the STUN server. You can enter up to 2 values separated by a comma. The first value is the primary and the second value is the backup. For example:

3478,3479

Default is **3478**. Range of values are 0 to 65535.

4. Click **Save Settings** to save your changes.

Configure TURN on the IP Phone

**Aastra Web UI**

5. In the **“TURN Server”** field, enter the IP address and/or qualified domain name of the TURN server in your network. You can enter up to 2 values separated by a comma. The first value is the primary and the second value is the backup. For example:

10.50.103.12, turnbackup.aastra.com.

The TURN configuration is only used for media (RTP traffic) that goes through the server - not for signaling. (For signaling, you need to enable Rport if the NAT device does not recognize SIP).

The TURN configuration applies globally to each phone.

If you configure both STUN and TURN on the phone, it discovers what type of NAT device is between the phone and the public network. If the NAT device is full cone, restricted cone, or port restricted cone, the phone uses STUN. If the NAT device is symmetric, the phone uses TURN. If you configure TURN only, the phone uses TURN with the NAT discovery process. TURN is compatible with all types of NAT devices but can be costly since all traffic goes through a media relay (which can be slow, can exchange more messages, and requires the TURN server to allocate bandwidth for calls).

Note:

The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.

6. In the **“TURN Port”** field, enter the port number of the TURN server. You can enter up to 2 values separated by a comma. The first value is the primary and the second value is the backup. For example:

3479,3480

Default is **3479**. Range of values are 0 to 65535.

7. (Optional) In the **“TURN User ID”** field, enter the username that a user must enter when accessing an account on the TURN server. For example, **0412919146**. Valid values are up to 63 alphanumeric characters.

8. (Optional) In the **“TURN Password”** field, enter the password that a user must enter when accessing an account on the TURN server. For example, **42447208233b8b8b8a234**. Valid values are up to 63 alphanumeric characters.

9. Click **Save Settings** to save your changes.

Interactive Connectivity Establishment (ICE) Support

The phones now support the Interactive Connectivity Establishment (ICE) Protocol. ICE makes use of the Session Traversal Utilities for NAT (STUN) protocol and its extension, Traversal Using Relay NAT (TURN).

In an ICE environment, two agent endpoints (or two phones communicating at different locations) are able to communicate via the SIP Protocol by exchanging Session Description Protocol (SDP) messages. At the beginning of the ICE process, the agents are ignorant of their own topologies. In particular, they might or might not be behind a NAT (or multiple tiers of NATs).

ICE allows the agents to discover enough information about their topologies to potentially find one or more paths by which they can communicate.

The ICE Protocol is automatically enabled if both STUN and TURN servers are configured in the network. The following occurs when ICE is used on the phone:

- The TURN address/port is always used as the preferred media address in initial INVITES.
- Media is sent through the TURN server prior to the completion of the ICE connectivity check.
- A Re-INVITE is used to adjust media (if required) after the ICE connectivity check is complete.
- When ICE is enabled, call hold is performed via the send only attribute instead of changing the media address to 0.0.0.0.
- The ICE Protocol supports the RTCP SDP attribute (RFC 3605)

STUN and TURN can be enabled using the Aastra Web UI or the configuration files. This automatically enables ICE.

Reference

To configure STUN and TURN (which automatically enables ICE), see [“Configuring STUN and TURN Servers Using the Configuration Files”](#) on page 4-30 and [“Configuring STUN and TURN Servers Using the Aastra Web UI”](#) on page 4-31.

HTTPS Client/Server Configuration

HTTPS is a Web protocol that encrypts and decrypts user page requests as well as the pages that are returned by the Web server. HTTPS uses Secure Socket Layer (SSL) or Transport Layer Security (TLS) as a sublayer under its regular HTTP application layering. SSL is a commonly-used protocol for managing the security of a message transmission on the Internet. It uses a 40-bit key size for the RC4 stream encryption algorithm, which is considered an adequate degree of encryption for commercial exchange. TLS is a protocol that ensures privacy between communicating applications and their users on the Internet. When a server and client communicate, TLS ensures that no third party may eavesdrop or tamper with any message. TLS is the successor to SSL.

Note:

HTTPS uses port 443 instead of HTTP port 80 in its interactions with the TCP/IP lower layer.

When an HTTPS client opens and closes its TCP socket, the SSL software respectively handshakes upon opening and disconnects upon closing from the HTTPS server. The main HTTPS client functions are:

- Downloading of configuration files and firmware images.
- Downloading of script files based on an “HTTPS://” URL supplied by a softkey definition.

The HTTPS server provides HTTP functionality over secure connections. It coexists with the HTTP server but has its own set of tasks. The main HTTPS server functions are:

- Delivery of web page content to a browser client over a secure connection.
- Execution of HTTP GET and POST requests received over a secure connection.

Using the configuration files, the IP phone UI, or the Aastra Web UI, you can configure the following regarding HTTPS:

- Specify HTTPS security client method to use (TSLv1 or SSLv3)
- Enable or disable HTTP to HTTPS server redirect function
- HTTPS server blocking of XML HTTP POSTS to the phone

Configuring HTTPS Client and Server Settings

Use the following procedures to configure the HTTPS client and server for the IP phones.

Note:

To enable or disable the IP phones to use the HTTPS protocol as the configuration server, see the section, [“Configuring the Configuration Server Protocol”](#) on page 4-87.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“HTTPS Client and Server Settings”](#) on page A-30.

IP Phone UI

1. Press  on the phone to enter the Options List.

2. Select **Administrator Menu**.

3. Enter your Administrator password.

Note:

The IP Phones accept numeric passwords only.

4. Select **Configuration Server**.

5. Select **HTTPS Settings**.

Configure HTTPS Client

6. Select **HTTPS Client**.

7. Select **Client Method**.

8. Press **Change** to select a client method to use for HTTPS. Valid values are:

- SSL 3.0 (default)
- TLS 1.0

9. Press **Done** to save the changes.

Configure HTTPS Server

10. Select **HTTPS Server**.

11. Select **HTTP->HTTPS**.

12. Press **Change** to select **“Yes”** or **“No”**. Default is **“No”**. Enabling this feature redirects the HTTP protocol to HTTPS.

13. Press **Done** to save the changes.

14. Select **XML HTTP POSTs**.

15. Press **Change** to select **“Yes”** or **“No”**. Default is **“No”**. Enabling this feature blocks XML HTTP POSTs from the IP Phone.

16. Press **Done** (4 times) to finish.

Note:

The session prompts you to restart the IP phone to apply the configuration settings.

17. Select **Restart**.

For 6739i:**IP Phone UI**

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is “**22222**”.
4. Press **Cfg. Svr.**
5. Press **HTTPS**.

Configure HTTPS Client

6. Press **HTTPS Client Method**.
7. Press a client method value to use for HTTPS. Valid values are:
 - SSL 3.0 (default)
 - TLS 1.0
8. Press **Done** to save the changes.

Configure HTTPS Server

9. Press **HTTPS Server**.
10. Enter the IP address of the HTTPS server in the text box. Enabling this feature redirects the HTTP protocol to HTTPS.
11. Press  until the Options List screen displays.
12. Press **Restart** to restart the phone for the change to take affect.

For 6867i:**IP Phone UI**

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “**22222**”.
4. Select **Configuration Server**.
5. In the **Download Protocol** field, select **HTTPS**.

Configure HTTPS Client

6. In the **HTTPS Client Method** field, press a client method value to use for HTTPS. Valid values are:
 - SSL 3.0 (default)
 - TLS 1.0

Configure HTTPS Server

7. In the **HTTPS Server** field, enter the IP address of the HTTPS server in the text box. Enabling this feature redirects the HTTP protocol to HTTPS.
8. Press the **Save** softkey.
9. Restart the phone for the selection to take affect.

Aastra Web UI

1. Click on **Advanced Settings->Network->HTTPS Settings**.

2. Select an HTTPS client method to use from the **HTTPS Client Method** field. Valid values are:
 - SSL 3.0 (default)
 - TLS 1.0
3. Enable HTTP to HTTPS redirect by checking the **HTTPS Server - Redirect HTTP to HTTPS** field check box. (Disable this field by unchecking the check box). Default is disabled.
4. Enable the blocking of XML HTTP POSTs by the HTTPS server by checking the **HTTPS Server - Block XML HTTP POSTs** field check box. (Disable this field by unchecking the check box). Default is disabled.
5. Click **Save Settings** to save your settings.

HTTPS Server Certificate Validation

The HTTPS client on the IP Phones support validation of HTTPS certificates. This feature supports the following:

- Verisign, GeoTrust, Thawte, Comodo, Entrust, and CyberTrust signed certificates
- User-provided certificates
- Checking of hostnames
- SSL Wildcard certificate (i.e. SSL certificate specifying the Common Name as a wildcard [e.g. CN=*.company.com]) support.
- Checking of certificate expiration
- Ability to disable any or all of the validation steps
- Phone displays a message when a certificate is rejected (except on check-sync operations)

All validation options are enabled by default.

Note:

The IP Phones do not support the transmission of HTTPS client certificates for validation by HTTPS servers. If the IP Phone attempts to download files from an HTTPS server that requires a client certificate during a file download transaction, a “No Certificate” error will occur and be logged on the IP Phone (viewable under the Options->Phone Status ->Error Messages menu in the IP Phone UI or on the Troubleshooting page of the respective IP Phone’s Web UI).

Certificate Management

Aastra Provided Certificates

The phones come with root certificates from Verisign, GeoTrust, Thawte, Comodo, Entrust, and CyberTrust pre-loaded.

User Provided Certificates

The administrator has the option to upload their own certificates onto the phone. The phone downloads these certificates in a file of .PEM format during boot time after configuration downloads. The user-provided certificates are saved on the phone between firmware upgrades but are deleted during a factory default. The download of the user-provided certificates are based on a filename specified in the configuration parameter, **https user certificates (Trusted Certificates Filename)** in the Aastra Web UI; user-provided certificates are not configurable via the IP Phone UI).

Note:

Certificates that are signed by providers other than Verisign, GeoTrust or Thawte do not verify on the phone by default. The user can overcome this by adding the root certificate of their certificate provider to the use-provided certificate .PEM file.

Certificate Validation

Certificate validation is enabled by default. Validation occurs by checking that the certificates are well formed and signed by one of the certificates in the trusted certificate set. It then checks the expiration date on the certificate, and finally, compares the name in the certificate with the address for which it was connected.

If any of these validation steps fail, the connection is rejected. Certificate validation is controlled by three parameters which you can configure via the configuration files, the IP Phone UI, or the Aastra Web UI:

- **https validate certificates** - Enables/disables validation.
- **https validate hostname** - Enables/disables the checking of the certificate commonName against the server name.
- **https validate expires** - Enables/disables the checking of the expiration date on the certificate.

User Interface**Certificate Rejection**

When the phone rejects a certificate, it displays, "**Bad Certificate**" on the LCD.

For Verisign Certificate Rejection

The phones support 2048-bit Verisign certificates. In case of a certificate error, detailed descriptions can be found from the error message list in the phone status menu.

The following error descriptions are now available:

- No Certificate
- Bad Certificate
- Unsupported Certificate
- Certificate Revoked
- Certificate Expired
- Certificate Unknown

Configuring HTTPS Server Certificate Validation

An Administrator can configure HTTPS Server Certificate Validation using the configuration files, the IP Phone UI, or the Astra Web UI. Use the following procedures to configure the HTTPS server certificate validation on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "HTTPS Server Certificate Validation Settings" on page A-31.

IP Phone UI

1. Press **Options**, and then select **Administrator Menu**.
2. Select **Configuration Server**.
3. Select **HTTPS Settings->Cert. Validation**.

The following list displays:

- Enable
- Check Expires
- Check Hostnames

Enable/Disable HTTPS Server Certificate Validation

4. Select **Enable**.
5. Press **Change** to toggle the "Enable" field to "Yes" or "No".

Note:

If you are using HTTPS as a configuration method, and use a self signed certificate, you must set this field to "No" before upgrading to Release 2.3 of the IP Phones.

6. Press **DONE** to save the change and return to the Certificates screen.

Note:

This change is immediately applied after pressing **DONE**.

Enable/Disable HTTPS Validate Certificate Expiration

7. Select **Check Expires**.
8. Press **Change** to toggle the "Check Expires" field to "Yes" or "No".

Notes:

- This change is immediately applied after pressing **DONE**.
- If the "Check Expires" parameter is set to **Yes**, the clock on the phone must be set for the phone to accept the certificates.

**IP Phone UI**

9. Press **DONE** to save the change and return to the Certificates screen.

Note:

This change is immediately applied after pressing **DONE**.

Enable/Disable HTTPS Validate Hostname

10. Select **Check Hostnames**.
11. Press **Change** to toggle the “**Check Hostnames**” field to “**Yes**” or “**No**”.
12. Press **DONE** to save the change and return to the Certificates screen.

Note:

This change is immediately applied after pressing **DONE**.

13. Press  to exit the Options Menu and return to the idle screen.

For 6739i:**IP Phone UI**

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is “**22222**”.
4. Press **Cfg. Svr.**
5. Press **HTTPS**.

Enable/Disable HTTPS Server Certificate Validation

6. Press **Cert. Validation**, and select **Enable**.
7. Press  to scroll to the next screen.

Enable/Disable HTTPS Validate Certificate Expiration

8. Press **Check Expires**, and select **Enable**.

Enable/Disable HTTPS Validate Hostname

9. Press **Check Hostnames**, and select **Enable**.
10. Press  until the Options List screen displays.
11. Press **Restart** to restart the phone for the change to take affect.

For 6867i:**IP Phone UI**

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “**22222**”.
4. Select **Configuration Server**.
5. In the **Download Protocol** field, select **HTTPS**.

Enable/Disable HTTPS Server Certificate Validation

- In the **Cert. Validation** checkbox, press the button to enable the feature.

Enable/Disable HTTPS Validate Certificate Expiration

- In the **Check Expires** checkbox, press the button to enable the feature.

Enable/Disable HTTPS Validate Hostname

- In the **Check Hostnames** checkbox, press the button to enable the feature.

- Press the **Save** softkey.

- Restart the phone for the selection to take affect.

Aastra Web UI

- Click on **Advanced Settings->Network->HTTPS Settings.**

HTTPS Validation Certificate Parameters

HTTPS Settings	
HTTPS Server - Redirect HTTP to HTTPS	<input type="checkbox"/> Enabled
HTTPS Server - Block XML HTTP POSTs	<input type="checkbox"/> Enabled
HTTPS Client Method	SSL 3.0
Validate Certificates	<input checked="" type="checkbox"/> Enabled
Check Certificate Expiration	<input checked="" type="checkbox"/> Enabled
Check Certificate Hostnames	<input checked="" type="checkbox"/> Enabled
Trusted Certificates Filename	<input type="text"/>

- The **“Validate Certificates”** field is enabled by default. To disable validation of certificates, click the check mark in the box to clear the check mark.

When this parameter is enabled, the HTTPS client performs validation on SSL certificates before accepting them.

Notes:

- This parameter is immediately applied after clicking the **SAVE SETTINGS** button.
- If you are using HTTPS as a configuration method, and use a self signed certificate, you must disable (uncheck) this field before upgrading to Release 2.3 of the IP Phones.**

- The **“Check Certificate Expiration”** field is enabled by default. To disable validation of certificate expiration, click the check mark in the box to clear the check mark.

When this parameter is enabled, the HTTPS client verifies whether or not a certificate has expired prior to accepting the certificate.

Notes:

- This parameter is immediately applied after clicking the **SAVE SETTINGS** button.
- If the **“Check Certificates Expiration”** parameter is set to **Yes**, the clock on the phone must be set for the phone to accept the certificates.

- The **“Check Certificate Hostnames”** field is enabled by default. To disable validation of hostnames, click the check mark in the box to clear the check mark.

Note:

This parameter is immediately applied after clicking the **SAVE SETTINGS** button.

Aastra Web UI

5. If you require the download of User-provided certificates in a .PEM formatted file, enter the file name in the format <filename.pem> in the “**Trusted Certificates Filename**” field. For example:

trustedCerts.pem

This parameter specifies a file name for a .PEM file located on the configuration server. This file contains the User-provided certificates in PEM format. These certificates are used to validate peer certificates.

Notes:

- You must disable the “**Validate Certificates**” field in order for the phone to accept the User-provided certificates.
- This parameter requires you restart the phone in order for it to take affect.

6. Click **Save Settings** to save your changes.
7. If you entered a filename in the “**Trusted Certificates Filename**” field, click on **Operation->Reset**, and restart the phone for the changes to take affect.

Virtual LAN (optional)

Virtual Local Area Network (VLAN) is a feature on the IP phone that allows for multiple logical Ethernet interfaces to send outgoing RTP packets over a single physical Ethernet as described in IEEE Std 802.3. On the IP phone, you configure a VLAN ID that associates with the physical Ethernet port.

By configuring specific VLAN parameters, the IP phones have the capability of adding and removing tags, and processing the ID and priority information contained within the tag.

Note:

All latest VLAN functionality is backwards compatible with IP Phone Releases 1.3 and 1.3.1.

VLAN on the IP phones is disabled by default. When you enable VLAN, the IP phone provides defaults for all VLAN parameters. If you choose to change these parameters, you can configure them using the configuration files, the IP Phone UI, or the Aastra Web UI.

The following sections describe the VLAN features you can configure on the IP phones.

Type of Service (ToS), Quality of Service (QoS), and DiffServ QoS

ToS is an octet as a field in the standard IP header. It is used to classify the traffic of the different QoSs.

QoS provides service differentiation between IP packets in the network. This service differentiation is noticeable during periods of network congestion (for example, in case of contention for resources) and results in different levels of network performance.

Port 0 is the Ethernet LAN Port connected to the network. Port 1 is the Ethernet PC Port used for passthrough to a PC.

Differentiated Service (DiffServ) QoS is class-based where some classes of traffic receive preferential handling over other traffic classes.

The Differentiated Services Code Point (DSCP) value is stored in the first six bits of the ToS field. Each DSCP specifies a particular per-hop behavior that is applied to a packet.

The following parameters allow an administrator to configure ToS, QoS, and DiffServ QoS for VLAN:

Parameters in Configuration Files	Parameters in Aastra Web UI
Global	
tagging enabled	VLAN Enable
priority non-ip	Priority, Non-IP Packet
vlan hpq	HPQ Enable

Parameters in Configuration Files	Parameters in Aastra Web UI
LAN Port	
vlan id	VLAN ID
tos priority map	SIP Priority
tos priority map	RTP Priority
tos priority map	RTCP Priority
PC Port	
vlan id port 1	VLAN ID
QoS eth port 1 priority	Priority

Notes:

- In order for the software to successfully maintain connectivity with a network using VLAN functionality, the IP phone reboots if you modify the "**tagging enabled**" (**VLAN Enable** in the Web UI), "**vlan id**", or "**vlan id port 1**" parameters.
- Setting the LAN Port VLAN ID (**vlan id**) to 4095 and PC Port VLAN ID (**vlan id port 1**) to any ID from 1 to 4094 will allow frames from the PC Port (containing a VLAN ID) to be untagged before being forwarded to the LAN Port and frames from the LAN Port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC Port. For configuring this feature via the Phone UI and the Aastra Web UI, see "[Configuring VLAN \(optional\)](#)" on [page 4-45](#). For configuring this feature using the configuration files, see Appendix A, the section, "[Virtual Local Area Network \(VLAN\) Settings](#)" on [page A-34](#).
- Alternatively setting the LAN Port VLAN ID (**vlan id**) to any ID from 1 to 4094 and PC Port VLAN ID (**vlan id port 1**) to 4095 will allow frames from the LAN Port (containing a VLAN ID) to be untagged before being forwarded to the PC Port and frames from the PC Port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN Port. For configuring this feature via the Phone UI and the Aastra Web UI, see "[Configuring VLAN \(optional\)](#)" on [page 4-45](#). For configuring this feature using the configuration files, see Appendix A, the section, "[Virtual Local Area Network \(VLAN\) Settings](#)" on [page A-34](#).

DSCP Range/VLAN Priority Mapping

DSCP bits in the ToS field of the IP header are set for RTP, RTCP, and SIP packets using either the default values or the values configured via the "**tos sip**", "**tos rtp**", and "**tos rtcp**" parameters.

When the VLAN global configuration parameter, "**tagging enabled**" is set to **1**, VLAN priority for IP packets is mapped to the DSCP value instead of a single priority for all packets. An administrator can also configure VLAN priority for non-IP packets using the "**priority non-ip**" parameter.

Since the default DSCP settings for SIP, RTP, and RTCP are 26, 46, and 46 respectively, this results in corresponding default VLAN priorities of 3 for SIP, 5 for RTP, and 5 for RTCP (based on the settings in the table "[DSCP Range/VLAN Priority Mapping](#)" on [page 4-42](#)).

You can change the default parameters by modifying just the DSCP values, just the VLAN priority values, or by modifying all values.

The following table shows the DSCP range/VLAN priority mapping:

DSCP Range	VLAN Priority
0-7	0
8-15	1
16-23	2
24-31	3
32-39	4
40-47	5
48-55	6
56-63	7

The following table identifies the default DSCP values for the protocols:

Protocol Name	Default DSCP Values in the ToS Field
sip	26
rtp	46
rtcp	46

Configuring Type of Service (ToS)/DSCP (optional)

Use the following procedures to configure ToS/DSCP on the IP phone.

Note:

ToS/DSCP is enabled by default. The SIP, RTP, and RTCP parameters show defaults of 26, 46, and 46, respectively. Use the following procedures to change these settings if required.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Type of Service (ToS)/DSCP Settings” on page A-39.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.

Note:

The IP Phones accept numeric passwords only.

4. Select **Network Settings**.
5. Select **Type of Service DSCP**.
6. Select **Type of Service SIP**.
or
Select **Type of Service RTP**.
or
Select **Type of Service RTCP**.

IP Phone UI

7. Enter a value for “**Type of Service SIP**”. Default is **26**.
or
Enter a value for “**Type of Service RTP**”. Default is **46**.
or
Enter a value for “**Type of Service RTCP**”. Default is **46**.

Valid values are **0** to **63**.

Note:

If you change the ToS/DSCP setting for a Protocol, and VLAN is enabled, you will need to map the applicable priority to the Protocol setting as shown in the first table in “[DSCP Range/VLAN Priority Mapping](#)” on page 4-42 For more information, see the section “[Configuring VLAN \(optional\)](#)” on page 4-45.

8. Press **Done** (3 times) to save the changes.

Note:

The session prompts you to restart the IP phone to apply the configuration settings

9. Select **Restart**.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is “**22222**”.
4. Press **Network**.
5. Press  to scroll to the next screen.
6. Press **Type of Service DSCP**.
7. Press **Type of Service SIP**, and then enter a value for ToS. Default is **26**.
8. Press **Type of Service RTP**, and then enter a value for ToS. Default is **46**.
9. Press **Type of Service RTCP**, and then enter a value for ToS. Default is **46**.
10. Press  until the Options List screen displays.
11. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is “**22222**”.
4. Select **Network > DSCP**.
5. Enter a value for “**Type of Service SIP**”. Default is **26**.
or
Enter a value for “**Type of Service RTP**”. Default is **46**.
or
Enter a value for “**Type of Service RTCP**”. Default is **46**.

Valid values are **0** to **63**.

Note:

If you change the ToS/DSCP setting for a Protocol, and VLAN is enabled, you will need to map the applicable priority to the Protocol setting as shown in the first table in “[DSCP Range/VLAN Priority Mapping](#)” on page 4-42 For more information, see the section “[Configuring VLAN \(optional\)](#)” on page 4-45.

IP Phone UI

6. Press the **Save** softkey.
7. Restart the phone for the selection to take affect.

Aastra Web UI

1. Click on **Advanced Settings->Network->Type of Service DSCP**.

Type of Service DSCP	
SIP	<input type="text" value="26"/>
RTP	<input type="text" value="46"/>
RTCP	<input type="text" value="46"/>

2. Select a Protocol field:
 - "SIP"
 or
 - "RTP"
 or
 - "RTCP"
3. Enter a value from **0** to **63**. Default values are as follows:
 - SIP = 26
 - RTP = 46
 - RTCP = 46

Note:

If you change the ToS/DSCP setting for a Protocol, and VLAN is enabled, you will need to map the applicable priority to the Protocol setting as shown in the first table in "DSCP Range/VLAN Priority Mapping" on page 4-42. For more information, see the section "Configuring VLAN (optional)" on page 4-45.

4. Click **Save Settings** to save your settings.

Configuring VLAN (optional)

Use the following procedures to configure VLAN on the IP phone.

Notes:

- VLAN is disabled by default. When you enable VLAN, the IP phones use the default settings for each VLAN parameter. You can change the default settings if required using the following procedure.
- PC Port parameters are not applicable to the 6730i IP Phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Virtual Local Area Network (VLAN) Settings" on page A-34.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Admin Menu**.

IP Phone UI

- Enter your Administrator password.

Note:

The IP Phones accept numeric passwords only.

- Select **Network Settings**.

- Select **Ethernet and VLAN**.

To globally enable/disable VLAN and set priority for non-IP packets:

- Select **VLAN Settings**.

- Select **VLAN**.

- Select **Enable**.

- Press **Done** or **Set** to save the changes.

- Select **LAN Port VLAN**.

- Select **Other Priority** and enter a non-IP priority value from **0** to **7** for non-IP packets. Default for this field is **5**.

- Press **Done** (2 times) to return to the VLAN Settings menu.

To set VLAN ID and priority for LAN Port (Port 0):

- Select **LAN Port VLAN**.

- Select **LAN Port VLAN ID** and enter a value from **1** to **4095** to specify the VLAN ID for the LAN Port. Default is **1**.

Note:

Setting the LAN Port VLAN ID to 4095 and PC Port VLAN ID to any ID from 1 to 4094 will allow frames from the PC port (containing a VLAN ID) to be untagged before being forwarded to the LAN port and frames from the LAN port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC port.

Example:

You enable tagging on the phone port as normal but set the LAN Port VLAN ID to 4095 and the PC Port VLAN ID to any ID from 1 to 4094. The following example sets the PC port to be on VLAN 3 but the LAN port is configured as untagged.

```
VLAN Settings->VLAN: Enable
VLAN Settings->LAN Port VLAN->LAN Port VLAN ID: 4095
VLAN Settings->PC Port VLAN->PC Port VLAN ID: 3
```

- Press **Enter** or **Set** to save the change.

- Select **VLAN Priority**.

- Select one of the following VLAN Protocols:

- **SIP Priority**
- **RTP Priority**
- **RTCP Priority**

- Enter a VLAN priority value from **0** to **7** for the associated Protocol. Default values for each Protocol are:
SIP Priority = 3
RTP Priority = 5
RTCP Priority = 5

- Press **Done** (2 times) to return to the VLAN Settings menu.

To set VLAN ID and priority for PC Port (Port 1):

- Select **PC Port VLAN**.

Note:

PC Port parameters are not applicable to the 6730i IP Phone.

IP Phone UI

21. Select **PC Port VLAN ID** and enter a value from **1** to **4095** to specify the VLAN ID for the PC Port. Default is **4095**.

Note:

Setting the PC Port VLAN ID to 4095 and LAN Port VLAN ID to any ID from 1 to 4094 will allow frames from the LAN port (containing a VLAN ID) to be untagged before being forwarded to the PC port and frames from the PC port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN port.

Example:

You enable tagging on the phone port as normal but set the PC Port VLAN ID to 4095 and the LAN Port VLAN ID to any ID from 1 to 4094. The following example sets the LAN port to be on VLAN 3 but the PC port is configured as untagged.

```
VLAN Settings->VLAN: Enable
VLAN Settings->LAN Port VLAN->LAN Port VLAN ID: 3
VLAN Settings->PC Port VLAN->PC Port VLAN ID: 4095
```

22. Press **Enter** or **Set** to save the change.
23. Select **PC Port Priority**.
24. Select a PC Port VLAN priority value from **0** to **7** for the PC Port. Default is **0**.
25. Press **Done** to save the changes.
26. Navigate back to the **Options List** menu.
27. Select **Restart Phone** and follow the prompts to restart the phone and apply the configuration changes.

For the 6739j:**IP Phone UI**

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "22222".
4. Press **Network**.
5. Press  to scroll to the next screen.
6. Press **Ethernet & VLAN**.

To globally enable/disable VLAN and set priority for non-IP packets:

7. Press **VLAN Settings**.
8. Press the VLAN Disable/Enable button, and then press **Enable**.
9. Select **LAN Port VLAN**.
10. Select **Other Priority** and enter a non-IP priority value from **0** to **7** for non-IP packets. Default for this field is **5**.
11. Press  to return to the VLAN screen.

To set VLAN ID and priority for LAN Port (Port 0):

12. Press **LAN Port VLAN**.
13. Press **LAN Port VLAN ID** and then enter a value from 1 to 4095 to specify the VLAN ID for the LAN Port. Default is **1**.

Note:

Setting the LAN Port VLAN ID to 4095 and PC Port VLAN ID to any ID from 1 to 4094 will allow frames from the PC port (containing a VLAN ID) to be untagged before being forwarded to the LAN port and frames from the LAN port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC port.

Example:

You enable tagging on the phone port as normal but set the LAN Port VLAN ID to 4095 and the PC Port VLAN ID to any ID from 1 to 4094. The following example sets the PC port to be on VLAN 3 but the LAN port is configured as untagged.

```
VLAN Settings->VLAN: Enable
VLAN Settings->LAN Port VLAN->LAN Port VLAN ID: 4095
VLAN Settings->PC Port VLAN->PC Port VLAN ID: 3
```

14. Press **SIP Priority** and then enter a value from **0** to **7** to specify the SIP priority for the LAN Port. Default is **3**.
15. Press **RTP Priority** and then enter a value from **0** to **7** to specify the RTP priority for the LAN Port. Default is **5**.
16. Press **RTCP Priority** and then enter a value from **0** to **7** to specify the RTCP priority for the LAN Port. Default is **5**.
17. Press  to return to the VLAN screen.

To set VLAN ID and priority for PC Port (Port 1):

18. Press **PC Port VLAN**.

**IP Phone UI**

19. Press **PC Port VLAN ID** and then enter a value from 1 to 4095 to specify the VLAN ID for the LAN Port. Default is **4095**.

Note:

Setting the PC Port VLAN ID to 4095 and LAN Port VLAN ID to any ID from 1 to 4094 will allow frames from the LAN port (containing a VLAN ID) to be untagged before being forwarded to the PC port and frames from the PC port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN port.

Example:

You enable tagging on the phone port as normal but set the PC Port VLAN ID to 4095 and the LAN Port VLAN ID to any ID from 1 to 4094. The following example sets the LAN port to be on VLAN 3 but the PC port is configured as untagged.

```
VLAN Settings->VLAN: Enable
VLAN Settings->LAN Port VLAN->LAN Port VLAN ID: 3
VLAN Settings->PC Port VLAN->PC Port VLAN ID: 4095
```

20. Press **Priority** and then enter a value from **0** to **7** to specify the PC Port VLAN priority. Default is **0**.

21. Press  until the **Options List** screen displays.

22. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:**IP Phone UI**

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "**22222**".
4. Select **Network > VLAN**.

To globally enable/disable VLAN and set priority for non-IP packets:

5. In the **Basic Settings > VLAN** field enable VLAN by pressing the right navigation key.
6. In the **LAN Port VLAN > Other Priority** field, change the non-IP priority value from **0** to **7** for non-IP packets. Default for this field is **5**.

To set VLAN ID and priority for LAN Port (Port 0):

7. In the **LAN Port VLAN > LAN Port VLAN ID** field, enter a value from 1 to 4095 to specify the VLAN ID for the LAN Port. Default is **1**.

Note:

Setting the LAN Port VLAN ID to 4095 and PC Port VLAN ID to any ID from 1 to 4094 will allow frames from the PC port (containing a VLAN ID) to be untagged before being forwarded to the LAN port and frames from the LAN port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC port.

Example:

You enable tagging on the phone port as normal but set the LAN Port VLAN ID to 4095 and the PC Port VLAN ID to any ID from 1 to 4094. The following example sets the PC port to be on VLAN 3 but the LAN port is configured as untagged.

```
VLAN Settings->VLAN: Enable
VLAN Settings->LAN Port VLAN->LAN Port VLAN ID: 4095
VLAN Settings->PC Port VLAN->PC Port VLAN ID: 3
```

8. In the **LAN Port VLAN > SIP Priority** field, enter a value from **0** to **7** to specify the SIP priority for the LAN Port. Default is **3**.
9. In the **LAN Port VLAN > RTP Priority** field, enter a value from **0** to **7** to specify the RTP priority for the LAN Port. Default is **5**.
10. In the **LAN Port VLAN > RTCP Priority** field, enter a value from **0** to **7** to specify the RTCP priority for the LAN Port. Default is **5**.

To set VLAN ID and priority for PC Port (Port 1):

IP Phone UI

- In the **PC Port VLAN > PC Port VLAN ID** field, enter a value from 1 to 4095 to specify the VLAN ID for the LAN Port. Default is **4095**.

Note:

Setting the PC Port VLAN ID to 4095 and LAN Port VLAN ID to any ID from 1 to 4094 will allow frames from the LAN port (containing a VLAN ID) to be untagged before being forwarded to the PC port and frames from the PC port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN port.

Example:

You enable tagging on the phone port as normal but set the PC Port VLAN ID to 4095 and the LAN Port VLAN ID to any ID from 1 to 4094. The following example sets the LAN port to be on VLAN 3 but the PC port is configured as untagged.

```
VLAN Settings->VLAN: Enable
VLAN Settings->LAN Port VLAN->LAN Port VLAN ID: 3
VLAN Settings->PC Port VLAN->PC Port VLAN ID: 4095
```

- In the **PC Port VLAN > Priority** field, enter a value from **0** to **7** to specify the PC Port VLAN priority. Default is **0**.
- Press the **Save** softkey.
- Restart the phone for the selection to take affect.

Aastra Web UI

- Click on **Advanced Settings->Network->VLAN**.

VLAN	
Global	
VLAN Enable	<input type="checkbox"/> Enabled
Priority, Non-IP Packet	5
HPQ Enable	<input checked="" type="checkbox"/> Enabled
LAN Port	
VLAN ID	1
SIP Priority	3
RTP Priority	5
RTCP Priority	5
PC Port	
VLAN ID	4095
Priority	0

To globally enable/disable VLAN and set priority for non-IP packets:

- Enable VLAN by checking the **VLAN Enable** field check box. (Disable this field by unchecking the check box).
- With VLAN enabled, select the priority (**0** to **7**) for non-IP packets in the **Priority, Non-IP Packet** field.
- Enable or disable VLAN HPQ by checking or unchecking the **HPQ Enable** field check box.

Aastra Web UI

To set VLAN ID and priority for the LAN Port (Port 0):

5. Enter a VLAN ID value from **1** to **4095** in the **VLAN ID** field. Default is **1**.

Note:

Setting the LAN Port VLAN ID to 4095 and PC Port VLAN ID to any ID from 1 to 4094 will allow frames from the PC port (containing a VLAN ID) to be untagged before being forwarded to the LAN port and frames from the LAN port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC port.

Example:

You enable tagging on the phone port as normal but set the LAN Port VLAN ID to 4095 and the PC Port VLAN ID to any ID from 1 to 4094. The following example sets the PC port to be on VLAN 3 but the LAN port is configured as untagged.

VLAN	
Global	
VLAN Enable	<input checked="" type="checkbox"/> Enabled
Priority, Non-IP Packet	5
HPQ Enable	<input checked="" type="checkbox"/> Enabled
LAN Port	
VLAN ID	4095
SIP Priority	3
RTP Priority	5
RTCP Priority	5
PC Port	
VLAN ID	3
Priority	0

6. Choose a VLAN Protocol (**SIP Priority**, **RTP Priority**, and/or **RTCP Priority**), and select a priority for the associated Protocol. Valid values are **0** to **7**. Defaults are as follows:
- SIP Priority = 3
 - RTP Priority = 5
 - RTCP Priority = 5

Aastra Web UI

To set VLAN ID and priority for the PC Port (Port 1):

7. Enter a VLAN ID value from **1** to **4095** in the **VLAN ID** field. Default is **4095**.

Note:

Setting the PC Port VLAN ID to 4095 and LAN Port VLAN ID to any ID from 1 to 4094 will allow frames from the LAN port (containing a VLAN ID) to be untagged before being forwarded to the PC port and frames from the PC port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN port.

Example:

You enable tagging on the phone port as normal but set the PC Port VLAN ID to 4095 and the LAN Port VLAN ID to any ID from 1 to 4094. The following example sets the LAN port to be on VLAN 3 but the PC port is configured as untagged.

VLAN	
Global	
VLAN Enable	<input checked="" type="checkbox"/> Enabled
Priority, Non-IP Packet	5
HPQ Enable	<input checked="" type="checkbox"/> Enabled
LAN Port	
VLAN ID	3
SIP Priority	3
RTP Priority	5
RTCP Priority	5
PC Port	
VLAN ID	4095
Priority	0

8. Select a VLAN priority value from **0** to **7** for the PC Port in the **Priority** field. Default is **0**.

9. Click **Save Settings** to save your settings.

RPORT

The Session Initiation Protocol (SIP) operates over UDP and TCP. When used with UDP, responses to requests are returned to the source address from which the request came, and returned to the port written into the topmost “Via” header of the request. However, this behavior is not desirable when the client is behind a Network Address Translation (NAT) or firewall.

A parameter created for the “Via” header called “**Rport**” in RFC 3581, allows a client to request that the server send the response back to the source IP address **and** the port from which the request came.

When you enable “Rport, the phone always uses symmetric signaling (listens on the port used for sending requests.)

Note:

Configuring the Rport parameter is recommended for clients behind a Network Address Translation (NAT) or firewall since this parameter allows a client to request that the server send the response back to the source IP address and the port from which the request came.

An Administrator can configure “**Rport**” using the configuration files or the Aastra Web UI.

Configuring Rport Using the Configuration Files

Use the following procedures to configure Rport on your phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Rport Setting" on page A-26.

Configuring Rport Using the Aastra Web UI

Use the following procedure to configure Rport on your phone using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Network->Advanced Network Settings**.

Advanced Network Settings	
DHCP Download Options	Any
LLDP	<input checked="" type="checkbox"/> Enabled
LLDP packet interval	30
NAT IP	0.0.0.0
NAT SIP Port	51620
NAT RTP Port	51720
STUN Server	0.0.0.0
STUN Port	3478
TURN Server	0.0.0.0
TURN Port	3479
TURN User ID	
TURN Password	
Rport (RFC 3581)	<input type="checkbox"/> Enabled

2. In the "Advanced Network Settings" section, enable the "Rport (RFC3581)" field by checking the check box. (Disable Rport by unchecking the box).

"Rport" in RFC 3581, allows a client to request that the server send the response back to the source IP address **and** the port from which the request came.

3. Click **Save Settings** to save your changes.

Network Time Servers

Network Time Protocol (NTP) is a protocol that the IP phone uses to synchronize the phone clock time with a computer (configuration server) in the network.

To use NTP, you must enable it using the configuration files or the Aastra Web UI. You can specify up to three time servers in your network.

Note:

The IP phones support NTP version 1.

Configuring NTP Servers (optional)

Use the following procedure to enable/disable and configure the NTP servers using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Time Server Settings" on page A-45.

Use the following procedure to enable/disable the NTP server using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Preferences**.
3. Select **Time and Date**.
4. Select **Timer Server 1**, **Timer Server 2**, or **Time Server 3**.
5. Enter the IP Address (in dotted decimal) or qualified domain name for the Time Server.
6. Press **Done** to save the change.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
1. Press **Set Time**.
2. Press **Timer Server 1**, **Time Server 2**, or **Time Server 3**.
3. Enter the IP Address (in dotted decimal) or qualified domain name for the Time Server.
4. Press  to return to the idle screen.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Select **Time and Date > Set Date and Time**.
3. In the **Timer Server 1**, **Time Server 2**, and/or **Time Server 3** fields, enter the respective IP address (in dotted decimal) or qualified domain name.
4. Press the **Save** softkey.

Use the following procedure to enable/disable and configure the NTP Servers using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Time and Date Setting**.

2. Enable the **"NTP Time Servers"** field by checking the check box. (Disable this field by unchecking the box). Default is disabled.
3. Enter an IP address or qualified domain name in the **"Time Server 1"**, **"Time Server 2"**, and/or **"Time Server 3"** field(s) to specify the location of the NTP time server.
4. Click **Save Settings** to save your changes.

Global SIP Settings

Description

The IP phone uses the information in the Global Session Initiation Protocol (SIP) settings to register at the IP PBX.

The IP phone configuration defines network and user account parameters that apply **globally** to all SIP lines. Since not all SIP lines are necessarily hosted using the same IP-PBX/server or user account, additional sets of **per-line** parameters can also be defined for network and user account.

You configure and modify these parameters and associated values using the configuration files, the IP phone UI, or the Aastra Web UI. The Aastra Web UI and configuration file methods configure global and per-line SIP settings on the IP phone. The IP phone UI configures global SIP settings only.

On the IP Phones, you can configure Basic and Advanced SIP Settings. The Basic SIP Settings include authentication and network settings. The Advanced SIP Settings include other features you can configure on the IP Phone.

Reference

For more information about Basic SIP Settings (for authentication and network), see [“Basic SIP Settings”](#) on page 4-55.

For more information about Advanced SIP Settings, see [“Advanced SIP Settings \(optional\)”](#) on page 4-69.

Basic SIP Settings

Specific parameters are configurable on a global and per-line basis. You can also configure specific parameters using the IP Phone UI, the Aastra Web UI, or the configuration files. If you have a proxy server or have a SIP registrar present at a different location than the PBX server, the SIP parameters may need to be changed.

The IP phones allow you to define different SIP lines with the same account information (i.e., same user name) but with different registrar and proxy IP addresses. This feature works with Registration, Subscription, and Notify processing. This feature also works with the following types of calls: incoming, outgoing, Broadsoft Shared Call Appearance (SCA), Bridged Line Appearance (BLA), conference, transfer, blind transfer.

The following tables identify the SIP global and per-line, authentication and network parameters on the IP phones.

SIP Global Parameters

IP Phone UI Parameters	Aastra Web UI Parameters	Configuration File Parameters
SIP Global Authentication Parameters		
<ul style="list-style-type: none"> • Screen Name • User Name • Display Name • Authentication Name • Password 	<ul style="list-style-type: none"> • Screen Name • Screen Name 2 • Phone Number • Caller ID • Authentication Name • Password • BLA Number • Line Mode • Call Waiting (see Chapter 5, “Configuring Operational Features”) 	<ul style="list-style-type: none"> • sip screen name • sip screen name 2 • sip user name • sip display name • sip auth name • sip password • sip bla number • sip mode • call waiting (see Chapter 5, “Configuring Operational Features”) • sip vmail
SIP Global Network Parameters		
<ul style="list-style-type: none"> • Proxy Server • Proxy Port • Registrar Server • Registrar Port 	<ul style="list-style-type: none"> • Proxy Server • Proxy Port • Backup Proxy Server • Backup Proxy Port • Outbound Proxy Server • Outbound Proxy Port • Backup Outbound Proxy • Backup Outbound Proxy Port • Registrar Server • Registrar Port • Backup Registrar Server • Backup Registrar Port • Registration Period • Conference Server URI (see Chapter 5, “Configuring Operational Features”) 	<ul style="list-style-type: none"> • sip proxy ip • sip proxy port • sip backup proxy ip • sip backup proxy port • sip outbound proxy • sip outbound proxy port • sip backup outbound proxy • sip backup outbound proxy port • sip registrar ip • sip registrar port • sip backup registrar ip • sip backup registrar port • sip registration period • sip centralized conf (see Chapter 5, “Configuring Operational Features”)

Reference

For more information about centralized conferencing, see Chapter 5, the section, “[Centralized Conferencing \(for Sylanro and Broadsoft Servers\)](#)” on [page 5-266](#).

SIP Per-Line Parameters

IP Phone UI Parameters	Aastra Web UI Parameters	Configuration File Parameters
SIP Per-Line Authentication Parameters		
<ul style="list-style-type: none"> • Screen Name • User Name • Display Name • Auth Name • Password 	<ul style="list-style-type: none"> • Screen Name • Screen Name 2 • Phone Number • Caller ID • Authentication Name • Password • BLA Number • Line Mode • Call Waiting (see Chapter 5, "Configuring Operational Features") 	<ul style="list-style-type: none"> • sip lineN screen name • sip lineN screen name 2 • sip lineN user name • sip lineN display name • sip lineN auth name • sip lineN password • sip lineN bla number • sip lineN mode • sip lineN call waiting (see Chapter 5, "Configuring Operational Features") • sip lineN vmail
SIP Per-Line Network Parameters		
<ul style="list-style-type: none"> • Proxy Server • Proxy Port • Registrar Server • Registrar Port 	<ul style="list-style-type: none"> • Proxy Server • Proxy Port • Backup Proxy Server • Backup Proxy Port • Outbound Proxy Server • Outbound Proxy Port • Backup Outbound Proxy Server • Backup Outbound Proxy Port • Registrar Server • Registrar Port • Backup Registrar Server • Backup Registrar Port • Registration Period • Conference Server URI (see Chapter 5, "Configuring Operational Features") 	<ul style="list-style-type: none"> • sip lineN proxy ip • sip lineN proxy port • sip lineN backup proxy ip • sip lineN backup proxy port • sip lineN outbound proxy • sip lineN outbound proxy port • sip lineN backup outbound proxy • sip lineN backup outbound proxy port • sip lineN registrar ip • sip lineN registrar port • sip lineN backup registrar ip • sip lineN backup registrar port • sip lineN registration period • sip lineN centralized conf (see Chapter 5, "Configuring Operational Features")

Reference

For more information about centralized conferencing, see Chapter 5, the section, "[Centralized Conferencing \(for Sylanro and Broadsoft Servers\)](#)" on [page 5-266](#).

Note:

The "**sip vmail**" and "**sip lineN vmail**" parameters are configurable using the configuration files only. To configure voicemail see Chapter 5, the section, "[Voicemail](#)" on [page 5-235](#).

Specific sets of SIP parameters are inter-dependent with each other. To prevent conflicting parameter values from being applied, per-line values always take precedence over the corresponding set of global values.

For example, if a parameter value is configured for one of the per-line sets, all parameters from that set are applied and all parameters from the corresponding global section are ignored, even if some of the parameters within the global set are not defined in the per-line set.

SIP Password Masking

The “**mask sip password**” configuration parameter can be used to mask a user’s SIP account password in the server.cfg and local.cfg files (downloaded from the IP phone’s Web UI troubleshooting page for debug purposes). The parameter is disabled by default.

Configuring SIP Password Masking

Use the following procedure to configure SIP password masking using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “SIP Basic, Global Settings” on page A-61.

SIP Precedence Example

The following example shows the SIP proxy feature and example schema for storage and parsing of the SIP configuration parameters.

The following SIP configuration is assumed:

```
# SIP network block
sip proxy ip: 10.30.11.154
sip proxy port: 5060
sip registrar ip: 10.44.122.37
sip registrar port: 4020
sip line3 proxy ip: siparator.vonage.com
sip line3 proxy port: 0
```

Line3 specifies per-line values for proxy IP address and proxy port, so the phone uses those parameter values for SIP calls made on that line. However, because those parameters are part of the SIP network block, the phone does not apply any of the global SIP network block parameters. So even though the global parameters configure a SIP registrar, Line3 on the phone ignores all global network block parameters. Since line3 does not contain a per-line SIP registrar entry, the phone does not use a registrar for that line.

Note:

Global SIP parameters apply to all lines unless overridden by a per-line configuration. Per-line settings are configurable for lines 1 through 7.

Backup Proxy/Registrar Support

The IP phones support a backup SIP proxy and backup SIP registrar feature. If the primary server is unavailable, the phone automatically switches to the backup server allowing the user's phone to remain in service.

How it Works

All SIP registration messages are sent to the primary registrar first. If the server is unavailable, then a new registration request is sent to the backup registrar. This also applies to registration renewal messages, which try the primary server before the backup.

Similarly, any outgoing calls attempt to use the primary proxy first, then the backup if necessary. In addition, subscriptions for BLF, BLA, and explicit MWI can also use the backup proxy when the primary fails. Outgoing calls and the previously mentioned subscriptions behave the same as registrations, where the primary proxy is tried before the backup.

You can configure the backup SIP proxy on a global or per-line basis via the configuration files or the Aastra Web UI.

SIP Outbound Support

The IP Phones support draft-ietf-sip-outbound-15. That specification describes how a SIP User Agent (UA) behind a fire-wall, reuses an existing connection (usually the REGISTER outbound connection) for the inbound request if the proxy supports it. The UA uses keep-alive packets to monitor the connection status.

An Administrator can enable or disable this feature using the following parameter in the configuration files:

- **sip outbound support**

Note:

If the Global SIP parameter “Persistent TLS” is set on the phone, then only one TLS persistent connection can be established since the phone uses the local port 5061 for connection. If the Global SIP parameter “TLS” is set on the phone, more than one connection can be setup since the phone uses a random local port for connection.

Enabling/Disabling SIP Outbound Draft 15 Support

Use the following procedure to enable/disable SIP outbound Draft 15 support.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “SIP Outbound Support” on [page A-60](#).

Backup Outbound Proxy and Failover Support

The IP phones support a backup outbound proxy and failover. This feature provides the following:

- The ability to specify a backup outbound proxy.
- The ability to support SIP outbound on all connection types.
- The ability to configure the SIP outbound keep alive timer.
- The ability to reestablish failed outbound connections in the background.
- The ability to support the DNS Cache Time-to-Live (TTL) requirements

Using this feature depends on the SIP network settings on your phone. The following table identifies network configuration scenarios, and the method by which this specific feature works in each scenario.

IF	THEN
SIP Outbound Disabled and	
backup proxy and backup registrar configured,	<ul style="list-style-type: none"> • All invite, register, and subscribe requests attempt to use the primary proxy/registrar first • If the primary registrar fails, the phone registers to the backup proxy. • If the backup proxy fails, the phone registers using the Address of Record (AOR) of the backup proxy, and moves all subscriptions to the backup proxy. • When the primary registrar comes back online, the phone registers to it using the currently active AOR. • When the primary proxy comes back online the phone registers with the primary AOR to the currently active registrar and moves all subscriptions to the primary proxy.
backup proxy, backup registrar, and backup outbound proxy configured,	<ul style="list-style-type: none"> • All invite, register, and subscribe requests attempt to use the primary proxy/registrar first. • If any connection fails, the phone registers the backup AOR on the backup registrar. It moves all subscriptions to the backup proxy. • When the primary is functional again, registration and subscriptions are moved back to the primary proxy/registrar.
backup outbound proxy configured only,	<ul style="list-style-type: none"> • All invite, register and subscribe requests are sent through the primary outbound proxy first. • If the primary proxy fails, the phone performs registration and subscriptions through the backup outbound proxy. • When the primary proxy comes back online, the registrations and subscriptions are performed again through the primary outbound proxy.

SIP Outbound Enabled and	
backup proxy and backup registrar configured,	<ul style="list-style-type: none"> Establishes flow to the primary proxy and registrar. If the flow to the primary registrar fails, the phone: <ul style="list-style-type: none"> establishes flow to the backup registrar. registers to the backup registrar. attempts to reestablish flow to the primary registrar in the background. When the primary registrar comes back up, the phone unregisters from the backup and registers with the primary. If the flow to the primary proxy fails, the phone: <ul style="list-style-type: none"> establishes flow to the backup proxy. registers the new AOR with the active registrar. moves subscriptions to the backup proxy. attempts to reestablish the flow to the primary proxy in the background. When the flow to the primary proxy is reestablished, the phone: <ul style="list-style-type: none"> registers the primary AOR to the active registrar. moves subscriptions to the primary proxy. unregisters/unsubscribes from the backup proxy/registrar.
backup proxy, backup registrar, and backup outbound proxy configured,	<ul style="list-style-type: none"> Establishes a flow to the primary outbound proxy. If the flow fails, the phone: <ul style="list-style-type: none"> establishes the flow to the backup proxy. registers the backup AOR to the backup registrar. moves subscriptions to the backup proxy. attempts to reestablish connection to the primary outbound proxy in the background. When the flow to the primary proxy is reestablished, the phone: <ul style="list-style-type: none"> registers the primary AOR to the primary registrar. moves the subscriptions to the primary proxy. unregisters/unsubscribes from the backup proxy/registrar.
backup outbound proxy configured only,	<ul style="list-style-type: none"> Establishes a flow to the primary outbound proxy. If the flow fails, the phone: <ul style="list-style-type: none"> establishes the flow to the backup proxy. registers the backup AOR to the backup registrar. moves subscriptions to the backup proxy.

Note:

This configuration assumes that the outbound proxy is maintaining its own outbound connections to the proxy/registrar.

Configuring a Backup Outbound Proxy

To configure this feature an Administrator can set the following parameters in the configuration files or the Aastra Web UI:

Parameter	Aastra Web UI Configuration	Configuration File Configuration
sip outbound support	-	✓
sip symmetric udp signaling	-	✓
sip transport protocol	✓	✓
Global Parameters		
sip backup outbound proxy	✓	✓
sip backup outbound proxy port	✓	✓
Per-Line Parameters		
sip lineN backup outbound proxy	✓	✓
sip lineN backup outbound proxy port	✓	✓

Note:

The “**sip outbound support**”, “**sip symmetric udp signaling**”, and “**sip transport protocol**” parameters are existing parameters on the phone. For more information about these parameters, see Appendix A “**SIP Outbound Support**”, “**Symmetric UDP Signaling Setting**”, and “**Advanced SIP Settings**”.

Use the following procedure to configure backup outbound proxies.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Backup Outbound Proxy (Global Settings)” on page A-68 and “Backup Outbound Proxy (Per-line Settings)” on page A-77.

Limitations

The following are limitations with this feature:

- Keep-alive mechanisms shall be limited to IPv4 only.
- Per M5T, RFC5686 is not fully supported although the draft upon which it was based (draft-ietf-sip-outbound-15) is supported.

SIP Server (SRV) Lookup

The SIP SRV Lookup feature allows you to configure the IP phone to issue a DNS query to retrieve records pertaining to a SIP proxy, a SIP registrar, or a SIP outbound proxy.

The IP phone issues a DNS query for an SRV record when the IP address of the server is FQDN and the corresponding port is 0.

Note:

The phones only generate a ‘request’ and do *not* facilitate the ‘DNS or SRV service or provide a response to the requests.

For example, if the phone is configured with **sip proxy ip of "ana.aastra.com"**, and **sip proxy port of "0"**, the SRV lookup may return multiple servers, based on the priorities if one is selected as primary and others are selected as secondary. However, if the IP address is an FQDN and the corresponding server port is non-zero, then the phone issues a DNS "A" Name Query to resolve the FQDN into dot notation form.

If the IP address is a valid dot notation and the port is zero, then a default port 5060 is used.

You can configure SRV lookup using the configuration files (*aastra.cfg* and *<mac>.cfg*) only. The parameters to use are:

- **sip proxy ip**
- **sip proxy port**

Contact Header Matching

When sending SIP packets, the IP Phones observe the Contact header by matching the username, domain name, port, and transport as referenced in SIP RFC 3261. This is called “strict SIP Contact header matching.” However, in specific networks (such as behind some SOHO routers), the phone registers with its private address in the Contact, but when the response is sent back, the router maintains the public side IP address in the Contact header. This causes a non-matching Contact header and the phone does not accept the new registration expiry timer.

You can set the parameter, “**sip contact matching**”, which allows the Administrator to specify the method used by the phone to match the Contact Header. Previously by default, when sending SIP packets, the IP phones observed the contact header by doing a full URI matching of username, domain, phone IP and port name, and transport (value=‘0’). Now the default value for the “**sip contact matching**” parameter is to match the username only (value=‘2’). This parameter is available via the configuration files only.

Enabling/Disabling the “Contact Header Matching” Feature

Use the following procedure to enable/disable the “Contact Header Matching” feature.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Contact Header Matching” on page A-60.

Configuring Basic SIP Authentication Settings

You can configure SIP authentication settings using the configuration files, the IP Phone UI, or the Aastra Web UI.

Note:

To configure the SIP settings per-line, use the configuration files or the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “SIP Basic, Global Settings” on page A-61 or “SIP Basic, Per-Line Settings” on page A-69. For specific parameters you can set in the configuration files for call waiting, see the section, “Call Waiting Settings” on page A-64 or “SIP Per-Line Call Waiting Setting” on page A-73.

Reference

For more information about setting the call waiting parameters, see Chapter 5, the section, “Call Waiting” on page 5-57. Call Waiting cannot be set via the IP Phone UI.

Note:

You can set global configuration only using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.
The IP Phones accept numeric passwords only.
4. Select **SIP Settings**.
5. Select **User Name** to enter the username that appears in the name field of the SIP URI. This user name is also used for registering the phone at the registrar.
Note:
The IP phones allow usernames containing dots (“.”). You can also enter the same user name for different registrar and proxy IP addresses.
6. Press **Done** to save the changes.
7. Select **Display Name** to enter the name used in the display name field of the “From SIP” header field.
8. Press **Done** to save the changes.
9. Select **Screen Name** and enter the name to display on the idle screen.
10. Press **Done** to save the changes.
11. Select **Authentication Name** to enter the authorization name used in the username field of the Authorization header field of the SIP REGISTER request.
12. Press **Done** to save the changes.
13. Select **Password** to enter the password used to register the IP phone with the SIP proxy.
Note:
The IP phones accept numeric passwords only.
14. Press **Done** (3 times) to save the changes.
Note:
The session prompts you to restart the IP phone to apply the configuration settings
15. Select **Restart**.

**IP Phone UI****For the 6739i:**

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Advanced**. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "22222".
4. Press **SIP**.
5. Press **User Name** and enter the username that appears in the name field of the SIP URI. This user name is also used for registering the phone at the registrar.

Note:

The IP phones allow usernames containing dots ("."). You can also enter the same user name for different registrar and proxy IP addresses.

6. Press  to scroll to the next screen.
7. Press **Display Name** and enter the name used in the display name field of the "From SIP" header.
8. Press **Screen Name** and enter the name to display on the idle screen.
9. Press **Auth. Name** and enter the authorization name used in the username field of the Authorization header field of the SIP REGISTER request.
10. Press **Password** and enter the password used to register the IP phone with the SIP proxy.

Note:

The IP phones accept numeric passwords only.

11. Press  until the Options List screen displays.
12. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **SIP > User**.
5. In the **User Name** field, enter the username that appears in the name field of the SIP URI. This user name is also used for registering the phone at the registrar.

Note:

The IP phones allow usernames containing dots ("."). You can also enter the same user name for different registrar and proxy IP addresses.

6. In the **Display Name** field, enter the name used in the display name field of the "From SIP" header.
7. In the **Screen Name** field, enter the name to display on the idle screen.
8. In the **Auth. Name** field, enter the authorization name used in the username field of the Authorization header field of the SIP REGISTER request.
9. In the **Password** field, enter the password used to register the IP phone with the SIP proxy.

Note:

The IP phones accept numeric passwords only.

10. Press the **Save** softkey.
11. Restart the phone for the changes to take affect.

Aastra Web UI

1. For global configuration, click on **Advanced Settings->Global SIP->Basic SIP Authentication Settings**.

Global SIP Settings

Basic SIP Authentication Settings

Screen Name	John Smith
Screen Name 2	Lab Phone
Phone Number	555-555-1010
Caller ID	555-555-1010
Authentication Name	jsmith
Password	••••••••
BLA Number	1010
Line Mode	Generic
Call Waiting	<input checked="" type="checkbox"/> Enabled

- Or, for per-line configuration, click on **Advanced Settings->Line N (1-9)->Basic SIP Authentication Settings**.

Configuration Line 1

Basic SIP Authentication Settings

Screen Name	John Burns
Screen Name 2	Lab Phone
Phone Number	555-555-1010
Caller ID	555-555-1010
Authentication Name	jburns
Password	••••••••
BLA Number	1010
Line Mode	Generic
Call Waiting	Global

Configure SIP authentication settings:

2. In the **"Screen Name"** field, enter the screen name that displays on the idle screen.
3. In the **"Screen Name 2"** field, enter the text you want to display on the phone under the "Screen Name" on the idle screen.

Notes:

- If other status messages display on the phone, such as "Network Disconnected", the Screen Name 2 value does not display.
- Symbol characters are allowed (such as "#").
- If the text is longer than the display width, than the display truncates the text to fit the display.

4. In the **"Phone Number"** field, enter the phone number of the IP phone.
5. In the **"Caller ID"** field, enter the phone number of the IP phone.
6. In the **"Authentication Name"** field, enter the name used in the username field of the Authorization header of the SIP REGISTER request.
7. In the **"Password"** field, enter the password used to register the IP phone with the SIP proxy.

Note:

The IP phones accept numeric passwords only.

8. In the **"BLA Number"** field, enter the Bridge Line Appearance (BLA) number to be shared across all IP phones. For more information about setting the BLA on the phone, see Chapter 5, the section, ["Bridged Line Appearance \(BLA\)"](#) on page 5-166.
9. In the **"Line Mode"** field, select "Generic" for normal mode, "BroadSoft SCA" for a BroadWorks network.

Aastra Web UI

Configure Global Call Waiting

10. The "Call Waiting" field is enabled by default. To disable call waiting on a global basis, uncheck this box. For more information about setting the call waiting parameters, see Chapter 5, the section, "Call Waiting" on page 5-57.

Configure Per-Line Call Waiting

11. The "Call Waiting" field is set to "Global" by default. To enable call waiting for a specific line, select "enabled" from the list in this field. To disable call waiting for a specific line, select "disabled" from the list in this field. For more information about setting the call waiting parameters, see Chapter 5, the section, "Call Waiting" on page 5-57.
12. Click **Save Settings** to save your changes.

Configuring Basic SIP Network Settings (optional)

You can configure SIP network settings using the configuration files, the IP Phone UI, or the Aastra Web UI.

Note:

To configure the SIP settings per-line, use the configuration files or the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "SIP Basic, Global Settings" on page A-61 or "SIP Basic, Per-Line Settings" on page A-69.

Note:

You can set global configuration only using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.

Note:

The IP Phones accept numeric passwords only.

4. Select **SIP Settings**.

Configuring Proxy IP and Proxy Port

5. Select **Proxy IP/Port**.
6. Enter an IP address or fully qualified host name in the **Proxy Server** field. Default is **0.0.0.0**.
7. Enter a Proxy Port number in the **Proxy Port** field for accessing the SIP proxy server. Default is **0**.
8. Press **Done** to save the changes.

Configuring Registrar IP and Registrar Port

9. Select **Registrar IP/Port**.

**IP Phone UI**

10. Enter an IP address or fully qualified host name in the **Registrar Server** field. Default is **0.0.0.0**.

A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone.

If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e., line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.

11. Enter a Registrar Port number in the **Registrar Port** field for accessing the SIP registrar server. Default is **0**.

12. Press **Done** to save the changes.

Enabling/Disabling the Use of the Registrar Server

13. Select **SIP Register**.

14. Press **Change** to set Register to "**Yes**" (enable) or "**No**" (disable). Default is "**Yes**".

This parameter enables/disables the IP phone to register on the network.

15. Press **Done** to save the changes.

Note:

The session prompts you to restart the IP phone to apply the configuration settings.

16. Select **Restart**.

For the 6739i:**Note:**

You can set global configuration only using the IP Phone UI.

**IP Phone UI**

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** button. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "**22222**".
4. Press the **SIP** button.

Configuring Proxy IP and Proxy Port

5. Press **Proxy Server** and enter an IP address or fully qualified host name in the **Proxy Server** field. Default is **0.0.0.0**.
6. Press **Proxy Port** and enter a Proxy Port number in the **Proxy Port** field for accessing the SIP proxy server. For example, **5060**. Default is **0**.

Configuring Registrar IP and Registrar Port

7. Press **Registrar Server** and enter an IP address or fully qualified host name in the **Registrar Server** field. Default is **0.0.0.0**.
A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone.
If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e., line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
8. Press **Registrar Port** and enter a Registrar Port number in the **Registrar Port** field for accessing the SIP registrar server. For example, **5060**. Default is **0**.
9. Press  until the Options List screen displays.
10. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:**Note:**

You can set global configuration only using the IP Phone UI.

**IP Phone UI**

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **SIP > Call Server**.

Configuring Proxy IP and Proxy Port

5. In the **Proxy Server** field, enter an IP address or fully qualified host name in the **Proxy Server** field. Default is **0.0.0.0**.
6. In the **Proxy Port** field, enter a Proxy Port number in the **Proxy Port** field for accessing the SIP proxy server. For example, **5060**. Default is **0**.

Configuring Registrar IP and Registrar Port

7. In the **Registrar Server**, enter an IP address or fully qualified host name in the **Registrar Server** field. Default is **0.0.0.0**.

A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone.

If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e, line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.

8. In the **Registrar Port** field, enter a Registrar Port number in the **Registrar Port** field for accessing the SIP registrar server. For example, **5060**. Default is **0**.
9. Press the **Save** softkey.
10. Restart the phone for the changes to take affect.

Aastra Web UI

- For global configuration, click on **Advanced Settings->Global SIP->Basic SIP Network Settings**.

Basic SIP Network Settings	
Proxy Server	pbx.proxy.com
Proxy Port	5060
Backup Proxy Server	0.0.0.0
Backup Proxy Port	0
Outbound Proxy Server	0.0.0.0
Outbound Proxy Port	0
Backup Outbound Proxy Server	0.0.0.0
Backup Outbound Proxy Port	0
Registrar Server	pbx.proxy.com
Registrar Port	5060
Backup Registrar Server	0.0.0.0
Backup Registrar Port	0
Registration Period	300
Conference Server URI	

- Or, for per-line configuration, click on **Advanced Settings->Line N (1-9)->Basic SIP Network Settings**.

Basic SIP Network Settings	
Proxy Server	pbx.proxy.com
Proxy Port	5060
Backup Proxy Server	0.0.0.0
Backup Proxy Port	0
Outbound Proxy Server	0.0.0.0
Outbound Proxy Port	0
Backup Outbound Proxy Server	0.0.0.0
Backup Outbound Proxy Port	0
Registrar Server	pbx.proxy.com
Registrar Port	5060
Backup Registrar Server	0.0.0.0
Backup Registrar Port	0
Registration Period	300
Conference Server URI	

- In the **"Proxy Server"** field, enter an IP address or fully qualified host name of the SIP proxy server.
- In the **"Proxy Port"** field, enter a port number for accessing the SIP proxy server.
- In the **"Backup Proxy Server"** field, enter an IP address or fully qualified host name for the backup proxy server.
- In the **"Backup Proxy Port"** field, enter a port number for accessing the backup proxy server.
- In the **"Outbound Proxy Server"** field, enter the SIP outbound proxy server IP address or fully qualified domain name. This parameter allows all SIP messages originating from a line on the IP phone, to be sent to an outbound proxy server.

Note:

If you configure an outbound proxy and registrar for a specific line, and you also configure a global outbound proxy and registrar, the IP phone uses the global configuration for all lines except line 1. Line 1 uses the outbound proxy and registrar that you configured for that line.

- In the **"Outbound Proxy Port"** field, enter the port on the IP phone that allows SIP messages to be sent to the outbound proxy server.

**Aastra Web UI**

8. In the **"Backup Outbound Proxy Server"** field, enter the backup SIP outbound proxy server IP address or fully qualified domain name.
9. In the **"Backup Outbound Proxy Port"** field, enter the port on the IP phone that allows SIP messages to be sent to the backup outbound proxy server.
10. In the **"Registrar Server"** field, enter an IP address or fully qualified host name for the SIP registrar server. A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone.

If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e., line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
11. In the **"Registrar Port"** field, enter the port number associated with the Registrar.
12. In the **"Backup Registrar Server"** field, enter an IP address or fully qualified host name for the backup registrar server. A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone.

If the Backup Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e., line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
13. In the **"Backup Registrar Port"** field, enter the port number associated with the backup registrar.
14. In the **"Registration Period"** field, enter the requested registration period, in seconds, from the registrar.
15. To enter a value in the **"Conference Server URI"** field, see Chapter 5, the section, ["Centralized Conferencing \(for Sylantro and Broadsoft Servers\)"](#) on page 5-266.
16. Click **Save Settings** to save your changes.

Advanced SIP Settings (optional)

Advanced SIP Settings on the IP Phone allow you to configure specific features on the phone. The following table provides a list of Advanced SIP Settings that you can configure using the Aastra Web UI or the configuration files.

Aastra Web UI Parameters	Configuration File Parameters
Explicit MWI Subscription Explicit MWI Subscription Period	sip explicit mwi subscription sip explicit mwi subscription period
MWI for BLA Account	sip mwi for bla account (see Chapter 5, "Configuring Operational Features")
Missed Call Summary Subscription (global) Missed Call Summary Subscription (per-line) (see Chapter 6, "Configuring Advanced Operational Features")	sip missed call summary subscription (global) sip lineN missed call summary subscription (per-line) (see Chapter 6, "Configuring Advanced Operational Features")
Missed Call Summary Subscription Period (see Chapter 6, "Configuring Advanced Operational Features")	sip missed call summary subscription period (see Chapter 6, "Configuring Advanced Operational Features")
AS-Feature-Event Subscription (global) AS-Feature-Event Subscription (per-line) (see Chapter 6, "Configuring Advanced Operational Features")	sip as-feature-event subscription (global) sip lineN as-feature-event subscription (per-line) (see Chapter 6, "Configuring Advanced Operational Features")
AS-Feature Event Subscription Period (see Chapter 6, "Configuring Advanced Operational Features")	sip as-feature-event subscription period (see Chapter 6, "Configuring Advanced Operational Features")
Send MAC Address in REGISTER Message (see Chapter 6, "Configuring Advanced Operational Features")	sip send mac (see Chapter 6, "Configuring Advanced Operational Features")
Send Line Number in REGISTER Message (see Chapter 6, "Configuring Advanced Operational Features")	sip send line (see Chapter 6, "Configuring Advanced Operational Features")
Session Timer	sip session timer
T1 Timer T2 Timer	sip T1 timer sip T2 timer
Transaction Timer	sip transaction timer
Transport Protocol	sip transport protocol

Aastra Web UI Parameters	Configuration File Parameters
Local SIP UDP/TCP Port (see page 4-27)	sip local port (see page 4-27)
Local SIP TLS Port (see page 4-27)	sip local tls port (see page 4-27)
Registration Failed Retry Timer	sip registration retry timer
Registration Timeout Retry Timer	sip registration timeout retry timer
Registration Renewal Timer	sip registration renewal timer
N/A	sip subscription timeout retry timer
N/A	sip subscription failed retry timer
BLF Subscription Period (see Chapter 5, "Configuring Operational Features")	sip blf subscription period (see Chapter 5, "Configuring Operational Features")
ACD Subscription Period (see Chapter 5, "Configuring Operational Features")	sip acd subscription period (see Chapter 5, "Configuring Operational Features")
BLA Subscription Period (see Chapter 5, "Configuring Operational Features")	sip acd subscription period (see Chapter 5, "Configuring Operational Features")
Blacklist Duration (see Chapter 6, "Configuring Advanced Operational Features")	sip blacklist duration (see Chapter 6, "Configuring Advanced Operational Features")
Whitelist Proxy (see Chapter 6, "Configuring Advanced Operational Features")	sip whitelist (see Chapter 6, "Configuring Advanced Operational Features")
XML SIP Notify (see Chapter 6, "Configuring Advanced Operational Features")	XML SIP Notify (see Chapter 6, "Configuring Advanced Operational Features")

The "**sip subscription timeout retry timer**" and "**sip subscription failed retry timer**" are only configurable through the configuration files. The "**sip subscription timeout retry timer**" parameter can be used to control how long the phone delays then retries a subscription when a SUBSCRIBE request is responded with a 408 (timeout) or 503 (service unavailable) error code. The "**sip subscription failed retry timer**" parameter can be used to control how long the phone delays then retries a subscription when a SUBSCRIBE request is responded with error codes other than 408 or 503.

If any one of the above parameters are configured with a valid setting, the default retry times for all event packages will be overwritten with the new setting. If the parameters are not configured or contains a invalid setting, the default retry timers for all event packages will be retained. Both parameters are disabled by default.

Reference

Refer to Appendix A, "[Advanced SIP Settings](#)" on [page A-82](#) for a description of each of the above parameters.

For more information about Blacklist Duration and Whitelist Proxy, see [Chapter 6, "Configuring Advanced Operational Features."](#)

Configuring Advanced SIP Settings

Use the following procedures to configure the advanced SIP settings on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Advanced SIP Settings](#)" on [page A-82](#).

Aastra Web UI

- For Global configuration, click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	<input type="text" value="86400"/>
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	<input type="text" value="3600"/>
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	<input type="text" value="0"/>
T1 Timer	<input type="text" value="0"/>
T2 Timer	<input type="text" value="0"/>
Transaction Timer	<input type="text" value="4000"/>
Transport Protocol	UDP <input type="button" value="v"/>
Local SIP UDP/TCP Port	<input type="text" value="5060"/>
Local SIP TLS Port	<input type="text" value="5061"/>
Registration Failed Retry Timer	<input type="text" value="1800"/>
Registration Timeout Retry Timer	<input type="text" value="120"/>
Registration Renewal Timer	<input type="text" value="15"/>
BLF Subscription Period	<input type="text" value="3600"/>
ACD Subscription Period	<input type="text" value="3600"/>
BLA Subscription Period	<input type="text" value="300"/>
Blacklist Duration	<input type="text" value="300"/>
Park Pickup Config	<input type="text"/>
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

- Or for per-line configuration, click on **Advanced Settings->Line N**.

Advanced SIP Settings	
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
Park Pickup Config	<input type="text"/>

- Enable the "**Explicit MWI Subscription**" field by checking the check box.
(Disable this field by unchecking the check box. Default is disabled).

If the IP phone has a message waiting subscription with the Service Provider, a Message Waiting Indicator (MWI) (LED or display icon) tells the user there is a message on the IP Phone.

- If you enable the "**Explicit MWI Subscription**" field, then in the "**Explicit MWI Subscription Period**" field, enter the requested duration, in seconds, before the MWI subscription times out. The phone re-subscribes to MWI before the subscription period ends. Default is 86400.
- Enable the "**MWI for BLA Account**" to enable or disable a BLA configured line to send an MWI SUBSCRIBE message for the BLA account.

Notes:

- If you change the setting on this parameter, you must reboot the phone for it to take affect.
- Both the "sip explicit mwi subscription" and "sip mwi for bla account" parameters must be enabled in order for the MWI subscription for BLA to occur.
- The MWI re-subscription for the BLA account uses the value set for the "sip explicit mwi subscription period" parameter to re-subscribe.
- Whether or not the "sip mwi for bla account" parameter is enabled, the priority for displaying MWI does not change.

Aastra Web UI

6. Enable the **"AS-Feature-Event Subscription"** field by checking the check box. (Disable this field by unchecking the check box. Default is disabled).

This feature enables or disables the specified line with the BroadSoft's server-side DND, CFWD, or ACD features.

For more information about this feature, see Chapter 6, the section, ["As-Feature-Event Subscription"](#) on page 6-11.

Note:

The "AS-Feature-Event Subscription" feature is configurable on a global or per-line basis.

7. If you enable the **"AS-Feature-Event Subscription"** field, then in the **"AS-Feature-Event Subscription Period"** field, enter the amount of time, in seconds, between re-subscribing. If the phone does not re-subscribe in the time specified for this parameter, it loses subscription. Default is 3600.

For more information about this feature, see Chapter 6, the section, ["As-Feature-Event Subscription"](#) on page 6-11.

8. Enable the **"Send MAC Address in REGISTER Message"** and the **"Send Line Number in REGISTER Message"** fields by checking the check boxes. (Disable these fields by unchecking the check boxes. Default is disabled for both fields).

For more information about these message features, see Chapter 6, the section, ["TR-069 Support"](#) on page 6-4.

Note:

The "AS-Feature-Event Subscription Period" feature is configurable on a global basis only.

9. In the **"Session Timer"** field, enter the time, in seconds, that the IP phone uses to send periodic re-*INVITE* requests to keep a session alive. The proxy uses these re-*INVITE* requests to maintain the status' of the connected sessions. See RFC4028 for details.

10. In the **"Timer 1"** and **"Timer 2"** fields, enter a time, in milliseconds, that will apply to an IP phone session. These timers are SIP transaction layer timers defined in RFC 3261.

Timer 1 is an estimate of the round-trip time (RTT). Default is 500 msec.

Timer 2 represents the amount of time a non-*INVITE* server transaction takes to respond to a request. Default is 4 seconds.

11. In the **"Transaction Timer"** field, enter the amount of time, in milliseconds, that the phone allows the call server (registrar/proxy) to respond to SIP messages that it sends. Valid values are 4000 to 64000. Default is 4000.

Note:

If the phone does not receive a response in the amount of time designated for this parameter, the phone assumes the message has timed out.

12. In the **"Transport Protocol"** field, select a transport protocol to use when sending SIP Real-time Transport Protocol (RTP) packets. Valid values are User Datagram Protocol (UDP) and Transmission Control Protocol (TCP), UDP/TCP, Transport Layer Security (TLS) or Persistent TLS. The value **"UDP"** is the default. For more information about TLS, see ["RTP Encryption"](#) on page 4-79 and Chapter 6, the section, ["Transport Layer Security \(TLS\)"](#) on page 6-16.

13. In the **"Local SIP UDP/TCP Port"** field, specify the local source port (UDP/TCP) from which the phone receives SIP messages. Default is 5060.

For more information about this feature, see the section, ["SIP and TLS Source Ports for NAT Traversal"](#) on page 4-27.

14. In the **"Local SIP TLS Port"** field, specify the local source port (SIPS/TLS) from which the phone sends SIP messages. Default is 5061.

For more information about this feature, see the section, ["SIP and TLS Source Ports for NAT Traversal"](#) on page 4-27.

15. In the **"Registration Failed Retry Timer"** field, enter the amount of time, in seconds, that the phone waits between registration attempts when a registration is rejected by the registrar. Valid values are 30 to 1800. Default is 1800.

16. In the **"Registration Timeout Retry Timer"** field, enter the amount of time, in seconds, that the phone waits until it re-attempts to register after a REGISTER message times out. Valid values are 30 to 2147483647. Default is 120.

Aastra Web UI

- 17.** In the **"Registration Renewal Timer"** field, enter the threshold value, in seconds, prior to expiration, that the phone renews registrations. The phone will automatically send registration renewals half-way through the registration period, unless half-way is more than the threshold value.
- For example, if the threshold value is set to 60 seconds and if the registration period is 600 seconds, the renewal REGISTER message will be sent 60 seconds prior to the expiration, as half-way ($600/2$) $>$ 60. If the registration period was 100 seconds, then the renewal would be sent at the half-way point as ($100/2$) $<$ 60.
- Valid values are 0 to 2147483647. Default is 15.
-
- 18.** The **"BLF Subscription Period"** field is enabled by default with a value of 3600 seconds.
- This feature sets the duration, in seconds, before the BLF subscription times out. The phone re-subscribes to the BLF subscription service before the defined subscription period ends.
- Note:**
This parameter is not applicable to BLF/List subscriptions.
- For information about setting the "BLF Subscription Period", see Chapter 5, the section, ["BLF Subscription Period"](#) on [page 5-137](#).
-
- 19.** (For Sylanro Servers) The **"ACD Subscription Period"** field is enabled by default with a value of 3600 seconds.
- This feature sets the time period, in seconds, that the IP phone re-subscribes the BLF subscription service after a software/firmware upgrade or after a reboot of the IP phone.
- For information about setting the "ACD Subscription Period", see Chapter 5, the section, ["ACD Subscription Period"](#) on [page 5-150](#).
-
- 20.** The **"BLA Subscription Period"** field is enabled by default with a value of 300 seconds.
- This feature sets the amount of time, in seconds, that the phone waits to receive a BLA subscribe message from the server. If you specify zero (0), the phone uses the value specified for the BLA expiration in the subscribe message received from the server. If no value is specified, the phone uses the default value of 300 seconds.
- For information about setting the "BLA Subscription Period", see Chapter 5, the section, ["BLA Subscription Period"](#) on [page 5-170](#).
-
- 21.** (For Broadsoft Servers) The **"Blacklist Duration"** field is enabled by default with a value of 300 seconds (5 minutes). Valid values are 0 to 9999999.
- This feature specifies the length of time, in seconds, that a failed server remains on the server blacklist. The IP phone avoids sending a SIP message to a failed server (if another server is available) for this amount of time.
- Note:**
The value of **"0"** disables the blacklist feature.
- For information about setting the "Blacklist Duration", see Chapter 6, the section, ["Blacklist Duration"](#) on [page 6-13](#).
-
- 22.** In the **"Park Pickup Config"** field, enter the appropriate value based on the server in your network.
- Notes:
- For values to enter in this field, see the table ["Park/Pickup Call Server Configuration Values"](#) on [page 5-182](#).
 - Leave the park/pickup configuration field blank to disable the park and pickup feature.
-
- 23.** Enable the **"Whitelist Proxy"** field by checking the check box.
(Disable this field by unchecking the check box. Default is disabled).
- When this feature is enabled, an IP phone accepts call requests from a trusted proxy server *only*. The IP phone rejects any call requests from an untrusted proxy server.
- For information about setting the "Whitelist Proxy", see Chapter 6, the section, ["Whitelist Proxy"](#) on [page 6-15](#).

**Aastra Web UI**

- 24.** Enable the "XML SIP Notify" field by checking the check box.
(Disable this field by unchecking the check box. Default is disabled).

Enabling this parameter allows the phone to accept or reject an aastra-xml SIP NOTIFY message.

Note:

To ensure the SIP NOTIFY is coming from a trusted source, it is recommended that you enable the Whitelist feature (**Whitelist Proxy** parameter) on the IP phone. If enabled, and the phone receives a SIP NOTIFY from a server that is NOT on the whitelist (i.e. untrusted server), the phone rejects the message.

For information about setting this feature, see Chapter 5, the section, "XML SIP Notify Events" on page 5-256.

- 25.** Click **Save Settings** to save your changes.

Real-time Transport Protocol (RTP) Settings

Real-time Transport Protocol (RTP) is used as the bearer path for voice packets sent over the IP network. Information in the RTP header tells the receiver how to reconstruct the data and describes how the bit streams are packetized (i.e. which codec is in use). Real-time Transport Control Protocol (RTCP) allows endpoints to monitor packet delivery, detect and compensate for any packet loss in the network. Session Initiation Protocol (SIP) and H.323 both use RTP and RTCP for the media stream, with User Datagram Protocol (UDP) as the transport layer encapsulation protocol.

Note:

If RFC2833 relay of DTMF tones is configured, it is sent on the same port as the RTP voice packets. The phones support decoding and playing out DTMF tones sent in SIP INFO requests. The following DTMF tones are supported:

- Support signals 0-9, #, *
- Support durations up to 5 seconds

You can set the following parameters for RTP on the IP Phones:

Aastra Web UI Parameters	Configuration File Parameters
RTP Port	sip rtp port
Basic Codecs (G.711 u-Law, G.711 a-Law, G.729)	sip use basic codecs
AMR and AMR-WB (G.722.2) Codecs (Licensed feature for 6735i, 6737i, 6863i, 6865i, 6867i only)	sip amr codec payload format sip amr codec mode set sip amr wb codec mode set
Force RFC2833 Out-of-Band DTMF	sip out-of-band dtmf
Customized Codec Preference List	sip customized codec
DTMF Method (global and per-line settings)	sip dtmf method (global and per-line settings)
RTP Encryption (global and per-line settings)	sip srtp mode (global and per-line settings)
Silence Suppression	sip silence suppression

RTP Port

RTP is described in RFC1889. The UDP port used for RTP streams is traditionally an even-numbered port, and the RTCP control is on the next port up. A phone call therefore uses one pair of ports for each media stream.

The RTP port is assigned to the first line on the phone, and is then incremented for each subsequent line available within the phone to provided each line a unique RTP port for its own use.

On the IP phone, the initial port used as the starting point for RTP/RTCP port allocation can be configured using "**RTP Port Base**". The default RTP base port on the IP phones is 3000.

For example, if the RTP base port value is 5000, the first voice patch sends RTP on port 5000 and RTCP on port 5001. Additional calls would then use ports 5002, 5003, etc.

You can configure the RTP port on a global-basis only, using the configuration files, the IP Phone UI, or the Aastra Web UI.

Basic Codecs (G.711 u-Law, G.711 a-Law, G.729)

CODEC is an acronym for **CO**mpress-**DE**compress. It consists of a set of instructions that together implement one or more algorithms. In the case of IP telephony, these algorithms are used to compress the sampled speech data, to decrease the content's file size and bit-rate (the amount of network bandwidth in kilobits per second) required to transfer the audio. With smaller file sizes and lower bit rates, the network equipment can store and stream digital media content over a network more easily.

Aastra IP phones support the International Telecommunications Union (ITU) transmission standards for the following CODECs:

- **Waveform CODECs:** G.711 pulse code modulation (PCM) with a-Law or u-Law companding
- **Parametric CODEC:** G.729a conjugate structure - algebraic code excited linear prediction (CS_ACELP)

All codecs have a sampling rate of 8,000 samples per second, and operate in the 300 Hz to 3,700 Hz audio range. The following table lists the default settings for bit rate, algorithm, packetization time, and silence suppression for each codec, based on a minimum packet size.

Default Codec Settings

CODEC	Bit Rate	Algorithm	Packetization Time	Silence Suppression
G.711 a-law	64 Kb/s	PCM	30 ms	enabled
G.711 u-law	64 Kb/s	PCM	30 ms	enabled
G.729a	8 Kb/s	CS-ACELP	30 ms	enabled

You can enable the IP phones to use a default "basic" codec set, which consists of the set of codecs and packet sizes shown above;

or

you can configure a custom set of codecs and attributes instead of using the defaults (see "Customized Codec Preference List" below).

Note:

The basic and custom codec parameters apply to all calls, and are configured on a global-basis only using the configuration files or the Aastra Web UI.

AMR and AMR-WB (G722.2) Codecs (Licensed Feature for 6735i, 6737i, 6863i, 6865i, and 6867i Only)

Administrators can configure Adaptive Multi-Rate (AMR) and Adaptive Multi-Rate Wideband (AMR-WB) codecs on the 6735i, 6737i, 6863i, 6865i, and 6867i IP phones. AMR/AMR-WB codecs provide improved speech quality during calls due to wider speech bandwidth, and cover both real-time transfers through Real-time Transport Protocol (RTP) and non-real-time transfers through stored files. AMR supports eight narrowband speech encoding modes (0-7) with bit-rates ranging from 4.75 to 12.2 kilobits per second (kbps). AMR-WB supports nine wideband speech encoding modes (0-8), with bit-rates ranging from 6.60 to 23.85 kbps.

Note:

AMR/AMR-WB codecs is a licensed feature on the SIP IP phones. To confirm that the license is active, Administrators can view the license through the phone's Web UI on the Licensing Status page. AMR/AMR-WB should be listed if the feature is available to be used. If Administrators configure AMR/AMR-WB when there is no license, the codec will be ignored and not negotiated.

Administrators can configure AMR/AMR-WB on the IP phones in the **Customized Codec Preference List** on the Web UI or in the configuration files using the existing "**sip customized codec**" parameter.

Optional parameters have also been created to configure this feature. Administrators can enable the feature by using the **"sip amr codec payload format"**, which specifies the payload format for AMR/AMR-WB. AMR/AMR-WB can operate in either bandwidth-efficient mode (0) or in octet-aligned mode (1), depending on the value configured. Administrators can also disable the octet-align mode and still send the octet-align:0 header in the Session Description Protocol (SDP) by using value (2) for the parameter. By default, the IP phones utilize bandwidth-efficient mode.

Administrators can also specify the list of mode sets that the IP phones support and state the preferred mode to use if multiple modes are supported by both sides, using the **"sip amr codec mode set"** and/or the **"sip amr wb codec mode set"** parameters. If no modes are defined then all codec modes are allowed for the payload type.

The following tables list the AMR/AMR-WB codec modes and corresponding bit-rates.

AMR Codec Modes

AMR Mode	Bit-Rate (kbps)
0	4.75
1	5.15
2	5.90
3	6.70
4	7.40
5	7.95
6	10.2
7	12.2

AMR-WB (G.722.2) Codec Modes

AMR-WB Mode	Bit-Rate (kbps)
0	6.60
1	8.85
2	12.65
3	14.25
4	15.85
5	18.25
6	19.85
7	23.05
8	23.85

Customized Codec Preference List

You can also configure the IP phones to use preferred codecs. To do this, you must enter the payload value (**payload**), the packetization time in milliseconds (**ptime**), and enable or disable silence suppression (**silsupp**).

Payload is the codec type to be used. This represents the data format carried within the RTP packets to the end user at the destination. The default payload setting is to allow all codecs. You can set payload to use only basic codecs (G.711 u-Law, G.711 a-Law, G.729), and/or Adaptive Multi-Rate (AMR) and Adaptive Multi-Rate Wideband (AMR-WB) (G.722.2) codecs (for the 6735i, 6737i, 6863i, 6865i, and 6867i IP phones if a license is available), or select from up to 14 codecs for the phones AND customize a codec preference list of up to 10 codecs. In the Aastra Web UI, codecs 2 through 10 can be set to “None” if required (no codecs).

Note:

In the Aastra Web UI:

- Setting Codec 1 to “All” ignores the packetization interval (ptime). The packetization interval setting defaults to 30, which is the default for all codecs.
- Setting Codec 1 to “All” automatically sets all other codec preference fields 2 through 10 to “None”.
- Setting Codec 1 to “Basic” and all other codec preferences in 2 through 10 to “None”, forces the phone to use only the basic codecs as in previous releases (G.711 u-law, G.711 a-law, and G.729). If you select an additional codec to use in the codec preferences 2 through 10 fields, those codecs are added to the list of Basic codecs for the phone to use.

Ptime (packetization time) is a measurement of the duration of PCM data within each RTP packet sent to the destination, and hence defines how much network bandwidth is used for transfer of the RTP stream. You enter the ptime values for the customized codec list in milliseconds. (See table below).

Silsupp is used to enable or disable silence suppression. Voice Activity Detection (VAD) on the IP phones is used to determine whether each individual packet contains useful speech data. Enabling **silsupp** results in decreased network bandwidth, by avoiding the transmission of RTP packets for any frame where no voice energy was detected by the VAD.

You must enter the values for this feature in list form as shown in the following example:

```
payload=8;ptime=10;silsupp=on,payload=0;ptime=10;silsupp=off
```

The valid values for creating a codec preference list are as follows (in numerical order of payload).

Customized Codec Settings

Attribute	Value	
payload	Configuration Files	Web UI
Codec 1	0 - G711u/8000	G.711u (8K)
Codec 2	8 - G711a/8000	G.711a (8K)
.	9 - G722/8000	G.722
.	18 - G729/8000	G.729
.	96 - G726-40/8000	G.726-40
.	97 - G726-24/8000	G.726-24
.	98 - G726-16/8000	G.726-16
.	106 - BV16/8000	BV16 (8K)
Codec 10	107 - BV32/16000	BV32 (16K)
(in Web UI)	110 - G711u/16000	G711u (16K)
	111 - G711a/16000	G711a (16K)
	112 - L16/8000	L16 (8K)
	113 - L16/16000	L16 (16K)
	115 - G726-32/8000	G.726-32
	118 - AMR G.722.2	AMR (Licensed feature for 6735i, 6737i, 6863i, 6865i, 6867i only)
	119 - AMR-WB G.722.2	AMR-WB (Licensed feature for 6735i, 6737i, 6863i, 6865i, 6867i only)
	Leave blank for all codecs	All (Codec 1 only) Basic (Codec 1 only) None (Codecs 2 thru 10 only)
ptime (in milliseconds)	5, 10, 15, 20.....90	
Packetization Interval (in Web UI)		
silsupp	on off	
Silence Suppression (in Web UI)		

If the customized codec preference list is configured as "All", the phone will set the codec order of preference as per the following table:

Preference	Payload	Codec
1	0	G711u/8000
2	18	G729/8000
3	106	BV16/8000
4	107	BV32/16000
5	113	BV32/16000
6	110	G711u/16000
7	111	G711a/16000
8	112	L16/8000
9	98	G726-16/8000
10	97	G726-24/8000
11	115	G726-32/8000
12	96	G726-40/8000
13	9	G722/8000
14	8	G711a/8000

15	118	AMR (G.722.2) (Licensed feature for 6735i, 6737i, 6863i, 6865i, and 6867i only)
16	119	AMR-WB (G.722.2) (Licensed feature for 6735i, 6737i, 6863i, 6865i, and 6867i only)

You can specify a customized codec preference list on a global-basis using the configuration files or the Aastra Web UI.

Out-of-Band DTMF and DTMF Method

The IP phones support out-of-band Dual-Tone Multifrequency (DTMF) mode as referenced in RFC2833. In the Aastra Web UI, you can enable or disable this feature as required. The "out-of-band DTMF" is enabled by default. In out-of-band mode, the DTMF audio is automatically clamped (muted) and DTMF digits are not sent in the RTP packets. You can configure out-of-band DTMF on a global-basis using the configuration files or the Aastra Web UI.

An additional feature on the IP phone allows you to select the DTMF method that the phone uses to send DTMF digits from the IP phone via INFO messages. You can set the DTMF method as Real-Time Transport Protocol (RTP), SIP INFO, or both. You can configure the DTMF method on a global or per-line basis using the configuration files or the Aastra Web UI.

The matrix below details DTMF behavior when the out-of-band DTMF and DTMF method settings are configured in various scenarios:

Web UI Setting/Configuration Parameter Setting		DTMF Behavior		
DTMF Method/ sip dtmf method	Force RFC2833 Out-of-Band DTMF/ sip out-of-band dtmf	SIP INFO	In-Band DTMF	Out-of-Band DTMF (RFC2833)
RTP (0)	Disabled (0)	No	Yes	No
RTP (0)	Enabled (1)	No	No	Yes
SIP INFO (1)	Disabled (0)	Yes	No	No
SIP INFO (1)	Enabled (1)	Yes	No	Yes
RTP and SIP INFO (2)	Disabled (0)	Yes	Yes	No
RTP and SIP INFO (2)	Enabled (1)	Yes	No	Yes

RTP Encryption

The IP Phones include support for Secure Real-time Transfer Protocol (SRTP), using Session Description Protocol Security (SDS) key negotiation, for encryption and authentication of RTP/RTCP messages sent and received by the Aastra IP phones on your network.

As administrator, you specify the global SRTP setting for all lines on the IP phone. You can choose among three levels of SRTP encryption, as follows:

- **SRTP Disabled (default):** IP phone generates and receives non-secured RTP calls. If the IP phone gets called from SRTP enabled phone, it ignores SRTP tries to answer the call using RTP. If the receiving phone has SRTP only enabled, the call fails; however, if it has SRTP preferred enabled, it will accept RTP call.
- **SRTP Preferred:** IP phone generates RTP secured calls, and accepts both secured and non-secured RTP calls. If the receiving phone is not SRTP enabled, it sends non-secured RTP calls instead.
- **SRTP Only:** IP phone generates and accepts RTP secured calls only; all other calls are rejected (fail).

You can override the global setting as necessary, configuring SRTP support on a per-line basis. This allows IP phone users to have both secured and unsecured lines operating on the same phone.

When an active call is using SRTP (i.e. when an SRTP enabled IP phone initiates a call and the receiving phone is also SRTP enabled) and the transport protocol is set to TLS, the IP Phone UI displays a “lock” icon, indicating that the call is secure. If one of the phones does not support SRTP and/or TLS is not enabled, the IP Phone UIs do not display the lock icon, indicating that the call may not be secure.

Note:

If you enable SRTP, then you should also enable Transport Layer Security (TLS). This prevents capture of the key used for SRTP encryption. To enable TLS, set the **Transport Protocol** parameter (located on the Global SIP Settings menu) to **TLS**.

You can configure SRTP on a global or per-line basis using the configuration files or the Aastra Web UI.

Silence Suppression

In IP telephony, silence on a line (lack of voice) uses up bandwidth when sending voice over a packet-switched system. Silence suppression is encoding that starts and stops the times of silence in order to eliminate that wasted bandwidth. Silence suppression is enabled by default on the IP phones. The phone negotiates whether or not to use silence suppression. Disabling this feature forces the phone to ignore any negotiated value.

You can configure silence suppression on a global-basis using the configuration files or the Aastra Web UI.

Option to Include/Remove Silence Suppression Attribute from SDP Offer

The parameter **sip remove silence suppression offer** is available allowing administrators the ability to control whether or not the silence suppression attribute should be included in the Session Description Protocol (SDP) offer.

If enabled (1), the silence suppression attribute will be removed from the SDP offer. If disabled (0), the attribute will not be removed from the SDP offer. This parameter is disabled by default and requires a reboot if the value of the parameter has changed. You can configure this parameter using the configuration files only.

Configuring RTP Features

Use the following procedures to configure the RTP features on the IP phone.

Configuration Files

For specific parameters you can set for RTP features in the configuration files, see Appendix A, the section, “RTP, Codec, DTMF Global Settings” on page A-99.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.

Note:

The IP Phones accept numeric passwords only.

4. Select **SIP Settings**.
5. Select **RTP Port Base** to change the RTP port base setting. Default is **3000**.
6. Press **Done** (2 times) to save the change.

Note:

The session prompts you to restart the IP phone to apply the configuration settings

7. Select **Restart**.

IP Phone UI

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** button. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is "22222".
4. Press the **SIP** button.
5. Press  to scroll to the next screen.
6. Press **RTP Port Base** and enter an RTP port base setting. Default is **3000**.
7. Press  until the Options List screen displays.
8. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **SIP > Call Server**.
5. In the **RTP Port Base** field, enter an RTP port base setting. Default is **3000**.
6. Press the **Save** softkey.
7. Restart the phone for the change to take affect.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->RTP Settings. Global Settings.**

RTP Settings	
RTP Port	3000
Force RFC2833 Out-of-Band DTMF	<input checked="" type="checkbox"/> Enabled
DTMF Method	RTP
RTP Encryption	SRTP Disabled
Codec Preference List	
Note: Basic Codecs Include G.711u (8K), G.711a (8K), G.729	
Codec 1	All
Codec 2	None
Codec 3	None
Codec 4	None
Codec 5	None
Codec 6	None
Codec 7	None
Codec 8	None
Codec 9	None
Codec 10	None
Packetization Interval	30
Silence Suppression	<input checked="" type="checkbox"/> Enabled

- Click on **Advanced Settings->Line <N>->RTP Settings. Per-Line Settings.**

RTP Settings	
DTMF Method	RTP
RTP Encryption	Global

2. Enter an RTP Port Base in the **RTP Port** field. Default is **3000**.

The RTP Port indicates the port through which the RTP packets are sent. This value must specify the beginning of the RTP port range on the gateway or router. The RTP port is used for sending DTMF tones and for the audio stream. Your network administrator may close some ports for security reasons. You may want to use this parameter to send RTP data using a different port.

Note:

The phones support decoding and playing out DTMF tones sent in SIP INFO requests. The following DTMF tones are supported:

- Support signals 0-9, #, *
- Support durations up to 5 seconds

3. The "**Force RFC2833 Out-of-Band DTMF**" field is enabled by default. Disable this field by unchecking the box.

Enabling this parameter forces the IP phone to use out-of-band DTMF according to RFC2833.

4. Select a method to use from the "**DTMF Method**" list box. Valid values are **RTP, SIP Info, Both**. Default is **RTP**.

Note:

You can configure the DTMF Method on a global or per-line basis.

5. Select the type of RTP encryption to use from the "**RTP Encryption**" list box. Valid values are **SRTP Disabled, SRTP Preferred, or SRTP Only**. Default is **SRTP Disabled**.

Note:

You can configure RTP Encryption on a global or per-line basis.

**Aastra Web UI**

6. In the **Codec Preference List**, select a codec (with its payload type) you want the phones to use. Valid values are:

- All
- Basic (G.711 u-law, G.711 a-law, G.729)
- G722
- G711u/8K
- G711u/16K
- G711a/8K
- G711a/16K
- G729
- G726-16
- G726-24
- G726-32
- G726-40
- BV16 (8K)
- BV32 (16K)
- L16 (8K)
- L16 (16K)
- AMR (Licensed feature for 6735i, 6737i, 6863i, 6865i, and 6867i only)
- AMR-WB (G.722.2) (Licensed feature for 6735i, 6737i, 6863i, 6865i, and 6867i only)

Notes:

- Setting Codec 1 to “All” ignores the packetization interval (ptime). The packetization interval setting defaults to 30, which is the default for all codecs.
- Setting Codec 1 to “All” automatically sets all other codec preference fields 2 through 10 to “None”.
- Setting Codec 1 to “Basic” and all other codec preferences in 2 through 10 to “None”, forces the phone to use only the basic codecs as in previous releases (G.711 u-law, G.711 a-law, and G.729). If you select an additional codec to use in the codec preferences 2 through 10 fields, those codecs are added to the list of Basic codecs for the phone to use.

7. (Optional) In Codec 2 through Codec 10, select a preference of codecs (with its payload type) to use on the phone. Valid values are:

- None
- G722
- G711u/8K
- G711u/16K
- G711a/8K
- G711a/16K
- G729
- G726-16
- G726-24
- G726-32
- G726-40
- BV16 (8K)
- BV32 (16K)
- L16 (8K)
- L16 (16K)
- AMR (Licensed feature for 6735i, 6737i, 6863i, 6865i, and 6867i only)
- AMR-WB (G.722.2) (Licensed feature for 6735i, 6737i, 6863i, 6865i, and 6867i only)

Note:

You can select up to 9 codecs in addition to the codec you selected in step 6.

8. In the **“Packetization Interval”** field, select the time, in milliseconds. Valid values are 5 to 90, in increments of 5 milliseconds.

9. The **“Silence Suppression”** field is enabled by default. Disable this field by unchecking the check box.

When enabled, the phone negotiates whether or not to use silence suppression. Disabling this feature forces the phone to ignore any negotiated value.

10. Click **Save Settings** to save your changes.

RTCP Summary Reports

The IP phones include the capability of enabling/disabling the generation of RTCP summary reports using the SIP vq-rtcpxr event package. These RTCP summary reports include voice quality statistics according to draft-ietf-sipping-rtcp-summary-05 specifications including packet loss, jitter, and delay statistics, as well as call quality scores. When this feature is enabled, an RTCP summary report is sent at the end of each call via a PUBLISH message to the configuration server.

In addition to enabling/disabling the generation of these reports, you must specify the hostname and port of the entity, known as the collector, receiving the reports. Similar to the other IP Phone SIP account parameters, the RTCP summary report parameters can be set on a global or a per-line basis using the configuration files only.

The RTCP summary report parameters are:

- **sip rtcp summary reports**
- **sip LineN rtcp summary reports**
- **sip rtcp summary report collector**
- **sip LineN rtcp summary report collector**
- **sip rtcp summary report collector port**
- **sip LineN rtcp summary report collector port**

Note:

The transport protocol used for RTCP summary reports is also configurable. Refer to [Configurable Transport Protocol for SIP Services and RTCP Summary Reports](#) on page 6-40 for more information.

Limitations

The following is a limitation when enabling RTCP summary reports on the phone:

- The call must be at least 5 seconds long in order to generate the RTCP extended reports.

Configuring RTCP Summary Reports

Use the following procedure to configure RTCP summary reports.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “RTCP Summary Reports” on page A-37.

Autodial Settings

The IP phones include a feature called “Autodial”. When you configure Autodial on an IP phone, the phone automatically dials a pre-configured number whenever it is off-hook. Depending on the configuration you specify, the Autodial functions as either a “**hotline**”, or as a “**warmline**,” as follows:

- **Hotline (default):** The IP phone immediately dials a preconfigured number when you lift the handset.
- **Warmline:** The IP phone waits for a specified amount of time after you lift the handset before dialing a pre-configured number. If you do not dial a number within the time allotted, then the IP phone begins to dial the number.

By default, the Autodial feature functions as a hotline. If you want Autodial to function as a warmline, you can use the Autodial “time-out” parameter to specify the length of time (in seconds) the IP phone waits before dialing a pre-configured number.

As administrator, you configure Autodial globally, or on a per-line basis, for an IP phone. The line setting overrides the global setting. For example, you can disable Autodial on a specific line simply by setting the line's autodial number parameter to empty (blank).

Warning!

Before configuring Autodial on your IP phone:

- Any speeddial numbers that you configure on an IP phone are not affected by autodial settings.
- If you configure autodial on your IP phone, any lines that function as hotlines do not accept conference calls, transferred calls, and/or intercom calls.

Configuring Autodial Using the Configuration Files

You use the following parameters to configure Autodial using the configuration files:

Global Configuration:

- **sip autodial number**
- **sip autodial timeout**

Per-Line Configuration:

- **sip lineN autodial number**
- **sip lineN autodial timeout**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Autodial Settings" on page A-104.

Configuring Autodial Using the Aastra Web UI

Use the following procedure to configure Autodial using the Aastra Web UI.

By default, your IP phone uses the global settings you specify for Autodial for all lines on your IP phone. However, you can also configure Autodial on a per-line basis.

Aastra Web UI

Global Configuration

1. Click on **Advanced Settings->Global SIP->Autodial Settings**.

Autodial Settings	
Autodial Number	<input type="text"/>
Autodial Timeout	<input type="text" value="0"/>

2. In the "**Autodial Number**" field, specify the SIP number that the IP phone dials whenever the IP phone is off-hook. An empty (blank) value disables autodial on the phone.

For example: **8500**

3. In the "**Autodial Timeout**" field, specify a value, in seconds, for the timer as follows:
 - If you want the IP phone to autodial the number immediately (hotline) whenever the IP phone is off-hook, accept the default value of **0**.
 - If you want to specify a length of time for the IP phone to wait before dialing the number, enter the length of time (in seconds). For example: **30**

Valid values are 0 to 120.

4. Click **Save Settings** to save your changes.

Aastra Web UI

Per-Line Configuration

1. Click on **Advanced Settings->Line <1 - 9>->Autodial Settings.**

Autodial Settings	
Use Global Settings	<input checked="" type="checkbox"/> Enabled
Autodial Number	<input type="text" value="-1"/>
Autodial Timeout	<input type="text" value="0"/>

2. Perform one of the following actions:
 - To allow this line to use the global autodial settings, click on the **Use Global Settings** parameter to enable it, then click **Save Settings** to save your changes.
 - To specify a different autodial configuration for this specific line, disable the **Use Global Settings** parameter. Then proceed to step 3.
3. In the **“Autodial Number”** field, specify the SIP number for this line that the IP phone dials whenever the IP phone is off-hook as follows:
 - If set to -1, then the global autodial settings for this IP phone to this line.
 - If set to empty (blank), then disable Autodial on this line.
 - If set to a valid SIP number, dial the SIP number specified for this line. For example: **8500**
4. In the **“Autodial Timeout”** field, specify a value, in seconds, for the timer for this line as follows:
 - If you want the IP phone to autodial the number immediately (hotline) whenever the IP phone is off-hook, accept the default value of **0**.
 - If you want to specify a length of time for the IP phone to wait before dialing the number, enter the length of time (in seconds). For example: **30**

Valid values are 0 to 120.

5. Click **Save Settings** to save your changes.

Configuration Server Protocol

You can download new versions of firmware and configuration files from the configuration server to the IP phone using any of the following types of protocols: TFTP, FTP, HTTP, and HTTPS. For each Protocol, you can specify the path for which the configuration files are located on the server. For HTTP and HTTPS, you can also specify the port number to use for downloading the phone configuration. For FTP, you can configure a Username and Password that are authenticated by the FTP server.

The TFTP setting is the default download protocol. You can configure the type of protocol that the IP phones use by setting it in the configuration files, the IP phone UI, or the Aastra Web UI.

Note:

For DHCP to automatically populate the IP address or domain name for the TFTP, FTP, HTTP, or HTTPS server, your DHCP server must support download protocol as referenced in RFC2131 and RFC1541 for Option 66. For more information, see this chapter, the section, "DHCP" on page 4-3.

Configuring the Configuration Server Protocol

Use the following procedure to configure the configuration server protocol.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Configuration Server Settings" on page A-16.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu**.
3. Enter your Administrator password.

Note:

The IP Phones accept numeric passwords only.

4. Select **Configuration Server**.
5. Select **Download Protocol**.
6. Select from the following:
 - Use TFTP
 - Use FTP
 - Use HTTP
 - Use HTTPS

Default is "Use TFTP".

The IP phone uses the protocol you select to download new firmware and configuration files from the configuration server.

7. Press **Done** (8 and 11-Line LCD phones) or **Set** (3-Line LCD phones) to save the changes.
8. From the Configuration Server menu, select from the following. This selection is dependent on the Download Protocol you selected in step 6.
 - TFTP Settings
 - FTP Settings
 - HTTP Settings
 - HTTPS Settings

IP Phone UI

9. Enter the IP address of the protocol server (in dotted decimal format).
Use the following table to configure the applicable server.

TFTP Settings

- Select **Primary TFTP**.
- Enter the IP address or fully qualified domain name of the primary TFTP server.
- Press **Done** or **Set** to save the change.
- Select **Pri TFTP Path**.
- Enter the path name for which the configuration files reside on the TFTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, ***ipphone\6757i\configfiles***.
- **Optional:** You can also configure an Alternate TFTP server and Alternate TFTP Path if required by selecting the "Alternate TFTP" and the "Alt TFTP Path" parameters.
- From the TFTP Settings menu, select **Alternate TFTP** and press Enter.
- Enter the IP address or fully qualified domain name of the alternate TFTP server.
- Press **Done** or **Set** to save the change.
- Select **Alt TFTP Path**.
- Enter the path name for which the configuration files reside on the Alternate TFTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, ***ipphone\6757i\configfiles***.

FTP Settings

- Select **FTP Server**.
 - Enter the IP address or fully qualified domain name of the FTP server.
 - Press **Done** or **Set** to save the change.
 - Select **FTP Path**.
 - Enter the path name for which the configuration files reside on the FTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, ***ipphone\6757i\configfiles***.
 - **Optional:** You can enter a username and password for accessing the FTP server if required:
 - Select **FTP Username**.
 - Enter a username for accessing the FTP server.
 - Press **Done**.
 - Select **FTP Password**.
 - Enter a password for accessing the FTP server.
 - Press **Done** or **Set**.
-

IP Phone UI

HTTP Settings

- Select **HTTP Server**
- Enter the IP address of the HTTP server.
- Press **Done** or **Set**.
- Select **HTTP Path**.
- Enter the path name for which the configuration files reside on the HTTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *ipphone\6757i\configfiles*.
- Select **HTTP Port**.
- Enter the HTTP port that the server uses to load the configuration to the phone over HTTP. Default is 80.
- Press **Done** or **Set**.

HTTPS Settings

- Select **HTTP Client**.
- Select **Download Server**.
- Enter the IP address of the HTTPS server.
- Press **Done** or **Set**.
- Select **Download Path**.
- Enter the path name for which the configuration files reside on the HTTPS server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *ipphone\6757i\configfiles*.
- Press **Done** or **Set**.
- Select **Client Method**.
- Select the client method to use for downloading the configuration files (SSI 3.0 or TLS 1.0). For more information about which client method to use, see the section, "[HTTPS Client/Server Configuration](#)" on [page 4-33](#).
- Select **Download Port**.
- Enter the HTTPS port that the server uses to load the configuration to the phone over HTTPS. Default is 443.
- Select **HTTPS Server**.
- Select **HTTP->HTTPS**.
- **For 3-Line LCD Displays:**
 - Press **Change** to select "**Do not redirect**" or "**Redirect**". Default is "**Do not redirect**". Enabling this feature redirects the HTTP protocol to HTTPS.
 - Press **Set**.
- **For 8 and 11-Line LCD Displays:**
 - Press **Change** to select "**Yes**" and redirect HTTP to HTTPS. Select "**No**" to not direct HTTPS to HTTPS, Default is "**No**". Enabling this feature redirects the HTTP protocol to HTTPS.
 - Press **Done**.
- Select **XML HTTP POSTs**.
- **For 3-Line LCD Displays:**
 - Press **Change** to select "**Do not block**" or "**Block**". Enabling this feature blocks XML HTTP POSTs from the IP Phone.
- **For 8 and 11-Line LCD Displays:**
 - Press **Change** to select "**Yes**" and block XML HTTP Posts. Select "**No**" to unblock XML HTTP Posts. Default is "**No**". Enabling this feature blocks XML HTTP POSTs from the IP Phone.

Note:

For more information on configuring the HTTPS security method, HTTP to HTTPS redirect, and HTTPS server blocking for HTTP XML POSTs, see the section, "[HTTPS Client/Server Configuration](#)" on [page 4-33](#).

10. Press **Done** or **Set** repeatedly until the session prompts you to restart the IP phone to apply the configuration settings.
11. Select **Restart**.

For the 6739j:

IP Phone UI

1. Press the **Options** key on the phone to enter the Options List.
2. Press the **Advanced** button. A keyboard displays.
3. Enter the Administrator password using the keyboard. Default is **"22222"**.
4. Press **Cfg. Svr.**
5. Press the **Download Protocol** field, and press the value you want the phone to use for downloading from the configuration server. Valid values are:
 - TFTP (Default)
 - FTP
 - HTTP
 - HTTPS

The IP phone uses the protocol you select to download new firmware and configuration files from the configuration server.

6. After selecting the download protocol, you must identify specific parameters for that protocol. On the Cfg. Svr screen, press the button associated with the download protocol you selected in step 6.
7. Use the following table to configure the applicable server.

TFTP Settings

- Press **TFTP Server**.
- Enter the IP address or fully qualified domain name of the primary TFTP server.
- Press **TFTP Path**.
- Enter the path name for which the configuration files reside on the TFTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, ***ipphone\6757i\configfiles***.
- **Optional:** You can also configure an Alternate TFTP server and Alternate TFTP Path if required by selecting the "Alternate TFTP" and the "Alt TFTP Path" parameters.
- Press **Use Alternate TFTP**, and press **"Yes"** to use an alternate TFTP server. Default is **"No"**.
- Press **Alternate TFTP Server**.
- Enter the IP address or fully qualified domain name of the alternate TFTP server.
- Press **Alt. TFTP Path**.
- Enter the path name for which the configuration files reside on the Alternate TFTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, ***ipphone\6757i\configfiles***.

FTP Settings

- Press **FTP Server**.
- Enter the IP address or fully qualified domain name of the FTP server.
- Press **FTP Path**.
- Enter the path name for which the configuration files reside on the FTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, ***ipphone\6757i\configfiles***.
- **Optional:** You can enter a username and password for accessing the FTP server if required:
 - Press **FTP Username**.
 - Enter a username for accessing the FTP server.
 - Press **FTP Password**.
 - Enter a password for accessing the FTP server.

**IP Phone UI****HTTP Settings**

- Press **HTTP Server**.
- Enter the IP address of the HTTP server.
- Press **HTTP Port**.
- Enter the HTTP port that the server uses to load the configuration to the phone over HTTP. Default is **80**.
- Press **HTTP Path**.
- Enter the path name for which the configuration files reside on the HTTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *iphone\6757i\configfiles*.

HTTPS Settings

- Press **HTTPS Server**.
- Enter the IP address of the HTTPS server.
- Press **HTTPS Port**.
- Enter the HTTPS port that the server uses to load the configuration to the phone over HTTPS. Default is **443**.
- Press **HTTPS Path**.
- Enter the path name for which the configuration files reside on the HTTPS server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *iphone\6757i\configfiles*.
- Press **HTTPS Client Method**.
- Select the client method to use for downloading the configuration files (SSI 3.0 or TLS 1.0). For more information about which client method to use, see the section, "HTTPS Client/Server Configuration" on page 4-33.

8. Press  until the Options List screen displays.

9. Press **Restart** to restart the phone for the change to take affect.

For the 6867i:**IP Phone UI**

1. Press  on the phone to enter the Options List.

2. Press the **Advanced** softkey.

3. Enter the Administrator password using the keypad. Default is "**22222**".

4. Select **Configuration Server**.

5. In the **Download Protocol** field, select the protocol you want the phone to use for downloading from the configuration server. Valid values are:

- TFTP (Default)
- FTP
- HTTP
- HTTPS

The IP phone uses the protocol you select to download new firmware and configuration files from the configuration server.

6. After selecting the download protocol, you must identify specific parameters for that specific protocol.

IP Phone UI

7. Use the following table to configure the applicable server.

TFTP Settings

- In the **Primary Server** field, enter the IP address or fully qualified domain name of the primary TFTP server.
- In the **Pri TFTP Path** field, enter the path name for which the configuration files reside on the TFTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, **ipphone\6867i\configfiles**.
- **Optional:** You can also configure an Alternate TFTP server and Alternate TFTP Path if required by selecting the **Use Alt TFTP** checkbox and entering the alternate path in the **Alt TFTP Path** field.

FTP Settings

- In the **FTP Server** field, enter the IP address or fully qualified domain name of the FTP server.
- In the **FTP Path** field, enter the path name for which the configuration files reside on the FTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, **ipphone\6867i\configfiles**.
- **Optional:** You can enter a username and password for accessing the FTP server if required by entering them in the **FTP Username** and **FTP Password** fields.

HTTP Settings

- In the **HTTP Server** field, enter the IP address of the HTTP server.
- In the **HTTP Port** field, enter the HTTP port that the server uses to load the configuration to the phone over HTTP. Default is **80**.
- In the **HTTP Path** field, enter the path name for which the configuration files reside on the HTTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, **ipphone\6867i\configfiles**.

HTTPS Settings

- In the **HTTPS Server** field, enter the IP address of the HTTPS server.
- In the **HTTPS Port** field, enter the HTTPS port that the server uses to load the configuration to the phone over HTTPS. Default is **443**.
- In the **HTTPS Path** field, enter the path name for which the configuration files reside on the HTTPS server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, **ipphone\6867i\configfiles**.
- In the **HTTPS Client Method** field, select the client method to use for downloading the configuration files (SSL 3.0 or TLS 1.0). For more information about which client method to use, see the section, "[HTTPS Client/Server Configuration](#)" on [page 4-33](#).

8. Press the **Save** softkey.

9. Restart the phone for the change to take affect.

1. Click on **Advanced Settings->Configuration Server.**

Configuration Server Settings

Aastra Web UI

2. Select the protocol from the "Download Protocol" list box. Valid values are **TFTP**, **FTP**, **HTTP**, and **HTTPS**. Default is **TFTP**. The IP phone uses the protocol you select to download new firmware and configuration files from the configuration server. Use the following table to configure the applicable server.

TFTP

- Enter an IP address or fully qualified domain name in the "TFTP Server" field.
- Enter the path name in the "TFTP Path" field for which the configuration files reside on the TFTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *iphone\6757\configfiles*.
- **Optional:** You can also configure an alternate TFTP server if required. If "Use Alternate TFTP" is enabled, you must also enter an IP address or qualified domain name for the alternate server in the "Alternate TFTP" field. You can also enter a path name for the alternate TFTP server in the "Alternate TFTP Path" field.

FTP

- Enter an IP address or fully qualified domain name in the "FTP Server" field.
- Enter the path name in the "FTP Path" field for which the configuration files reside on the FTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *iphone\6757\configfiles*.
- **Optional:** You can enter a username and password for accessing the FTP server if required.
- Enter a username for a user that will access the FTP server in the "FTP User Name" field.
- Enter a password for a user that allows access to the FTP server in the "FTP Password" field.

HTTP

- Enter an IP address or fully qualified domain name in the "HTTP Server" field.
- Enter the path name in the "HTTP Path" field for which the configuration files reside on the HTTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *iphone\6757\configfiles*.
- Enter the HTTP port number in the "HTTP Port" field that the server uses to load the configuration to the phone over HTTP.
- **Optional:** You can enter a list of users to be authenticated when they access the HTTP server in the "XML Push Server List (Approved IP Addresses)" field.

HTTPS

- Enter an IP address or fully qualified domain name in the "HTTPS Server" field.
- Enter the path name in the "HTTPS Path" field for which the configuration files reside on the HTTP server for downloading to the IP Phone. If the IP phone's files are located in a sub-directory beneath the server's root directory, the relative path to that sub-directory should be entered in this field. Enter the path name in the form *folderX\folderX\folderX*. For example, *iphone\6757\configfiles*.
- Enter the HTTPS port number in the "HTTPS Port" field that the server uses to load the configuration to the phone over HTTPS.
- **Optional:** You can enter a list of users to be authenticated when they access the HTTP server in the "XML Push Server List (Approved IP Addresses)" field.

Note:

For more information on configuring the HTTPS security method, HTTP to HTTPS redirect, and HTTPS server blocking for HTTP XML POSTs, see the section, "HTTPS Client/Server Configuration" on page 4-33.

3. Click **Save Settings** to save your settings.

Note:

The session prompts you to restart the IP phone to apply the configuration settings.

4. Select **Operation->Reset** and click **Restart**.

Chapter 5

Configuring Operational Features

About this Chapter

The IP phones have specific operational features you can configure to customize your IP phone. This chapter describes each feature and provides procedures for configuring your phone to use these features.

Topics

This chapter covers the following topics:

Topic	Page
Operational Features	page 5-4
User Passwords	page 5-4
Administrator Passwords	page 5-7
Locking/Unlocking the Phone	page 5-7
Defining an Emergency Dial Plan	page 5-12
Configurable Emergency Call Behavior	page 5-14
User Dial Plan Setting	page 5-14
Time and Date	page 5-15
Backlight Mode	page 5-27
Display	page 5-28
Background Image on Idle Screen	page 5-30
Configurable Home/Idle Screen Modes	page 5-31
Picture ID Feature	page 5-32
Audio DHSG Headset	page 5-33
Configurable Bluetooth Support	page 5-34
Audio Hi-Q on G.722 Calls	page 5-35
Wideband Audio Equalizer	page 5-35
Audio Transmit and Receive Gain Adjustments	page 5-36
Live Dialpad	page 5-37
Language	page 5-38
Minimum Ringer Volume	page 5-49
Locking IP Phone Keys	page 5-49
Locking/Unlocking the SAVE and DELETE keys	page 5-51
Local Dial Plan	page 5-52
Suppressing DTMF Playback	page 5-55
Display DTMF Digits	page 5-55
Filter Out Incoming DTMF Events	page 5-56

Topic	Page
Call Waiting	page 5-57
Stuttered Dial Tone	page 5-61
XML Beep Support	page 5-62
Status Scroll Delay	page 5-63
Switch Focus to Ringing Line	page 5-64
Call Hold Reminder During Active Calls	page 5-65
Call Hold Reminder (on Single Hold)	page 5-66
Call Hold Reminder Timer & Frequency	page 5-67
Preferred Line and Preferred Line Timeout	page 5-68
Goodbye Key Cancels Incoming Call	page 5-69

Operational Features

Description

This section describes the operational features managed and configured by a System Administrator.

User Passwords

A user or an administrator can change the user passwords on the phone using the configuration files, the IP phone UI, or the Aastra Web UI.

Use the following procedures to change the user password.

Note:

The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.

Configuring a User Password

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Password Settings" on page A-14.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **User Password**.
3. Enter the current user password.
4. Press **Enter**.
5. Enter the new user password.

Note:

The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.

6. Press **Enter**.
7. Re-enter the new user password.
8. Press **Enter**.
A message, "Password Changed" displays on the screen.

For the 6739i:

1. Press the **Options** key on the phone to enter the Options List.
2. Press **Password**. A keyboard displays.
3. Press on the "**Current Password**" text box, and enter the current user password.
4. Press on the "**New Password**" text box, and enter the new user password.
5. Press on the "**Re-enter Password**" text box, and re-enter the user password.
6. Press **Save**. The Options screen displays indicating your changes were saved.

IP Phone UI

For the 6867i:

1. Press  to enter the Options List.
2. Select **Lock > Password**.
3. Press on the "**Current Password**" text box, and enter the current user password.
4. Press on the "**New Password**" text box, and enter the new user password.
5. Press on the "**Re-enter Password**" text box, and re-enter the user password.
6. Press **Save**. The Options screen displays indicating your changes were saved.

Aastra Web UI

1. Click on **Operation->User Password**.

Reset User Password

Please enter the current and new passwords

Current Password

New Password

Password Confirm

2. In the "**Current Password**" field, enter the current user password.
3. In the "**New Password**" field, enter the new user password.

Note:

The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.

4. In the "**Password Confirm**" field, enter the new user password again.
5. Click **Save Settings** to save your changes.

Resetting a User Password

If a user forgets his password, either the user or an administrator can reset it so a new password can be entered. The reset user password feature resets the password to the factory default which is blank (no password).

You can reset a user password using the Aastra Web UI only at the path *Operation->Phone Lock*. Use the following procedure to reset a user password.

 **Aastra Web UI**

1. Click on **Operation->Phone Lock**.

2. In the **“Reset User Password”** field, click **Reset**.

The following screen displays:

3. In the **“Current Password”** field, leave this blank.
 4. In the **“New Password”** field, enter a new password for the user.
- Note:**
The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.
5. In the **“Password Confirm”** field, re-enter the new user password.
 6. Click **Save Settings** to save the new user password and perform the next procedure.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Select **Lock > Password**.
3. Enter the current password in the **<Current Password>** field.
4. Press the down navigation key and enter the new password in the **<New Password>** field.
5. Press the down navigation key and enter the new password again in the **<Re-enter Password>** field.
6. Press the **Save** softkey.
A message, **“Password Changed”** displays on the screen.

Administrator Passwords

An administrator can change the administrator passwords on the phone using the configuration files only.

An administrator can also assign a password for using the Options key on the IP phone. You turn this feature on and off by entering the "**options password enabled**" parameter followed by a valid value in the configuration files. Valid values are **0** (false; Options key not password protected), or **1** (true; Options key password protected). If this parameter is set to 1, a user has to enter a password at the IP phone UI. If the password is entered correctly, the user is allowed to gain access to the Options Menu and no more password prompts display for other password protected screens. If the user fails to enter the correct password in three attempts, access to the Options Menu is denied and the IP phone returns to the idle screen.

Changing the Administrator Password

Use the following procedure to change the administrator password.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Password Settings" on [page A-14](#).

Locking/Unlocking the Phone

A user or administrator can lock a phone to prevent it from being used or configured. Once the phone is locked, the user or administrator can enter their password to unlock the phone.

You can lock/unlock a phone using the configuration files, the IP Phone UI, or the Aastra Web UI.

You can use any of the following methods to lock/unlock a phone:

- Using the IP Phone UI at the path *Options->Lock*.
- Using the Aastra Web UI via the path *Operation->Phone Lock*.
- Using the configuration files to configure a softkey as "phonelock", and then pressing the key to lock/unlock the phone.
- Using the Aastra Web UI to configure a softkey as "Phone Lock", and then pressing the key to lock/unlock the phone.

Note:

All of the methods above configure locking/unlocking of the phone dynamically. Once configured, the feature takes affect immediately. To unlock the phone, a user or administrator must enter their password.

Locking/Unlocking the Phone Using the IP Phone UI

Use the following IP Phone UI procedure to lock/unlock an IP phone and prevent it from being used or configured.

IP Phone UI

Lock the phone:

1. Press  on the phone to enter the Options List.
2. Select **Phone Lock**.
The prompt, "Lock the phone?" displays.
3. Press **Lock** to lock the phone.

Unlock the phone:

1. Press  on the phone to enter the Options List.
The prompt, "To unlock the phone...Password:"
2. Enter the user or administrator password and press **Enter**. Default is "22222".
The phone unlocks.

For the 6739i:

IP Phone UI

Lock the phone:

1. Press  on the phone to enter the Options List.
2. Press **Lock**.
The prompt, "Lock the phone?" displays.
3. Press **Yes** to lock the phone
The phone locks.

Unlock the phone:

1. Press  on the phone to enter the Options List.
A "Phone is Locked" screen displays allowing you to press an "**Unlock the Phone**" button.
2. Press **Unlock the Phone**.
A prompt, "Enter Unlock Password" displays as well as a keyboard.
3. Enter the user or administrator password and press **Enter**. Default is "22222".
A prompt "Unlock the Phone?" displays.
4. Press **Yes** to unlock the phone.
The phone unlocks.

For the 6867i:**IP Phone UI****Lock the phone:**

1. Press  on the phone to enter the Options List.

2. Select **Lock > Phone Lock**.

The prompt, "Lock the phone?" displays.

3. Select **Yes** or press the **Lock** softkey to lock the phone.

Unlock the phone:

1. Press  on the phone to enter the Options List.
An "Enter Unlock Password" prompt displays.

2. Enter the user or administrator password and press **Enter**. Default is "22222".
A prompt "Unlock the Phone?" displays.

3. Select **Yes** or press the **Unlock** softkey to unlock the phone.

Locking/Unlocking the Phone Using the Aastra Web UI

Use the following Aastra Web UI procedure to lock/unlock an IP phone and prevent it from being used or configured.

**Aastra Web UI**

1. Click on **Operation->Phone Lock**.

Phone Lock**Lock or unlock the phone**

Emergency Dial Plan

911|999|112|110

Lock the phone?

Lock

Reset User Password

Reset

Lock the phone:

2. In the "Lock the Phone?" field, click **Lock**.

The phone locks dynamically and displays the following message:
"Phone is locked".

Unlock the phone:

3. Click on **Operation->Phone Lock**.

4. In the "Unlock the Phone?" field, click **Unlock**.

The phone unlocks dynamically and displays the following message: "Phone is unlocked".

Configuring a Lock/Unlock Key Using the Configuration Files

Using the configuration files, you can configure a key on the phone (softkey, programmable key, or expansion module key) to use as a lock/unlock key. In the configuration files, you assign the function of the key as "**phonelock**".

Use the following procedure to configure a key as a lock/unlock key using the configuration files.

 **Configuration Files**

To configure a softkey/programmable key as a lock/unlock key using the configuration files, see Appendix A, the section, “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.

Reference

To use the lock/unlock softkey or programmable key, see “Using the Configured Lock/Unlock Softkey on the IP Phone” on page 5-10.

Configuring a Lock/Unlock Softkey using the Aastra Web UI

Using the Aastra Web UI, you can configure a softkey on the phone (softkey, programmable key, expansion module key) to use as a lock/unlock key. In the Aastra Web UI, you assign the function of the softkey as “**Phone Lock**”.

Use the following procedure to configure a key as a lock/unlock key using the Aastra Web UI.

 **Aastra Web UI**

1. Click on **Operation->Softkeys and XML**
or
Click on Operation->Programmable Keys
or
Click on Operation->Expansion Module <N>.

Note:

Depending on your phone-model, the key configuration screen displays. The 6755i Softkey Configuration Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Phone Lock			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
5	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Select a key you want to configure for locking/unlocking the phone.
3. In the “**Type**” field, select **Phone Lock** from the list of options.
4. Click **Save Settings** to save your changes.

Using the Configured Lock/Unlock Softkey on the IP Phone

After configuring a key as a lock/unlock key, refer to the following procedure to use the key on the IP phone.

 **IP Phone UI**

Lock the phone:

1. Press the **LOCK** softkey.

The phone locks.
The LED for the softkey AND the Message Waiting Lamp illuminate steady ON.
An “**Unlock**” label appears next to the softkey you just pressed.

**IP Phone UI****Unlock the phone:**

1. Press the **UNLOCK** softkey.
A password prompt displays.
2. Enter the user or administrator password and press ENTER.
The phone unlocks.
The LED for the softkey AND the Message Waiting Lamp go OFF.
The **“Lock”** label appears next to the softkey you just pressed.

For the 6739i:**IP Phone UI****Lock the phone:**

1. Press the **LOCK** softkey. The phone locks.
The message *“Phone is Locked”* displays on the screen.
The LED for the softkey AND the Message Waiting Lamp illuminate steady ON.

Unlock the phone:

1. Press the **UNLOCK** key. The *“Unlock”* key has a steady ON LED.
A password prompt displays.
2. Enter the user or administrator password and press **Enter**. Default is **“22222”**.
A prompt *“Unlock the Phone?”* displays.
3. Press **Yes** to unlock the phone.
The phone unlocks.

For the 6867i:**IP Phone UI****Lock the phone:**

1. Press the **LOCK** softkey. The phone locks.
The message *“Phone is Locked”* displays on the screen.
The LED for the softkey (if applicable) AND the Message Waiting Lamp illuminate steady ON.

Unlock the phone:

1. Press the **UNLOCK** softkey.
A password prompt displays.
2. Enter the user or administrator password and press the  button or **Enter** softkey. Default is **“22222”**.
A prompt *“Unlock the Phone?”* displays.
3. Press **Yes** to unlock the phone.
The phone unlocks.

Defining an Emergency Dial Plan

Public telephone networks in countries around the world have a single emergency telephone number (emergency services number), that allows a caller to contact local emergency services for assistance when required. The emergency telephone number may differ from country to country. It is typically a three-digit number so that it can be easily remembered and dialed quickly. Some countries have a different emergency number for each of the different emergency services.

You can specify the digits to dial on the IP phone for contacting emergency services. Once you specify the emergency number(s) on the phone, you can dial those numbers directly on the dial pad when required and the phone automatically dials to those emergency services.

Note:

Contact your local phone service provider for available emergency numbers in your area.

The following table describes the default emergency numbers on the IP phones.

Emergency Number	Description
911	A United States emergency number
999	A United Kingdom emergency number
112	An international emergency telephone number for GSM mobile phone networks. In all European Union countries it is also the emergency telephone number for both mobile and fixed-line telephones.
110	A police and/or fire emergency number in Asia, Europe, Middle East, and South America.

Emergency Dial Plan and Pattern Matching

The IP Phones support emergency dialing using pattern matching and prepend dial plan functionality.

There are two ways to dial a number on the phone:

- dialing digit-by-digit (i.e., select line and dial)
- dialing by string (i.e., pre-dial then go off-hook)

When a user dials digit-by-digit, the phone adds every digit to a dialed string and checks against the dial plan. If the phone is not locked, it checks against the regular dial plan. If the phone is locked, it checks against the emergency dial plan.

When a user dials by string, (pre-dial, speed-dial, etc., and then goes off-hook), and the phone is not locked, it checks to see if the number matches the emergency dial plan. If it doesn't match, it blocks the call from going through. If the phone is locked, and the number matches the emergency dial plan it allows the call to go through.

Adding a prepend to a dial plan also works with both dialing digit-by-digit and dialing by string.

Limitation

The following is a limitation for emergency dial plans with pattern matching:

- Secondary dial tone is not supported.

You can set the emergency dial plan via the configuration files or the Aastra Web UI.

Configuring an Emergency Dial Plan

Use the following procedures to specify the numbers to use on your phone for dialing emergency services in your area.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Emergency Dial Plan Settings" on [page A-15](#).

**Aastra Web UI**

1. Click on **Operation->Phone Lock**.

Phone Lock

Lock or unlock the phone

Emergency Dial Plan

Lock the phone?

Reset User Password

2. In the **"Emergency Dial Plan"** field, enter the number used in your local area to contact emergency services. For multiple numbers, enter a **"|"** between each emergency number.

For example:

911|110.

Default for this field is "911|999|112|110". You can enter up to 512 characters in this field.

3. Click **Save Settings** to save the emergency dial plan to your phone.

Configurable Emergency Call Behavior

Administrators have the option of changing the default behavior of the IP phones when an emergency call (i.e. a call made to an emergency number matching one of the values defined in the **“emergency dial plan”** parameter) is placed. If the **“emergency call connection hold enabled”** configuration parameter is enabled, the IP phones employ the following behaviors:

- **Connection Hold:** If an emergency call is placed, the IP phones ensure the voice/audio path and other resources associated with the emergency call are continually active, even if the caller hangs up the phone (i.e. the handset is placed on-hook).
 - If the handset is placed on-hook, the phone automatically switches to speakerphone mode ensuring that the call is still active. Alternatively, if the handset is taken off-hook, the phone automatically switches to handset mode.
 - All softkey and hardkey events (e.g. hold, conference, transfer, end call, park, mute, etc...) are disabled as they may impede or be disruptive to the active call.
 - The phone does not allow for the origination or termination of any call while the phone is connected to the emergency services agent. All incoming calls and pages are ignored and a busy tone is presented to the remote caller.
- **Enhanced Called Party Hold:** As a complement to the Connection Hold feature, Enhanced Called Party Hold allows the voice/audio path to be established the moment the emergency call is placed.
 - When a caller places a call to an emergency services number, all Connection Hold features are activated, even if the SIP session has not been established completely.
 - Even if the caller abandons the call before the emergency services agent answers, the voice/audio path and Connection Hold features will still be active.
- **Forced Disconnect:** As the Connection Hold feature ensures that the caller cannot terminate the call, the only way the call can be terminated is if the emergency services agent forces the disconnection by ending the call himself/herself.

The **“emergency call connection hold enabled”** parameter is disabled by default.

Configuring Emergency Call Behavior

Use the following procedures to configure the IP phone’s behavior when emergency calls are placed.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, **“Emergency Call Behavior Settings”** on page A-15.

User Dial Plan Setting

The IP Phones have a parameter for configuring a dial plan that distinguishes between calling a real PSTN number and a number that looks like a PSTN number but is actually on an IP network.

This parameter is **“sip user parameter dial plan”**. Using the configuration files, an Administrator can configure a dial plan corresponding to a IP network number (i.e. **6xx|8xxxx|9xxxxxxxx**) that the phone checks before sending the SIP packet. If for example, the number that was dialed was 645, the phone checks the dial plan and matches the number to the dial plan (**6xx** in the example above), before sending out the SIP packet. The SIP packet header omits the user parameter `user=ip` (i.e. `“To: <sip:645@10.30.102.24:10060>”`) identifying the number as one from an IP network. If the number that was dialed was 456-2345, the phone tries to match the number to the dial plan before sending out the SIP packet but as it is not part of the dial plan the phone identifies the number as a PSTN number. The SIP packet header in this case indicates `user=phone` (i.e., `“To: <sip:4562345:10060;user=phone>”`).

Note:

- Entering a dial plan value for this parameter enables this feature. Entering no value for this parameter in the configuration files, disables this feature.
- You can configure the **“sip user parameter dial plan”** parameter on a global basis only. If it is misconfigured, then the parameter is ignored.

Configuring the SIP User Parameter Dial Plan

Use the following procedure to configure the SIP user parameter dial plan.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “User Dial Plan Setting” on page A-16.

Limitation

The “**sip user parameter dial plan**” value is checked AFTER an existing prepend dial plan is checked, so the number that the phone dials will have prepend digits also.

Time and Date

In addition to enabling/disabling the time server, you can also set the time and date format, set the time zone, and set daylight savings time on the IP phones. You configure these features using the configuration files, the IP Phone UI, or the Aastra Web UI. The following table identifies which method of configuration applies to each feature.

Feature	Method of configuration
Set Time Format	Configuration Files IP Phone UI Aastra Web UI
Set Date Format	Configuration Files IP Phone UI Aastra Web UI
Set Time Zone	IP Phone UI Configuration Files
Set Daylight Savings Time	IP Phone UI Configuration Files

Daylight Savings Time (DST) Information

The Aastra IP Phones incorporate the federally mandated DST observance change. This change became affective starting in 2007.

The US has made a change to its daylight savings time observance starting in 2007. The Energy Policy Act of 2005 mandates that DST will now begin at 2:00 A.M. on the second Sunday in March and revert to Standard time on the first Sunday in November.

Note:

In previous years, the DST began on the first Sunday of April and ended on the first Sunday of October.

The changes to daylight savings time applies to the U.S. and Canada, but may impact other countries outside North America.

Note:

DST can be set on the phones using the IP Phone UI and configuration files only. For more information, see “Time Zone & DST” on page 5-15.

Time Zone & DST

There are two ways you can set the time zone on the IP Phones.

Method 1

You can set a time zone using the **Time Zone** option in the IP Phone UI or you can use the “**time zone name**” parameter in the configuration files. Both methods allow you to enter a value from the Time Zone table. The list of time zone names is provided in the table in Appendix A, the section, “**Time Zone Name/Time Zone Code Table**” on [page A-42](#). The following is an example:

```
time zone name: US-Eastern
```

Method 2

You can use the **Time Zone** option in the IP Phone UI or you can use the “**time zone name**” parameter in the configuration files, and specify a value of “**Custom**” for this parameter (must use initial caps). The “Custom” option allows you to customize the time zone for your area using additional configuration parameters. The following is an example using relative time for EST:

```
time zone name: Custom
```

The following table identifies the additional time zone and DST parameters you can enter in the configuration files.

Custom Configuration File Parameter	Description	Example
time zone minutes	The number of minutes the time zone is offset from UTC (Coordinated Universal Time). This can be positive (West of the Prime Meridian) or negative (East of the Prime Meridian). The default is Eastern Standard Time (EST) with a value of 300 (GMT minus 5 hours).	time zone minutes: 300 For additional values for this parameter, see “Custom Time Zone and DST Settings” on page A-47 .
dst minutes	The number of minutes to add during Daylight Saving Time. Valid values are a positive integer between 0 to 60.	dst minutes: 60
dst [start end] relative date	Specifies how to interpret the start and end day, month, and week parameters - absolute (0) or relative (1).	dst [start end] relative date: 1
Absolute Time (not applicable to Eastern Standard Time (EST))		
dst start month	The month that DST starts. Valid values are 1 to 12 (January to December).	dst start month: 3
dst end month	The month that DST ends. Valid values are 1 to 12 (January to December).	dst end month: 4
dst [start end] week	Not applicable to absolute time.	N/A
dst start day	The day of the month that DST starts. Valid values are 1 to 31.	dst start day: 15
dst end day	The day of the month that DST ends. Valid values are 1 to 31.	dst end day: 31
dst start hour	The hour that DST starts. Valid values are an integer from 0 (midnight) to 23.	dst start hour: 5
dst end hour	The hour that DST ends. Valid values are an integer from 0 (midnight) to 23.	dst end hour: 23
Relative Time		
dst start month	The month that DST starts. Valid values are 1 to 12 (January to December).	dst start month: 4
dst end month	The month that DST ends. Valid values are 1 to 12 (January to December).	dst end month: 5

Custom Configuration File Parameter	Description	Example
dst start week	<p>The week in the specified month in which DST starts. Valid value is a positive or negative integer from 1 to 5.</p> <p>1 = first full week of month -1 = last occurrence "dst start day" in the month 2 = second full week of month -2 = second last occurrence "dst start day" in the month . . . 5 = fifth full week of month -5 = fifth last occurrence "dst start day" in the month</p>	dst start week: 2
dst end week	<p>The week in the specified month in which DST ends. Valid value is a positive or negative integer from 1 to 5.</p> <p>1 = first full week of month -1 = last occurrence "dst start day" in the month 2 = second full week of month -2 = second last occurrence "dst start day" in the month . . . 5 = fifth full week of month -5 = fifth last occurrence "dst start day" in the month</p>	dst end week: -1
dst start day	<p>The day of the specified week in the specified month that DST starts on. Valid values are an integer from 1 to 7.</p> <p>1 = Sunday 2 = Monday . . . 7 = Saturday</p>	dst start day: 2
dst end day	<p>The day of the specified week in the specified month that DST ends on. Valid values are an integer from 1 to 7.</p> <p>1 = Sunday 2 = Monday . . . 7 = Saturday</p>	dst end day: 7
dst start hour	The hour that DST starts. Valid values are an integer from 0 (midnight) to 23.	dst start hour: 10
dst end hour	The hour that DST ends. Valid values are an integer from 0 (midnight) to 23.	dst end hour: 23

Example 1

The following is an example of a custom time zone configuration in the configuration files using relative time (for EST):

```
time zone name: Custom
dst [start|end] relative date: 1 #relative
time zone minutes: 300
dst minutes: 60
```

Example 2

The following is an example of a custom time zone configuration in the configuration files using absolute time:

```
time zone name: Custom
dst [start|end] relative date: 0 #absolute

#start of DST
dst start month: 3 #March
dst start week: 2 #second full week
dst start day: 1 #Sunday

#End of DST
dst end month: 11 #November
dst end week: 1 #first full week
dst end day: 1 #Sunday
```

DHCP Time Offset (Option 2) Support

DHCP Option 42 enables the phone to be configured with the Network Time Protocol (NTP) server addresses. However, NTP provides the Coordinated Universal Time (UTC) time so the phone requires the offset from UTC in order to deliver the correct local time.

A User or Administrator can set the offset of UTC using DHCP Option 2.

An Administrator can enable Option 2 in the configuration files by setting the parameter **"time zone name"**. If this parameter contains the **DP-Dhcp** value, the phone derives the time and date from UTC and the time offset offered by the DHCP server.

Using the IP Phone UI, a User or Administrator can enable the phone to use DHCP Option 2 by setting the following values from the Country Code list on the phone:

Country Name	Country Code
Dhcp	DP

Note:

The country name, country code, and time zone name are case sensitive.

On the IP Phone UI for 8 and 11-line phones, a User or Administrator can select **Preferences->Time and Date->Time Zone->Others** and choose **"DP-Dhcp"** from the displayed time zone list.

On the IP Phone UI for 3-line phones, you select **Preferences->Time and Date->Time Zone->Others** and enter **"DP"** for the country code, or press **"*"** and select **"Dhcp"** from the displayed time zone list.

On the 6739i, a User or Administrator can select **Set Time->Timezone->Others** and choose **"DP-Dhcp"** from the displayed time zone list.

If you enable DHCP Option 2 via the IP Phone UI, the change takes place dynamically.

Notes:

- When DHCP Option 2 is enabled on the phone, the phone still uses the values configured for **Daylight Savings** to control daylight savings time.
- The default behavior for the phone is to use the NTP server from Option 42 (or current configuration setting) and the current time zone settings.
- If the time zone name parameter is set to a value other than Dhcp, then DHCP Option 2 is disabled.

References

For more information about setting DP-DHCP for the timezone, see Appendix A, **"Time Zone Name"** on page A-41.

For more information about setting the country code, see Appendix A, **"Country Codes (from Standard ISO 3166)"** on page A-138.

Custom Time Zone Support

A User or Administrator can also set a custom time zone on the phone to be configured with the Network Time Protocol (NTP) server addresses. However, NTP provides the Coordinated Universal Time (UTC) time so the phone requires the offset from UTC in order to deliver the correct local time.

On the IP Phone UI for 8 and 11-line phones, a User or Administrator can select **Preferences->Time and Date->Time Zone->Others** and choose “**Custom**” from the displayed time zone list.

On the IP Phone UI for 3-line phones, you select **Preferences->Time and Date->Time Zone->Others** and enter “**Custom**” for the country code.

On the 6739i, a User or Administrator can select **Set Time->Timezone->Others** and choose “**Custom**” from the displayed time zone list.

References

For more information about setting a custom timezone, see Appendix A, “[Time Zone Name](#)” on [page A-41](#).

Configuring Time and Date Using the Configuration Files

Use the following information to set a time and date format, time zone, and daylight savings time using the configuration files.

Configuration Files

For specific date and time parameters you can set in the configuration files, see Appendix A, the section, “[Time and Date Settings](#)” on [page A-40](#).

For specific parameters you can set for custom time zone settings, see Appendix A, the section, “[Custom Time Zone and DST Settings](#)” on [page A-47](#).

Configuring Time and Date Using the IP Phone UI

Use the following procedure to set a time and date, time and date format, time zone, and daylight savings time using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.

Set Time Format:

2. Select **Time and Date**.
3. Select **Time Format**.
Valid values are **12 Hour** and **24 Hour**.

Note:

The default Time Format is **12 Hour**.

4. Use the navigation keys to select the preferred time format.
5. Press **Done** to save the Time Format you selected.

Set Date Format:

6. Select **Date Format**.

IP Phone UI

7. Select a date format from the list of options.

Valid values are:

- WWW MMM DD (default)
- DD-MMM-YY
- YYYY-MM-DD
- DD/MM/YYYY
- DD/MM/YY
- DD-MM-YY
- MM/DD/YY
- MMM DD
- DD MMM YYYY
- WWW DD MMM
- DD MMM
- DD.MM.YYYY

Note:

The default Date Format is **WWW MMM DD** (Day of Week, Month, Day).

8. Press **Done** to save the Date Format.

Set Time Zone:

9. Select **Time Zone**.

10. **For 3-Line LCD Displays:**

Press * to display a list of time zones.

For 8 and 11-Line LCD Displays:

Use the navigation keys to view available time zones.

Note:

For more information about setting the time zone to "DP-Dhcp" or "Custom", see "DHCP Time Offset (Option 2) Support" on page 5-18, "Custom Time Zone Support" on page 5-19, or Appendix A, "Time Zone Name" on page A-41.

11. Select a Time Zone from the list of values.

For valid values, see Appendix A, the section, "Time and Date Settings" on page A-40.

Note:

The default Time Zone is **US-Eastern**.

12. Press **Done** to save the Time Zone you selected.

Set Daylight Savings Time:

13. Select **Daylight Savings**.

14. Select a Daylight Savings time from the list of options.

Valid values are:

- OFF
- 30 min summertime
- 1 hr summertime
- automatic

Note:

The default for Daylight Savings is **Automatic**.

15. Press **Done** to save the Daylight Savings value you selected.

For the 6739i:**IP Phone UI**

1. Press the **Options** key on the phone to enter the Options List.

Set Time Format:

2. Press **Set Time**.
3. Press **Time Format** and select a value for the time format on your phone.
Valid values are **12 Hour** and **24 Hour**.

Note:

The default Time Format is **12 Hour**.

Set Date Format:

4. Press **Date Format**.
5. Select a date format from the list of values.
Valid values are:
 - WWW MMM DD (default)
 - DD-MMM-YY
 - YYYY-MM-DD
 - DD/MM/YYYY
 - DD/MM/YY
 - DD-MM-YY
 - MM/DD/YY
 - MMM DD
 - DD MMM YYYY
 - WWW DD MMM
 - DD MMM
 - DD.MM.YYYY

Note:

The default Date Format is **WWW MMM DD** (Day of Week, Month, Day).

Set Time Zone:

6. Press **Time Zone**.
7. Press a country. Valid values are:
 - America
 - Asia
 - Atlantic
 - Australia
 - Europe
 - Pacific
 - Others (DP-Dhcp, Custom)

Note:

For more information about setting the time zone to "DP-Dhcp" or "Custom", see "DHCP Time Offset (Option 2) Support" on page 5-18, "Custom Time Zone Support" on page 5-19, or Appendix A, "Time Zone Name" on page A-41.

8. Press a Time Zone from the list of values.
For valid values, see Appendix A, the section, "Time and Date Settings" on page A-40.

The default Time Zone is **US-Eastern**.

9. Press the  to return to the previous screen.

IP Phone UI

Set Daylight Savings Time:

10. Press **Daylight Savings**.

11. Press a Daylight Savings time option.

Valid values are:

- OFF
- 30 min summertime
- 1 hr summertime
- automatic

Note:

The default for Daylight Savings is **Automatic**.

12. Press the  to return to the previous screen.

13. Press the  button or the  button at any time to return to the idle screen.

For the 6867i:

IP Phone UI

1. Press  to enter the Options List.

Set Time Format:

2. Navigate to the **Time and Date** -> **Settings** option and press the  button or **Select** softkey.
3. With Time Format highlighted press the 4 key to move to selection column.
4. Use the 5 and 2 keys to scroll through and choose the desired time format. Valid values are 12 Hour and 24 Hour (the default is 12 Hour).

Set Daylight Savings:

5. Press the 3 key to move to back to the options column and press the 4 key to highlight **Daylight Savings**.
6. With **Daylight Savings** highlighted press the 4 key to move to selection column.
7. Use the 5 and 2 keys to scroll through and choose the desired daylight savings setting. Valid values are:
 - Off
 - 30 min summertime
 - 1h summertime
 - Automatic (default)

Set Date Format:

8. Press the 3 key to move to back to the options column and press the 4 key to highlight **Date Format**.
9. With **Date Format** highlighted press the 4 key to move to selection column.
10. Use the 5 and 2 keys to scroll through and choose the desired date format. Valid values are:
 - WWW MMM DD (default)
 - DD-MMM-YY
 - YYYY-MM-DD
 - DD/MM/YYYY
 - DD/MM/YY
 - DD-MM-YY
 - MM/DD/YY
 - MMM DD
 - DD MMM YYYY
 - WWW DD MMM
 - DD MMM
 - DD.MM.YYYY
11. Press the **Save** softkey to save your changes.

Set Daylight Savings Time:

12. Navigate to the **Time and Date** -> **Time Zone** option and press the  button or **Select** softkey. A list of time zones displays for different areas of the world.
13. Use the 5 and 2 keys to scroll through and highlight the desired region. Valid values are:
 - America
 - Asia
 - Atlantic
 - Australia
 - Europe
 - Pacific
 - Others
14. With the desired region highlighted press the 4 key to move to selection column.
15. Use the 5 and 2 keys to scroll through and choose the time zone that applies to your area. The default time zone is **US-Eastern**.
16. Press the **Save** softkey to save your changes.

Configuring Time and Date Using the Aastra Web UI

Use the following procedure to set a time and date, time and date format, time zone, and daylight savings time using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Time and Date Setting**.

Time and Date Setting	
Time Format	24h
Date Format	DD/MM/YYYY
NTP Time Servers	<input checked="" type="checkbox"/> Enabled
Time Server 1	0.0.0.0
Time Server 2	0.0.0.0
Time Server 3	0.0.0.0

2. In the **“Time Format”** field, select the time format you want to use on your phone. Valid values are:
 - **12h** (12 hour format) (default)
 - **24h** (24 hour format).

Note:

The time displays on the phone's idle screen in the format you select for this field.

3. In the **“Date Format”** field, select the date format you want to use on your phone. Valid values are:
 - WWW MMM DD (default)
 - DD-MMM-YY
 - YYYY-MM-DD
 - DD/MM/YYYY
 - DD/MM/YY
 - DD-MM-YY
 - MM/DD/YY
 - MMM DD
 - DD MMM YYYY
 - WWW DD MMM
 - DD MMM
 - DD.MM.YYYY

Note:

The date displays on the phone's idle screen in the format you select for this field.

4. Click **Save Settings** to save your changes.

Time Servers

A time server is a computer server that reads the actual time from a reference clock and distributes this information to the clients in a network. The time server may be a local network time server or an internet time server. The Network Time Protocol (NTP) is the most widely used protocol that distributes and synchronizes time in the network with the time on the time server.

On the IP phones, you can enable or disable a Time Server to be used to synchronize time on the phones with the Timer Server you specify. An Administrator can use the IP Phone UI, Aastra Web UI, or configuration files to enable/disable the Time Server and specify a Time Server 1, Timer Server 2, and/or Time Server 3. A User can enable/disable the Time Server using the IP Phone UI or Aastra Web UI only. The Time Server is enabled by default.

Setting Time Server Using the Configuration Files

Use the following procedure to enable/disable the Time Server and optionally set the IP Address of Time Servers 1, 2, and/or 3.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Time Server Settings" on page A-45.

Setting Time Server Using the IP Phone UI

Use the following procedure to set the Time Server and optionally set the IP Address of Time Servers 1, 2, and/or 3.

IP Phone UI

Enable/the Time Server by specifying Time Server 1, 2, and/or 3:

1. Press  on the phone to enter the Options List.
2. Select **Preferences->Time and Date**.
3. Select **Timer Server 1, Time Server 2**, and/or **Time Server 3**.
4. Enter the IP address of the Time Server, in dotted decimal format. Use the available softkeys to help you enter the information.
5. Click **Done** to save your changes.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press **Set Time**.
3. Press **Timer Server 1, Time Server 2**, and/or **Time Server 3**. A text box displays.
4. Press the text box and enter the IP address of the Time Server, in dotted decimal format using the keyboard that displays.
5. Press **Enter** to save your changes.
6. Press the  to return to the previous screen.
7. Press the  button or the  button at any time to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.
2. Select **Time and Date -> Set Date and Time**.
3. Ensure there is a checkmark in the box corresponding to the **Use Network Time** setting. If there is no checkmark, press the  button to enable the **Use Network Time** setting.
4. Press the 2 key to highlight **Time Server 1, Time Server 2**, or **Time Server 3**.
5. Using the keys on the dialpad, enter an IP address or domain name for the time server.
6. Press the **Save** softkey to save your changes.

Setting Time Server Using the Aastra Web UI

Use the following procedure to set the Time Server and optionally set the IP Address of Time Servers 1, 2, and/or 3.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Time and Date Setting**.

To enable/disable Time Server:

2. The “**NTP Time Server**” field is enabled by default. If you need to disable the Time Server, uncheck the box. The Time Server 1, 2, and 3 fields are grayed out when disabled.

To set Time Server 1, 2, and/or 3:

3. **Note:**
The “**Time Server**” field must be enabled to enter values in the “**Time Server 1, 2, and 3**” fields.

In the “**Time Server 1**”, “**Time Server 2**”, and/or “**Time Server 3**” field(s), enter the IP address of the Time Server 1, 2, and/or 3 in your network, in dotted decimal format. Default for this field is **0.0.0.0**.
For example, 132.234.5.4

4. Click **Save Settings** to save your changes.

Backlight Mode

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, 6757i CT, and 6865i IP Phones only.

The 6735i, 6737i, 6755i, 6757i, 6757i CT and 6865i have a backlight feature that allows you to turn the backlight on the LCD:

- **Off** - Backlight is always OFF.
- **Auto** (Default)- Automatically turns ON the backlight when the phone is in use, and then automatically turns OFF the backlight when the phone is idle after a specified length of time.

"The Auto" setting sets the phone to turn off the backlighting after a period of inactivity. The period of time that the phone waits before turning the backlight off is also configurable.

You can set this backlight feature using the configuration files and the IP Phone UI.

Configuring the Backlight Mode Using the Configuration Files

Use the following information to set the backlight mode and backlight timer on the IP Phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Backlight Mode Settings" on page A-53.

Note:

Using the configuration files, you can set the backlight to Off (always off) or Auto (On and then off after a period of inactivity).

Configuring the Backlight Mode Using the IP Phone UI

Use the following procedure to set the backlight mode and backlight timer on the IP Phone using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
 2. Select Preferences.
 3. Select **Display**.
 4. Select **Backlight**.
 5. Use the **UP** and **DOWN** arrow keys to select the Backlight status for your phone. Default is "Auto". Valid options are:
 - Off
 - Auto (Default)
- Note:**
Setting the Backlight to "Auto" displays an **ADVANCED** button for you to set the Auto timer.
6. If you select "Off", press **Done** to save your setting.
 7. If you select "Auto", press the **Advanced** softkey to set the automatic timer.
 8. Using the keypad, enter the amount of seconds you want the phone to stay backlit when the phone is idle. Valid values are **1** to **7200** seconds. Default is **600 seconds** (equals 10 minutes). When this period of time is reached, the phone turns OFF the backlight. Use the "**Backspace**" and/or "**Clear**" softkeys to delete entries if required.
 9. Press **Done** to save your setting. The setting applies immediately to the phone.

Display

Note:

Applicable to the 6739i and 6867i IP Phones only.

The **Display** option on the 6739i and 6867i IP phones allows you to set the following on your phone:

- Brightness Level
- Brightness Timer
- Calibrate Screen (6739i only)

Brightness Level

The "**Brightness Level**" option allows you to set the amount of light that illuminates the LCD display. Use this option to set your preference of brightness.

Setting Brightness

For the 6739i:

IP Phone UI

1. Press  on the phone to enter the Options List
2. Press the **<Display>** button.
3. Press the **<Brightness Level>** button. The following options display.
 - Level 1
 - Level 2
 - Level (default)3
 - Level 4
 - Level 5
4. Press the level of brightness you want on your phone. Level 1 is the least bright and Level 5 is the most bright. Default is Level 3.
5. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

IP Phone UI

1. Press  to enter the Options List.
2. Navigate to the **Display** option and press the  button or Select softkey.
3. Use the 3 and 4 navigation buttons to increase or decrease the intensity of brightness on the LCD.
4. Press the **Save** softkey to save your changes.

Brightness Timer

The "**Brightness Timer**" option allows you to set the amount of time you want the LCD display to stay illuminated before turning the backlight off during a period of inactivity. For example, if you set the brightness timer to 60, when the phone reaches 60 seconds of inactivity, the LCD backlight goes off.

Setting Brightness Timer

For the 6739i:

IP Phone UI

1. Press  on the phone to enter the Options List
2. Press the **<Display>** button.
3. Press the **<Brightness Timer>** button. A text box displays.
4. Press the text box. A pop-up keyboard displays.
5. Press the "123" key and enter a value, in seconds, for the Brightness Timer. You can set the Brightness Timer from 0 to 7200 seconds. Default is 600 (10 minutes).
6. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

IP Phone UI

1. Press  to enter the Options List.
2. Navigate to the **Display** option and press the  button or Select softkey.
3. Press the 2 key to highlight **Brightness Timer**.
4. Enter a value, in seconds, using the dialpad keys. You can set the timer from 1 to 7200 seconds. Default is 600 (10 minutes).
5. Press the **Save** softkey to save your changes.

Configuring the Brightness Level Settings Using the Configuration Files

Use the following information to configure the brightness level settings on the 6739i and 6867i.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Brightness Level Settings](#)" on [page A-54](#).

Calibrate Screen (6739i only)

The “**Calibrate Screen**” option allows you to calibrate the color touchscreen. This process makes fine adjustments to the color screen on the phone for optimal display purposes.

Calibrating the Screen

IP Phone UI

1. Press  on the phone to enter the Options List
2. Press the <Display> button.
3. Press the <Calibrate Screen> button.
A “Recalibrate touchscreen?” prompt displays.
4. Press “Yes” to continue or “No” to cancel the recalibration.
5. If you press “Yes”, the following messages display:
“Waiting for touchscreen activity to subside...”
6. Press the screen as indicated by each prompt using a **SOFT** fine tip stylus pen. Do not use a sharp object such as an ink pen or pencil which may damage the touch screen:
“Touch the UPPER-LEFT corner of the screen.”
“Touch the UPPER-RIGHT corner of the screen.”
“Touch the LOWER-RIGHT corner of the screen.”
“Touch the LOWER-LEFT corner of the screen.”

If you touched the screen in the wrong location, the following message displays:
“Received unreliable data. You will be asked to touch the same point again.”
Retouch the screen in the correct location to continue.

The following message displays:
“Validating calibration data...please wait.”

Then the following message and prompt displays:
“Sanity Check OK. Save changes?”
7. Press the **Yes** button to complete the recalibration, and the phone automatically restarts.

Background Image on Idle Screen

Note:

Applicable to the 6739i and 6867i IP Phones only.

Administrators can brand the idle screen of the 6739i and 6867i IP phones with their own company logo or image. The phones can now display a background image in the bottom layer of the idle screen. This image can be set by the new “**background image**” parameter. Current text (i.e. screen name, extension, and date/time) and softkeys on the idle screen are on top of the background image. The background image can be downloaded from your configuration server using either tftp, ftp, http, and https protocols.

Idle Screen Image Requirements for the 6739i:

- 640 x 480 pixels
- 24-bit color depth
- Both .png and .jpg files are supported
- There should be no frame around the image
- Avoid using images with light-colored elements

Idle Screen Image Requirements for the 6867i:

- 240x320 pixels
- 24-bit color depth.
- .png files only are supported
- There should be no frame around the image
- Avoid using images with light-colored elements

Configuring Background Image on Idle Screen

Use the following procedures to configure the background image on the idle screen

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, “Background Image on Idle Screen” on page A-55.

Configurable Home/Idle Screen Modes**Note:**

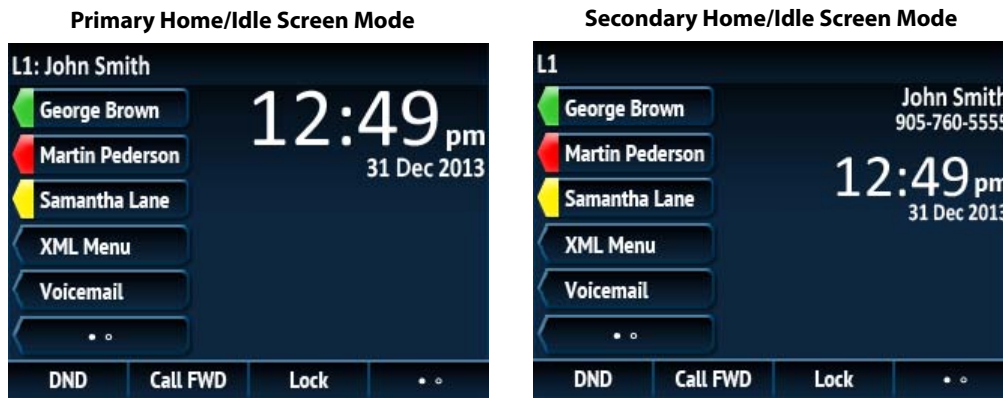

Applicable to the 6867i IP Phone only.

The 6867i IP phone contains two Home/Idle screen layout options. The default primary screen mode provides users with a larger date and time and displays the Screen Name (“**sip screen name**”) parameter beside the line number in the top status bar.

Note:

Screen Name 2 (“**sip screen name 2**”) is not displayed on the 6867i IP phone’s screen when the primary screen mode is configured for use.

The secondary screen mode displays both the Screen Name and Screen Name 2 parameters. They are displayed above the smaller, repositioned date and time.

Administrators can switch the home/idle screen to the preferred layout by defining the “**idle screen mode**” parameter in the configuration files.

Switching the 6867i IP Phone's Home/Idle Screen Mode

Use the following procedures to switch the 6867i IP phones home/idle screen mode.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Configurable Home/Idle Screen Modes](#)" on [page A-55](#).

Picture ID Feature

Note:

Applicable to the 6739i and 6867i IP Phones only.

The Picture ID feature on the 6739i and 6867i shows a picture ID of a caller on the LCD for all of the following events on the phone:

- Incoming Calls (matched to Caller ID numbers)
- Outgoing Calls (matched to dialed numbers)
- Directory entries
- Callers List entries
- Redial List entries

Your Administrator stores the pictures in a centralized picture repository. The pictures are dynamically retrieved from the centralized server for each call and then locally cached in the phone to reduce network traffic.

If there is no picture on the central server for the dialed number and/or Caller Id number, and Directory, Callers List, and/or Redial List entry, the generic blue figure image is shown.

**Generic
Blue Image**

Pictures must be in ".png" format, 150pixels wide x 200pixels tall, and in 24-bit color (the 6867i also supports 32-bit color). The filenames for pictures must be stored using the phone number as the filename (for example, 9995551234.png). Enabling and disabling Picture ID on the phone can be done by an Administrator using the configuration files only

Note:

The Picture ID feature supports the use of TFTP, FTP, HTTP, and HTTPS protocols when downloading pictures.

Enabling/Disabling the Picture ID on the Phone Using the Configuration Files

Use the following parameter to enable/disable Picture ID on the phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Picture ID Feature](#)" on [page A-56](#).

Audio DHSG Headset

Note:

Applicable to the 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, 6757i CT, 6865i, and 6867i IP Phones only.

DHSG is a standard for telecommunication headsets. The Aastra 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, 6757i CT, 6865i, and 6867i IP Phones support the use of a DHSG headset.

Aastra's DHSG headset support has been tested and verified with the following products:

- GN Netcom GN 9350, GN 9350e, GN 9120, GN 9125.
All require the GN 14201-10 cable.
- Plantronics CS60, CS70N, CS351N, and Voyager 510S.
All require the APS-1 cable.
- Sennheiser BW900. Requires the TCI01 adapter box.

Use of a non-verified DHSG headset solution is at the customer's own discretion and the customer should be aware that some DHSG headsets require an optional cable in order to be electrically DHSG compliant. Aastra is not responsible for any damage to the IP phone or headset that may result from the use of non-verified headsets, or from incorrectly connecting headsets or cables.

Warning!

- Only the Aastra DHSG cable should be connected directly to your phone. **No** 3rd party DHSG cables should be connected directly to the Aastra IP phone. Any damage caused by connecting a 3rd party DHSG headset cable directly to your phone will void your warranty with Aastra.
- The headset port is for headset use only. Plugging any other devices into this port may cause damage to the phone and will void your warranty.
- Customers should read and observe all safety recommendations contained in headset operating guides when using any headset.

Reference

For more information about installing a DHSG headset on your phone, see the **IP Phone-Specific Installation Guide**.

Configuring DHSG on the Phone

You can enable or disable the use of a DHSG headset using the parameter "**dhsg**" in the configuration files, or at the location **Options->Preferences->Set Audio->DHSG** in the IP Phone UI. Default for DHSG is disabled (OFF).

Configuring DHSG Using the Configuration Files

Use the following information to configure the use of a DHSG headset on the IP Phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "DHSG Settings" on [page A-56](#).

Configuring DHSG using the IP Phone UI

Use the following procedure to configure DHSG using the IP Phone UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select Preferences.
3. Select **Set Audio**.
4. Select **DHSG** and toggle the DHSG support ON or OFF

**IP Phone UI**

5. If you select **“Off”**, press **Done** to save your setting.
6. Press **Set** or **Done** to save your setting. The setting applies immediately to the phone.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press the **<Audio>** button.
3. Press the **<Headset Device>** button. The following values display:
 - Wired (default)
 - DHS
 - Bluetooth
4. Press the value you want to set for the headset device.
5. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.
2. Navigate to the **Audio > Headset** option and press the  button or Select softkey.
3. Press the 2 key to highlight **DHSG**.
4. With **DHSG** highlighted press the 4 key to move to selection column.
5. Use the 5 and 2 keys to scroll through and choose whether or not to enable DHS. Valid values are:
 - DHS is OFF (default)
 - DHS is ON
6. Press the **Save** softkey to save your changes.

Configurable Bluetooth Support

Note:

Applicable to the 6739i IP Phone only.

Administrators now have the option of enabling or disabling Bluetooth functionality on the 6739i IP phone. By defining the **“audio bluetooth”** parameter as **“0”** in the configuration files, Bluetooth functionality will be completely disabled and all Bluetooth-related options in the 6739i’s native User Interface (UI), along with the Bluetooth-related references in the phone’s Web UI, will be inaccessible.

Administrators can re-enable Bluetooth functionality by defining the **“audio bluetooth”** parameter as **“1”** in the configuration files.

Note:

Bluetooth functionality is enabled by default.

Configuring Bluetooth Support Using the Configuration Files

Use the following parameters to configure Bluetooth support using the configuration files.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, **“Bluetooth Support Settings”** on [page A-57](#).

Audio Hi-Q on G.722 Calls

The Aastra IP phones support the Hi-Q (high quality) audio technology which delivers enhanced performance and voice clarity for Aastra's 6700i series of SIP phones. Incorporating wideband audio technology, Aastra Hi-Q significantly improves the audio quality of calls. This technology provides a more lifelike conversation when the G.722 wideband Codec is used. The phones with 8 and 11-line LCD screens display a large icon when Hi-Q is being used on the call. On 3-line LCD screens, the text of "**Hi-Q**" displays on the same line as the call timer.

Wideband Audio Equalizer

Note:

Applicable to the 6739i IP Phone only.

Different wideband audio equalizer settings are available for the speakerphone and handset audio paths on the 6739i model IP phones. In addition to the default setting, three additional equalizer settings for both audio paths are available to choose from.

Users can select and save their preferred setting for each individual audio path by using the IP phone's UI. Administrators have the additional option of configuring the equalizer settings by defining the "**handset rx wb equ filter**" and "**speaker rx wb equ filter**" parameters in the configuration files.

Note:

Only the default equalizer settings (i.e. Setting1) for each audio path on the IP phones meet TIA-920 and Aastra Hi-Q™ standards.

Configuring Wideband Audio Equalizer Settings Using the IP Phone UI

Use the following procedure to configure the wideband audio equalizer settings using the IP phone's UI.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Press the <Audio> button.
3. Navigate to the second page and press the <WBand RX Filters> key.
4. Press the settings button next to the audio path (i.e. **Speaker** or **Handset**) you would like to make changes to.
5. Press the wideband audio equalizer setting you want to apply for the audio path. The default settings for the respective audio paths are **Spkr Setting1** and **HS Setting1**.
6. Press the  to return to the previous menu or press the  to return to the idle screen.

Configuring Wideband Audio Equalizer Settings Using the Configuration Files

Use the following parameters to configure the wideband audio equalizer settings using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Wideband Audio Equalizer Settings](#)" on [page A-57](#).

Audio Transmit and Receive Gain Adjustments

The audio gain properties for the IP phone handset, headset, and speakerphone is adjusted to reduce side-tone and echo on the local and far-end equipment. You can adjust these settings from -10 db to +10 db to best suit your comfort level and deployment environment by using the following parameters in the configuration files:

- **headset tx gain**
- **headset sidetone gain**
- **handset tx gain**
- **handset sidetone gain**
- **handsfree tx gain**
- **audio mode**

The default setting for these parameters is 0 (zero).

Note:

Aastra recommends you leave the default of 0 (zero) as the settings for these parameters.

The following table describes each parameter.

Parameter	Description
Headset tx gain	The increased (+db) or decreased (-db) amount of signal transmitted from the headset microphone to the far-end party.
Headset sidetone gain	The increased (+db) or decreased (-db) amount of sidetone signal from the headset microphone to the headset speaker.
Handset tx gain	The increased (+db) or decreased (-db) amount of signal transmitted from the handset microphone to the far-end party.
Handset sidetone gain	The increased (+db) or decreased (-db) amount of sidetone signal from the handset microphone to the handset speaker.
Handsfree tx gain	The increased (+db) or decreased (-db) amount of signal transmitted from the base microphone to the far-end party.
Audio mode	Allows you to configure how the d/f key (handsfree key) works. Audio mode has 4 options: <ul style="list-style-type: none"> • 0 (Speaker) - Calls can be made or received using the handset or handsfree speakerphone and can be switched between the two modes by pressing the d /fkey. When on speaker, you can return to using the handset by placing the handset on the cradle and picking it up again. • 1 (Headset) - Calls can be made or received using the headset. Calls can be switched between the headset and handset by pressing the d /fkey. • 2 (Speaker/Headset) - Incoming calls are sent to the speakerphone. By pressing the d /fkey, you can switch between the handsfree speakerphone, the headset, and the handset. • 3 (Headset/Speaker) - Incoming calls are sent to the headset. By pressing the d /fkey, you can switch between the headset, the handsfree speakerphone, and the handset.

Configuring Audio Transmit and Receive Gain Adjustments

You can configure the audio transmit and gain adjustments using the configuration files only.

Use the following procedure to configure this feature.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Audio Transmit and Receive Gain Adjustment Settings](#)” on page A-148.

Live Dialpad

The "Live Dialpad" option on the IP phone turns the Live Dial Pad mode ON or OFF. With live dial pad ON, the IP phone automatically dials out and turns ON Handsfree mode as soon as a dial pad key or softkey is pressed. With live dial pad OFF, if you dial a number while the phone is on-hook, lifting the receiver or pressing the  initiates a call to that number.

*Availability of feature dependant on your phone system or service provider.

A User can turn the "Live Dialpad" ON and OFF using the IP Phone UI only. A System Administrator can turn it ON and OFF using the IP Phone UI or the configuration files.

Enabling/Disabling Live Dialpad Using the Configuration Files

Use the following procedure to enable/disable Live Dialpad on the IP Phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Live Dialpad Settings" on page A-58.

Enabling/Disabling Live Dialpad Using the IP Phone UI

Use the following procedure to enable/disable Live Dialpad on the IP Phones.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Preferences**.
3. Select **Live Dialpad**.
4. On 3-Line LCD phones:
Press the **UP** and **DOWN** arrow keys to toggle the live dialpad setting ON or OFF.

On 8 and 11-Line LCD phones:

Press **Change** to toggle the live dialpad setting ON or OFF.

5. Press **Done** to save the setting.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Select **Live Dial**.
3. Select the **Off/On** button next to Live Dialpad and touch the applicable button to enable or disable the feature.
4. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.
2. Navigate to the **Dialpad -> Live Dialpad** option and press the  button or Select softkey.
3. Use the 5 and 2 keys to scroll through and enable (On) or disable (Off) the live dialpad feature.
4. Press the **Save** softkey to save your changes.

Language

The IP phones support several different languages. You can have the IP phone UI and the Aastra Web UI display in a specific language as required. When you set the language to use, all of the display screens (menus, services, options, configuration parameters, etc.) display in that language. The IP phones support the following languages:

Available Language	Associated Language File (included in the firmware file when downloaded from configuration server)
English	Default (resides on the phone)
Czech (UTF-8)*	lang_cs.txt
Czech (ASCII)*	lang_cs_op.txt
Catalan*	lang_ct.txt
Valencian*	lang_ct_va.txt
Welsh*	lang_cy.txt
German*	lang_de.txt
Danish*	lang_da.txt
Spanish	lang_es.txt
Mexican Spanish	lang_es_mx.txt
Finnish*	lang_fi.txt
French	lang_fr.txt
Canadian French	lang_fr_ca.txt
Italian*	lang_it.txt
Dutch*	lang_nl.txt
Dutch (Netherlands)*	lang_nl_nl.txt
Norwegian*	lang_no.txt
Polish (ASCII)*	lang_pl.txt
Polish (UTF-8)*	lang_pl_pl.txt
Portuguese*	lang_pt.txt
Portuguese Brazilian*	lang_pt_br.txt
Romanian*	lang_ro.txt
Russian*	lang_ru.txt
Slovak (UTF-8)*	lang_sk.txt
Slovak (ASCII)*	lang_sk_op.txt
Swedish*	lang_sv.txt
Turkish*	lang_tr.txt

Notes:

- The above languages denoted with asterisks (i.e. *) are not applicable to the 6757i CT cordless handset.
- The 6753i does not support UTF-8 encoded language files.

Loading Language Packs

You make languages available to use on the phone by loading language packs from the configuration server to the local <MAC>.cfg configuration file. You can use the configuration files or the Aastra Web UI to perform the download. Each language pack consists of the IP Phone UI and Aastra Web UI translated in a specific language.

Loading Language Packs via the Configuration File (<mac>.cfg)

Using the configuration files, you specify a language pack to load in the following format:

```
lang_<ISO 639>_<ISO 3166>.txt
or
lang_<ISO 639>.txt
```

where <ISO 639> is the language code specified in Standard ISO 639 (see Appendix A, the section, [Language Codes \(from Standard ISO 639\)](#) on [page A-137](#)) and <ISO 3166> is the country code specified in Standard ISO 3166 (see [Country Codes \(from Standard ISO 3166\)](#) on [page A-138](#)). The <ISO 3166> attribute is optional.

Note:

Adding/changing language packs can only be done at bootup of the IP phone. The default language (English) cannot be changed or removed.

Example

The following is an example of the parameters you would enter in the <MAC>.cfg file to load a French, Italian, German, and Spanish language pack to the IP phone.

```
language 1: lang_fr_ca.txt
language 2: lang_it.txt
language 3: lang_de.txt
language 4: lang_es.txt
```

The above entries in the <MAC>.cfg file tells the phone which language packs to load. When the language pack(s) have loaded, you must then use the configuration files IP Phone UI to specify which language to display on the IP phone. You must use the Aastra Web UI to specify the language to use in the Web UI.

References

For more information about specifying the language to use, see the section, [“Specifying the Screen Language to Use”](#) on [page 5-40](#).

For more information about language codes and country codes, see Appendix A, the section, [“Language Pack Settings”](#) on [page A-136](#).

Loading Language Packs via the Aastra Web UI

Using the Aastra Web UI, you can specify a language pack to load using the parameters at *Basic Settings->Preferences->Language Settings*.

You use the following fields in the Aastra Web UI to specify which language packs to load:

Once the language pack is loaded to the phone, it is available for selection from either the configuration files, the IP Phone UI or the Aastra Web UI.

Specifying the Screen Language to Use

Once the language pack(s) have loaded, you must then specify which language to use on the phone. After the phone has booted up, you can specify which language(s) to use. You can use the configuration files (via the “**language**” parameter) and the IP Phone UI to specify the language for the IP Phone UI. You can use the configuration files (via the “**web language**” parameter) and Aastra Web UI to specify the files for the Aastra Web UI.

Use the following procedures to specify the language to use on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Language Settings](#)” on [page A-134](#) and “[Language Pack Settings](#)” on [page A-136](#).

Notes:

- If you specify the language to use on the phone via the configuration files, you must reboot the phone for the changes to take affect.
- All languages may not be available for selection. The available languages are dependant on the language packs currently loaded to the IP phone.

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Language**.
3. Select **Screen Language**.
4. Select the applicable language.

Notes:

- Valid values for the 6757i CT cordless handset are English, French, and Spanish only.
- All languages may not be available for selection. The available languages are dependant on the language packs currently loaded to the IP phone. English is the default language and cannot be changed or removed. For more information about loading language packs, see “[Loading Language Packs](#)” on [page 5-38](#).

5. Press **Done** to save the changes.

The change is dynamic. The IP phone UI displays all menu items in the language you chose.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press the <**Language**> button.
3. Press the <**Screen Language**> button. The screen displays a list of available languages.

Note:

All languages may not be available for selection. The available languages are dependant on the language packs currently loaded to the IP phone. English is the default language and cannot be changed or removed. For more information about loading language packs, see “[Loading Language Packs](#)” on [page 5-38](#).

4. Press the screen language you want to set on the phone. The change takes place immediately.
5. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.

IP Phone UI

2. Navigate to the **Language** option and press the  button or Select softkey.
3. With **Screen Language** highlighted press the 4 key to move to selection column.
4. Use the 5 and 2 keys to scroll through and choose the desired screen language.
5. Press the **Save** softkey to save your changes.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Language Settings**.

Language Settings	
Webpage Language	English
Input Language	English
Language 1	lang_dk.txt
Language 2	lang_es.txt
Language 3	lang_fr.txt
Language 4	lang_it.txt

Loading the Language Pack

2. In the “**Language N**” fields, enter the file name of the language pack you want to use to display a specific language in the Aastra Web UI. For example, you could enter any of the following in the “Language 1”, “Language 2”, “Language 3”, and “Language 4” fields to display the Aastra Web UI in the respective language:
 - lang_cs.txt (Czech - UTF-8)
 - lang_cs_op.txt (Czech - ASCII)
 - lang_ct.txt (Catalan)
 - lang_ct_va.txt (Valencian)
 - lang_cy.txt (Welsh)
 - lang_de.txt (German)
 - lang_da.txt (Danish)
 - lang_es.txt (Spanish)
 - lang_es_mx.txt (Mexican Spanish)
 - lang_fi.txt (Finnish)
 - lang_fr.txt (French)
 - lang_fr_ca.txt (Canadian French)
 - lang_it.txt (Italian)
 - lang_nl.txt (Dutch)
 - lang_nl_nl.txt (Dutch - Netherlands)
 - lang_no.txt (Norwegian)
 - lang_pl.txt (Polish - ASCII)
 - lang_pl_pl.txt (Polish - UTF-8)
 - lang_pt.txt (Portuguese)
 - lang_pt_br.txt (Brazilian Portuguese)
 - lang_ro.txt (Romanian)
 - lang_ru.txt (Russian)
 - lang_sk.txt (Slovak - UTF-8)
 - lang_sk_op.txt (Slovak - ASCII)
 - lang_sv.txt (Swedish)
 - lang_tr.txt (Turkish)

You must have the language pack(s) already loaded to your phone in order to use them. For more information about loading language packs, see [“Loading Language Packs”](#) on page 5-38.

For more information about language codes and country codes, see Appendix A, the section, [“Language Pack Settings”](#) on page A-136.

3. Click **Save Settings** to save your changes.

Aastra Web UI

Specifying the Language to Use in the Aastra Web UI

4. After restarting your phone, log back in using the Aastra Web UI.
5. Click on **Basic Settings->Preferences->Language Settings**.
6. In the **"Webpage Language"** field, select a language to apply to the Aastra Web UI.

Notes:

 - Valid values for the 6757i CT cordless handset are English, French, and Spanish only.
 - All languages may not be available for selection. The available languages are dependant on the language packs currently loaded to the IP phone. English is the default language and cannot be changed or removed. For more information about loading language packs, see ["Loading Language Packs"](#) on page 5-38.
7. Click **Save Settings** to save your changes.

The Aastra Web UI displays all screens in the language you chose.

Specifying the Input Language to Use

The phones support text and character inputs in various languages (English, German, French, Spanish, Italian, Portuguese, Russian, and Nordic).

Inputting textual or character information into the IP Phone UI, Aastra Web UI, and XML scripts can now be done in various languages using the keypad on the phone. The System Administrator and User can enable this feature using the Aastra Web UI or the IP Phone UI. An Administrator can also use the configuration files to enable this feature. Users can then use text and characters in a specific language when performing inputs on the phone.

The following tables identify the language characters that a User can enter on the 5i Series phones that support the Input Language feature.

Keypad Text/Character Input Tables

Configuring Language Input Using the Configuration Files

An Administrator can specify the input language to use by entering a specific parameter in the configuration files. An Administrator must enter the following parameter to enable this feature:

- **input language**

Use the following procedures to specify the input language to use on the IP phone.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, “Language Settings” on page A-134.

Configuring Language Input Using the IP Phone UI

Once “Language Input” is enabled, an Administrator or User can change the input language on the phone using the IP Phone UI. The “**Input Language**” option appears under the Language option in the IP Phone UI.

Use the following procedure to change the input language using the IP Phone UI.

IP Phone UI

1. Press the **Options** key.
2. Select **Language** from the Options List.
3. Select **Input Language** from the Language List.
4. Select the language you want to use on the IP phone for inputting text and characters. Valid values are:
 - English (default)
 - Français (French)
 - Español (Spanish)
 - Deutsch (German) (not applicable to 6757i CT cordless handset)
 - Italiano (Italian) (not applicable to 6757i CT cordless handset)
 - Português (Portuguese) (not applicable to 6757i CT cordless handset)
 - Русский (Russian) (not applicable to 6757i CT cordless handset)
 - Nordic
5. Press **Done** when you have selected a language.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press the <**Language**> button.
3. Press the <**Input Language**> button. The following options display:
 - English (default)
 - Français (French)
 - Español (Spanish)
 - Deutsch (German)
 - Italiano (Italian)
 - Português (Portuguese)
 - Русский (Russian)
 - Nordic
4. Press the input language you want to set on the phone. The change takes place immediately.
5. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.
2. Navigate to the **Language** option and press the  button or Select softkey.
3. Press the 2 key to highlight the Input Language option.
4. With **Input Language** highlighted press the 4 key to move to selection column.
5. Use the 5 and 2 keys to scroll through and choose the desired input language. Valid values are:
 - English (default)
 - Français (French)
 - Español (Spanish)
 - Deutsch (German)
 - Italiano (Italian)
 - Português (Portuguese)
 - Русский (Russian)
 - Nordic
6. Press the **Save** softkey to save your changes.

Configuring Language Input Using the Aastra Web UI

Once “Language Input” is enabled, an Administrator or User can also change the input language on the phone using the Aastra Web UI. The “**Input Language**” option appears at the path *Basic Settings->Preferences->Language Settings*. Use the following procedure to set the input language using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings-> Preferences->Language Settings**.

Language Settings	
Webpage Language	English
Input Language	English
Language 1	lang_dk.txt
Language 2	lang_es.txt
Language 3	lang_fr.txt
Language 4	lang_it.txt

2. Select a language from the “**Input Language**” field. Setting this field allows you to specify the language to use when entering text in the Aastra Web UI, IP Phone UI, or in XML applications on the phone. Valid values are:
 - English (default)
 - Français (French)
 - Español (Spanish)
 - Deutsch (German) (not applicable to 6757i CT cordless handset)
 - Italiano (Italian) (not applicable to 6757i CT cordless handset)
 - Português (Portuguese) (not applicable to 6757i CT cordless handset)
 - Русский (Russian) (not applicable to 6757i CT cordless handset)
 - Nordic

Note:

Available input languages are dependent on the configuration enabled by your System Administrator.

3. Click **Save Settings** to save your changes.

Configuring Language Input for an XML Application

A System Administrator can enable input languages in XML applications using the `<AastraIPPhoneInputScreen>` object and the “**inputLanguage**” attribute.

Reference

For more information about using XML objects for defining input language, contact Aastra Customer Support regarding the **Aastra XML Development Guide**.

UTF- 8 Codec for Multi-National Language Support

The IP Phones and expansion modules include support for ISO 8859-2 (Latin2) of multi-national languages when displaying and inputting in the IP Phone UI and the Aastra Web UI.

Note:

This feature is not applicable to the handsets on the 6757i CT and the 9480i CT.

UTF-8 is also compatible with XML encoding on the IP Phones.

The following table illustrates the Latin 2 character set now used on the IP Phones.

	-0	-1	-2	-3	-4	-5	-6	-7	-8	-9	-A	-B	-C	-D	-E	-F
A-	NBSP 00A0 160	À 0104 161	Á 02D8 162	Â 0141 163	Ã 00A4 164	Ä 013D 165	Å 015A 166	Æ 00A7 167	Ç 00A8 168	Š 0160 169	Ş 015E 170	Ť 0164 171	Ž 0179 172	ŠHY 00AD 173	Ž 017D 174	Ž 017B 175

Minimum Ringer Volume

To prevent the user from turning off the ringer, an Administrator can configure a parameter called “**ringer volume minimum**” to set the minimum ringer volume level. When the minimum ringer level is reached while the user keeps pressing the button, the level of sound does not change.

Note:

This minimum ringer volume does not affect the “silent” ring tone. When the silent ring tone is selected, no ringing will be played by the phone

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “[Minimum Ringer Volume](#)” on page A-150.

Locking IP Phone Keys

The IP phones allow you to lock or unlock programmable keys, softkeys, keypad keys, hard keys, cordless handset keys, and expansion keys (for expansion modules). When key locking is enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. In this case, the local settings (i.e. those configured through the Web UI or [for the 6739i] the phone UI) take precedence over any key parameters defined in the configuration files.

Notes:

- If no settings are configured locally but the key type is defined in a configuration file, the phone will lock the respective key with the type defined in the configuration file along with any values associated with the additional key parameters (e.g. for softkeys, “softkeyN label”, “softkeyN value”, “softkeyN line”, “softkeyN states”).
- Administrators also have the option of simply adding an exclamation mark (i.e. “!”) in front of the respective key parameters to lock the keys to the values defined in the configuration files, overriding any locally configured settings (see [Locking Parameters in the Configuration File](#) on page 2-15 for further details).

You can lock and unlock keys using the configuration files only. When viewing the locked key via the Aastra Web UI, the key is grayed out (disabled) and cannot be changed. Locking is dynamic for XML pushes.

You use the following “locking” parameters in the configuration files to lock the softkeys and/or programmable keys on all the phones. If no key settings are configured locally, the locking parameters impact existing softkey and programmable key parameters defined in the configuration files as detailed in the table below.

Locking Parameter	Impacted Parameters	Applicable Phone Models
softkeyN locked	softkeyN type softkeyN label softkeyN value softkeyN line softkeyN states	9480i 9480i CT 6735i 6737i 6739i 6755i 6757i 6757i CT 6867i
topsoftkeyN locked	topsoftkeyN type topsoftkeyN label topsoftkeyN value topsoftkeyN line	6737i 6757i 6757i CT 6867i
prgkeyN locked	prgkeyN type prgkeyN value prgkeyN line	9143i 6730i 6731i 6735i 6753i 6755i 6863i 6865i
pnhkeypadN locked	pnhkeypadN value pnhkeypadN line	All IP phone models
featurekeyN locked	featurekeyN type featurekeyN label	9480i CT 6757i CT
expmodX keyN locked	expmodX keyN type expmodX keyN label (M675i only) expmodX keyN value expmodX keyN line	6700i and 6800i-series phones only (not applicable to the 6730i, and 6731i)
hardkeyN locked	hardkeyN type hardkeyN value hardkeyN line	6867i

Note:

The 3-line LCD phones prevent users from setting a Speeddial key via the Phone UI on a key that has been locked.

Locking the IP Phone Keys using the Configuration Files

Use the following procedures to lock the softkeys and programmable keys on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Locking Keys” on page A-187.

Locking/Unlocking the SAVE and DELETE keys

Note:

Applicable to the 6730i, 6731i, 6753i, and 6865i IP Phones only.

By default, the 6730i, 6731i, 6753i, and 6865i have two keys dedicated to the **Save** and **Delete** functions. These two keys can be made programmable by the Administrator, freeing up the total number of programmable keys if required.

If a System Administrator unlocks the **Save** and **Delete** keys, these keys can be configured with the same functions that are available for the other programmable keys. Only the System Administrator can unlock these keys.

The **Save** key allows you to save entries to the Directory and perform a Save-To from the Callers List. It also allows you to save speeddial information to a programmable key. You can also use the **Save** key while using specific XML applications.

The **Delete** key allows you to remove entries from the Directory List and Callers List. (Must enter the Directory or Callers list and select an entry, then press twice to delete entry).

By default, the **Save** and **Delete** keys are locked so that a user can use them for saving and deleting only. An Administrator can unlock these keys using the configuration files, allowing the keys to be programmed with other functions if required. An Administrator can use the following parameters in the configuration file to lock and unlock the **Save** and **Delete** keys:

For the 6730i, 6731i, and 6865i:

- **prgkey5 locked**
- **prgkey6 locked**

For the 6753i:

- **prgkey1 locked**
- **prgkey2 locked**

The value of "0" unlocks the keys, and the value of "1" locks the keys. The default is "1" (lock).

The following is an example of unlocking the **Save** and **Delete** keys on the 6753i using the configuration files:

Example:

```
prgkey1 locked: 0
prgkey2 locked: 0
```

Once the **Save** and **Delete** keys are unlocked, a User can change the function of the keys using the Aastra Web UI. An Administrator can change the function of the keys using the Aastra Web UI or the configuration files.

Notes:

- If you change the functions of the **Save** and **Delete** keys, and then an Administrator locks the respective keys, the functions are automatically set back to the default settings of "Save" and "Delete"
- The **Save** and **Delete** functions are limited to Key 1 and Key 2 on the 6753i and Keys 5 and 6 on the 6730i, 6731i, and 6865i IP phones only.

Locking and Unlocking the Save and Delete Keys Using the Configuration Files

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "Locking the SAVE and DELETE Keys" on page A-190.

Local Dial Plan

A dial plan describes the number and pattern of digits that a user dials to reach a particular telephone number. Access codes, area codes, specialized codes, and combinations of the number of digits dialed are all part of a dial plan. For instance, the North American Public Switched Telephone Network (PSTN) uses a 10-digit dial plan that includes a 3-digit area code and a 7-digit telephone number. Most PBXs support variable length dial plans that use 3 to 11 digits. Dial plans must comply with the telephone networks to which they connect. Only totally private voice networks that are not linked to the PSTN or to other PBXs can use any dial plan.

The Dial Plan field accepts up to 512 characters. If a User enters a dial plan longer than 512 characters, or a parsing error occurs, the phone uses the default dial plan of "x+#|xx+*". You configure the SIP Local Dial Plan using the Aastra Web UI or the configuration files.

The IP phone SIP local dial plan available symbols are as follows:

Symbol	Description
0, 1, 2, 3, 4, 5, 6, 7, 8, 9	Digit symbol
;	Allows a secondary dial tone to be audible before dialing a number.
X	Match any digit symbol (wildcard)
*, #, .	Other keypad symbol
	Expression inclusive OR
+	0 or more of the preceding digit symbol or [] expression
[]	Symbol inclusive OR
-	Used only with [], represent a range of acceptable symbols; For example, [2-8]
;	Used when a secondary dial tone is required on the phone. (For example, "9;xxxxx", when a user has to dial "9" to get an outside line and needs a secondary dial one presented)

Dial Plan Example

An example of a SIP Local Dial Plan is:

```
[ 01 ] XXX | [ 2-8 ] XXXX | 91XXXXXXXX
XXXX | X+ . | *XX
```

The dial plan in the above example can accept any 4-digit dial strings that begin with a '0' or '1', any 5-digit dial strings that begin with a '2' up to '8', any 12-digit dial strings that begin with '91', any non-empty digit string that ends with a '.' or any 2-digit code that begins with a '*'.

Prefix Dialing

The IP phones support a prefix dialing feature for outgoing calls.

You can manually dial a number or dial a number from a list. The phone automatically maps the pre-configured prepended digit in the configuration, to the outgoing number. When a match is found, the prepended digits are added to the beginning of the dial string and the call is dialed.

Note:

The prepend digits are also added if the dialing times-out on a partial match.

You can enable this feature by adding a prepend digit(s) to the end of the **Local Dial Plan** parameter string in the configuration files or the Aastra Web UI at

Basic Settings->Preferences->General.

For example, if you add a prepend map of "[2-9]XXXXXXXX,91", the IP phone adds the digits "91" to any 10-digit number beginning with any digit from 2 to 9 that is dialed out. Other examples of prepend mappings are:

- **1X+#,9** (Prepends 9 to any digit string beginning with "1" and terminated with "#".)
- **6XXX,579** (Prepends "579" to any 4-digit string starting with "6".)
- **[4-6]XXXXXX,78** (Prepends "78" to any 7-digit string starting with "4", "5", or "6".)

Note:

You can configure a local dial plan via the configuration files or the Aastra Web UI.

Example:

If you enter the following dial string for a local dial plan:

```
sip dial plan: 1+#,9
```

where "9" is the prepended digit, and you dial the following number:

```
15551212
```

the IP phone automatically adds the "9" digit to the beginning of the dialed number before the number is forwarded as **915551212**.

Note:

You can configure a local dial plan via the configuration files or the Aastra Web UI.

SIP Dial Plan Terminator

The IP phone provides a feature that allows an administrator to configure whether or not pressing the hash/pound (i.e. "#") key, while performing an outgoing call on an open line, should be sent as %23 to the proxy in the dial string or if the key should be used as a dial plan terminator (i.e. dials out the call immediately). By default, the hash/pound key is configured as a dial plan terminator; however, an administrator can change the behavior using the Aastra Web UI or the configuration files.

Digit Timeout

The IP phone allows you to configure a "**Digit Timeout**" feature on the IP phone. The Digit Timeout is the time, in seconds, between consecutive key presses on the IP phone's keypad. The default for this parameter is 4 seconds. If you press a key on the phone and wait 4 seconds before pressing the next key, the key times out and cancels the digit selection. You must press consecutive keys before the timeout occurs.

Secondary Dial Tone

The IP phones now support a feature that allows the user to dial a predefined dial string, obtain a dial tone, and continue dialing. A User or Administrator can configure this using the existing Dial Plan feature on the phone.

You can enter a new character string in the dial plan that allows you to configure the secondary dial tone. The character string is of the form ";:", where the period indicates an arbitrary number of digits and the semicolon indicates that the phone is to present a dial tone after the previous dialed digit. For example, in the string:

```
"9 ;xxxxx"
```

the user dials "9" to get the outside line, listens for the dial tone, and continues to dial the applicable number. The ";" tells the phone to present a second dial tone after the previously dialed digit. The "xxxxx" in the example tells the phone that a phone number is dialed after the secondary dial tone is audible.

You can enter the Secondary Dial Tone string in the Dial Plan using the configuration files or the Aastra Web UI.

You use the following parameter in the configuration files to configure a secondary dial tone:

- **sip dial plan**

Example:

```
sip dial plan: "9;5551313"
```

Configuring the SIP Local Dial Plan, Dial Plan Terminator, and Digit Timeout

Use the following procedures to configure the SIP Local Dial Plan using the configuration files or the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "SIP Local Dial Plan Settings" on page A-58.

Aastra Web UI

1. Click on **Basic Settings-> Preferences->General**.

The screenshot shows the 'Preferences' window with the 'General' tab selected. The settings are as follows:

Setting Name	Value
Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. In the "**Local Dial Plan**" field, enter a valid local dial plan (up to 512 alphanumeric characters) for the IP phone. Default is X+#|XX+*. Enter prepended digits or a ";" to present a secondary dial tone if required.

Note:

If a User enters a dial plan longer than 512 characters, or a parsing error occurs, the phone uses the default dial plan of "x+#|xx+*".

3. Enable the "**Send Dial Plan Terminator**" field by checking the check box. (Disable this field by unchecking the box). Default is disabled.
4. In the "**Digit Timeout (in seconds)**" field, enter a timeout value. This is the length of time, in seconds, the phone waits before dialing. Default is 4 seconds.
5. Click **Save Settings** to save your changes.

Suppressing DTMF Playback

A feature on the IP phones allows administrators to enable or disable the suppression of DTMF playback when a number is dialed from the softkeys and programmable keys.

When suppression of DTMF playback is disabled, and you press a softkey or programmable key, the IP phone dials the stored number and displays each digit as dialed in the LCD window.

When the suppression of DTMF playback is enabled, the IP phone dials the stored number and displays the entire number immediately in the LCD window, allowing the call to be dialed much faster.

DTMF playback suppression is enabled by default. The **“suppress dtmf playback”** parameter can be configured using the configuration files.

Configuring Suppression of DTMF Playback

Use the following procedures to configure the suppression of DTMF playback on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“Suppress DTMF Playback Setting”](#) on page A-143.

Display DTMF Digits

A feature on the IP phones allows administrators to enable or disable DTMF (dual-tone multi-frequency) digits to display to the IP phone when using the keypad to dial, or when dialing from a softkey or programmable key.

DTMF is the signal sent from the phone to the network that you generate when you press the phone’s touch keys. This is also known as “touchtone” dialing. Each key you press on your phone generates two tones of specific frequencies. One tone is generated from a high-frequency group of tones and the other from a low frequency group.

If you enable the Display DTMF Digits parameter, the digits you are dialing from the keypad or from a softkey or programmable key display to the IP phone’s LCD display. This parameter is disabled by default (no digits display when dialing).

You can enable the **“display dtmf digits”** parameter using the configuration files or the Aastra Web UI.

Configuring Display DTMF Digits

Use the following procedures to configure the display DTMF digits option on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“Display DTMF Digits Setting”](#) on page A-143.

**Aastra Web UI**

1. Click on **Basic Settings-> Preferences->General.**

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. Enable the "**Display DTMF Digits**" field by checking the check box. (Disable this field by unchecking the box). Default is disabled.
3. Click **Save Settings** to save your changes. You must restart your IP phone for the changes to take effect.
4. Click on **Operation->Reset.**
5. In the "**Restart Phone**" field click **Restart** to restart the IP phone and apply the changes.

Filter Out Incoming DTMF Events

An Administrator can enter a parameter in the configuration files to suppress incoming DTMF playback. This new parameter called "**suppress incoming dtmf playback**" will suppress the playback of both SIP INFO and RFC2833 incoming DTMF tones. The locally generated DTMF tones will still be played.

Configuring Suppress Incoming DTMF Playback

Use the following procedures to suppress incoming DTMF playback on the IP phone.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, "**Filter Out Incoming DTMF Events**" on [page A-144](#).

Call Waiting

The call waiting feature notifies a user on an active call on the phone, of a new incoming call. You can disable this call waiting feature, so that the new incoming call is automatically rejected by the phone with a busy message. A User or Administrator can configure this feature.

If you disable call waiting on the phone, and the user is on a call, any further incoming calls will receive busy unless “Call Forward Busy” or “Call Forward No Answer and Busy” is configured on the phone. It will then forward the call according to the rule configured. The phone can only:

- transfer the currently active call
or
- accept transferred calls if there is no active calls.

If call waiting is disabled:

- on the 6757i CT bases, and the handset is currently on a call, all additional incoming calls are rejected on the handset.
- intercom calls are treated as regular incoming calls and are rejected.
- pre-dialing with live dialpad disabled still accepts incoming calls.
- the Missed Calls List does not get updated with details of calls.
- the Blind Transfer feature on the phone may not work if two calls are made to the phone at one time.

You can enable/disable call waiting on a global or per-line basis using the configuration files or the Aastra Web UI.

Configuring Call Waiting

Use the following procedures to configure the Call Waiting feature on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Call Waiting Settings](#)” on [page A-64](#) or “[SIP Per-Line Call Waiting Setting](#)” on [page A-73](#).

**Aastra Web UI**

1. For global configuration, click on **Advanced Settings->Global SIP->Basic SIP Authentication Settings**.

Global SIP Settings**Basic SIP Authentication Settings**

Screen Name	<input type="text" value="John Smith"/>
Screen Name 2	<input type="text" value="Lab Phone"/>
Phone Number	<input type="text" value="555-555-1010"/>
Caller ID	<input type="text" value="555-555-1010"/>
Authentication Name	<input type="text" value="jsmith"/>
Password	<input type="password" value="••••••••"/>
BLA Number	<input type="text" value="1010"/>
Line Mode	<input type="text" value="Generic"/> ▾
Call Waiting	<input checked="" type="checkbox"/> Enabled

- Or, for per-line configuration, click on **Advanced Settings->Line N (1-9)0->Basic SIP Authentication Settings**.

Configuration Line 1**Basic SIP Authentication Settings**

Screen Name	<input type="text" value="John Burns"/>
Screen Name 2	<input type="text" value="Lab Phone"/>
Phone Number	<input type="text" value="555-555-1010"/>
Caller ID	<input type="text" value="555-555-1010"/>
Authentication Name	<input type="text" value="jburns"/>
Password	<input type="password" value="••••••••"/>
BLA Number	<input type="text" value="1010"/>
Line Mode	<input type="text" value="Generic"/> ▾
Call Waiting	<input type="text" value="Global"/> ▾

Configure Global Call Waiting

2. The "**Call Waiting**" field is enabled by default. To disable call waiting on a global basis, uncheck this box.

Configure Per-Line Call Waiting

3. The "**Call Waiting**" field is set to "**Global**" by default. To enable call waiting for a specific line, select "**enabled**" from the list in this field. To disable call waiting for a specific line, select "**disabled**" from the list in this field.
4. Click **Save Settings** to save your changes.

Call Waiting Tone

You can also enable or disable the playing of a short "call waiting tone" when there is an incoming call on your phone using the "**play call waiting tone**" parameter. This feature is enabled by default. If you have Call Waiting enabled, and a call comes into the line for which you are on an active call, a tone is audible to notify you of that incoming call.

Note:

The Call Waiting Tone feature works only if Call Waiting is enabled.

A User or Administrator can configure this feature using the Aastra Web UI. An Administrator can also configure this feature using the configuration files.

Configuring Call Waiting Tone

Use the following procedures to configure the Call Waiting Tone feature on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Call Waiting Settings" on page A-64.

Aastra Web UI

1. Click on **Basic Settings-> Preferences->General**.

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. The "Play Call Waiting Tone" field is enabled by default. To disable this field, uncheck the box. This feature allows you to enable or disable the call waiting tone on the IP phone.

Note:

The Call Waiting Tone feature works only if the "Call Waiting" tone field is enabled at the location *Advanced Settings->Global SIP (or Line X)->Basic SIP Authentication Settings*.

3. Click **Save Settings** to save your changes.

Call Waiting Tone Period

A User or Administrator can specify a specific time period (in seconds) for the call waiting tone to play at regular intervals on an active call using the parameter "call waiting tone period". A value of "0" is the default and plays the call waiting tone only once on the active call. When the incoming caller hangs up, the call waiting tone stops on the existing active call. You can enable or disable this feature in the configuration files or in the Aastra Web UI.

Configuring “Call Waiting Tone Period”

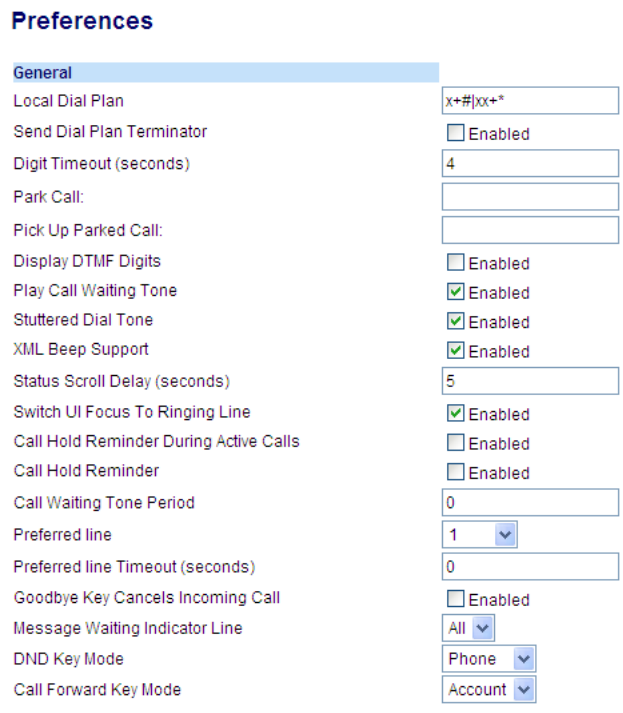

You use the following procedures to enable or disable “Call Waiting Tone Period”.

 **Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, “Call Waiting Settings” on page A-64.

 **Aastra Web UI**

1. Click on **Basic Settings->Preferences->General**.

Preferences	
General	
Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. In the "**Call Waiting Tone Period**" field, enter a time period, in seconds, that the call waiting tone will be audible on an active call when another call comes in. Default is 0 seconds.

When enabled, the call waiting tone plays at regular intervals for the amount of time set for this parameter. For example, if set to “30” the call waiting tone plays every 30 seconds. When set to “0”, the call waiting tone is audible only once on the active call

3. Click **Save Settings** to save your changes.

Stuttered Dial Tone

You can enable or disable the playing of a stuttered dial tone when there is a message waiting on the IP phone. You can configure this feature using the configuration files and the Aastra Web UI.

Configuring Stuttered Dial Tone

Use the following procedures to configure stuttered dial tone on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files for enabling/disabling stuttered dial tone, see Appendix A, the section, “[Stuttered Dial Tone Setting](#)” on page A-125.

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled

Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. The "**Stuttered Dial Tone**" field is enabled by default. To disable this field, uncheck the box.
3. Click **Save Settings** to save your changes.

XML Beep Support

The IP phones have a feature that allows you to enable or disable a beep on the phone when it receives a status message from an XML application. This beep can be turned ON or OFF using the Aastra Web UI, the configuration files, or in an XML script. If you disable this feature, then no beep is heard when the XML application arrives to the phone.

If your System Administrator has set a value for this feature in a custom XML application or in the configuration files, the value you set in the Aastra Web UI overrides the Administrator's setting. Setting and saving the value in the Aastra Web UI applies to the phone immediately.

Reference

For more information about enabling/disabling the XML Beep Support in an XML script, see [“XML Customized Services”](#) on [page 5-239](#).

Configuring XML Beep Support

Use the following procedures to enable/disable XML Beep Support.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“XML Settings”](#) on [page A-114](#).

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences	
General	
Local Dial Plan	x+#{xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled

Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. The **“XML Beep Support”** field is enabled by default. To disable this field, uncheck the box.
3. Click **Save Settings** to save your changes.

Status Scroll Delay

The IP phones have a feature that allows you to specify the time delay, in seconds, between the scrolling of each status message (including XML status messages) on the phone. The default time is 5 seconds for each message to display before scrolling to the next message. You can configure this option via the configuration files or the Aastra Web UI.

Reference

For more information about configuring the status scroll delay for XML status messages, see [“XML Customized Services” on page 5-239](#).

Configuring Status Scroll Delay

Use the following procedures to configure Status Scroll Delay.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“XML Settings” on page A-114](#).

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled

Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. In the **“Status Scroll Delay (seconds)”** field, enter a value, in seconds, that each XML status message displays on the phone. Default is 5 seconds. Valid values are 1 to 25.
3. Click **Save Settings** to save your changes.

Switch Focus to Ringing Line

An Administrator or User can control the behavior of the phone when it receives an incoming call when it is already in a connected call. By default, the phone switches focus to the ringing line to enable the user to see who is calling them.

You can turn off this functionality so that the phone now stays focused on the connected call. You can do this using the **“switch focus to ringing line”** parameter in the configuration files or the Aastra Web UI.

Note:

If you configure the BLF/Xfer key(s) and/or Speeddial/Xfer key(s) on the phone, you can enable or disable the switching of the user interface focus to ringing line while the phone is in the connected state.

Configuring “Switch Focus to Ringing Line”

You use the following procedures to enable or disable “Switch Focus to Ringing Line”.

Configuration Files

For specific parameters you can set in the configuration files for enabling/disabling “Switch Focus to Ringing Line”, see Appendix A, the section, “Switch Focus to Ringing Line” on page A-122.

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+#{xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. The **“Switch Focus to Ringing Line”** field is enabled by default. To disable this field, uncheck the box.
3. Click **Save Settings** to save your changes.

Call Hold Reminder During Active Calls

The IP phones allow a User or Administrator to enable or disable the ability for the phone to initiate a continuous reminder tone on the active call when another call is on hold. For example, when this feature is enabled, and the call on Line 1 is on hold, and then the User answers a call on Line 2 and stays on that line, a reminder tone is played in the active audio path on Line 2 to remind the User that there is still a call on hold on Line 1.

When this feature is disabled, a ring splash is heard when the active call hangs up and there is still a call on hold.

You can enable or disable this feature using the **“call hold reminder during active calls”** parameter in the configuration files or in the Aastra Web UI.

Configuring “Call Hold Reminder During Active Calls”

You use the following procedure to enable or disable “Call Hold Reminder During Active Calls”.

Configuration Files

For the specific parameter you can set in the configuration files for enabling/disabling “Call Hold Reminder During Active Calls”, see Appendix A, the section, [“Call Hold Reminder Settings”](#) on page A-123.

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. In the **“Call Hold Reminder During Active Calls”** field, enable this feature by placing a check mark in the box.

When this feature is enabled, a reminder tone is heard on the active call when another call is on hold. When disabled, a ring splash is heard when the active call hangs up and there is still a call on hold.

3. Click **Save Settings** to save your changes.

Call Hold Reminder (on Single Hold)

In previous releases, the call hold reminder ring splash was triggered when you hung up a call and there was at least one other call on hold. The reminder ring splash timer started only when the active call hung up and there was still another call on hold.

On the IP phones, a User or Administrator can enable or disable a feature that would start the reminder ring splash timer as soon as you put a call on hold (even when no other calls are active on the phone). When enabled, the phone initiates a reminder ring splash periodically for the single call on hold. When disabled, no reminder ring splash is audible.

You can enable or disable this feature using the “**call hold reminder**” parameter in the configuration files or in the Aastra Web UI.

Configuring “Call Hold Reminder”

You use the following procedure to enable or disable “Call Hold Reminder”.

Configuration Files

For the specific parameter you can set in the configuration files for enabling/disabling “Call Hold Reminder”, see Appendix A, the section, “[Call Hold Reminder Settings](#)” on [page A-123](#).

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences	
General	
Local Dial Plan	x+#{xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. The “**Call Hold Reminder**” field is disabled by default. To enable this feature, place a check mark in the box.

When this feature is enabled, the reminder ring splash timer starts as soon as you put a call on hold (even when no other calls are active on the phone).The phone initiates a reminder ring splash periodically for the single call on hold. When disabled, no reminder ring splash is audible.

3. Click **Save Settings** to save your changes.

Call Hold Reminder Timer & Frequency

There are two parameters an Administrator can set on the IP Phones along with the “**call hold reminder**” and “**call hold reminder during active calls**” parameters:

- **call hold reminder timer**
- **call hold reminder frequency**

These parameters specify the time delay and time frequency of the ring splash that sounds when you are on an active call and have placed another call on hold. You can configure these parameters using the configuration files only.

Notes:

- You must enable the “**call hold reminder**” and/or “**call hold reminder during active calls**” parameter(s) for the above parameters to work.
- A value of “**0**” for the “**call hold reminder timer**” parameter disables the call hold reminder feature.
- A value of “**0**” for the “**call hold reminder frequency**” parameter prevents additional rings.

Configuring “Call Hold Reminder Timer”

You use the following procedure to configure the “Call Hold Reminder Timer”.

Configuration Files

For the specific parameter you can set in the configuration files for setting the “Call Hold Reminder Timer”, see Appendix A, the section, “[Call Hold Reminder Settings](#)” on [page A-123](#).

Configuring “Call Hold Reminder Frequency”

You use the following procedure to configure the “Call Hold Reminder Frequency”.

Configuration Files

For the specific parameter you can set in the configuration files for setting the “Call Hold Reminder Frequency”, see Appendix A, the section, “[Call Hold Reminder Settings](#)” on [page A-123](#).

Preferred Line and Preferred Line Timeout

An Administrator or User can define a **preferred line** as well as a **preferred timeout**. If a preferred line is selected, after a call ends (incoming or outgoing), the display switches back to the preferred line. Next time you go off-hook, you pickup on the preferred line. You can specify the number of seconds it takes for the phone to switch back to the preferred line using the “**preferred timeout**” parameter.

An Administrator can configure the “**preferred line**” and the “**preferred timeout**” parameters using the configuration files or the Aastra Web UI. A User can configure these parameters using the Aastra Web UI only.

The following table provides the behavior of the preferred line focus feature with other features on the phone.

Phone Feature	Preferred Line Behavior
Call Return	The phone switches back to the focused line immediately after the call ends.
Speeddial	The line is already specified when the speeddial is created. The phone switches back immediately after the call ends.
Conference	For incoming calls, the phone switches back immediately after the call ends.
Transfer	For incoming or outgoing calls, the current behavior is that the same line used to transfer the call does not change. For incoming calls, the phone switches back immediately after the call transfers.
BLF	The phone switches back immediately after the call ends.
Park	The phone switches back immediately after the call ends.
Voicemail	The phone switches back immediately after the call ends.
Redial	The phone switches back immediately after the call ends.
Dialing	For incomplete dialing on a non-preferred line, the focus does not change if some digits are entered. If no digits are entered or digits were cleared, the focus changes to preferred line after the time out has passed without activities.
Caller ID	If the "Switch UI Focus To Ringing Line" parameter is disabled, the User is able to see the Caller ID when the phone switches the focus to the ringing line.
Factory Default	Factory default and recovery mode clears the "preferred line" and "preferred line timeout" parameters, and the phone operates in a non-preferred line mode.

Notes:

- If you specify a value of “0” for the **preferred line** parameter, it disables the preferred line focus feature.
- If you specify a value of “0” for the **preferred line timeout** parameter, the phone returns the line to the preferred line immediately.

Configuring the Preferred Line and Preferred Line Timeout

You use the following procedures to configure the Preferred Line and the Preferred Line Timeout on the IP Phones.

Configuration Files

For specific parameters you can set in the configuration files for configuring the Preferred Line and Preferred Line Timeout, see Appendix A, the section, “Preferred Line and Preferred Line Timeout” on page A-124.

Use the following parameters to configure preferred line focus using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+#{xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1 ▾
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All ▾
DND Key Mode	Phone ▾
Call Forward Key Mode	Account ▾

2. In the **“Preferred Line”** field, select a preferred line to switch focus to after incoming or outgoing calls end on the phone. Valid values are:
 - None (disables the preferred line focus feature)
 - 1 to 9

Default is 1.

For example, if you set the preferred line to **“1”**, when a call (incoming or outgoing) ends on the phone (on any line), the phone switches focus back to Line 1.

3. In the **“Preferred Line Timeout”** field, enter the amount of time, in seconds, that the phone switches back to the preferred line after a call (incoming or outgoing) ends on the phone, or after a duration of inactivity on an active line. Default is 0. Valid values are 0 to 999.
4. Click **Save Settings** to save your changes.

Goodbye Key Cancels Incoming Call

You can configure the Goodbye key to drop active calls or ignore incoming calls using the **“goodbye cancels incoming call”** parameter or through the Web UI. This parameter controls the behavior of the goodbye key when the phone is on an active call and a second call is presented to the phone.

How it Works

When you enable this parameter (1 = enable in the configuration files), which is the default, the Goodbye key rejects the incoming call. When you disable this parameter (0 = disable in the configuration files), the Goodbye key hangs up the active call.

For 8 and 11-line LCD phones

If you enable this parameter, and the phone receives another call when an active call is already present, the phone displays softkey 1 as “**answer**” and softkey 2 as “**ignore**”. You can press the required softkey as applicable.

For 3-line LCD phones

If you disable this parameter, and the phone receives another call when an active call is already present, the “**ignore**” option displays in the LCD window. The phone will ignore the incoming call if you press the **DOWN** arrow navigation key. The phone will hang up on the active call if you press the Goodbye key.

You can set this parameter using the configuration files or the Aastra Web UI.

Configuring the Goodbye Key to Cancel Incoming Calls

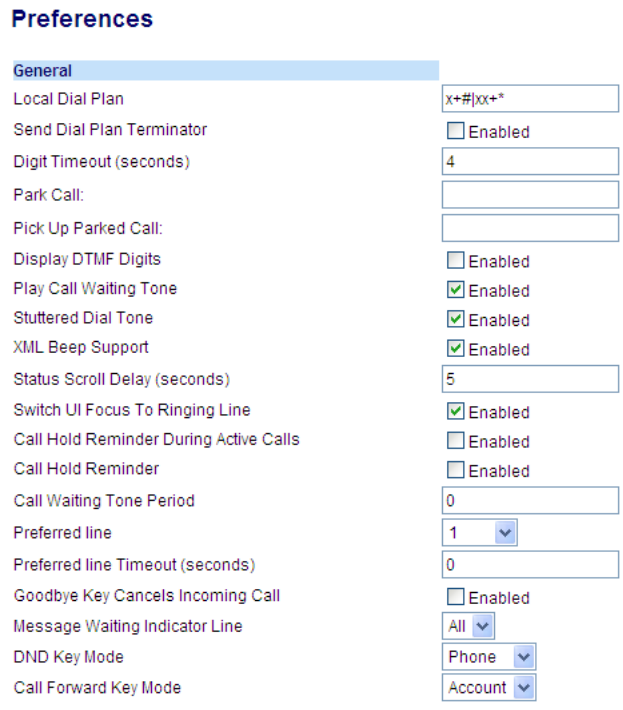

Use the following procedures to configure the behavior of the Goodbye Key on the IP phone.

 **Configuration Files**

For specific parameters you can set in the configuration files for enabling/disabling the behavior of the Goodbye Key, see Appendix A, the section, “[Goodbye Key Cancels Incoming Call](#)” on [page A-125](#).

 **Aastra Web UI**

1. Click on **Basic Settings->Preferences->General**.

Preferences	
General	
Local Dial Plan	x+#{xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled

Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input checked="" type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. Enable or disable the “**Goodbye Key Cancels Incoming Call**” field by checking or unchecking the check box.
3. Click **Save Settings** to save your changes.

Configurable Status Code on Ignoring Incoming Calls

When a user presses the “**Ignore**” key on the phones during an incoming call, the phone rejects the incoming call with a status code of “486 Busy Here”. The IP phones allow an administrator to configure this status code. You can configure the status code using the configuration files only.

Note:

Valid status codes are based on RFC3261.

Use the following parameter to configure a status code when ignoring incoming calls:

- **sip ignore status code**

Configuring Status Codes on Ignoring Incoming Calls

You can use the following procedure to set the status code sent in the response when a user presses the “Ignore” key.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “[Status Code on Ignoring Incoming Calls](#)” on page A-122.

Message Waiting Indicator Line

A User or Administrator can configure the Message Waiting Indicator (MWI) to illuminate for a specific line or for all lines. For example, if you configure the MWI LED on line 3 only, the LED illuminates if a voicemail is pending on line 3. If you configure the MWI LED for all lines, the LED illuminates if a voicemail is pending on any line on the phone (lines 1 through 9).

A User can configure the MWI using the Aastra Web UI only. An Administrator can configure the MWI on single or all lines using the configuration files or the Aastra Web UI.

Configuring Message Waiting Indicator (MWI)

Use the following procedures to configure MWI on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Message Waiting Indicator Settings](#)” on page A-126.

**Aastra Web UI**

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+## xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. In the **“Message Waiting Indicator Line”** field, select a single line from 1 to 9, or select **“All”** for all lines. If you select a single line, the MWI illuminates when a voicemail message is pending on that line. If you select all lines, the MWI illuminates when a voicemail message is pending on any line from 1 to 9.
3. Click **Save Settings** to save your changes.

Customizable Message Waiting Indicator (MWI) Request URI

In Release 3.1 and up, an Administrator can enter a parameter in the configuration files to customize the request-URI for MWI feature subscription. This parameter is called **“sip linex mwi request uri”**.

This feature can be set on a per-line basis using the configuration files only.

Note:

“Sip Explicit MWI Subscription” must be enabled to use this feature. For more information about the Sip Explicit MWI Subscription parameter, see **“Advanced SIP Settings (optional)”** on page 4-69.

Configuring Message Waiting Indicator (MWI) Request URI

Use the following procedure to configure an MWI request URI on the IP phone.

**Configuration Files**

For the specific parameter you can set in the configuration files, see Appendix A, the section, **“Message Waiting Indicator Settings”** on page A-126.

DND Key Mode

The IP phones have a feature you can enable called "Do not Disturb (DND). An Administrator or User can set "do not disturb" based on the accounts on the phone (all accounts or a specific account). You can set specific modes for the way you want the phone to handle DND. The three modes you can set on the phone for DND are:

- Account
- Phone
- Custom

An Administrator or User can set the DND mode using the Aastra Web UI at the path *Basic Settings->Preferences->General->DND Key Mode*. An Administrator can also set the DND Key Mode using the configuration files.

Note:

You must configure a DND key on the phone to use this feature.

Reference

For more information about how DND works and how you can use it on the phones, see the section, "Do Not Disturb (DND)" on [page 5-154](#).

Configuring the DND Key Mode

Use the following procedures to set the DND Key Mode on the phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "DND Key Mode Settings" on [page A-127](#).

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. In the **"DND Key Mode"** field, select a "do not disturb" (DND) mode to use on the phone. Valid values are:
 - **Account**
Sets DND for a specific account. DND key toggles the account in focus on the IP Phone UI, to ON or OFF.
 - **Phone**
Sets DND ON for all accounts on the phone. DND key toggles all accounts on the phone to ON or OFF.
 - **Custom**
Sets the phone to display custom screens after pressing the DND key, that list the account(s) on the phone. The user can select a specific account for DND, turn DND ON for all accounts, or turn DND OFF for all accounts.
The default is **Phone**.

Notes:

 - If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
 - Using the Aastra Web UI, if you change the DND Key Mode to "phone", all accounts synchronize to the current setting of Account 1.
3. Configure a DND key on the phone using the procedures in the section, **"Do Not Disturb (DND)"** on page 5-154.
4. Click **Save Settings** to save your changes.
The change takes effect immediately without a reboot.

Reference

For more information, see the section, **"Do Not Disturb (DND)"** on page 5-154.

Call Forward Mode

Call Forward (CFWD) on the IP phone allows incoming calls to be forwarded to another destination. The phone sends the SIP message to the SIP proxy, which then forwards the call to the assigned destination.

An Administrator or User can configure CFWD on the phone-side by setting a mode for the phone to use (**Account**, **Phone**, or **Custom**). Once the mode is set, you can use the IP Phone UI to use the CFWD feature at *Options->Call Forward* or by pressing a configured Call Forward softkey/programmable key/extension module key.

The following describes the behavior for each CFWD mode.

- **Account mode** - The account mode allows you to configure CFWD on a per account basis. Pressing a configured CFWD key applies to the account in focus.
- **Phone mode** - The Phone mode allows you to set the same CFWD configuration for all accounts (**All**, **Busy**, and/or **No Answer**). When you configure the initial account, the phone applies the configuration to all other accounts. (In the Aastra Web UI, only the account you configured is enabled. All other accounts are grayed out but set to the same configuration.) Using the Aastra Web UI, if you make changes to that initial account, the changes apply to all accounts on the phone.
- **Custom mode** - The Custom mode allows you to configure CFWD for a specific account or all accounts. You can configure a specific mode (**All**, **Busy**, and/or **No Answer**) for each account independently or all accounts. On the 3-line LCD phones and the 6867i, you can set all accounts to **ALL On** or **ALL Off**. On the 8 and 11-Line LCD phones and the 6739i, you can set all accounts to **All On**, **All Off**, or copy the configuration for the account in focus to all other accounts using a **CopytoAll** softkey.

Note:

If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".

The states you can set for Call Forward are **All**, **Busy**, **No Answer**. You can enable different call forwarding rules/modes independently (for example, you can set different phone numbers for Busy, All, and NoAns modes and then turn them on/off individually. The behavior of these states is dependent on the mode (account, phone, or custom) you configure on the phone.

Reference

For more information about how Call Forwarding works and how you can use it on the IP Phones, see ["Call Forwarding"](#) on page 5-190.

Configuring Call Forward Key Mode

Use the following procedures to set the Call Forward key mode on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, ["Call Forward Key Mode Settings"](#) on page A-111.

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

Note:

If there is no CFWD key configured on the phone or it is removed, you can still configure Call Forwarding via the IP Phone UI at the path *Options->Call Forward*.

2. In the “**Call Forward Key Mode**” field, select a call forward mode to use on the phone. Valid values are:
 - **Account**
The account mode allows you to configure CFWD on a per account basis. Pressing a configured CFWD key applies to the account in focus.
 - **Phone**
The Phone mode allows you to set the same CFWD configuration for all accounts (**All**, **Busy**, and/or **No Answer**). When you configure the initial account, the phone applies the configuration to all other accounts. (In the Aastra Web UI, only the account you configured is enabled. All other accounts are grayed out but set to the same configuration.) Using the Aastra Web UI, if you make changes to that initial account, the changes apply to all accounts on the phone.
 - **Custom**
The Custom mode allows you to configure CFWD for a specific account or all accounts. You can configure a specific state (**All**, **Busy**, and/or **No Answer**) for each account independently or all accounts. On the 3-Line LCD phones and the 6867i, you can set all accounts to **All On** or **All Off**.
On the 8 and 11-Line LCD phones and the 6739i, you can set all accounts to **All On**, **All Off**, or copy the configuration for the account in focus to all other accounts using a **CopytoAll** softkey.

The default is **Account**.

Notes:

- If there is no CFWD key configured on the phone or it is removed, you can still set the CFWD modes via the IP Phone UI at the path *Options->Call Forward*.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to “Phone”.
- When configuring a CFWD state (**All**, **Busy**, **No Answer**) for an account, you must configure a CFWD number for that state in order for the state to be enabled.

3. Click **Save Settings** to save your changes.

The change takes effect immediately without a reboot.

Reference

For more information, see the section, “**Call Forwarding**” on page 5-190.

Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) and Emergency Location Identification Number (ELIN)

The IP Phones support Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED). LLDP-MED is designed to allow for things such as:

- Auto-discovery of LAN policies (such as VLAN, Layer 2 Priority and Diffserv settings) leading to "plug and play" networking.
- Extended and automated power management of Power over Ethernet endpoints.
- Inventory management, allowing network administrators to track their network devices, and determine their characteristics (manufacturer, software and hardware versions, serial / asset number).

On the IP Phones, LLDP-MED performs the following:

- Supports the MAC/PHY configuration (e.g. speed rate/duplex mode).
- Supports VLAN info from the network policy; this takes precedence over manual settings.
- Allows you to enable/disable LLDP-MED if required.
- Allows you to configure time interval between successive LLDP Data Unit (LLDPDU) frames.
- Allows LLDP packets to be received from the LAN port.
- Allows the phone to use the location information, Explicit Congestion Notification (ECN) Emergency Location Identification Number (ELIN), sent by the switch, as a caller ID for making emergency calls.

Note:

If the phone receives location information in ECN ELIN format (10 to 25 numeric string), the phone replaces the caller ID SIP header with the ECN ELIN value and the SIP URI does not change. The phone determines if this is an emergency number by checking the emergency dial plan configured on the phone.

Aastra IP Phones have a 32 second time-out for listening to LLDP-MED responses when the phone is booting up. If LLDP-MED responses are received after this initial listening period, the phone will ignore the response. Administrators can configure this time-out interval using the "**lldp startinterval**" parameter. This parameter is only valid during the phone bootup process and it will control the LLDP-MED time-out interval where the phone sends LLDP-MED advertisements and listens for the LLDP-MED responses from the switch before proceeding to the DHCP stage. The default value of this parameter is 32 seconds.

Administrators can also now configure the optional Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) Inventory Management type-length-value (TLV) sets. Using the "**lldp optional inventory management tlv**" parameter, Administrators can configure the phone to either send all Inventory Management TLV (1) sets or to send none (0). The default for this parameter is (1).

The following table identifies the configuration parameters for LLDP and ELIN and which method you can use to configure each parameter. This table also indicates whether the parameters can be configured by an Administrator, a User, or both.

Parameter	Method of Configuration	Who Can Configure
lldp	Configuration Files	Administrator
lldp interval	Configuration Files	Administrator
use lldp elin	Configuration Files	Administrator
lldp startinterval	Configuration Files	Administrator
lldp optional inventory management tlv	Configuration Files	Administrator
LLDP Support	IP Phone UI	Administrator
LLDP	Aastra Web UI	Administrator
LLDP Packet Interval	Aastra Web UI	Administrator

Configuring LLDP-MED and ELIN

Use the following procedures to configure LLDP-MED and ELIN on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "LLDP-MED and ELIN Settings" on page A-112.

Use the following procedure to enable/disable LLDP-MED using the IP Phone UI.

Note:

You cannot configure the "LLDP Interval" or the "Use LLDP ELIN" parameters via the IP Phone UI.

IP Phone UI

1. Press **Options**, and then select **Administrator Menu**.
2. Select **Network Settings**.
3. Select **Ethernet & VLAN**.
4. Select **LLDP Support**.
5. Press **CHANGE** to toggle the LLDP setting to **Enabled** or **Disabled**.
This field enables or disables Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) on the IP Phone.
6. Press **DONE** to save the change.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press the **<Advanced>** and enter your Administrator password using the pop-up keyboard.
3. Press the **<Network>** button, navigate to the second page and press **<Ethernet & VLAN>**.
4. Navigate to the second page and press the button beside **<LLDP Support>**.
This option enables or disables Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) on the IP Phone.
5. Press the **<Enable>** button to enable the feature.
6. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **Network > LLDP**.
This option enables or disables Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) on the IP Phone.
5. Use the **5** and **2** keys to enable or disable the feature.
6. Press the **Save** softkey.

Use the following procedure to configure LLDP-MED using the Aastra Web UI:

Aastra Web UI

1. Click on **Advanced Settings->Network->Advanced Network Settings**.

Advanced Network Settings	
DHCP Download Options	Any
LLDP	<input checked="" type="checkbox"/> Enabled
LLDP packet interval	30
NAT IP	0.0.0.0
NAT SIP Port	51620
NAT RTP Port	51720
STUN Server	0.0.0.0
STUN Port	3478
TURN Server	0.0.0.0
TURN Port	3479
TURN User ID	
TURN Password	
Rport (RFC 3581)	<input type="checkbox"/> Enabled

2. The **“LLDP”** field is enabled by default. To disable LLDP, click the check mark in the box to clear the check mark.
3. In the **“LLDP Packet Interval”** field, enter the time, in seconds, between the transmission of LLDP Data Unit (LLDPDU) packets.
The value of zero (0) disables this parameter. Valid values are 0 to 2147483647. Default is 30.
4. Click **Save Settings** to save your changes.

Incoming/Outgoing Intercom with Auto-Answer and Barge In

The Intercom feature allows you to press the configured Intercom button on the IP phone and then enter the number you want to call to initiate an intercom call. Intercom calls can be controlled either locally (phone-side) or by the SIP server (server-side).

You can configure incoming and outgoing intercom calls on all phone models. A User can configure incoming intercom calls only.

Outgoing Intercom Calls

On outgoing intercom calls, an available unused line is found when the lcom button is pressed. Since this line has no configuration, the phone applies an existing configuration ("Outgoing Intercom Settings", Line, default is Line 1) to this line in preparation for placing the intercom call. For example, an outgoing intercom call can use the configuration of line 1 but places the actual intercom call using line 9. Only an Administrator can configure outgoing intercom calls.

A **phone-side** Intercom call indicates the phone is responsible for telling the recipient that an intercom call is being placed, while a **server-side** intercom call means the SIP server is responsible for informing the recipient. Server-side calls require additional configuration of a **prefix code**. After pressing the lcom button and entering the number to call, the phone automatically adds the prefix to the called number and sends the outgoing call via the server.

For outgoing intercom calls, an administrator can configure the following parameters:

Configuration File Parameters	Web UI Parameters
• sip intercom type	• Type)
• sip intercom prefix code	• Prefix Code
• sip intercom line	• Line

Note:

To configure outgoing intercom calls using these parameters, see “Configuring Intercom Calls Settings” on page 5-81.

Incoming Intercom Calls

You can configure how the phone handles incoming intercom calls. You can receive incoming intercom calls whether or not there are active calls on the phone. The way the phone handles the call depends on the incoming intercom call configuration. The following paragraphs describe the configuration parameters for incoming intercom calls.

Microphone Mute

You can mute or unmute the microphone on the IP phone for intercom calls made by the originating caller. If you want to mute the intercom call, you enable this feature. If you want to unmute (or hear the intercom call), you disable this feature.

Auto-Answer/Play Warning Tone

The auto-answer feature on the IP phone allows you to enable or disable automatic answering for an Intercom call. If “Auto-Answer” is enabled, the phone automatically answers an incoming intercom call. If “Play Warning Tone” is also enabled, the phone plays a tone to alert the user before answering the intercom call. If “Auto-Answer” is disabled, the phone treats the incoming intercom call as a normal call.

The IP phone recognizes if an incoming call is an intercom auto-answer call if the SIP INVITE includes one of the following:

- A “Call-Info” header containing “answer-after=0”.
- An “Alert-Info” header containing “info=alert-autoanswer”.
- An “Alert-Info” header containing “Auto Answer” AND the “To” header containing “intercom=true”.
 - When the IP phones recognize this third type of incoming intercom call, the call will automatically be answered and the call’s audio will be played through the IP phone’s speaker (i.e. the user’s audio preferences will be ignored).

“Delay” before Auto-Answer

The IP Phones include support for the “delay” parameter (in the Alert-Info header, used in conjunction with info=alert-autoanswer) in order to facilitate auto-answer functionality. When present, the value of the “delay” parameter specifies the length of time in seconds an IP phone rings before a call is auto-answered. If this value of the “delay” parameter set to 0 (delay=0), then an incoming call is immediately auto-answered. The absence of the parameter is considered as ring forever.

In order for the delay functionality to operate, you must first enable Auto-Answer on the IP Phone.

Allow Barge In

You can configure whether or not the IP phone allows an incoming intercom call to interrupt an active call. The “**sip intercom allow barge in**” parameter controls this feature. When you enable the **sip intercom allow barge in** parameter (1 = enable in the configuration files), which is the default value, an incoming intercom call takes precedence over any active call, by placing the active call on hold and automatically answering the intercom call. When you disable this parameter (0 = disable in the configuration files), and there is an active call, the phone treats an incoming intercom call like a normal call and plays the call warning tone. You can set this parameter using the configuration files or the Aastra Web UI.

For incoming intercom calls, an administrator or user can configure the following parameters:

Configuration File Parameters	Web UI Parameters
sip allow auto answer	Auto-Answer
sip intercom mute mic	Microphone Mute
sip intercom warning tone	Play Warning Tone
sip intercom allow barge in	Barge In

Note:

To configure incoming intercom calls using these parameters, see [“Configuring Intercom Calls Settings”](#) on page 5-81.

Configuring Intercom Calls Settings

You can configure the Intercom feature using the configuration files or the Aastra Web UI.

Note:

An administrator can configure the incoming and outgoing Intercom feature. A user can configure the incoming Intercom feature only.

Use the following procedures to configure Intercom calls on the IP phone.

**Configuration Files**

For specific parameters you can set in the configuration files for outgoing Intercom, see Appendix A, the section, [“Outgoing Intercom Settings”](#) on page A-144.

For specific parameters you can set in the configuration files for incoming Intercom, see Appendix A, the section, [“Incoming Intercom Settings”](#) on page A-145.

**Aastra Web UI****Outgoing intercom Settings**

1. Click on **Basic Settings->Preferences->Outgoing Intercom Settings**.

2. Select an Intercom type for outgoing Intercom calls from the **Type** list box. Valid values are **Phone-Side**, **Server-Side**, **Off**. Default is **Off**.
3. If Server-Side is selected, enter a prefix to add to the phone number in the **"Prefix Code"** field.

Note:

For Sylantro servers, enter *96.

4. If Phone-Side or Server-Side is selected, select a line from the **Line** list box for which you want the IP phone to use as its configuration on the Intercom call.

Note:

The IP phone uses the configuration from the line you select from this list box. The call itself is made using the first available line at the time of the call.

5. Click **Save Settings** to save your changes.

**Aastra Web UI****Incoming Intercom Settings:**

1. Click on **Basic Settings->Preferences->Incoming Intercom Settings**.

Outgoing Intercom Settings	
Type	Off
Prefix Code	
Line	1
Incoming Intercom Settings	
Auto-Answer	<input checked="" type="checkbox"/> Enabled
Microphone Mute	<input checked="" type="checkbox"/> Enabled
Play Warning Tone	<input checked="" type="checkbox"/> Enabled
Allow Barge In	<input checked="" type="checkbox"/> Enabled

2. The "**Auto-Answer**" field is enabled by default. The automatic answering feature is turned on for the IP phone for answering Intercom calls. To disable this field, uncheck the box.

Note:

If the Auto-Answer field is not checked (disabled), the phone treats the incoming intercom call as a normal call.

3. The "**Microphone Mute**" field is enabled by default. The microphone is muted on the IP phone for Intercom calls made by the originating caller. To disable this field, uncheck the box.
4. The "**Play Warning Tone**" field is enabled by default. If "Auto-Answer" is enabled, the phone plays a warning tone when it receives in incoming intercom call. To disable this field, uncheck the box.
5. The "**Allow Barge In**" field is enabled by default. If an active line on the phone receives an incoming intercom call, the active call is put on hold and the phone automatically answers the incoming intercom call. To disable this field, uncheck the box.
6. Click **Save Settings** to save your changes.

Group Paging RTP Settings

An Administrator or User can configure a specific key (softkey, programmable key, or expansion module key) on the phone that allows you to send/receive a Real Time Transport Protocol (RTP) stream to/from pre-configured multicast addresses without involving SIP signaling. This is called Group Paging on the IP phones. You can specify up to 5 listening multicast addresses.

An Administrator can use the following parameters in the configuration files to set Group Paging RTP Settings:

- **paging group listening**
- **softkeyN type, topsoftkeyN type, prgkeyN type, or expmodX keyN type**
- **softkeyN label**
- **softkeyN value, topsoftkeyN value, prgkeyN value, or expmodX keyN value**

An Administrator or User can use the following parameters in the Aastra Web UI to set Group Paging RTP Settings:

- **Paging Listen Addresses** (Path: **Basic Settings->Preferences->Group Paging RTP Settings**)
- **<Paging> Key** (**Operation->Softkeys and XML, Programmable Keys, or Expansion Module Keys**)

Note:

The Group Paging RTP Settings are dependant upon the setting for the "**Allow Barge In**" parameter.

How it works

After pressing a configured "Paging" key on the phone, the phone sends an RTP stream to a preconfigured multicast address (IP port). Any phone in the local network then listens for the RTP stream on the preconfigured multicast address (IP port). For both sending and receiving of the multicast RTP there is no sip signaling involved. When the phone sends or receives a multicast RTP, it shows its involvement to the user by displaying "Paging".

Note:

Multicast RTP is one way only - from sender to the receiver (i.e. from sender to the multicast address (receiver)).

The phone uses a preconfigured G711 uLaw CODEC for multicast RTP.

For Paging Systems, the phone only plays RTP traffic; users have the ability to drop a rogue page. The recipient can drop the incoming page if required. The recipient can also set Do Not Disturb (DND) to ignore any incoming pages.

Note:

For outgoing RTP multicasts, all other existing calls on the phone are put on hold.

For incoming RTP multicasts, the ringing display is dependant on the "Allow Barge-In" parameter. If this parameter is **disabled**, and there is not other call on the phone, then the paging is automatically played via the preferred audio device (see the <Model-Specific> **IP Phone User Guide** for setting Audio Mode on the phone).

If there is an existing call on the phone, the call initially displays in the ringing state. The user has the option to accept/ignore the call. If the "Allow Barge-In" parameter is **enabled**, the RTP multicast call barges in, and any existing calls are put on hold.

If an RTP multicast session already exists on the phone, and the phone receives another incoming RTP multicast session, the priority is given to the first multicast session and the second multicast session is ignored. The behavior for the incoming calls in this case is also based on the setting for the "Allow Barge-in" parameter. The incoming call is handled as if there were an existing call already on the phone.

Configuring Group Paging RTP Settings

Use the following procedure to configure Group Paging RTP Settings using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Group Paging RTP Settings" on page A-147.

Use the following procedure to configure RTP streaming for Paging applications using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Group Paging RTP Settings**.

Group Paging RTP Settings

Paging Listen Addresses

2. In the "Paging Listen Addresses" text box, enter the multicast IP address(es) and port number(s) on which the phone listens for incoming multicast RTP packets.

Notes:

- Enter the IP address in dotted decimal format (for example, **224.0.0.2:10000,239.0.1.20:15000**) If this field is blank, Paging listening capability is disabled on the phone.
- The valid port range is from 1 to 65535.

**Aastra Web UI**

- Click on **Softkeys and XML**.
or
Click on **Programmable Keys**.
or
Click on **Expansion Module Keys**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Paging	Group 1	224.0.0.2:10000	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

- Choose a key that you want to assign as the Paging Key and select **Paging** from the “**Type**” field.
 - In the “**Label**” field, enter a key label to assign to the Paging key (for example, “**Group 1**”).
 - In the “**Value**” field, enter a multicast IP address and a port number for the Paging key. When you press this key, the phone initiates an outgoing multicast RTP session to the specified address using the specified port. (For example, **224.0.0.2:10000**).
- Notes:**
- When you select **Paging** for the “**Type**” field, the “**Line**” field and state fields are disabled.
 - The valid port range is from 1 to 65535.
- Click **Save Settings** to save your changes.

Using the Configured Paging Key on the IP Phone

The following procedure describes the use of the Paging key. The procedure assumes you have already configured the Paging key using the configuration files or the Aastra Web UI.

Notes:

- The recipient of a Paging call can set a global “Do Not Disturb” (DND) to ignore any incoming pages.
- For incoming Paging, the phones use the Intercom configuration settings. The incoming Page is dependant on the “**Allow Barge-In**” parameter setting and the “*Idling/On Call*” state.

**IP Phone UI**

- On the IP Phone, press the key you configured for Paging.
The phone opens a multicast RTP session and an outgoing OR incoming phone screen displays.

Note:

If you enable global DND on the phone, the incoming multicast RTP session is dropped.

- Press the **Drop** key to end the multicast RTP session and return to the idle screen.

Speedial Key Mapping

There are hard keys on your phone, such as **Hold**, **Redial**, **Xfer**, and **Conf** that are configured by default for specific call-handling features. (See the <Model-Specific> **IP Phone User Guide** for more information about these key functions).

Enabling/Disabling Redial, Xfer, and Conf Keys

You can enable or disable the **Redial**, **Xfer**, and **Conf** keys as required using the following parameters in the configuration files:

- **redial disabled**
- **conference disabled**
- **call transfer disabled**

Valid values for this parameter are **0** (enabled) and **1** (disabled).

If this parameter is set to **1**, the key is not active and is ignored if pressed by the user. For "**redial disabled**" the value of 1 does not save the dialed number to the "Redial List".

If this parameter is set to **0**, the key is active and can be pressed by the user.

This feature is configurable via the configuration files only.

Use the following procedure to enable/disable the **Redial**, **Xfer**, and **Conf** keys.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Mapping Key Settings](#)" on [page A-152](#).

Mapping Redial and Conf Keys as Speeddials

You can map the **Redial** and **Conference** keys on the IP phone to use as Speeddial keys. When the **Redial** or **Conference** key is pressed, the number configured for the key automatically speeddials. If no number is configured, the **Redial** and **Conference** keys return to their original functionality.

You can configure this feature using the configuration files or the Aastra Web UI.

Note:

If you configure the **Redial** and **Conference** keys for speeddialing on the 6757i CT Base Station, the **Redial** and **Conference** keys on the 6757i CT handset retain their original functionality. The **Redial** and **Conference** keys on the handset are not configured for speeddial.

Use the following procedures to set the Redial and Conf keys as Speeddial keys.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Mapping Key Settings](#)" on [page A-152](#).

Aastra Web UI

1. Click on **Basic Settings->Preferences**.

Key Mapping	
Map Redial Key To	<input type="text" value="902-123-4567"/>
Map Conf Key To	<input type="text" value="555-555-5555"/>

2. In the **Key Mapping** section, enter a number in the "**Map Redial Key To**" field, that the IP phone will use to speeddial when the Redial key is pressed.
3. Enter a number in the "**Map Conf Key To**" field, that the IP phone will use to speeddial when the Conf Key is pressed.
4. Click **Save Settings** to save your changes.

Using Redial Key for “Last Number Redial”

The IP phones have an enhanced redial user interface that allows a user to quickly redial the last number that was dialed out from the phone. You can:

- Press the **Redial** key twice to redial the last number dialed.
- Press the **Redial** key once, scroll the list of numbers, then press the **Redial** button again to dial the number that displays on the screen.

The “last number redial” feature for the Redial key is static and is not configurable.

Note:

You can use the Redial key during active calls.

Send DTMF for Remapping Conference or Redial Key

Previously, the “Conf” and “Redial” keys could be mapped to a speed dial to generate a call to a custom number when the phone was idle. During an active call, pressing the “Redial” or “Conf” keys would put the current call on hold and then dial the custom number. Now the “Conf” and “Redial” key remappings have the same behavior as the “Speed Dial” key when the phone is idle. During an active call the phone will send the custom number as DTMF using the phone configured DTMF method (inbound vs out-of-band RFC2833 vs SIP INFO).

This feature can be configured using the new “**map redial as dtmf**” and “**map conf as dtmf**” parameters.

When a user presses the “Redial” key, the mapped number will be sent out as DTMF during an active call if the current “**map redial key to**” parameter is configured to a number and the “**map redial as dtmf**” parameter is set to “1”.

When a user presses the “Conf” key, the mapped number will be sent out as DTMF during an active call if the current “**map conf key to**” parameter is configured to a number and “**map conf as dtmf**” parameter is set to “1”.

Enabling or Disabling the Sending of DTMF with Remapped Redial and Conf Keys

Use the following procedures to configure the remapping of the “Redial” and “Conf” keys on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Send DTMF for Remapping Conference or Redial Key](#)” on [page A-153](#).

Ring Tones and Tone Sets

You can configure ring tones and ring tone sets on the IP phones.

Ring Tones

There are several distinct ring tones a user or administrator can select from to set on the IP phones. You can enable/disable these ring tones on a global basis or on a per-line basis.

The following table identifies the valid settings and default values for each type of configuration method.

Ring Tone Settings Table

Configuration Method	Valid Values	Default Value
Configuration Files	Global: 0 (Tone1) 1 (Tone 2) 2 (Tone 3) 3 (Tone 4) 4 (Tone 5) 5 (Silent)	Global: 0 (tone 1)
	Per-Line: -1 (global) 0 (Tone1) 1 (Tone 2) 2 (Tone 3) 3 (Tone 4) 4 (Tone 5) 5 (Silent)	Per-Line: -1 (global)
IP Phone UI	Global: Tone 1 Tone 2 Tone 3 Tone 4 Tone 5	Global: Tone 1
Configuration Method	Valid Values	Default Value
Aastra Web UI	Global: Tone 1 Tone 2 Tone 3 Tone 4 Tone 5 Silent	Global: Tone 1
	Per-Line: Global Tone 1 Tone 2 Tone 3 Tone 4 Tone 5 Silent	Per-Line: Global

Ring Tone Sets

In addition to ring tones, you can configure ring tone sets on a global-basis on the IP phones. Ring tone sets consist of tones customized for a specific country. The ring tone sets you can configure on the IP phones are:

- Australia
- Brazil
- Europe (generic tones)
- France
- Germany
- Italy
- Italy2
- Malaysia
- Mexico
- Russia
- Slovakia
- UK
- US (Default - also used in Canada)

When you configure the country's tone set, the country-specific tone is heard on the phone for the following:

- dial tone
- secondary dial tone
- ring tone
- busy tone
- congestion tones
- call waiting tone
- ring cadence pattern

Note:

You configure ring tones and tone sets using the Aastra Web UI, IP Phone UI, or configuration files. However, when using the IP phone UI, you can set global configuration only.

Configuring Ring Tones and Tone Sets

Use the following procedures to configure ring tones and tone sets on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files for ring tones, see Appendix A, the section, "[Ring Tone and Tone Set Global Settings](#)" on [page A-120](#) or "[Ring Tone Per-Line Settings](#)" on [page A-121](#).

IP Phone UI

For global configuration only:

1. Press  on the phone to enter the Options List.
2. Select **Preferences**.
3. Select **Tones**.
4. Select **Set Ring Tone**.

**IP Phone UI**

5. Select the type of ring tone (**Tone 1** through **Tone 5**, or **Silent**).

6. Press **Done** to save the change.

7. Select **Tone Set**.

8. Select the country for which you want to apply the tone set.

Valid values are **Australia, Brazil, Europe, France, Germany, Italy, Italy2, Malaysia, Mexico, Brazil, Russia, Slovakia, UK**, and **US**. Default is **US**.

9. Press **Done** to save the change.

The ring tone and tone set you select is immediately applied to the IP phone.

For the 6739i:

1. Press  on the phone to enter the Options List.

2. Press the **<Audio>** button.

3. Press the **<Ring Tone>** button. The following values display:

- Tone 1 (Default)
- Tone 2
- Tone 3
- Tone 4
- Tone 5
- Silent

4. Press the value you want to set for the Ring Tone.

5. Press the **<Tone Set>** button.

6. Select the country for which you want to apply the Tone Set.

Valid values are **Australia, Brazil, Europe, France, Germany, Italy, Italy2, Malaysia, Mexico, Brazil, Russia, Slovakia, UK**, and **US**. Default is **US**.

7. Press the  to return to the previous menu or press the  to return to the idle screen.

For the 6867i:

1. Press  to enter the Options List.

2. Navigate to the **Audio > Ring Tones** option and press the  button or **Select** softkey.

3. Use the 5 and 2 keys to scroll through and choose the desired ring tone (Tone 1 through Tone 5, or Silent).

4. Press the **Save** softkey to save your changes.

5. Navigate to the **Audio > Tone Sets** option and press the  button or **Select** softkey.

6. Use the 5 and 2 keys to scroll through and choose the desired tone set.

Valid values are **Australia, Brazil, Europe, France, Germany, Italy, Italy2, Malaysia, Mexico, Brazil, Russia, Slovakia, UK**, and **US**. Default is **US**.

7. Press the **Save** softkey to save your changes.

Aastra Web UI

1. Click on **Basic Settings->Preferences**.

Ring Tones	
Tone Set	US
Global Ring Tone	Tone 1
Line 1	Global
Line 2	Global
Line 3	Global
Line 4	Global
Line 5	Global
Line 6	Global
Line 7	Global
Line 8	Global
Line 9	Global

For global configuration:

2. In the "**Ring Tones**" section, select a country from the "**Tone Set**" field.
Valid values are **Australia, Brazil, Europe, France, Germany, Italy, Italy2, Malaysia, Mexico, Brazil, Russia, Slovakia, UK, and US**. Default is **US**
3. Select a value from the "**Global Ring Tone**" field.

Note:

See the "[Ring Tone Settings Table](#)" on page 5-87 for valid values.

For per-line configuration:

4. In the "**Ring Tone**" section, select a line for which you want to set ring tone.
5. Select a value from the "**LineN**" field.

Note:

See the "[Ring Tone Settings Table](#)" on page 5-87 for valid values.

6. Click **Save Settings** to save your changes.

Ring Tone via Speaker During Active Calls

The parameter "**ring audibly enable**" can be used to configure the IP phones to play the ring tone of an incoming call via the phone's speaker while in an active call or if a user is in the process of dialing out.

With the parameter enabled, if a user is in an active call on an extension, and the phone receives a call for the same or different extension, the incoming call will be represented by the call's ring tone being played through the speaker as well as the respective line's LED flashing. This is also the case if a user is in the process of dialing out to a remote number and the phone receives a call for any line other than the line that is being used to dial out. When the phone exits the ringing state (e.g. the incoming call is answered), the tone device of the phone will revert back to originally configured audio device. Feature compatibility is dependant on the IP phone model (see the following table for compability details).

IP Phone	Handset Audio Mode	Speaker Audio Mode
9143i	X	X
9480i and 9480i CT	✓	X
6730i	X	X
6731i	X	X

IP Phone	Handset Audio Mode	Speaker Audio Mode
6735i	✓	✓
6737i	✓	✓
6739i	✓	X
6753i	✓	X
6755i	✓	X
6757i and 6757i CT	✓	X
6863i	✓	✓
6865i	✓	✓
6867i	✓	✓

Notes:

- The “**ring audibly enable**” parameter is disabled by default.
- This feature is not supported when utilizing the headset audio mode.
- With this feature enabled and when the phone’s speaker is playing the incoming call’s ring tone, call-waiting tones will not be played.

Configuring the Ring Tone via Speaker During Active Calls Feature

Use the following procedures to configure the ring tone via speaker during active calls feature.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Ring Tone via Speaker During Active Calls Settings](#)” on [page A-121](#).

No Service Congestion Tone

Administrators can configure the IP phones to play a congestion/fast busy tone instead of a dial tone when the phone is in a “No Service” state. This feature allows visually impaired persons the ability to discern whether or not the phone is in service and can be used to send/receive calls.

The configuration parameter “**no service congestion tone**” allows administrators the ability to enable this accessibility feature. When enabled, the congestion tone will replace the conventional dial tone when the handset is off hook, a headset is employed, or the speakerphone is engaged. The congestion tone’s frequency/pattern is based on the respective phone’s configured tone set. Additionally, the congestion tone is played on a per-line basis whereby only the specific lines that are without service are affected.

Note:

If the phone or individual lines are configured to have no registration by intent (e.g. if the Registrar is set to 0.0.0.0) enabling the “**no service congestion tone**” parameter will have no effect and the default dial tone will be played.

With consideration to scenarios where a dial tone should be played even if the phone is in a “No Service” state (e.g. scenarios where the proxy may still accept INVITEs from the phone even if unregistered), the “**no service congestion tone**” parameter has been programmed as disabled by default.

Configuring the No Service Congestion Tone

Use the following procedures to configure the no service congestion tone feature.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "No Service Congestion Tone Settings" on [page A-122](#).

Priority Alerting

Priority alerting on the IP phones is a feature that allows incoming calls to trigger pre-defined ringing or call waiting alert tones.

You can enable or disable priority alerting on the IP phone for the Asterisk, Broadworks, and Sylanro servers using the configuration files and the Aastra Web UI. Configuration of priority alerting is on a global-basis only.

How Priority Alerting Works

When the IP phone detects an incoming call, the phone firmware inspects the INVITE request in the IP packet for an "Alert-Info" header.

If it contains an "Alert-Info" header, the firmware strips out the URL and keyword parameter and maps it to the appropriate Bellcore tone.

If there is no keyword parameter in the "Alert-Info" header, or the INVITE message contains no "Alert-Info" header, then the IP phone firmware uses the Bellcore standard ring tone.

Asterisk/Broadworks Servers

The ring tone keywords that can display in the "Alert-Info" header for an Asterisk and Broadworks server are:

- Bellcore-dr2
- Bellcore-dr3
- Bellcore-dr4
- Bellcore-dr5

When the ring tone keywords appear in an "Alert-Info" header from an Asterisk or Broadworks server, the IP phone maps the keywords to the default ring tone patterns.

Example:

The following are examples of the Asterisk/Broadworks Server ring tone keywords:

```
Alert-Info: <http://127.0.0.1/Bellcore-dr2>  
or  
Alert-Info: <Bellcore-dr2>
```

Sylantro Servers

The ring tone keywords that can display in the "Alert-Info" header for a Sylantro server are:

- alert-acd (auto call distribution)
- alert-community-1
- alert-community-2
- alert-community-3
- alert-community-4
- alert-emergency
- alert-external
- alert-group
- alert-internal
- alert-priority

When the ring tone keywords appear in an "Alert-Info" header from a Sylantro server, the keyword is mapped to the ring tone pattern based on the configuration you set in the Aastra Web UI or the configuration files.

Ring Tone Patterns

In IP Telephony, different ringing patterns have different frequencies and cadences. Ring cadence is the ringing pattern heard by the called party, before they pick up the call.

On the IP phones, if you enable priority alerting when using an Asterisk or Broadworks server, the IP phone uses the following Bellcore-specified tones by default:

Ring Tone Pattern (Asterisk/Broadworks Servers)

Call Criteria	Bellcore Tones
internal calls	Bellcore-dr2
external calls	Bellcore-dr3
calls with contact list	Bellcore-dr4
calls with specific time frames	Bellcore-dr5

If you enable priority alerting when using a Sylantro server, you can specify the Bellcore tone to be used for the following configurable criteria:

Ring Tone Pattern (Sylantro Servers)

Call criteria	Bellcore tones for each call criteria
alert-acd (auto call distribution)	Normal ringing (default)
alert-community-1	Bellcore-dr2
alert-community-2	Bellcore-dr3
alert-community-3	Bellcore-dr4
alert-community-4	Bellcore-dr5
alert-emergency	Silent
alert-external	
alert-group	
alert-internal	
alert-priority	

A System Administrator can configure the ring tone cadences if required, using the configuration files. The following table identifies the different Bellcore ring tone patterns and cadences.

Bellcore Tone	Pattern ID	Pattern	Cadence	Minimum Duration (ms)	Nominal Duration (ms)	Maximum Duration (ms)
(Standard)	1	Ringing Silent	2s On 4s Off	1800 3600	2000 4000	2200 4400
Bellcore-dr2	2	Ringing Silent	Long	630 315	800 400	1025 525
		Ringing Silent	Long Long	630 3475	800 4000	1025 4400
Bellcore-dr3	3	Ringing Silent	Short	315 145	400 200	525 525
		Ringing Silent	Short	315 145	400 200	525 525
		Ringing Silent	Long	630 2975	800 4000	1025 4400
Bellcore-dr4	4	Ringing Silent	Short	200 145	300 200	525 525
		Ringing Silent	Long	800 145	1000 200	1100 525
		Ringing Silent	Short	200 2975	300 4000	525 4400
Bellcore-dr5	5	Ringing		450	500	550

Note:

If the "Do Not Disturb" (DND) or the "Call Forward" (CFWD) feature is enabled on the server-side, and the user is still waiting for a call, the "Bellcore-dr5" is a ring splash tone that reminds the user that these are enabled.

Mexican Tone Set Cadences

The following are Mexican tone set cadences.

Tone	Frequency (Hz)	Cadence (on/off)
Dial	425	Continuous
Secondary Dial	425	300/100/300/1300
Ringing	425	1000/4000
Busy	425	500/500
Congestion	425	250/250
Call Waiting	425	100/100/100/10000
Ring Cadence		1000/4000

Brazilian Tone Set Cadences

The following are Brazilian tone set cadences.

Tone	Frequency (Hz)	Cadence (on/off)
Dial	425	Continuous
Secondary Dial	425	300/100/300/1300
Ringing	425	1000/4000
Busy	425	250/250
Congestion	425	500/500
Call Waiting	425	100/100/100/10000
Ring Cadence		1000/4000

Russian Tone Set Cadences

The following are Russian tone set cadences.

Tone	Frequency (Hz, dBm0)	Cadence (ms) tone pause tone	Note
Dial	425, -10	-	Continuous
Special Dial	425, -10	500/50	Repetitive
Busy	425, -10	500/500	Repetitive
Ringing	425, -10	1000/4000	Repetitive
Congestion	425, -10	200/200	Repetitive
Call Waiting	425, -10	200/600/200	Non-repetitive

Malaysian Tone Set Cadences

The following are Malaysian tone set cadences.

Tone	Frequency (Hz)	Cadence (on/off)
Dial	425	Continuous
Secondary Dial	425	160/160
Ringing	425 * 50	400/200/400/2000
Busy	425	500/500
Congestion	425	250/250
Call Waiting	425	100/200/100/8600
Ring Cadence	-	400/200/400/2000

Limitations for Malaysian Cadences

- The phone does not apply a different volume level to the first part of the call waiting tone.
- The level of the 50Hz modulation signal for ring back is 90%.

Italian Tone Set Cadences

The following are Italian tone set cadences (for "Italy").

Tone	Frequency (Hz)	Cadence (on/off)
Dial	425	0.2/0.2/0.6/1.0
Secondary Dial	425	Continuous
Ringing	425	1.0/4.0
Busy	425	0.5/0.5
Congestion	425	0.2/0.2
Call Waiting	425	0.40/0.10/0.25/0.10/0.15

Slovak Tone Set Cadences

The following are Slovak tone set cadences.

Tone	Frequency (Hz)	Cadence (on/off)
Dial	425	0.33/0.33/0.66/0.66
Secondary Dial	425	(0.165/0.165)x3 /0.66/0.66
Ringing	425	1.0/4.0
Busy	425	0.33/0.33
Congestion	425	0.165/0.165
Call Waiting	425	0.33 on repeating every 10 sec when Call Waiting period is set to 10

Configuring Priority Alerting and Ring Tone Cadences using the Configuration Files

Use the following procedures to configure priority alerting and ring tone cadences on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the sections,

- "Priority Alert Settings" on page A-127.
- "Bellcore Cadence Settings" on page A-131.

Note:

You can configure Bellcore cadences using the configuration files only.

Configuring Priority Alerting using the Aastra Web UI

Use the following procedure to configure Priority Alerting using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences**.

Priority Alerting Settings	
Enable Priority Alerting	<input checked="" type="checkbox"/> Enabled
Group	Normal ringing ▼
External	Normal ringing ▼
Internal	Normal ringing ▼
Emergency	Normal ringing ▼
Priority	Normal ringing ▼
Auto call distribution	Normal ringing ▼
Community 1	Normal ringing ▼
Community 2	Normal ringing ▼
Community 3	Normal ringing ▼
Community 4	Normal ringing ▼

2. In the "Priority Alerting Settings" section, enable the "**Enable Priority Alerting**" field by checking the check box. (Disable this field by unchecking the box).

For Sylantrio Servers:

3. Select a ring tone pattern for each of the following fields:
 - Group
 - External
 - Internal
 - Emergency
 - Priority
 - Auto call distribution
 - Community 1
 - Community 2
 - Community 3
 - Community 4
4. Click **Save Settings** to save your changes.

Call Waiting Tones

Call Waiting is a feature that tells you if a new caller is trying to contact you when you are already on the phone. A discreet tone alerts you to the new caller, so you can answer your second incoming call by putting your first caller on hold.

The IP phones use the following Bellcore-specified call waiting tones.

Bellcore Call-Waiting Tone	Pattern ID	Pattern	Minimum Duration (ms)	Nominal Duration (ms)	Maximum Duration (ms)
CallWaitingTone 1	1	Tone On	270	300	330
Bellcore-dr2 CallWaitingTone2	2	Tone On	90	100	110
		Tone Off	90	100	110

Bellcore-dr3 CallWaitingTone3	3	Tone On	90	100	110
		Tone Off	90	100	110
		Tone On	90	100	110
		Tone Off	90	100	110
Bellcore-dr4 CallWaitingTone4	4	Tone On	90	100	110
		Tone Off	90	100	110
		Tone On	270	300	330
		Tone Off	90	100	110

For Asterisk and Broadworks servers, call waiting tones are specified by the default Bellcore tones indicated in the table [Ring Tone Pattern \(Asterisk/Broadworks Servers\)](#) on [page 5-93](#).

For Sylanro servers, call waiting tones are specified by the Bellcore tones you configure in the Aastra Web UI or the configuration files. See the table [Ring Tone Pattern \(Sylanro Servers\)](#) on [page 5-93](#).

Reference

For more information about enable/disabling call waiting on the IP Phone, see the section, [“Call Waiting”](#) on [page 5-57](#).

Directed Call Pickup (BLF or XML Call Interception)

Note:

Feature availability is dependant on your call manager.

Directed call pickup (for Asterisk and sipXecs servers) is a feature on the phones that allows a user to intercept a call on a ringing phone which is part of the same interception group. The phones also support the Busy Lamp Field (BLF) hold state that is expressed by a slow flashing LED. When using an Asterisk server, if administrators configure BLF for Directed Call Pickup, users are able to pickup the held call, as the phone sends the directed call pickup prefix to the extension number.

You can use the Directed call pickup feature on the phone in multiple ways:

- With the existing BLF feature on Asterisk or sipXecs, a user can dial *“*76”* or *“*78”* respectively, followed by the extension to pick up a ringing call on another phone. (For more information about BLF, see [“Busy Lamp Field \(BLF\)”](#) on [page 5-128](#).)
- Using XML, a user can intercept a call by selecting an extension from a list and then pressing a “Pickup” softkey/programmable key. To use the Directed call pickup feature from an XML application, you must list all ringing extensions using the **AstralIPPhoneTextMenu** XML object in an XML script. This allows the user to select the ringing extension from a text menu without having to dial.

BLF and XML softkeys/programmable keys monitor the states of an extension. The extension states can be one of three states: “busy”, “ringing” and “idle”. If the monitored extension is in the “ringing” state with an incoming call, and “Directed call pickup” is enabled, pressing the BLF or XML key can pick up the incoming call on the monitored extension.

Reference

For more information about using the **AstralIPPhoneTextMenu** object, contact Aastra Customer Support regarding the [Aastra XML Development Guide](#).

Directed Call Pickup Prefix (optional)

The optional “directed call pickup prefix” allows you to enter a specific prefix string (depending on what is available on your server), that the phone automatically dials when dialing the Directed Call Pickup number. For example, for Broadsoft servers, you can enter a value of *98 for the “directed call pickup prefix” (for sipXecs, *78 is used). When the phone performs the Directed Call Pickup after pressing a BLF or BLF/List softkey, the phone prepends the *98 value to the designated extension of the BLF or BLF/List softkey when dialing out.

How this Feature Works when Directed Call Pickup is Enabled with BLF or BLF/List

1. Phone A monitors Phone B via BLF/List.
2. Phone C calls Phone B; Phone B rings.
3. If you press the BLF/List softkey on Phone A, it picks up the ringing line on Phone B.
4. Phone C connects to Phone A.

How this Feature Works when Directed Call Pickup is Disabled with BLF or BLF/List

1. Phone A monitors Phone B via BLF/List.
2. Phone C calls Phone B; Phone B rings
3. If you press the BLF/List softkey on Phone A, it performs a speeddial to Phone B.
4. Phone C and Phone A are ringing Phone B on separate lines (if available).

Notes:

- The default method for the phone to use is Directed Call Pickup over BLF if the server provides applicable information. If the Directed Call Pickup over BLF information is missing in the messages to the server, the Directed Call Pickup by Prefix method is used if a value for the prefix code exists in the configuration.
- You can define only one prefix, which will be applicable to all BLF- or BLF/List-monitored extensions.
- The phone that picks up displays the prefix code + the extension number (for example, *981234 where prefix key = *98, extension = 1234).

You can enable/disable "Directed Call Pickup" using the configuration files or the Aastra Web UI.

Note:

The "Directed Call Pickup" feature is disabled by default.

Enabling/Disabling Directed Call Pickup

Use the following procedure to enable or disable the Directed Call Pickup feature on the IP phone.

**Configuration Files**

To enable/disable Directed Call Pickup on the IP phone using the configuration files, see Appendix A, the section, "Directed Call Pickup (BLF or XML Call Interception) Settings" on page A-150.

**Aastra Web UI**

1. Click on **Basic Settings->Preferences->Directed Call Pickup Settings**.

Directed Call Pickup Settings	
Directed Call Pickup	<input checked="" type="checkbox"/> Enabled
Directed Call Pickup by Prefix	<input type="text"/>
Play a Ring Splash	Enabled also in call

2. Enable the "**Directed Call Pickup**" field by checking the check box. (Disable this field by unchecking the box). Default is disabled.)
3. (optional) Enter a prefix in the "**Directed Call Pickup Prefix**" field. For example, *98. This prefix is appended to the beginning of the Directed Call Pickup number when dialed from the BLF or BLF/List softkey.

Aastra Web UI

4. For the 6739i, 6755i, 6757i, and 6757i CT enable the "**Play a Ring Splash**" feature by selecting either Enabled (when idle) or Enabled also in call (when idle and in an active call state). For all other IP phones enable the "**Play a Ring Splash**" feature by clicking on the checkbox. (Default is disabled).

If the "**Play a Ring Splash**" parameter is enabled, the IP phone plays a short "ring splash" when there is an incoming call on the BLF monitored extension.

Note:

This global setting is not dynamic. Changes to this setting will take effect only after the phone has been rebooted.

5. Click **Save Settings** to save your changes.

Configuring BLF/BLF List for Directed Call Pickup

Use the following procedure to configure BLF/BLF List for Directed Call Pickup in the configuration files.

Note:

You must enable Directed Call Pickup before performing these procedures. See "Enabling/Disabling Directed Call Pickup" on page 5-99.

Configuration Files

To set BLF or BLF/List in the configuration files for Directed Call Pickup, see Appendix A, the sections:

- "Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters" on page A-156.
- "BLF List URI Settings" on page A-192.

Use the following procedure to configure BLF or BLF/List for Directed Call Pickup in the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Directed Call Pickup Settings**.

2. Enable the "**Directed Call Pickup**" field by checking the check box.
3. (optional) Enter a prefix in the "**Directed Call Pickup Prefix**" field. For example, *98. This prefix is appended to the beginning of the Directed Call Pickup number when dialed from the BLF or BLF/List softkey.
4. For the 6739i, 6755i, 6757i, and 6757i CT enable the "**Play a Ring Splash**" feature by selecting either Enabled (when idle) or Enabled also in call (when idle and in an active call state). For all other IP phones enable the "**Play a Ring Splash**" feature by clicking on the checkbox. (Default is disabled).

If the "**Play a Ring Splash**" parameter is enabled, the IP phone plays a short "ring splash" when there is an incoming call on the BLF monitored extension.

Note:

This global setting is not dynamic. Changes to this setting will take effect only after the phone has been rebooted.

Aastra Web UI

5. Click on **Operation->Softkeys and XML**
or
Click on **Operation->Programmable Keys**
or
Click on **Operation->Expansion Module <N>**.

Note:

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy

Services	
XML Application URI:	<input type="text"/>
XML Application Title:	<input type="text"/>
BLF List URI:	<input type="text" value="sip:9@192.168.104.13"/>

6. Select a softkey or programmable key to configure.
7. In the **"Type"** field, select **"BLF"** (Asterisk), **"BLF/List"** (BroadSoft BroadWorks).

8. For 8 and 11-Line LCD softkeys:

In the **"Label"** field, enter the name of the person who's extension you are monitoring (if "Type" is BLF).

Note:

If BLF/List type is selected, no label value is required. The BroadWorks BLF List name is configured in the "BLF List URI" field instead.

9. In the **"Value"** field, enter a value to associate with the softkey or programmable key.
For example, for BLF, the value is the extension you want to monitor.
For BLF/List, the value is an identifier for the list of numbers you are monitoring.
10. Click **Save Settings** to save your changes.
11. In the **"Line"** field, select a line number that is actively registered to the appropriate SIP proxy you are using.

**Aastra Web UI**

- In the "**BLF List URI**" field, enter the name of the BLF list defined on the BroadSoft BroadWorks Busy Lamp field page for your particular user. For example, sip:9@192.168.104.13.

Note:

The value of the BLF/List URI parameter must match the list name configured. Otherwise, no values display on the 6757i screen and the feature is disabled.

- Select the line state (idle, connected, incoming, outgoing, busy) that you want to apply to the BLF softkey or programmable key.
- Click **Save Settings** to save your changes.

Configuring XML for Directed Call Pickup

Use the following procedure to configure XML for Directed Call Pickup in the configuration files.

Notes:

- Before implementing this procedure, you must create an XML application that the phone uses when the XML softkey or programmable key is pressed. This XML application must be entered as a URI in the "Value" field of the XML key. For information about creating an XML script, see the [Aastra XML Developer's Guide](#).
- You must enable Directed Call Pickup before performing these procedures. See "Enabling/Disabling Directed Call Pickup" on page 5-99.

**Configuration Files**

To set XML in the configuration files for Directed Call Pickup, see Appendix A, the section, "[Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters](#)" on page A-156.

Use the following procedure to configure XML for Directed Call Pickup in the Aastra Web UI.

**Aastra Web UI**

- Click on **Basic Settings->Preferences->Directed Call Pickup Settings**.

- Enable the "**Directed Call Pickup**" field by checking the check box.
- (optional) Enter a prefix in the "**Directed Call Pickup Prefix**" field. For example, *98. This prefix is appended to the beginning of the Directed Call Pickup number when dialed from the BLF or BLF/List softkey.
- For the 6739i, 6755i, 6757i, and 6757i CT enable the "**Play a Ring Splash**" feature by selecting either Enabled (when idle) or Enabled also in call (when idle and in an active call state. For all other IP phones enable the "**Play a Ring Splash**" feature by clicking on the checkbox. (Default is disabled).

If the "**Play a Ring Splash**" parameter is enabled, the IP phone plays a short "ring splash" when there is an incoming call on the BLF monitored extension.

Note:

This global setting is not dynamic. Changes to this setting will take effect only after the phone has been rebooted.

Aastra Web UI

5. Click on **Operation->Softkeys and XML**
or
Click on **Operation->Programmable Keys**
or
Click on **Operation->Expansion Module <N>**.

Note:

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	XML	XML Menu	http://65.205.71.13/xml	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Services	
XML Application URI:	http://65.205.71.13/xml/startup/key.php?user=\$\$SIP
XML Application Title:	XML Menu
BLF List URI:	

6. Select a softkey or programmable key to configure.
 7. In the "**Type**" field, select "**XML**".
 8. **For 8 and 11-Line LCD softkeys:**

In the "**Label**" field, enter the name of the person who's extension you are monitoring.
 9. In the "**Value**" field, enter the URI that the phone uses to display the XML application to the LCD.
For example, http://65.205.71.13/xml/startup/key.php?user=\$\$SIPREMOVEDNUMBER\$\$.
- Note:**
For more information about creating an XML script to use with Directed Call Pickup, see the *Aastra XML Developer's Guide*.
10. Select the line state (idle, connected, incoming, outgoing, busy) that you want to apply to the XML softkey or programmable key.
 11. Click **Save Settings** to save your changes.

Softkeys/Programmable Keys/Feature Keys/Expansion Module Keys

You can configure the softkeys, programmable keys, feature keys, and expansion module keys that are applicable to a specific phone model, to perform specific functions on the IP phones.

Note:

When entering definitions for softkeys in the configuration files, the “#” sign must be enclosed in quotes.

Softkeys

The following table provides the number of softkeys you can configure, and the number of lines available for each phone model that has configurable softkeys.

IP Phone Model	Softkeys	Expansion Module Keys	Programmable Keys	Lines Available	Handset Keys Available
9480i	6	Not Applicable	-	9	-
9480i CT	6	Not Applicable	-	9	15
6735i	6	36 to 108* (Model M670i)	6	9	-
		60 to 180** (Model M675i)			
6737i	12	36 to 108* (Model M670i)	-	9	-
		60 to 180** (Model M675i)			
6739i	55	36 to 108* (Model M670i)	-	9	-
		60 to 180** (Model M675i)			
6755i	6	36 to 108* (Model M670i)	6	9	-
		60 to 180** (Model M675i)			
6757i	12	36 to 108* (Model M670i)	-	9	-
		60 to 180** (Model M675i)			
6757i CT	12	36 to 108* on Base Station (Model M670i)	-	9	15
		60 to 180** on Base Station (Model M675i)			
6867i	10	16 to 48*** (Model M680i)	-	9	-

*The M670i expansion module consists of 36 softkeys. You can have up to 3 expansion modules on an IP phone totalling 108 softkeys. Valid for 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, and 6757i CT phones.

**The M675i expansion module consists of 60 softkeys. You can have up to 3 expansion modules on an IP phone totalling 180 softkeys. Valid for 6735i, 6737i, 6739i, 6755i, 6757i, and 6757i CT phones.

***The M680i expansion module consists of 16 softkeys. You can have up to 3 expansion modules on an IP phone totalling 48 softkeys. Valid for 6865i and 6867i phones.

State-Based Softkeys

Users and administrators can configure a specific state to display when a softkey is being used. Available states you can configure for each softkey include:

- **idle** - The phone is not being used.
- **connected** - The current line is in an active call (or the call is on hold)
- **incoming** - The phone is ringing.
- **outgoing** - The user is dialing a number, or the far-end is ringing.
- **busy** - The current line is busy because the line is in use or the line is set as “Do Not Disturb”.

The following table identifies the applicable default states for each type of softkey you can configure on the IP phone.

Softkey Type	Default States
None	All states disabled.
Line	idle, connected, incoming, outgoing, busy
Speeddial	idle, connected, incoming, outgoing, busy
DND	idle, connected, incoming, outgoing, busy
BLF	idle, connected, incoming, outgoing, busy
BLF List	idle, connected, incoming, outgoing, busy
Auto Call Distribution (ACD)	idle
Directed Call Pickup (DCP) (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.) Group Call Pickup (GCP) (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.)	idle, connected, incoming, outgoing, busy
XML	idle, connected, incoming, outgoing, busy
Flash	All states disabled.
Sprecode	connected
Park	connected
Pickup	idle, outgoing
Last Call Return	idle, connected, incoming, outgoing, busy
Call Forward	idle, connected, incoming, outgoing, busy
BLF/Xfer	idle, connected, incoming, outgoing, busy
Speeddial/Xfer	idle, connected, incoming, outgoing, busy
Speeddial/Conf	idle, connected, incoming, outgoing, busy
Speeddial/MWI (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.)	idle, connected, incoming, outgoing, busy
Directory	idle, connected, incoming, outgoing, busy
Filter (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.)	idle, connected, incoming, outgoing, busy
Callers List	idle, connected, incoming, outgoing, busy
Redial	idle, connected, incoming, outgoing, busy
Conference	idle, connected, incoming, outgoing, busy
Transfer	idle, connected, incoming, outgoing, busy
Icom (Intercom)	idle, connected, incoming, outgoing, busy
Services	idle, connected, incoming, outgoing, busy
Phone Lock	All states disabled.

Softkey Type	Default States
Paging	All states disabled.
Empty	idle, connected, incoming, outgoing, busy

You can enable or disable the softkey states using the configuration files or the Aastra Web UI. In the Aastra Web UI, you disable a state by unchecking the box for that operational state.

In the configuration files, you use the following parameters to enable and disable operational states:

- **softkeyN states**

You can enter multiple values (**idle, connected, incoming, outgoing, busy**) for the "**softkeyN state**" parameter. For example:

```
softkeyN states: idle connected
```

You must associate the softkeyN state parameter with a specific softkey. In the following example, the softkeyN states parameter is associated with softkey 12:

```
softkey12 type: speeddial
softkey12 label: voicemail
softkey12 value *89
softkey12 states: outgoing
```

Notes:

- By default the IP phone idle screen collapses the softkeys. So in the previous example, softkey 12 will appear in position 1 if no other softkeys are set.
- A softkey type of "empty" does not display on the idle screen at all. For more information about the softkey type of "empty" see Appendix A, the section, "[Softkey Settings](#)" on [page A-158](#).

Configuration Example

The following example illustrates the use of the "**softkeyN states**" parameter, and the "**softkeyN type**" parameter with a value of **empty**. For clarity purposes, only the "**softkeyN type**" and "**softkeyNstates**" parameters are shown.

```
softkey1 type: line
softkey1 states: idle connected
softkey3 type: dnd
softkey3 states: idle
softkey4 type: line
softkey5 type: empty
softkey5 states: connected
softkey6 type: speeddial
softkey6 states: connected
```

The following table shows how the keys in the example above would display on the IP Phone UI.

Note:

The "empty" key type allows a softkey to be removed quickly by deleting the softkey information from the configuration file.

Softkey	Idle	Connected	Notes
softkey1	Key 1	Key 2	Line displays for softkey1. Key 1 in connected state is the Drop key. Idle and connected display as applicable.
softkey2	(not used)	(not used)	Softkey2 is not displayed.
softkey3	Key 2	(not used)	DND displays for softkey3. Idle displays as applicable.
softkey4	Key 3	Key 3	Line displays for softkey4. Default state values (idle, connected, incoming, outgoing) display as applicable.
softkey5	(not used)	Key 4 (blank)	A blank displays for softkey5. Connected displays as applicable.
softkey6	(not used)	Key 5	Speeddial displays for softkey6. Connected displays as applicable.

Softkeys and programmable keys are configurable using the Aastra Web UI or the configuration files.

Programmable Keys

The following table provides the number of softkeys and programmable keys you can configure, and the number of lines available for each type of phone that has programmable keys.

IP Phone Model	Softkeys	Expansion Module Keys	Programmable Keys	Lines Available	Handset Keys Available
9143i	-	Not Applicable	7	9	-
6730i	-	Not Applicable	8	6	-
6731i	-	Not Applicable	8	6	-
6735i	6	36 to 108* (Model M670i)	6	9	-
		60 to 180** (Model M675i)			
6753i	-	36 to 108* (Model M670i)	6***	9	-
6755i	6	36 to 108* (Model M670i)	6	9	-
		60 to 180** (Model M675i)			
6863i	-	Not Applicable	3	2	-
6865i	-	16 to 48** (Model M680i)	8	9	-

*The M670i expansion module consists of 36 softkeys. You can have up to 3 expansion modules on an IP phone totalling 108 softkeys.

**The M680i expansion module consists of 16 softkeys. You can have up to 3 expansion modules on an IP phone totalling 48 softkeys. Valid for 6865i and 6867i phones.

***On the 6753i, two of the 6 programmable keys are the DELETE and SAVE keys and can be programmed only if Administrator allows.

Softkey/Programmable Key/Expansion Module Key Functions

You can configure the softkeys and programmable keys on the phones and any attached expansion module keys to perform specific functions using the configuration files or the Aastra Web UI.

Note:

On the 6739i, you can also configure softkeys using the IP Phone UI. For more information, see the [Aastra Model 6739i IP Phone User Guide](#).

The following table identifies the available functions of the softkeys, programmable keys, and expansion module keys on the IP phones. Available functions may vary on each model phone.

Note:

These functions apply to all model phones unless specifically indicated that the function does not apply.

Key Functions Table

Softkey/Programmable Key Function	Configuration File Parameter	Aastra Web UI Parameter	Description
None	none	None	Indicates not setting for the key.
Line	line	Line	Indicates the key is configured for line use.
Speeddial	speeddial	Speeddial	Indicates the key is configured for speeddial use. You can configure a softkey to speeddial a specific number. Optionally, you can also configure a Speeddial key to dial prefix numbers. With this option, the prefix numbers automatically dial when you press the softkey, and the phone waits for you to enter the remaining numbers to dial out. For more information about speeddial prefixes, see “Speeddial Prefixes” on page 5-128 . You can also create Speeddial keys and edit the keys using the IP Phone keypad. For more information about Speeddial keys and editing Speeddial keys, see your <Model-Specific> IP Phone User Guide for more information.
Busy Lamp Field (BLF)	blf	BLF	Indicates the key is configured for Busy Lamp Field (BLF) use. A user can dial out on a BLF configured key. You can also set a BLF subscription period. For more information about BLF, see the section “Busy Lamp Field (BLF)” on page 5-128 . For more information about BLF Subscription Period, see “BLF Subscription Period” on page 5-137 .
Busy Lamp Field List	list	BLF/List	Indicates the key is configured for BLF list use. A user can dial out on a BLF/List configured key. For more information on BLF, see the section “Busy Lamp Field (BLF)” on page 5-128 .
Auto Call Distribution (ACD)	acd	Auto Call Distribution	(For Sylantrio Servers) Indicates the key is configured for automatic call distribution (ACD). ACD allows the Sylantrio Server to distribute calls from a queue to registered IP Phones (agents). You can also set an ACD subscription period. For more information about ACD, see the section “Automatic Call Distribution (ACD) (for Sylantrio Servers)” on page 5-147 . For more information about ACD subscription period, see “ACD Subscription Period” on page 5-150 .

Softkey/Programmable Key Function	Configuration File Parameter	Aastra Web UI Parameter	Description
Directed Call Pickup (DCP)/Group Call Pickup (GCP)	dcp	Directed Call Pickup	<p>(This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3).</p> <p>(For Sylantrio Servers) Indicates the key is configured for either Directed Call Pickup or Group Call Pickup. The DCP/GCP feature allows you to intercept - or pickup - a call on a monitored extension(s).</p> <p>For more information about DCP/GCP, see the section “Directed Call Pickup/Group Call Pickup” on page 5-151.</p>
Do Not Disturb (DND)	dnd	Do Not Disturb	<p>Indicates key is configured for "do not disturb" use.</p> <p>For more information on DND, see the section “Do Not Disturb (DND)” on page 5-154.</p>
Extensible Markup Language (XML)	xml	XML	<p>Indicates the key is configured to accept an XML application for accessing customized XML services. You can also specify a URL for an XML key.</p> <p>For more information on XML, see the section “XML Customized Services” on page 5-239.</p>
Flash	flash	Flash	<p>Indicates the key is set to generate a flash event when it is pressed, or when a feature key is pressed on the 6757i CT handset. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold).</p> <p>For more information about the Flash key, see your <Model-Specific> IP Phone User Guide.</p>
Sprecode	sprecode	Sprecode	<p>Indicates the key is set to automatically activate specific services offered by the server. For example, if the sprecode value of *82 is configured, then by pressing the key, *82 automatically activates a service provided by the server. The value you enter for this field is dependent on the services provided by the server.</p> <p>For more information about the Sprecode key, see your <Model-Specific> IP Phone User Guide.</p>
Park	park	Park	<p>Indicates the key is set to be used as a park key to park an incoming call.</p> <p>For more information on park, see the section “Park/Pick Up Static and Programmable Configuration” on page 5-177.</p>
Pickup	pickup	Pickup	<p>Indicates the key is set to be used as a pickup key to pick up a parked call.</p> <p>For more information on pickup, see the section “Park/Pick Up Static and Programmable Configuration” on page 5-177.</p>
Last Call Return (LCR)	lcr	Last Call Return	<p>(For Sylantrio Servers) Indicates the key is set to be used to dial the last call that came in on that line.</p> <p>For more information on lcr, see the section “When the user presses the Pickup softkey, the phone will dial out *88 to connect to the pickup orbit, wait four seconds, automatically send the pickup dial code of 42, and then at this time the user can enter the last two digits of the pickup extension to complete the call pickup.” on page 5-186.</p>
Call Forward	callforward	Call Forward	<p>Indicates the key is set to be used to access the Call Forward menus on the phone.</p> <p>For more information about call forwarding, see the section “Call Forwarding” on page 5-190.</p>
BLF/Xfer	blfxfer	Call Forward	<p>Indicates the key is set to be used as a BLF key AND as a Transfer key.</p> <p>For more information about the BLF/Xfer feature, see the section “Use the following parameters to configure the ring splashsettings:” on page 5-137.</p>

Softkey/Programmable Key Function	Configuration File Parameter	Aastra Web UI Parameter	Description
Speeddial/Xfer	speeddialxfer	Speeddial/Xfer	Indicates the key is set to be used as a Speeddial key AND as a Transfer key. For more information about the Speeddial/Xfer feature, see the section "Use the following parameters to configure the ring splashsettings:" on page 5-137.
Speeddial/Conf	speeddialconf	Speeddial/Conf	Indicates the key is set to be used as a Speeddial key AND as a Conference key. For more information about the Speeddial/Conf feature, see the section "Speeddial/Conference Key" on page 5-141.
Speeddial/MWI	speeddialmwi	Speeddial/MWI	(This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). Indicates the key is set to be used as a Speeddial key for a voicemail account. For more information about the Speeddial/MWI feature, see the section "Speeddial/MWI Key" on page 5-143.
Directory	directory	Directory	Indicates the key is set for accessing the Directory List. For more information about the Directory List, see the section "Directory List" on page 5-226.
Filter	filter	Filter	(This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). Indicates the key is set for activating/deactivating Executive Call Filtering. For more information about the Executive and Assistant Services feature, see the section "BroadSoft BroadWorks Executive and Assistant Services Feature" on page 6-44.
Callers List	callers	Callers List	Indicates the key is set for accessing the Callers List. For more information on the Callers List, see the section "Callers List" on page 5-221.
Redial List	redial	Redial	Indicates the key is configured to access the Redial List. For more information about the Redial List, see your <Model-Specific> IP Phone User Guide .
Conference	conf	Conference	Indicates the key is configured as a Conference key (for local conferencing). (For Sylantrio and Broadsoft Servers) An Administrator can also enable centralized conferencing on the IP Phones. For more information about using the Conference key, see your <Model-Specific> IP Phone User Guide . For information about enabling centralizing conferencing, see "Centralized Conferencing (for Sylantrio and Broadsoft Servers)" on page 5-266.
Transfer	xfer	Transfer	Indicates the key is configured as a Transfer key for transferring calls. For more information about using the Transfer key, see your <Model-Specific> IP Phone User Guide .
Icom	icom	Intercom	Indicates the key is set to be used as the Intercom key. For more information about using the Intercom key, see your <Model-Specific> IP Phone User Guide . For information about other Intercom features, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.

Softkey/Programmable Key Function	Configuration File Parameter	Aastra Web UI Parameter	Description
Services	services	Services	Indicates the key is set to access Services, such as, Directory List, Callers List, Voicemail, and any other XML applications configured on the phone. For more information about using the Services key, see your <Model-Specific> IP Phone User Guide .
Phone Lock (Not applicable to the cordless handsets on CT models)	phone lock	Phone Lock	Indicates the key is configured as a phone lock key, allowing you to press this key to lock/unlock the phone. For more information about the lock/unlock key, see “ Locking IP Phone Keys ” on page 5-49 .
Paging	paging	Paging	Indicates the softkey is set for Group Paging on the phone. Pressing this key automatically sends a Real Time Transport Protocol (RTP) stream to pre-configured multicast addresses without involving SIP signaling. For more information about the Paging key, see “ Group Paging RTP Settings ” on page 5-82 .
Empty (Not applicable to programmable keys or expansion module keys)	empty	Empty	Indicates the key is configured to force a blank entry on the IP phone display for a specific key. If a particular key is not defined, it is ignored. For more information about empty keys, see your <Model-Specific> IP Phone User Guide .

Reference

For more information about key functions for your model phone, see your <Model-Specific> **IP Phone User Guide**.

Configuring Softkeys and Programmable Keys

Use the following procedures to configure the softkeys and programmable keys on the IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the sections, “[Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters](#)” on [page A-156](#).

Aastra Web UI

1. Click on **Operation->Softkeys and XML**
or
 Click on **Operation->Programmable Keys**
or
 Click on **Operation->Expansion Module <N>**.

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	BLF/List			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Services

XML Application URI:

XML Application Title:

BLF List URI:

2. Select a key to configure.

For Softkeys and Expansion Module Keys:

3. In the **"Type"** field, select the type of softkey you want to configure.

Reference: For available type values on each IP phone model, see Appendix A, the section, [“Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters”](#) on page A-156.

4. If applicable, enter a label in the **"Label"** field.

5. If applicable, in the **"Value"** field, enter a value to associate with the softkey. For example, for a Speeddial value, you can enter a number you want to use for the Speeddial key, or 12345+ as a Speeddial prefix.

6. If applicable, in the **"Line"** field, select the line for which you want to associate the softkey.

7. Some softkey types allow you to configure specific operational states. Operational states display to the IP phone when a softkey is used. To enable/disable an operational state, click the **"Idle"**, **"Connected"**, **"Incoming"**, or **"Outgoing"** fields to check or uncheck the box.

Operational states are not applicable to expansion modules.

8. Click **Save Settings** to save your changes.

Aastra Web UI

For Programmable Keys:

9. In the **"Hard Key"** field, select the programmable key type you want to configure.

Reference: For available type values on each IP phone model, see Appendix A, the section, ["Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters"](#) on page A-156.

10. In the **"Value"** field, enter a value to associate with the programmable key. For example, for a Speeddial value, you can enter a number you want to use for the Speeddial key, or 12345+ as a Speeddial prefix.

11. In the **"Line"** field, select the line for which you want to associate the programmable key.

12. Click **Save Settings** to save your changes.

Shifting of Softkey Positions for Busy States

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, 6757iCT, 9480i, and 9480iCT IP Phones only.

Administrators can shift the softkey position for busy states using the **"collapsed context user softkey screen"** parameter. If this parameter is configured, user programmable softkeys on the 6735i, 6737i, 6755i, 6757i, 6757iCT, 9480i, and 9480iCT phones will collapse and fill in any unused softkeys starting on the first page of softkeys during the following states:

- outgoing
- ringing
- connected
- hold

Note:

The phone defined context-sensitive softkeys (including empty/unassigned keys) will remain in the same location.

For Example:

During a call on a 6755i IP phone with this parameter disabled and with softkey 1 configured as Park and softkey 2 configured as DND, these two softkeys will not appear on page 1. The user has to press the More key to access them on page 2.

During a call on a 6755i IP phone with the **"collapsed context user softkey screen"** parameter enabled Park and DND appear on page 1 in softkey positions 4 and 5 (Drop, Conf, and Xfer situated in softkey positions 1, 2, and 3).

Configuring Collapsed Context User Softkey Screen

Use the following procedures to configure the collapsed context user softkey screen.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, ["Shifting of Softkey Positions for Busy States"](#) on page A-164.

Option to Remove the "More" Softkey when Not Required

Note:

Applicable to the the 9480i, 9480i CT, 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT IP, and 6867i IP phones only.

Administrators can control how softkeys are displayed on the IP phones' screens when the number of softkeys configured matches the exact number of softkey buttons on the phone.

For example, with the 9480i, 9480i CT, 6735i, and 6755i IP phone has a total of six physical softkey buttons. By default, when a total of six softkeys are configured, the screen displays five softkeys and offers a “More” option to access the remaining softkey.

```
L1          Thomas Keller
           01/01/14 11:00am
Services          DND
Directory         Paging
Callers          More
```

Default Screen 1

```
L1          Thomas Keller
           01/01/14 11:00am
Lock
                                           More
```

Default Screen 2

By enabling the “**collapsed more softkey screen**” parameter, in the scenario above, the “More” softkey is removed allowing the phones to display all six configured softkeys on one screen.

```
L1          Thomas Keller
           01/01/14 11:00am
Services          DND
Directory         Paging
Callers          Lock
```

When the “**collapsed more softkey screen**” parameter is enabled for the 6737i, 6757i, or 6757i CT the phone will apply the same behavior if six top softkeys or six bottom softkeys are configured.

Parameter Enabled

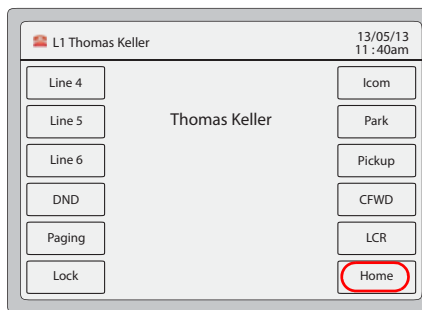

When the “**collapsed more softkey screen**” parameter is enabled for the 6739i IP phone, the phone will apply the same behavior if a total of 12 softkeys are configured.

Default Screen 1

Default Screen 2

Parameter Enabled

When the **“collapsed more softkey screen”** parameter is enabled for the 6867i IP phone, the phone will apply the same behavior if six top softkeys or four bottom softkeys are configured.

Default Screen 1

Default Screen 2

Parameter Enabled

Configuring the Collapsed More Softkey Screen Option

Use the following parameter to configure the collapsed more softkey screen option:

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“Increase of Displayed Characters for Softkey Line Labels”](#) on [page A-165](#).

Increased Number of Displayed Characters for Softkey Line Labels

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, and 6757iCT IP Phones only.

Administrators can now choose to display 10 characters on softkeys and top softkeys for line labels on 6735i, 6737i, 6755i, 6757i, and 6757i CT model phones. This is useful if the user wants to display a full 10 digit number as the softkey label, instead of a shortened label containing only 7 digits followed by ellipsis characters.

When a softkey or top softkey is defined as a line, the circle in front of the softkey label (line icon) can be removed using the new **“line icon disabled”** parameter. When the **“line icon disabled”** parameter is set to **“1”**, the line icon will not appear and the label can be displayed with up to 10 characters (label will not be shortened and no ellipsis characters will appear).

Configuring the Increase of Displayed Characters for Softkey Line Labels

Use the following parameter to disable the line icon and increase the number of characters displayed for softkey line labels:

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Increase of Displayed Characters for Softkey Line Labels" on page A-165.

6757i Cordless (CT) Feature Keys

In addition to the softkeys on the 6757i CT, this phone also has handset keys you can configure with specific features. You can use the Aastra Web UI to configure the handset keys.

Note:

You configure the handset keys using the Aastra Web UI (**Operation->Handset Keys**) or by pressing the "F" button on the handset.

You can program up to 15 feature keys on the 6757i CT handset with specific functions using the Aastra Web UI. The following table identifies the functions available for all 15 handset keys and the default functions for each key.

Handset Key	Key Function	Description
1	Line 1	Line 1 key - Selects line one
2	Line 2	Line 2 key - Selects line two
3	Line 3	Line 3 key - Selects line three
4	Line 4	Line 4 key - Selects line four
5	Icom	Icom key – Enter handset list to select handset to call
6	Dir	Directory key – Activate directory feature
7	Callers	Callers key – Activate callers feature
8	Xfer	Transfer key - Activate transfer feature
9	Conf	Conference key - Activate conference feature
10	Public	Public key – Toggle between public & private call mode
11	None	No function selected. Line 5 key (if available) - Selects line five.
12	None	No function selected. Line 6 key (if available) - Selects line six.
13	None	No function selected. Line 7 key (if available) - Selects line seven.
14	None	No function selected. Line 8 key (if available) - Selects line eight.
15	None	No function selected. Line 9 key (if available) - Selects line nine.

Feature Key Programming Guidelines

The following are guidelines to use when programming the feature keys on the handset:

- All handsets paired with the same Base Station have the same programmed functions since the web interface applies the functions to all the handsets paired with that base.
- A newly registered handset or handset that was out-of-range during the programming needs to perform an "off-hook and on-hook" sequence in order for the newly programmed function to be broadcasted to the affected handsets. Simply press the \checkmark key from the idle state to go off-hook. Then, press the γ key to go back on-hook.
- Duplicate functions can exist in the feature key as there is no filtering or duplicate checking done on the handset or

the base.

- If no line keys are programmed for the feature key, the handset is restricted to intercom calls only.
- If all 12 programmable functions have been programmed to "None", the user is presented with a List empty message when the feature key is pressed.

- For security reasons, the user has 180 seconds (3 minutes) to complete the programming. Otherwise, the phone displays the following error:
** Error **: Session expired, Please reload page.
- For security reasons, the user must submit the page from the same browser that was used to load the page. If the user tries to submit the page from any other IP address, the following error displays:
** Error **: Session invalid. Different Client IP Addresses. — Please reload page

Handset Feature Key Functions

You can configure the features keys on the 6757i CT handset to perform specific functions using the configuration files or the Aastra Web UI. The following table identifies the available functions for the feature keys on the 6757i CT handset.

The following **Handset Key Functions Table** lists the available functions for the keys on the 6757i CT IP Phone.

Handset Key Functions Table

Feature Key Function	Configuration File Parameter	Aastra Web UI Parameter	Description
None	none	None	Indicates the key is disabled. This option is available from Web UI only.
Line (Lines 1 through 9 are available for selection)	line	Line	Indicates the key is configured for line use.
Icom	icom	Icom	Indicates the key is set to be used as the Intercom key. For more information about the Icom key, see your Aastra IP Phone 6757i CT User's Guide . For information about other Intercom features, see "Incoming/Outgoing Intercom with Auto-Answer and Barge In" on page 5-79.
Directory	dir	Dir	Indicates the key is set for accessing the Directory List. For more information about the Directory List, see the section "Directory List" on page 5-226.
Callers	callers	Callers	Indicates the key is set for accessing the Callers List. For more information on the Callers List, see the section "Callers List" on page 5-221.
Transfer	xfer	Xfer	Indicates the key is configured as a Transfer key for transferring calls. For more information about the Xfer key, see your Aastra IP Phone 6757i CT User's Guide .
Park	park	Park	Indicates the key is set to be used as a park key to park an incoming call. For more information on park, see the section "Park/Pick Up Static and Programmable Configuration" on page 5-177.
Pickup	pickup	PickUp	Indicates the key is set to be used as a pickup key to pick up a parked call. For more information on pickup, see the section "Park/Pick Up Static and Programmable Configuration" on page 5-177.
Conference	conf	Conf	Indicates the key is configured as a Conference key (for local conferencing). (For Sylanro and Broadsoft Servers) An Administrator can also enable centralized conferencing on the IP Phones. For more information about using the Conference key, see your Aastra IP Phone 6757i CT User's Guide . For information about enabling centralizing conferencing, see "Centralized Conferencing (for Sylanro and Broadsoft Servers)" on page 5-266.

Feature Key Function	Configuration File Parameter	Aastra Web UI Parameter	Description
Public	public	Public	<p>Indicates the key is configured to toggle from public to private mode. A public and private key can be used when at a line item in the Directory List. The Private key toggles a number in the Directory List to private. The Public key allows a number in the Directory List to be sent to the handsets. A 6757i CT accepts a maximum of 50 entries with the public attribute.</p> <p>For more information about the public/private keys, see your Aastra IP Phone 6757i CT User's Guide.</p>
Flash	flash	Flash	<p>Indicates the key is set to generate a flash event when it is pressed, or when a feature key is pressed on the 6757i CT cordless handset. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold).</p> <p>For more information about the Flash key, see your Aastra IP Phone 6757i CT User's Guide.</p>

Reference

For more information about features key functions for your 6757i CT, see your **Aastra IP Phone 6757i CT User's Guide**.

Configuring Handset Feature Keys

You can program up to 15 feature keys on the 6757i CT IP phone using the configuration files or the Aastra Web UI. Use the following procedure to program the feature keys on your 6757i CT Base Station and all paired handsets.

Use the following procedures to configure the IP phone handset feature keys.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Handset Feature Key Settings" on [page A-175](#).

Aastra Web UI

1. Click on **Operation->Handset Keys**.

Cordless Handset Feature Key Configuration

Key	Type	Label
1	Line 1	Line1
2	Line 2	Line2
3	Line 3	Line3
4	Line 4	Line4
5	Icom	Intercom
6	Dir	Directory
7	Callers	Callers
8	Xfer	Transfer
9	Conf	Conference
10	Public	Public
11	None	
12	None	
13	None	
14	None	
15	None	

2. Select the handset key you want to program.
3. Select the function for that handset key from the "**Key Function**" field.
4. Click **Save Settings** to save the function you selected to the handset key.

The key programming information is sent to the 6757i Base Station and to all the cordless handsets associated with that Base Station. Any key programmed to "None" does not appear in the handset's list.

Press-and-Hold Speeddial Keypad Keys

The keypad keys on the IP phones can be used to store speeddial numbers that are dialed out when a user presses and holds the respective key. These press-and-hold speeddial numbers can be configured using the IP phone UI, the Aastra Web UI, or by defining the “**pnhkeypadN value**” and “**pnhkeypadN line**” parameters in the configuration files.

Configuring Press-and-Hold Speeddial Keypad Keys

You can program one speeddial number for each applicable keypad key (keys 1 through 9). For information on how to configure the press-and-hold keypad keys using the IP phone UI, please refer to the respective phone model's *Aastra SIP IP Phone User Guide*.

Use the following procedures to configure the press-and-hold keypad keys.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Press-and-Hold Speeddial Keypad Key Settings](#)” on [page A-174](#).

Aastra Web UI

1. Click on **Operation->Keypad Speed Dial**.

Keypad Speed Dial

Key	Value	Line
1	<input type="text" value="9051234567"/>	1 <input type="button" value="v"/>
2	<input type="text" value="9067654321"/>	1 <input type="button" value="v"/>
3	<input type="text" value="9050000000"/>	1 <input type="button" value="v"/>
4	<input type="text"/>	1 <input type="button" value="v"/>
5	<input type="text"/>	1 <input type="button" value="v"/>
6	<input type="text"/>	1 <input type="button" value="v"/>
7	<input type="text"/>	1 <input type="button" value="v"/>
8	<input type="text"/>	1 <input type="button" value="v"/>
9	<input type="text"/>	1 <input type="button" value="v"/>

2. Select the keypad key you want to program.
3. In the “**Value**” field, enter the speeddial number.
4. In the “**Line**” field, select the line number you want the phone to use when dialing the speeddial number.
5. Click **Save Settings**.

6867i Hard Key Reprogramming

Administrators have the ability to reprogram 7 of the 6867i IP phone's hard keys with any one of the phone's softkey functions.

6867i Hard Key Mapping

Notes:

- The reprogramming of hard keys 5, 6, 7, and 11 (indicated above in red) is not supported.
- Hard keys are only configurable using the configuration files.

The following parameters can be used to reprogram the hard keys:

Configuration Parameter	Description
hardkeyN type	<p>The type of key to which you would like to change the hard key. Valid types include:</p> <ul style="list-style-type: none"> • none • line • speeddial • dnd • blf • list • acd • xml • flash • sprecode • park • pickup • lcr • callforward • blfxfer • speeddialxfer • speeddialconf • directory • callers • redial • conf • xfer • icom • phonelock • paging
hardkeyN value	<p>The value you would like to assign to the hard key you are configuring. The “hardkeyN value” parameter can be set for the following key types only:</p> <ul style="list-style-type: none"> • speeddial • blf • sprecode • xml • park • pickup • blfxfer • speeddialxfer • speeddialconf • paging
hardkeyN line	<p>The line associated with the hard key you are configuring. The “hardkeyN line” parameter can be set for the following key types only:</p> <ul style="list-style-type: none"> • speeddial • blf • list • acd • park • pickup • lcr • blfxfer • speeddialxfer • speeddialconf

In addition to the above basic parameters, the following supplementary parameters can also be used for the hard keys:

Configuration Parameter	Description
hardkeyN locked	<p>Locks the specified hard key on the IP phones. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key.</p> <p>Note: If no settings are configured locally but the “hardkeyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “hardkeyN” parameters (i.e. “hardkeyN value” and “hardkeyN line”).</p>
hardkeyN ring splash	<p>When a key is configured for BLF functionality, this parameter controls the ring splash alert pattern per key. The following alerting patterns are available:</p> <ul style="list-style-type: none"> • Silence (ring splash off). • Normal splash (same as current BLF ring splash). • Normal - delayed (After a delay of (x) seconds, the normal ring splash is played). • Periodic (similar to the normal ring signal that is used by the phone itself. The actual ring melody is based on the current melody set for the line where the BLF key is associated to). • Periodic - delayed (after a delay of (x) seconds, the ring signal that is used by the phone is played - see above). • One low volume splash (same as the current BLF ring splash but at a lower level to be less intrusive). • One low volume splash - delayed (after a delay of (x) seconds, the ring signal that is the same as the current BLF ring splash is played at a lower level). <p>When a key is configured for BLF/List functionality, this parameter controls the ring tone per key. The following ring tones are available:</p> <ul style="list-style-type: none"> • Ring tone 1 • Ring tone 2 • Ring tone 3 • Ring tone 4 • Ring tone 5 • Silence (ring tone off) <p>Note: Ring tones are based on the current ring tone set configured on the IP phone.</p>

Notes:

- The value of “N” in the above “hardkeyN” parameters corresponds to the hard key’s mapping number as per the “6867i Hard Key Mapping” figure.
- Hard keys 1 to 4 can be remapped to any key type. If applicable, LED indication will follow the colour/cadence of the corresponding feature when the key is reprogrammed.
- Hard keys 8, 9, and 10 can be remapped to any key type except for the following: Line, BLF, BLF/List, Auto Call Distribution, and BLF/Xfer.
- If a hard key is configured with the type “None”, functionality of the hard key (and its corresponding LED) is disabled.
- Misconfiguration of the hard key will result in the key going back to its default function. For example, reprogramming hard key 3 (Redial) to

```
hardkey3 type: line
hardkey3 line: 33
```

will result in hard key 3 reverting back to its default Redial functionality as the “hardkey3 line: 33” definition is invalid.

Reprogramming Hard Key Functionality Using the Configuration Files

Use the following procedures to reprogram the functionality of hard keys on the IP 6867i IP phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the sections, “Hard Key Settings for 6867i” on page A-182, “Locking Keys” on page A-187, and “Ring Splash Settings” on page A-193.

Customizing the Key Type List in the Aastra Web UI

An Administrator can configure which key types display in the Aastra Web UI list for a Softkey, Programmable Key, Expansion Module Key, and/or Feature Key (CT Models). Currently, in the Aastra Web UI for a phone, you can select a type of key from a list of more than 20 key types to assign to a softkey, programmable key, expansion module key, and/or feature key. Using the configuration files, you can specify key types to display in the key type list that apply to a User's environment.

Example of a List of Configured Keys Types (None, Line, XML, Empty)

Key	Type	Label	Value
1	None		
2	None Line XML Empty		
3			
4	None		
5	None		
6	None		
7	None		

In addition to being able to specify which key types display in the list, the Administrator can also determine in which order the key types display.

You can use the following configuration file parameters to control which key types to display and specify in which order to display them in:

- **softkey selection list**
- **feature key selection list**

If no value is specified for the "softkey selection list" and/or "feature key selection list" parameters, the key "Type" list displays all of the key types by default.

If an Administrator configures specific key types for a phone in the configuration file, and the phone for which he downloads the configuration to already has key types configured on it, those key types display in the key list for those keys, in addition to the key types specified by the Administrator. For example, a phone has a Park key and a Pickup key already configured on the phone, and the Administrator downloads a configuration file to the phone that has specific key types of None, Line, Speeddial, and XML. After the configuration file is downloaded, the Park key list will show None, Line, Speeddial, XML, and Park; the Pickup key list will show None, Line, Speeddial, XML, and Pickup; all other keys that were configured as None before the download will show only None, Line, Speeddial, and XML.

Notes:

- Any key types configured that do not apply to the phone are ignored.
- The SAVE and DELETE keys appear by default as Keys 1 and 2 on the 6753i and 9143i, and as Keys 5 and 6 on the 6730i and 6731i, unless your Administrator configured these keys as other functions.
- An Administrator must use the English value when configuring the key types in the configuration files.
- After configuring specific key types for a phone, the key types in the Aastra Web UI display the same for both the User and Administrator Web interfaces for that phone.

Customizing the Key Type List Using the Configuration Files

Use the following procedure to configure the Key Type List that displays in the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Customizing the Key Type List" on page A-185.

Speeddial Prefixes

The normal function of the **Speeddial** option allows you to configure a specific key on the phone to dial a number quickly by pressing the configured key. For example, if you had the following Speeddial configuration in the configuration files:

```
softkey1 type: speeddial
softkey1 label: Office
softkey1 value: 5552345
softkey1 line: 1
```

after you press softkey1 on the phone, it dials the Office number at 555-2345 on line 1.

A new feature for the Speeddial option allows you to configure a preset string of numbers followed by a "+". This feature allows the phone to speeddial a prefix number and then pause to let you enter the remaining phone number. You can use this feature for numbers that contain long prefixes. For example, if you had the following Speeddial configuration in the configuration files:

```
softkey2 type: speeddial
softkey2 label: Europe Office
softkey2 value: 1234567+
softkey2 line: 2
```

after you press softkey2 on the phone, it dials the prefix number automatically and pauses for you to enter the remaining number using the keypad on the phone.

You can configure the Speeddial prefix using the configuration files or the Aastra Web UI.

Enabling/Disabling Ability to Add or Edit a Speeddial Key

The IP Phones allow you to set a parameter, "**speeddial edit**" using the configuration files that allows you to enable or disable the ability to add a Speeddial key or edit a Speeddial key from the IP Phone UI. Disabling this parameter prevents a user from adding or editing a Speeddial key.

The default for this parameter is enabled, allowing you to create and edit Speeddial keys on the phone using the Press-and-hold feature, softkeys, programmable keys, expansion module keys and key pad, Speeddial menu in the IP Phone UI, and the SAVE TO key.

If this parameter is set to disabled, it blocks the user from using any of the features on the phone to create or edit a Speeddial key.

Enabling/Disabling the Ability to Add or Edit a Speeddial Key Using the Configuration Files

Use the following procedure to enable/disable the ability to add and edit a Speeddial key.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "" on page A-191.

Busy Lamp Field (BLF)

The BLF feature on the IP phones allows a specific extension to be monitored for state changes. BLF monitors the status (busy or idle) of extensions on the IP phone.

Note:

BLF feature availability is dependant on your call manager.

Example

A Supervisor configures BLFs on his phone for monitoring the status of a worker's phone use (busy or idle). When the worker picks up his phone to make a call, a busy indicator on the Supervisor's phone shows that the worker's phone is in use and busy.

BLF Setting

(For use with Asterisk and sipXecs servers)

On 8 and 11-Line LCD phones, the busy and idle indicators show on the IP phone screen display next to the softkey or programmable key configured for BLF functionality. When the monitored user is idle, an icon with the handset on-hook shows next to the BLF softkey or programmable key. When the monitored user is on an active call, a small telephone icon is shown with the handset off-hook.

On 3-Line LCD phones, the LED lights next to each BLF programmable key illuminate steady to indicate the monitored line is off-hook or unregistered. The LED goes off when the line is idle.

On the 6739i, the busy and idle states are indicated by icons as well as by the color of the softkey button on screen (i.e. red for busy, black for idle).

On the 6867i, the busy and idle states are indicated by the color of the softkey button on screen (i.e. red for busy, green for idle) as well as the LED indicators (i.e. solid for busy and off for idle).

Note:

You can configure a maximum of 50 BLFs on the M670i, and M675i Expansion Modules. You can configure a maximum of 48 BLFs on the M680i Expansion Modules.

You can configure a BLF key on the IP Phones using the configuration files or the Aastra Web UI.

BLF/List Setting

(For use with the BroadSoft Broadworks Rel 13 or higher platform only)

The BLF/List feature on the IP phones is specifically designed to support the BroadSoft Broadworks Rel 13 Busy Lamp Field feature. This feature allows the IP phone to subscribe to a list of monitored users defined through the BroadWorks web portal.

In addition to monitoring the idle and busy state, the BLF/List feature also supports the ringing state. When the monitored user is idle, there is a small telephone icon shown with the handset on-hook. When the monitored user is in ringing state, there is a small bell icon shown. When the monitored user is on an active call then a small telephone icon is shown with the handset off-hook.

On 3-Line LCD phones, the LED lights next to each BLF programmable key illuminate steady to indicate the monitored line is off-hook or unregistered. The LED goes off when the is idle. When the monitored extension is ringing, the LED flashes.

Note:

The Broadworks BLF feature is not the same as the Broadworks Shared Call Appearance (SCA) feature and does not permit call control over the monitored extension.

You can configure a BLF/List key on the IP Phones using the configuration files or the Aastra Web UI. You can also specify a BLF list URI that the phone uses to access the required BLF list. You can specify a BLF List URI using the "list uri" parameter in the configuration files or the BLF List URI field in the Aastra Web UI at the path *Operation->Softkeys/Programmable Keys/Expansion Module Keys->Services->BLF List URI*. For more information about the "list uri" parameter, see Appendix A, the section, "BLF List URI Settings" on page A-192.

Note:

On the 6739i, you can configure a BLF/List softkey using the IP Phone UI also. For more information, *see the Aastra Model 6739i IP Phone User Guide*.

Example

A receptionist has a 6757i running Broadsoft firmware that subscribes to a list of extensions from the BroadWorks Application Server. Each monitored extension in the list shows up individually on the 6757i screen next to a softkey button. The softkey icons on the screen change depending on the state of the extensions.

On 3-Line LCD phones running Broadsoft firmware, the programmable key LEDs illuminate either flashing, solid, or turn off depending on the state of those extensions.

On the 6739i, the BLF states are indicated by icons as well as by the color of the softkey button on screen (red for busy, flashing red for ringing, and black for idle).

On the 6867i, the BLF states are indicated by the color of the softkey button on screen (red of busy, yellow for ringing, and green for idle) as well as the LED indicators (i.e. solid for busy, flashing for ringing, and off for idle).

Asterisk BLF Configuration

You can enable the BLF feature on Asterisk to enable monitoring for specific extensions. BLF on Asterisk is possible through the “hint” extension parameter.

Add the following in the Asterisk *extensions.conf* file for each target extension being monitored.

For example:

```
exten -> 9995551212,hint,SIP/9995551212
```

Add the following in the Asterisk *sip.conf* file for each subscriber if it is not defined already.

For example:

```
[9995551212]
Subscribecontext=sip
```

BroadSoft BLF Configuration

You can enable the BLF feature on BroadSoft BroadWorks Rel 13 or higher through the BroadWorks Web Portal. Each user must have the Busy Lamp Field service enabled for their user. The user must add each desired extension to the “Monitored Users List” on the Busy Lamp Field service page and also enter in a list name for the monitored users BLF list on the same page.

Changes to the “Monitored Users List” are dynamic and the Aastra IP phones are automatically updated without requiring a restart.

Reference

For sample BLF configurations, see [Appendix D, “Sample BLF Softkey Settings.”](#)

Configuring BLFs

Use the following procedures to configure BLF and BLF/List on the IP phone.

Configuration Files

To set BLF or BLF/List in the configuration files, see Appendix A, the sections,

- “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.
- “BLF List URI Settings” on page A-192.

Aastra Web UI

1. Click on **Operation->Softkeys and XML**
or
Click on **Operation->Programmable Keys**
or
Click on **Operation->Expansion Module <N>**.

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	BLF/List			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

18	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
19	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
20	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Services	
XML Application URI:	<input type="text"/>
XML Application Title:	<input type="text"/>
BLF List URI:	<input type="text" value="sip:9@192.168.104.13"/>

2. Select a softkey, programmable, or expansion module key to configure.
3. In the **"Type"** field, select "BLF" (Asterisk/sipXecs), "BLF/List" (BroadSoft BroadWorks).
4. **For 8 and 11-Line LCD softkeys:**
In the **"Label"** field, enter the name of the person who's extension you are monitoring (if "Type" is BLF).

Note:

If BLF/List type is selected, no label value is required. The BroadWorks BLF List name is configured in the "BLF List URI" field instead.

5. In the **"Value"** field, enter a value to associate with the softkey or programmable key.
For example, for BLF, the value is the extension you want to monitor.
For BLF/List, the value is an identifier for the list of numbers you are monitoring.
6. Click **Save Settings** to save your changes.
7. In the **"Line"** field, select a line number that is actively registered to the appropriate SIP proxy you are using.

**Aastra Web UI**

8. In the "**BLF List URI**" field, enter the name of the BLF list defined on the BroadSoft BroadWorks Busy Lamp field page for your particular user. For example, sip:9@192.168.104.13.

Note:

The value of the BLF/List URI parameter must match the list name configured. Otherwise, no values display on the 6757i screen and the feature is disabled.

9. Click **Save Settings** to save your changes.

BLF Page Switch Feature

Note:

Applicable to the 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT, and 6867i IP Phones only.

A new feature enables the 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT, and 6867i model phones to automatically switch the screen focus to a softkey page or M675i expansion module page that has an active Busy Lamp Field (BLF or BLF/List key(s)). Administrators can configure this feature using the "**blf activity page switch**" parameter.

If this parameter is set to "1", the screen will switch to a softkey page or an M675i expansion module page if a monitored extension transitions to a ringing (fast flashing) state. If this parameter is set to "2", the screen will switch if a monitored extension transitions to either a ringing (fast flashing) or a hold (slow flashing) state. Finally, if this parameter is set to "3", the screen will switch if a monitored extension transitions to either a ringing or hold state OR from an idle (off) state to an "in call" (solid) state.

The following can be observed with this new feature:

- If there is a lot of activity on the monitored extensions, the page will be shown on the screen for at least 5 seconds before switching again. When a user manually scrolls the pages by pressing the **More** key or the **Function** key (for the page you want to display) on the M675i, no activity-triggered page flipping should occur for 5 seconds after the manual switch.
- If the phone softkeys are hidden by an overlay screen, such as an XML UI object, a menu (e.g. the Services, Directory, or Callers List menu), or if the phone is in an active call, the screen will not automatically switch focus to a softkey page with BLF activity (it will however for an expansion module page).
- When the phone is in Idle mode, the menu switches to the page with the BLF key when there is an incoming call to the monitored extension. The page is shown for 10 seconds if the call is answered. If the call is not answered by the BLF extension, the BLF key page will be shown as long as ringing is ongoing.
- When the BLF key page is shown and there is another incoming call on another BLF key on the same page, the new call is also shown on this BLF key.
- When the BLF key page is shown and there is another incoming call on another BLF key on another page, the switch to the other page will be done after 10 seconds.
- When the BLF key page is shown and there are several more incoming calls on BLF keys, after 10 seconds the next active BLF key will be shown in the key number order.

Notes:

- To minimize the chance of a lot of switching between the Idle screen and the page(s) with BLF keys, it is recommended to have the BLF keys with most frequent traffic on one page. If the expansion module has several BLF keys, it is recommended to use an extra display panel unit.
- The IP phones (as well as the M675i Expansion Module) will automatically switch to the idle page (or the first page on the M675i Expansion Module) if no BLF activity is detected by the phone.

Configuring BLF Page Switch

Use the following procedures to configure the BLF page switch feature on the IP phone.

Configuration Files

To configure the BLF page switch on the IP phones using the configuration files, see Appendix A, the section, “BLF Page Switch” on [page A-192](#).

Configurable Display for Blank BLF/List Softkeys

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, and 6757i CT IP Phones only.

When softkeys for the 6735i, 6737i, 6755i, 6757i, 6757i CT model phones and the M675i Expansion Module are configured as BLF/List keys on the phone but there are not enough members in the BLF/List on the Broadsoft server side, then a series of question marks are displayed on screen beside some of the softkeys.

Administrators can configure whether or not the series of question marks should be hidden using the “**keys noname hidden**” parameter. If this parameter is set to “1” (enabled) then the series of question marks will be hidden and nothing will be shown on the screen beside the affected softkeys. If this parameter is set to “0” (disabled) then the series of question marks will be displayed on the screen indicating blank BLF/List softkeys.

Configuring the Display for Blank BLF/List Softkeys

Use the following procedure to configure the display for blank BLF/List softkeys:

Configuration Files

To configure the display for blank BLF/List softkeys on the IP phone using the configuration files, see Appendix A, the section, “Configurable Display for Blank BLF/List Softkeys” on [page A-193](#).

Ring Signal Type for BLF

There is a global parameter “**play a ring splash**” that controls whether or not a ring splash is played when there is an incoming call on a Busy Lamp Field (BLF) monitored extension. For the 6739i, 6755i, 6757i, and 6757i CT IP phones, you can configure the phone to play the ring splash when idle only or when idle and also in an active call state. For all other phones, the ring splash can only be configured to play when in an idle state.

Note:

The “**play a ring splash**” parameter is not dynamic. Changes to this parameter will take effect only after the phone has been rebooted.

In addition to this global ring splash control, administrators can control the ring splash alert pattern on a per key basis. Each type of key can have a different ring splash alerting pattern and volume. When the phone UI receives the event update from the line manager for BLF transitions to ringing state, the ring splash value is checked to take the appropriate action.

The following alerting patterns are available for all IP phones:

- **0:** Silence (ring splash off).
- **1:** Normal (same as current BLF ring splash).
- **2:** Normal delayed (After a delay of [x] seconds, the ring signal that is the same as the current BLF ring splash is played [use the “**ring splash delay**” parameter to define the delay]).
- **3:** Periodic (similar to the normal ring signal that is used by the phone itself. The actual ring melody is based on the current melody set for the line to which the BLF key is associated [use the “**ring splash frequency**” parameter to define

the frequency interval).

- **4:** Periodic delayed (same as Periodic but after a delay of [x] seconds, the ring signal that is used by the phone is played [use the “**ring splash frequency**” parameter to define the frequency interval and the “**ring splash delay**” parameter to define the delay]).
- **5:** Low volume (same as the current BLF ring splash but at a lower level to be less intrusive).
- **6:** Low volume delayed (after a delay of [x] seconds, the ring signal that is the same as the current BLF ring splash is played at a lower level [use the “**ring splash delay**” parameter to define the delay]).

For the 6739i, 6755i, 6757i, and 6757i CT IP phones, the additional alerting patterns are available:

- **7:** The behavior is determined by the global parameter “**play a ring splash**”.
 - If “**play a ring splash**” is defined as 0 then the feature is disabled.
 - If “**play a ring splash**” is defined as 1 then the behavior is the same as Normal.
 - If “**play a ring splash**” is defined as 2 the the behavior is the same as Normal but the ring splash plays when idle and also during the active call state.
- **8:** In call delayed (same as Normal delayed but ring splash plays when idle and also during the active call state [use the “**ring splash delay**” parameter to define the delay]).
- **9:** In call periodic (same as Periodic but ring splash plays when idle and also during the active call state [use the “**ring splash frequency**” parameter to define the frequency interval]).
- **10:** In call periodic delayed (same as Periodic delayed but ring splash plays when idle and also during the active call state [use the “**ring splash frequency**” parameter to define the frequency interval and the “**ring splash delay**” parameter to define the delay]).
- **11:** In call low volume (same as Low volume but ring splash plays when idle and also during the active call state).
- **12:** In call low volume delayed (same as Low volume delayed but ring splash plays when idle and also during the active call state [use the “**ring splash delay**” parameter to define the delay]).

The following parameters are available allowing administrators to set and pass the control of the ring splash to the key (instead of the phone using the global “**play a ring splash**” parameter).

- “**prgkeyN ring splash**”
- “**softkeyN ring splash**”
- “**topsoftkeyN ring splash**”
- “**expmodX KeyN ring splash**”
- “**ring splash delay**” (applicable when the “...keyN ring splash” parameter is set to a “delayed” alerting pattern)
- “**ring splash volume**” (applicable when the “...keyN ring splash” parameter is set to a “low volume” alerting pattern)
- “**ring splash frequency**” (applicable when the “...keyN ring splash” parameter is set to a “periodic” alerting pattern)

The per key settings overwrite the global setting (“**play a ring splash**” parameter) on the phone. If the global parameter is *disabled*, a ring splash can still be enabled on a key basis. If the global parameter is *enabled*, all keys will have a ring splash unless the value “0” is configured explicitly for a key.

The following table details the ring splash behavior in the different call states/events when the feature is enabled for active calls states. The behavior is consistent for all audio sources and audio mode configurations.

State	Behavior
Idle	Ring splash played through the speaker.
Active Call	Ring splash played through the speaker.
Call Waiting	Ring splash played through speaker.
Mid-Conference/Transfer Establishment	Ring splash played through speaker.
Do Not Disturb (Idle/In Call)	No ring splash played.
Hold	Ring splash played through speaker.
Ringling - Outgoing	Ring splash played through speaker.
Ringling - Incoming	No ring splash played.

State	Behavior
Initiating a direct call pickup of the BLF target	No ring splash played.
Initiating a speed dial of the BLF target	No ring splash played.

Considerations

The following considerations must be taken into account when using this feature:

- When a BLF softkey's ring splash parameter is dynamically changed, the change will not take effect until the BLF target becomes idle.
- The playing of a ring splash will be postponed if it is not allowed to be played in the current state and will start playing if the phone transitions to a state where the ring splash can be played. However, if the BLF target stops ringing before the transition, the ring splash will not be played.
- The playing of a delayed ring splash will be postponed until the delay expires. However, if the BLF target stops ringing before the delay expires, the ring splash will not be played.
- In scenarios where the BLF target goes into the ringing state while an initial in-call ring splash is playing or while a call hold or call waiting reminder is playing, the secondary in-call ring splash will be played 500ms after the current event has ended. The inverse is also true whereby call hold or call waiting reminders will be played 500ms after the BLF ring splash, if they occur while a BLF ring splash is playing.
- In scenarios where multiple keys are configured for periodic ring splashes and multiple BLF targets are ringing, only one periodic ring splash for one target will be played.
- While on an active call, if the "ring audibly enable" parameter is enabled and a call is incoming while a periodic ring splash is playing, the periodic ring splash will stop allowing the incoming call's ring tone to be played, and then resume after the incoming call's ring tone has ended.

Configuring Ring Splash Settings

Use the following parameters to configure the ring splash settings:

Configuration Files

To set the ring splash on a per key basis in the configuration files for BLF, see Appendix A, the sections "Ring Splash Settings" on [page A-193](#).

Ring Signal Type for BLF/List

Administrators can also control whether or not a ring tone is played when there is an incoming call on a BLF/List-monitored extension. Each BLF/List-monitored extension can be individually configured to play one of five different ring tones (or to play none at all).

After configuring the BLF/List URI and BLF/List keys, you can enable ring tone playback on the BLF/List-monitored extensions by defining the existing "**play a ring splash**" parameter as "**1**" in the respective configuration file.

Note:

The "**play a ring splash**" parameter is not dynamic. Changes to this parameter will take effect only after the phone has been rebooted.

Additionally, the following "**ring splash**" parameters can be used to control which specific ring tone is played (depending on the type of key for which BLF/List functionality is configured):

- **softkeyN ring splash**
- **prgkeyN ring splash**
- **topsoftkeyN ring splash**
- **expmodX keyN ring splash**

Applicable values for the above parameters include:

- **100** (Ring tone 1)
- **101** (Ring tone 2)
- **102** (Ring tone 3)
- **103** (Ring tone 4)
- **104** (Ring tone 5)
- **105** (Silence)

Note:

Ring tones are based on the current ring tone set configured on the IP phone.

Examples

To enable ring tone 3 playback for a BLF/List-monitored extension configured on a soft/prg/topsoft/expmodX “key1”, add the following parameters in the respective configuration file:

For Softkeys

```
play a ring splash: 1
softkey1 type: list
softkey1 ring splash: 102
```

For Programmable Keys

```
play a ring splash: 1
prgkey1 type: list
prgkey1 ring splash: 102
```

For Top Softkeys

```
play a ring splash: 1
topsoftkey1 type: list
topsoftkey1 ring splash: 102
```

For Expansion Module Keys

```
play a ring splash: 1
expmod1 key1 type: list
expmod1 key1 ring splash: 102
```

Considerations

When using this feature the following must be taken into consideration:

- If there is an incoming call on a BLF/List-monitored extension, the corresponding ring tone will play only if all of the regular lines are in an idle or hold state and both paging and conf/xfer is not active.
- The BLF/List-related ring tone will stop playing if a regular line starts dialing, starts ringing, is unheld, or if paging is activated. The BLF/List-related ring tone will resume when the phone is in an idle state and paging is not active.
- If multiple BLF/List-monitored extensions are ringing simultaneously, they are placed in a queue based on the ringing start time and priority is given to the extension that rang first. For example, if BLF/List is configured for extension 1, extension 2, and extension 3, and all three receive incoming calls in sequence, the phone will play the ring tone for extension 1. If ringing stops for extension1, ringing will begin for extension 2, and so on.
- Call waiting tone playback behavior for BLF/List-monitored extensions is based on the same rules as regular lines, but the call waiting tone for BLF/List-monitored extensions will also be played/stopped when paging is activated/deactivated.

Configuring Ring Splash Settings

Use the following parameters to configure the ring splash settings:

Configuration Files

To set the ring splash on a per key basis in the configuration files for BLF, see Appendix A, the sections “[Ring Splash Settings](#)” on [page A-193](#).

BLF Subscription Period

On the IP phones, you can set the time period, in seconds, that the IP phone re-subscribes the BLF subscription service. In the configuration files, enter the following parameter with a valid value to set the BLF subscription period:

```
sip blf subscription period: <value in seconds>
```

The minimum value for this parameter is 120 seconds (2 minutes) and the maximum is 2147483647 seconds. The default is 3600 (1 hour). The phone resubscribes to the BLF subscription service before the defined subscription period ends.

You can configure this feature using the configuration files or the Aastra Web UI.

Note:

The “**sip blf subscription period**” parameter is not applicable to BLF/List subscriptions.

Configuring BLF Subscription Period

Use the following procedures to configure the BLF subscription period on the IP phone.

Configuration Files

To configure the BLF subscription period on the IP phones using the configuration files, see Appendix A, the section, “[Advanced SIP Settings](#)” on [page A-82](#).

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings.**

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	86400
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	3600
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	0
T1 Timer	0
T2 Timer	0
Transaction Timer	4000
Transport Protocol	UDP
Local SIP UDP/TCP Port	5060
Local SIP TLS Port	5061
Registration Failed Retry Timer	1800
Registration Timeout Retry Timer	120
Registration Renewal Timer	15
BLF Subscription Period	3600
ACD Subscription Period	3600
BLA Subscription Period	300
Blacklist Duration	300
Park Pickup Config	
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. Enter a value, in seconds, from 120 to 2147483647 in the "**BLF Subscription Period**" field.
3. Click **Save Settings** to save your changes.

BLF/Xfer and Speeddial/Xfer Keys

The IP Phones have a transfer (Xfer) enhancement feature you can use with the BLF and Speeddial keys - **BLF/Xfer** and **Speeddial/Xfer**.

The BLF key allows one or more extensions to be monitored, and once there is any state change with those extensions, the key shows the status of the monitored lines. The Xfer key allows a call to be transferred to other recipients blindly or consultatively.

The Speeddial key allows a number to be dialed quickly by pressing one key configured for speeddialing. After answering a call, the recipient can transfer the call to an extension by:

1. Pressing Xfer key.
2. Entering the number of the extension or pressing Speeddial or BLF key.
3. Pressing Xfer key again

The BLF and Speeddial transfer enhancement feature provides a simpler way of transferring calls using the keys called **BLF/Xfer** and **Speeddial/Xfer**. The **BLF/Xfer** key combines the BLF and Xfer key's functionality together allowing the user to transfer calls or use BLF with one key. Similarly, the **Speeddial/Xfer** key combines the Speeddial key and Xfer key's functionality together allowing the user to press one key to speeddial and transfer calls.

Note:

It is recommended that you enable the **"switch focus to ringing"** parameter when using the BLF and Speeddial Transfer key feature. For more information about this parameter, see ["Switch Focus to Ringing Line"](#) on page 5-64.

BLF/Xfer Key Requirements and Functionality

- **BLF/Xfer and BLF**

A BLF/Xfer key can be configured for subscribing to an extension and monitor the status of the extension, similar to the BLF key functionality. Changes of the state of the monitored extension are indicated by a LED / Icon.

- **BLF/Xfer and Blind Transfer Calls**

When the focused line is in the "Connected" state, pressing the BLF/Xfer key transfers the call to the extension unconditionally, disregarding the status of the monitored extension.

If transferring a call to an extension fails, a message *"Transfer Failed"* displays on the phone, and you can reconnect the call (get the call back) by pressing the line key again.

- **BLF/Xfer and Call forward**

When the focused line is in the "Ringing" state, pressing the BLF/Xfer key forwards the call to the extension unconditionally, disregarding the status of the monitored extension.

- **BLF/Xfer and Speeddial**

When the focused line and the monitored extension are idle, pressing the BLF/Xfer key causes the phone to go offhook and dial the number of the extension.

Speeddial/Xfer Key Requirements and Functionality

The Speeddial/Xfer key has the following capabilities:

- **Speeddial/Xfer and Speeddial**

When the phone is in the "Idle" state, pressing the Speeddial/Xfer key causes the phone to go offhook and dial the predefined extension.

- **Speeddial/Xfer and Blind Transfer**

When the phone is connected to a call, pressing the Speeddial/Xfer key blind transfers the call to the predefined target.

If transferring a call fails, a message *"Transfer Failed"* displays, and you can reconnect the call (get the call back) by pressing the line key again.

- **Speeddial/Xfer and Call Forward**

When the phone is in the "Ringing" state, pressing the Speeddial/Xfer key forwards the call to the predefined extension.

Note:

On the 6739i, you can configure a BLF/Xfer and Speeddial/Xfer softkeys using the IP Phone UI also. For more information, see the [Aastra Model 6739i IP Phone User Guide](#).

Configuring the BLF/Xfer Key and the Speeddial/Xfer Key Using the Configuration Files

You use the following parameters in the configuration files to configure the BLF/Xfer key and/or Speeddial/Xfer key on the IP Phone.

Softkey Parameters	Programmable Key Parameters	Expansion Module Parameters
softkeyN type softkeyN label softkeyN value softkeyN line softkeyN states	prgkeyN type prgkeyN value prgkeyN line	expmoN keyN type expmoN keyN label expmoN keyN value expmoN keyN line

Top Softkey Parameters

topsoftkeyN type
topsoftkeyN label
topsoftkeyN value
topsoftkeyN line

Examples:

```
softkey1 type: speeddialxfer
softkey1 label: BX7801
softkey1 value: 7801
softkey1 line: 1
softkey1 states: idle connected incoming outgoing busy

prgkey1 type: blfxfer
prgkey1 value: 35
prgkey1 line: 1
```

Refer to the following in Appendix A to configure a BLF/Xfer and Speeddial/Xfer key on the IP phone using the configuration files.

Configuration Files

To set a BLF/Xfer and Speeddial/Xfer key using the configuration files, see Appendix A, “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.

Configuring the BLF/Xfer Key and the Speeddial/Xfer Key Using the Aastra Web UI

You configure the BLF/Xfer key and/or the Speeddial/Xfer Key on the IP phone similar to configuring a BLF key or Speeddial key using the Aastra Web UI. Use the following procedure to configure BLF/Xfer and/or Speeddial/Xfer.

Aastra Web UI

1. Click on **Operation->Softkeys and XML.**
or
Click on **Operation->Programmable Keys.**
or
Click on **Operation->Expansion Keys.**

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	BLF/Xfer	BX35	35	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	Speeddial/Xfer	SX7801	7801	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. Choose a key that you want to assign the BLF/Xfer key or a Speeddial/Xfer key to, and select **BLF/Xfer** or **Speeddial/Xfer** from the "Type" field.
3. In the "Label" field, enter a key label to assign to the BLF/Xfer key (for example, "BX35").
4. In the "Value" field, enter the monitored extension (for example, "35").
5. In the "Line" field, select the line for which you want to use the key functionality.
6. Select the state(s) (idle, connected, incoming, outgoing, busy) for which you want to use on the key.

Note:

States are not applicable to programmable keys.

7. Click **Save Settings** to save your changes.

Speeddial/Conference Key

The IP Phones allow you to configure a softkey/programmable key/expansion module key to be used as a Speeddial Conference key (**Speeddial/Conf** key) while remaining in the current call. This key allows a user on a call, to conference another party at a pre-defined number while remaining in the conference call.

For example, while on an active call, a user can use the Speeddial/Conf key to dial a recording service and have the resulting conference recorded.

Note:

If currently in a conference, the Speeddial/Conf key is disabled on the active call.

How it Works

If you configure a softkey/programmable key/expansion module as a **Speeddial/Conf** key, and you press this key while on an active call, the focused line changes to the dialing line. A **Cancel** softkey displays on the phone (only those phones that have LCDs larger than 3 lines), allowing you to abort the conference speeddial if required. The message "Ringling..." displays below the number when the far end is ringing. The message "Conf. Unavailable" briefly displays when a conference is already in progress or when the CT handset is in use. The active call is not put on hold when the speeddial number is dialed.

Limitations for Speeddial/Conference Key

The following are limitations for the Speeddial/Conference key:

- The CT handsets are not supported.
- The feature is not compatible with centralized conferencing.

The softkey/programmable key is called "**Speeddial/Conf**" in the Web UI drop down list. In the configuration file, use "**speeddialconf**" as the softkey type.

Note:

On the 6739i, you can configure a Speeddial/Conf softkey using the IP Phone UI also. For more information, see the [*Aastra Model 6739i IP Phone User Guide*](#).

Configuring the Speeddial/Conf Key Using the Configuration Files

To configure the Speeddial/Conf key using the configuration files, you enter "**speeddialconf**" for the key type. The following parameters are examples you can use to configure the Speeddial/Conf key:

```
softkey1 type: speeddialconf
softkey1 label: Sales
softkey1 value: 5645
softkey1 line: 3
```

```
topsoftkey1 type: speeddialconf
topsoftkey1 label: Sales
topsoftkey1 value: 5645
topsoftkey1 line: 3
```

```
prgkey1 type: speeddialconf
prgkey1 value: 5645
prgkey1 line: 1
expmod1 key1 type: speeddialconf
expmod1 key1 label: Sales
expmod1 key1 value: 5645
expmod1 key1 line: 3
```

Refer to the following in Appendix A to configure a Speeddial/Conf key on the IP phone using the configuration files.

Configuration Files

To set a Speeddial/Conf key using the configuration files, see Appendix A, “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.

Configuring the Speeddial/Conf Key Using the Aastra Web UI

Use the following procedure to configure the Speeddial/Conf Key using the Aastra Web UI.

Aastra Web UI

1. Click on **Operation->Softkeys and XML.**
or
Click on **Operation->Programmable Keys.**
or
Click on **Operation->Expansion Module Keys.**

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Speeddial/Conf	Sales	4556	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. In the “**Type**” field, select **Speeddial/Conf** from the list of options.
3. In the “**Label**” field, enter a key label to assign to the Speeddial/Conf key (for example, “**Sales**”).
4. In the “**Value**” field, enter the number that the phone dials when the Speeddial/Conf key is pressed (for example, “**4556**”).
5. In the “**Line**” field, select the line for which you want to use the key functionality.
6. For phones with softkeys:
In the States field, select the state(s) (idle, connected, incoming, outgoing, busy) for which you want to use on the key.

Note:
States are not applicable to programmable keys (9143i, 6730i, 6731i, 6735i, 6753i, 6755i, 6863i, 6865i).
7. Click **Save Settings** to save your changes.

Speeddial/MWI Key

Note:

This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.

Multiple voicemail registration is supported on the IP phones. This feature can be useful in scenarios where a user needs to monitor the voicemail accounts of his/her team members or an assistant requires access to his/her manager's voicemail messages.

By configuring a softkey, programmable key, or expansion module softkey as **Speeddial/MWI** and defining call and voicemail URIs, users can monitor and listen to pending messages on multiple voicemail accounts. When new messages are pending on a monitored voicemail account the corresponding Speeddial/MWI key's LED will blink and the UI (for softkeys) will display an envelope icon  and the number of pending messages beside the defined label.

When a user presses the softkey, the phone will send an INVITE to the configured call URI whereby the user will be able to listen to the new messages.

Users can configure the Speeddial/MWI key through the Aastra Web UI while Administrators can configure the key through the Aastra Web UI as well as the configuration files.

Note:

For the 6739i IP phone, the Speeddial/MWI key can be configured directly using the IP phone's UI.

Configuring the Speeddial/MWI Key Using the Configuration Files

To configure the Speeddial/MWI key using the configuration files, you must enter "**speeddialmwi**" for the key type. For the label, enter a key label to assign to the Speeddial/MWI key (e.g. Peter). For the value, enter in the call URI and voicemail URI separated by a semi-colon, as per the following syntax: [call URI];[voicemail URI]. For example:

```
+33123456,,,3456#0000#@domain;sip:voicemail_peter@domain
```

Notes:

- As the example above illustrates, pauses and DTMF are supported for the call URI.
- Ensure that no spaces are added between the call URI and the voicemail URI when defining the key value.
- If only one URI is provided, the value will be used for the voicemail URI and the call URI will be left as undefined.

For the line, enter the line for which you want to use the key functionality (e.g. 1 through 9).

The following parameters are examples you can use to configure the Speeddial/MWI key using the configuration files:

For Softkeys

```
softkey1 type: speeddialmwi
softkey1 label: Peter
softkey1 value: +33123456,,,3456#0000#@domain;sip:voicemail_peter@domain
softkey1 line: 3
```

For Top Softkeys

```
topsoftkey1 type: speeddialmwi
topsoftkey1 label: Peter
topsoftkey1 value:
+33123456,,,3456#0000#@domain;sip:voicemail_peter@domain
topsoftkey1 line: 3
```

For Programmable Keys

```
prgkey1 type: speeddialmwi
prgkey1 value: +33123456,,,3456#0000#@domain;sip:voicemail_peter@domain
prgkey1 line: 3
```

For Expansion Module Softkeys

```
expmod1 key1 type: speeddialmwi  
expmod1 key1 label: Peter  
expmod1 key1 value: +33123456,,,3456#0000#@domain;sip:voicemail_peter@domain  
expmod1 key1 line: 3
```

Refer to the following in Appendix A to configure a Speeddial/MWI key on the IP phone using the configuration files.

Configuration Files

To set a Speeddial/Conf key using the configuration files, see Appendix A, [“Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters”](#) on page A-156.

Configuring a Speeddial/MWI Key Using the Aastra Web UI

Use the following procedure to configure a Speeddial/MWI key using the Aastra Web UI:

Aastra Web UI

1. Click on **Operation->Softkeys and XML.**
or
Click on **Operation->Programmable Keys.**
or
Click on **Operation->Expansion Module Keys.**

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Speeddial/MWI	Peter	+33123456...3456#00	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. In the **"Type"** field, select **Speeddial/MWI** from the list of options.
3. If applicable, in the **"Label"** field, enter a key label to assign to the **Speeddial/MWI** key.
When messages are pending, the IP phone UI will display an envelope icon , the number of pending messages, and then the defined label (e.g.  3 Peter).
4. In the **"Value"** field, enter in the call URI and voicemail URI separated by a semi-colon, as per the following syntax: [call URI];[voicemail URI].
For example, +33123456,,3456#0000#@domain;sip:voicemail_peter@domain
Notes:
As the example above illustrates, pauses and DTMF are supported for the call URI.
Ensure that no spaces are added between the call URI and the voicemail URI when defining the key value.
If only one URI is provided, the value will be used for the voicemail URI and the call URI will be left as undefined.
5. In the **"Line"** field, select the line for which you want to use the key functionality.
6. For phones with softkeys:
In the **"States"** field, select the state(s) (idle, connected, incoming, outgoing, busy) for which you want to use on the key.
Note:
States are not applicable to programmable keys.
7. Click **Save Settings** to save your settings.

Configuring a Speeddial/MWI Key Using the IP Phone UI (6739i only)

Use the following procedure to configure a Speeddial/MWI key using the 6739i IP phone's UI:

IP Phone UI

1. Press  on the phone to enter the Options menu.
2. Select **Softkeys**. By default, all of the softkeys that display are configured as **"None"**.
3. Press a **<None>** key. A softkey configuration screen displays.
4. In the **"Type"** field, press the **<None>** key. A screen displays with softkey keys.
5. Press the **<Speeddial/MWI>** function key to apply to the softkey.
1. In the **"Label"** field, enter a key label to assign to the **Speeddial/MWI** key.
When messages are pending, the IP phone UI will display an envelope icon , the number of pending messages, and then the defined label (e.g.  3 Peter).

IP Phone UI

2. In the **“Value”** field, enter in the call URI and voicemail URI separated by a semi-colon, as per the following syntax: [call URI];[voicemail URI]. For example, +33123456,,,3456#0000#@domain;sip:voicemail_peter@domain
Notes:
As the example above illustrates, pauses and DTMF are supported for the call URI.
Ensure that no spaces are added between the call URI and the voicemail URI when defining the key value.
If only one URI is provided, the value will be used for the voicemail URI and the call URI will be left as undefined.

3. In the **“Line”** field, press the  or  to select a line for which to apply to the softkey. Valid values are 1 through 9.

4. Press **<Save>** to save the softkey. The softkey applies to your phone immediately and displays on your idle screen.

5. Press the  to return to the previous menu or press the  key to return to the idle screen.

Automatic Call Distribution (ACD) (for Sylanro Servers)

The IP phones support an Automatic Call Distribution (ACD) feature for Sylanro servers. The ACD feature allows the Sylanro server to distribute calls from a queue to registered IP phone users (agents).

To use the ACD feature on an IP phone, the administrator must first configure an ACD softkey or programmable key. When an IP phone user wants to subscribe to a queue (in order to receive incoming calls), the user presses the ACD key. The IP phone UI prompts the user to log in.

When the IP phone user is ready to receive calls from the server, the user logs into a queue. Depending on the server configuration, the IP phone is either in an “unavailable” or “available” state. If the phone is set to “available” then the server begins to distribute calls to this phone immediately. If the phone is set to unavailable, then server waits until the IP phone user manually changes the phone status to “available” (using the IP phone UI) before distributing calls.

Whenever the IP phone user answers a call, or misses a call, the server automatically changes the phone’s status to unavailable. The server updates its database with this new information and no longer distributes calls to this phone. The IP phone will remain in this state until:

- the IP phone user makes himself “available” again.
- the ACD auto-availability timer expires. This occurs only if the administrator has configured an ACD auto-availability timer as described in “ACD Auto-Available Timer” on [page 5-147](#).

The IP phone user can also choose to manually change the phone status to unavailable, using the IP Phone UI.

Note:

It is recommended you configure no more than a single ACD softkey or programmable key per IP phone.

ACD Auto-Available Timer

Whenever the IP phone user answers a call, or misses a call, the server automatically changes the phone’s status to unavailable. The administrator can control how long the IP phone remains in the unavailable state by configuring an auto-availability timer. When the timer expires, the IP phone status is automatically changed to available. The default setting for the timer is 60 seconds.

You use the following parameters to configure an ACD Auto-Available Timer in the configuration files:

- **acd auto available**
- **acd auto available timer**

Configuring an Automatic Call Distribution (ACD) Key

You can configure an ACD key on softkeys, programmable keys, and extension module keys.

Note:

On the 6739i, you can configure an ACD softkey using the IP Phone UI also. For more information, see the [Aastra Model 6739i IP Phone User Guide](#).

The following table illustrates examples of configuring an ACD key on the phone.

Softkey Examples	Top Softkey Examples	Programmable Key Examples	Extension Module Examples
softkey1 type: acd softkey1 label: sales softkey1 line: 1 softkey1 states: idle	topsoftkey1 type: acd topsoftkey1 label: sales topsoftkey1 line: 1 topsoftkey1 states: idle	prgkey1 type: acd prgkey1 line: 1	expmod1 key1 type: acd expmod1 key1 label: sales expmod1 key 1 line: 1

Use the following procedures to configure an ACD key on the IP phone.

Configuration Files

To configure an ACD key using the configuration files, see Appendix A, the section, “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.

Configuring the ACD Auto-Available Timer

Configuration Files

To configure the ACD Auto-Available Timer using the configuration files, see Appendix A, the section, “ACD Auto-Available Timer Settings” on page A-151.

Configuring an ACD Key Using the Aastra Web UI

Use the following procedure to configure an ACD softkey, programmable key, or expansion module key using the Aastra Web UI. This procedure uses the 6757i IP phone as an example.

Aastra Web UI

1. Click on **Operation->Softkeys and XML**
or
Click on Operation->Programmable Keys
or
Click on Operation->Expansion Module <N>.

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Auto call distribution	Sales		1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. In the “**Type**” field, select **Auto Call Distribution**.
3. In the “**Label**” field, specify a name for this ACD softkey. The Label helps identify which queue you are subscribing to when you login. (This field does not apply to the programmable keys on the 6730i, 6731i, 6735i, 6753i, 6755i and 9143i.)

For example: **Sales**
4. In the “**Line**” field, select the line which the IP phone uses to subscribe to the queue.

For example: **Line 1**
5. Click **Save Settings** to save your changes.

Configuring the ACD Auto-Available Timer Using the Aastra Web UI

Use the following procedure to configure an ACD auto-available timer using the Aastra Web UI.

Aastra Web UI

1. Click on **Basic Settings->Preferences->Auto Call Distribution Settings**.

2. In the **"Auto Available"** check-box, click **Enabled**.
3. In the **"Auto Available Timer"** field, specify the length of time (in seconds) before the IP phone state is automatically reset to "available." Valid values are 0 to 120 seconds. Default is 60.

For example: **60**

4. Click **Save Settings** to save your changes.

Using the ACD Feature on your IP Phone

The ACD feature allows you to login to a phone queue in order to receive distributed calls on your IP phone. To login to a phone queue, your system administrator must preconfigure an ACD softkey or programmable key on your Aastra IP phone.

For models 8 and 11-Line LCD phones, the ACD softkey is labeled according to your network requirements. Check with your administrator to verify the label assigned to the ACD softkey on your IP phone. The label usually describes which phone queue you are accessing when you press the ACD softkey.

For example, suppose the administrator wants to configure an ACD softkey to allow an IP phone user to log into the Customer Support phone queue. The administrator assigns the label "Support" to the softkey, so it is easily recognizable to the IP phone user. When the IP phone user wants to subscribe to the Customer Support queue, the user presses the Support key and can log in.

Once logged in to the queue, you can make yourself "available" or "unavailable" to take calls by pressing the Available/Unavailable key on the phone UI. The server monitors your IP phone status. When you set the IP phone to "available," the server begins distributing calls to your phone. When you set the IP phone to "unavailable," the server temporarily stops distributing calls to your phone.

The icon that appears next to the ACD softkey or programmable key on the IP Phone UI reflects your current status. In the example shown below, the  icon shows the current status of this IP phone user as "logged off."

This icon changes when you log on to the phone queue and are available to take calls. The icon changes again when you are busy with an active call.

The table below describes the meaning of the LED, and each icon, as they may appear on your IP phone:

Phone Model	Status: Logged In and Available	Status: Unavailable	Logged Out
9143i	Solid Red LED	Blinking red LED	No LED
9480i, 9480i CT	Solid Red LED  icon	Blinking Red LED Blinking  icon	No LED  icon
6730i, 6731i, 6753i	Solid Red LED	Blinking red LED	No LED
6735i, 6737i, 6755i, 6757i, 6757i CT	Solid Red LED  icon	Blinking Red LED Blinking  icon	No LED  icon

Logging In to a Phone Queue

Use the following procedure to log into a phone queue from your Aastra IP phone.

IP Phone UI

1. Press the ACD key on your IP phone.

Note:

Check with your administrator to verify the label assigned to the ACD softkey on your IP phone.

The login screen appears. In this example, the ACD softkey accesses the Customer Support phone queue and is labelled "Support."

2. Press the **Log In** softkey.

You are logged into the phone queue. Once you log in, examine the IP Phone UI, and note the following information:

- If your IP phone status is set to "available" then the server will begin to distribute phone calls from this queue to your IP phone.
- If your IP phone status remains "unavailable" after you log in, then you must manually change the state to "available" in order to start receiving calls.
- To temporarily stop receiving calls, you can switch the IP phone status to "unavailable."

While you are on a call (or miss a call that has been distributed to your IP phone), your IP phone status automatically switches to "unavailable." Your IP phone remains in the unavailable state until one of the following things occur:

- You use the IP Phone UI to manually switch the IP phone state back to available, or
 - The availability "timer" for your IP phone expires. This only occurs if your administrator has configured an auto-availability timer on your IP phone.
-

3. To Log out of the queue, select **Log Out**. The server no longer distributes phone calls to your IP phone.
-

ACD Subscription Period

On the IP phones, you can set the time period, in seconds, that the IP phone resubscribes the ACD subscription service after a software/firmware upgrade or after a reboot of the IP phone.

In the configuration files, you enter the following parameter with a valid value to set the ACD subscription period:

```
sip acd subscription period: <value in seconds>
```

The minimum value for this 120 seconds (2 minutes).

The default is 3600 (1 hour).

Setting this parameter to a value lower than 3600 allows the configured ACD feature to become active more quickly after a software/firmware upgrade or after a reboot of the IP phone. If you enter a value lower than 120 for this parameter, the default value (3600) will be used by the IP phone.

You can configure this feature using the configuration files or the Aastra Web UI.

Configuring ACD Subscription Period

Use the following procedures to configure the ACD subscription period on the IP phone.

Configuration Files

To configure the ACD subscription period on the IP phones using the configuration files, see Appendix A, the section, "[Advanced SIP Settings](#)" on [page A-82](#).

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	<input type="text" value="86400"/>
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	<input type="text" value="3600"/>
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	<input type="text" value="0"/>
T1 Timer	<input type="text" value="0"/>
T2 Timer	<input type="text" value="0"/>
Transaction Timer	<input type="text" value="4000"/>
Transport Protocol	UDP <input type="button" value="v"/>
Local SIP UDP/TCP Port	<input type="text" value="5060"/>
Local SIP TLS Port	<input type="text" value="5061"/>
Registration Failed Retry Timer	<input type="text" value="1800"/>
Registration Timeout Retry Timer	<input type="text" value="120"/>
Registration Renewal Timer	<input type="text" value="15"/>
BLF Subscription Period	<input type="text" value="3600"/>
ACD Subscription Period	<input type="text" value="3600"/>
BLA Subscription Period	<input type="text" value="300"/>
Blacklist Duration	<input type="text" value="300"/>
Park Pickup Config	<input type="text"/>
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. Enter a value, in seconds, from 120 (2 min) to 3600 (1 hour) in the "**ACD Subscription Period**" field.
3. Click **Save Settings** to save your changes.

Directed Call Pickup/Group Call Pickup

Note:

This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.

Aastra IP phones and any attached Expansion Modules support the Directed Call Pickup (DCP) and Group Call Pickup (GCP) features.

The Directed Call Pickup/Group Call Pickup feature allows you to intercept - or pickup - a call on a monitored extension. An Administrator or User can configure this feature using the Aastra Web UI to create a DCP or GCP softkey on the IP phone. When you configure a DCP softkey, you specify the extension that you want to monitor. Then, when the monitored extension receives a call, you press the DCP softkey to "pickup" (intercept) it. If the monitored extension receives multiple incoming calls simultaneously, the IP Phone UI displays a list of incoming calls. You select a call from this list, and are connected to the call.

When you configure a GCP softkey, you specify the ring group that you want to monitor for incoming calls. For example, suppose an Operator configures a GCP softkey to monitor incoming calls for a specific ring group (extensions 2200-2210). When an incoming call is received on any of these extensions, the Operator presses the GCP softkey and is connected to the call. If multiple incoming calls are received simultaneously, the Operator does the following actions:

- Presses the GCP softkey. The Operator Phone UI displays the current list of incoming calls (see below).
- Selects an extension to “pickup” first.
- Presses the Pickup softkey. The Operator is connected to the incoming call.

Notes:

- DCP/GCP feature availability is dependant on your call manager.
- On the 6739i, you can configure DCP/GCP softkey using the IP Phone UI also. For more information, see the **Aastra Model 6739i IP Phone User Guide**.

Configuring DCP/GCP Using the Configuration Files

Use the following procedures to configure DCP/GCP using the configuration files.

Configuration Files

To set DCP/GCP in the configuration files, see Appendix A, the section, “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.

Configuring Directed Call Pickup (DCP) Using the Aastra Web UI

Use the following procedure to configure Directed Call Pickup using the Aastra Web UI. This procedure uses the 6755i IP Phone as an example.

Aastra Web UI

1. Click on **Operation->Softkeys and XML**
or
 Click on **Operation->Programmable Keys**
or
 Click on **Operation->Expansion Module <N>**.

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Directed Call Pickup	DCP2200	2200	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Select a key for which to configure Directed Call Pickup.
3. In the “**Type**” field, select **Directed Call Pickup**.
4. In the “**Label**” field, specify a name for this Directed Call Pickup softkey.
 For example: **DCP2200**
5. In the “**Value**” field, specify the extension you want to intercept when you press this softkey.
 For example: **2200**
6. Click **Save Settings** to save your changes.

Configuring Group Call Pickup (GCP) Using the Aastra Web UI

Use the following procedure to configure Group Call Pickup using the Aastra Web UI.

Note:

A ring group must be configured on the server in order for a GCP softkey to function.

Aastra Web UI

1. Click on **Operation->Softkeys and XML**
or
Click on **Operation->Programmable Keys**
or
Click on **Operation->Expansion Module <N>**.

Depending on your phone-model, the key configuration screen displays. The 6755i Key Screen is shown as an example.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Directed Call Pickup	GCP_A	groupcallpickup	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. Select a key for which to configure Group Call Pickup.
3. In the **"Type"** field, select **Directed Call Pickup**.
4. In the **"Label"** field, specify a name for this Directed Call Pickup softkey.

For example: **GCP_A**
5. In the **"Value"** field, enter **groupcallpickup**.
6. Click **Save Settings** to save your changes.

Using Directed Call Pickup/Group Call Pickup

Use the following procedure for the DCP/GCP on your phone.

Note:

Before using the DCP/GCP feature on your phone, you must first configure the DCP or GCP key. You must identify the extension(s) or phone number(s) you want to monitor when configuring the key.

IP Phone UI

Using Directed Call Pickup (DCP)

1. When the monitored extension receives a call, press the **DCP** softkey to pick up the call.
2. If the monitored extension receives multiple incoming calls simultaneously, the phone displays a list of incoming calls.
3. Select a call from this list using the **UP** and **DOWN** arrow keys.
The call is answered.

Using Group Call Pickup (GCP)

1. When any of the monitored group of extensions receives a call, press the **GCP** softkey to pick up the call.
The call is answered.

**IP Phone UI**

2. If the monitored extension receives multiple incoming calls simultaneously, the phone displays a list of incoming calls.
3. Select a call from this list using the **UP** and **DOWN** arrow keys.
Press the "**Pickup**" softkey to answer the call you selected.

Do Not Disturb (DND)

The IP phones have a feature you can enable called "Do Not Disturb (DND)". An Administrator or User can set "Do Not Disturb" based on the accounts on the phone (all accounts or a specific account). You can set specific modes for the way you want the phone to handle DND. The three modes you can set on the phone for DND are:

- Account
- Phone
- Custom

DND Account-Based Configuration

An Administrator or User can configure DND on the phone-side by setting a mode for the phone to use (**account**, **phone**, or **custom**). Once the mode is set, you can use the IP Phone UI to use the DND feature.

Notes:

- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- You must configure a DND key on the phone to be able to use this feature via the phone's keypad.

The following describes the DND key behavior for each DND mode.

- **Account** - DND key toggles the account in focus on the IP Phone UI, to ON or OFF if DND enabled for that account.
- **Phone** - DND key toggles all accounts on the phone to ON or OFF.
- **Custom** - DND key displays custom screens on the IP Phone UI. User can select whether to enable/disable DND per account, enable DND on all accounts, or disable DND on all accounts.

The following table describes the DND key and Message Waiting Indicator (MWI) LEDs when you enable DND on the IP Phone.

Softkey LED Behavior for All Modes	MWI LED Behavior for All Modes
DND key LED RED if current account in focus has DND ON. DND key LED OFF when current account in focus has DND disabled.	MWI LED ON if current account in focus has DND ON. MWI LED OFF if current account in focus has DND OFF.

You can configure the DND softkey and the DND mode (**Account**, **Phone**, **Custom**) using the configuration files or the Aastra Web UI. Once you configure DND, you can access the DND screen on the IP Phone UI.

Notes:

- In the Aastra Web UI, the "Account Configuration" page replaces the previous "Call Forward Settings" page.
- In the IP Phone UI, the new DND key feature now has new menu screens.
- If you make changes to the configuration for DND via the IP Phone UI, you must refresh the Aastra Web UI screen to see the changes.
- On the 6739i, you can configure a DND softkey using the IP Phone UI also. For more information, see the **Aastra Model 6739i IP Phone User Guide**.

Configuring DND Using the Configuration Files

You use the following parameters to configure DND on the IP Phone:

- **dnd key mode**
- **softkeyN type, topsoftkeyN type, prgkeyN type, or expmodX keyN type**
- **softkeyN states (optional)**

Note:

If there is no DND key configured or if it is removed, DND is disabled on the IP Phone.

Example

The following is an example of configuring the mode for DND in the configuration files:

```
dnd key mode: 2
softkey1 type: dnd
softkey1 states: idle connected incoming outgoing busy
```

In the above example, softkey 1 is configured for DND for line 1 only, with a “**custom**” configuration. Pressing softkey 1 displays DND screens for which you can customize on the phone.

Configuration Files

To set DND in the configuration files, see Appendix A, the sections:

- “DND Key Mode Settings” on [page A-127](#).
- “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on [page A-156](#).

Configuring DND Using the Aastra Web UI

Use the following procedure to configure DND mode using the Aastra Web UI:

Aastra Web UI

1. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+#{xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1 ▼
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All ▼
DND Key Mode	Phone ▼
Call Forward Key Mode	Account ▼

2. In the **"DND Key Mode"** field, select a "do not disturb" (DND) mode to use on the phone. Valid values are: Account, Phone, Custom. Default is **Phone**.
 - **Account** Sets DND for a specific account. DND key toggles the account in focus on the IP Phone UI, to ON or OFF.
 - **Phone** Sets DND ON for all accounts on the phone. DND key toggles all accounts on the phone to ON or OFF.
 - **Custom** Sets the phone to display custom screens after pressing the DND key, that list the account(s) on the phone. The user can select a specific account for DND, turn DND ON for all accounts, or turn DND OFF for all accounts.

Notes:

- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- Using the Aastra Web UI, if you change the DND Key Mode to "phone", all accounts synchronize to the current setting of Account 1.

3. Click **Save Settings** to save your changes. The change takes effect immediately without a reboot.

Aastra Web UI

4. Click on **Basic Settings->Account Configuration**.

Account Configuration

Account	DND	Call Forward	State	Label	No. Rings
1. Screenname1	<input type="checkbox"/>	All Busy No Answer	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text" value="1"/>
2. Screenname2	<input type="checkbox"/>	All Busy No Answer	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text" value="1"/>
3. Screenname3	<input checked="" type="checkbox"/>	All Busy No Answer	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text" value="1"/>

5. For each account, enable DND by placing a check mark in the box. Disable DND by unchecking the box.

Notes:

- If you selected **"Account"** or **"Custom"** mode in step 2, you can enable/disable each account or all accounts as applicable. If you selected **"Phone"** mode, the first account allows you to change the DND status for all accounts.
- Number and name of accounts that display to this screen are dependant on the number and name of accounts configured on the phone. In the screen in step 4, Screenname1 is configured on Line 1, Screenname2 is configured on Line 2, and Screenname3 is configured on Line 3. The name for the account is dependant on the name specified for the **"Screen Name"** parameter at the path *Advanced Settings->LineN*. If you do not specify a value for the "Screen Name" parameter, the account name is based on the **"Phone Number"** parameter at the path *Advanced Settings->LineN*. If neither the "Screen Name" nor the "Phone Number" parameters are specified, the account name shows "1", "2", "3", etc. only.

6. Click **Save Settings** to save your changes.
The change takes effect immediately without a reboot.
7. Click on **Operation->Softkeys and XML**;
or
Click on **Operation->Programmable Keys**;
or
Click on **Operation->Expansion Module**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Do Not Disturb	<input type="text"/>	<input type="text"/>	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	Do Not Disturb	<input type="text"/>	<input type="text"/>	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None	<input type="text"/>	<input type="text"/>	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None	<input type="text"/>	<input type="text"/>	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Note:

If there is no DND key configured or if it is removed, DND is disabled on the IP Phone.

8. Click **Save Settings** to save your changes.

Configuring DND via the IP Phone UI (3-Line Phones)

After you add a DND key to your phone, you can toggle the DND state using this key on the phone. Use the following procedure to enable/disable DND on the IP phone.

The following procedures assume you have already configured a DND key AND assumes there are two accounts configured on the phone.

Notes:

- If there is no **DND** key configured or if it is removed, DND is disabled on the IP phone.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to Phone.
- Using the Aastra Web UI, if you change the DND key mode to Phone, all accounts synchronize to the current setting of Account 1.

DND in Account Mode

IP Phone UI

1. Use the **3** and **4** navigation keys to scroll through each account.

2. With the account in focus on the IP phone UI, press the **DND** key to turn on/off DND for the account.

In the above example, two accounts are configured on the phone. Only account 1 has DND enabled while account 2 has DND disabled.

DND in Phone Mode (Default)

IP Phone UI

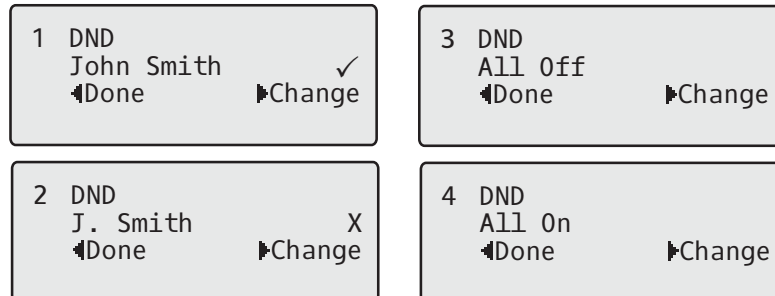

1. Press the **DND** key to turn on/off DND for all accounts on the phone.
2. Use the **3** and **4** navigation keys to scroll through each account.

In the above example, enabling DND for account 1 also enables DND for account 2.

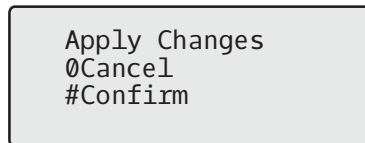

DND in Custom Mode**IP Phone UI**

1. Press the **DND** key on the phone. The screen displays a list of the accounts on the phone and allows you to enable/disable a specific account or all accounts.
2. Use the 2 and 5 navigation keys to scroll through the accounts.

In the above example, account 1 has DND enabled as indicated by a check mark (✓). Account 2 has DND disabled as indicated by an X. Items 3 and 4 allow you to disable or enable DND on all accounts, respectively.

3. Use the 4 **Change** key to enable or disable DND for a specific account or to enable/disable DND for all accounts. After making the change, press 3 **Done** and then # **Confirm** to save the change. Pressing 0 **Cancel** cancels the attempted change.

**Configuring DND via the IP Phone UI (8-Line and 11-Line Phones)**

After you add a DND key to your phone, you can toggle the DND state using this key on the phone. Use the following procedure to enable/disable DND on the IP Phone.

**IP Phone UI**

The following procedures assume you have already configured a DND key AND assumes there are three accounts configured on the phone.

Notes:

- If there is no DND key configured or if it is removed, DND is disabled on the IP Phone.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- Using the Aastra Web UI, if you change the DND key mode to "phone", all accounts synchronize to the current setting of Account 1.

DND in Account Mode

IP Phone UI

1. With the account in focus on the IP Phone UI, press the DND key to toggle DND ON or OFF for the account. Use the RIGHT and LEFT arrow keys to scroll through each account.
2. Use the RIGHT and LEFT arrow keys to scroll through each account.

In the above example, Screenname1, Screenname2, and Screenname3, are three accounts configured on the phone. Only Screenname1 and 3 have DND ON. Screenname 2 has DND OFF.

DND in Phone Mode (Default)

IP Phone UI

1. Press the DND key to toggle DND ON or OFF for all accounts on the phone. Toggling to ON enables DND on all accounts on the phone. Toggling to OFF disables DND on all accounts on the phone. Use the RIGHT and LEFT arrow keys to scroll through each account. Use the RIGHT and LEFT arrow keys to scroll through each account.

In the above example, toggling Screenname1 to DND ON, enabled DND for Screenname2 and 3 also.

Note:

Enabling DND in “Phone” mode toggles all accounts on the phone to DND ON.

DND in Custom Mode**IP Phone UI**

1. Press the **DND** key on the phone. The screen displays a list of the accounts on the phone and allows you to enable/disable a specific account or all accounts. Use the UP and DOWN arrow keys to scroll through the accounts.

2. You use the **CHANGE** key to enable or disable DND for a specific account selected.
3. Press **DONE** to save the change.

In the above example, Screenname1 and 3 have DND ON as indicated by a check mark (✓). Screenname2 has DND off as indicated by an X. The ALL ON and ALL OFF softkeys allow you to enable or disable DND on all accounts, respectively.

Configuring DND Modes via the IP Phone UI (6739i)

If you add a DND key using the configuration files or the Aastra Web UI, you can toggle the DND state using the. Use the following procedure to enable/disable DND on the IP Phone.

The following procedure assumes you have already configured a DND key AND assumes there are three accounts configured on the phone.

Notes:

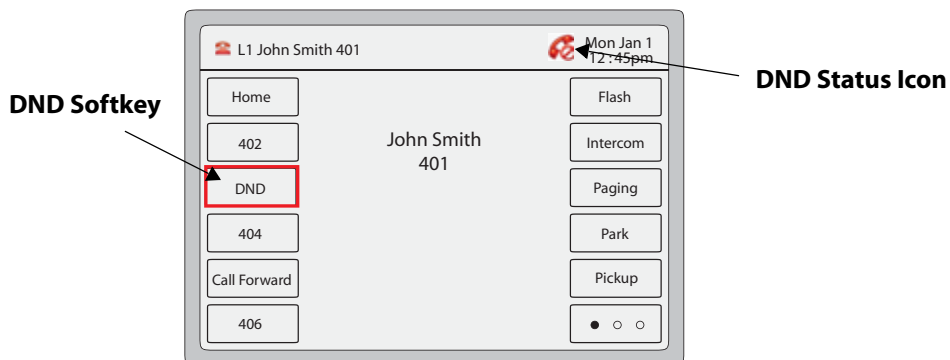

- If there is no DND key configured or if it is removed, DND is disabled on the IP Phone.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- Using the Aastra Web UI, if you change the DND key mode to "phone", all accounts synchronize to the current setting of Account 1.

DND in Account Mode

IP Phone UI

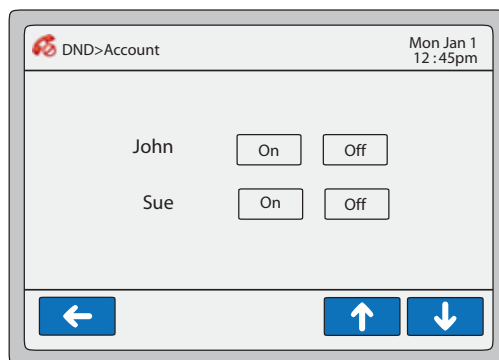

1. **On the 6739i:**
With the account in focus on the , press the DND key to toggle DND ON or OFF for the account.

In the above example, pressing the DND key on the line in focus highlights the softkey in red to show that DND is enabled. The MWI LED illuminates ON. A DND icon appears in the status bar on the upper right of the screen. Pressing the DND key again disables DND on the line in focus, turns off the MWI LED, and the DND status icon disappears.

To enable/disable DND for another account:

- Press the <Services> button.
- Press the <DND> button.

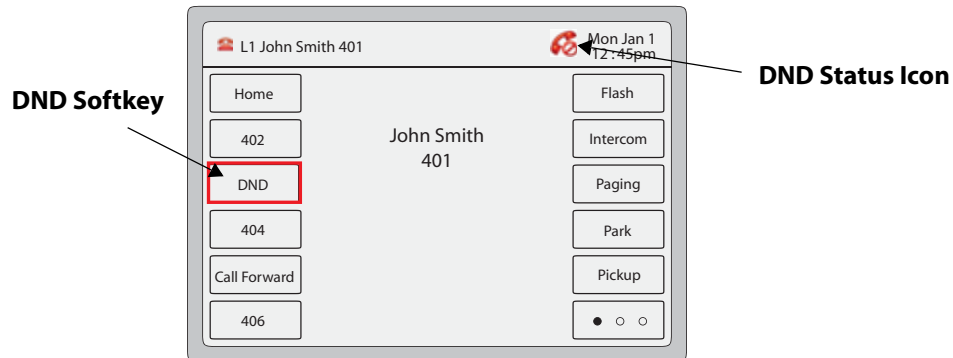

- Press <On> or <Off> to enable/disable DND for a specific account. Use the scroll keys if applicable to scroll through accounts.

DND in Phone Mode (Default)

IP Phone UI

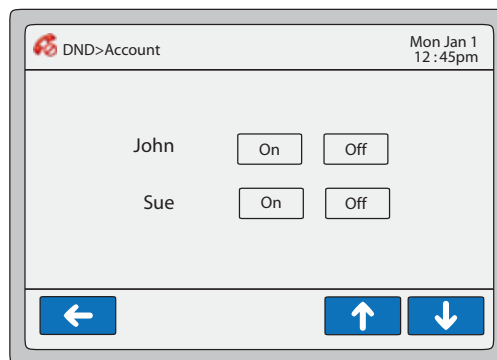

1. With the account in focus on the , press the DND key to toggle DND ON or OFF for the account.

In the above example, pressing the DND key on the line in focus highlights the softkey in red to show that DND is enabled. The MWI LED illuminates ON. A DND icon appears in the status bar on the upper right of the screen. Pressing the DND key again disables DND on the line in focus, turns off the MWI LED, and the DND status icon disappears.

To enable/disable DND for another account:

- Press the **<Services>** button.
- Press the **<DND>** button.

- Press **<On>** or **<Off>** to enable/disable DND for a specific account. Use the scroll keys if applicable to scroll through accounts.

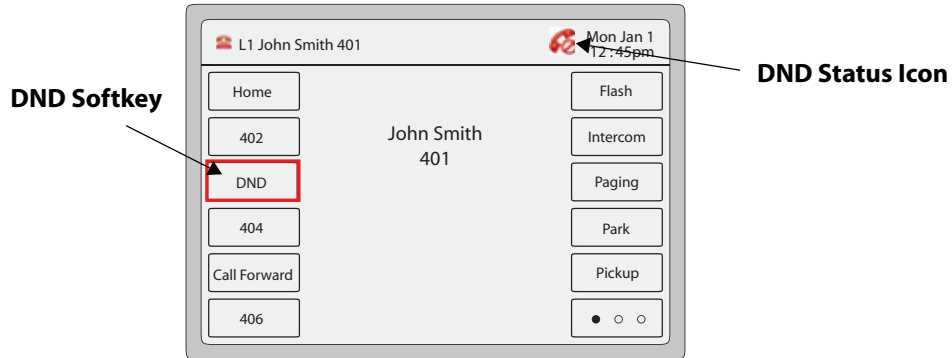

Note:

Enabling DND in Phone mode toggles all accounts on the phone to DND on.

DND in Custom Mode

 IP Phone UI

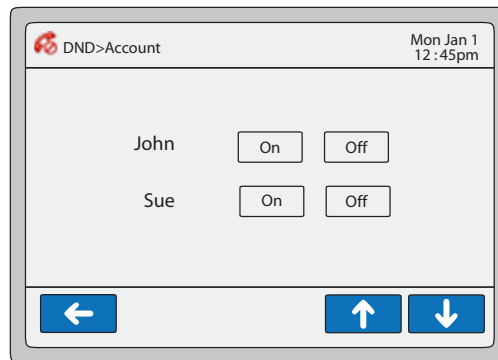

1. With the account in focus on the , press the DND key to toggle DND ON or OFF for the account.

In the above example, pressing the DND key on the line in focus highlights the softkey in red to show that DND is enabled. The MWI LED illuminates ON. A DND icon appears in the status bar on the upper right of the screen. Pressing the DND key again disables DND on the line in focus, turns off the MWI LED, and the DND status icon disappears.

To enable/disable DND for another account:

- Press the **<Services>** button.
- Press the **<DND>** button.

- Press **<On>** or **<Off>** to enable/disable DND for a specific account. Use the scroll keys if applicable to scroll through accounts.

Configuring DND Using the IP Phone UI (6867i)

After you add a DND key to your phone, you can toggle the DND state using this key on the phone. Use the following procedure to enable/disable DND on the IP phone.

The following procedures assume you have already configured a DND key AND assumes there are multiple accounts configured on the phone.

DND in Account Mode

IP Phone UI

1. From the Home screen press the 4 navigation key to move to the **Line Selection** screen.
2. Highlight the desired account using the 2 and 5 navigation keys.
3. Press the 3 navigation key to go back to the **Home** screen
4. With the account in focus on **Home** screen, press the **DND** softkey to toggle DND on or off for the account.

DND in Phone Mode (Default)

IP Phone UI

1. From the **Home** screen, press the **DND** softkey to toggle DND on or off for all accounts on the phone.

Note:

Enabling DND in Phone mode toggles all accounts on the phone to DND on.

DND in Custom Mode

IP Phone UI

1. From the Home screen, press the **DND** softkey.
The screen displays a list of the accounts on the phone and allows you to enable/disable a specific account or all accounts.

2. Use the 2 and 5 navigation keys to scroll through the accounts and press the button to enable DND for the selected account.

Note:

Press the **All On** or **All Off** softkeys to quickly enable or disable DND for all accounts.

3. Press the **Save** softkey to save your changes.

Bridged Line Appearance (BLA)

A SIP bridge line appearance (BLA) on the IP phones allows multiple devices to share a single directory address (DA).

For example, people working at a technical support department could be located in different places. If their desktop phones are configured for BLA DA, when customer calls come in, all the phones with the BLA DA would ring but the call can only be answered by one of them.

Once the call is answered, the rest of the phones reflect the status of the call. If the call was put on "hold" by the original recipient, any one from the group can pick up the call.

Note:

This feature is dependent on the IP telephony system to which the IP phone is registered and according to `draft-anil-sipping-bla-02.txt`.

You can apply BLA on the IP phones as follows:

- **As a single BLA group** - One BLA DA is shared among multiple phones. Only one phone at a time can pick up an incoming call or initiate an outgoing call on the BLA DA. All phones reflect the usage of the BLA DA. If the call is put on "hold", any one from the group can pick up the "held" call.
- **As a multiple BLA group** - On one single phone, multiple BLA DA can be associated with different line appearances. Every BLA DA is independent from each other and follows the same rules as "a single BLA group".
- **As multiple instances of a BLA DA** - A "x-line-id" parameter was defined in `draft-anil-sipping-bla-02.txt` to present the incoming call to or place an outgoing call on the specified line appearance instance. The parameter is carried in "Alert-Info" header field over the request-URI (INVITE e.g.) or in the NOTIFY messages to report the status of a dialog.

BLA DA can be configured on a global basis or on a per-line basis on the IP phones using the Aastra Web UI or the configuration files.

The following table shows the number of lines that can be set to BLA for each model phone.

IP Phone Model	Possible # of BLA Lines
9143i	9
9480i	9
9480i CT	9
6730i	6
6731i	6
6735i	9
6737i	9
6739i	9
6753i	9
6755i	9
6757i	9
6757i CT	9
6863i	2
6865i	9
6867i	9

Configuring BLA

You can configure BLA on a global or per-line basis using the configuration files or the Aastra Web UI.

Global BLA

You configure BLA on a global basis in the configuration files using the following parameters:

- **sip mode**
- **sip user name**
- **sip bla number**

You configure BLA on a global basis in the Aastra Web UI using the following fields at **Advanced Settings->Global SIP->Basic SIP Authentication Settings**:

- **Line Mode**
- **Phone Number**
- **BLA Number**

Per-Line BLA

You configure BLA on a per-line basis in the configuration files using the following parameters:

- **sip lineN mode**
- **sip lineN username**
- **sip lineN bla number**

You configure BLA on a per-line basis in the Aastra Web UI using the following fields at **Advanced Settings->Line 1 thru Line 9**:

- **Line Mode**
- **Phone Number**
- **BLA Number**

Sylantro servers and ININ servers require specific configuration methods for per-line configurations.

For Sylantro Server

When configuring the BLA feature on a per-line basis for a Sylantro server, the value set for the "sip lineN bla number" parameter shall be the same value set for the "sip lineN user name" parameter for all the phones in the group. For example, if sip lineN user name is 1010, you would configure BLA on a per-line basis for the Sylantro server as follows:

```
sip line 1 mode: 3
sip line1 user name: 1010 (# for all the phones)
sip line1 bla number: 1010
```

For ININ Server

When configuring the BLA feature on an ININ server, the value set for the sip lineN bla number parameter shall be the same value set for the sip lineN user name parameter without the incremented digit added to the phone #. For example, if the sip lineN user name for the first phone is 10101, and the sip lineN user name for the second phone is 10102, etc., you would configure BLA on a per-line basis for the ININ server as follows:

(# for phone 1 with appearance of phone 3)

```
sip line1 mode: 3
sip line1 user name: 10101 sip line1 bla number: 1010
(# for phone 2 with appearance of phone 3)
sip line1 mode: 3
sip line1 user name: 10102
sip line1 bla number: 1010
(# for phone 3)
sip line1 mode: 3
sip line1 user name: 1010
```

```
sip line1 bla number: 1010
```

Note:

The original phone number which has the bridged line appearance on other phones, will have the "sip lineN user name" parameter the same as the "sip lineN bla number" (1010 in the above example on Phone 3).

Configuring Global BLA Using the Configuration Files

Use the following procedures to configure global BLA on the IP phone.

Configuration Files

For specific **global** parameters you can set in the configuration files, see Appendix A, the section, "[SIP Basic, Global Settings](#)" on [page A-61](#).

Configuring Per-Line BLA Using the Configuration Files

Use the following procedures to configure per-line BLA on the IP phone.

Configuration Files

For specific **per-line** parameters you can set in the configuration files, see Appendix A, the section, "[SIP Basic, Per-Line Settings](#)" on [page A-69](#).

Configuring BLA Using the Aastra Web UI

Aastra Web UI

1. For global configuration of BLA:

Click on **Advanced Settings->Global SIP->Basic SIP Authentication Settings**.

Global SIP Settings

Basic SIP Authentication Settings

Screen Name	John Smith
Screen Name 2	J. Smith
Phone Number	555-555-5555
Caller ID	555-555-5555
Authentication Name	4148
Password	•••••
BLA Number	5555
Line Mode	BLA
Call Waiting	<input checked="" type="checkbox"/> Enabled

For per-line configuration of BLA:

Click on **Advanced Settings->Line N (1-9)**.

Configuration Line 1

Basic SIP Authentication Settings

Screen Name	John Smith
Screen Name 2	J. Smith
Phone Number	555-555-5555
Caller ID	555-555-5555
Authentication Name	4148
Password	•••••
BLA Number	5555
Line Mode	BLA
Call Waiting	Global

In the "**Line Mode**" field, select the **BLA** option.

2. In the "**Phone Number**" field, enter the phone number of the IP phone.
3. For global configuration of BLA:
In the "**BLA Number**" field, enter the Bridge Line Appearance (BLA) number to be shared across all IP phones.

For per-line configuration of BLA:

In the "**BLA Number**" field, enter the Bridge Line Appearance (BLA) number to be shared on a specific line.

4. Click **Save Settings** to save your changes.

BLA Subscription Period

The IP Phones include a **SIP BLA subscription period** parameter that allows an Administrator to set the amount of time, in seconds, of the BLA subscription period.

If this parameter is set to zero (0), the phone uses the value specified for the BLA expiration in the subscribe message received from the server. If no value is specified in the Subscribe message received from the server, the phone uses the default value of 300 seconds.

You can configure this parameter using the configuration files or the Aastra Web UI.

Configuring the BLA Subscription Period

Use the following procedures to configure the BLA Subscription Period.

Configuration Files

To configure the BLA subscription period on the IP phones using the configuration files, see Appendix A, the section, [“Advanced SIP Settings”](#) on page A-82.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	<input type="text" value="86400"/>
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	<input type="text" value="3600"/>
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	<input type="text" value="0"/>
T1 Timer	<input type="text" value="0"/>
T2 Timer	<input type="text" value="0"/>
Transaction Timer	<input type="text" value="4000"/>
Transport Protocol	UDP <input type="button" value="v"/>
Local SIP UDP/TCP Port	<input type="text" value="5060"/>
Local SIP TLS Port	<input type="text" value="5061"/>
Registration Failed Retry Timer	<input type="text" value="1800"/>
Registration Timeout Retry Timer	<input type="text" value="120"/>
Registration Renewal Timer	<input type="text" value="15"/>
BLF Subscription Period	<input type="text" value="3600"/>
ACD Subscription Period	<input type="text" value="3600"/>
BLA Subscription Period	<input type="text" value="300"/>
Blacklist Duration	<input type="text" value="300"/>
Park Pickup Config	<input type="text" value=""/>
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. In the **“BLA Subscription Period”** field, enter a value, in seconds, that the phone waits to receive a BLA subscribe message from the server. If you specify zero (0), the phone uses the value specified for the BLA expiration in the subscribe message received from the server. If no value is specified, the phone uses the default value of 300 seconds. Valid values are 0 to 3700. Default is 300 seconds.
3. Click **Save Settings** to save your changes.

Using a BLA Line on the IP Phone

If you have either a global or per-line BLA configuration, and you want to share a call on the line with a BLA group, you need to press the Hold button before sharing the call with the group.

For example, if line 1 is configured for BLA, and you pick up a call on line 1, you must press the Hold button to share the call with the BLA group.

If you pick up a call on line 1 configured for BLA, and another call comes in on line 2, you can pick up line 2 without putting line 1 on hold. The line 1 call will be on hold automatically; however it is on hold locally only. The line 1 call cannot be shared with the BLA group.

Note:

The Hold button must be pressed for a call on a BLA line to be shared with the BLA group.

BLA Support for Third-Party Registration

BLA allows an Address Of Record (AOR) to be assigned onto different line appearances for a group of SIP user agents (IP phones). When a call is made to this BLA number, the call is offered to all user agents that have mapping to this BLA. To support this, the IP phones need to support third party registration for the BLA along with the registration for its own primary appearance number. If the IP phone has the primary appearance as a BLA, then there is no need for third party registration.

When configuring the BLA feature on a per-line basis for third party registration and subscription, the third party name must be configured using the “**sip lineN bla number**” parameter. For third party registration to work effectively, one of the lines should register as generic with its own username.

For example, Bob has Alice’s appearance on his phone. Bob’s configuration is as follows:

```
#line 1 Bob
sip line1 auth name:4082272203
sip line1 password:
sip line1 mode: 0
sip line1 user name:4082272203
sip line1 display name:Bob
sip line1 screen name:Bob
```

```
#line 2 Alice
sip line2 auth name:4082272203
sip line2 password:
```

```
#BLA mode 3
sip line2 mode: 3
sip line2 user name:4082272203
```

```
#Alice phone number
sip line2 bla number:4085582868
sip line2 display name:Alice
sip line2 screen name:Alice
```

Alice’s configuration is as follows:

```
#line 1
sip line1 auth name:4085582868
sip line1 password:
sip line1 mode: 3
sip line1 user name:4085582868
sip line1 display name: Alice
sip line1 screen name: Alice
```

P-Preferred Identity Header for BLA Accounts

The IP Phones support the BLA specification, draft-anil-sipping-bla-02, which states that the P-Preferred-Identity header (RFC3325) gets added to the INVITE message to indicate the Caller-ID that is used for the call.

Note:

The P-Preferred-Identity for BLA accounts is also sent for hold/unhold messages.

BLA Support for Message Waiting Indicator (MWI)

The IP Phones have an option for a Busy Line Appearance (BLA) configured line to send a SUBSCRIBE SIP message for a Message Waiting Indicator (MWI).

Notes:

- If you change the setting on this parameter, you must reboot the phone for it to take affect.
- Both the "**sip explicit mwi subscription**" and "**sip mwi for bla account**" parameters must be enabled in order for the MWI subscription for BLA to occur.
- The MWI re-subscription for the BLA account uses the value set for the "**sip explicit mwi subscription period**" parameter to re-subscribe.
- Whether or not the "**sip mwi for bla account**" parameter is enabled, the priority for displaying MWI does not change.

You can configure this feature using the configuration files or the Aastra Web UI.

Limitations

The following are limitations of the BLA Support for MWI feature:

- The phone shows MWI for the first matching identity if more than one line with different user names has the same BLA account.
- If a normal line has the same user name as the BLA user of another line, the phone shows MWI only for the normal line.

Configuring BLA Support for MWI Using the Configuration Files

Use the following procedure to configure BLA support for MWI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[BLA Support for MWI](#)" on [page A-77](#).

Configuring BLA Support for MWI Using the Aastra Web UI

Use the following procedure to configure BLA support for MWI.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	86400
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	3600
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	0
T1 Timer	0
T2 Timer	0
Transaction Timer	4000
Transport Protocol	UDP
Local SIP UDP/TCP Port	5060
Local SIP TLS Port	5061
Registration Failed Retry Timer	1800
Registration Timeout Retry Timer	120
Registration Renewal Timer	15
BLF Subscription Period	3600
ACD Subscription Period	3600
BLA Subscription Period	300
Blacklist Duration	300
Park Pickup Config	
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. The **"MWI for BLA Account"** field is disabled by default. To enable this feature, place a checkmark in the **"Enabled"** box.

Notes:

- If you change the setting on this parameter, you must reboot the phone for it to take affect.
- Both the **"sip explicit mwi subscription"** and **"sip mwi for bla account"** parameters must be enabled in order for the MWI subscription for BLA to occur.
- The MWI re-subscription for the BLA account uses the value set for the **"sip explicit mwi subscription period"** parameter to re-subscribe.
- Whether or not the **"sip mwi for bla account"** parameter is enabled, the priority for displaying MWI does not change.

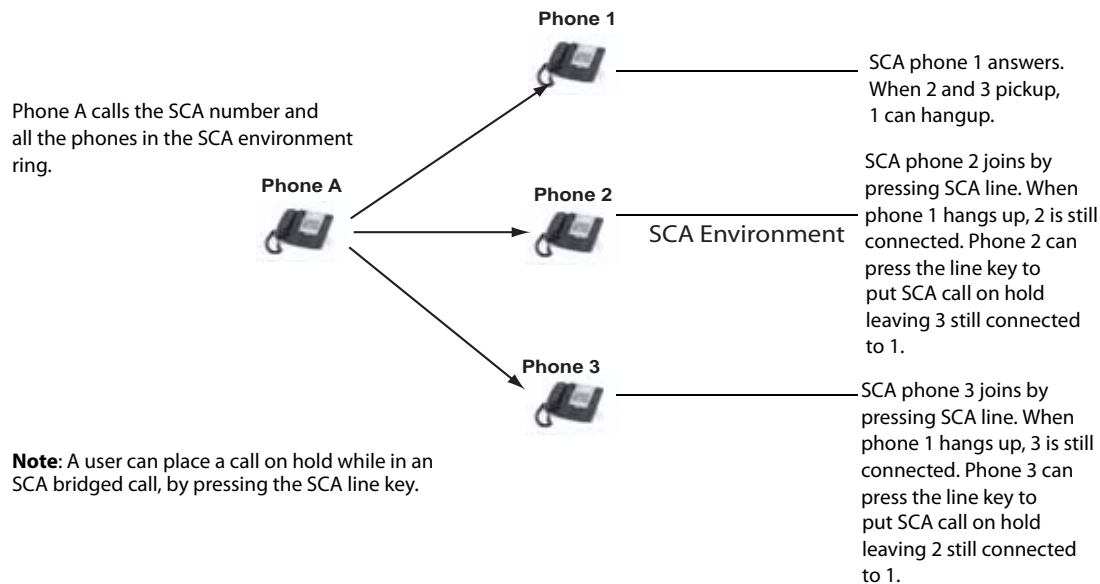

3. Click **Save Settings** to save your changes and reboot the phone for the change to take affect.

Shared Call Appearance (SCA) Call Bridging

Shared Call Appearance (SCA) is when incoming calls are presented to multiple phones simultaneously. For example, it is the ability to assign the boss' extension to a button on the secretary's phone. Calls can be transferred between two phones with the same extension button by simply putting the call on hold at one phone and picking it up on the other. Status LEDs light and flash in unison, allowing all people sharing the extension to see the status at a glance.

The IP Phones include an enhanced SCA for the servers that support call bridging and allows two or more SCA users to be connected in a call with a third party.

Refer to the following example.

Using the example above, when a call comes into Phone 1, Phone 2 and Phone 3 can pickup the same call by pressing the SCA line key. Phone 2 and 3 display the call they are bridging into on the LCD of the phones. Existing SCA parties in a bridge or one-to-one call hear an audible beep when another party has joined the call.

Note:

Enabling/disabling the beep is configurable on the server-side.

If a phone is configured for SCA bridging and it attempts to join a call, but the account on the server does not have this functionality enabled, an error message displays to the LCD on the phone.

The SCA call bridging feature is disabled by default on all phones. You can enable this feature on a global or per-line basis using the configuration files only.

Note:

A "Call-Info" header is included in the requests as well as the 200ok response to an INVITE, RE-INVITE, and UPDATE messages for SCA lines.

Keys States and LED Behavior

There are two new call states on the phones that support SCA bridging:

- **Bridge-active** - A bridged call is in progress
- **Bridge-held** - The 3rd-party (i.e., non-SCA party) in the bridge is on hold.

The following tables provide the key states and LED behavior in an SCA bridge call for users involved in an SCA call and users not involved in the SCA call.

Line Keys and Idle Screens

State	LED for Local	Caller ID for Local	LED for Remote	Caller ID for Remote
Idle	Off	N/A	Off	N/A
Seized	Solid Green	None	Solid Red	None
Progressing (outgoing call)	Green	Called Party	Solid Red	None
Alerting (incoming call)	Flashing Red	N/A	Off	N/A
Active	Solid Green	Far-end	Solid Red	Far-end
Held	Slow Flashing Green	Far-end	Slow Flashing Red	Far-end
Hold private	Slow Flashing Green	Far-end	Solid Red	Far-end
Bridge-active	Solid Green	Far-end	Solid Red	Far-end
Bridge-held	Slow Flashing Green	Far-end	Solid Red	Far-end

Softkey Line Keys

State	Icon for Local	LED for Local	Icon for Remote	LED for Remote
Idle	Small circle	None	Small circle	None
Seized	N/A	N/A	Solid Circle	Solid Red
Progressing (outgoing call)	Empty circle	Solid Red	Solid Circle	Solid Red
Alerting (incoming call)	Empty blinking circle	Flashing Red	N/A	N/A
Active	Empty circle	Solid Red	Solid Circle	Solid Red
Held	Reverse empty blinking circle	Slow Flashing Red	Solid Reverse Circle	Slow Flashing Red
Hold private	Reverse empty blinking circle	Slow Flashing Red	Solid Circle	Solid Red
Bridge-active	Empty circle	Solid Red	Solid Circle	Solid Red
Bridge-held	Reverse empty blinking circle	Slow Flashing Red	Solid Circle	Solid Red

9143i Phone LED States

State	LED for Local	LED for Remote
Idle	N/A	N/A
Seized	Solid Red	Solid Red
Progressing (outgoing call)	Solid Red	Solid Red
Alerting (incoming call)	Flashing Red	Flashing Red
Active	Solid Red	Solid Red
Held	Slow Flashing Red	Slow Flashing Red
Hold private	Slow Flashing Red	Solid Red
Bridge-active	Solid Red	Solid Red
Bridge-held	Slow Flashing Red	Solid Red

Line Key Phone Behavior

State	Line Key Pressed for Local	Line Key Pressed for Remote
Idle	N/A	Attempt to seize the line
Seized	Hang up	Ignore
Progressing	Hang up	Ignore
Alerting	answer	N/A
Active	Hold	Bridge
Held	Retrieve	Bridge
Hold private	Retrieve	Ignore
Bridge-active	Hold	Bridge
Bridge-held	Retrieve	Bridge

6867i Softkeys

State	Softkey Image for Local	Softkey LED for Local	Softkey Image for Remote	Softkey LED for Remote
Idle		Off		Off
Seized		Solid Red		Solid Red
Progressing (outgoing call)		Solid Red		Solid Red
Alerting (incoming call)		Flashing Red		N/A
Active		Solid Red		Solid Red
Held	 (Blinking)	Slow Flashing Red	 (Blinking)	Slow Flashing Red
Hold Private	 (Blinking)	Slow Flashing Red	 (Blinking)	Solid Red
Bridge-Active		Solid Red		Solid Red
Bridge-Held	 (Blinking)	Slow Flashing Red	 (Blinking)	Solid Red

Enabling/Disabling SCA Call Bridging Feature

Use the following procedure to enable/disable SCA call bridging on the IP Phones.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, "Shared Call Appearance (SCA) Call Bridging" on page A-78.

Park/Pick Up Static and Programmable Configuration

The IP phones (including the CT handsets) have a park and pickup call feature that allows you to park a call and pickup a call when required. Administrators can configure call park and pickup using a static configuration (for 8 and 11-Line LCD phones) or by using a programmable configuration (3-Line, and 8 and 11-Line LCD phones).

Notes:

- The 8 and 11-LCD phones accept both methods of configuration, however to avoid redundancy, Aastra recommends you configure either a static configuration or a programmable configuration.
- When using the IP phones with the BroadSoft BroadWorks call manager, an enhanced park/pickup configuration method is also available to be used. For more details see [“Enhanced Park/Pickup Configuration Method \(BroadSoft BroadWorks\)”](#) on page 5-185

Administrators can use configuration files or the Aastra Web UI to configure a park/pickup static or programmable configuration. Users can make changes to customize the label and the state of the park/pick up keys using the Web UI.

Note:

On the 6739i, you can configure Park/Pickup softkeys using the IP Phone UI also. For more information, see the [Aastra Model 6739i IP Phone User Guide](#).

The IP phones support the Park/Pickup feature on the Asterisk, BroadWorks, Sylantro, and ININ PBX servers.

The following paragraphs describe the static and programmable configuration of the call park and pickup feature.

Park/Pickup Static Configuration

Note:

This feature does not work when the “collapsed context user softkey screen” parameter is enabled (see [“Shifting of Softkey Positions for Busy States”](#) on page 5-113).

The static method configures park and pickup on a global basis for all supported IP phones. You can use the configuration files or the Aastra Web UI to configure a park/pickup static configuration. In the configuration files, you use the following parameters to statically configure park/pickup: “**sprecode**” and “**pickupsprecode**”.

In the Aastra Web UI, you use the following fields at **Basic Settings -> Preferences** to configure park/pickup statically:

- Park Call
- Pick Up Parked Call

How it Displays on the Phone

On the phone UI, the static configuration method displays the following:

- When a call comes in and you pickup the handset, the default label of “Park” displays on the first screen of the phone UI.
- After pressing the “Park” softkey to park the call, the default label of “Pickup” displays on the first screen of the phone UI.

Notes:

On the 6757i CT handset, pressing **¶** displays the “Park” and “Pickup” labels.

The values you enter for the Park/Pickup feature are dependant on your type of server. The following table provides the values you enter for the “**sprecode**” and “**pickupsprecode**” parameters (configuration files), or “**Park Call**” and “**Pickup Parked Call**” fields (Aastra Web UI).

Park/Pickup Call Server Configuration Values

Server	Park Values**	Pickup Values**
Asterisk	70	70
Sylantro	*98	*99
BroadWorks	*68	*88
ININ PBX	callpark	pickup

**Leave "value" fields blank to disable the park and pickup feature.

Configuring Park/Pickup Static Configuration Using the Configuration Files

Use the following parameters to configure park/pickup static configuration:

- **sprecode**
- **pickupsprecode**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "" on [page A-184](#).

Configuring Park/Pickup Static Configuration Using the Aastra Web UI

Aastra Web UI

For 8 and 11-Line LCD Phones

1. Click on **Basic Settings** ->**Preferences** ->**General**

Preferences

General	
Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. Enter a server value in the Park Call field to which incoming live calls will be parked.

Note:

For values to enter in this field, see the table "Park/Pickup Call Server Configuration Values" on page 5-178.

3. Enter a server value in the Pick Up Parked Call field.
4. Click Save Settings to save your changes.

Park/Pickup Programmable Configuration (Using a Softkey)

The programmable method of configuration creates park and pickup keys (softkeys, programmable keys, expansion module keys) that you can configure on the IP phones.

For all 8/11-Line LCD phones and the 6739i and 6867i phones you can set a key as "Park" or "Pickup" and then:

- specify a customized label to display on the Phone UI
- specify the state of the park and/or pickup keys

For 3-Line LCD display phones, you can set a programmable key as "Park" or "Pickup".

On 8/11-Line LCD Phone and 6739i and 6867i Phone UIs

- When a call comes in, and you pickup the handset, the custom label that you configured for the Park softkey displays on the Phone UI.
- After the call is parked, the label that you configured for the Pickup softkey displays on other phones in the network. You can then press the "Pickup" softkey, followed by the applicable value to pickup the call on another phone in your network.
- On the Model CTs, the customized labels apply to the base unit only. On the Model CT handsets, pressing the **Features** key displays the default labels of "Park" and "Pickup".

Note:

On the 9480i/9480i CT and 6757i/6757i CT, the old softkey labeled "Pickup" has been renamed to "Answer". This softkey uses the old functionality - when you pickup the handset, you see a softkey labeled "Answer". You can then press this key to pick up an incoming call. Do not confuse this feature with the new Park/Pickup configuration feature.

On 3-Line LCD Phone UIs

When a call comes in, and you pickup the handset, you can press the applicable "Park" programmable key to park the call.

After the call is parked, you can press the "Pickup" programmable key, followed by the applicable value to pickup the call.

Configuring Park/Pickup Key Using Configuration Files

In the configuration files, you configure the park/pickup keys using the key parameters. You also must specify the "sip lineN park and pickup config" parameter. The following examples show park/pickup configurations using specific servers.

Examples for Models with 8 /11-Line LCDs as well as 6739i and 6867i

Server	Park Configuration	Pickup Configuration
Asterisk	softkeyN type: park softkeyN label: parkCall softkeyN states: connected* sip lineN park pickup config: 70;70;asterisk	softkeyN type: pickup softkeyN label: pickupCall softkeyN states: idle, outgoing** sip lineN park pickup config: 70;70;asterisk
Sylantro	softkeyN type: park softkeyN label: parkCall softkeyN states: connected* sip lineN park pickup config: *98;*99;sylantro	softkeyN type: pickup softkeyN label: pickupCall softkeyN states: idle, outgoing** sip lineN park pickup config: *98;*99;sylantro
BroadWorks	softkeyN type: park softkeyN label: parkCall softkeyN states: connected* sip lineN park pickup config: *68;*88;broadworks	softkeyN type: pickup softkeyN label: pickupCall softkeyN states: idle, outgoing** sip lineN park pickup config: *68;*88;broadworks
ININ PBX	softkeyN type: park softkeyN label: parkCall softkeyN states: connected* sip lineN park pickup config: callpark;pickup;inin	softkeyN type: pickup softkeyN label: pickupCall softkeyN states: idle, outgoing** sip lineN park pickup config: callpark;pickup;inin

*When you configure a softkey as "Park", you must configure the state of the softkey as "connected".

**When you configure a softkey as "Pickup", you can configure the state of the softkey as "idle, outgoing", or just "idle", or just "outgoing".

Examples for Models with 3-Line LCDs

Server	Park Configuration	Pickup Configuration
Asterisk	prgkeyN type: park sip lineN park pickup config: 70;70;asterisk	prgkeyN type: pickup sip lineN park pickup config: 70;70;asterisk
Sylantro	prgkeyN type: park sip lineN park pickup config: *98;*99;sylantro	prgkeyN type: pickup sip lineN park pickup config: *98;*99;sylantro
BroadWorks	prgkeyN type: park sip lineN park pickup config: *68;*88;broadworks	prgkeyN type: pickup sip lineN park pickup config: *68;*88;broadworks
ININ PBX	prgkeyN type: park sip lineN park pickup config: callpark;pickup;inin	prgkeyN type: pickup sip lineN park pickup config: callpark;pickup;inin

Note:

The 6730i, 6731i, 6735i, 6737i, 6753i, 6755i, 6863i, 6865i and 9143i do not allow for the configuration of labels and states for programmable keys.

Call Park/Pickup Configuration Precedence Rule

For users upgrading from Release 2.x firmware, the "**softkeyN value**" parameter will be used if the "**sip lineN park pickup config**" parameter is not set. If the per-line park pickup config parameter is set, the following precedence rule will apply:

- "sip lineN park pickup config: <park_value>;<pickup_value>;<asterisk | sylantro | broadworks>" will override "sip park pickup config: <park_value>; <pickup_value>; <asterisk | sylantro | broadworks | inin>"
- "sip park pickup config: <park_value>;<pickup_value>;<asterisk | sylantro | broadworks | inin>" will override "softkeyN value: <park_or_pickup_value>" (or topsoftkeyN, prgkeyN, or expmod1 keyN).
- "softkeyN value: <asterisk|sylantro|broadworks|inin>;<park_or_pickup_value>" will have lowest priority.

For example, the following has been configured on the phone:

```
softkey1 type: park
softkey1 label: parkCall
softkey1 states: connected
softkey1 value: broadworks;*68
softkey2 type: pickup
softkey2 label: pickupCall
softkey2 states: idle, outgoing
softkey2 value: broadworks;*88
sip park pickup config: 70;70;asterisk
sip line1 park pickup config: *78;*98;broadworks
```

If the active call is using Line1, the phone will use the BroadWorks method for park (*78) and pickup (*98) since per-line has the highest precedence.

If the active call is using any other line except Line1, the phone will use the Asterisk method for park (70) and pickup (70) since it has precedence over the softkey value.

**Configuration Files**

For specific parameters you can set in the configuration files, see Appendix A, the section, "" on page A-184, "Softkey Settings" on page A-158 and "Programmable Key Settings" on page A-166.

Configuring a Park/Pickup Key Using Aastra Web UI

For all phones and CT handsets, you first configure the park and pickup keys at **Advanced Settings -> Line 1-N** by entering the appropriate value based on the server in your network.

Note:

Applicable values depend on the server in your network (Asterisk, BroadWorks, Sylanro, ININ). See the table below for applicable values.

For 8/11-Line LCD phones and 6739i and 6867i phones, you can enter a key label and change the sofkey states at **Operation->Softkeys and XML**. The default state of the park configuration is "connected". The default state of the Pickup configuration is "idle, outgoing".

For CT handsets, you can enter a key label at **Operation->Handset Keys**. If park or pickup are enabled on more than one line on the base unit, the CT handsets use the first programmable configuration.

For example, if line 1 and line 6 are configured for park, the CT handsets use the configuration set for line 1 to park a call. On 3-Line LCD phones, you can enter a key label at **Operation->Softkeys and XML**.

Park/Pickup Call Server Configuration Values

Server	Park Values*	Pickup Values*
Asterisk	70	70
Sylanro	*98	*99
BroadWorks	*68	*88
ININ PBX	callpark	pickup

Use the following procedure to configure the park/pickup call feature using the Aastra Web UI.

Aastra Web UI

For 8/11-Line LCD Phones, 6739i, and 6867i

1. Click on **Advanced Settings ->Line 1** (you can select any line)
2. Under **Advanced SIP Settings** in the "Park Pickup Config" field, enter the appropriate value based on the server in your network.

Notes:

- For values to enter in this field, see the table "Park/Pickup Call Server Configuration Values" on page 5-182.
- Leave the park/pickup configuration field blank to disable the park and pickup feature.

3. Click on **Operation->Softkeys and XML**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Park	Park call		1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	Pickup	Pickup		1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

4. Pick a softkey to configure for parking a call.
5. In the "Type" field, select **Park**.

Aastra Web UI

- In the "Label" field, enter a label for the park softkey.

Note:

The "Value" and "Line" fields are already configured from the "Park Pickup Config" field.

- The park softkey has a default state of "Connected". Leave this state enabled or to disable, uncheck the check box.

- Pick a softkey to configure for Picking up a call.

- In the "Type" field, select **Pickup**.

- In the "Label" field, enter a label for the Pickup softkey.

Note:

The "Value" and "Line" fields are already configured from the "Park Pickup Config" field.

- The pickup softkey has a default state of "Idle" and "Outgoing". Leave these states enabled or to disable, uncheck the check boxes.

- Click **Save Settings** to save your changes.

- Click on **Reset**, then click **Restart** to restart the IP phone and apply the changes.

For CT Handset:s

- Click on **Advanced Settings** -> **Line 1** (you can select any line)

- Under Advanced SIP Settings in the "Park Pickup Config" field, enter the appropriate value based on the server in your network.

Notes:

- For values to enter in this field, see the table "Park/Pickup Call Server Configuration Values" on page 5-182.
- Leave the park/pickup configuration field blank to disable the park and pickup feature.

- Click on **Operation**->**Handset Keys**.

Cordless Handset Feature Key Configuration

Key	Type	Label
1	Park	Park
2	PickUp	Pickup

- Pick a handset key to configure for parking a call.

- In the "Type" field, select **Park**.

- In the "Label" field, enter a label for the park softkey.

- Pick another handset key to configure for picking up a call.

- In the "Type" field, select **Pickup**.

- In the "Label" field, enter a label for the pickup softkey.

- Click **Save Settings** to save your changes.

- Click on **Reset**, then click **Restart** to restart the IP phone and apply the changes.

For 3-Line LCD phones:

- Click on **Advanced Settings** -> **Line 1** (you can select any line)

Aastra Web UI

- Under Advanced SIP Settings in the “**Park Pickup Config**” field, enter the appropriate value based on the server in your network.

Advanced SIP Settings	
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
Park Pickup Config	70;70;asterisk

Notes:

- For values to enter in this field, see the table “Park/Pickup Call Server Configuration Values” on page 5-182.
- Leave the park/pickup configuration field blank to disable the park and pickup feature.

- Click on **Operation->Programmable Keys**.

6731i Screen**Programmable Keys Configuration**

Key	Type	Value	Line
1	Park		1
2	Pickup		1
3	None		1
4	None		1

- Pick a key to configure for parking a call.

- In the “**Type**” field, select **Park**.

Note:

The “**Value**” and “**Line**” fields are already configured from the “**Park Pickup Config**” field.

- Pick a key to configure for picking up a call.

- In the “**Type**” field, select **Pickup**.

Note:

The “**Value**” and “**Line**” fields are already configured from the “**Park Pickup Config**” field.

- Click **Save Settings** to save your changes.

- Click on **Operation->Reset**.

- Click on **Reset**, then click **Restart** to restart the IP phone and apply the changes.

Using the Park Call/Pickup Parked Call Feature

Use the following procedures on the IP phones to park a call and pick up a parked call.

IP Phone UI

Parking a Call

1. While on a live call, press the **"Park"** softkey.
2. Perform the following for your specific server:

For Asterisk Server:

Server announces the extension number where the call has been parked. Once the call is parked, press the **Goodbye** key to complete parking.

For BroadWorks Server:

After you hear the greeting from the Call-Park server, enter the extension where you want to park the call.

For Sylantrio Server:

Enter the extension number where you want to park the call, followed by **"#"** key.

For ININ PBX Server:

Enter the extension number where you want to park the call, followed by **"#"** key.

If the call is parked successfully, the response is either a greeting voice confirming that the call was parked, or a hang up occurs. The parked call party will get music on hold.

3. If the call fails, you can pick up the call (using the next procedure) and press the **"Park"** softkey again to retry step 2.

Picking up a Parked Call

4. Pick up the handset on the phone.
5. Enter the extension number where the call was parked.
6. Press the **"Pickup"** softkey.

If the call pick up is successful, you are connected with the parked call.

Enhanced Park/Pickup Configuration Method (BroadSoft BroadWorks)

Notes:

- Applicable to the 9840i, 9840i CT, 6735i, 6737i, 6755i, 6757i, and 6757i CT IP phones only.
- This feature can only be configured for networks utilizing the BroadSoft BroadWorks call manager.

As mentioned above, Administrators have a choice between two methods of Park/Pickup configuration: static configuration or programmable configuration. With the static configuration method, Administrators are required to define the **"sprecode"** and **"pickupsprecode"** global configuration parameters (or alternatively define the **"Park Call"** and **"Pickup Parked Call"** fields in the Aastra Web UI). By employing the static configuration method, the Park and Pickup keys are automatically generated and displayed on the phone when the context presents itself (i.e. the Park key is presented during an active call, and the Pickup key is presented when the call is parked). The benefit of this method is that individual Park and Pickup keys do not have to be defined. However, with this method, when the Park or Pickup key is pressed, the phone seizes a secondary line to dial out using the Park or Pickup code.

With the programmable configuration method, Administrators are required to define the **"sip park pickup config"** (global) or **"sip lineN park pickup config"** (per line) configuration parameter (or alternatively define the **"Park Pickup Config"** field in the Aastra Web UI). By employing the programmable configuration method, individual Park and Pickup program-

mable keys/softkeys must be defined for the Park and Pickup keys to be displayed. However, the benefit of this method is that the phone does not seize a secondary line to dial out the Park or Pickup code but instead utilizes a secondary call appearance of the same line (i.e. a “hidden” or “virtual” line).

Administrators now can employ an enhanced method of configure park/pickup functionality for the 9840i, 9840i CT, 6735i, 6737i, 6755i, 6757i, and 6757i CT IP phones whereby the phone will automatically generate and display keys for Park and Pickup functionality as per the static configuration method, but will use the SIP signalling behavior (i.e. a secondary call appearance of the same line) of the programmable configuration method.

This enhancement can be set using the configuration files by defining the “**sprecode**” and “**pickupsprecode**” parameters in conjunction with the “**sip park pickup config**” (global) or “**sip lineN park pickup config**” (per line) configuration parameters. For example:

```
sprecode: *68
pickupsprecode: *88
sip line1 park pickup config: *68;*88;broadworks
```

Notes:

- To set the enhancement using the Aastra Web UI the “**Park Call**” and “**Pickup Parked Call**” along with the “**Park Pickup Config**” fields must be defined.
- Programmable keys/softkeys do not need to be configured when utilizing this enhanced configuration method.

Predefining Dial Codes for Park/Pickup Programmable Configuration

Administrators can also predefine dial codes when configuring park/pickup functionality using the enhanced park/pickup configuration method. Predefining dial codes can be useful for individuals (in scenarios where the park/pickup extension is always be the same) or for deployments (in scenarios where all the extensions of the network start with the same common leading numbers).

The configuration parameters “**sip park pickup config**” (global) and “**sip lineN park pickup config**” (per line) now support the following enhanced syntax:

```
sip (lineN) park pickup config: <park_code>,<park_dial_code>;
<pickup_code>,<pickup_dial_code>;broadworks
```

For example, if the parameter is defined as:

```
sip (lineN) park pickup config: *68,4200#;*88,4200#;broadworks
```

the dial code 4200# will be automatically dialed out after the *68 park code is sent and the user is connected to the parking orbit. Additionally, 4200# will be automatically dialed out after the *88 pickup code is sent and the user is connected to the pickup orbit.

Pauses can also be introduced to the dial code by adding commas whereby each comma equates to a 500ms pause. For example, if the parameter is defined as:

```
sip (lineN) park pickup config: *68,,,,,4200#;*88,,,,,4200#;broadworks
```

a two-second pause will be introduced before the each of the 4200# dial codes is dialed out.

Use Case Scenario

Take, for example, a BroadSoft BroadWorks-managed call network where the park/pickup extensions all start with the first two digits 4 and 2 and the last two digits have a range from 00 to 99. Administrators can define the “**sip park pickup config**” parameter as:

```
sip park pickup config: *68,,,,,,,,,42;*88,,,,,,,,,42;broadworks
```

When a user is in an active call and presses the Park softkey, the active call will be placed on hold, the phone will dial *68 to connect to the parking orbit, wait four seconds (so that the user can hear the parking announcement from the call manager), automatically send the park dial code of 42, and then at this time the user can enter the last two digits of the parking extension to complete the call park.

When the user presses the Pickup softkey, the phone will dial out *88 to connect to the pickup orbit, wait four seconds, automatically send the pickup dial code of 42, and then at this time the user can enter the last two digits of the pickup extension to complete the call pickup.

Enabling Enhanced Park/Pickup Configuration Method (for BroadSoft BroadWorks only)

Use the following procedure to enable the enhanced park/pickup method on the IP Phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Park and Pickup Settings" on page A-154.

Aastra Web UI

1. Click on **Basic Settings** ->**Preferences** ->**General**

Preferences	
General	
Local Dial Plan	x+# xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	*68
Pick Up Parked Call:	*88
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

2. Enter the park code in the **Park Call** field to which active calls will be parked (e.g. *68 for BroadSoft BroadWorks).
3. Enter the pickup code in the **Pick Up Parked Call** field (e.g. *88 for BroadSoft BroadWorks).
4. Click **Save Settings** to save your changes.
5. Click on **Advanced Settings** ->**Global SIP** (or Line #).
6. Under **Advanced SIP Settings** in the "**Park Pickup Config**" field enter in the appropriate values based on the following syntax:

```
<park_code>, <park_dial_code>;  
<pickup_code>, <pickup_dial_code>;broadworks
```

Advanced SIP Settings	
AS-Feature-Event Subscription	<input checked="" type="checkbox"/> Enabled
Park Pickup Config	*68,42;*88,42;broadwo

7. Click **Save Settings** to save your changes.

Aastra Web UI

8. Click on **Operation->Reset**
9. Click on **Restart** to restart the IP phone and apply the changes.

Last Call Return (lcr) (Sylantro Servers)

Last call return (lcr) allows an administrator or user to configure a "last call return" function on a softkey or programmable key. This feature is for Sylantro servers only.

You can configure the "lcr" softkey feature via the configuration files or the Aastra Web UI.

Note:

On the 6739i, you can configure a Last Call Return softkey using the IP Phone UI also. For more information, see the **Aastra Model 6739i IP Phone User Guide**.

How it works

If you configure "lcr" on a softkey or programmable key, and a call comes into your phone, after you are finished with the call and hangup, you can press the key configured for "lcr" and the phone dials the last call you received. When you configure an "lcr" softkey, the label "LCR" displays next to that softkey on the IP phone. When the Sylantro server detects an "lcr" request, it translates this request and routes the call to the last caller.

Configuring Last Call Return

Use the following procedures to configure LCR on the IP phones.

Configuration Files

For specific last call return (lcr) parameters you can set in the configuration files, see Appendix A, the section, "Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters" on page A-156.

Aastra Web UI

For the 6755i & 6757i/6757i CT:

1. Click on **Operation->Softkeys and XML**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Last Call Return			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Pick a softkey to configure for Last Call Return.
3. In the "Type" field, select **Last Call Return**.
4. In the "Line" field, select a line for which to apply the last call return configuration.
5. The lcr softkey has a default state of "Idle", "Connected", "Incoming", "Outgoing". Leave these states enabled or to disable, uncheck the check boxes as required.
6. Click **Save Settings** to save your changes.

Aastra Web UI

For the 6757i CT Handset:

1. Click on **Operation->Handset Keys**.

Cordless Handset Feature Key Configuration

Key	Type	Label
1	Park	Park
2	PickUp	Pickup
3	Line 3	Line3
4	Line 4	Line4
5	Icom	Intercom
6	Dir	Directory
7	Callers	Callers
8	Xfer	Transfer
9	Conf	Conference
10	Public	Public
11	None	
12	None	
13	None	
14	None	
15	None	

2. Pick a handset key to configure for Last Call Return.
3. In the "Key Function" field, select **Last Call Return**.
4. Click **Save Settings** to save your changes.

For 3-Line LCD phones:

1. Click on **Operation->Programmable Keys**.

6753i Screen

Programmable Keys Configuration

Key	Type	Value	Line
1	Last Call Return		1
2	None		1
3	None		1
4	None		1

2. Pick a key to configure for Last Call Return.
3. In the "Type" field, select **Last Call Return**.
4. In the "Line" field, select a line for which to apply the lcr configuration.
5. Click **Save Settings** to save your changes.

Call Forwarding

Call Forward (CFWD) on the IP phone allows incoming calls to be forwarded to another destination. The phone sends the SIP message to the SIP proxy, which then forwards the call to the assigned destination.

An Administrator or User can configure CFWD on the phone-side by setting a mode for the phone to use (**Account**, **Phone**, or **Custom**). Once the mode is set, you can use the IP Phone UI to use the CFWD feature at *Options->Call Forward* or by pressing a configured Call Forward softkey/programmable key/extension module key.

The following describes the behavior for each CFWD mode.

- **Account mode** - The account mode allows you to configure CFWD on a per account basis. Pressing a configured CFWD key applies to the account in focus.
- **Phone mode** - The Phone mode allows you to set the same CFWD configuration for all accounts (**All**, **Busy**, and/or **No Answer**). When you configure the initial account, the phone applies the configuration to all other accounts. (In the Aastra Web UI, only the account you configured is enabled. All other accounts are grayed out but set to the same configuration.) Using the Aastra Web UI, if you make changes to that initial account, the changes apply to all accounts on the phone.
- **Custom mode** - The Custom mode allows you to configure CFWD for a specific account or all accounts. You can configure a specific mode (**All**, **Busy**, and/or **No Answer**) for each account independently or all accounts. On 3-Line LCD phones and the 6867i, you can set all accounts to **ALL On** or **ALL Off**. On the 8 and 11-Line LCD phones and the 6739i, you can set all accounts to **All On**, **All Off**, or copy the configuration for the account in focus to all other accounts using a **CopytoAll** softkey.

Note:

If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".

You can enable different call forwarding rules/modes independently (for example, you can set different phone numbers for Busy, All, and NoAns modes and then turn them on/off individually).

The following table describes the key and Message Waiting Indicator (MWI) LEDs when you enable CFWD on the IP Phone.

Key LED Behavior for All Modes	MWI LED Behavior for All Modes
CFWD key LED RED if any CFWD mode is enabled for the account in focus.	MWI LED ON if any CFWD mode is enabled for the account in focus.
CFWD key LED OFF if all CFWD modes are disabled for the account in focus.	MWI LED OFF if all CFWD modes are disabled for the account in focus.

You can enable/disable CFWD and set a CFWD key using the configuration files or the Aastra Web UI. You can set CFWD mode (**Account**, **Phone**, **Custom**) using the configuration files, Aastra Web UI or IP Phone UI.

Important Notes

- In the configuration files, the "**call forward key mode**" parameter in the section, "[Configuring Call Forwarding](#)" on [page 5-191](#) is in addition to the previous call forward parameter (**call forward disabled**). You can still use the previous call forwarding parameter if desired in the configuration files.
- In the IP Phone UI, you can access the Call Forwarding features at the path *Options->Call Forward* or by pressing a configured CFWD key.
- If you make changes to the configuration for CFWD via the IP Phone UI, you must refresh the Aastra Web UI screen to see the changes.

Note:

On the 6739i, you can configure a Call Forward softkey using the IP Phone UI also. For more information, see the [Aastra Model 6739i IP Phone User Guide](#).

Configuring Call Forwarding

You use the following parameters to set CFWD on the IP Phone using the configuration files:

- **call forward key mode**
- **softkeyN type, topsoftkeyN type, prgkeyN type, or expmodX keyN type**
- **softkeyN states** (optional)

Notes:

- If there is no CFWD key configured on the phone or it is removed, you can still set the CFWD modes via the IP Phone UI at the path *Options->Call Forward*.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- When configuring a CFWD mode (**All, Busy, No Answer**) for an account, you must configure a CFWD number for that mode in order for the mode to be enabled.

Use the following procedures to configure Call Forwarding on the IP phones.

Configuration Files

For specific call forwarding parameters you can set in the configuration files, see Appendix A, the sections,

- "Call Forward Settings" on page A-110.
- "Call Forward Key Mode Settings" on page A-111.
- "Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters" on page A-156.

Aastra Web UI

1. Click on **Operation->Softkeys and XML;**
or
 Click on **Operation->Programmable Keys;**
or
 Click on **Operation->Expansion Module.**

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Call Forward			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
4	None			1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Click **Save Settings** to save your changes.

Aastra Web UI

3. Click on **Basic Settings->Preferences->General**.

Preferences

General

Local Dial Plan	x+#!xx+*
Send Dial Plan Terminator	<input type="checkbox"/> Enabled
Digit Timeout (seconds)	4
Park Call:	
Pick Up Parked Call:	
Display DTMF Digits	<input type="checkbox"/> Enabled
Play Call Waiting Tone	<input checked="" type="checkbox"/> Enabled
Stuttered Dial Tone	<input checked="" type="checkbox"/> Enabled
XML Beep Support	<input checked="" type="checkbox"/> Enabled
Status Scroll Delay (seconds)	5
Switch UI Focus To Ringing Line	<input checked="" type="checkbox"/> Enabled
Call Hold Reminder During Active Calls	<input type="checkbox"/> Enabled
Call Hold Reminder	<input type="checkbox"/> Enabled
Call Waiting Tone Period	0
Preferred line	1
Preferred line Timeout (seconds)	0
Goodbye Key Cancels Incoming Call	<input type="checkbox"/> Enabled
Message Waiting Indicator Line	All
DND Key Mode	Phone
Call Forward Key Mode	Account

Note:

If there is no CFWD key configured on the phone or it is removed, you can still set the CFWD modes via the IP Phone UI at the path *Options->Call Forward*.

4. In the “**Call Forward Key Mode**” field, select a call forward mode to use on the phone.
Valid values are: Account, Phone, Custom. Default is **Account**.

- **Account**
The account mode allows you to configure CFWD on a per account basis. Pressing a configured CFWD key applies to the account in focus.
- **Phone**
The Phone mode allows you to set the same CFWD configuration for all accounts (**All**, **Busy**, and/or **No Answer**). When you configure the initial account, the phone applies the configuration to all other accounts. (In the Aastra Web UI, only the account you configured is enabled. All other accounts are grayed out but set to the same configuration.) Using the Aastra Web UI, if you make changes to that initial account, the changes apply to all accounts on the phone.
- **Custom**
The Custom mode allows you to configure CFWD for a specific account or all accounts. You can configure a specific state (**All**, **Busy**, and/or **No Answer**) for each account independently or all accounts. On 3-Line LCD phones, you can set all accounts to **All On** or **All Off**. On the 8 and 11-Line LCD phones, you can set all accounts to **All On**, **All Off**, or copy the configuration for the account in focus to all other accounts using a **CopytoAll** softkey.

Notes:

- If there is no CFWD key configured on the phone or it is removed, you can still set the CFWD modes via the IP Phone UI at the path *Options->Call Forward*.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to “Phone”.
- When configuring a CFWD state (**All**, **Busy**, **No Answer**) for an account, you must configure a CFWD number for that state in order for the state to be enabled.

5. Click **Save Settings** to save your changes.

The change takes effect immediately without a reboot.

Aastra Web UI

6. Click on **Basic Settings->Account Configuration**.

Account Configuration

Account	DND	Call Forward	State	Label	No. Rings
1. Screenname1	<input type="checkbox"/>	All Busy No Answer	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text" value="1"/> ▾
2. Screenname2	<input type="checkbox"/>	All Busy No Answer	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text" value="1"/> ▾
3. Screenname3	<input checked="" type="checkbox"/>	All Busy No Answer	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	<input type="text"/> <input type="text"/> <input type="text"/>	<input type="text" value="1"/> ▾

Note:

If the BroadSoft BroadWorks Executive and Assistant Services feature is enabled and your phone is configured with the Assistant's role, an additional Forward Filtering option may be available on the Account Configuration page. For information on the BroadWorks Executive and Assistant Services feature, refer to [BroadSoft BroadWorks Executive and Assistant Services Feature on page 6-44](#). For details on how to configure and utilize Forward Filtering, please refer to the respective phone model's [Aastra SIP IP Phone User Guide](#).

7. For each account, enable CFWD state by placing a check mark in one or more of the following **"State"** fields:
- All
 - Busy
 - No Answer

The **"All"** option forwards all incoming calls for this account to the specified phone number regardless of the state of the phone. The phone can be in the Busy or No Answer states, or can be in the idle state. The phone still forwards all calls to the specified number.

The **"Busy"** option call forwards incoming calls only if the account is in the busy state. The calls are forwarded to the specified phone number.

The **"No Answer"** option call forwards incoming calls only if the account rings but is not answered in the defined number of rings. The call gets forwarded to the specified number.

Note:

You can use the **"Busy"** and **"No Answer"** states together using different forwarding phone numbers. If these states are enabled for an account (the **"All"** state is disabled), and the phone is in the busy state when a call comes in, the phone can forward the call to the specified phone number (for example, voicemail). If there is no answer on the phone after the specified number of rings, the phone can forward the call to a different specified number, such as a cell phone number.

8. For each account, in the **"Number"** field, enter the phone number for which you want the incoming calls to forward to if the phone is in the specified state.

If using the **"Account"** mode or **"Custom"** mode, you can enter different phone numbers for each account.

Notes:

- If you selected **"Account"** mode in step 4, you can enable/disable each account or all accounts as applicable. You can enter different phone number for each enabled state.
- If you selected **"Custom"** mode, you can enable/disable each account or all accounts as applicable. You can enter different phone numbers for each enabled state.

If you selected **"Phone"** mode, all accounts are set to the same CFWD configuration (All, Busy, and/or No Answer) as Account 1 on the phone. (In the Aastra Web UI, only Account 1 is enabled. All other accounts are grayed out but use the same configuration as Account 1.)

Using the Aastra Web UI, if you make changes to Account 1, the changes apply to all accounts on the phone. Using the IP Phone UI, if you make changes to any other account other than Account 1, the changes also apply to all accounts on the phone. When enabling a CFWD state, you must specify a phone number for the phone to CFWD to. The number you specify applies to all accounts of the same mode.

- Number and name of accounts that display to this screen are dependant on the number and name of accounts configured on the phone. In the screen in step 6, Screenname1 is configured on Line 1, Screenname2 is configured on Line 2, and Screenname3 is configured on Line 3. The name for the account is dependant on the name specified for the **"Screen Name"** parameter at the path *Advanced Settings->LineN*. If you do not specify a value for the **"Screen Name"** parameter, the account name is based on the **"Phone Number"** parameter at the path *Advanced Settings->LineN*. If neither the **"Screen Name"** nor the **"Phone Number"** parameters are specified, the account name shows "1", "2", "3", etc. only.

Aastra Web UI

9. For the **No Answer** state, in the “**No. Rings**” field, enter the number of times that the account rings before forwarding the call to the specified number. Valid values are 1 through 20. Default is 1.

Note:

When using the “**Account**” mode or “**Custom**” mode, you can enter a different number of rings for each account. If you use the Aastra Web UI to change the Call Forward Key Mode to “**Phone**”, all accounts synchronize to Account 1.

10. Click **Save Settings** to save your changes.
The change takes effect immediately without a reboot.

Configuring CFWD via the IP Phone UI (3-Line Phones)

Once CFWD is enabled on your phone, you can access and change the configuration using the IP phone UI or the Aastra Web UI. You can access the CFWD menus by pressing a pre-configured **CFWD** key, or by selecting *Options > Call Forward* from the IP phone UI.

Notes:

- If there is no CFWD key configured on the phone or it is removed, you can still enable CFWD via the at the path *Options->Call Forward*.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to “Phone”.
- Using the Aastra Web UI, if you change the CFWD key mode to “**Phone**”, all accounts synchronize to the current setting of Account 1.
- If the BroadSoft BroadWorks Executive and Assistant Services feature is enabled and your phone is configured with the Assistant’s role, an additional Forward Filtering option may be available on the CFWD Mode menu. For information on the BroadWorks Executive and Assistant Services feature, refer to [BroadSoft BroadWorks Executive and Assistant Services Feature](#) on page 6-44. For details on how to configure and utilize Forward Filtering, please refer to the respective phone model’s [Aastra SIP IP Phone User Guide](#).

CFWD in Account Mode

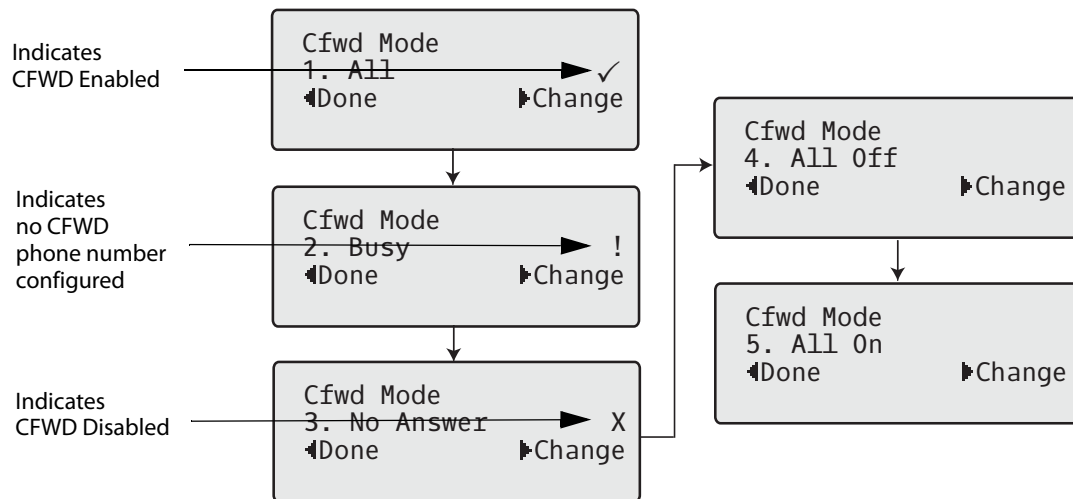

IP Phone UI

- Use the 3 and 4 navigation keys to scroll through each account.

In the above example, account 1 has CFWD All enabled and account 2 has CFWD Busy enabled.

- Press the programmed **Call Forward** key. The Call Forward Mode screen displays. Use the 2 and 5 navigation keys to scroll through each state type.

In the above example, CFWD All is enabled as indicated by a check mark (✓), CFWD Busy is enabled but no call forward phone number configured as indicated by a !, and CFWD No Answer is disabled, as indicated by an X.

- Select a state for the account(s) in focus using the 2 and 5 navigation keys. You can enable/disable any or all of the following states for an account:
 - All: Forwards all incoming calls for the respective account to the specified number.
 - Busy: Forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
 - No Answer: Forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.

Note:
If CFWD All, CFWD Busy, and CFWD No Answer are all enabled (and/or if the account has DND enabled), the CFWD All settings take precedence over CFWD Busy and CFWD No Answer.

You can also use the following keys if required:

 - All Off: Disables all CFWD states for the current account in focus
 - All On: Enables all CFWD states for the current account in focus

IP Phone UI

- Press the **4 Change** navigation key for the state you selected in Step 3. Scroll to the CFWD State screen. This displays the current state of the mode you selected. In the following example, the CFWD All state is ON.

- Press the **4 Change** navigation key in the CFWD State screen. Press **2** to toggle the state of the CFWD mode ON or OFF. In the example in Step 4, you press **2** to change the option to OFF.

- Press **4 Set** to save the change.

- In the CFWD State screen, press the **2** navigation keys to scroll to the CFWD Number screen and press **4 Change**.

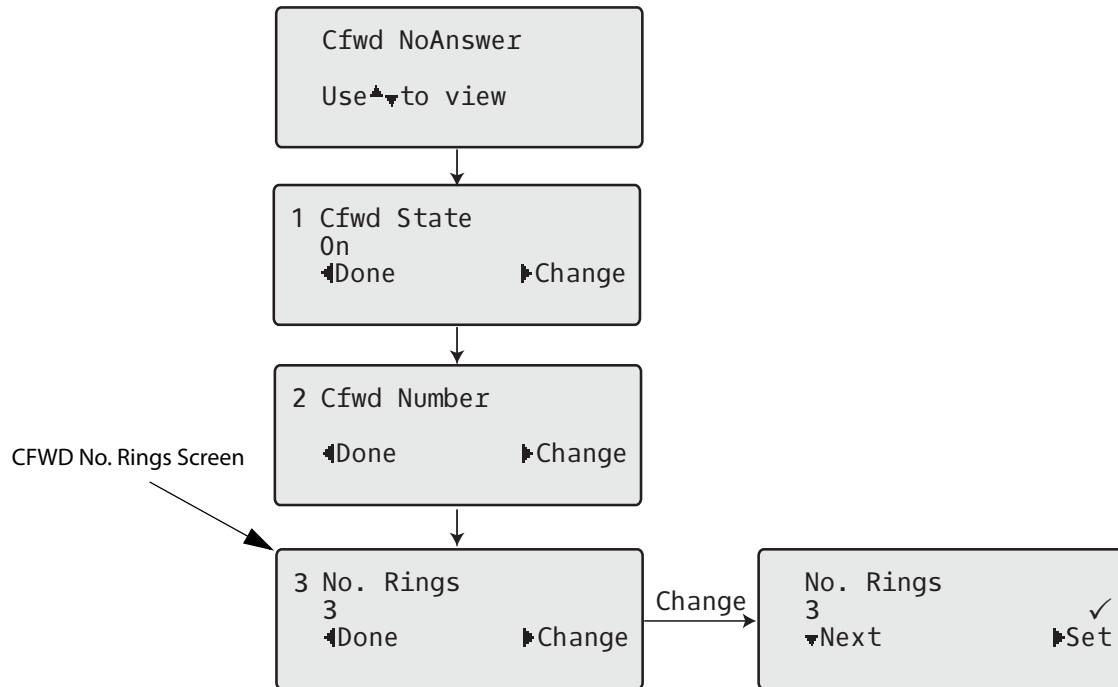

- Enter a phone number to apply to the current state in focus. When the phone is in the state you specified, and a call comes into the phone, it forwards the call to the number you specify.

- Press **4 Set** to save the change.

IP Phone UI

10. For the **CFWD No Answer** state, In the CFWD Number screen, press the 2 navigation key to scroll to the CFWD No. Rings screen and press 4 **Change**.

11. Press 2 **Next** to select the number of rings to apply to the phone for call forwarding incoming calls. Valid values are 1 to 20. Default is 3. When the phone receives an incoming call, and call forward is configured on the phone, the phone rings the number of times you specify in the No. Rings screen, and then forwards the call if there is no answer.
12. Press 4 **Set** to save the change.
13. Press 3 **Done** to save all your changes. Each time you press 3 **Done**, the following screen displays.

```

Apply Changes
0Cancel
#Confirm
  
```

14. Press # **Confirm** to confirm the change(s) each time the Apply Changes screen displays. All changes are saved to the phone.

CFWD in Phone Mode

IP Phone UI

- Use the 3 and 4 navigation keys to scroll through each account.

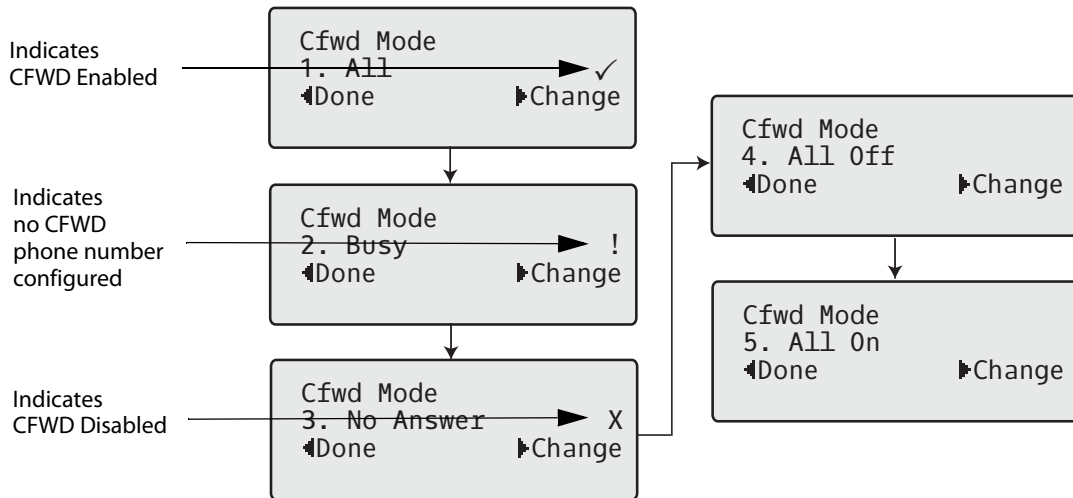

In the above example, account 1 and account 2 are the accounts configured on the phone. Both accounts have CFWD enabled as indicated by the **CFWD All** message.

Note:

In Phone mode, when you change the call forward configuration for an account, the change applies to all accounts.

- Press the **Call Forward** key. The Call Forward menu displays. Use the 2 and 5 navigation keys to scroll through each state type.

In the above example, CFWD All is enabled as indicated by a check mark (✓), CFWD Busy is enabled but no call forward phone number configured as indicated by a !, and CFWD No Answer is disabled, as indicated by an X.

- Select a state using the 2 and 5 navigation keys.

You can enable/disable a specific account on the phone with any or all of the following states. However, the configuration you set will apply to all accounts on the phone.

- All: Forwards all incoming calls for the respective account to the specified number.
- Busy: Forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
- No Answer: Forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.

Note:

If CFWD All, CFWD Busy, and CFWD No Answer are all enabled (and/or if the account has DND enabled), the CFWD All settings take precedence over CFWD Busy and CFWD No Answer.

You can also use the following keys if required:

- All Off: Disables all CFWD states for the current account in focus
- All On: Enables all CFWD states for the current account in focus

Note:

In Phone mode, the initial configuration you set for an account applies to all the accounts on the phone.

IP Phone UI

4. Press the **4 Change** key for the mode you selected in Step 2. Scroll to the CFWD State screen. This screen displays the current state of the mode you selected. In the following example, the CFWD All state is ON.

5. Press the **4 Change** key in the CFWD State screen. Press **2 Next** to toggle the state of the CFWD state ON or OFF. In the example in Step 4, you press **2 Next** to change the option to **Off**.

6. Press the **4 Set** key to save the change.

7. In the CFWD State screen, press the **2** navigation key to scroll to the CFWD Number screen and press **4 Change**.

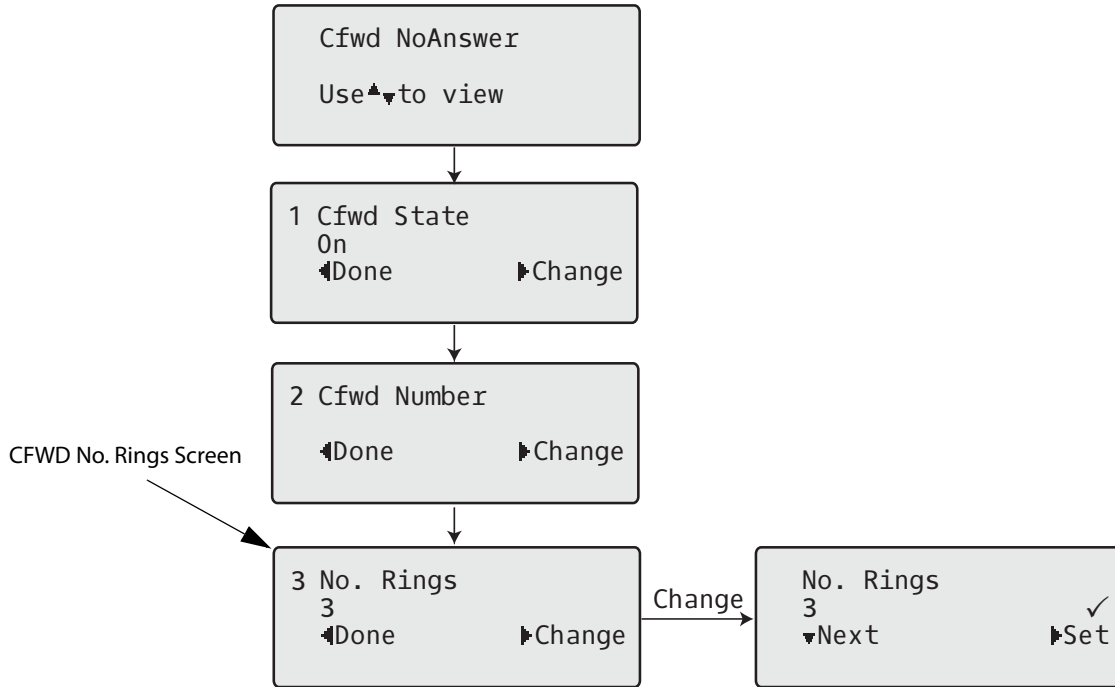

8. Enter a phone number to apply to the current state in focus. When the phone is in the state you specified, and a call comes into the phone, it forwards the call to the number you specify.

9. Press **4 Set** to save the change.

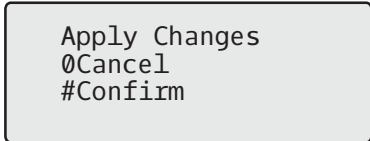

IP Phone UI

10. For the CFWD No Answer state, in the CFWD Number screen, press the 2 navigation key to scroll to the CFWD No. Rings screen and press 4 **Change**.

11. Press the 2 **Next** key to select the number of rings to apply to the phone for call forwarding incoming calls. Valid values are 1 to 20. Default is 3.
When the phone receives an incoming call, and call forward is configured on the phone, the phone rings the number of times you specify in the No. Rings screen, and then forwards the call.
12. Press 4 **Set** to save the change.
13. Press 3 **Done** to save all your changes.
Each time you press 3 **Done**, the following screen displays.

14. Press # **Confirm** to confirm the change(s) each time the Apply Changes screen displays.
All the same changes are saved to all accounts on the phone.

CFWD in Custom Mode

IP Phone UI

- Use the 3 and 4 navigation keys to scroll through each account.

In the above example, account 1 has CFWD All enabled and account 2 has CFWD Busy enabled.

- Press the **Call Forward** key. The Call Forward menu displays. Use the 2 and 5 navigation keys to scroll through each state type.

In the above example, CFWD All is enabled as indicated by a check mark (✓), CFWD Busy is enabled but no call forward phone number configured as indicated by a !, and CFWD No Answer is disabled, as indicated by an X.

- Select a state for the account(s) in focus using the 2 and 5 navigation keys.

You can enable/disable any or all of the following states for a specific account or for all accounts (with individual configurations):

- All: Forwards all incoming calls for the respective account to the specified number.
- Busy: Forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
- No Answer: Forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.

Note:

If CFWD All, CFWD Busy, and CFWD No Answer are all enabled (and/or if the account has DND enabled), the CFWD All settings take precedence over CFWD Busy and CFWD No Answer.

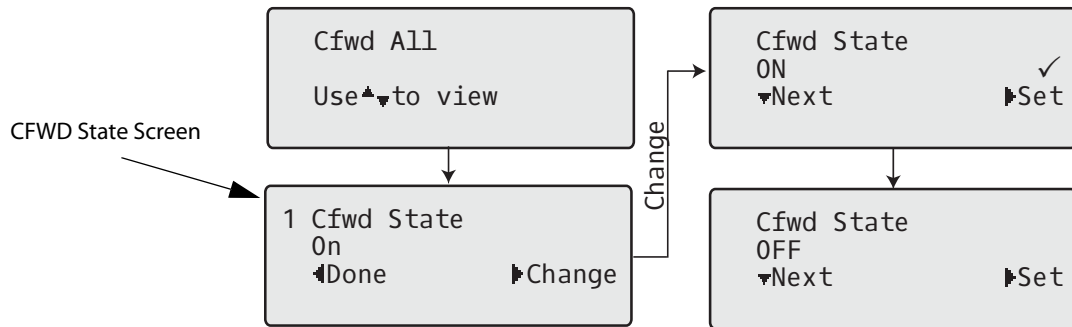

You can also use the following keys if required:

- All Off: Disables all CFWD states for the current account in focus
- All On: Enables all CFWD states for the current account in focus

IP Phone UI

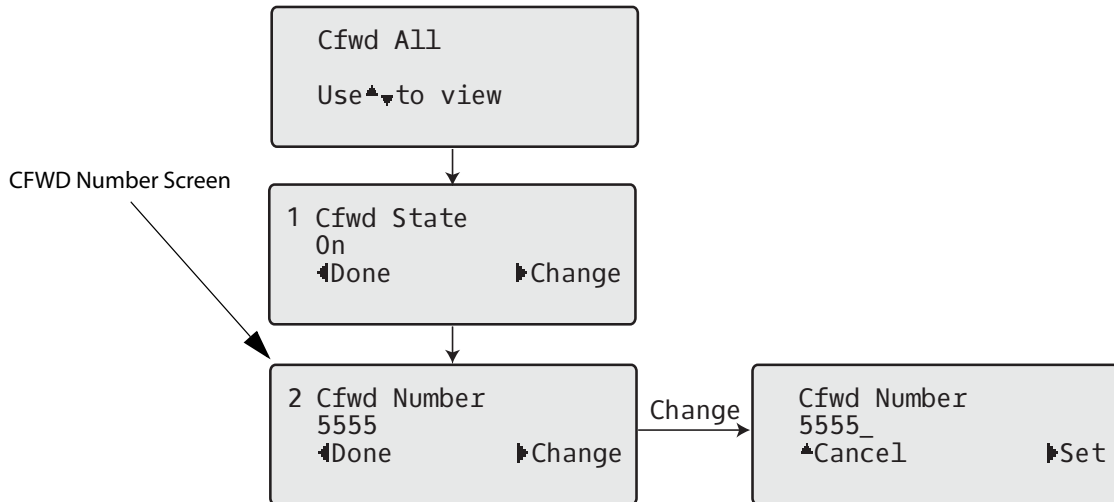

- Press the **4 Change** key for the mode you selected in step 2. Scroll to the CFWD State screen. This displays the current state of the mode you selected. In the following example, the CFWD All state is ON.

- Press the **4 Change** key in the CFWD State screen. Press **2 Next** to toggle the state of the CFWD state ON or OFF. In the example in Step 4, you press **2 Next** to change the option to **Off**.

- Press the **4 Set** key to save the change.

- In the CFWD State screen, press the **2** navigation key to scroll to the CFWD Number screen and press **4 Change**.

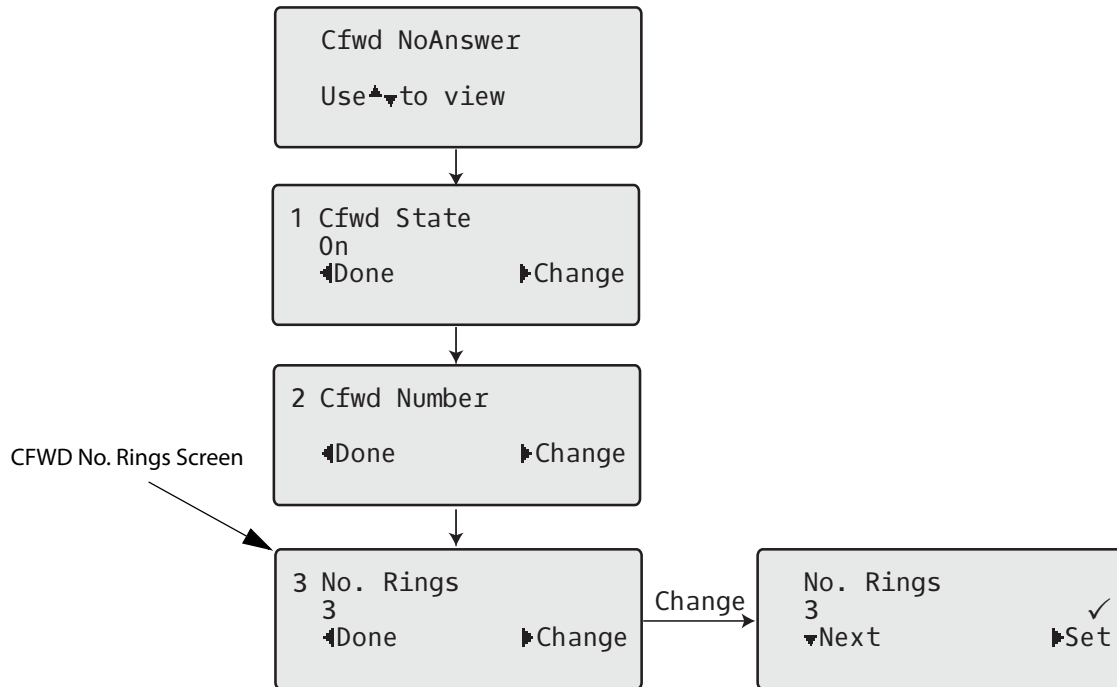

- Enter a phone number to apply to the current state in focus. When the phone is in the state you specified, and a call comes into the phone, it forwards the call to the number you specify.

- Press **4 Set** to save the change.

IP Phone UI

10. For the CFWD No Answer state, in the CFWD Number screen, press the 2 navigation key to scroll to the CFWD No. Rings screen and press 4 **Change**.

11. Press the 2 **Next** key to select the number of rings to apply to the phone for call forwarding incoming calls. Valid values are 1 to 20. Default is 3.
When the phone receives an incoming call, and call forward is configured on the phone, the phone rings the number of times you specify in the No. Rings screen, and then forwards the call.
12. Press 4 **Set** to save the change.
13. Press 3 **Done** to save all your changes.
Each time you press 3 **Done**, the following screen displays.

```

Apply Changes
0Cancel
#Confirm
  
```

14. Press # **Confirm** to confirm the change(s) each time the Apply Changes screen displays.
All changes are saved to the phone for all accounts.

Using CFWD via the IP Phone UI (8-Line and 11-Line Phones)

Once CFWD is enabled on your phone, you can access and change the configuration using the IP Phone UI or the Aastra Web UI. You can access the CFWD menus by pressing a pre-configured Call Forward key, or by selecting *Options->Call Forward* from the IP Phone UI.

The following procedure assumes you have already configured a CFWD key AND assumes there are three accounts configured on the phone.

Notes:

- If there is no CFWD key configured on the phone or it is removed, you can still enable CFWD via the at the path *Options->Call Forward*.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- Using the Aastra Web UI, if you change the CFWD key mode to "**Phone**", all accounts synchronize to the current setting of Account 1.
- If the BroadSoft BroadWorks Executive and Assistant Services feature is enabled and your phone is configured with the Assistant's role, an additional Forward Filtering option may be available on the CFWD Mode menu. For information on the BroadWorks Executive and Assistant Services feature, refer to [BroadSoft BroadWorks Executive and Assistant Services Feature](#) on page 6-44. For details on how to configure and utilize Forward Filtering, please refer to the respective phone model's **Aastra SIP IP Phone User Guide**.

CFWD in Account Mode

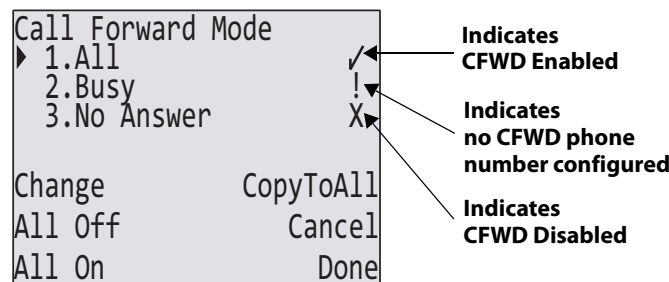

IP Phone UI

1. Use the **RIGHT** and **LEFT** arrow keys to scroll through each account.

In the above example, Screenname1, Screenname2, and Screenname3, are three accounts configured on the phone. Screenname1 has "CFWD All" enabled, Screenname2 has "CFWD Busy" enabled, and Screenname3 has CFWD disabled as indicated by no message displayed.

2. Press the **Call Forward** key. The Call Forward Mode screen displays for the account you selected. Use the **UP** and **DOWN** arrow keys to scroll through each state type.

In the above example, **CFWD All** is enabled as indicated by a check mark (✓), **CFWD Busy** is enabled but no call forward phone number is configured as indicated by a **!**, and **CFWD NoAns** is disabled as indicated by an **X**.

3. Select a state for the account(s) in focus using the **UP** and **DOWN** arrow keys.

You can enable/disable any or all of the following states for an account:

- **All** - Enables **CFWD All** for an account and forwards all incoming calls for that account, to the specified number.
- **Busy** - Enables **CFWD Busy** for an account and forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
- **No Answer** - Enables **CFWD NoAns** for an account and forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.

Note:

If **CFWD All** AND **CFWD Busy** AND **CFWD NoAns** are all enabled (and/or if the account has DND enabled), the **CFWD All** settings take precedence over **CFWD Busy** and **CFWD NoAns**.

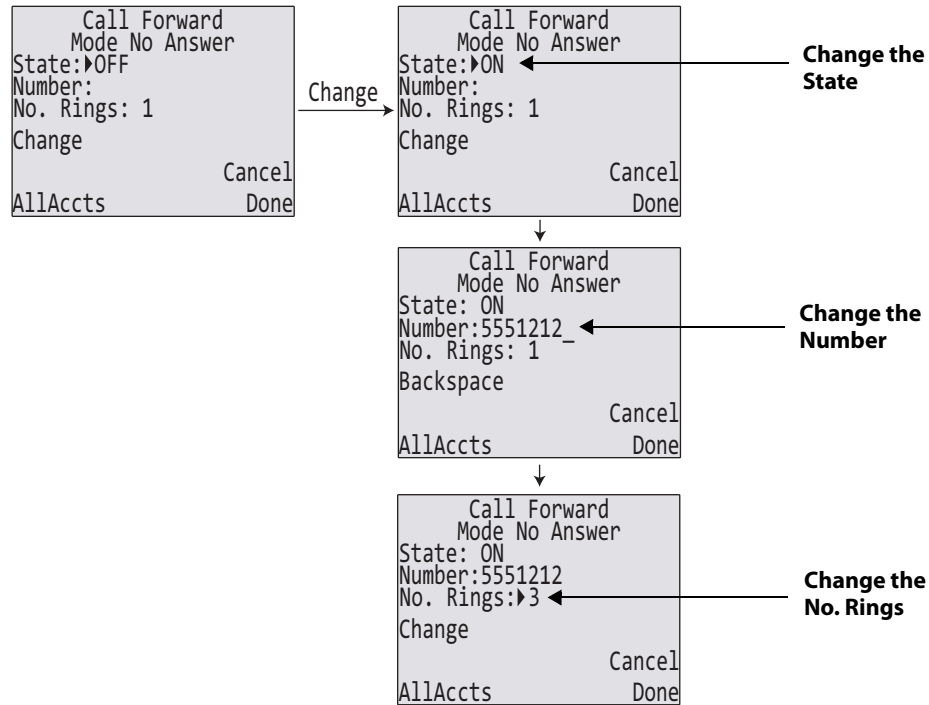

You can also use the following keys if required:

- **All Off** - Disables all CFWD states for the current account in focus.
- **All On** - Enables all CFWD states for the current account in focus.
- **CopytoAll Key** - Copies the call forward phone number and state of the Call Forward mode (All, Busy, No Answer) in focus to every Call Forward mode of that account. For example, if you have the cursor pointing at the "All" state and it is enabled and has a call forward phone number configured, pressing the **CopytoAll** Key enables the **Busy** state and the **NoAns** state and assigns the same phone number to both states.
- **Cancel Key** - Cancels any configuration you may have made without saving. To cancel a configuration, you must press this **CANCEL** key before pressing the **DONE** key.

IP Phone UI

- Press the **CHANGE** key for the mode you selected in step 2. This displays the Call Forward State screen.

Note:

You can press the **AllAccts** key to copy the settings in the current Call Forward Settings screen for a specific call forward mode, to every account on the phone. Every account will have the same settings for that call forward mode.

- Press the **CHANGE** key in the CFWD State screen. With the cursor in the “**State**” field, toggle the state ON and OFF by pressing the **CHANGE** key.
- Use the **DOWN** arrow key to scroll to the “**Number**” field. Enter a phone number to apply to the current state in focus. When the phone is in the state you specified, and a call comes into the phone, it forwards the call to the number you specify. Use the **BACKSPACE** key if required to delete characters.
- Use the **DOWN** arrow key to scroll to the “**No. Rings**” field. Press the **CHANGE** key to select the number of rings to apply to the phone for call forwarding incoming calls. Valid values are 1 to 20. Default is 3. When the phone receives an incoming call, and call forward is configured on the phone, the phone rings the number of times you specify in the No. Rings screen, and then forwards the call.
- Press **DONE** in the CFWD State Screen to save all changes.
- Press **DONE** in the CFWD Mode Screen to save all changes.

CFWD in Phone Mode

IP Phone UI

1. Use the **RIGHT** and **LEFT** arrow keys to scroll through each account.

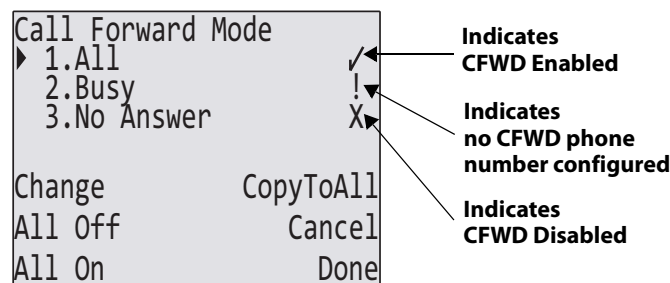

In the above example, Screenname1, Screenname2, and Screenname3, are three accounts configured on the phone. Screenname1, 2 and 3 have "CFWD All" enabled.

Note:

In "Phone" mode, when you change the call forward configuration for an account, the change applies to all accounts.

2. Press the **Call Forward** key. The Call Forward menu displays. Use the **UP** and **DOWN** arrow keys to scroll through each state type.

In the above example, **CFWD All** is enabled as indicated by a check mark (✓), **CFWD Busy** is enabled but no call forward phone number is configured as indicated by a !, and **CFWD No Answer** is disabled, as indicated by an X.

3. Select a state using the **UP** and **DOWN** arrow keys. You can enable/disable a specific account on the phone with any or all of the following states. However, the configuration you set will apply to all accounts on the phone.

- **All** - Enables **CFWD All** on the phone and forwards all incoming calls to the specified number.
- **Busy** - Enables **CFWD Busy** on the phone and forwards incoming calls to a specified number if DND has been enabled OR if the phone is currently engaged in another call.
- **No Answer** - Enables **CFWD NoAns** on the phone and forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.

Note:

If **CFWD All** AND **CFWD Busy** AND **CFWD NoAns** are all enabled (and/or if the account has DND enabled), the **CFWD All** settings take precedence over **CFWD Busy** and **CFWD NoAns**.

You can also use the following keys if required:

- **All Off Key** - Disables all CFWD modes.
- **All On Key** - Disables all CFWD modes.
- **CopytoAll Key** - Copies the call forward phone number and state of the Call Forward mode (All, Busy, No Answer) in focus to every Call Forward mode. For example, if you have the cursor pointing at the "All" state and it is enabled and has a call forward phone number configured, pressing the **CopytoAll** Key enables the **Busy** state and the **NoAns** state and assigns the same phone number to both states.
- **Cancel Key** - Cancels any configuration you may have made without saving. To cancel a configuration, you must press this **CANCEL** key before pressing the **DONE** key.

IP Phone UI

4. Press the **CHANGE** key for the mode you selected in step 2. This displays the Call Forward State screen.

5. Press the **CHANGE** key in the CFWD State screen. With the cursor in the “**State**” field, toggle the state ON and OFF by pressing the **CHANGE** key.

6. Use the **DOWN** arrow key to scroll to the “**Number**” field. Enter a phone number to apply to the current state in focus. When the phone is in the state you specified, and a call comes into the phone, it forwards the call to the number you specify. Use the **BACKSPACE** key if required to delete characters.

7. Use the **DOWN** arrow key to scroll to the “**No. Rings**” field. Press the **CHANGE** key to select the number of rings to apply to the phone for call forwarding incoming calls. Valid values are **1 to 20**. Default is **3**. When the phone receives an incoming call, and call forward is configured on the phone, the phone rings the number of times you specify in the No. Rings screen, and then forwards the call.

8. Press **DONE** in the CFWD State Screen to save all changes.

9. Press **DONE** in the CFWD Mode Screen to save all changes.

Note:

In “**Phone**” mode, the configuration applies to all the accounts on the phone.

CFWD in Custom Mode

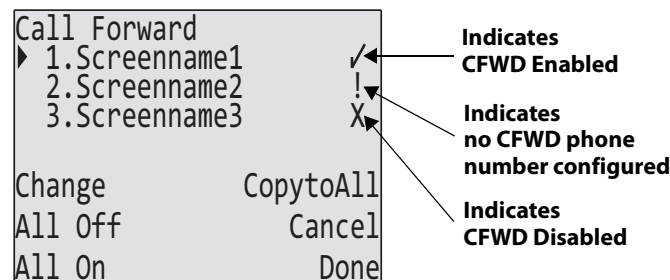

IP Phone UI

1. Use the **RIGHT** and **LEFT** arrow keys to scroll through each account.

In the above example, Screenname1, Screenname2, and Screenname3, are three accounts configured on the phone. Screenname1 has "CFWD All" enabled, Screenname2 has "CFWD Busy" enabled, and Screenname3 has CFWD disabled as indicated by no message displayed.

2. With the account in focus on the IP Phone UI, press the **Call Forward** key. The Call Forward Account screen displays which lists all the accounts on the phone. Use the **UP** and **DOWN** arrow keys to scroll through each account.

In the above example, Screenname1 has one or more CFWD states enabled as indicated by a check mark (✓), Screenname 2 has one or more CFWD states enabled but a specific state has no call forward phone number configured as indicated by a !, and Screenname3 has one or more CFWD states disabled as indicated by an X.

3. Select an account using the **UP** and **DOWN** arrow keys.

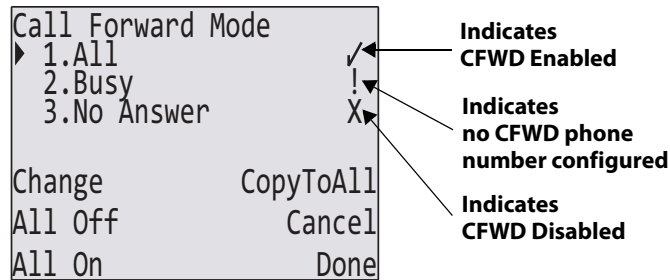

You can also use the following keys if required:

- **All Off Key**- Disables CFWD for all accounts on the phone.
- **All On Key** - Enables CFWD for all accounts on the phone.
- **CopytoAll Key** - Copies all settings for the account you select, to all other accounts on the Call Forward Account screen. For example, if you have the cursor pointing at Screenname1, and you press the **CopytoAll** key, all of the CFWD settings for Screenname1 are copied to Screenname2 and Screenname3.
- **Cancel Key** - Cancels any configuration you may have made without saving. To cancel a configuration, you must press this **CANCEL** key before pressing the **DONE** key.

IP Phone UI

4. After selecting an account, press **CHANGE**.
The Call Forward Mode screen displays for the account you selected. Use the **UP** and **DOWN** arrow keys to scroll through each state type.

In the above example, **CFWD All** is enabled as indicated by a check mark (✓), **CFWD Busy** is enabled but no call forward phone number is configured as indicated by a !, and **CFWD No Answer** is disabled, as indicated by an X.

Select a state for the selected account(s) using the **UP** and **DOWN** arrow keys.

You can enable/disable any or all of the following states for a specific account or for all accounts (with individual configurations):

- **All** - Enables **CFWD All** for an account and forwards all incoming calls for that account, to the specified number. The phone number can be different between accounts.
- **Busy** - Enables **CFWD Busy** for an account and forwards incoming calls to a specified number if DND has been enabled for that account OR if that account is currently engaged in another call. The phone number can be different between accounts.
- **No Answer** - Enables CFWD NoAns for an account and forwards incoming calls to a specified number if the call has not been answered for a specified number of rings. The phone number can be different between accounts.

Note:

If **CFWD All** AND **CFWD Busy** AND **CFWD NoAns** are all enabled (and/or if the account has DND enabled), the **CFWD All** settings take precedence over **CFWD Busy** and **CFWD NoAns**.

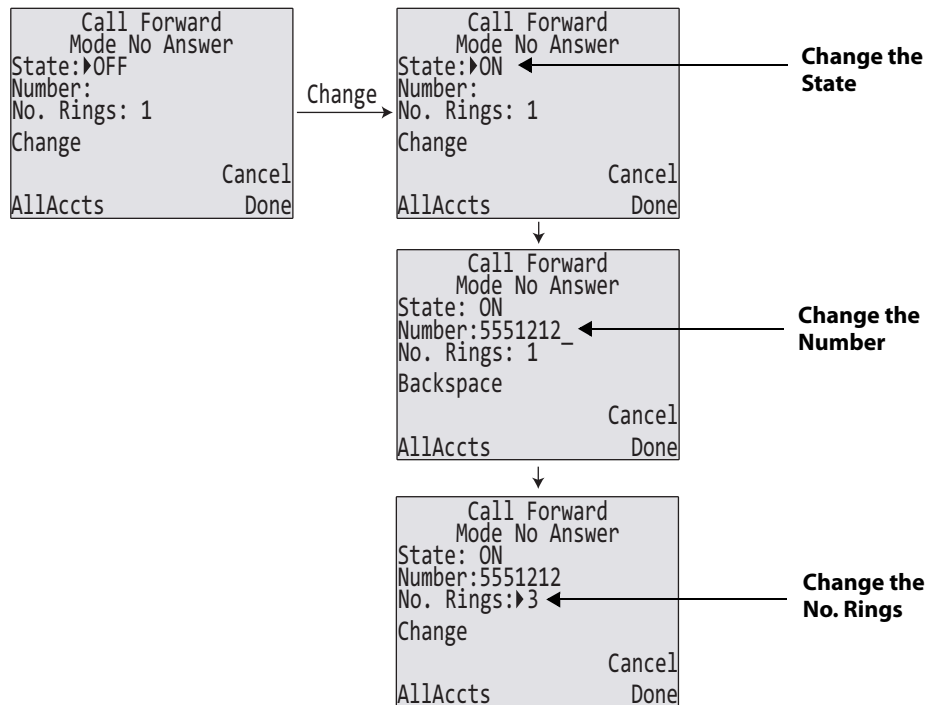

You can also use the following keys if required:

- **All Off Key** - Disables all CFWD states for the selected account.
- **All On Key** - Enables all CFWD states for the selected account.
- **CopytoAll Key** - Copies the call forward phone number and state of the selected Call Forward mode (All, Busy, No Answer) to every Call Forward mode of that account. For example, if you have the cursor pointing at the "All" state and it is enabled and has a call forward phone number configured, pressing the **CopytoAll** Key enables the **Busy** state and the **NoAns** state and assigns the same phone number to both states.
- **Cancel Key** - Cancels any configuration you may have made without saving. To cancel a configuration, you must press this **CANCEL** key before pressing the **DONE** key.

IP Phone UI

5. Press the **CHANGE** key for the mode you selected in step 4. This displays the Call Forward State screen.

**Note:**

You can press the **AllAccts** key to copy the settings in the current Call Forward Settings screen for a specific call forward mode, to every account on the phone. Every account will have the same settings for that call forward mode.

6. Press the **CHANGE** key in the CFWD State screen. With the cursor in the "State" field, toggle the state ON and OFF by pressing the **CHANGE** key.
7. Use the **DOWN** arrow key to scroll to the "Number" field. Enter a phone number to apply to the current state in focus. When the phone is in the state you specified, and a call comes into the phone, it forwards the call to the number you specify. Use the **BACKSPACE** key if required to delete characters.
8. Use the **DOWN** arrow key to scroll to the "No. Rings" field. Press the **CHANGE** key to select the number of rings to apply to the phone for call forwarding incoming calls. Valid values are 1 to 20. Default is 3. When the phone receives an incoming call, and call forward is configured on the phone, the phone rings the number of times you specify in the No. Rings screen, and then forwards the call.
9. Press **DONE** in the CFWD State screen to save all changes.
10. Press **DONE** in the CFWD Mode screen to save all changes.
11. Press **DONE** in the CFWD Account screen to save all changes.

Configuring CFWD via the IP Phone UI (6739i)

If you enable/disable CFWD using the configuration files or the Aastra Web UI, you can use the CFWD screens that display to the . You can access the CFWD parameters by pressing a configured CFWD key (if previously configured) OR by pressing *Options->Call Forward* on the phone's front panel.

The following procedure assumes you have already configured a CFWD key AND assumes there are three accounts configured on the phone.

Notes:

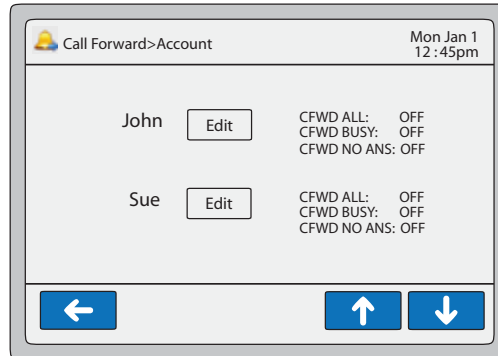

- If there is no CFWD key configured on the phone or it is removed, you can still enable CFWD via the at the path *Options->Call Forward*.
- If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to "Phone".
- Using the Aastra Web UI, if you change the CFWD key mode to "**Phone**", all accounts synchronize to the current setting of Account 1..

CFWD in Account Mode

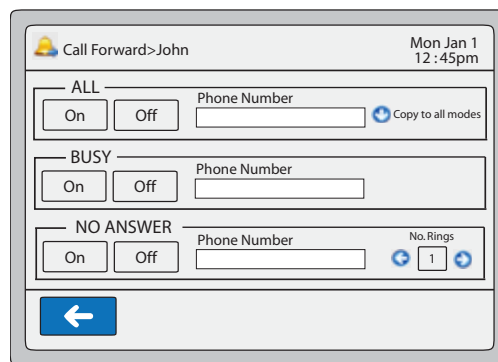

IP Phone UI

1. Press the <Services> Key, then press the <Call Forward> button.
or
Press a pre-configured **Call Forward** softkey.
The following screen displays.

Call Forward Account Mode

2. Use the  and  keys to scroll the list of accounts and select an account to apply CFWD.
3. Press <Edit>. The screen displays for the account you selected. The following example shows the CFWD screen for John's account.

4. Select the parameter you want to enable (ALL, BUSY, and/or NO ANSWER). Selecting the ALL parameter call forwards all calls to another number regardless of the state of your phone.
5. Press the <On> button to turn the CFWD parameter ON or the <Off> button to turn the CFWD parameter OFF.
6. Press the "Phone Number" field. A pop-up keyboard displays.
7. Using the keyboard, enter the phone number that your phone will call forward to and press <Enter>.
8. If you enter a phone number for the ALL parameter, you can press the  **Copy to all modes** to automatically copy the same phone number to the BUSY and NO ANSWER phone number fields.
9. For the NO ANSWER parameter, in the "No. Rings" field, select the number of rings you want your phone to perform before call forwarding a call.

Note:

If **All** AND **Busy** AND **NoAns** are all enabled, and if the account has DND enabled, the **CFWD All** settings take precedence over **CFWD Busy** and **CFWD NoAns**.

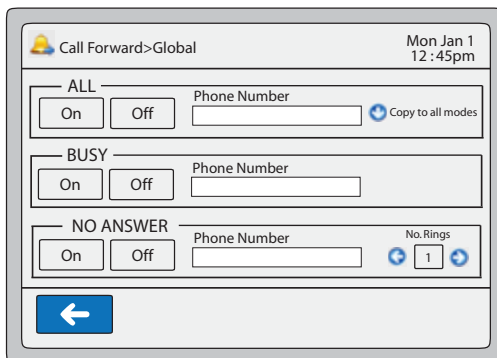

10. Press the  to return to the previous menu or press the  to return to the idle screen.

CFWD in Phone Mode

IP Phone UI

1. Press the <Services> Key, then press the <Call Forward> button.
or
Press a pre-configured **Call Forward** softkey.
The following screen displays.

Call Forward Phone Mode

2. Select the parameter you want to enable (ALL, BUSY, and/or NO ANSWER). Selecting the ALL parameter call forwards all calls to another number regardless of the state of your phone.
3. Press the <On> button to turn the CFWD parameter ON or the <Off> button to turn the CFWD parameter OFF.
4. Press the “Phone Number” field. A pop-up keyboard displays.
5. Using the keyboard, enter the phone number that your phone will call forward to and press <Enter>.
6. If you enter a phone number for the ALL parameter, you can press the **Copy to all modes** to automatically copy the same phone number to the BUSY and NO ANSWER phone number fields.
7. For the NO ANSWER parameter, in the “No. Rings” field, select the number of rings you want your phone to perform before call forwarding a call.

Note:

If All AND Busy AND NoAns are all enabled, and if the account has DND enabled, the CFWD All settings take precedence over CFWD Busy and CFWD NoAns.

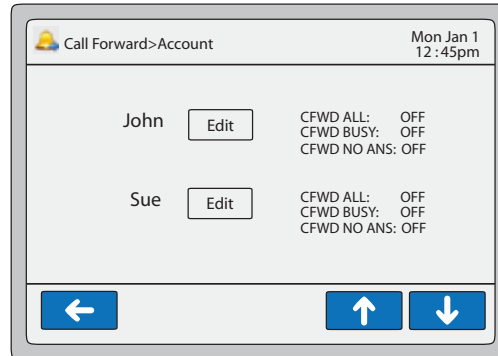

8. Press the to return to the previous menu or press the to return to the idle screen.

CFWD in Custom Mode

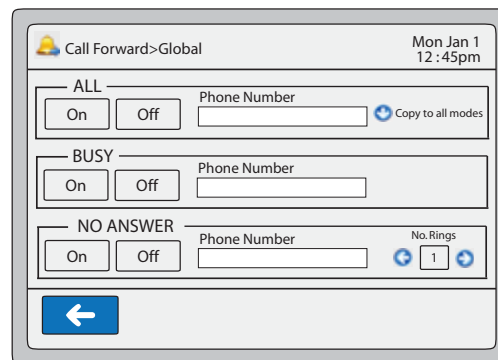

IP Phone UI

1. Press the **<Services>** Key, then press the **<Call Forward>** button.
or
Press a pre-configured **Call Forward** softkey.
The following screen displays.

Call Forward Custom Mode

2. Use the  and  keys to scroll the list of accounts and select an account to apply CFWD.
3. Press **<Edit>**. The screen displays for the account you selected. The following example shows the CFWD screen for John's account.

4. Select the parameter you want to enable (ALL, BUSY, and/or NO ANSWER). Selecting the ALL parameter call forwards all calls to another number regardless of the state of your phone.
5. Press the **<On>** button to turn the CFWD parameter ON or the **<Off>** button to turn the CFWD parameter OFF.
6. Press the **"Phone Number"** field. A pop-up keyboard displays.
7. Using the keyboard, enter the phone number that your phone will call forward to and press **<Enter>**.
8. If you enter a phone number for the ALL parameter, you can press the  **Copy to all modes** to automatically copy the same phone number to the BUSY and NO ANSWER phone number fields.
9. For the NO ANSWER parameter, in the **"No. Rings"** field, select the number of rings you want your phone to perform before call forwarding a call.
10. Press the  to return to the previous menu.

IP Phone UI

11. To configure CFWD for additional accounts, repeat steps 2 through 9.

Note:

If All AND Busy AND NoAns are all enabled, and if the account has DND enabled, the CFWD All settings take precedence over CFWD Busy and CFWD NoAns.

12. Press the to return to the previous menu or press the to return to the idle screen.

Configuring Call Forward via the IP Phone UI (6867i)

Once Call Forward is enabled on your phone, you can access the Call Forward menus by pressing a pre-configured **Call Forward** key, or by selecting *Options > Call Forward* from the IP phone UI.

CFWD in Account Mode

IP Phone UI

1. From the Home screen press the 4 navigation key to move to the **Line Selection** screen.
2. Highlight the desired account using the 2 and 5 navigation keys.
3. Press the 3 navigation key to go back to the **Home** screen
4. With the account in focus on **Home** screen, press the configured **Call Fwd** softkey or press , navigate to the **Call Forward** option and press the button or **Select** softkey.
The Call Forward screen displays for the account you selected.

5. Enter forwarding numbers using the dialpad keys for any of the following states:
 - All: Forwards all incoming calls for the respective account to the specified number.
 - Busy: Forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
 - No Answer: Forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.

Notes:

 - Pressing the 2 navigation key moves the selection to the next field/checkbox.
 - If All and Busy and No Answer are all enabled (and/or if the account has DND enabled), the All settings take precedence over Busy and No Answer.
 - Pressing the **CopyToAll** key copies the call forward number of the Call Forward mode in focus to every Call Forward mode of that account. For example, if you have the cursor pointing at the All state and has a call forward phone number configured, pressing the **CopytoAll** key assigns the same phone number to the Busy and No Answer states as well.
6. If configuring a forwarding number for the No Answer state, navigate to the **No. Rings** field and press the 3 or 4 navigation keys to change the desired number of rings.

**IP Phone UI**

7. Using the **2** navigation key, move to the **On** checkbox beside the respective Call Forward mode and press the  button to enable the Call Forward mode.
8. Press the **Save** softkey to save your changes.

CFWD in Phone Mode**IP Phone UI**

1. Press the configured **Call Fwd** softkey or press , navigate to the **Call Forward** option and press the  button or **Select** softkey. The Call Forward screen displays and is applicable to all accounts configured on the phone.

2. Enter forwarding numbers using the dialpad keys for any of the following states:
 - All: Forwards all incoming calls for the respective account to the specified number.
 - Busy: Forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
 - No Answer: Forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.**Notes:**
 - Pressing the **2** navigation key moves the selection to the next field/checkbox.
 - If All and Busy and No Answer are all enabled (and/or if the account has DND enabled), the All settings take precedence over Busy and No Answer.
 - Pressing the **CopyToAll** key copies the call forward number of the Call Forward mode in focus to every Call Forward mode of that account. For example, if you have the cursor pointing at the All state and has a call forward phone number configured, pressing the **CopytoAll** key assigns the same phone number to the Busy and No Answer states as well.
3. If configuring a forwarding number for the No Answer state, navigate to the **No. Rings** field and press the **3** or **4** navigation keys to change the desired number of rings.
4. Using the **2** navigation key, move to the **On** checkbox beside the respective Call Forward mode and press the  button to enable the Call Forward mode.
5. Press the **Save** softkey to save your changes.

Note:

In **Phone** mode, the configuration applies to all the accounts on the phone.

CFWD in Custom Mode

IP Phone UI

1. Press the configured **Call Fwd** softkey or press , navigate to the **Call Forward** option and press the  button or **Select** softkey. The Call Forward screen displays.

2. Press the 3 or 4 navigation keys to change to the desired account.
Note:
 Select **All Accounts** if you want your changes to be made to all the accounts configured on the phone.
3. Enter forwarding numbers using the dialpad keys for any of the following states:
 - All: Forwards all incoming calls for the respective account to the specified number.
 - Busy: Forwards incoming calls to a specified number if DND has been enabled for that account OR if the account is currently engaged in another call.
 - No Answer: Forwards incoming calls to a specified number if the call has not been answered for the specified number of rings.**Notes:**
 - Pressing the 2 navigation key moves the selection to the next field/checkbox.
 - If All and Busy and No Answer are all enabled (and/or if the account has DND enabled), the All settings take precedence over Busy and No Answer.
 - Pressing the **CopyToAll** key copies the call forward number of the Call Forward mode in focus to every Call Forward mode of that account. For example, if you have the cursor pointing at the All state and has a call forward phone number configured, pressing the **CopytoAll** key assigns the same phone number to the Busy and No Answer states as well.
4. If configuring a forwarding number for the No Answer state, navigate to the **No. Rings** field and press the 3 or 4 navigation keys to change the desired number of rings.
5. Using the 2 navigation key, move to the **On** checkbox beside the respective Call Forward mode and press the  button to enable the Call Forward mode.
6. Press the **Save** softkey to save your changes.

SIP Phone Diversion Display

When an outgoing call from the phone is being diverted to another destination (i.e. via call forward), the phone displays the Caller ID (phone number and/or caller name) of the new destination and the reason for the call diversion. Similarly, at the new destination, the Caller ID of the original call destination now displays

Call Diversion Example

1. Tim calls Mark at x400.
2. Mark's phone is busy.
3. Mark's phone diverts the incoming call to another destination (Roger @ x 464).
4. Tim's phone displays name and extension of where the call is being diverted to and reason for diverting the call. The screen scrolls between Screen 1 and Screen 2.
5. Roger's phone accepts the call and displays the name and number of the phone the incoming call (Tim) and the name (or number) of the original destination (Mark). The screens scroll between Screen 1 and Screen 2.

Note:

If proxy servers exist in the network, it is possible that multiple diversions can take place on the phones. When multiple diversion headers are returned in a single 302 response back to the originating phone, the phone that originated the call (i.e., Tim's phone in above example) displays the URI of the newest (first encountered) Diversion header, but displays the REASON of the oldest (last encountered) Diversion Header. The phone that receives the diverted call (i.e., Roger's phone in example above) displays the information of the oldest diverted call (last encountered).

You can enable or disable this feature on a global or per-line basis using the configuration files only.

Configuring SIP Diversion Display on the Phone

Use the following procedures to configure SIP diversion display on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "SIP Diversion Display" on [page A-132](#).

Limitations

- The diversion header assumes that the ID of the 'diverted' caller is passed in a URI style manner.
- This feature relies on the server supporting and generating the Diversion header; the phone does not generate the header itself.
- Diversion header parameters such as counter, limit, privacy, screen, and extension are not recognized or supported by the phone. However, they are still passed along during the diversion process.

Display Name Customization

By default, if the IP phone receives an incoming call and the number of the incoming call matches an entry in the local directory, the IP phone will display the information stored in the local directory instead of the display name of the INVITE. The "**directory lookup suppression pattern**" allows for the customization of the name displayed on the IP phone's screen and suppression of the local directory lookup.

This parameter is useful in such cases where a call manager will intentionally modify the display name according to a specific scenario. For example, if a Manager forwards an incoming call to an employee, the call manager may modify the display name to state "--> [Manager's Name] Caller's Name". With the **"directory lookup suppression pattern"** parameter configured for "-->" pattern matching, the IP phone will bypass the local directory lookup and the phone's screen will display the call as intended by the call manager.

Pattern Rules and Syntax

The customized display name must start with the pattern. The patterns that can be configured include the following regular expressions:

- "-->x+"
- "==">x+"
- "@@x@"
- "aaax+"

Additionally, the pattern syntax supports the regular expression | to specify multiple OR combined patterns (e.g. "-->x+|==">x+|aaax+").

Notes:

- Pattern matching is only applied for incoming calls and against the From header display name for incoming calls.
- Pattern matching is applied to shared lines.
- Pattern matching is not applied against the display name in the P-Asserted-Identity (PAI) header.

Configuring the Display Name Customization Feature

Use the following procedures to configure the display name customization feature.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, ["Display Name Customization Settings"](#) on [page A-133](#).

Displaying Call Destination for Incoming Calls

The IP Phones allow an Administrator to enable and disable the call destination name in the “TO” header of the INVITE message for incoming calls. When this feature is enabled, the call destination name displays on the LCD of the phone. This allows the user to easily determine the intended destination of an incoming call.

Behavior of the Phone

When this feature is enabled, the phone behaves as follows:

IF	THEN
A value exists for the Display Name field in the “TO” header of the INVITE message for incoming calls...	the phone displays the call destination name.
Display Name field is empty...	the phone uses the name specified for the “Screen name 1” parameter.
“Screen name 1” parameter is empty...	the phone uses the name specified for the “Display Name” parameter.
“Display Name” parameter is empty...	the phone uses the name specified for the “SIP User Name” parameter.
“SIP User Name” parameter is empty...	the phone uses the name specified for the “Call Destination Number” parameter.

The call destination information displays on multiple screens that scroll every 3 seconds.

Note:

When both call diversion and call destination are enabled, the formation displays to the phone’s screens in the following order:

- **Screen 1:** Caller info
- **Screen 2:** Call destination
- **Screen 3:** Call diversion

Configuring the Display of Call Destination for Incoming Calls

Use the following procedures to configure the display of call destination for incoming calls on the IP Phones.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Display of Call Destination for Incoming Calls” on page A-133.

Limitations

The following are limitations of this feature:

- Any call destination name exceeding the screen length is truncated by the phone.
- The CT cordless handsets do not support this feature.
- Page scrolling every 3 seconds is hard-coded and not configurable.

Callers List

The IP phones have a “Callers List” feature that store the name, phone number, and incremental calls, for each call received by the phone. You can enable and disable the Callers List feature using the configuration files. When disabled, the Callers List does not display on the IP phone UI and the Caller List key is ignored when pressed.

When enabled, you can view, scroll, and delete line items in the Callers List from the IP phone UI. You can also directly dial from a displayed line item in the Callers List. You can download the Callers List to your PC for viewing using the Aastra Web UI.

When you download the Callers List, the phone stores the *callerlist.csv* file to your computer in comma-separated value (CSV) format.

You can use any spreadsheet application to open the file for viewing. The following is an example of a Callers List in a spreadsheet application.

	A	B	C	D	E	F
1	John	41373	2			
2	Tim	41376	1			
3	Carol	4443245	1			
4	Tom	41356	3			
5						
6						
7						
8						
9						
10						
11						
12						

The file displays the name, phone number, and the line that the call came in on.

Enabling/Disabling Callers List

You can enable and disable user access to the Callers List on the IP phones using the following parameter in the configuration files:

- **callers list disabled**

Valid values for this parameter are **0** (enabled) and **1** (disabled). If this parameter is set to **0**, the Callers List can be accessed by all users. If this parameter is

set to **1**, the IP phone does not save any caller information to the Caller List. For any applicable phones, the "Callers List" option on the IP phone is removed from the Services menu, and the Caller List key is ignored if pressed by the user.

Use the following procedures to enable/disable the Callers List on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files for enabling/disabling the Callers List, see Appendix A, the section, "Callers List Settings" on [page A-109](#).

Using the Callers List

Use the following procedure to access and use the Callers List.

IP Phone UI

1. On the 9143i, 6863i, 6865i, and all 6700i phones:
Press the "**Callers List**" key on the phone to enter the Callers List.

On the 9480i, 9480i CT:
Press the "**Services**" key on the phone, and then select "**Callers List**" from the list of options.

2. Use the 5 and 2 to scroll through the line items in the Callers List.

To the left of a line item, a **b** icon displays with the handset ON or OFF the receiver. The ON receiver indicates the call came in as a missed call. The OFF receiver indicates the call came in and was answered.

**IP Phone UI**

3. To dial a displayed entry from the Callers List, pick up the handset, press the  key, or press a line key.

Note:

After selecting a number from the Callers List, you can edit the number if necessary.

4. To delete all entries in the Callers list, press the  **Delete** key at the "Callers List" header.

To delete a line item from the Callers List, select the line item you want to delete and press the  **Delete** key.

5. To cancel a delete function, press the 5 or 2 keys.

6. To save a line item to a programmable key for speeddialing, press the  **Save** key and enter the line number at the "Save to?" prompt that is already configured for speeddialing at a programmable key.

7. To exit the Callers List, press the **"Callers List"** key again or the **"Goodbye"** key.

For the 6739i:

1. Press the  key on the phone to enter the Callers List.

2. Use the  and  keys to navigate to the Caller record for which you want to call.

A **GREEN** checkmark  displays next to the entries that were answered. A **RED** exclamation point  displays next to the entries that were missed calls.

3. To dial from the Callers List, press the Caller record and then press  **Dial** . The phone automatically dials the number from the record you selected.

Note:

After selecting a number from the Callers List, you can edit the number if necessary.

4. To delete a record from the Callers List, press the Caller record and then press  .

5. To save a Caller record to the directory, press the Caller record and then press the  **Add to Directory** . button. The Directory displays. Check that all of the information from the Callers record was entered correctly in the Directory List entry.

For the 6867i:

1. Press the  key.

2. Use the 5 or 2 keys to scroll through the entries in the Callers List.

 displays next to the entries that were answered.  displays next to the entries that were not answered.  displays next to the entries that were missed calls.

3. Press 4 to see more detailed information about the Callers List entry.

Note:

The detailed view screen contains the picture ID of the caller (if available), the date and time of the incoming call, whether or not the call was answered, the line on which the call was received, call duration (if the call was answered), any applicable call feature indicators, and the caller ID details.

4. To dial the displayed number while in the Callers List, press the  button, press the handsfree button, lift the handset, or press any of the line keys.

Note:

After selecting a number from the Callers List, you can edit the number if necessary.

IP Phone UI

5. To delete a record from the Callers List, highlight the Caller record, press the **Delete** softkey, and then the **DeleteItem** softkey.
6. To save a Caller record to the directory, highlight the Caller record and then press the **Copy** softkey. Check that all of the information from the Callers record was entered correctly in the Directory List entry.

Downloading the Callers List

Use the following procedure to download the Callers List using the Aastra Web UI.

Aastra Web UI

1. Click on **Operation->Directory**.

2. In the Callers List field, click on **Save As**.
A "File Download" message displays.
3. Click **Save**.
4. Enter the location on your computer where you want to download the Callers List and click **Save**.
The *callerslist.csv* file downloads to your computer.
5. Use a spreadsheet application to open and view the Callers List.

Customizable Callers List and Services Keys

The IP phones may have a Callers List key and a Services key (as a hard key or softkey/programmable key) depending on your model phone. An Administrator can specify URI overrides for these keys using the following parameters in the configuration files:

- **services script**
- **callers list script**

Specifying URIs for these parameters cause the creation of an XML custom application instead of the standard function of the Callers List and Services keys.

An Administrator can configure these parameters using the configuration files only.

Creating Customizable Callers List and Services Keys

Use the following procedure to create customized Callers List and Services keys on the IP Phone using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Customizable Callers List and Services Key" on page A-110.

Missed Calls Indicator

The IP phone has a "missed calls" indicator that increments the number of missed calls to the phone. This feature is accessible from the IP phone UI only.

You can enable and disable the Missed Calls Indicator feature using the configuration files. When disabled, the Missed Calls Indicator does not increment as calls come into the IP phone.

When enabled, the number of calls that have not been answered increment on the phone's idle screen as "**<number> New Calls**". As the number of unanswered calls increment, the phone numbers associated with the calls are stored in the Callers List. The user can access the Callers List and clear the call from the list. Once the user accesses the Callers List, the "**<number> New Calls**" on the idle screen is cleared.

Note:

The phones also include a "Missed-Calls-Message" field in a "message summary" event of a SIP NOTIFY message.

Enabling/Disabling Missed Calls Indicator

You can enable (turn on) and disable (turn off) the Missed Calls Indicator on the IP phones using the following parameter in the configuration files:

- **missed calls indicator disabled**

Valid values for this parameter are **0** (enabled) and **1** (disabled). If this parameter is set to **0**, the indicator increments as unanswered calls come into the IP phone. If set to **1**, the indicator does not increment the unanswered calls.

Use the following procedures to enable/disable the Missed Calls Indicator on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files for enabling/disabling the Missed Calls Indicator, see Appendix A, the section, "Missed Calls Indicator Settings" on page A-114.

Accessing and Clearing Missed Calls

Use the following procedure to access and clear missed calls from the Callers List. Once you display the Callers List, the "**<number> New Calls**" indicator clears.

IP Phone UI

1. Press the "**Callers List**" key on the phone to enter the Callers List.
2. Use the 5 and 2 to scroll through the line items in the Callers List to find the line items that have the  icon with the receiver ON. These are the missed calls to the phone.
3. To clear the line item from the Callers List, select the line item you want to clear and press the 3, **Clear**, or **Delete** key (depending on your phone model).

Note:

To cancel a delete function, press the 5 or 2 keys.

The line item deletes from the Callers List.

For the 6739i:

1. Press the  key on the phone to enter the Callers List.
2. Use the  and  keys to navigate to the Caller record marked with a  indicating missed calls.
3. To delete the missed call from the Callers List, press the Caller record and then press  .

IP Phone UI

For the 6867i:

1. Press the  key.
2. Use the 5 or 2 keys to scroll through the entries in the Callers List.

 displays next to the entries that were answered.  displays next to the entries that were not answered.  displays next to the entries that were missed calls.

The missed calls icon automatically clears when you highlight a different Caller record.

Directory List

The IP phones have a "**Directory List**" feature that allows you to store frequently used names and numbers on the phone. You can also dial directly from the directory entry.

Directory List Capabilities

In the Directory List a user or administrator can store a maximum of 7 numbers associated with a unique name. You can apply pre-defined labels to the entry which include, **Office**, **Home**, **Cell**, and **Pager**, or create your own labels (for phones with softkeys). Labels can be up to 14 characters in length for all phones with softkeys except the 6867i. The 6867i's character length limit is variable and as such automatically truncates labels that are too long.

Reference

For more detailed information about the Directory Key on your IP phone, and the Directory List, see your **Aastra <Model-Specific> IP Phone User Guide**.

Administrator/User Functions for Directory List

You can perform the following pertaining to the Directory List:

- You can enable and disable access to the Directory List using the configuration files. When disabled, the Directory List does not display on the IP phone UI and the Directory List softkey is ignored when pressed. This is an administrator function only.
- If the Directory List is enabled, you can view, add, change, and delete entries to/from the Directory List using the IP phone UI. You can also directly dial a number from the Directory List. This is an administrator and user function.
- A public and private softkey can be used when at a line item in the Directory List. The **Private** key toggles a number in the Directory List to private. The **Public** key allows a number in the Directory List to be sent to the handsets. A 6757i CT accepts a maximum of 50 entries with the public attribute. This is an administrator and user function.
- You can download the Directory List to your PC via the Aastra Web UI. The phone stores the *directorylist.csv* file to your PC in comma-separated value (CSV) format. This is an administrator and user function.
- You can use any spreadsheet application to open the file for viewing. The following is an example of a Directory List in

a spreadsheet application. This is an administrator and user function.

	A	B	C	D	E	F
1	John	41373	2			
2	Tim	41376	1			
3	Carol	4443245	1			
4	Tom	41356	3			
5						
6						
7						
8						
9						
10						
11						
12						

The file displays the name, phone number(s), and line number(s) for each Directory entry.

Enabling/Disabling Directory List

You can enable and disable user access to the Directory List on the IP phones using the following parameters in the configuration files:

- **directory disabled**

Valid values for this parameter are **0** (enabled) and **1** (disabled). If this parameter is set to **0**, the Directory List can be accessed by all users. If this parameter is set to **1**, the Directory List does not display on the IP phone and the Directory key is disabled. On 3-Line LCD phones, the "Directory" option is also removed from the "Services" menu.

Use the following procedures to enable/disable the Directory List on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files for enabling/disabling the Directory List, see Appendix A, the section, "Directory Settings" on page A-107.

Server to IP Phone Download

You can populate your IP phone Directory List with server directory files. To activate this feature, you need to add the following parameters to the configuration files:

- **directory 1: company_directory**
- **directory 2: my_personal_directory**

The IP phone recognizes the following characters in a Directory List:

Character	Description
'#'	Pound character; any characters appearing after the # on a line are treated as a comment
,	Comma character; used to separate the name, URI number, line, and mode fields within each directory entry.
"	Quotation mark; when pound and comma characters are found between quotes in a name field or URI number field, they are treated as regular characters.

A valid directory entry has a name, a URI number, and optional line number, and an optional mode attribute, all separated by commas. If a line number is not present, the entry is assigned to line 1. If a mode attribute (public or private) is not present, the entry is assigned to **"Private"**.

The following directory entries are considered valid:

```
# our company's directory
# updated 1 jan 2012
# mode = private, by default
#
joe foo bar, 123456789, 6

# line = 1, by default
# mode = private, by default
#
snidley whiplash, 000111222

# the parser ignores the COMMA # in the name
# mode = private, by default
#
"manny, jr", 093666888, 9

# the parser ignores the POUND # chars in the URI number
# mode = private, by default
#
hello dolly, "12#34#7", 2
```

Server to IP Phone Download Behavior

The software that reads directory files from the server, loads the file's contents into the phone's NVRAM when the phone is booting. Directory entries in the NVRAM that originate from a server directory file are "owned" by the server.

During the boot process both directory files are read, combined into a single list, and any duplicate entries are deleted from the list. Any entries in this list that are not already in the phone's NVRAM are added to the NVRAM and flagged as being owned by the server. Likewise, any entries in the NVRAM that are owned by the server, but are no longer in one of the server's directory files, are removed from the NVRAM. Entries made from the IP phone UI are never touched.

Note:

Duplicate entries are recognized by the IP phone as those that contain the same name, URI number, and line number. The label and mode attribute (i.e. public or private) are not taken into consideration by the IP phone when comparing entries.

Directory List Limitations

The following table indicates the maximum characters for each line and field in the Directory List.

Directory List Limitations	
Maximum length of a line	255 characters
Maximum length of a name	15 characters for all phones except the 6867i. The 6867i has variable character lengths and automatically truncates names that are too long).
Maximum length of a URI	45 characters
Maximum number directory entries in the NVRAM	200 entries
Maximum number directory entries in the NVRAM with the "public" attribute (6757i CT only)	50 entries

Using the Directory List

Use the following procedures to access and use the Directory List.

Note:

In the following procedure, the location of keys (hard keys, softkeys, and programmable keys) on the phone are dependant on your specific phone model. See [Chapter 1, "Overview"](#), for the keys that are specific to your phone model.

IP Phone UI

1. On the 9143i, 6863i, 6865i, and all 6700i phones:

Press the **DIRECTORY** key to enter the Directory List.

On the 9480i, 9480i CT:

Press the **Services** key, and then select "**Directory**" from the list of options.

Note:

After entering the Directory List, if no key is pressed within 3 seconds, the phone prompts you to press the first letter in the name of the required directory entry. The phone finds and displays the first name with this letter.

2. Use the 5 and 2 to scroll through the line items in the Directory List.

To dial from an entry in the Directory List:

3. At a line item in the Directory List, pick up the handset, press the  key, or press a line key.

The phone automatically dials the Directory List number for you.

To add a new entry to the Directory List:

4.
 - a. Press the **SAVE** key or **ADD NEW** softkey (depending on your model phone) at the Directory List header screen and perform step 4. or Press the **SAVE** key or **ADD NEW** softkey at a line item and press the **DIRECTORY** key again.
 - b. Enter a phone number, name, and line number and press the **SAVE** key after each field entry.

To edit an entry in the Directory List:

5.
 - a. At a line item in the Directory List, press the 3 key.

Note:

Use the **SAVE** key to scroll between the number, name and line entries.

- b. Edit the phone number if required and press **SAVE**.
- c. Edit the name if required and press **SAVE**.
- d. Edit the line if required and press **SAVE**.
- e. Press **SAVE** to save the changes and exit the editing function.

To delete an entry from the Directory List:

6.
 - a. At a line item in the Directory List, press **DELETE**. The following prompt displays:

"DELETE again to erase this item".

- b. Press **DELETE** again to delete the entry from the Directory List.

Note:

To cancel a delete function, press the 5 or 2 keys.

IP Phone UI

To delete all entries from the Directory List:

7. a. At the Directory List header, press **DELETE** or **DELETE LIST** (depending on your phone model). The following prompt displays:

"DELETE again to erase all items".

b. Press DELETE again to delete all entries from the Directory List.

Note:

To cancel a delete function, press the 5 or 2 keys.

To copy an entry from the Directory List to a Speeddial key (for 3-Line LCD phones):

8. At a line item in the Directory List, press the **SAVE** key.
The "Save to?" prompt displays.
Enter a number from 1 to 9 (associated with the keypad) where you want to save the item as a speeddial.

Note:

You must have a Speeddial key previously configured on your phone to use this feature. To configure a Speeddial key, see your <Model-Specific> *User's Guide*.

9. To exit the Directory List, press the **DIRECTORY** key again, the **GOODBYE** key, or the **QUIT** key (depending on your specific phone model).

From the CT handsets:

10. a. Press the **Public/Private** softkeys to toggle between making the new entry public or private.

Note:

The entry is set to **Private** by default. If the entry is made **Public**, the entry is sent to the handsets. A 6757i CT accepts a maximum of 50 entries with the public attribute.

- b. To edit an entry, use the **Change** softkey.
A screen displays allowing you to edit the name, phone number, and line number, as well as the public/private setting.

- c. To dial a displayed entry from the Directory List, pick up the handset, press the  key, or press the **Dial** softkey.

Using the Directory on the 6739i

Accessing and Searching the Directory

Use the following procedures to access and search for entries in your Directory List.

IP Phone UI

1. Press the  Key. The Directory screen displays. The screen is blank if the Directory is empty.
2. Use the  and  keys to navigate the list to look for an entry.
3. Press the entry to display a single entry's details.

Using the Search Feature in the Directory

IP Phone UI

1. Press the button on the main Directory screen. A keyboard displays.
2. Enter the name or phone number of the entry for which you are searching. As you type characters on the keyboard, the entries beginning with those characters display on the screen. When you have completed your typing, the entry you are looking for, displays on the screen and the characters you typed display in a text box.

Dialing from the Directory

You can dial a phone number or extension directly from an entry in the Directory List.

IP Phone UI

1. Press the Key. The Directory screen displays.
2. Use the and keys to navigate the list to look for an entry.
or
Press the button.
3. Select the entry you want to dial. All of the numbers display that are associated with the single entry (i.e., Cell, Office, Home, etc.)

Note:
A “**picture ID**” displays when you select an entry in the Directory if your System Administrator enabled this feature on your phone. Contact your System Administrator for more information about the “picture ID” feature.
4. Press a number button to dial the number or extension. The phone goes off-hook and automatically dials the number from the Directory. For example, pressing the “**Office**” button in the screen above dials “**2345**” automatically from the Directory. The outgoing call defaults to using Line 1.

Adding an Entry

You can add up to 200 entries to your Directory. You can also store up to a maximum of 7 numbers associated with a single entry (i.e., office number, cell number, home number, etc.). You can apply custom labels to each entry as required.

IP Phone UI

1. Press the Key. The Directory screen displays.
2. Press the Add button.
3. Press the “**First**” field, enter the first name of the person you are adding to your directory, and then press <Enter>. Use the pop-up keyboard to enter the first name.
4. Press the “**Last**” field, enter the last name of the person you are adding to your directory, and then press <Enter>.
5. Press Add . The “**Number/Label**” fields display on the screen.
6. Press the “**Number**” field, enter the number of the person you are adding to your directory, and then press <Enter>. Use the pop-up keyboard to enter the number.
7. Press the “**Label**” field, enter the label associated with the number you just entered, and then press <Enter>. Use the pop-up keyboard to enter the label.
8. Press the buttons to select a Line (1 through 9) to associate with the phone number and label you are entering. When you dial the current number from the directory, the outgoing call uses the line number you assigned it.
9. To add another phone number and label, press Add . An additional “**Number/Label**” field displays.
10. Repeat steps 6 through 8 to enter another number and label for the current entry.

IP Phone UI

- When you are finished entering **Numbers/Labels** for the current entry, press . This saves the entry and all associated numbers/labels to the Directory on your phone

Note:

When adding an entry, number, and label to the Directory, you can press the any time to cancel the entry. It is not saved to the Directory.

- Press the to return to the previous menu or press the to return to the idle screen.

Editing an Entry

You can edit a Directory entry, number, and/or label as required from a single entry screen.

IP Phone UI

- Press the Key. The Directory screen displays.
- Use the and keys to navigate the list to look for an entry.
or
Press the button.
- Press the entry you want to edit. The single entry screen displays.
- Press the number and/or label that you want to edit, and press the button.
- Edit the Number and/or Label as required using the touch keypad that displays, and press .
- Press the to return to the previous menu or press the to return to the idle screen

Deleting an Entry

You can delete entries from the Directory List in the following ways:

- Delete a single entry and all associated numbers and labels
- Delete all entries in the Directory List
- Delete specific numbers and labels from an entry

IP Phone UI

Deleting a single entry or all entries

- Press the Key. The Directory screen displays.
- Use the and keys to navigate the list to look for an entry.
or
Press the button.
- Press the entry you want to delete. The single entry screen displays.
- Press the button. The following screen displays.

IP Phone UI

Deleting a single entry or all entries

5. Press  to delete the entry and all associated numbers and labels from the Directory. The main Directory screen displays.
or
Press  to delete **all** entries from the Directory. The main Directory screen displays.
6. Press the  to return to the previous menu or press the  to return to the idle screen

Deleting a number and/or label from an entry

1. Press the  Key. The Directory screen displays.
2. Use the  and  keys to navigate the list to look for an entry.
or
Press the  button. For a procedure on using the search button, see [“Using the Search Feature in the Directory”](#) on [page 5-231](#).
3. Press the entry for which you want to delete a number/label. The single entry screen displays.
4. Press the  button. All of the Numbers/Labels associated with this entry display on the screen.
5. Press the  button next to the Number/Label to delete both the number and label from the entry.
or
Press the field (Number or Label) you want to delete. When the keyboard displays, press the **<Backspace>** key to delete the text in the field and press **<Enter>**.
6. Press the  button to save your change(s).
7. Press the  to return to the previous menu or press the  to return to the idle.

Downloading from the Server to the IP Phone

You can use the configuration files to download the Directory List from the configuration server to the IP phone.. Use the following procedure to configure the download.

Configuration Files

For specific parameters you can set in the configuration files for downloading the Directory List, see Appendix A, the section, [“Directory Settings”](#) on [page A-107](#).

Downloading from the IP Phone to the Server

You can use the Aastra Web UI to download the Directory List from the IP phone to the configuration server.

Use the following procedure to configure the download.

Aastra Web UI

1. Click on **Operation->Directory**.

2. In the Directory List field, click on **Save As**.

A "File Download" message displays.

3. Click **Save**.

4. Enter the location on your computer where you want to download the Directory List and click **Save**.

The *directorylist.csv* file downloads to your computer.

5. Use a spreadsheet application to open and view the Directory List.

Local Directory Loose Number Matching

If the incoming calling number does not match exactly to the local directory, the lookup will fail and the phone will not display the stored directory name. Now, the phone can be configured to match only the specified number of digits against the local directory.

Administrators can enter a parameter "**directory digits match**" to determine the number of digits (from the incoming call) that the phone will use to perform a lookup in the local directory to match the number to a contact. The phone will take the last *n* digits of the incoming call to perform the lookup.

For example, if a local directory contains the following contact:

555123456 Spain Office

and the "directory digits match" parameter is configured (directory digits match: 9), the phone will take the last 9 digits of the incoming number (+34555123456) and match it to the contact in the directory and display the following on the phone:

Spain Office

+34555123456

Configuring Local Directory Loose Number Matching

Use the following procedures to configure local directory loose number matching on the IP phones.

Configuration Files

For specific parameters you can set in the configuration files for configuring the local directory loose number matching, see Appendix A, the section, "[Directory Settings](#)" on [page A-107](#).

Customizable Directory List Key

The IP phones may have a Directory List key (either a hard key or softkey/programmable key) depending on the model of the phone. An Administrator can specify a URI override for the Directory List key by defining the **"directory script"** parameter in the configuration files. Specifying a URI for this parameter causes the creation of an XML custom application instead of the standard function of the Directory List key. An Administrator can configure this parameter using the configuration files only.

Creating a Customizable Directory List Key

Use the following procedure to create a customized Directory List key on the IP Phone using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, ["Customizable Directory List Key"](#) on [page A-109](#).

Voicemail

The Voicemail feature on the IP phones allow you to configure lines with phone numbers so the phone can dial out to connect to a voicemail server. You associate the Voicemail numbers with the phone numbers configured on each line.

For each assigned Voicemail number, there can be a minimum of 0 or a maximum of 1 Voicemail access phone number.

The Voicemail list displays a list of phone numbers assigned to the IP phone that has registered voicemail accounts associated with them.

Note:

The Voicemail list does not display the voicemail access number.

The phone displays up to 99 voicemails for an account even if the number of voicemails exceeds the limit.

Registered account numbers/URIs that exceed the length of the screen, either with or without the voicemail icon and the message count, are truncated with an ellipse character at the end of the number/URI string.

The end of the Voicemail list displays the number of new voicemail messages (if any exist).

Note:

Multiple voicemail registration and monitoring of multiple voicemail accounts is available on the IP phones. See ["Speeddial/MWI Key"](#) on [page 5-143](#) for more information.

Configuring Voicemail

You configure Voicemail in the configuration files to dial a specific number to access an existing voicemail account. The user then follows the voicemail instructions for listening to voicemails.

Note:

The phone must have a registered voicemail account from a server for this feature to be enabled. When no registered voicemail accounts are registered to the phone, the display shows "List Empty".

To configure the Voicemail feature on the IP phone, you must enter the following parameter in the configuration files:

- **sip lineN vmal**

You can enter a Voicemail number for each line on the phone.

For example:

```
sip line1 vmail: *97
sip line2 vmail: *95
```

Note:

In the above example, the user would dial *97 to access the voicemail account for line 1, and *95 to access the voicemail account for line 2.

Use the following procedure to configure voicemail using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "Voicemail Settings" on [page A-105](#).

Using Voicemail

Use the following procedure to access and use voicemail.

IP Phone UI

1. Press **Services** on the phone to display the **Services** menu.
2. From the **Services** menu, select "**Voicemail**".
3. Use the 5 and 2 to scroll through the line items in the Voicemail List.
4. When you have selected a line item, press the  key, 4 key, or press a line softkey to make an outgoing call using the voicemail access phone number associated with the line for which the voicemail account is registered.

From a selected item in the Voicemail list, you can also lift the handset (go offhook) to make an outgoing call using the voicemail access phone number.

For the 6739i:

1. Press the  Key or the  icon on the phone.
2. Using your finger, scroll through the line items in the Voicemail list.
3. When you have selected a line item, press the  Key, or press a line/call appearance key to make an outgoing call using the voicemail access phone number associated with the line for which the voicemail account is registered.

From a selected item in the Voicemail list, you can also lift the handset (go offhook) to make an outgoing call using the voicemail access phone number.

Note:

You can also access your Voicemail via the "**Services**" Key on your phone if this has been setup by your System Administrator.

Visual Indicators for Voicemail on SCA-Configured Lines

Visual indicators for voicemail messages on Shared Call Appearance (SCA) lines have been implemented on the 9480i, 9480i CT, 6735i, 6737i, 6755i, 6757i, and 6757i CT model IP phones. The parameter **“voice mail indicator”** is available allowing administrators the ability to configure what types of visual indicators the IP phones should display when voicemail messages are pending on a respective SCA line.

Administrators have three options when configuring the **“voice mail indicator”** parameter:

- 0: When a line has pending messages, the IP phone does not display any visual indicators.
- 1: When a line has pending messages, the line’s corresponding softkey will display an envelope icon  and the number of pending messages beside the softkey’s label . Additionally, the softkey’s LED will be illuminated (if available).
- 2: When a line has pending messages, the line’s corresponding softkey will display only the envelope icon  beside the softkey’s label (i.e. no indication of the number of pending messages). Additionally, the softkey’s LED will be illuminated (if available).

The parameter is set to 0 (no visual indicators) by default.

Notes:

- The above behaviors are also applicable to expansion module softkeys representing SCA lines.
- For programmable keys representing SCA lines, the respective programmable key’s LED will flash when voicemail messages are pending.
- The **“voice mail indicator”** parameter takes precedence over the **“line icon disabled”** parameter. If both **“voice mail indicator”** and **“line icon disabled”** are enabled, an envelope icon (and number of messages, if configured) will be displayed when voicemail messages are pending.
- For information on SCA see [“Shared Call Appearance \(SCA\) Call Bridging”](#) on page 5-174.

Configuring SCA Voicemail Visual Indicators

Use the following procedure to configure the SCA voicemail visual indicators.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“SCA Voicemail Indicator Settings”](#) on page A-106.

PIN and Authorization Code Suppression

Certain features on MX-ONE require a PIN/authorization code to be entered on the phone (for example: to register, for authorization, locking/unlocking, or accounting).

The number format is the following:

```
*<feature code>*PIN# or *<feature code>*PIN*<number>#
```

To deactivate features, the first star is replaced by #, for example:

```
#<feature code>*PIN#.
```

Administrators can now configure the “**pin suppression dial plan**” parameter so that if such a feature code with a PIN is entered, the PIN does not show up in any of the phone logs (i.e. the redial list) nor is it displayed on the screen during a call. The phone will dynamically mask the PIN on the display within a second of the code being entered by the user.

Note:

The pin will be masked with wildcard characters (i.e. “*”) on the display and in the logs.

The “**pin suppression dial plan**” parameter introduces new alphanumeric characters that control the masking of the PIN: “(” and “)”.

The following is an example value of the new configuration parameter:

```
"*11*(1XXX)*5555+#|*72*(1XXX)#|#73*(1XXX)#"
```

where (1XXX) will mask any PINs that are 4 digits long and start with 1.

This parameter value should lead to the following masking:

- Entered digits *11*1234*5555# will lead to INVITE to this number but *11*****5555# is shown on the display and in the redial list.
- Entered digits *72*1234# will lead to INVITE to this number but *72*****# is shown on the display and in the redial list.
- Entered digits #73*1234# will lead to INVITE to this number but #73*****# is shown on the display and in the redial list.

Use the following procedure to configure the pin suppression feature using the configuration files.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “PIN Suppression” on page A-112.

XML Customized Services

Extensible Markup Language (XML) is a markup language much like HTML. HTML was designed to display data and to focus on how data looks. XML was designed to describe data and to focus on what data is.

The following are characteristics of XML:

- XML tags are not predefined. You must define your own tags.
- XML uses a Document Type Definition (DTD) or an XML Schema to describe the data.
- XML with a DTD or XML Schema is designed to be self-descriptive
- XML is a W3C Standard Recommendation

Creating Customized XML Services on the IP Phones

The XML application for the IP phones allows users to create custom services they can use via the phone's keyboard and display. These services include things like weather and traffic reports, contact information, company info, stock quotes, or custom call scripts.

The IP phone XML application supports the following proprietary objects that allow for the customization of the IP phone's display.

XML Object	Description
AstralPPhoneTextMenu (for Menu screens)	Creates a numerical list of menu items on the IP phones.
AstralPPhoneTextScreen (for Text screens)	Creates a screen of text that wraps appropriately.
AstralPPhoneFormattedTextScreen (for Text screens)	Creates a formatted screen of text (specifies text alignment, text size, text static or scrolling)
AstralPPhoneInputScreen (for User Input screens)	Creates screens for which the user can input text where applicable.
AstralPPhoneInputScreen Time and Date Attributes (for User Input screens)	Allows you to specify US (HH:MM:SS am/pm and MM/DD/YYYY) or International (HH:MM:SS and DD/MM/YYYY) time/date formats for an XML user input screen.
AstralPPhoneDirectory (for Directory List screen)	Creates an online Directory List that a user can browse in real-time.
AstralPPhoneStatus (for Idle screen)	Creates a screen that displays status messages when applicable.
AstralPPhoneExecute (for executing XML commands)	Allows the phone to execute commands (i.e., "reset", "NoOp", etc.) using XML.
AstralPPhoneConfiguration (for pushing a configuration to the phone)	Allows the server to push a configuration to the phone.(See page 5-241 for more information).
AstralPPhoneImageScreen (Standard Bitmap Image)	Creates a display with a single bitmap image according to alignment, height, and width specifications.
AstralPPhoneImageMenu (Menu Image)	Creates a display with a bitmap image as a menu. Menu selections are linked to keypad keys (0-9, *, #).
AstralPPhoneTextMenu (Icon Menu) (Icon Menu Image)	Creates a display that has a small icon before each item in the menu.

Reference

For more information about creating customized XML applications, contact Aastra Customer Support regarding the **Aastra XML Developer's Guide**.

You can also use the following attributes/options with the XML objects to further customize your XML applications:

Attribute/Option	Description/Usage	Valid Values
Beep	Enables or disables a BEEP option to indicate a status on the phone. Use with: XML object (See the <i>Aastra XML Developer's Guide</i>) Configuration files (See page 5-241) Aastra Web UI (See page 5-241)	yes no Default = no Note: This value is case sensitive.
Clickable PhoneStatus Object (6739i only)	On the 6739i, the status messages are displayed in a "box" on the idle screen, which is also used by the phone to display missed calls. This "box" can either be flat or a button the user can press if an URI has been sent along with the XML object. Use with: XML object (See the <i>Aastra XML Developer's Guide</i>)	some URI
xml status scroll delay (config files) Status Scroll Delay (seconds) (Web UI)	Allows you to set the time delay, in seconds, between the scrolling of each status message on the phone. Use with: Configuration files (See page 5-241) Aastra Web UI (See page 5-241)	1 to 25 Default = 5
XML Unit Scroll Tag (6739i only)	Allows you to change the behavior of the scrolling and mimic the behavior of the 6757i (the arrow keys move the selected item one by one). Use with: XML object (See the <i>Aastra XML Developer's Guide</i>)	yes no Default = no Note: 6739i Only.
XML Scroll Up and Scroll Down Tags	Supports the new tags "scrollUp" and "scrollDown" that are triggered when the scrolling reaches the top or the bottom of the menu items. Use with: XML object (See the <i>Aastra XML Developer's Guide</i>)	some URI
Timeout	Specifies a timeout value for the LCD screen display. Use with: XML object (See the <i>Aastra XML Developer's Guide</i>)	0, 30, 45, 60 Default =45
XML Get Timeout	Specifies a timeout value, in seconds, that the phone waits for the far side to return a response after accepting the HTTP GET connection. Use with: Configuration Files (See page 5-242)	0 to 2147483647 seconds Default =0 (never timeout)
LockIn	Specifies whether or not the information on the LCD screen stays displayed when other events occur (such as pressing buttons on the keypad). Use with: XML object (See the <i>Aastra XML Developer's Guide</i>)	yes no Default = no
CancelAction	Specifies a URI that the phone executes a GET on when the user presses the default CANCEL key. Use with: XML object (See the <i>Aastra XML Developer's Guide</i>)	Fully qualified URI For example: cancelAction= http://10.50.10.117/ft.xml

Enabling/Disabling a Beep for Status Message Displays

You can enable or disable a BEEP option using the Status Message object (AstralIPPhoneStatus), the configuration files, or the Aastra Web UI.

Note:

For enabling/disabling a status message beep using the Status Message object, see the [Aastra XML Developer's Guide](#).

When the phone receives a status message, the BEEP notifies the user that the message is displaying.

You can use the following to enable/disable a status message beep:

- **AstralIPPhoneStatus** object (via XML object; see the [Aastra XML Developer's Guide](#))
- **xml beep notification** (via configuration files)
- **XML Beep Support** (via the Aastra Web UI)

Enabling the beep is an indication to the phone to sound a beep when it receives an AstralIPPhoneStatus object. If you disable the beep, or no AstralIPPhoneStatus object appears in the status message, then the default behavior is no beep is heard when the object arrives to the phone.

The value set in the configuration files and Aastra Web UI override the attribute you specify for the AstralIPPhoneStatus object.

For example, if the AstralIPPhoneStatus object has the attribute of **Beep="yes"**, and you uncheck (disable) the **"XML Beep Support"** in the Aastra Web UI, the phone does not beep when it receives an AstralIPPhoneStatus object.

Setting the BEEP option in the configuration files and the Aastra Web UI applies to the phone immediately.

Reference

For information about enabling/disabling the XML beep in the Aastra Web UI, see ["XML Beep Support"](#) on page 5-62.

Scroll Delay Option for Status Messages

The IP phones support a scroll delay option that allows you to set the time delay, in seconds, between the scrolling of each status message on the phone. The default time is 5 seconds for each message to display before scrolling to the next message. You can configure this option via the configuration files or the Aastra Web UI.

You can use the following to set the scroll delay for status messages:

- **xml status scroll delay** (via the configuration files)
- **Status Scroll Delay (seconds)** (via the Aastra Web UI)

Changes apply to the phone immediately.

Reference

For more information about configuring status scroll delay, see ["Status Scroll Delay"](#) on page 5-63.

XML Configuration Push from the Server

The IP phones provide an XML feature that allows you to make configuration changes to the phone that take affect immediately, without having to reboot the phone. This feature involves creating XML scripts that push the changed configuration parameter(s) from the server to the IP phones.

You can use the **AstralIPPhoneConfiguration** object in the XML scripts to change configuration parameters or configure new parameters. However, since the IP phone does not save **new** parameters created in XML scripts to the *local.cfg* file, when the phone reboots, it does not save the new parameters on the phone. In order for the phone to apply **new** configuration parameters, you have to enter the parameters via the user interfaces (Telephone User Interface, Web User Interface, or configuration files), or reapply the new parameters using the XML scripts after every boot.

Specific configuration parameters are dynamic on the phone when pushed from XML scripts on the server. See the [Aastra XML Developer's Guide](#) for more information about XML configuration scripts and dynamic configuration parameters.

For more information about creating XML configuration scripts and for XML script examples, see the ***Aastra XML Developer's Guide***.

Configuring the Phone to use XML

You can configure the phone to request the XML objects you create by configuring specific parameters via the configuration files or the Aastra Web UI.

Users can access XML applications via softkeys configured on the IP phones. The phone performs an HTTP GET on the URI configured in the Aastra Web UI or configuration files.

You configure the following parameters for object requests:

- **xml application URI**
- **xml application title**

The xml application URI is the application you are loading into the IP phone.

The xml application title is the name of the XML application that displays on the Services menu in the IP Phone UI (as option #4).

XML Get Timeout

The IP phone has a parameter called, "**xml get timeout**" that allows you to specify a timeout value, in seconds, that the phone waits for the far side to return a response after accepting the HTTP GET connection. If the far side accepts the GET connection but never returns a response, it blocks the phone until it is rebooted. If you enter a value greater than 0 for this parameter, the phone times out and will not be blocked.

For more information about configuring this parameter, see Appendix A, the section, "**XML Settings**" on [page A-114](#).

XML Push Requests

In addition to initiating a request to an XML application from a softkey, an HTTP server can push an XML object to the phone via HTTP Post. When the phone sees a PUSH request containing an XML object, it tries to authenticate the request. It does so by checking the IP address or host name of the requesting host against a list of trusted hosts (or domain names) configured via the Aastra Web UI (parameter called **XML Push Server List**) or the configuration files (parameter called **xml application post list**). If the request is authenticated, the XML object is handled by the IP phone accordingly, and displays the information to the screen.

Note:

The HTTP Post must contain HTTP packets that have an "xml" line in the message body. For more information about adding "xml" lines in HTTP packets, see the ***Aastra XML Developer's Guide***.

Example Configuration of XML Application

The following example shows the parameters you enter in the configuration files to configure an XML application:

```
xml application URI: http://172.16.96.63/aastra/internet.php
xml application title: Aastra Telecom
xml application post list: 10.50.10.53, dhcp10-53.ana.aastra.com
```

Configuring for XML on the IP Phone

After creating an XML application, an administrator can configure the IP phone to use the application using the configuration files or the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "XML Settings" on page A-114.

Aastra Web UI

For 8 and 11-Line LCD phones:

1. Click on **Operation->Softkeys and XML**.

Softkeys Configuration

5. In the "**XML Application URI**" field, enter the HTTP server path or qualified domain name of the XML application you want to load to the IP phone. For example, you could enter an XML application called "http://172.16.96.63/aastra/internet.php" in the applicable field.
6. In the "**XML Application Title**" field, enter the name of the XML application that you want to display on the IP phone Services Menu. In the illustration above, the XML Application Title is "**Aastra Telecom**".
7. Click **Save Settings** to save your changes.

The XML application is applied to the IP phone immediately.

When the XML application is pushed to the phone via an HTTP POST, a host IP address or DNS server is required.

8. Click on **Advanced Settings->Configuration Server**.

XML Push Server List(Approved IP Addresses)

10.50.10.53, 10.50.10.5

9. In the "**XML Push Server List (Approved IP Addresses)**" field, enter the host IP address and/or DNS server. You can enter multiple IP address and/or DNS servers (separated by commas). In the example in Step 6, the illustration shows a host IP address of "10.50.10.53, 10.50.10.54" in the applicable field.
10. Click **Save Settings** to save your changes.

Note:

No posting is performed if a session times out.

Using the XML Customized Service

After you create, save, and configure the IP phone with an XML application, the customized service is ready for you to use.

Reference

For more information about customizing the phones using XML objects, contact Aastra Customer Support regarding the "**Aastra XML Development Guide**".

Use the following procedure to use the XML feature on the IP phone.

IP Phone UI

For 8 and 11-Line LCD phones:

1. Press the **Services** key on the phone to display the **Services** menu.
2. Select "**Custom Features**".
3. Use the **5** and **2** to scroll through the line items in a menu-driven and directory "**Custom Features**" screen.

Message services display to the screen after selecting the "**Custom Features**" option.
For user input services, follow the prompts as appropriate.
4. To exit from the "**Custom Features**" screen, press **Exit**.

**IP Phone UI****For 3-Line LCD phones:**

1. Press the programmable key configured on the phone for XML services.
A "**Custom Features**" screen displays.
2. Use the 5 and 2 to scroll through the customized features.
3. Select a service to display the information for that customized service.

Message services display to the screen after pressing the programmable key.
For user input services, follow the prompts as appropriate.
4. To exit from the "**Custom Features**" screen, press the XML programmable key again.

For the 6739i:

1. Press **Services** key on the phone.
2. Press "**Custom Features**".
3. Use the  and  keys to scroll through the line items in a menu-driven and directory "**Custom Features**" screen.

Message services display to the screen after selecting the "**Custom Features**" option.
For user input services, follow the prompts as appropriate.
4. Press the  to return to the previous screen.
5. Press the  button at any time to return to the idle screen.

For the 6739i:

1. Press the **XML** softkey on the 6867i phone. An XML screen displays.
2. Use the 5 and 2 to scroll through the customized features.
3. For menu and directory services, select a service to display the information for that customized service. Message services display to the screen after pressing the respective key. For user input services, follow the on-screen prompts.
4. To exit from the XML screen, press the **XML** softkey again or press the  button.

Action URIs

The IP phones have a feature that allows an administrator to specify a uniform resource identifier (URI) that triggers a GET when certain events occur. The IP phone events that support this feature are:

The IP phones have a feature that allows an administrator to specify a uniform resource identifier (URI) that triggers a GET when certain XML events occur. The Action URI feature prevents the phones from hanging if the Action URIs should fail. The phones also support transparent, non-blocking, XML post execute item URIs.

The IP phone XML events that support this feature are defined in the following table.

Action URI	Description
Startup	Specifies the URI for which the phone executes a GET on when a startup event occurs.
Successful Registration	Specifies the URI for which the phone executes a GET on when a successful registration event occurs.

Action URI	Description
Registration Event	Specifies the URI for when registration events occur or when there are registration state changes. Note: This action URI is not called when the same event is repeated (for example, a timeout occurs again when registration is already in a timeout state.)
Incoming Call	Specifies the URI for which the phone executes a GET on when an incoming call event occurs.
Outgoing Call	Specifies the URI for which the phone executes a GET on when an outgoing call event occurs.
Offhook	Specifies the URI for which the phone executes a GET on when an offhook event occurs.
Onhook	Specifies the URI for which the phone executes a GET on when an onhook event occurs.
Connected	Specifies the URI for which the phone executes an HTTP GET when it goes into the "connected" state. This includes regular phone calls, intercom calls, paging calls, RTP streaming, and the playing of a WAV file. It is also triggered when the phone establishes the second leg of a 3-way call. For more information, see "Action URI Connected" on page 5-253.
Disconnected	Specifies the URI that the phone executes a GET on, when it transitions from the incoming, outgoing, calling, or connected state into the idle state. For more information, see "Action URI Disconnected" on page 5-254.
XML SIP Notify	Specifies the URI to be called when an empty XML SIP NOTIFY is received by the phone. For more information, see "XML SIP Notify Events" on page 5-256.
Poll	Specifies the URI to be called every "action uri poll interval" seconds. For more information, see "Polling Action URIs" on page 5-252.
Poll Interval	Specifies the interval, in seconds, between calls from the phone to the "action uri poll". For more information, see "Polling Action URIs" on page 5-252.

Note:

For more information about the XML execute items, see the [Aastra XML Developer's Guide](#).

The following table identifies the configurable action URI parameters in the configuration files and the Aastra Web UI. This table also identifies the variables that apply to specific parameters.

Action URIs and Associated Variables

Configuration File Parameters	Aastra Web UI Parameters at Advanced Settings->Action URI	Applicable Variables
action uri startup	Startup	\$\$DISPLAYNAME\$\$ \$\$SIPUSERNAME\$\$ \$\$SIPAUTHNAME\$\$ \$\$PROXYURL\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$ \$\$REGISTRATIONSTATE\$\$ \$\$REGISTRATIONCODE\$\$
action uri registered	Successful Registration	\$\$SIPUSERNAME\$\$ \$\$SIPAUTHNAME\$\$ \$\$PROXYURL\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$
action uri registration event	Registration Event	\$\$REGISTRATIONSTATE\$\$ \$\$REGISTRATIONCODE\$\$

Configuration File Parameters	Aastra Web UI Parameters at Advanced Settings->Action URI	Applicable Variables
action uri incoming	Incoming Call	\$\$REMOTENUMBER\$\$ \$\$DISPLAYNAME\$\$ \$\$SIPUSERNAME\$\$ \$\$INCOMINGNAME\$\$ \$\$LINESTATE\$\$ \$\$CALLDURATION\$\$ \$\$CALLDIRECTION\$\$ \$\$LOCALIP\$\$
action uri outgoing	Outgoing Call	\$\$REMOTENUMBER\$\$ \$\$SIPUSERNAME\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$
action uri offhook	Offhook	\$\$LINESTATE\$\$ \$\$LOCALIP\$\$
action uri onhook	Onhook	\$\$LOCALIP\$\$ \$\$CALLDURATION\$\$ \$\$CALLDIRECTION\$\$ \$\$LINESTATE\$\$
action uri connected	Connected	\$\$REMOTENUMBER\$\$ \$\$DISPLAYNAME\$\$ \$\$SIPUSERNAME\$\$ \$\$SIPAUTHNAME\$\$ \$\$INCOMINGNAME\$\$ \$\$PROXYURL\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$ \$\$DISPLAYNAME\$\$ \$\$CALLDURATION\$\$ \$\$CALLDIRECTION\$\$ \$\$REGISTRATIONSTATE\$\$ \$\$REGISTRATIONCODE\$\$
action uri disconnected	Disconnected	\$\$LINESTATE\$\$ \$\$LOCALIP\$\$
		For more information, see "Action URI Disconnected" on page 5-254.
action uri xml sip notify	XML SIP Notify	\$\$LOCALIP\$\$
		For more information, see "XML SIP Notify Events" on page 5-256.
action uri poll	Poll	For more information, see "Polling Action URIs" on page 5-252.
action uri poll interval	Interval	For more information, see "Polling Action URIs" on page 5-252.

Variable Descriptions

The following table provides a description of each variable.

Variable	Description
\$\$SIPUSERNAME\$\$	Username associated with: <ul style="list-style-type: none"> registered phone incoming caller outgoing caller
\$\$SIPAUTHNAME\$\$	Authentication name associated with: <ul style="list-style-type: none"> registered phone
\$\$PROXYURL\$\$	Proxy URL associated with: <ul style="list-style-type: none"> registered phone

Variable	Description
\$\$LINESTATE\$\$	Current line state associated with: <ul style="list-style-type: none"> • registered phone • incoming caller • outgoing caller • offhook • onhook • disconnected
\$\$LOCALIP\$\$	IP Address associated with: <ul style="list-style-type: none"> • registered phone • onhook <p>Note: This variable allows for enhanced information in call records and billing applications.</p>
\$\$REMOTENUMBER\$\$	Remote number associated with: <ul style="list-style-type: none"> • incoming caller • outgoing caller
\$\$DISPLAYNAME\$\$	Display name associated with: <ul style="list-style-type: none"> • incoming caller
\$\$SIPUSERNAME\$\$	Username associated with: <ul style="list-style-type: none"> • registered phone • incoming caller • outgoing caller
\$\$INCOMINGNAME\$\$	Name associated with: <ul style="list-style-type: none"> • incoming caller
\$\$CALLDURATION\$\$	Duration of last call. This variable is associated with: <ul style="list-style-type: none"> • onhook <p>Note: This variable allows for enhanced information in call records and billing applications.</p>
\$\$CALLDIRECTION\$\$	Specifies whether the current/last call was incoming or outgoing. This variable is associated with: <ul style="list-style-type: none"> • onhook <p>Note: This variable allows for enhanced information in call records and billing applications.</p>
\$\$REGISTRATIONSTATE\$\$	Specifies the state of the phone's registration. Registration states can be: <ul style="list-style-type: none"> • registered • unregistered • expired • refused • timeout
\$\$REGISTRATIONCODE\$\$	Specifies the code generated during the registration process. Registration code can be: "xxx" where xxx is the 3 digit code; for example, "403". Possible codes are: <ul style="list-style-type: none"> • 001 (registration successful) • 403 (registration failed)

How it Works

When a startup, successful registration, incoming call, outgoing call, offhook, or onhook call event occurs on the phone, the phone checks to see if the event has an action URI configured. If the phone finds a URI configured, any variables configured (in the form \$\$VARIABLENAME\$\$) are replaced with the value of the appropriate variable. After all of the variables are bound, the phone executes a GET on the URI. The Action URI binds all variables and is not dependant on the state of the phone.

For example, if you enter the following string for the **action uri outgoing** parameter:

```
action uri outgoing: http://10.50.10.140/outgoing.pl?number=$$REMOTENUMBER$$
```

and you dial out the number 5551212, the phone executes a GET on:

```
http://10.50.10.140/outgoing.pl?number=5551212
```

Note:

If the phone cannot find the Action URI you specify, it returns a “NULL” response. For example,

```
http://10.50.10.140/outgoing.pl?number=
```

You can configure this feature via the configuration files or the Aastra Web UI.

Configuring XML Action URIs

Use the following procedures to configure XML Action URIs using the configuration files or the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Action URI Settings” on page A-116.

Aastra Web UI

1. Click on **Advanced Settings->Action URI**.

Action URI Configuration

Event	Settings
StartUp	<input type="text" value="http://10.50.10.140/startup"/>
Successful Registration	<input type="text" value="http://10.50.10.14/registered.php?auth name=\$\$SIP"/>
Registration Event	<input type="text" value="http://10.30.100.39/PHPtests/actionuri.php?action=F"/>
Incoming Call	<input type="text" value="http://10.50.10.140/incoming.php?number=\$\$REMC"/>
Outgoing Call	<input type="text" value="http://10.50.10.140/outgoing.php?number=\$\$REMO"/>
Offhook	<input type="text" value="http://10.50.10.140/offhook.php?state=\$\$LINESTATE"/>
Onhook	<input type="text" value="http://10.50.10.140/onhook.php?state=\$\$LINESTATE"/>
Connected	<input type="text"/>
Disconnected	<input type="text"/>
XML SIP Notify	<input type="text"/>

Event	Settings	
Poll	<input type="text"/>	Interval <input type="text" value="0"/>

2. Enter an XML URI for a startup event in the “**Startup**” field. For example:

```
http://10.50.10.140/startup
```

This parameter specifies the URI for which the phone executes a GET on when a startup event occurs.

**Aastra Web UI**

3. Enter an XML URI for a successful registration in the **“Successful Registration”** field. For example:

```
http://10.50.10.14/registered.php?auth name=$$SIPAUTHNAME$$
```

This parameter specifies the URI for which the phone executes a GET on when a successful registration event occurs.

Note:

For a successful registration event, use the associated variables indicated in the table [“Action URIs and Associated Variables”](#) on page 5-247.

The **“Successful Registration”** parameter executes on the first successful registration of each unique line configured on the phone.

4. Enter an XML URI in the **“Registration Event”** field, for when the phone performs registration. For example:

```
http://10.30.100.39/PHPtests/actionuri.php?action=RegEvt&regstate=$$REGISTRATIONSTATE$$&regcode=$$REGISTRATIONCODE$$
```

This parameter specifies the URI that the phone executes a GET on, when a registration event change occurs.

Note:

For a registration event, use the associated variables indicated in the table [“Action URIs and Associated Variables”](#) on page 5-247.

5. Enter an XML URI for an incoming call event in the **“Incoming Call”** field. For example:

```
http://10.50.10.140/incoming.php?number=$$REMOTENUMBER$$
```

This parameter specifies the URI for which the phone executes a GET on when an incoming call event occurs.

Note:

For an incoming call event, use the associated variables indicated in the table [“Action URIs and Associated Variables”](#) on page 5-247.

6. Enter an XML URI for an outgoing call event in the **“Outgoing Call”** field. For example:

```
http://10.50.10.140/outgoing.php?number=$$REMOTENUMBER$$
```

This parameter specifies the URI for which the phone executes a GET on when an outgoing call event occurs.

Note:

For an outgoing call event, use the associated variables indicated in the table [“Action URIs and Associated Variables”](#) on page 5-247.

7. Enter an XML URI for an offhook event in the **“Offhook”** field. For example:

```
http://10.50.10.140/offhook.php?state=$$LINESTATE$$
```

This parameter specifies the URI for which the phone executes a GET on when an offhook event occurs.

Note:

For an offhook event, use the associated variables indicated in the table [“Action URIs and Associated Variables”](#) on page 5-247.

8. Enter an XML URI for an onhook event in the **“Onhook”** field. For example:

```
http://10.50.10.140/onhook.php?state=$$LINESTATE$$
```

This parameter specifies the URI for which the phone executes a GET on when an onhook event occurs.

Note:

For an onhook event, use the associated variables indicated in the table [“Action URIs and Associated Variables”](#) on page 5-247.

9. To configure a Connected event, see the section, [“Action URI Connected”](#) on page 5-253.

10. To configure a Disconnected event, see the section, [“Action URI Disconnected”](#) on page 5-254.

11. To configure an XML SIP Notify event, see the section, [“XML SIP Notify Events”](#) on page 5-256.

Aastra Web UI

12. (Optional) You can poll a URI at specific intervals on the phones. For more information about polling Action URIs, see [“Polling Action URIs”](#) on page 5-252.
13. Click **Save Settings** to save your changes.

Polling Action URIs

Another way to reach a phone behind a NAT/firewall is to have the phone make an XML call at periodic intervals. An Administrator can use the **action uri poll** parameter that commands the phone to perform an XML call at configurable intervals.

An Administrator can specify the URI to be called and specify the interval between polls using the configuration files or the Aastra Web UI. Configuration of this feature is dynamic (no reboot required).

Configuring Polling Action URI via the Configuration Files

Use the following parameters to configure the polling Action URI on the IP Phones.

- **action uri poll**
- **action uri poll interval**

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, [“Polling Action URI Settings”](#) on page A-119.

Configuring Polling Action URI via the Aastra Web UI

Use the following procedure to configure polling Action URI using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Action URI**.

Action URI Configuration

Event	Settings
StartUp	<input type="text" value="http://10.50.10.140/startup"/>
Successful Registration	<input type="text" value="http://10.50.10.14/registered.php?auth name=\$\$SIP"/>
Registration Event	<input type="text" value="http://10.30.100.39/PHPtests/actionuri.php?action=F"/>
Incoming Call	<input type="text" value="http://10.50.10.140/incoming.php?number=\$\$REMC"/>
Outgoing Call	<input type="text" value="http://10.50.10.140/outgoing.php?number=\$\$REMO"/>
Offhook	<input type="text" value="http://10.50.10.140/offhook.php?state=\$\$LINESTATE"/>
Onhook	<input type="text" value="http://10.50.10.140/onhook.php?state=\$\$LINESTATE"/>
Connected	<input type="text"/>
Disconnected	<input type="text"/>
XML SIP Notify	<input type="text"/>

Event	Settings
Poll	<input type="text" value="http://myserver.com/myappli.xml"/> Interval <input type="text" value="0"/>

2. In the **“Poll”** field, enter a URI to be called every "action uri pool interval" seconds. Enter the value in a URI format. For example, **http://myserver.com/myappli.xml**.

Aastra Web UI

3. In the **"Interval"** field, enter the interval, in seconds, between calls from the phone to the "action uri poll". The value of **"0"** is disabled.
4. Click **Save Settings** to save your changes.

Action URI Connected

A parameter called **"action uri connected"** (configuration files) and **"Connected"** (Aastra Web UI) now allows XML scripts to determine when a call is connected. When enabled, the phone triggers an HTTP GET when it goes into the "connected" state. This includes regular phone calls, intercom calls, paging calls, RTP streaming, and the playing of a WAV file. It is also triggered when the phone establishes the second leg of a 3-way call.

This parameter can use the following variables:

- \$\$REMOTENUMBER\$\$
- \$\$DISPLAYNAME\$\$
- \$\$SIPUSERNAME\$\$
- \$\$SIPAUTHNAME\$\$
- \$\$INCOMINGNAME\$
- \$\$PROXYURL\$\$
- \$\$LINESTATE\$\$
- \$\$CALLDIRECTION\$\$
- \$\$LOCALIP\$\$
- \$\$DISPLAYNAME\$\$
- \$\$CALLDURATION\$\$
- \$\$REGISTRATIONSTATE\$\$
- \$\$REGISTRATIONCODE\$\$

If the Administrator enables this feature (by specifying a connect URI), when a call is connected, the phone checks to see if the event has a Connect URI configured. If the phones finds a configured URI it executes an XML script or the variable if defined.

Example

In the configuration files, you can enter the following:

```
action uri connected: http://www.example.com/connect.php
```

An Administrator can enable the "Connected" Action URI feature using the configuration files or the Aastra Web UI.

Limitations

- During SLA calls, the phone uses the Action URI Connected parameter when the line is seized before the caller dials out.
- SCA and BLA calls on hold trigger the Action URI Connected parameter, since the retrieval is a 2nd call by the phone, and the phone cannot link the retrieved call with the earlier held call.

For more information about the XML API objects, see the **Aastra XML Developers Guide**.

Configuring the Action URI Connected Feature

Use the following procedure to configure the Action URI Connected feature on the phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, **"Action URI Settings"** on page A-116.

**Aastra Web UI**

1. Click on **Advanced Settings->Action URI**.

Action URI Configuration

Event	Settings
StartUp	<input type="text" value="http://10.50.10.140/startup"/>
Successful Registration	<input type="text" value="http://10.50.10.14/registered.php?auth name=\$\$SIP"/>
Registration Event	<input type="text" value="http://10.30.100.39/PHPtests/actionuri.php?action=F"/>
Incoming Call	<input type="text" value="http://10.50.10.140/incoming.php?number=\$\$REMO"/>
Outgoing Call	<input type="text" value="http://10.50.10.140/outgoing.php?number=\$\$REMO"/>
Offhook	<input type="text" value="http://10.50.10.140/offhook.php?state=\$\$LINESTATE"/>
Onhook	<input type="text" value="http://10.50.10.140/onhook.php?state=\$\$LINESTATE"/>
Connected	<input type="text" value="http://www.example.com/connect.php"/>
Disconnected	<input type="text"/>
XML SIP Notify	<input type="text"/>

Event	Settings
Poll	<input type="text" value="http://myserver.com/myappli.xml"/> Interval <input type="text" value="0"/>

2. In the **“Connected”** field, enter a valid URI for which the phone executes a GET on, when it goes into the “connected” state. Leaving this field empty disables the Action URI Connected feature. For example,

http://www.example.com/connect.php

3. Click **Save Settings** to save your settings.

Action URI Disconnected

The phones have a parameter, **“action uri disconnected”** that allow a disconnect event to occur when the phone transitions from any active state (outgoing, incoming, connected, or calling) to an idle state. This parameter can use the variable **“\$\$LINESTATE\$\$”**.

Note:

The **\$\$LINESTATE\$\$** variable is optional and not required when enabling the **“action uri disconnected”** parameter.

If the Administrator enables this feature (by specifying a disconnect URI), when a call is disconnected, the phone checks to see if the event has a Disconnect URI configured. If the phones finds a configured URI with a **\$\$LINESTATE\$\$** variable, it replaces the **\$\$LINESTATE\$\$** variable with the appropriate line state of the current active line. After all of the variables are bound, the phone executes a GET on the URI. The following table lists the applicable values for the **\$\$LINESTATE\$\$** variable.

\$\$LINESTATE\$\$ Value	Description	Meaning in a Disconnected URI
IDLE	Phone is idle.	N/A
DIALING	Phone is offhook and ready to dial.	N/A
CALLING	A SIP INVITE was sent but no response was received.	Error occurred during the call.
OUTGOING	Remote party is ringing.	Call was cancelled.
INCOMING	Local phone is ringing.	Call was missed or cancelled.

\$\$LINESTATE\$\$ Value	Description	Meaning in a Disconnected URI
CONNECTED	Parties are talking.	Call was successful.
CLEARING	Call was released but not acknowledged.	N/A

The Action URI Disconnect feature allows an Administrator to determine the reason for the disconnect if required.

Note:

If you enable the Action URI Disconnect feature by specifying a URI, the URI is called when any disconnect event occurs including an intercom call or a conference setup.

Example

If you enter the following string on Phone A for the “**action uri disconnected**” parameter:

```
action uri disconnected: http://fargo.ana.aastra.com/disconnected.xml?state=$$LINESTATE$$
```

and then Phone A calls Phone B, Phone B answers and then hangs up, Phone A executes a GET on:

```
http://fargo.ana.aastra.com/disconnected.xml?state=CONNECTED
```

which is what the remote server receives.

Note:

If the phone can't find the Action URI you specify, it returns a “NULL” response. For example,

```
http://fargo.ana.aastra.com/disconnected.xml?state=
```

An Administrator can enable the disconnect feature using the configuration files or the Aastra Web UI.

Configuring the Action URI Disconnected Feature

Use the following procedure to configure the Action URI Disconnected feature on the phone.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Action URI Settings” on page A-116.

Aastra Web UI

1. Click on **Advanced Settings->Action URI->Event.**

Action URI Configuration

Event	Settings
StartUp	<input type="text" value="http://10.50.10.140/startup"/>
Successful Registration	<input type="text" value="http://10.50.10.14/registered.php?auth name=\$\$SIP"/>
Registration Event	<input type="text" value="http://10.30.100.39/PHPtests/actionuri.php?action=F"/>
Incoming Call	<input type="text" value="http://10.50.10.140/incoming.php?number=\$\$REMO"/>
Outgoing Call	<input type="text" value="http://10.50.10.140/outgoing.php?number=\$\$REMO"/>
Offhook	<input type="text" value="http://10.50.10.140/offhook.php?state=\$\$LINESTATE"/>
Onhook	<input type="text" value="http://10.50.10.140/onhook.php?state=\$\$LINESTATE"/>
Connected	<input type="text" value="http://www.example.com/connect.php"/>
Disconnected	<input "="" type="text" value="http://fargo.ana.aastra.com/disconnected.xml?state="/>
XML SIP Notify	<input type="text"/>

Event	Settings
Poll	<input type="text" value="http://myserver.com/myappli.xml."/> Interval <input type="text" value="0"/>

2. In the **“Disconnected”** field, enter a valid URI for which the phone executes a GET on, when it transitions from the incoming, outgoing, calling, or connected state into the idle state. Leaving this field empty disables the Action URI Disconnected feature. For example,

http://fargo.ana.aastra.com/disconnected.xml?state=\$\$LINESTATE\$\$

The following table lists the applicable values and descriptions for the \$\$LINESTATE\$\$.

\$\$LINESTATE\$\$ Value	Description	Meaning in a Disconnected URI
IDLE	Phone is idle.	N/A
DIALING	Phone is offhook and ready to dial.	N/A
CALLING	A SIP INVITE was sent but no response was received.	Error occurred during the call.
OUTGOING	Remote party is ringing.	Call was cancelled.
INCOMING	Local phone is ringing.	Call was missed or cancelled.
CONNECTED	Parties are talking.	Call was successful.
CLEARING	Call was released but not acknowledged.	N/A

3. Click **Save Settings** to save your settings.

XML SIP Notify Events

In order for an XML push to bypass the NAT/firewall, the phone supports a proprietary SIP NOTIFY event (aastra-xml) with or without XML content. An Administrator can enable/disable the SIP NOTIFY event using a specific parameter in the configuration files (**sip xml notify event**) or the Aastra Web UI (**XML SIP Notify**).

If XML content is provided in the SIP NOTIFY, it is processed directly by the phone as it is done for an XML PUSH.

If the content is empty in the SIP NOTIFY, the phone automatically triggers a new pre-configured action uri (**action uri xml sip notify**).

Example of a SIP NOTIFY with XML Content

```
NOTIFY sip:200@10.30.100.103:5060 SIP/2.0
Via: SIP/2.0/UDP 10.30.100.103:5060;branch=z9hG4bK7bbc1fac;rport
From: <sip:201@10.30.100.103:5060>;tag=81be2861f3
To: Jacky200 <sip:200@10.30.100.103:5060>
Contact: <sip:201@10.30.100.103>
Call-ID: 59638f5d95c9d301
CSeq: 4 NOTIFY
Max-Forwards: 70
Event: aastra-xml
Content-Type: application/xml
Content-Length: 115
<AastraIPPhoneExecute><ExecuteItem URI="http://10.30.100.39/XMLtests/SampleText-
Screen.xml" /></AastraIPPhoneExecute>
```

When the phone receives the SIP NOTIFY, the XML content is processed as any XML object. In the above example, the phone calls <http://10.30.100.39/XMLtests/SampleTextScreen.xml> after reception of the SIP NOTIFY.

Note:

The phone supports all the current XML objects with all the existing limitations. For example if an `AastraIPPhoneExecute` is used, the embedded URI(s) can not be HTTPS based.

Example of a SIP NOTIFY without XML Content

```
NOTIFY sip:200@10.30.100.103:5060 SIP/2.0
Via: SIP/2.0/UDP 10.30.100.103:5060;branch=z9hG4bK7bbc1fac;rport
From: <sip:201@10.30.100.103:5060>;tag=81be2861f3
To: Jacky200 <sip:200@10.30.100.103:5060>
Contact: <sip:201@10.30.100.103>
Call-ID: 59638f5d95c9d301
CSeq: 4 NOTIFY
Max-Forwards: 70
Event: aastra-xml
Content-Type: application/xml
Content-Length: 0
```

When the phone receives the SIP NOTIFY, it will trigger the **action uri xml sip notify** parameter, if it has been previously configured using the configuration files or the Aastra Web UI. If the **action uri xml sip notify** parameter is not configured, the phone does not do anything.

On the phone side, a System Administrator can enable or disable this SIP NOTIFY feature using the configuration files or the phone Web UI.

Also to ensure that the SIP NOTIFY is coming from a trusted source, it is recommended that you enable the Whitelist feature (Whitelist Proxy parameter) on the IP phone. If enabled, and the phone receives a SIP NOTIFY from a server that is NOT on the whitelist, the phone rejects the message.

Enabling/Disabling XML SIP NOTIFY using the Configuration Files

To enable/disable the SIP NOTIFY event, you can set the following parameter in the configuration files:

- **sip xml notify event**

If the content is missing in the SIP NOTIFY message received by the phone, the phone automatically uses the value you specify for the following parameter:

- **action uri xml sip notify**

 **Configuration Files**

For the specific parameter you can set in the configuration files, see Appendix A, the section, "Polling Action URI Settings" on page A-119.

Enabling/Disabling XML SIP NOTIFY Using the Aastra Web UI

Use the following procedure to enable/disable the XML SIP NOTIFY feature in the Aastra Web UI.

 **Aastra Web UI**

Enabling/Disabling the XML SIP NOTIFY Feature

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	86400
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	3600
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	0
T1 Timer	0
T2 Timer	0
Transaction Timer	4000
Transport Protocol	UDP
Local SIP UDP/TCP Port	5060
Local SIP TLS Port	5061
Registration Failed Retry Timer	1800
Registration Timeout Retry Timer	120
Registration Renewal Timer	15
BLF Subscription Period	3600
ACD Subscription Period	3600
BLA Subscription Period	300
Blacklist Duration	300
Park Pickup Config	
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

**Aastra Web UI**

- The “**XML SIP Notify**” field is disabled by default. To enable this field, check the box.

This field enables or disables the phone to accept or reject an aastra-xml SIP NOTIFY message.

Note:

To ensure the SIP NOTIFY is coming from a trusted source, it is recommended that you enable the Whitelist feature (**Whitelist Proxy** parameter) on the IP phone. If enabled, and the phone receives a SIP NOTIFY from a server that is NOT on the whitelist (i.e. untrusted server), the phone rejects the message.

- Click **Save Settings** to save your changes.

Configuring XML SIP NOTIFY using the Aastra Web UI if an Empty SIP NOTIFY Message Received by the Phone

Use the following procedure in the Aastra Web UI to configure the XML SIP NOTIFY parameter when the phone receives an empty SIP NOTIFY message.

**Aastra Web UI**

- If the content is missing in the SIP NOTIFY message received by the phone, the phone automatically uses the value you specify for the Action URI **XML SIP Notify** parameter at the path *Advanced Settings->Action URI*.

Click on **Advanced Settings->Action URI**.

Action URI Configuration

Event	Settings
StartUp	<input type="text" value="http://10.50.10.140/startup"/>
Successful Registration	<input type="text" value="http://10.50.10.14/registered.php?auth name=\$\$SIP"/>
Registration Event	<input type="text" value="http://10.30.100.39/PHPtests/actionuri.php?action=F"/>
Incoming Call	<input type="text" value="http://10.50.10.140/incoming.php?number=\$\$REMC"/>
Outgoing Call	<input type="text" value="http://10.50.10.140/outgoing.php?number=\$\$REMO"/>
Offhook	<input type="text" value="http://10.50.10.140/offhook.php?state=\$\$LINESTATE"/>
Onhook	<input type="text" value="http://10.50.10.140/onhook.php?state=\$\$LINESTATE"/>
Connected	<input type="text" value="http://www.example.com/connect.php"/>
Disconnected	<input "="" type="text" value="http://fargo.ana.aastra.com/disconnected.xml?state="/>
XML SIP Notify	<input type="text" value="http://myserver.com/myappli.xml"/>

Event	Settings
Poll	<input type="text" value="http://myserver.com/myappli.xml"/> Interval <input type="text" value="0"/>

- Specify a URI to be called when an empty XML SIP NOTIFY is received by the phone.

For example:

http://myserver.com/myappli.xml

Note:

The **sip xml notify event** parameter at the path *Advanced Settings->Global SIP->Advanced SIP Settings* must be enabled.

- Click **Save Settings** to save your changes.

XML Softkey URI

In addition to specifying variables for the Action URIs, you can also specify variables in the XML softkey URIs that are bound when the key is pressed. These variables are the same as those used in the Action URIs.

When an administrator enters an XML softkey URI either via the Aastra Web UI or the configuration files, they can specify the following variables:

- \$\$SIPUSERNAME\$\$
- \$\$SIPAUTHNAME\$\$
- \$\$PROXYURL\$\$
- \$\$LINESTATE\$\$
- \$\$LOCALIP\$\$
- \$\$REMOTENUMBER\$\$
- \$\$DISPLAYNAME\$\$
- \$\$SIPUSERNAME\$\$
- \$\$INCOMINGNAME\$\$
- \$\$CALLDURATION\$\$
- \$\$CALLDIRECTION\$\$

Note:

For a description of each variable in the above list, see [“Variable Descriptions”](#) on page 5-248.

When the softkey is pressed, if the phone finds a URI configured with variables (in the form \$\$VARIABLENAME\$\$), they are replaced with the value of the appropriate variable. After all of the variables are bound, the softkey executes a GET on the URI.

Example

For example, if the administrator specifies an XML softkey with the value:

```
http://10.50.10.140/script.pl?name=$$SIPUSERNAME$$
```

This softkey executes a GET on:

```
http://10.50.10.140/script.pl?name=42512
```

assuming that the sip username of the specific line is 42512.

You can configure the XML softkey URI variables via the configuration files or the Aastra Web UI.

Configuring XML Softkey URIs

Use the following procedures to configure XML Softkey URIs using the configuration files or the Aastra Web UI.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, [“Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters”](#) on page A-156.

**Aastra Web UI****For 8 and 11-Line LCD phones:**

1. Click on **Operation->Softkeys and XML**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	XML	aastra	http://10.50.10.140/sr	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	None			1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. Select a key from keys 1 through 20.
3. In the "**Type**" field, select **XML** from the list box.
4. In the "**Label**" field, enter a label that displays on the IP phone for the XML softkey. For example, "**aastra**".
5. In the "**Value**" field, enter the URI that the phone performs a GET on when the key is pressed. For example:

http://10.50.10.140/script.pl?name=\$\$SIPUSERNAME\$\$

Note:

You can use the following variables in the URI:

- \$\$SIPUSERNAME\$\$
- \$\$SIPAUTHNAME\$\$
- \$\$PROXYURL\$\$
- \$\$LINESTATE\$\$
- \$\$LOCALIP\$\$
- \$\$REMOTENUMBER\$\$
- \$\$DISPLAYNAME\$\$
- \$\$SIPUSERNAME\$\$
- \$\$INCOMINGNAME\$\$
- \$\$CALLDURATION\$\$
- \$\$CALLDIRECTION\$\$

6. Click **Save Settings** to save your changes.

**Aastra Web UI****For 3-Line LCD phones:**

1. Click on **Operation->Programmable Keys**.

6753i Screen

Programmable Keys Configuration

Key	Type	Value	Line
1	XML	http://10.50.10.140/script.pl?name=\$\$SIPUSERNAM	1
2	None		1
3	None		1

2. On 3-Line LCD phones, select an available key.
3. In the "**Type**" field, select **XML** from the list box.

**Aastra Web UI**

4. In the "**Value**" field, enter the URI that the phone performs a GET on when the key is pressed. For example:

```
http://10.50.10.140/script.pl?name=${SIPUSERNAME}
```

Note:

You can use the following variables in the URI:

- \${SIPUSERNAME}
- \${SIPAUTHNAME}
- \${PROXYURL}
- \${LINESTATE}
- \${LOCALIP}
- \${REMOTENUMBER}
- \${DISPLAYNAME}
- \${SIPUSERNAME}
- \${INCOMINGNAME}
- \${CALLDURATION}
- \${CALLDIRECTION}

5. Click **Save Settings** to save your changes.

XML Key Redirection

The IP phones allow the redirecting of phone-based hard keys to XML scripts. This allows the server to provide the phone with Redial, Transfer (Xfer), Conference (Conf), and Intercom (Icom) key features, and the Voicemail option feature, rather than accessing them from the phone-side. This feature allows you to access the redirected keys and voicemail option from the server using the IP Phone's Services Menu. By default, the server-side keys function the same as the phone-side key features.

The following table identifies the phone states that apply to each key redirection.

Hard Keys/Options	Redirects in
Conference (Conf)	the connected state
Transfer (Xfer)	the connected and dialing states
Redial	all states
Intercom (Icom)	all states
Voicemail	all states

Notes:

- Key remapping takes precedence over redirecting.
- Disabling the redial, conference, or transfer features on the phone also disables the redirection of these keys.

The following URI configuration parameters control the redirection of the keys and the voicemail option:

- **redial script**
- **xfer script**
- **conf script**
- **icom script**
- **voicemail script**

An Administrator can configure the XML key, redirection URI parameters using the configuration files only.

Configuring XML Redirection of the Redial, Xfer, Conf, and Icom Keys, and the Voicemail Option

Use the following procedure to configure XML redirection of the Redial, Xfer, Conf, and Icom keys, and the Voicemail option.

**Configuration Files**

For the specific parameters you can set in the configuration files, see Appendix A, the section, “XML Key Redirection Settings (for Redial, Xfer, Conf, Icom, Voicemail)” on page A-207.

Options Key Redirection

The IP phones allow the redirecting of the Options Key to an XML script. This allows the server to provide the phone with available options, rather than accessing them from the phone-side. You access the Options Key XML script by pressing the Options Key. You can still access the Options Menu from the phone-side by pressing and holding the Options key to display the phone-side Options Menu.

The following URI configuration parameter controls the redirection of the Options Key:

- **options script**

Notes:

- If no Options URI script is configured, the local Options Menu on the phone displays as normal.
- If you configure password access to the Options Menu, this password is required when accessing the local Option Menu, but is not required for the Options Key redirection feature.
- Pressing the Options Menu for redirection from the server does not interfere with normal operations of the phone (for example, pressing the options menu when on a call does not affect the call).
- If the phone is locked, you must unlock the phone before accessing the Options Menu redirect feature. After pressing the Options Key, the phone displays a screen that allows you to unlock the phone before continuing.

An Administrator can configure the XML Options Key, redirection URI parameter using the configuration files only.

Configuring XML Redirection of the Options Key

Use the following procedure to configure XML redirection of the Options key.

**Configuration Files**

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Options Key Redirection Setting” on page A-209.

XML Applications and Off-Hook Interaction

A feature on the IP phone allows you to specify whether the phone is prevented from going into the off-hook/dialing state when the handset is off-hook and the call ends.

By default, the phone behaves as follows:

You are in a call using the handset and the phone displays an XML application. The far-end terminates the call, and a new XML application gets pushed/pulled onto the display. Since the handset is off-hook and in idle mode, the “offhook idle timer” starts. When this timer expires, the phone applies dial tone and moves to the off-hook/dialing state, which then destroys the XML application that was being displayed.

With the “off-hook interaction” feature you can set an “**auto offhook**” parameter that determines whether or not the phone is prevented from entering the off-hook/dialing state, if the handset is off-hook and the call ends.

An Administrator can enable (allow phone to enter the off-hook dialing state) or disable (prevent the phone from entering the off-hook dialing state) using the “**auto offhook**” parameter in the configuration files only.

Configuring the Off-Hook Interaction Feature

Use the following procedure to configure the XML application and off-hook interaction feature.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Off-Hook and XML Application Interaction Setting” on page A-209.

XML URI for Key Press Simulation

The Phones provide a feature that allow an XML Developer or Administrator to define XML Key URIs that can send key press events to the phone, just as if the physical hard key, softkey, or programmable key were pressed on the phone.

For more information about this feature, see [Chapter 6](#), the section, “XML URI for Key Press Simulation” on page 6-34.

XML Override for a Locked Phone

The IP phones have a feature that allows a locked phone to be overridden when an XML application is sent to the phone. This feature also allows you to still use any softkeys/programmable key/Extension Module Keys applicable to the XML application even though the phone is locked. However, any keys NOT associated with the XML application cannot be used when the phone is locked.

Also, XML Get Requests override the locked feature on the phone so that any softkey pressed by the user that initiates a Get Request continues to get sent.

To allow the overriding of the locked phone for XML applications, the System Administrator must enter the following parameter in the configuration files:

- **xml lock override**

Configuring XML Override for a Locked Phone using the Configuration Files

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “XML Override for a Locked Phone Setting” on page A-209.

Note:

A System Administrator can also lock and unlock a remote phone using the “**lock**” and “**unlock**” commands with the **AstralPPhoneExecute** object in an XML application. For more information about this feature, contact Aastra Customer Support regarding the **Aastra XML Development Guide**.

Configurable Indication of Terminated Calls

An Administrator can configure a parameter called, “**far-end disconnect timer**” which allows you to enable or disable whether or not the near-end phone displays a disconnected screen with a “Call Terminated” message when the far-end hangs up. An audible busy signal is also heard on the phone. If enabled with a maximum time interval value, this parameter also specifies the interval of time that the busy signal is audible.

You can enable/disable this new parameter using the configuration files only.

The following table identifies when a call terminated screen displays on the phone for different scenarios.

IF	THEN
1 line active and far-end disconnects,	<p>the line in focus:</p> <ul style="list-style-type: none"> displays disconnected screen. plays busy tone. displays “Call Terminated” message on the screen. <p>the line not in focus:</p> <ul style="list-style-type: none"> plays busy tone.
2 or more lines active, and far-end disconnects,	<p>the line in focus:</p> <ul style="list-style-type: none"> displays disconnected screen. plays busy tone. displays “Call Terminated” message on the screen for 5 seconds. When 5 second times out: <ul style="list-style-type: none"> the busy tone stops the disconnected screen disappears.
2 or more lines active, and a line NOT in focus is disconnected by the far-end,	<ul style="list-style-type: none"> no busy tone plays no disconnected screen displays no “Call Terminated” message displays
An incoming call comes in on the line in focus that has a disconnected screen displaying,	<ul style="list-style-type: none"> the line in focus with no calls on hold: <ul style="list-style-type: none"> displays a ringing screen the line in focus WITH calls on hold: <ul style="list-style-type: none"> flashes its’ Line LED
An incoming call comes in on another line (NOT in focus), and the disconnected screen is displaying on the line in focus,	<ul style="list-style-type: none"> the disconnected screen no longer displays on the line in focus.
A phone application is NOT in focus,	<ul style="list-style-type: none"> busy tone plays no disconnected screen displays When the phone application in focus on screen stops: <ul style="list-style-type: none"> busy tone plays disconnected screen displays

Note:

This “indication of terminated calls” feature does not affect parked calls on the phone or the conference call feature.

Configuring Indication of Terminated Calls

You can enable or disable whether or not the phone displays an indication of a terminated call using the parameter, “**far-end disconnect timer**.” This parameter also specifies the maximum time interval that the busy tone is audible on the phone. You can configure the indication of terminated calls using the configuration files only.

Use the following procedure to configure this feature.

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Terminated Calls Indicator” on page A-150.

Handling Call Termination Screens on the Phone UI

The following procedure describes how to handle the call terminated screens on your phone.

IP Phone UI

1. Press the Goodbye key.
The busy tone stops and the call terminated screen no longer displays.
or
Select any Line key.
The busy tone stops and the call terminated screen no longer displays.
A dial screen displays.

Centralized Conferencing (for Sylantrio and Broadsoft Servers)

The IP phones include support for centralized conferencing (Ad-Hoc conferencing) for Sylantrio and Broadsoft servers. This feature provides centralized conferencing on the SIP server (versus localized, on the phone) and allows IP phone users to do these tasks:

- Conference two active calls together into a conference call.
- When on an active conference call, invite another party into the call.
- Create simultaneous conference calls on the same IP phone (Sylantrio servers only). For example, the IP phone user at extension 2005 could create these two conferences, and put one conference on hold while conversing with the other party:
 - Line 1: conference together extensions 2005, 2010, and 2020.
 - Line 2: conference together extensions 2005, 2011 and 2021.

When an IP phone user is connected to multiple conference calls, some outbound proxies have maximum call “hold” time set from 30-90 seconds. After this time, the call that is on hold is disconnected.

- Disconnect from an active conference call while allowing the other callers to remain connected.
- Ability to create N-way conference.
- Join two active calls together into a conference call.
- Incoming or outgoing active call can join any of the existing conferences.

If the administrator does not configure centralized conferencing, then the IP phone uses localized conferencing by default.

Note:

When you configure centralized conferencing globally for an IP Phone, the global settings apply to all lines. Although, for the global setting to work on soft lines, the user must configure the lines with the applicable phone number.

An Administrator can configure centralized conferencing on a global or per-line basis using the configuration files or the Astra Web UI.

To use the centralized conferencing after it is enabled, see your <Model-Specific> **IP Phone User Guide**.

Configuring Centralized Conferencing Using the Configuration Files

You use the following parameters to configure centralized conferencing in the configuration files:

Global Parameter

- **sip centralized conf**

Per-Line Parameter

- **sip lineN centralized conf**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Centralized Conferencing Settings” on page A-79.

Configuring Centralized Conferencing Using the Aastra Web UI

Use the following procedure to configure centralized conferencing using the Aastra Web UI.

Aastra Web UI

Global Configuration

1. Click on **Advanced Settings->Global SIP Settings->Basic SIP Network Settings.**

Basic SIP Network Settings	
Proxy Server	0.0.0.0
Proxy Port	0
Backup Proxy Server	0.0.0.0
Backup Proxy Port	0
Outbound Proxy Server	0.0.0.0
Outbound Proxy Port	0
Backup Outbound Proxy Server	0.0.0.0
Backup Outbound Proxy Port	0
Registrar Server	0.0.0.0
Registrar Port	0
Backup Registrar Server	0.0.0.0
Backup Registrar Port	0
Registration Period	0
Conference Server URI	

2. In the “**Conference Server URI**” field, do one of the following actions:
 - To disable centralized conferencing on the IP phone, leave this field empty (blank).
 - To enable SIP centralized conferencing on the IP phone, do one of the following actions:
 - If you have specified a proxy server/registrar server, then to reach the media server via the proxy server, set this field to one of the following:
 - conf** (Sylantro server), or
 - Conference (Broadsoft server)**

By setting this field to **conf** or **Conference**, you specify `conf@<proxy_server_address>:<proxy_port>`. For example, if the proxy server address is 206.229.26.60 and the port used is 10060, then by setting this parameter to **conf**, you are specifying the following: `conf@206.229.26.60:10060`.
 - To reach the media server using a different address/port than that specified by the proxy, set this field to the following:
 - conf@<media_server_address>:<media_port>**
3. Click **Save Settings** to save your changes.

Aastra Web UI

Per-Line Configuration

1. Click on **Advanced Settings->Line <#>->Basic SIP Network Settings**

Basic SIP Network Settings	
Proxy Server	<input type="text" value="0.0.0.0"/>
Proxy Port	<input type="text" value="0"/>
Backup Proxy Server	<input type="text" value="0.0.0.0"/>
Backup Proxy Port	<input type="text" value="0"/>
Outbound Proxy Server	<input type="text" value="0.0.0.0"/>
Outbound Proxy Port	<input type="text" value="0"/>
Backup Outbound Proxy Server	<input type="text" value="0.0.0.0"/>
Backup Outbound Proxy Port	<input type="text" value="0"/>
Registrar Server	<input type="text" value="0.0.0.0"/>
Registrar Port	<input type="text" value="0"/>
Backup Registrar Server	<input type="text" value="0.0.0.0"/>
Backup Registrar Port	<input type="text" value="0"/>
Registration Period	<input type="text" value="0"/>
Conference Server URI	<input type="text"/>

2. In the “**Conference Server URI**” field, do one of the following actions:
 - To disable centralized conferencing on this line, leave this field empty (blank).
 - To enable SIP centralized conferencing on this line, do one of the following actions:
 - If you have specified a proxy server/registrar server, then to reach the media server via the proxy server, set this field to one of the following:
 - conf** (Sylantro server), or
 - Conference (Broadsoft server)**
 By setting this field to **conf** or **Conference**, you specify `conf@<proxy_server_address>: <proxy_port>`.
 - To reach the media server using a different address/port than that specified by the proxy, set this field to the following:
 - conf@<media_server_address>: <media_port>**
3. Click **Save Settings** to save your changes.

Custom Ad-Hoc Conference

Previously, the phone will wait for server response prior to completing the ad-hoc and centralized conference feature. This results in an interoperability issue with certain call managers, such as Genband. Now the phone no longer waits for server response before referring the call to the conference host when the "**custom adhoc conference**" parameter is enabled.

Configuring the "Custom AD-Hoc Conference" Feature Using the Configuration Files

You use the following parameters to configure the "Custom AD- Hoc Conference" feature in the configuration files:

- **custom adhoc conference**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[Custom Ad-Hoc Conference](#)" on [page A-80](#).

"SIP Join" Feature for 3-Way Conference

The IP Phones support a feature referenced in RFC 3911, which allows an additional caller to join an active call between two parties if the caller knows the dialog information. This feature begins a conference using a join header as described in RFC 3911.

The "SIP Join" feature provides the following:

- Security via the whitelist (which is a feature that already exists on the phone).
- Initiates an offhook action uri when it is answered.
- Initiates an onhook action uri at call termination.
- Creates a caller list entry.

This feature is disabled by default. You can enable the "SIP Join" feature by setting the "sip join support" parameter in the configuration files.

Limitations of the "SIP Join" Feature

The following are limitations of the "SIP Join" feature:

- Not applicable to a conference call already in progress.
- Not applicable to a CT handset that has two active calls.
- Not applicable to a phone mixing RTP.
- Allows secondary parties to join calls if they can determine the dialog parameters. In order to provide security, it is recommended that the Administrator configure the SIP whitelist.
- Not applicable while the active call between two parties is in the early dialog state.

Configuring the "SIP Join" Feature Using the Configuration Files

You use the following parameters to configure the "SIP Join feature in the configuration files:

sip join support

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, "[SIP Join Feature for 3-Way Conference](#)" on [page A-80](#).

Conference/Transfer Support for Live Dial Mode

By default, when users are initiating a conference call or transfer, they will not hear a dial tone before dialing begins (pre-dial mode). The phone does not automatically dial out the number until the user presses the “Conf” or “Transfer” key. This allows the users to make changes to the dialing number before initiating the call. Administrators can now enable live dial mode by configuring the new “**confxfer live dial**” parameter. In live dial mode, when the user is completing a conference call or transfer, they will hear a dial tone before dialing begins. In addition, the phone will either match the number to the dial plan or wait for the set digit timeout.

In the default pre-dial mode, users are able to edit the destination number prior to dialing, whereas in live dial mode they are not able to, however the “Dial” and “Cancel” softkeys are provided while the user inputs the number.

Reference

For more information about conference/transfer support for live dial mode, see your **Aastra< Model-Specific> SIP IP Phone User Guide**.

Configuring Conference/Transfer in Live Dial Mode

You use the following parameters to configure conference/transfer feature in live dial mode:

- **confxfer live dial**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “[Conference/Transfer in Live Dial Mode](#)” on [page A-80](#).

Authentication Support for HTTP/HTTPS Download Methods, used with Broadsoft Client Management System (CMS)

The IP phones support HTTP/HTTPS digest authentication as defined in RFC 2617. (The HTTP client supports digest authentication; the HTTP server does not; the HTTP server supports basic authentication). This feature allows the phones to interoperate with Broadsoft’s CMS phone configuration tool.

Using the configuration files, you can enable/disable the following parameter to display a LOG IN softkey which allows the HTTP/HTTPS server to perform digest authentication:

- **http digest force login** - specifies whether or not to display the LOG IN softkey on the IP Phone UI screen. Valid values are 0 (disabled) or 1 (enabled). Default is 0 (disabled).

If the “**http digest force login**” parameter is set to **1** (enabled), after the phone boots, the LOG IN softkey displays on the phone’s LCD. If the user presses this softkey, a username/password screen displays, allowing the user to enter the configured username and password that is sent to the HTTP/HTTPS server for digest authentication by the server. By default, username is “**aastra**” and password is “**aastra**”. You can enter the username and password in two ways:

- Using the configuration files, you can change the default values for the following parameters:
 - **http digest username** - specifies the username to use for HTTP/HTTPS digest authentication.
 - **http digest password** - specifies the password to use for HTTP/HTTPS digest authentication.
- By enabling the “**http digest force login**” parameter (setting to 1) - the phone displays the LOG IN key so the user can enter the default username/password via the IP Phone UI.

Configuring Broadsoft CMS Support via the Configuration Files

Configure Broadsoft CMS support on the IP Phone using the following parameters in the configuration files:

- **http digest force login**
- **http digest username**
- **http digest password**

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “HTTP/HTTPS Authentication Support for Broadsoft CMS” on page A-81.

Using the IP Phone when Broadsoft CMS is Enabled

If you enable the HTTP/HTTPS digest authentication feature, the phone behaves as follows with the BroadSoft CMS tool:

1. Factory default the phone.
2. Configure the HTTP or HTTPS server (specify the HTTP or HTTPS server, path, and port).
3. Restart the phone.

The first time the phone reboots, the phone is challenged by the server. The phone sends the default username of “**aastra**” and the default password of “**aastra**” to the server.

The server sends the default profile to the phone. This profile includes the information “**http digest force login: 1**”. When the phone receives the profile, it displays the “**Log In**” key on the IP Phone UI’s idle screen.

4. Press the “**Log In**” key to displays the username/password screen

Note:

On the 8 and 11-Line LCD phones as well as the 6739i and 6867i, you use the **Log In** softkey to log in. On 3-Line LCD phones, you press the **right arrow** key to log in.

5. Enter a username in the “Username” field (up to 40 characters) and a password in the “Password” field (up to 20 characters).

Note:

The “**Username**” and “**Password**” fields accept special characters, such as, @, #, %, =, _, etc. You can also specify domain names in the **Username** field (i.e., user@domain).

6. After entering the username and password, press **Submit**.

The phone attempts to authenticate with the server. If successful, the phone reboots and loads the user configuration. If unsuccessful, the phone displays “*Authentication Failed*”.

Customizing the Display Columns on the M675i Expansion Module

The M675i Expansion Module screen displays softkeys in column format. The function keys on the bottom left of the Module allow you to display 3 full screens of softkeys. Each screen consists of 2 columns with the following default headings on each page:

- Page 1 "List 1" and "List 2"
- Page 2 "List 3" and "List 4"
- Page 3 "List 5" and "List 6"

Page 1 Screen

Page 2 Screen

Page 3 Screen

To use the M675i, press the function key for the page you want to display to the LCD (page 1, page2, or page 3), and press the applicable softkey.

You can customize the headings on each M675i Expansion Module screen using the configuration files. You use the following parameters to customize the column headings:

Expansion Module 1 (3 pages)

- expmod1page1left
- expmod1page1right
- expmod1page2left
- expmod1page2right
- expmod1page3left
- expmod1page3right

Expansion Module 2 (3 pages)

- expmod2page1left
- expmod2page1right
- expmod2page2left
- expmod2page2right
- expmod2page3left
- expmod2page3right

Expansion Module 3 (3 pages)

- expmod3page1left
- expmod3page1right
- expmod3page2left
- expmod3page2right
- expmod3page3left
- expmod3page3right

The following is an example of configuring Expansion Module 1 column headings.

expmod1page1left: **Personnel Ext**

expmod1page1right: **Operations Ext**

expmod1page2left: **Marketing Ext**

expmod1page2right: **Logistics Ext**

expmod1page3left: **Engineering Ext**

expmod1page3right: **Shipping Ext**

These settings display to the Expansion Module as shown in the following illustrations.

Page 1 Screen

Page 2 Screen

Page 3 Screen

Customizing the M675i Expansion Module Column Display

Configuration Files

For specific parameters you can set in the configuration files, see Appendix A, the section, “Customizing M675i Expansion Module Column Display” on [page A-204](#).

Chapter 6

Configuring Advanced Operational Features

About this Chapter

The IP phones have advanced operational features you can configure using the configuration files and/or the Aastra Web UI. This chapter describes each of these features and provides procedures for configuring each feature.

Topics

This chapter covers the following topics:

Topic	Page
Advanced Operational Features	page 6-3
TR-069 Support	page 6-4
MAC Address/Line Number in REGISTER Messages	page 6-5
SIP Message Sequence for Blind Transfer	page 6-7
SIP Message Sequence for Semi-Attended Transfer	page 6-7
Update Caller ID During a Call	page 6-8
Boot Sequence Recovery Mode	page 6-8
Auto-discovery Using mDNS	page 6-9
Single Call Restriction	page 6-9
Missed Call Summary Subscription	page 6-10
As-Feature-Event Subscription	page 6-11
Blacklist Duration	page 6-13
Whitelist Proxy	page 6-15
Transport Layer Security (TLS)	page 6-16
802.1x Support	page 6-20
Symmetric UDP Signaling	page 6-25
Symmetric TLS Signaling	page 6-25
Removing UserAgent and Server SIP Headers	page 6-26
GRUU and sip.instance Support	page 6-27
Multi-Stage Digit Collection (Billing Codes) Support (for Sylantro Servers)	page 6-27
Configurable DNS Queries	page 6-28
Ignore Out of Sequence Errors	page 6-29
“Early-Only” Parameter in Replaces Header RFC3891	page 6-30
Switching Between Early Media and Local Ringing	page 6-30
Enable Microphone During Early Media	page 6-30
“Call-Info” Header to 200ok Responses for Shared Call Appearance (SCA) Lines	page 6-30
Reason Header Field in SIP Message	page 6-31

Topic	Page
Configurable “Allow” and “Allow-Event” Optional Headers	page 6-31
Configurable SIP P-Asserted Identity (PAI)	page 6-32
Configurable Route Header in SIP Packet	page 6-33
Configurable Compact SIP Header	page 6-33
Reject INV or BYE when Unsupported Value in REQUIRE Header	page 6-33
XML URI for Key Press Simulation	page 6-34
Domain Name System (DNS) Server Pre-caching Support	page 6-36
Configurable Transport Protocol for SIP Services and RTCP Summary Reports	page 6-40
Configurable Alphanumeric Input Order for Username Prompts	page 6-40
Active Voice-over-IP (VoIP) Recording	page 6-42
BroadSoft BroadWorks Executive and Assistant Services Feature	page 6-44

Advanced Operational Features

Description

This section provides the following information about advanced features of the IP phones:

Feature	Description
TR-069 Support	The IP Phones support the Technical Report (TR) 069 Protocol, a Protocol that provides the communication between Customer-Premises Equipment (CPE) (like the IP Phones) and Auto Configuration Servers (ACS) over DSL/broadband connections.
MAC Address/Line Number in REGISTER Messages	Allows you to enable or disable the sending of the MAC address and line number from the IP phone to the call server, in a REGISTER message.
SIP Message Sequence for Blind Transfer	Allows you to enable or disable the phone to use the Blind Transfer method available in software prior to release 1.4.
Update Caller ID During a Call	Allows you to enable or disable the updating of the Caller ID information during a call.
Boot Sequence Recovery Mode	Allows you to enable or disable Web recovery mode and set the maximum boot count on the IP phone.
Auto-discovery Using mDNS	The IP phones automatically perform an auto-discovery of all servers on a network using mDNS. When the IP phone discovers a TFTP server, it is automatically configured by that TFTP server.
Single Call Restriction	Allows you to enable or disable a single call restriction between the 6757i CT base unit and a call server.
Missed Call Summary Subscription	Allows missed calls that have been redirected by the server, to be incremented in the missed calls indicator on the phone it was initially directed to.
As-Feature-Event Subscription	Allows you to enable or disable a specific line on the phone with the BroadSoft's server-side DND, CFWD, or ACD features.
Blacklist Duration	Allows you to specify the length of time, in seconds, that a failed server remains on the server blacklist. The IP phone avoids sending a SIP message to a failed server (if another server is available) for this amount of time.
Whitelist Proxy	Allows you to configure the phone to either accept or reject call requests from a trusted proxy server.
Transport Layer Security (TLS)	Allows you to enable or disable the use of Persistent Transport Layer Security (TLS). Persistent TLS sets up the connection to the server once and re-uses that connection for all calls from the phone. The setup connection for Persistent TLS is established during the registration of the phone. If the phones are set to use Persistent TLS, and a call is made from the phone, this call and all subsequent calls use the same authenticated connection. This significantly reduces the delay time when placing a call.
802.1x Support	Allows you to enable or disable the 802.1x Protocol support on the IP Phones.
Symmetric UDP Signaling	Allows you to enable or disable the phone to use port 5060 to send SIP UDP messages.
Symmetric TLS Signaling	Allows you to enable or disable the phone to use port 5061 to send SIP TLS messages.
Removing UserAgent and Server SIP Headers	Allows you to enable or disable the addition of the User-Agent and Server SIP headers in the SIP stack.
GRUU and sip.instance Support	The IP phones provide GRUU support using draft-ietf-sip-gruu-15. A sip.instance is added to all non-GRUU contacts.
Multi-Stage Digit Collection (Billing Codes) Support (for Sylanro Servers)	IP Phones support Sylanro Server features, like mandatory and optional billing codes that require the application server to notify the phone to collect more digits before completing the call. The IP phone is able to collect digits in two stages to support the billing code feature.
Configurable DNS Queries	Allows you to specify the Domain Name Service (DNS) query method to use when the phone performs a DNS lookup.
Ignore Out of Sequence Errors	Allows you to configure the phone to ignore CSeq number errors on all SIP dialogs on the phone.

Feature	Description
"Early-Only" Parameter in Replaces Header RFC3891	The phones support the "early-only" parameter in the "Replaces" header as referenced in RFC3891.
Switching Between Early Media and Local Ringing	The phones support switching between early media and local ring tone.
Enable Microphone During Early Media	Allows you to enable or disable the microphone during early media.
"Call-Info" Header to 200ok Responses for Shared Call Appearance (SCA) Lines	In Release 2.6 and up, a "Call-Info" header is included in the 200ok response to an INVITE, RE-INVITE, and UPDATE messages for SCA lines.
Reason Header Field in SIP Message	The IP Phones support the receiving of the Reason Header Field in a SIP CANCEL message, as described in RFC3326.
Configurable "Allow" and "Allow-Event" Optional Headers	On the IP Phones, an Administrator can enable or disable whether or not the optional "Allow" and "Allow-Events" headers are included in the NOTIFY message from the phone.
Configurable SIP P-Asserted Identity (PAI)	The IP Phones support a private extension to SIP for Asserted Identity within trusted networks (as defined in RFC 3325).
Configurable Route Header in SIP Packet	The IP Phones support a parameter that enables or disables the addition of the Route header in a SIP packet.
Configurable Compact SIP Header	The phones provide a feature that allows an Administrator to shorten the length of a SIP packet by using the compact form. This feature is in accordance with Compact SIP Headers defined in RFC 3261.
Reject INV or BYE when Unsupported Value in REQUIRE Header	The IP Phones support a parameter that allows you to enable or disable the rejection of an INV or BYE with a "420 Bad Extension" if the INV or BYE contains an unsupported value in the REQUIRE header.
XML URI for Key Press Simulation	The phones provide a feature that allow an XML Developer or Administrator to define XML Key URIs that can send key press events to the phone, just as if the physical hard key, softkey, or programmable key were pressed on the phone.
Domain Name System (DNS) Server Pre-caching Support	This feature allows administrators to configure the phone to download a text file which contains persistent DNS "A record" hostname to IP address mappings. In addition, support for persistent DNS "SRV records" has been added to permit SRV based high availability of services.
Configurable Transport Protocol for SIP Services and RTCP Summary Reports	The IP Phones support a parameter that allows administrators to ability to configure the transport protocols used for SIP services and RTCP summary reports.
Configurable Alphanumeric Input Order for Username Prompts	This feature allow administrators the ability to change the default behavior of the keypad input order during username prompts from uppercase letters > digit > lower case letters to digit > uppercase letters > lower case letters.
Active Voice-over-IP (VoIP) Recording	When using the IP phones with an Aastra call manager supporting voice recording and a recording system with the predefined subset of the SIP interface, administrators can configure the phones to send duplicate copies of the transmit and receive RTP or SRTP voice packets to the voice recording system.
BroadSoft BroadWorks Executive and Assistant Services Feature	The Executive and Assistant Services feature allows Administrators to create an inter-network relationship between Executives and Assistants allowing calls to the Executive's phone to be screened, filtered, and routed to an Assistant, whereby the Assistant can answer, divert, or push the filtered call back to the Executive (6730i, 6731i, 6753i, 6755i, 6757i, 6757i CT, 9143i, 9840i, and 9840i CT IP phones only).

TR-069 Support

The IP Phones support the Technical Report (TR)-069 Protocol. This Protocol is a bi-directional HTTP based protocol that provides the communication between Customer-Premises Equipment (CPE) (like the IP Phones) and Auto Configuration Servers (ACS) over DSL/broadband connections. It includes both a safe auto configuration and the control of other CPE management functions within an integrated framework.

Service providers can, through TR-069, use one common platform to manage (through the internet) all of their customer premise devices, regardless of the device or manufacturer. If TR-069 is enabled on the phones, when the remote ACS boots the phones, they contact the ACS and establish the configuration automatically.

In addition to configuring the phone with TR-069, you can also do the following:

- Reboot the phone
- Reset to factory defaults
- Update the firmware of the device
- Backup/restore configuration
- Upload the log file

Reference

For more information about TR-069, see the **Aastra TR-069 Configuration Guide**.

MAC Address/Line Number in REGISTER Messages

The IP phones can send the MAC address and line number in the REGISTER packets making it easier for the call server when a user configures the phones via the Aastra Web UI or the IP Phone UI. The following two configurable headers send this information to the call server:

```
Aastra-Mac: <mac address>
```

```
Aastra-Line: <line number>
```

The MAC address is sent in uppercase hex numbers, for example, 00085D03C792. The line number is a number between 1 and 9.

The following parameters allow you to enable/disable the sending of MAC address and line number to the call server:

- **sip send mac**
- **sip send line**

These parameters are disabled by default. The parameters are configurable via the configuration files or the Aastra Web UI.

Configuring the MAC address/Line Number in REGISTER Message

Configuration Files

For specific parameters you can set in the configuration files for enabling/disabling MAC address and line number, see Appendix A, the section, [Advanced Operational Parameters](#) on [page A-205](#).

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Setting.**

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	86400
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	3600
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	0
T1 Timer	0
T2 Timer	0
Transaction Timer	4000
Transport Protocol	UDP
Local SIP UDP/TCP Port	5060
Local SIP TLS Port	5061
Registration Failed Retry Timer	1800
Registration Timeout Retry Timer	120
Registration Renewal Timer	15
BLF Subscription Period	3600
ACD Subscription Period	3600
BLA Subscription Period	300
Blacklist Duration	300
Park Pickup Config	
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. Enable the "**Send MAC Address in REGISTER Message**" field by checking the check box.
(Disable this field by unchecking the box).
3. Enable the "**Send Line Number in REGISTER Message**" field by checking the check box.
(Disable this field by unchecking the box).
4. Click **Save Settings** to save your settings.

Note:

The session prompts you to restart the IP phone to apply the configuration settings.

5. Select **Operation->Reset** and click **Restart**.

SIP Message Sequence for Blind Transfer

The SIP message sequence for Blind Transfer avoids the transfer target having two simultaneous calls. Prior to release 1.4, a CANCEL message was sent to the transfer target (if it was in a ringing state) after sending a REFER to the transferee to complete the transfer. In the 1.4 and later releases, the CANCEL is now sent before the REFER message.

The following parameter allows the system administrator to force the phone to use the Blind Transfer method available in software versions prior to 1.4:

- **sip cancel after blind transfer**

This parameter is configurable via the configuration files only.

Configuring SIP Message Sequence for Blind Transfer

Configuration Files

For the specific parameter you can set in the configuration files for enabling/disabling the blind transfer method, see Appendix A, the section, “[Blind Transfer Setting](#)” on page A-205.

SIP Message Sequence for Semi-Attended Transfer

The SIP message sequence for a Semi-Attended Transfer allows the transferor to start the transfer while the target phone is still ringing.

The following parameter supports different behaviors of a semi-attended transfer:

- **sip refer-to with replaces**

This parameter is configurable via the configuration files only.

The combination of this new parameter (“**sip refer-to with replaces**”) and the existing parameter (“**sip cancel after blind transfer**”) determines how the semi-attended transfer is completed. The following table shows how the old and new parameters work together:

IF	THEN
The “sip cancel after blind transfer” parameter is set to 0 and the “sip refer-to with replaces” parameter is set to 0	The phone sends CANCEL before REFER for semi-attended transfer.
The “sip cancel after blind transfer” parameter is set to 1 and the “sip refer-to with replaces” parameter is set to 0	The phone sends CANCEL after REFER for semi-attended transfer.
The “sip cancel after blind transfer” parameter is set to 0 and the “sip refer-to with replaces” parameter is set to 1	The phone sends REFER with Replaces for semi-attended transfer and NO CANCEL.
The “sip cancel after blind transfer” parameter is set to 1 and the “sip refer-to with replaces” parameter is set to 1	The phone sends REFER with Replaces for semi-attended transfer and NO CANCEL.

On the transferor phone, the REFER request will always be sent to the transferee.

Configuring SIP Message Sequence for Semi-Attended Transfer

Configuration Files

For the specific parameter you can set in the configuration files for customizing the semi-attended transfer method, see Appendix A, the section, “[Semi-Attended Transfer Settings](#)” on page A-205.

Update Caller ID During a Call

It is possible for a proxy or call server to update the Caller ID information that displays on the phone during a call, by modifying the SIP Contact header in the re-INVITE message. The phone displays the updated name and number information contained within the Contact header.

The following parameter allows the system administrator to enable or disable this feature:

- **sip update callerid**

This parameter is configurable via the configuration files only.

Configuring Update Caller ID During a Call

Configuration Files

For the specific parameter you can set in the configuration files for enabling/disabling the update of caller ID during a call, see Appendix A, the section, “Update Caller ID Setting” on page A-205.

Boot Sequence Recovery Mode

You can force the IP phone into recovery mode by pressing the **1** and **#** keys during boot up when the logo displays. This feature is enabled by default on the IP phone.

You can disable this feature using the following parameter in the configuration files:

- **force web recovery mode disabled**

Valid values for this parameter are 0 (false) and 1 (true). Default is 0 (false).

A boot counter increments after each faulty boot. When the counter reaches a predetermined value, it forces Web recovery mode. The counter is reset to zero upon a successful boot.

The predetermined value is set using the following parameter in the configuration files:

- **max boot count**

A zero (0) value disables this feature. The default value is 10.

You can configure the boot sequence recovery mode parameters using the configuration files only.

Note:

After the phone has been successfully recovered through the web recovery mode, the phone will fully download and upgrade to the firmware defined in the configuration files (upon reboot) or pushed through the Web UI even if the defined/pushed firmware's version is identical to the version already loaded on the phone.

Configuring Boot Sequence Recovery Mode

Configuration Files

For the specific parameters you can set in the configuration files for boot sequence recovery mode, see Appendix A, the section, “Boot Sequence Recovery Mode Settings” on page A-206.

Auto-discovery Using mDNS

The IP phones can perform an auto-discovery of all servers on a network using mDNS. When the IP phone discovers a TFTP server, it is automatically configured by that TFTP server.

An unconfigured phone (phone right out of the box) added to a network, attempts to auto-discover a configuration server on the network without any end-user intervention. When it receives DHCP option 66 (TFTP server), it automatically gets configured by the TFTP server.

An already configured phone (either previously configured by auto-discovery or manually configured) added to a network, uses its predefined configuration to boot up.

Notes:

- Configuration parameters received via DHCP do not constitute configuration information, with the exception of a TFTP server. Therefore, you can plug a phone into a DHCP environment, still use the auto-discovery process, and still allow the use of the TFTP server parameter to set the configuration server.
- DHCP option 66 (TFTP server details) overrides the mDNS phase of the auto-discovery. Therefore, the DHCP option takes priority and the remaining process of auto-discovery continues.
- As the phone performs auto-discovery, all servers in the network (including the TFTP server), display in the phone window. However, only the server configured for TFTP automatically configures the phone.

Single Call Restriction

Note:

Applicable to the 6757i CT and 9480i CT IP Phones only.

On the 6757i CT and 9480i CT, an administrator can enable or disable a single call restriction between the 6757i CT and 9480i CT base unit and a call server.

When this feature is enabled (set to 1), you can make separate active calls from the 6757i CT and 9480i CT base unit and from the cordless handset. If this feature is disabled (set to 0), only one call can be active at a time either from the base unit or from the handset. When this feature is disabled, and you make an active call on either the base unit or the handset, any other attempt to make an active call is put on hold. Also, when this feature is disabled, more than one call can negotiate complex audio codecs since only a single call is decoding audio at a time.

You can configure this feature via the configuration files or the Aastra Web UI.

Configuring Single Call Restriction

Configuration Files

For the specific parameters you can set in the configuration files for single call restriction on the 6757i CT and 9480i CT, see Appendix A, the section, “Single Call Restriction Setting” on page A-206.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->RTP Settings**.

RTP Settings	
RTP Port	3000
Force RFC2833 Out-of-Band DTMF	<input checked="" type="checkbox"/> Enabled
DTMF Method	RTP
RTP Encryption	SRTP Disabled
Two Call Support	<input checked="" type="checkbox"/> Enabled

2. Enable the “**Two Call Support**” field by checking the check box. (Disable this field by unchecking the box).

3. Click **Save Settings** to save your settings.

Note:

The session prompts you to restart the IP phone to apply the configuration settings.

4. Select **Operation->Reset** and click **Restart**.

Missed Call Summary Subscription

The “**Missed Call Summary Subscription**” feature allows missed calls that have been redirected by the server, to be incremented in the missed calls indicator on the phone it was initially directed to. This feature is called the Missed Call Summary Subscription and can be set with a timer that allows the phone to use the feature for a period of time before the timer expires. For this feature to work, you must configure voicemail on the phone that the call was initially directed to.

For example, phones A, B, and C are connected to the server. You configure the server to direct calls coming into phone B (which has voicemail configured) to be forwarded to phone C. When phone A calls phone B, the server forwards the call to phone C. With this feature, phone B receives notification from the server that the call was forwarded and the missed calls indicator is incremented on phone B.

Missed calls indicator increments on phone B.

Note: Voicemail must be configured on phone B

An Administrator can configure this feature on a global or per-line basis using the configuration files.

Configuring Missed Call Summary Subscription using the Configuration Files

In addition to enabling/disabling the Missed Call Summary Subscription, You can also configure the amount of time, in seconds, that the phone uses this feature. The timer is configurable on a global basis only.

You use the following parameters to configure Missed Call Summary Subscription feature on a global basis:

Global Parameters

- **sip missed call summary subscription**
- **sip missed call summary subscription period**

Use the following parameters to configure Missed Call Summary Subscription feature on a per-line basis:

Per-Line Parameter

- **sip lineN missed call summary subscription**

Configuration Files

For the specific parameters you can set in the configuration files for Missed Call Summary Subscription, see Appendix A, the section, “Missed Call Summary Subscription Settings” on page A-87.

As-Feature-Event Subscription

The IP phones support server-side Do Not Disturb (DND), Call Forward (CFWD), and Automatic Call Distribution (ACD) feature events. This feature is called “as-feature-event” and works with the DND, CFWD, and ACD keys.

Note:

The DND, CFWD, and ACD server-side feature is not applicable to the CT handset.

This feature is configurable using the configuration files or the Aastra Web UI.

How it Works on the Phone UI

When you enable the “as-feature-event” on the phone, AND you activate a DND, CFWD, and/or ACD key, pressing the key performs as follows:

- If the key is configured for an account on the phone, the server applies DND, CFWD or ACD to that account. (For information about CFWD and DND account configuration, see Chapter 3, the section, “Account Configuration” on page 3-27).
- If the key is “custom” configured, a screen displays on the phone allowing the user to choose the account to apply DND or CFWD. (For information about CFWD and DND custom configuration, see Chapter 3, the section, “Account Configuration” on page 3-27).
- A solid “Message Waiting Indicator” (MWI) indicates if one line/account has DND or CFWD enabled, and the LED next to the DND/CFWD key is ON. A status displays on the LCD that indicates the status of the line in focus (for example, the status of CFWD could be “Call Forward Busy” (CFWDB) or “Call Forward No Answer” (CFWDNA).

Note:

If the ACD key is configured on the phone, and the “as-feature-event” is not enabled, the phones uses the ACD icons and LED behavior from a Sylanpro server instead.

When you press the DND, CFWD, or ACD key, only one attempt is made to enable/disable the “as-feature-event” feature on the server. The message “Trying” displays on the phone’s LCD after pressing the key. If the attempt is successful, the idle screen displays. If the attempt is unsuccessful, the message “Failed” displays. The user can press the softkey again to re-attempt the feature if required.

For server-side ACD, when you press the ACD softkey, the screen that displays is dependant on the state of the ACD subscription. Possible state for ACD are:

- **Logged Out** - User has the option of logging in.
- **Logged In** - User has the option of logging out or making the phone unavailable.
- **Unavailable** - User has the option of logging out or making the phone available.

Notes:

- If DND and CFWD are configured to use "Account" mode on the IP Phone, pressing the DND and CFWD keys apply to the account in focus as described in Chapter 3, the section, "Account Configuration" on page 3-27.
- If ACD is configured on the phone, the ACD softkey applies to the line for which the key is configured. The ACD softkey must be configured for the first line of an account. For example, if account 2 has line 3 and line 4 you must configure the ACD softkey for line 3.

Configuring As-Feature-Event Subscription Using the Configuration Files

If the phone-side features of the DND, CFWD, and ACD keys are enabled, the phone uses the existing parameter values for these keys. If the server-side features are enabled, the phone saves the state of the features from the server on the phone.

Use the following parameters to enable/disable the server-side "as-feature-event" on the IP Phone:

- **sip lineN as-feature-event subscription**
- **sip as-feature-event subscription period**

Configuration Files

For the specific parameters you can set in the configuration files, see Appendix A, the section, "As-Feature-Event Subscription Settings" on page A-88.

Configuring As-Feature-Event Subscription Using the Aastra Web UI

Use the following procedure to enable/disable the server-side "as-feature-event" on the IP Phone using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->LineN->Advanced SIP Settings**.

Advanced SIP Settings	
AS-Feature-Event Subscription	<input checked="" type="checkbox"/> Enabled
Park Pickup Config	<input type="text"/>

2. Enable the "As-Feature-Event Subscription" field, by checking the check box. (Disable this field by unchecking the box).
3. Click **Save Settings** to save your changes.

Aastra Web UI

4. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	86400
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	3600
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	0
T1 Timer	0
T2 Timer	0
Transaction Timer	4000
Transport Protocol	UDP
Local SIP UDP/TCP Port	5060
Local SIP TLS Port	5061
Registration Failed Retry Timer	1800
Registration Timeout Retry Timer	120
Registration Renewal Timer	15
BLF Subscription Period	3600
ACD Subscription Period	3600
BLA Subscription Period	300
Blacklist Duration	300
Park Pickup Config	
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

5. In the **“As-Feature-Event Subscription Period”** field, enter the amount of time, in seconds, that the phone waits after sending a SUBSCRIBE, to receive a NOTIFY response from the server side. Default is 3600.
6. Click **Save Settings** to save your changes.

Blacklist Duration

The Blacklist Duration feature helps to reduce unnecessary delays during proxy/registrar server failures, caused by the IP phone repeatedly sending SIP messages to a failed server. If you enable this feature, then whenever the IP phone sends a SIP message to a server, and does not get a response, the phone automatically adds the server to the blacklist. The IP phone avoids sending messages to any servers on the blacklist. If all servers are on the blacklist, then the IP phone attempts to send the message to the first server on the list.

You can specify how long failed servers remain on the blacklist in the IP phone’s configuration file or in the Aastra Web UI. The default setting is 300 seconds (5 minutes). If you set the duration to 0 seconds, then you disable the blacklist feature.

Configuring Blacklist Duration Using the Configuration Files

Use the following parameter to configure the Blacklist Duration in the configuration files:

- **sip blacklist duration**

Configuration Files

For the specific parameters you can set in the configuration files for setting Blacklist Duration, see Appendix A, the section, “Blacklist Duration Setting” on page A-207.

Configuring a Server Blacklist Using the Aastra Web UI

You use the following procedure to configure Blacklist Duration using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	<input type="text" value="86400"/>
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	<input type="text" value="3600"/>
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	<input type="text" value="0"/>
T1 Timer	<input type="text" value="0"/>
T2 Timer	<input type="text" value="0"/>
Transaction Timer	<input type="text" value="4000"/>
Transport Protocol	<input type="text" value="UDP"/>
Local SIP UDP/TCP Port	<input type="text" value="5060"/>
Local SIP TLS Port	<input type="text" value="5061"/>
Registration Failed Retry Timer	<input type="text" value="1800"/>
Registration Timeout Retry Timer	<input type="text" value="120"/>
Registration Renewal Timer	<input type="text" value="15"/>
BLF Subscription Period	<input type="text" value="3600"/>
ACD Subscription Period	<input type="text" value="3600"/>
BLA Subscription Period	<input type="text" value="300"/>
Blacklist Duration	<input type="text" value="300"/>
Park Pickup Config	<input type="text"/>
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. In the “**Blacklist Duration**” field, specify the length of time, in seconds, that a failed server remains on the server blacklist. The IP phone avoids sending a SIP message to a failed server (if another server is available) for this amount of time. Valid values are 0 to 9999999. Default is 300 seconds (5 minutes).
For example: **600**

Note:
The value of “**0**” disables the blacklist feature.

3. Click **Save Settings** to save your changes.

Whitelist Proxy

To protect your IP phone network, you can configure a “**Whitelist Proxy**” feature that screens incoming call requests received by the IP phones. When this feature is enabled, an IP phone accepts call requests from a trusted proxy server *only*. The IP phone rejects any call requests from an untrusted proxy server.

The whitelist is dynamically updated (i.e. the phones are able to refresh and resync the whitelist [without a reboot] if the IP addresses corresponding to the proxy FQDNs are changed on the DNS server).

The IP phone monitors the following events and an update is triggered if required:

- 200 OK responses to REGISTER requests if the peer’s IP address is not currently in the whitelist.
- 200 OK responses to INVITE requests if the peer’s IP address is not currently in the whitelist.
- INVITE requests from untrusted proxy servers.

Note:

An update will not be triggered for the following events:

- 200 OK responses to INVITE requests for an IP call.
- When more than one INVITE requests are received from the same untrusted proxy server.

Configuring Whitelist Proxy Using the Configuration Files

You use the following parameter to configure the whitelist proxy feature using the configuration files:

- **sip whitelist**

Configuration Files

For the specific parameters you can set in the configuration files for setting Whitelist Proxy, see Appendix A, the section, “[Whitelist Proxy Setting](#)” on [page A-207](#).

Configuring Whitelist Proxy Using the Aastra Web UI

Use the following procedure to configure the Whitelist Proxy feature using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	<input type="text" value="86400"/>
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	<input type="text" value="3600"/>
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	<input type="text" value="0"/>
T1 Timer	<input type="text" value="0"/>
T2 Timer	<input type="text" value="0"/>
Transaction Timer	<input type="text" value="4000"/>
Transport Protocol	UDP <input type="button" value="v"/>
Local SIP UDP/TCP Port	<input type="text" value="5060"/>
Local SIP TLS Port	<input type="text" value="5061"/>
Registration Failed Retry Timer	<input type="text" value="1800"/>
Registration Timeout Retry Timer	<input type="text" value="120"/>
Registration Renewal Timer	<input type="text" value="15"/>
BLF Subscription Period	<input type="text" value="3600"/>
ACD Subscription Period	<input type="text" value="3600"/>
BLA Subscription Period	<input type="text" value="300"/>
Blacklist Duration	<input type="text" value="300"/>
Park Pickup Config	<input type="text"/>
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. The "**Whitelist Proxy**" field is disabled by default. To enable this field, check the box.

When this feature is enabled, an IP phone accepts call requests from a trusted proxy server *only*. The IP phone rejects any call requests from an untrusted proxy server.

3. Click **Save Settings** to save your changes.

Transport Layer Security (TLS)

The IP Phones support a transport protocol called **Transport Layer Security (TLS)** and **Persistent TLS**. TLS is a protocol that ensures communication privacy between the SIP phones and the Internet. TLS ensures that no third party may eavesdrop or tamper with any message.

TLS is composed of two layers: the TLS Record Protocol and the TLS handshake protocol. The TLS Record Protocol provides connection security with some encryption method such as the Data Encryption Standard (DES). The TLS Handshake Protocol allows the server and client to authenticate each other and to negotiate an encryption algorithm and cryptographic keys before data is exchanged. TLS requires the use of the following security certificate files to perform TLS handshake:

- Root and Intermediate Certificates
- Local Certificate
- Private Key
- Trusted Certificate

When the phones use **TLS** to authenticate with the server, each individual call must setup a new TLS connection. This can take more time when placing each call. Thus, the IP phones also have a feature that allows you to setup the connection to the server once and re-use that one connection for all calls from the phone. It is called **Persistent TLS**. The setup connection for Persistent TLS is established during the registration of the phone. If the phones are set to use Persistent TLS, and a call is made from the phone, this call and all subsequent calls use the same authenticated connection. This significantly reduces the delay time when placing a call.

Notes:

- There can be only one persistent TLS connection created per phone.
- If you configure the phone to use Persistent TLS, you must also specify the Trusted Certificate file to use. The Root and Intermediate Certificates, Local Certificate, and Private Key files are optional.

On the IP phones, an Administrator can configure TLS and Persistent TLS on a global-basis only, using the configuration files or the Aastra Web UI.

There is a keep-alive feature for persistent TLS connections only. Administrators can configure this keep-alive feature using the parameter called “**sip persistent tls keep alive**”. When this feature is configured, the phone will send keep-alive pings to the proxy server at configured intervals. The keep-alive feature for persistent TLS connections performs the following functionalities:

- After a persistent TLS connection is established or re-established, activate the keep-alive, which will send CRLF to peer periodically.
- The phone will retry the connection automatically when a persistent TLS connection is down.
- When a persistent TLS connection is re-established (primary is up or primary is down and backup is up), refresh registration of the accounts associated with the connection.
- When a persistent TLS connection to primary is down, switch to backup if connection to backup is working.

Additionally the “**sip send sips over tls**” parameter allows administrators the ability to manually configure the IP phones to use either the SIP or SIPS URI scheme when TLS or persistent TLS is enabled. Disabling the “**sip send sips over tls**” parameter (i.e. defining the parameter as “**0**” in the configuration files) ensures the IP phones use the SIP URI scheme when TLS or persistent TLS is enabled. Enabling the parameter (i.e. defining the parameter as “**1**”) ensures the phones use the SIPS URI scheme in such scenarios. The SIPS URI scheme is used by default.

Configuring TLS Using the Configuration Files

You use the following parameters to configure TLS in the configuration files:

- **sip transport protocol**
- **sips persistent tls**
- **sip persistent tls keep alive**
- **sip send sips over tls**
- **sips root and intermediate certificates**
- **sips local certificate**
- **sips private key**
- **sips trusted certificates**

Configuration Files

For the specific parameters you can set in the configuration files for setting TLS, see Appendix A, the section, “[Transport Layer Security \(TLS\) Settings](#)” on [page A-89](#).

Configuring TLS Using the Aastra Web UI

To configure TLS using the Aastra Web UI, you must enable TLS or Persistent TLS first. Then you must define the TLS certificate file names that you want the phone to use. Use the following procedure to configure TLS using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Global SIP->Advanced SIP Settings**.

Advanced SIP Settings	
Explicit MWI Subscription	<input type="checkbox"/> Enabled
Explicit MWI Subscription Period	<input type="text" value="86400"/>
MWI for BLA account	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription	<input type="checkbox"/> Enabled
AS-Feature-Event Subscription Period	<input type="text" value="3600"/>
Send MAC Address in REGISTER Message	<input type="checkbox"/> Enabled
Send Line Number in REGISTER Message	<input type="checkbox"/> Enabled
Session Timer	<input type="text" value="0"/>
T1 Timer	<input type="text" value="0"/>
T2 Timer	<input type="text" value="0"/>
Transaction Timer	<input type="text" value="4000"/>
Transport Protocol	UDP <input type="button" value="v"/>
Local SIP UDP/TCP Port	<input type="text" value="5060"/>
Local SIP TLS Port	<input type="text" value="5061"/>
Registration Failed Retry Timer	<input type="text" value="1800"/>
Registration Timeout Retry Timer	<input type="text" value="120"/>
Registration Renewal Timer	<input type="text" value="15"/>
BLF Subscription Period	<input type="text" value="3600"/>
ACD Subscription Period	<input type="text" value="3600"/>
BLA Subscription Period	<input type="text" value="300"/>
Blacklist Duration	<input type="text" value="300"/>
Park Pickup Config	<input type="text"/>
Whitelist Proxy	<input type="checkbox"/> Enabled
XML SIP Notify	<input type="checkbox"/> Enabled

2. In the "Transport Protocol" field, select **TLS** or **Persistent TLS**.

Note:

If configuring **Persistent TLS**, you must go to *Advanced Settings->Global SIP->Basic Network Settings* and configure the "Outbound Proxy Server" and "Outbound Proxy Port" parameters.

3. Click **Save Settings** to save your changes.

4. Click on **Advanced Settings->TLS Support**.

TLS Support	
Configure File Names	
Root and Intermediate Certificates Filename	<input type="text"/>
Local Certificate Filename	<input type="text"/>
Private Key Filename	<input type="text"/>
Trusted Certificates Filename	<input type="text"/>

Aastra Web UI

5. Enter the certificate file names and the private key file name in the appropriate fields.

The Root and Intermediate Certificate files contain one root certificate and zero or more intermediate certificates which must be placed in order of certificate signing with root certificate being the first in the file. If the local certificate is signed by some well known certificate authority, then that authority provides the user with the Root and Intermediate Certificate files (most likely just CA root certificate).

The Trusted Certificate files define a list of trusted certificates. The phone's trusted list must contain the CA root certificates for all the servers it is connecting to. For example, if the phone is connecting to server A which has a certificate signed by CA1, and server B, which has a certificate signed by CA2, the phone must have CA1 root certificate and CA2 root certificate in its Trusted Certificate file.

Notes:

- If configuring TLS, you must specify the files for Root and Intermediate Certificates, the Local Certificate, the Private Key, and the Trusted Certificates in order for the phone to receive calls.
- If configuring Persistent TLS, you must specify the Trusted Certificates (which contains the trusted certificate list). All other certificates and the Private Key are optional.
- The certificate files and Private Key file names must use the format ".pem".
- To create custom certificate files and private key files to use on your IP phone, contact Aastra Technical Support.

6. Click **Save Settings** to save your changes.

802.1x Support

The IP phones support the IEEE 802.1x protocol. The 802.1x protocol is a standard for passing Extensible Authentication Protocol (EAP) over a wired or wireless Local Area Network (LAN).

The 802.1x protocol on the IP phone facilitates media-level access control, and offers the capability to permit or deny network connectivity, control LAN access, and apply traffic policy, based on user or endpoint identity. This feature supports both the EAP-MD5 and EAP-TLS protocols.

If 802.1x on the phone is enabled, a "**802.1x Authenticating...**" message displays during startup of the phone.

If the 802.1x failed to authenticate with the server, the phone continues its normal startup process using DHCP. However, the network port on the phone may or may not be disabled, depending on the switch configuration.

Certificates and Private Key Information

- If the certificates and private key are NOT stored in the phone:
 - the phone connects to an open unauthenticated VLAN and the certificates are downloaded.
 - or
 - the phone connects using EAP-MD5 to a restricted VLAN and the certificates are downloaded.
- If the certificates and private key ARE stored in the phone, the phone uses them during the authentication process.
- If the phone uses EAP-TLS for successful authentication, after the phone reboots, it downloads the latest certificates and private key files to the phone.
- The private key uses AES-128 to encrypt the private key file.
- Switch Supplicant Mode - The switch supports the following 2 modes:
 - **Single supplicant** - This mode enables the port once any machine connected to this port is authenticated. For security reasons, the IP phone has the option to disable the pass-through port.
 - **Multiple supplicants** - Using this mode, the switch can support multiple clients connected to same port. The switch distinguishes between the clients based on their MAC address.
- Factory default and recovery mode deletes all certificates and private keys, and sets the EAP type to **disabled**.

You can configure the 802.1x feature on the IP phone using the configuration files, the IP Phone UI, or the Aastra Web UI.

Note:

If configuring 802.1x using the IP Phone UI, the certificates and private keys must already be configured and stored on the phone. Use the configuration files or the Aastra Web UI to load certificates and private keys.

Configuring the 802.1x Protocol Using the Configuration Files

You use the following parameters to configure the 802.1x Protocol on your phone using the configuration files.

For EAP-MD5 use:

- eap type
- identity
- md5 password
- pc port passthrough enabled

For EAP-TLS use:

- eap type
- identity
- 802.1x root and intermediate certificates
(use 1 root and 0 or 1 intermediate certificates)
- 802.1x local certificate
(use 1 local certificate)
- 802.1x private key
(1 private key that corresponds to local certificate)
- 802.1x trusted certificates
(0 or more trusted certificates (a maximum of 2))

Configuration Files

For the specific parameters you can set in the configuration files for setting 802.1x support, see Appendix A, the section, "802.1x Support Settings" on page A-94.

Configuring the 802.1x Protocol Using the IP Phone UI

Use the following procedure to configure the 802.1x Protocol on your phone using the IP Phone UI.

Note:

If configuring 802.1x using the IP Phone UI, the certificates and private keys must already be configured and stored on the phone. Use the configuration files or the Aastra Web UI to load certificates and private keys.

IP Phone UI

1. Press  to enter the Options List.
2. Select **Administrator Menu** and enter your Administrator password.
3. On 11-Line LCDs:
Select **Network Settings->Ethernet & VLAN->802.1x Settings**.

On 3-Line LCDs:
Select **Network Settings->Ethernet & VLAN->802.1x Settings**.
4. Select **802.1x Settings**.
5. Select **802.1x Mode**.

IP Phone UI

6. Select **EAP-MD5** to configure the phone to use MD5 authentication;
or
Select **EAP-TLS** to configure the phone to use TLS authentication.

Note:

The 802.1x Protocol is disabled by default. If you select EAP-TLS authentication, you must use the configuration files or the Aastra Web UI to configure the certificates and private key for the phone.

7. Press **Done** (on 8 and 11-Line LCD phones)
or
Press **Set** (on 3-Line LCD phones).
8. To configure MD5, select **EAP-MD5 Settings**.
9. Select **Identity**.
10. Enter the identity or **username** used for authenticating the phone.
11. Use the keys as applicable while entering the username; then press **Done** (8 and 11-Line LCD phones).
or
Press **Set** (3-Line LCD phones).
12. Enter the password used for authenticating the phone.
13. Use the keys as applicable while entering the password; then press **Done** (8 and 11-Line LCD phones).
or
Press **Set** (3-Line LCD phones).
14. Press the  key to save your settings and exit from the IP Phone UI.

For the 6739i

IP Phone UI

1. Press  to enter the Options List.
2. Press **Advanced** and enter your Administrator password using the pop-up keyboard.
3. Press **Network**.
4. Press the  button to scroll to the next page.
5. Press **Ethernet & VLAN**.
6. Press **802.1x Support**.
7. Press **EAP Type** and select a value to set. Valid values are:
 - **Disable** (Default)
 - **EAP-MD5** (phone uses MD5 authentication)
 - **EAP-TLS** (phone uses TLS authentication)

Note:
The 802.1x Protocol is disabled by default. If you select EAP-TLS authentication, you must use the configuration files or the Aastra Web UI to configure the certificates and private key for the phone.
8. Press **EAP-TLS Settings**.
9. Press **Identity**, and then press the text box. A pop-up keyboard displays allowing you to enter a username used for authenticating the phone.
10. Press **MD5 Password**, and then press the text box to enter the password used for authenticating the phone.

Note:
You must restart the phone for the 802.1x authentication parameters to take affect.
11. Navigate to the **Options** screen and press **Restart** to restart the phone.

For the 6867i

IP Phone UI

1. Press  to enter the Options List.
2. Press the **Advanced** softkey.
3. Enter the Administrator password using the keypad. Default is "22222".
4. Select **Network > 802.1x**.
5. Press **Network**.
6. In the **Basic Settings > EAP Type** select one of the following:
 - **Disable** (Default)
 - **EAP-MD5** (phone uses MD5 authentication)
 - **EAP-TLS** (phone uses TLS authentication)

Note:
The 802.1x Protocol is disabled by default. If you select EAP-TLS authentication, you must use the configuration files or the Aastra Web UI to configure the certificates and private key for the phone.
7. In the **EAP-TLS Settings > Identity** field, enter a username used for authenticating the phone.
8. In the **EAP-TLS Settings > MD5 Password** field, enter the password used for authenticating the phone.

Note:
You must restart the phone for the 802.1x authentication parameters to take affect.

IP Phone UI

9. Press the **Save** softkey.
10. Restart the phone for the selection to take affect.

Configuring the 802.1x Protocol Using the Aastra Web UI

Use the following procedure to configure the 802.1x Protocol on your phone using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->802.1x Support**.

To configure EAP-MD5:

2. In the “**EAP Type**” field, select **EAP-MD5**.
Valid values are: **Disabled** (Default), **EAP-MD5**, and **EAP-TLS**.
3. In the “**Identify**” field, enter an Identity for the IP phone for which you are configuring 802.1x.
For example, **phone1**.
4. In the “**MD5 Password**” field, enter a password used for the MD5 authentication of the phone.
For example, **password1**.
5. Click **Save Settings** to save your changes.

To configure EAP-TLS:

1. Click on **Advanced Settings->802.1x Support**.

1. In the “**EAP Type**” field, select **EAP-TLS**.
Valid values are: **Disabled** (Default), **EAP-MD5**, and **EAP-TLS**.
2. In the “**Identify**” field, enter an Identity for the IP phone for which you are configuring 802.1x.
For example, **phone1**.

Aastra Web UI

3. In the “**Root and Intermediate Certificates Filename**” field, enter the filename that contains the root and intermediate certificates related to the local certificate. For example: **root_Intermed_certifi.pem**.
4. In the “**Local Certificate Filename**” field, enter the filename that contains the local certificate. For example: **localcertificate.pem**.
5. In the “**Private Key Filename**” field, enter the filename that contains the private key. For example: **privatekey.pem**.
6. In the “**Trusted Certificates Filename**” field, enter the filename that contains the trusted certificates. For example: **trusted_certificates.pem**.
7. Click **Save Settings** to save your changes.

Symmetric UDP Signaling

By default, the IP phones use symmetric UDP signaling for outgoing UDP SIP messages. When symmetric UDP is enabled, the IP phone generates and listens for UDP messages using port 5060.

You can manually disable symmetric UDP signaling using the IP phone’s configuration file. When you disable symmetric UDP signaling, then the IP phone chooses a random source port for UDP messages.

The IP phone also chooses a random source port for UDP messages to the registrar if you configure a backup registrar server. Likewise, the IP phone chooses a random source port for UDP messages with regards to communication with the respective proxy server if you configure a backup proxy server or backup outbound proxy server. If you configure a backup registrar server as well as a backup proxy server and/or a backup outbound proxy server, one random source port will be used for all UDP messages (i.e. for communication with the proxy server[s] and for registration).

An Administrator can configure symmetric UDP signaling using the configuration files only.

Configuring Symmetric UDP Signaling Using the Configuration Files

You use the following parameter to enable or disable Symmetric UDP Signaling in the configuration files:

- **sip symmetric udp signaling**

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “[Symmetric UDP Signaling Setting](#)” on [page A-210](#).

Symmetric TLS Signaling

The IP phones also use symmetric TLS signaling for outgoing TLS SIP messages by default. When symmetric TLS is enabled, the IP phone uses port 5061 as the persistent TLS connection source port.

Administrators can manually disable symmetric TLS signaling using the IP phone’s configuration files. When you disable symmetric TLS signaling, the IP phone chooses a random persistent TLS connection source port from the TCP range (i.e. 49152...65535) for TLS messages after each reboot regardless of whether the parameter **sip outbound support** is enabled or disabled.

Note:

If multiple persistent TLS connections are required, the persistent TLS connection source ports will follow the structure of random_port, random_port + 1, random_port + 2, etc....

An Administrator can configure symmetric TLS signaling using the configuration files only.

Configuring Symmetric TLS Signaling Using the Configuration Files

You use the following parameter to enable or disable Symmetric TLS Signaling in the configuration files:

- **sips symmetric tls signaling**

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Symmetric TLS Signaling Setting” on [page A-210](#).

Removing UserAgent and Server SIP Headers

Currently, the phone always configures the SIP UserAgent/Server headers to contain:

Aastra <PhoneModel>/<FirmwareVersion>

You can suppress the addition of these headers by using the following parameter in the configuration files:

- **sip user-agent**

Setting this parameter allows you to enable or disable the addition of the User-Agent and Server SIP headers from the SIP stack.

You can configure this feature using the configuration files only.

Configuring UserAgent/Server SIP Headers

You use the following parameter to specify whether the UserAgent and Server SIP header is added to the SIP stack.

- **sip user-agent**

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “User-Agent Setting” on [page A-210](#).

GRUU and sip.instance Support

Globally Routable User-Agent URIs (GRUUs) provide a way for anyone on the Internet to route a call to a specific instance of a User-Agent.

The IP phones provide GRUU support using draft-ietf-sip-gruu-15. A sip.instance is added to all non-GRUU contacts. By default, this feature is enabled. You can enable or disable this support using the configuration files.

Limitations of the GRUU Feature

The following are limitations of the GRUU feature on the phones:

- GRUU-Draft-15 is not compatible with versions prior to GRUU-Draft-10.
- Phones do not support temporary or phone-created GRUUs.

Enabling/Disabling GRUU and sip.instance Support

Use the following procedure to enable/disable GRUU and sip.instance support.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “GRUU and sip.instance Support” on page A-211.

Multi-Stage Digit Collection (Billing Codes) Support (for Sylantrō Servers)

The IP Phones support Multi-Stage Digit Collection (billing codes) for Sylantrō Servers. Sylantrō Server features, like mandatory and optional billing codes, requires that the application server notify the phone to collect more digits before completing the call. The IP phone is able to collect digits in two stages to support the billing code feature.

Aastra IP Phone users are prompted to enter the correct billing code when they dial these numbers:

- External numbers.
- Eternal numbers dialed using a Speed Dial key.

Billing Codes Implementation Notes

Note the following implementation information:

- IP phone users may enter a 2-9 digit billing code. Billing codes may not start with either 0 (Operator) or 9 (external calls).
- When using Sylantrō Click-to-Call, IP phone users select a billing code from a pull-down menu.
- When placing a call, a secondary dial tone alerts IP phone users to enter the billing code. The IP phone UI also displays a “Enter Billing Code” message.
- If an IP phone user redials a number, they do not have to re-enter the billing code. The billing code information is maintained and processed accordingly.
- If an IP phone user enters an invalid billing code, the call fails.

Mandatory versus Optional Billing Codes

This release of the Aastra IP phones supports two types of billing codes: Mandatory and Optional. The Sylantrō server configuration determines which type of billing code is used on the IP phones.

- **Mandatory billing codes:** Calls are not connected until the user enters a valid billing code. The user dials the phone number. When prompted for billing codes, user dials the billing code.

For example, suppose the IP phone user is using billing code 300, and dialing the external number 617-238-5500. The IP user then enters the number using the following format:

- **6172385000#300**

Using mandatory billing codes, if the user is configuring a Speed Dial number, then they enter the number using the following format:

– **<phonenumber>%23<billingcode>**

To use this format with the default dial plan terminator (#), the # sign required by Sylanro as a delimiter should be represented as an escaped character by using the sequence %23. The speed dial format for an external number that includes a mandatory billing code becomes:

– **<phonenumber>%23<billing code>**

- **Optional billing codes:** The user dials an optional billing code by dialing *50, followed by the billing code digits. When prompted for additional digits, user enters the phone number.

For example, suppose the IP phone user is using billing code 500, and dialing the external number 617-238-5000. The IP user then enters the number using the following format:

– ***50500#6172385000**

If the user is dialing configuring a Speed Dial number, then they enter the number using the following format:

– ***50<billingcode>#<phonenumber>**

To use this format with the default dial plan terminator (#), the # sign required by Sylanro as a delimiter should be represented as an escaped character by using the sequence %23. The speed dial format for an external number that includes an optional billing code becomes:

– ***50<billing code>%23<phone number>**

Numbers Not Requiring Billing Codes

Billing codes are not required for the following two types of calls:

- Emergency calls (E911)
- Calls between extensions

Configurable DNS Queries

The domain name system (DNS) is the way that Internet domain names are located and translated into Internet Protocol addresses. A domain name is a meaningful and easy-to remember identifier for an Internet address.

The lists of domain names and IP addresses are distributed throughout the Internet in a hierarchy of authority within a database of records. There is usually a DNS server within close proximity to your geographic location that maps the domain names in your Internet requests or forwards them to other servers in the Internet.

The IP Phones may be configured to issue requests for DNS records using one of three methods. In the first method, the IP phones issue requests for “**A**” records from the DNS server. In the second method, the IP phones issue requests for “**SRV**” records from the DNS server. In the third method, the IP phones issue requests for **NAPTR** records from the DNS server. However, the IP phones do not use the **NAPTR** record to determine whether to use a secure or unsecure communication path (see the following table for a description of each method).

When the IP phone accesses the IP network, it issues a DNS lookup request to find the IP address and port and then waits for a response from the DNS service that provides the IP address and port.

Note:

Whether or not the phone will operate/communicate in a secure or unsecure mode is **ONLY** determined by the pre-provisioning of the phone (i.e. the .cfg file).

You can configure the phone to use any one of these methods by entering the applicable Value in the configuration files:

Configuration File Value	DNS Server Method Used	Description
0	A only	The phone issues requests for "A" (Host IP Address) records from the DNS server to get the IP address, and uses the default port number of 5060.
1	SRV & A	The phone issues requests for "SRV" (Service Location Record) records from the DNS server to get the port number. Most often, the IP address is included in the response from the DNS server to avoid extra queries. If there is no IP address returned in the response, the phones send out the request for "A" records from the DNS server to find the IP address.
2	NAPTR & SRV & A	<p>First, the phone sends "NAPTR" (Naming Authority Pointer) lookup to get the "SRV" pointer and service type. For example, if Global SIP transport protocol on the phone is "UDP", and Proxy server on the phone is "test.aastra.com", then:</p> <ol style="list-style-type: none"> 1. If the NAPTR record is returned empty, the phone will use the default value "_sip_udp.test.aastra.com" for the "SRV" lookup. 2. If the NAPTR record is returned "test.aastra.com SIP+D2U_sip_udp.abc.aastra.co m", the phone will use "_sip_udp.abc.aastra.com" for the "SRV" lookup. 3. If the NAPTR record is returned "test.aastra.com SIP+D2T_sip_tcp.test.aastra.com", where the service type TCP mismatches the phone configured transport protocol "UDP", the phone will ignore this value and use the default value "_sip_udp.test.aastra.com" for the "SRV" lookup. <p>Note: The phone does not use the service type sent by the NAPTR response to switch its transport protocol, nor does it use the NAPTR response to determine whether to use a secure or unsecure communication path. The phone will always use a global sip protocol that is configured on the phone via configuration files or the web user interface.</p> <p>After performing NAPTR, the phone sends "SRV" lookup to get the IP address and port number. If there is no IP address in the "SRV" response, then it sends out an "A" lookup to get it.</p>

Note:

On the phone side, if you configure the phone with a Fully- Qualified Domain Name (FQDN) proxy and specified port, the phone always sends "A only" lookups to find the Host IP Address of the proxy.

Configuring the DNS Query Method

You can configure the DNS query method for the phone to use for performing DNS lookups using the following parameter in the configuration files:

- **sip dns query type**

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "DNS Query Setting" on page A-211.

Ignore Out of Sequence Errors

An Administrator can configure the phone via the "sip accept out of order requests" parameter to ignore CSeq number errors on all SIP dialogs on the phone. When this parameter is enabled, the phone no longer verifies that the sequence numbers increase for each message within a dialog, and does not report a "CSeq Out of Order" error if they do not increase.

Note:

As the default Asterisk configuration does not fully track dialogs through a reboot, it is recommended that this parameter be enabled when using the BLF feature with an Asterisk server. If you do not enable this feature, then rebooting the Asterisk server may cause BLF to stop working. With this parameter enabled, the BLF key starts working again when the phone re-subscribes, which by default, are one hour apart.

An Administrator can enable/disable this feature using the configuration files only.

Enabling/Disabling “Out of Order SIP Requests”

Use the following procedure to enable/disable “out of order SIP requests”.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Ignore Out of Order SIP Requests” on [page A-212](#).

“Early-Only” Parameter in Replaces Header RFC3891

The phones support the “early-only” parameter in the “Replaces” header as referenced in RFC3891. When the phone receives a Replaces header with the early-only parameter, it replaces the existing dialog if the call is still in the early state. If the call has been answered, then the Replaces request is rejected.

Note:

This feature is not supported in outgoing requests.

Switching Between Early Media and Local Ringing

Previous to release 2.6, the phone generated a local ring tone when receiving a 180 response unless early media was being played, regardless of SDP. The local ring tone stopped when the first RTP packet was received in the early session. The local ring tone did not resume when it received subsequent 180 responses, even though early media was not being received.

In Release 2.6 and up, the phone supports switching between early media and local ring tone. Upon receiving a 180 response, the phone now generates a local ring tone unless it is receiving an early media flow. If the phone receives any subsequent 180 responses, it regenerates the local ring tone unless it is receiving early media flow.

Enable Microphone During Early Media

The phones now allow Administrators to enable or disable the microphone during early media by configuring the “**sip early media mute mic**” parameter. Early media indicates the period when a call has not fully established (i.e. the far end has not answered the call). By enabling this parameter, Administrators can mute the microphone during early media to prevent the far end from listening into the call prior to answering it.

Enabling/Disabling “Microphone During Early Media”

Use the following procedure to enable/disable “microphone during early media”:

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Enable Microphone During Early Media” on [page A-147](#).

“Call-Info” Header to 200ok Responses for Shared Call Appearance (SCA) Lines

In earlier versions of the IP phone software releases, a “Call-Info” header was only added to the requests generated by the phone for Shared Call Appearance (SCA) lines. A “Call-Info” header is now also included in the 200ok response to an INVITE, RE-INVITE, and UPDATE messages for SCA lines. No configuration is required for this feature.

Reason Header Field in SIP Message

The IP Phones support the receiving of the Reason Header Field in a SIP CANCEL message, as described in RFC3326. This allows a call that is answered from somewhere else to still display in the Callers List. Also, the missed calls indicator and counter do not change.

Limitation

If the call is answered somewhere else, the duration of the call does not display in the Callers List.

Call Failed Message

Administrators can place certain restrictions on users for making outgoing calls (for example, only allow national calls, only allow internal calls, only allow emergency calls, etc.). Previously when a restriction was active and a user dialed a number that was not allowed, the PBX sent a certain status code 4xx and the phone displayed “Call Failed” or “Busy”, which was not very informative to the user.

Now when an outgoing call fails with a status code 4xx or 5xx, the phone will look for the Reason Header (RFC 3326) in the status message and display the Reason Header to the user. The reason text is displayed in the center of the screen and is limited to 20 characters.

If *there is* a Reason Header in the status code message, the reason text (if any) will be displayed on the phone. The tone that is played follows the status code (i.e., the busy tone for 486 and 503, and the call failed tone for all others).

If *there is no* Reason Header in the status message, the behaviour of the phone should be unchanged:

- “Busy” is displayed for the status codes 486 and 503 (SERVICE UNAVAILABLE) and the busy tone will be played,
- or “Call Failed” is displayed for status codes 4xx to 5xx and the call failed tone will be played,
- or “Not Configured” or “Seize Failed” is displayed in case of an internal error,
- or “Unavailable” is displayed in case of code less support (6735i, 6767i, 6755i, 6757i, 6757i CT, 6867i, 9480i, and 9480i CT phones only).

Configurable “Allow” and “Allow-Event” Optional Headers

On the IP Phones, an Administrator can enable or disable whether or not the optional “Allow” and “Allow-Events” headers are included in the NOTIFY message from the phone.

SIP NOTIFY messages from the phone may contain optional headers called “Allow” and “Allow-events”. If the NOTIFY message contains these headers, the UDP packet returned by the server may be too large and may fragment the packet. To prevent the fragmenting of the UDP packet, the “Allow” and “Allow-events” headers may be removed using the parameter, “**sip notify opt headers**”. If this parameter is set to “0” (disabled), the optional headers are not included in the SIP NOTIFY message which reduces the size of the packet returned by the server, and prevents fragmentation of the packet.

The value set for this parameter specifies whether or not to include the optional headers in the SIP NOTIFY message from the phone.

An Administrator can enable/disable the optional “Allow” and “Allow-Event” headers using the following parameter in the configuration files:

- **sip notify opt headers**

Enabling/Disabling Optional “Allow” and “Allow-Event” Headers

Use the following procedure to enable/disable “Allow” and “Allow-Event” headers.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Optional “Allow” and “Allow-Event” Headers” on page A-212.

Configurable SIP P-Asserted Identity (PAI)

The IP Phones support a private extension to SIP for Asserted Identity within trusted networks (as defined in RFC 3325). This feature allows a network of trusted SIP servers to assert the identity of authenticated users, and verify that phone messages originate from a Trusted Identity. Upon receiving a message from a caller in the Trusted Network, the IP phone reads the contents of the P-Asserted-Identity (PAI) header field and displays it on the phone UI. This field contains a more accurate description of the caller identity (extension/phone number) than is contained in the SIP message.

Notes:

- The phones support PAI header in the UPDATE message, according to draft-ietf-sipping-update-pai-00. This feature is always enabled.
- If an UPDATE is received with a PAI header from a trusted source, the phone updates the display with this information. The phone ignores any PAI received from untrusted entities.

When an IP phone receives an incoming call, the IP phone performs the following actions:

- Checks to see if the incoming call is from a registered proxy server.
- If the call is forwarded via a registered proxy server, then the message has already been verified and authenticated by the server. The caller is part of the Trust Network. The IP phone UI displays the caller information contained in the PAI header.
- If the call is not forwarded via a registered proxy server - and therefore is not a "Trusted Entity" - the IP phone UI does not display any trust information contained in the PAI header.

The phones provide the ability for the Administrator to enable or disable the display of P-Asserted Identity (PAI) information on the phone using the following parameter in the configuration files:

- **sip pai**

Enabling/Disabling P-Asserted Identity (PAI)

Use the following procedure to enable/disable PAI.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "[P-Asserted Identity \(PAI\)](#)" on [page A-212](#).

Configurable Route Header in SIP Packet

The IP Phones support the following parameter:

- **sip remove route**

This parameter enables or disables the addition of the Route header in a SIP packet. Enable this parameter for outbound proxies that do not support Route headers.

Note:

When enabled this will break all support for SIP routing, so if some other device in the network attempts to add itself to the route it will fail.

Enabling/Disabling the Route Header in the SIP Packet

Use the following procedure to enable/disable the addition of the Route header in the SIP packet.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "Route Header in SIP Packet" on page A-213.

Configurable Compact SIP Header

The phones provide a feature that allows an Administrator to shorten the length of a SIP packet by using the compact form. This feature is in accordance with Compact SIP Headers defined in RFC 3261.

For example, the following SIP header is the long format:

```
Via: SIP/2.0/UDP 10.50.91.2:5060;branch=z9hG4bK571ebe0c;rport=5060;received=10.50.91.2
From: "Unknown" <sip:Unknown@10.50.91.2>;tag=as19d00fc8
To: <sip:1106@10.50.110.54:5060;transport=udp>;tag=916699998
Call-Id: 73cad5456806f3a7768d17e8617279d7@10.50.91.2
CSeq: 102 OPTIONS
```

The following SIP header is equivalent to the above SIP header, but uses the short (compact) format instead:

```
v: SIP/2.0/UDP 10.50.91.2:5060;branch=z9hG4bK571ebe0c;rport=5060;received=10.50.91.2
f: "Unknown" <sip:Unknown@10.50.91.2>;tag=as19d00fc8
t: <sip:1106@10.50.110.54:5060;transport=udp>;tag=916699998
i: 73cad5456806f3a7768d17e8617279d7@10.50.91.2
CSeq: 102 OPTIONS
```

By default, the IP Phones use the long format. However, an Administrator can provision the short (compact) format using the configuration files. The Aastra Web UI does not support this configuration feature.

Enabling/Disabling the Compact SIP Headers Feature

Use the following procedure to enable/disable the Compact SIP Header in the SIP packet.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "Compact SIP Header" on page A-213.

Reject INV or BYE when Unsupported Value in REQUIRE Header

The IP Phones support the following parameter:

- **sip enforce require hdr**

This parameter allows you to enable (1) or disable (0) the rejection of an INV or BYE with a “420 Bad Extension” if the INV or BYE contains an unsupported value in the REQUIRE header.

Enabling/Disabling a Rejection of the INV or BYE

Use the following procedure to enable/disable the rejection of the INV or BYE if the INV or BYE contains an unsupported value in the REQUIRE header.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “Rejection of INV or BYE” on page A-213.

XML URI for Key Press Simulation

The phones provide a feature that allow an XML Developer or Administrator to define XML Key URIs that can send key press events to the phone, just as if the physical hard key, softkey, or programmable key were pressed on the phone.

When the Key URI event is sent from the server to the phone, the phone initiates the event as if the key was physically pressed. If the key is not present on the phone (hard key) or not available (softkey or programmable key), when the phone receives the URI, the event is discarded. If you are in the process of changing the softkey or programmable key setting, or the key is disabled while the event is being processed, the request is discarded. The phone maps key events to its physical keys and not to its mapped logical keys.

The following table identifies the XML URIs for pressing buttons on the phone..

XML Key URI	Description
Line Keys	
Key:Line1 to Key:Line<n>	Line 1 to <n>Keys Note: The phone ignores URI line key events if the line keys are not physically present on the phone.
Keypad Keys	
Key:KeyPad0 to Key:KeyPad9	Numeric Keypad Keys 0-9
Key:KeyPadStar	* - Star Key
Key:KeyPadPound	# Hash Key
Softkeys	
Key:SoftKey1 to Key:SoftKey<n>	Softkey 1 to <n> (valid softkeys depend on the number of physical softkeys on the phone)
Key:TopSoftKey1 to Key:TopSoftKey<n> top	Top softkeys 1 to <n> ((valid top softkeys depend on the number of physical top softkeys on the phone)
Programmable Keys	
Key:PrgKey1 to Key:PrgKey<n>	Programmable keys 1 to <n> (valid programmable keys depend on the number of physical programmable keys on the phone)
Expansion Module Keys	
Key:ExpMod1SoftKey1 to Key:ExpMod1SoftKey<n>	Expansion module 1 softkeys 1 to <n> (valid softkeys depend on the number of physical softkeys on the expansion module) Note: The phone ignores URI expansion module key events if the keys are not physically present on the expansion module.
Key:ExpMod2SoftKey1 to Key:ExpMod2SoftKey<n>	Expansion module 2 soft keys 1 to <n> (valid softkeys depend on the number of physical softkeys on the expansion module)

XML Key URI	Description
Key:ExpMod3SoftKey1 to Key:ExpMod3SoftKey<n>	Expansion module 3 soft keys 1 to <n> (valid softkeys depend on the number of physical softkeys on the expansion module)
Volume Key	
Key:VolDwn	Volume Decrease Key
Key:VolUp	Volume Increase Key
Feature Keys	
Key:Xfer	Transfer Key
Key:Conf	Conference Key
Key:Services	Services Key
Key:Intercom	Intercom Key
Key:Headset	Headset Key
	Note: For Headset URI key, the behavior will be as if the "speaker/headset" key is pressed; and does not switch to headset for headset key event or to speaker for speaker key event.
Key:Speaker	Speaker Key
	Note: For Speaker URI key, the behavior will be as if the "speaker/headset" key is pressed; and does not switch to headset for headset key event or to speaker for speaker key event.
Key:Mute	Mute Key
Key:Hold	Hold Key
Key:Redial	Redial Key
Key:Callers	Callers Key
Key:Directory	Directory Key
Key:Options	Options Key
Key:Save	Save Key
Key>Delete	Delete Key
Key:Swap	Swap Key
Key:Goodbye	GoodBye Key
Navigation Keys	
Key:NavUp	Navigation Up Key
Key:NavDwn	Navigation Down Key
Key:NavLeft	Navigation Left Key
Key:NavRight	Navigation Right Key
Function Keys (only if physically configured on the phone or expansion module)	
KeyPark	Park Softkey
KeyPickup	Pickup Softkey

Notes:

- If the URI key is a valid key, the phone executes the key regardless of the current state on the phone.
- Park and Pickup XML URI softkeys are available **ONLY** if these features are physically configured on the phone or expansion module.

Examples

There are two ways to format the XML key URI:

For XML Post Messages

```
<ExecuteItem URI="<XML Key URI>" />
```

Example:

```
<ExecuteItem URI="Key: Line1" />
```

For XML Key Scripts

```
<URI><XML Key URI></URI>
```

Example:

```
<URI>Key: Line1</URI>
```

```
<SoftKey index="1">
```

```
<Label>Keypad1</Label>
```

```
<URI>Key: Line1</URI>
```

```
</SoftKey>
```

Domain Name System (DNS) Server Pre-caching Support

The IP phones now support the use of a local DNS host file to resolve DNS queries, and supports pre-provisioning of DNS SRV records. This feature allows administrators to configure the phone to download a text file which contains persistent DNS “A record” hostname to IP address mappings. In addition, support for persistent DNS “SRV records” has been added to permit SRV based high availability of services.

There are two methods used to configure DNS pre-caching on the IP phone:

- Configure a unix style “host” file used instead of a DNS “A query” to resolve hostnames to IP addresses. The host file is downloaded and cached on the IP phone.
- Configure DNS “SRV queries” for geographic redundancy and failover. The configured SRV entries are used to pre-load the DNS cache on the IP phone.

Both these methods are configurable using the configuration files only, and are primarily intended for use when a third party hosting provider delivers SIP services but does not have local access or control of the LAN side DNS infrastructure.

Note:

Time-to-Live (TTL) used in this feature is hard-coded for each server and not configurable.

Configuring DNS “Host File” Pre-caching from the Configuration Server

The DNS host file must reside on the same server as the configuration files (*astra.cfg/tuz*, etc.) and the filename to download is specified within the configuration.

Use the following parameter to configure the phone to use the host file for host IP address lookups.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, “DNS Host File” on [page A-214](#).

The following procedure is an example of how to use the “sip dns host file” parameter to configure DNS lookup pre-caching from the configuration server.

Configuring “DNS Host” Pre-caching

1. Using a text-based editing application, create a blank text file
2. Enter the IP addresses of the DNS servers in your local network. For example:

```
1.2.3.4 server1
5.6.7.8 server2
9.0.1.2 server3
```

Note:
Ensure each line uses a Carriage Return (CR) or Carriage Return + Line Feed (CRLF) to terminate the line.
3. Save the file as “<filename>.txt”. For example, “**hostfile.txt**”.
4. Using a text-based editing application, open the *aastra.cfg* file for the phone(s) for which you want to apply the DNS hostfile.
5. Enter the following parameter in the *aastra.cfg* file followed by the host file name as the value:

```
sip dns host file: <filename>.txt
```

For example:
sip dns host file: hostfile.txt

Note:
If using a text file on a PC to enter this value, you must enter a carriage return (CR) after entering the host file name.
6. Save the file. Make sure the *aastra.cfg* and the *hostfile.txt* files are on the configuration server in your network before downloading to the phone(s).
7. Restart the phone(s) in your network.

The phone(s) downloads the specified host text file and stores it locally on the phone’s flash memory. Upon each subsequent boot of the phones, if the host text file is available on the configuration server, it is downloaded to replace the locally cached copy; otherwise, the previously cached copy is retained and used unchanged.

The configuration of the phone(s) can now use server1, server2, or server3 for SIP or other services instead of using the IP addresses. The phones will continue resolving the host names even if DNS on the network has conflicting or missing entries for server1, server2, or server3, or if the local LAN DNS server fails to respond.

Configuring DNS “Service (SRV) Records” Pre-caching

In addition to using a host file to resolve host names to IP addresses, an Administrator can also configure DNS “SRV records” (Service Records) for geographic redundancy and failover between application servers in the network.

The SIP registration and SIP proxy features on the phones previously allowed the use of server queries only to live DNS servers. Using the host file and specific DNS SVR parameters extends this mechanism to allow pre-configuration of server values in the *aastra.cfg* file. The following new parameters are used for this feature:

- **sip dns srvX name**
- **sip dns srvX priority**
- **sip dns srvX weight** (supported in a future release)
- **sip dns srvX port**
- **sip dns srvX target**

Note:

The “X” indicates a DNS SRV with a value from 1 to 4.

You can configure up to 4 DNS SRV records, with each server having a **priority** which tells the phone which server to use, and a host name or **target**. The IP phone will use the DNS SRV record with the lowest-numbered priority value first, and will only failover to other records if the connection with this record's host fails. Thus a service may have a designated failover server, which is only used if the primary server fails.

If a service has multiple SRV records with the same priority value, the IP phone(s) use the weight field to determine which host to use. The weight value is a ratio compared to the weight of other records with the same name and priority value.

Note:

The “sip dns srvX weight” parameter must be configured but the phones will support this feature in a future release.

In the following example, both the priority and weight fields are used to provide a combination of load balancing and backup service.

Example

```
sip dns srv1 name: _sip._udp.example.com
sip dns srv1 priority: 10
sip dns srv1 weight: 60
sip dns srv1 port: 5060
sip dns srv1 target: bigbox.example.com

sip dns srv2 name: _sip._udp.example.com
sip dns srv2 priority: 10
sip dns srv2 weight: 20
sip dns srv2 port: 5060
sip dns srv2 target: smallbox1.example.com

sip dns srv3 name: _sip._udp.example.com
sip dns srv3 priority: 10
sip dns srv3 weight: 20
sip dns srv3 port: 5060
sip dns srv3 target: smallbox2.example.com

sip dns srv4 name: _sip._udp.example.com
sip dns srv4 priority: 20
sip dns srv4 weight: 10
sip dns srv4 port: 5060
sip dns srv4 target: backupbox.example.com
```

The first three records (SRV 1, 2, and 3) share a priority of 10, so the weight field's value is used by the phones to load balance across the three target host names.

Bigbox will get 60% of the load, and smallbox1 and smallbox2 will each get 20% load.

If all three servers with priority 10 are unavailable, the next highest priority record is selected, in this case backupbox. This could be a server in another physical location.

The server entries in the *astra.cfg* file can use DNS hostnames or can use IP addresses. If hostnames are used, any pre-cached DNS A records via the host file mechanism are used before resorting to live DNS query if there is no local match.

For example, the following *hostfile.txt* uses IP addresses that are used in the DNS server queries:

```
hostfile.txt
192.168.2.3 bigbox.example.com
192.168.3.4 smallbox1.example.com
192.168.8.1 smallbox2.example.com
47.28.05.69 backupbox.example.com
```

Use the following procedure in the configuration files to configure DNS server query support for the phones.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "DNS Server Query" on page A-214.

Use the following procedure to configure DNS SRV record pre-caching.

Configuring DNS SRV Record Pre-caching

1. Using a text-based editing application, open the *aastra.cfg* file.
 2. Enter the parameter, "**sip dns srvX name**", where "X" is a value from 1 to 4.
Enter a value for the DNS SRV service URI. For example:

sip dns srv1 name: _sip._udp.example.com
 3. Enter the parameter, "**sip dnx srvX priority**", where "X" is a value from 1 to 4.
Enter a value for the DNS server priority. Valid values are 0 to 65535. Default is 0. For example:

sip dns srv1 priority: 10

After this parameter is downloaded from the configuration server to the phone, the phone uses the DNS server with the lowest numbered priority first to perform DNS lookups.
 4. Enter the parameter, "**sip dnx srvX weight**", where "X" is a value from 1 to 4.
Enter a value for the DNS server weight. Valid values are 0 to 65535. Default is 0. For example:

sip dns srv1 weight: 60

Note:
The "sip dns srv1 weight" parameter must be configured but will be supported in a future release.
 5. Enter the parameter, "**sip dnx srvX port**", where "X" is a value from 1 to 4.
Enter a value for the port number on the target host. Valid values are 0 to 65535. Default is 0. For example:

sip dns srv1 port: 5060
 6. Enter the parameter, "**sip dnx srvX target**", where "X" is a value from 1 to 4.
Enter a value for the DNS server target. Valid values are the host name or a fully qualified domain name. For example:

sip dns srv1 target: bigbox.example.com
 7. Save and close the file.
 8. Place the *aastra.cfg* file on the configuration server and download to the phones.
-

Configurable Transport Protocol for SIP Services and RTCP Summary Reports

Parameters have been implemented allowing administrators the ability to independently configure the transport protocols used by SIP services (e.g. the SIP XML Notify service) and RTCP summary reports. The following parameters are available to be defined in the configuration files:

SIP Services

- **sip services transport protocol**
- **sip services port**

The above parameters are used to specify the transport protocol and port used for SIP services.

RTCP Summary Reports

- **sip rtcp summary reports transport protocol**

The above parameter is used to specify the transport protocol used for RTCP summary reports.

Note:

- The parameter "sip symmetric udp signaling" is effective when the transport protocol for RTCP summary reports is set to be UDP. For more information on symmetric udp signaling, refer to [Symmetric UDP Signaling](#) on page 6-25.
- When the SIP transport protocol is set to TCP and the RTCP summary reports transport protocol is set to UDP, if an outbound proxy is configured, all SIP requests including RTCP summary reports will be sent over TCP.
- In cases where the SIP services transport protocol is the same as the SIP transport protocol or RTCP summary reports transport protocol, only the SIP services port is enabled (the phone listens on the SIP services port as well as the local SIP port if they are different [if they are the same, no extra action is needed]).

Use the following procedure in the configuration files to configure the transport protocol for SIP services and RTCP summary reports.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "SIP Services/RTCP Summary Reports Transport Protocol Settings" on page A-216.

Configurable Alphanumeric Input Order for Username Prompts

A configuration parameter **username alphanumeric input order** is available for the 6730i, 6731i, 6753i, 6863i, 6865i, and 9143i IP phones allowing administrators the ability to change the default behavior of the keypad input order during username prompts. . By default, keypad input order during username prompts changes from uppercase letters to the respective digit and then to lowercase letters with each successive press of the key. For example, when pressing "2" on the keypad, the following will be input with each successive press:

# of Presses	Letter/Number
1	A
2	B
3	C
4	2
5	a
6	b
7	c

When the **username alphanumeric input order** parameter is defined as "1", the respective digit will be available as the first input option followed by upper case and then lower case letters. For example, when pressing "2" on the keypad with this parameter enabled, the following will be input with each successive press:

# of Presses	Letter/Number
1	2
2	A
3	B
4	C
5	a
6	b
7	c

The behavior of the **username alphanumeric input order** parameter is applicable to the following username prompts as displayed on the phone's UI:

- HTTPS Login User Name
- SIP User Name
- SIP Display Name
- SIP Auth. Name
- FTP User Name

Note:

The parameter is set to "0" (uppercase letters first) by default.

Use the following procedure in the configuration files to configure the keypad input order for username prompts.

**Configuration Files**

For the specific parameter you can set in the configuration files, see Appendix A, the section, "[Alphanumeric Input Order for Username Prompts](#)" on [page A-217](#).

Active Voice-over-IP (VoIP) Recording

Active VoIP recording is supported by the IP phones. When using the IP phones with an Aastra call manager supporting voice recording and a recording system with the predefined subset of the SIP interface, administrators can configure the phones to send duplicate copies of the transmit and receive RTP or SRTP voice packets to the voice recording system.

Notes:

- Currently, the active VoIP recording feature is only supported when using the Aastra MX-ONE call manager (v4.1 or 5.0) in conjunction with ASC's EVO^{ip} 10.0 voice recording system. Support for additional call managers and voice recording systems will be implemented in future releases.
- The active VoIP recording feature is disabled by default.

Both dynamic (i.e. per call) and static (i.e. per the duration that the phone is registered) recording sessions are supported by the IP phones. Additionally, administrators have the option of enabling a Record-On-Demand feature allowing users to initiate and terminate a call recording session at their discretion. The call recording sessions are initiated by the voice recording system and when the session is established, the IP phone will duplicate all of its incoming and outgoing RTP/SRTP packets and send them to the voice recording system where they can be archived and analyzed as required.

Notes:

- Please contact your Aastra MX-ONE account manager for details on how to configure and utilize the Record-On-Demand feature.
- As the RTP/SRTP packets sent to the voice recording system are duplicate copies, the codec used for the original call as well as the recording are identical as well. If active VoIP recording is required, ensure that the IP phone is configured to use the G.711 or G.729 codec as these are currently the only two codecs supported by ASC's EVO^{ip} 10.0 voice recording system.

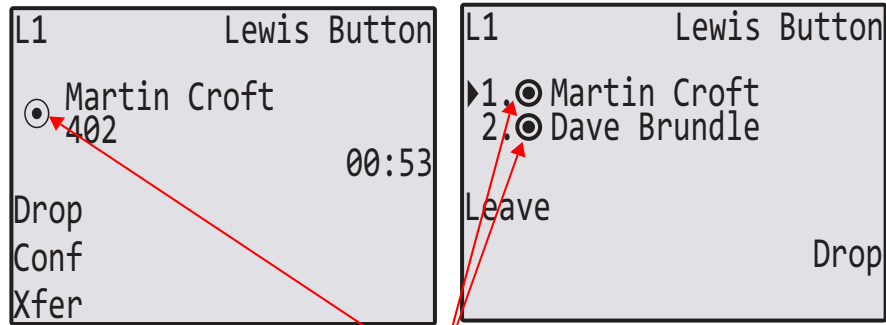

Administrators must configure a whitelist for voice recording system authentication using the “**recorder addressN**” parameters (where N is a number from 1 to 6). These parameters are used to specify trusted IP addresses corresponding to the voice recording system. The IP phone will check and respond to SIP messages coming from these IP addresses. If all of these parameters are left undefined, the active VoIP recording feature is disabled.

A whitelist can also be configured for RTP/SRTP packet destination authentication using the “**recording destinationN**” parameters (where N is a number from 1 to 6). These parameters are used to specify trusted IP addresses corresponding to the destination where the RTP/SRTP packets should be sent. The IP phone will check to see if the destination IP addresses are trusted before sending the duplicated RTP/SRTP packets. If all of these parameters are left undefined, no authentication checks will be performed.

When a recording session is in progress, the respective IP phones display the following recording icons on screen:

8 and 11-Line LCDS

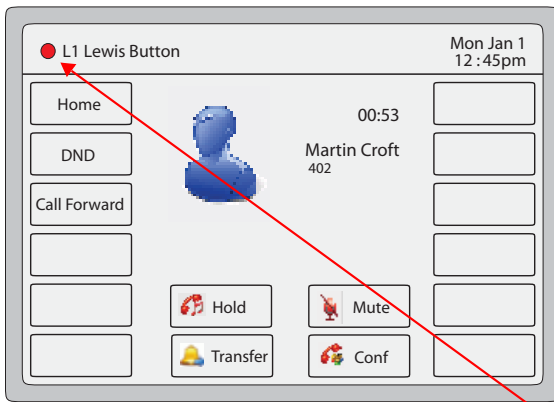

Normal Call

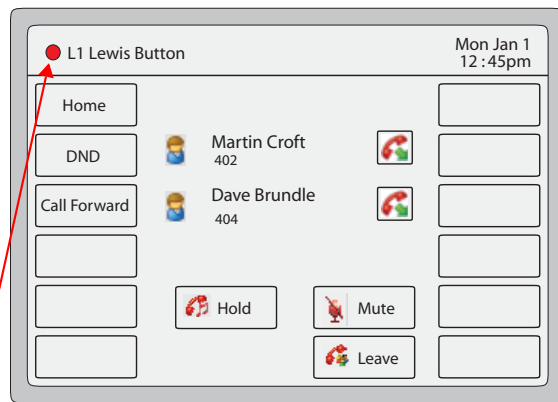

Conference Call

Recording Icons

6739i

Normal Call

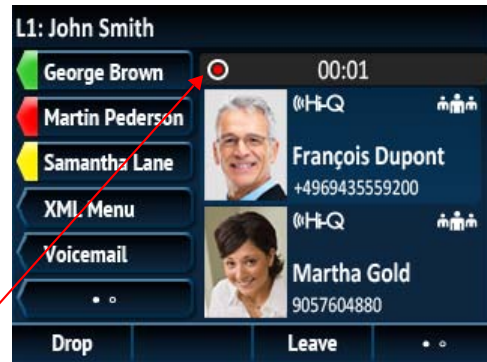

Conference Call

Recording Icons

6867i

Normal Call

Conference Call

Recording Icons

Warning!

The recording icon is displayed on the IP phones to indicate the recording session is active and that a duplicate copy of the RTP/SRTP stream is to be sent from the phone to the recording server. The overall recording and its quality is dependent on the recording server and the network.

Moreover, the phone will, by default, play a periodic audible beep tone through the selected audio path notifying users that their call is being recorded. Playback of the beep tone is configurable and if required, administrators can disable or set the playback interval of the beep tone by defining the **"recording periodic beep"** parameter in the configuration files. Additionally, by utilizing the **"recording beep direction"** parameter, administrators can define whether the beep tone is audible locally, remotely, or both.

Note:

In addition to the aforementioned parameters corresponding to the active IP voice recording feature, the transport protocol parameters for SIP services (i.e. **"sip services transport protocol"** and **"sip services port"**) must also be defined in the configuration files. See **"Configurable Transport Protocol for SIP Services and RTCP Summary Reports"** on page 6-40 for more information.

Use the following procedure in the configuration files to configure the active VoIP recording feature.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, **"Active VoIP Recording Settings"** on page A-218.

BroadSoft BroadWorks Executive and Assistant Services Feature

Note:

This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.

The 6730i, 6731i, 6753i, 6755i, 6757i, 6757i CT, 9143i, 9840i, and 9840i CT IP phones support the BroadSoft BroadWorks Executive and Assistant Services feature. The Executive and Assistant Services feature allows Administrators to create an inter-network relationship between Executives and Assistants allowing calls to the Executive's phone to be screened, filtered, and routed to an Assistant, whereby the Assistant can answer, divert the filtered call, or push the call back to the Executive.

Notes:

- The inter-network relationship is created dynamically through the BroadSoft BroadWorks call manager Web portal. For BroadSoft BroadWorks Executive and Assistant Services Web portal configuration details and procedures, please refer to the respective BroadSoft documentation.
- For details on how to configure and utilize the BroadSoft BroadWorks Executive and Assistant Services feature from a user's perspective, please refer to the respective phone model's **Aastra SIP IP Phone User Guide**.

Configuration Parameters

After configuring the applicable options on the BroadSoft Broadworks call manager Web portal, Administrators must define the newly introduced **"sip excassist filter call prefix"**, **"sip excassist fac call push"**, and **"sip excassist fac initiate call"** parameters for the phone.

The **"sip excassist filter call prefix"** parameter is used to identify the prefix of the Alerting Custom Calling Line ID Name of a filtered call. The Alerting Custom Calling Line ID Name as configured in the BroadWorks Web portal should follow the format:

```
[prefix] [Identifier] -> [Executive Name]
```

The Executive Name must match the name that is configured in the user's profile, separated by a space or comma.

Note:

The Alerting Calling Line ID Number can either be configured as the Executive's Number or Originator's Number.

For example, if the "Alerting Custom Calling Line ID Name" setting in the BroadWorks Web portal is defined as "[F] Filtrage -> Dupont, Francois", the From header of a filtered call sent by the BroadWorks SIP INVITE message will look similar to:

```
From: "[F] Filtrage -> Dupont, Francois"
<sip:5551234567@as.aastra.com;user=phone>
```

The "**sip execassist filter call prefix**" parameter in this scenario could be defined as:

```
sip execassist filter call prefix: "[F]"
```

The Assistant's phone will parse the From header of the SIP INVITE message of an incoming call sent by the call manager and will identify whether or not the call is a filtered call by the prefix. The prefix itself is not displayed on the phone's screen (e.g. in the case outlined above, the phone will only display "Filtrage -> Dupont, Francois").

The "**sip execassist fac call push**" parameter is used to specify the Feature Access Code (FAC) that is used to push a filtered call from the Assistant's phone back to the Executive's phone. The FAC should correspond to the value configured for the "Executive-Assistant Call Push" setting defined in the BroadSoft Web portal.

The "**sip execassist fac initiate call**" parameter is used to specify the FAC that is used by Assistants to initiate a call on behalf of the Executive. The FAC should correspond to the value configured for the "Executive-Assistant Initiate Call" setting defined in the BroadSoft Web portal.

Use the following procedure in the configuration files to configure the BroadSoft BroadWorks Executive and Assistant Services feature.

Configuration Files

For the specific parameter you can set in the configuration files, see Appendix A, the section, "[BroadSoft BroadWorks Executive and Assistant Services Settings](#)" on [page A-219](#).

Filter Softkey

In addition to the parameters, the "Filter" softkey type has been introduced allowing both Executives and Assistants the ability to easily activate and deactivate the Executive Call Filtering feature.

Notes:

- The **As-Feature Event Subscription** option must also be enabled for the Filter softkey to function. This feature can be enabled by defining the "**sip lineN as-feature-event subscription**" parameter as "**1**" in the configuration files (where "N" corresponds to the applicable line) or through the phone's Web UI under **Advanced Settings > LineN > Advanced SIP Settings > As-Feature-Event Subscription**. Refer to [As-Feature-Event Subscription](#) on [page 6-11](#) for additional details on the As-Feature Event Subscription feature.

Filter Softkey for the Executive's Phone

The Executive's phone requires that only one Filter softkey be configured. The Filter softkey's value can either be left undefined (which will toggle the Executive Call Filtering settings on the call manager via the SIP SUBSCRIPTION/NOTIFY mechanism) or, it can be defined using the following values (which will toggle the settings via an FAC call):

- Executive Call Filtering Activation FAC (e.g. "#61")
 - Used when the Deactivation FAC is in the same format as the Activation FAC but sequentially one number above the Activation FAC. For example, if the softkey value is defined as #61 (the Activation FAC), the phone will automatically assume that the Deactivation FAC is "#62" and will use that code to deactivate Executive Call Filtering.
- Executive Call Filtering Activation FAC followed by a semi-colon and then Executive Call Filtering Deactivation FAC (e.g. "#61;*61" or "#61;#71")
 - Used when the Activation and Deactivation FACs are not in the same format or when they are not sequential. For example, if the Activation FAC is configured in the BroadSoft BroadWorks Web portal is "#61" and the Deactivation FAC is configured as "*61" or "#71", the softkey value should be defined with the two specific FACs separated by a semi-

colon (i.e. "#61;*61" or "#61;#71" respectively).

Notes:

- If the Deactivation FAC is not specified after the semi-colon (e.g. "#61;"), the phone will ignore the semi-colon and behave as if only the Activation FAC was defined (i.e. the phone will automatically assume that the Deactivation FAC is in the same format but sequentially one number above the Activation FAC).
- The IP phones support Executive Call Filtering Activation/Deactivation FACs that contain the prefix "#" or "**".

Irrespective of a defined or undefined key value, when the Filter softkey is pressed, Executive Call Filtering will be activated and the softkey's corresponding LED will be lit. When the Filter softkey is pressed again, Executive Call Filtering will deactivate and the softkey's corresponding LED will turn off.

Note:

Upon a reboot, the initial state of the Filter softkey LED will correspond to the Executive Call Filtering state configured on the call manager.

Configuring the Filter Softkey on the Executive's Phone Using the Aastra Web UI

Use the following procedure to configure the Filter Softkey on the Executive's phone using the Aastra Web UI:

Aastra Web UI

1. Click on **Operation->Softkeys and XML.**
or
Click on **Operation-> Programmable Keys.**
or
Click on **Operation->Expansion Module Keys.**

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Filter	Filter		1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2				1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3				1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Select a key that you want to use as a Filter activate/deactivate key.
3. In the **"Type"** field, select **"Filter"**.
4. In the **"Label"** field (8 and 11-line phones only), enter a label to apply to this key (e.g. Filter).
5. (Optional) In the **"Value"** field, enter the Executive Call Filtering Activation FAC (e.g. #61) or both the Executive Call Filtering Activation and Deactivation FACs followed by a semi-colon (e.g. #61;*61).
6. In the **"Line"** field, select the line for which you want to use the key functionality.
7. Click **Save Settings** to save your settings.

Configuring the Filter Softkey on the Executive's Phone Using the Configuration Files

To configure the Filter softkey on the Executive's phone using the configuration files, you must enter **"filter"** for the key type. For the label (8 and 11-line phones only), enter a key label to assign to the Filter key (e.g. "Filter"). Defining the value is optional. If you prefer to toggle Executive Call Filtering using an FAC call, enter in the Executive Call Filtering Activation FAC (e.g. "#61") or both the Executive Call Filtering Activation and Deactivation FACs followed by a semi-colon (e.g. "#61;*61") for the value. For the line setting, enter the line number for which you want to use the key functionality.

The following parameters are examples you can use to configure the Filter softkey on the Executive's phone:

For Softkeys

```
softkey1 type: filter
softkey1 label: Filter
softkey1 value: "#61;*61"
softkey1 line: 1
```

For Programmable Keys

```
prgkey1 type: filter
prgkey1 value: "#61;*61"
prgkey1 line: 1
```

For Top Softkeys

```
topsoftkey1 type: filter
topsoftkey1 label: Filter
topsoftkey1 value: "#61;*61"
topsoftkey1 line: 1
```

For Expansion Module Softkeys

```
expmod1 key1 type: filter
expmod1 key1 label: Filter
expmod1 key1 value: "#61;*61"
expmod1 key1 line: 1
```

Filter Softkey for the Assistant's Phone

As an Assistant can be associated with multiple Executives simultaneously, the Assistant's phone can be configured with multiple Filter softkeys; one softkey for each Executive. In this case, the value of each Filter softkey should correspond to the phone number or extension of the respective Executive as per configured in the user's profile.

When Filter softkeys are configured with key values, pressing the respective Filter softkey will activate Executive Call Filtering for the applicable Executive and the softkey's corresponding LED will be lit. When the same Filter softkey is pressed again, Executive Call Filtering for the applicable Executive will deactivate and the softkey's corresponding LED will turn off.

Alternatively, a single Filter softkey can be configured without a defined key value. If this is the case, the Assistant will be able to manually activate and deactivate Executive Call Filtering for each associated Executive through the phone's UI. In this scenario, as only one Filter softkey is utilized, the softkey's corresponding LED will be lit when Executive Call Filtering is activated for even one associated Executive. If Executive Call Filtering is disabled for all associated Executives, the softkey's corresponding LED will turn off.

Note:

If Call Forward is enabled for filtered calls, LEDs for all Filter softkeys will be turned off.

Configuring the Filter Softkey on the Assistant's Phone Using the Aastra Web UI

Use the following procedure to configure the Filter Softkey on the Assistant's phone using the Aastra Web UI:

**Aastra Web UI**

1. Click on **Operation->Softkeys and XML**.
or
Click on **Operation-> Programmable Keys**.
or
Click on **Operation->Expansion Module Keys**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Filter	Filter-Stefan	4100	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	Filter	Filter-John	4101	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3				1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Select a key that you want to use as a Filter activate/deactivate key.
3. In the "**Type**" field, select "**Filter**".

**Aastra Web UI**

4. In the **"Label"** field (8 and 11-line phones only), enter a label to apply to this key (e.g. Filter-Stefan for a specific Executive or simply Filter for a generic Filter key with no defined value).

Note:
To utilize a single Filter softkey without a defined key value (so that you can manually activate and deactivate Executive Call Filtering through the phone's UI) skip to Step 8.
5. (In the **"Value"** field, enter the Executive's phone or extension number (e.g. 4100)
6. In the **"Line"** field, select the line for which you want to use the key functionality.
7. Repeat Steps 2 to 6 for each respective Executive for whom you would like to assign a Filter key.
8. Click **Save Settings** to save your settings.

Configuring the Filter Softkey on the Assistant's Phone Using the Configuration Files

To configure the Filter softkeys on the Assistant's phone using the configuration files, you must enter **"filter"** for the key types. For the labels (8 and 11-line phones only), enter key labels to assign to the Filter key (e.g. "Filter-Stefan" for a specific Executive or simply "Filter" for a generic Filter key with no defined value). Defining the value is optional. If you choose to assign a Filter softkey and define values for each Executive, enter in the respective Executive's phone or extension number (e.g. 4100). For the line setting, enter the line number for which you want to use the key functionality. If you prefer to utilize a single Filter softkey without a defined value you will be able to manually activate and deactivate Executive Call Filtering for each Executive to whom the Assistant is assigned through the phone's UI.

The following parameters are examples you can use to configure multiple Filter softkeys corresponding to multiple Executives on the Assistant's phone:

For Softkeys

```
softkey1 type: filter
softkey1 label: Filter-Stefan
softkey1 value: 4100
softkey1 line: 1
```

```
softkey2 type: filter
softkey2 label: Filter-John
softkey2 value: 4101
softkey2 line: 1
```

For Programmable Keys

```
prgkey1 type: filter
prgkey1 value: 4100
prgkey1 line: 1
```

```
prgkey2 type: filter
prgkey2 value: 4101
prgkey2 line: 1
```

For Top Softkeys

```
topsoftkey1 type: filter
topsoftkey1 label: Filter-Stefan
topsoftkey1 value: 4100
topsoftkey1 line: 1
```

```
topsoftkey2 type: filter
topsoftkey2 label: Filter-John
topsoftkey2 value: 4101
```

```
topsoftkey2 line: 1
```

For Expansion Module Softkeys

```
expmod1 key1 type: filter
expmod1 key1 label: Filter-Stefan
expmod1 key1 value: 4100
expmod1 key1 line: 1
```

```
expmod1 key2 type: filter
expmod1 key2 label: Filter-John
expmod1 key2 value: 4101
expmod1 key2 line: 1
```

Speeddial Softkey with Initiate Call Functionality (Assistants Only)

Speeddial softkeys can be configured to efficiently utilize the Executive-Assistant Initiate Call function. With a Speeddial softkey configured for this feature, Assistants can initiate a call on behalf of an Executive, whereby the call will appear to the target as one originated by the Executive himself/herself. The Speeddial softkey's value can be defined using the following syntax:

- Executive-Assistant Initiate Call FAC (e.g. "#64"):
 - In such scenarios, the call manager will play an audible prompt asking you to enter the Executive's Address and Destination Address manually using the keypad.
- Executive-Assistant Initiate Call FAC followed by the Executive's Address (e.g. "#644052"):
 - In such scenarios, only the Destination Address will need to be manually entered using the keypad.
- Executive-Assistant Initiate Call FAC, followed by the Executive's Address, an asterisk, and then the Destination Address (e.g. "#644052*4059"):
 - In such scenarios, addresses will not need to be manual entered and the phone will automatically initiate the call to the target phone on behalf of the Executive.

Note:

The Speeddial softkey type can be utilized for additional functions related to the Executive and Assistant Services feature that rely on FAC calls (i.e. opting in to an Executive's filtered call pool, opting out of an Executive's filtered call pool, etc...). Administrators simply need to configure the Speeddial key value as the FAC and label accordingly.

Configuring the Initiate Call Softkey on the Assistant's Phone Using the Aastra Web UI

Use the following procedure to configure the Initiate Call Softkey on the Assistant's phone using the Aastra Web UI:

Aastra Web UI

1. Click on **Operation->Softkeys and XML**.
or
Click on **Operation-> Programmable Keys**.
or
Click on **Operation->Expansion Module Keys**.

Softkeys Configuration

Key	Type	Label	Value	Line	Idle	Connected	Incoming	Outgoing	Busy
1	Speeddial	Init	#64	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2				1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3				1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

2. Select a key that you want to use as an Initiate Call key.
3. In the **"Type"** field, select **"Speeddial"**.
4. In the **"Label"** field (8 and 11-line phones only), enter a label to apply to this key (e.g. Init).

**Aastra Web UI**

5. In the "**Value**" field, enter the Initiate Call FAC (e.g. #64)
or
In the "**Value**" field, enter the Initiate Call FAC, followed by the Executive's Address (e.g. #644052)
or
In the "**Value**" field, enter the Initiate Call FAC, the Executive's Address, followed by an asterisk, and then the Destination Address (e.g. #644052*4059)
6. In the "**Line**" field, select the line for which you want to use the key functionality.
7. Click **Save Settings** to save your settings.

Configuring the Initiate Call Softkey on the Assistant's Phone Using the Configuration Files

To configure the Initiate Call Speeddial softkeys on the Assistant's phone using the configuration files, you must enter "**speeddial**" for the key types. For the labels (8 and 11-linephones only), enter key labels to assign to the Speeddial key (e.g. "Init"). For the values, enter one of the following:

- Executive-Assistant Initiate Call FAC (e.g. "#64")
- Executive-Assistant Initiate Call FAC followed by the Executive's Address (e.g. "#644052")
- Executive-Assistant Initiate Call FAC, followed by the Executive's Address, an asterisk, and then the Destination Address (e.g. "#644052*4059")

For the line setting, enter the line number for which you want to use the key functionality.

The following parameters are examples you can use to configure multiple Initiate Call Speeddial softkeys:

For Softkeys

```
softkey1 type: speeddial
softkey1 label: Init
softkey1 value: "#64"
softkey1 line: 1
```

```
softkey2 type: speeddial
softkey2 label: Init2
softkey2 value: "#644052"
softkey2 line: 1
```

```
softkey3 type: speeddial
softkey3 label: Init3
softkey3 value: "#644052*4059"
softkey3 line: 1
```

For Programmable Keys

```
prgkey1 type: speeddial
prgkey1 value: "#64"
prgkey1 line: 1
```

```
prgkey2 type: speeddial
prgkey2 value: "#644052"
prgkey2 line: 1
```

```
prgkey3 type: speeddial
prgkey3 value: "#644052*4059"
prgkey3 line: 1
```

For Top Softkeys

```
topsoftkey1 type: speeddial
topsoftkey1 label: Init
```

```
topsoftkey1 value: "#64"  
topsoftkey1 line: 1
```

```
topsoftkey2 type: speeddial  
topsoftkey2 label: Init2  
topsoftkey2 value: "#644052"  
topsoftkey2 line: 1
```

```
topsoftkey3 type: speeddial  
topsoftkey3 label: Init3  
topsoftkey3 value: "#644052*4059"  
topsoftkey3 line: 1
```

For Expansion Module Softkeys

```
expmod1 key1 type: speeddial  
expmod1 key1 label: Init  
expmod1 key1 value: "#64"  
expmod1 key1 line: 1
```

```
expmod1 key2 type: speeddial  
expmod1 key2 label: Init2  
expmod1 key2 value: "#644052"  
expmod1 key2 line: 1
```

```
expmod1 key2 type: speeddial  
expmod1 key2 label: Init3  
expmod1 key2 value: "#644052*4059"  
expmod1 key2 line: 1
```

Chapter 7

Encrypted Files on the IP Phone

About this Chapter

This chapter provides information about encryption on the IP phones and provides methods an administrator can use to store encrypted files to a server.

Topics

This chapter covers the following topics:

Topic	Page
Encrypted Files on the IP Phone	page 7-2
Configuration File Encryption Method	page 7-2
Procedure to Encrypt Configuration Files	page 7-3
Vendor Configuration File Encryption	page 7-4

Encrypted Files on the IP Phone

An encryption feature for the IP phone allows Service Providers the capability of storing encrypted files on their server to protect against unauthorized access and tampering of sensitive information (i.e., user accounts, login passwords, registration information). Service Providers also have the capability of locking a phone to use a specific server-provided configuration only.

Configuration File Encryption Method

Only a System Administrator can encrypt the configurations files for an IP Phone. System Administrators use a password distribution scheme to manually pre-configure or automatically configure the phones to use the encrypted configuration with a unique key.

From a Microsoft Windows command line, the System Administrator uses an Aastra-supplied configuration file encryption tool called "anacrypt.exe" to encrypt the <mac>.tuz file.

Note:

Aastra also supplies encryption tools to support Linux platforms (*anacrypt.linux*) if required.

This tool processes the plain text <mac>.cfg, <model>.cfg, and *aastra.cfg* files and creates triple-DES encrypted versions called <mac>.tuz, <model>.tuz, and *aastra.tuz*. Encryption is performed using a secret password that is chosen by the administrator.

The encryption tool is also used to create an additional encrypted tag file called *security.tuz*, which controls the decryption process on the IP phones. If *security.tuz* is present on the TFTP/FTP/HTTP server, the IP phones download it and use it locally to decrypt the configuration information from the *aastra.tuz* and <mac>.tuz files. Because only the encrypted versions of the configuration files need to be stored on the server, no plain-text configuration or passwords are sent across the network, thereby ensuring security of the configuration data.

To make changes to the configuration files, the System Administrator must save the original files.

Note:

If the use of encrypted configuration files is enabled (via *security.tuz* or pre-provisioned on the IP phone) the *aastra.cfg*, <model>.cfg, and <mac>.cfg files are ignored, and only the encrypted equivalent files *aastra.tuz*, <model>.tuz, and <mac>.tuz are read.

The security feature described above prevents unauthorized parties from **reading** or **writing** the contents of the <MAC>.tuz file. It also provides the following:

- Prevents users from using the <MAC>.tuz file that does not match the user's phone MAC address.
- Renders the <MAC>.tuz file invalid if the user renames the file.
- Works with IP phone releases prior to Release 2.2.
- Provides compatibility between the previous encryption routine and the new decryption routine.

Procedure to Encrypt Configuration Files

To encrypt the IP phone configuration files (using a Microsoft Windows OS):

1. Obtain the anacrypt encryption tool (anacrypt.exe) from your Aastra representative.
2. Open a command line window application (i.e. DOS window).
3. At the prompt, enter **anacrypt.exe** and press <Return>.
4. Enter a command utilizing the details provided in the help screen.

```
C:\> anacrypt.exe -h
```

```
Provides encryption of the configuration files used for the family of Aastra IP phones.
```

```
Copyright (c) 2005-2012, Aastra Technologies, Ltd.
```

```
Usage:
```

```
anacrypt {infile.cfg|-d <dir>} [-p password] [-m] [-i] [-v] [-h]
```

Anacrypt Switch	Description
{infile.cfg -d <dir>}	Specifies that all .cfg files in <dir> should be encrypted.
[-p password]	Specify password used to generate keys.
-m	Generate MAC.tuz files that are phone specific. This switch generates files that are only usable for phones with firmware version 2.2.0 and above.
-v1	Specifies the version of encryption that the anacrypt tool uses. Use version 1 encryption (i.e. -v1) to generate files that are readable by all model phones.
-v2	(Default) Specifies the version of encryption that the anacrypt tool uses. Use version 2 encryption (i.e. -v2) to generate files that are readable by phones with firmware 2.2.0 and above.
-v3	(Enhanced security version) Specifies the version of encryption that the anacrypt tool uses. Use version 3 encryption (i.e. -v3) to generate files that are readable by phones with firmware 3.3.1 and above.
-i	Generate security.tuz file.
-h	Show the help screen.

Notes:

- Configuration files that are encrypted using v3 encryption can only be decoded by phones on Release 3.3.1 (and above). Customers with v3-encrypted configuration files will lose the ability to decode the files (and in turn will lose all previously configured settings) if they downgrade their phones to any firmware release prior to 3.3.1.
- An incorrect password produces garbage. For site-specific keyfile security.cfg the plaintext must match the password.

Examples

The following examples illustrate the use of the anacrypt.exe file.

Example 1

Generating a security.tuz file with password 1234abcd:

For firmware version 3.3.1 (enhanced security):

```
C:\>anacrypt -i -p 1234abcd -v3
```

For firmware version 2.2.0 and above:

```
C:\>anacrypt -i -p 1234abcd
```

or

```
C:\>anacrypt -i -p 1234abcd -v2
```

For any firmware version:

```
C:\>anacrypt -i -p 1234abcd -v1
```

Example 2

Encrypting a single `aastra.cfg` file with password 1234abcd (for firmware version 3.3.1):

```
C:\>anacrypt aastra.cfg -p 1234abcd -v3
```

Example 3

Encrypting a `<mac>.cfg` file with password 1234abcd (for firmware version 3.3.1):

```
C:\>anacrypt 00085d000000.cfg -p 1234abcd -v3
```

Example 4

Encrypting a `<mac>.cfg` file with password 1234abcd using MAC encryption (for firmware version 3.3.1):

```
C:\>anacrypt 00085d000000.cfg -m -p 1234abcd -v3
```

Example 5

Encrypting all `cfg` files in `C:\data` with password 1234abcd using MAC encryption and generating a `security.tuz` file at the same time (for firmware version 3.3.1):

```
C:\>anacrypt -d C:\data -p 1234abcd -m -i -v3
```

Example 6

Encrypting all `cfg` files in `C:\data` with password 1234abcd and generating a `security.tuz` file at the same time (for firmware version 3.3.1):

```
C:\>anacrypt -d C:\data -p 1234abcd -i -v3
```

Vendor Configuration File Encryption

Some vendors can have specific methods to encrypt files on their configuration servers. For each phone, the configuration server can generate a random hex string (encryption key) that is used to encrypt the phone's MAC-specific configuration file.

The encryption key is placed in a plain text MAC-specific configuration file that the server downloads to the phone. After the phone receives the file, it updates the encryption key.

This method of encryption does not affect the implementation of the Aastra method of file encryption.

Note:

The `aastra.cfg` file is not encrypted with this feature.

You can set the phone-specific encryption key using the configuration files only.

For more information about configuration file encryption, contact Aastra Technical Support.

Configuring Vendor Configuration File Encryption

Use the following procedure to configure vendor configuration file encryption on the IP Phones.

Configuration Files

For specific parameters you can set in the configuration files for automatic update, see Appendix A, the section, "[Configuration Encryption Setting](#)" on [page A-214](#).

Chapter 8

Upgrading the Firmware

About this Chapter

This chapter provides information about upgrading the IP phone firmware.

Topics

This chapter covers the following topics:

Topic	Page
Upgrading the Firmware	page 8-2
Using the "Firmware Update" Page in the Aastra Web UI	page 8-2
Using the Restart Feature	page 8-4
Using the Auto-Resync Feature	page 8-5

Upgrading the Firmware

The IP phones support the protocols, TFTP, FTP, HTTP or HTTPS to download configuration files and upgrade firmware to the phones from a configuration server.

The configuration server should be ready and able to accept connections. For information on configuration server requirements, see Chapter 1, the section, “[Configuration Server Requirement](#)” on page 1-49.

You can download the firmware stored on the configuration server in one of three ways:

- Using the “**Firmware Update**” page in the Aastra Web UI at the location **Advanced Settings->Firmware Update**.
- Using the IP Phone UI or the Aastra Web UI to restart the phone. The phone automatically looks for firmware updates and configuration files during the boot process.
- Setting an **Auto-Resync** feature to automatically update the firmware, configuration files, or both at a specific time in a 24-hour period). (Feature can be enabled using the configuration files or the Aastra Web UI).

Using the “Firmware Update” Page in the Aastra Web UI

You can use the Aastra Web UI to manually force a firmware update from the configuration server to a phone in your network by selecting **Advanced Settings->Firmware Update**. You can configure the phone to perform the update using any of the protocols that the phone supports: TFTP, FTP, HTTP, or HTTPS.

Warning!

Do not reset or turn off the phone until the download is complete.

Note:

This procedure downloads an updated `<phone model.st>` file as well as any other firmware files that were updated, to your phone.

Use the following procedure to manually update the firmware on your phone from the specified configuration server.

Aastra Web UI

1. Click on **Advanced Settings->Firmware Update**.

Manual Firmware Update

Enter the server's IP address and the name of the firmware below to initiate a firmware update.

File Name	<input type="text" value="55i.st"/>
Download Protocol	TFTP <input type="button" value="v"/>
Server	<input type="text"/>
Path	<input type="text"/>
Port	<input type="text"/>
Username	<input type="text"/>
Password	<input type="text"/>

2. In the **"File Name"** field, enter the firmware file name (<phone model>.st) that you want to download to your IP phone. For example, 53i.st (for a 6753i phone).

Note:

This file name must match the actual name of the firmware file residing on your configuration server.

IMPORTANT: The phones use the following naming convention for the .st files. See the following table.

IP Phone Model	Associated Firmware
9143i	9143i.st
9480i	9480i.st
9480i CT	9480iCT.st
6730i	6730i.st
6731i	6731i.st
6735i	6735i.st
6737i	6737i.st
6739i	6739i.st
6753i	53i.st
6755i	55i.st
6757i	57i.st
6757i CT	57iCT.st
6863i	6863i.st
6865i	6865i.st
6867i	6867i.st

3. In the **"Download Protocol"** field, select the protocol from the list to use for downloading the new firmware. Valid values are:
 - TFTP
 - FTP
 - HTTP
 - HTTPS

Aastra Web UI

4. In the **"Server"** field, enter the IP address in dotted decimal format, of the TFTP configuration server, or the domain name of the FTP, HTTP, or HTTPS configuration servers (dependant on the protocol you selected in step 3.) For example: 432.221.45.6.
5. In the **"Path"** field, enter the path location on the protocol server for where the new firmware resides. For example, C:\aastra\config-server\firmwareupgrade.
6. In the **"Port"** field, enter the port number of the protocol server. For example, 80 (for HTTP) or 443 (for HTTPS).

Note:

This field is not applicable to the TFTP and FTP protocols.

7. (FTP only) In the **"Username"** field, enter the username that is used for authentication when the FTP server is accessed.
8. (FTP only) In the **"Password"** field, enter the password that is used for authentication when the FTP server is accessed.
9. Click **Download Firmware**.

This starts the upgrade process. If the upgrade is successful the following message displays on the screen: "Firmware Upgrade Successful".

Using the Restart Feature

Restarting the phone forces the phone to check for both firmware and configuration files stored on the configuration server.

Warning!

Do not reset or turn off the phone until the download is complete.

Restarting the Phone Using the IP Phone UI

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Restart Phone**.
3. For 3-Line LCD Displays:
Press # to confirm.

Note:

To cancel the Restart, press the **3** key.

For 8 and 11-Line LCD Displays:

Press **Restart**.

Note:

To cancel the Restart, press **Cancel**.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press **Restart**. The following prompt displays:
"Restart the phone?"
3. Press **<Yes>** to restart the phone
or
Press **<No>** to go back to the Options Screen.

For the 6867i:

1. Press  on the phone to enter the Options List.

IP Phone UI

2. Select **Restart**. The following prompt displays:
"Restart phone?"
3. Select **Yes** or press the Restart softkey to restart the phone
or
Select **No** or press the Cancel softkey to go back to the Options Screen.

Restarting the Phone Using the Aastra Web UI

Aastra Web UI

1. Click on **Operation->Reset->Phone**.

2. Click **Restart** to restart the phone.

Using the Auto-Resync Feature

The auto-resync feature on the IP phones allows an administrator to enable the phone to be updated automatically once a day at a specific time in a 24-hour period if the files on the server have changed. This feature works with TFTP, FTP, HTTP, and HTTPS servers. An administrator can enable this feature using the Aastra Web UI or using the configuration files (astra.cfg, <model>.cfg, and <mac>.cfg).

Note:

The automatic update feature works with both encrypted and plain text configuration files.

An Administrator can enable Auto-Resync using the configuration files or the Aastra Web UI. In the configuration files you set the following parameters:

- **auto resync mode** - Determines whether the configuration server automatically updates the phone's configuration files only, the firmware only, both the firmware and configuration files, or disables automatic updates. This parameter works with TFTP, FTP, HTTP, and HTTPS servers.
- **auto resync time** - Sets the time of day in a 24-hour period for the IP phone to be automatically updated. This parameter works with TFTP, FTP, HTTP and HTTPS servers.
- **auto resync max delay** - Specifies the maximum time, in minutes, the phone waits past the scheduled time before starting a checksync.
- **auto resync days** - Specifies the amount of days that the phone waits between checksync operations.

In the Aastra Web UI, you can set the following parameters at the path *Advanced Settings->Configuration Server->Auto-Resync*:

- **Mode**
- **Time (24 hours)**
- **Maximum Delay**
- **Days**

Setting the “**auto resync max delay**” (Maximum Delay) and “auto resync days” (Days) parameters can greatly reduce the load placed on the configuration server when downloading configurations.

Reloading of Directory Files and Background Image During an Auto-Resync

During an auto-resync, the IP phones have the ability to initiate a comparison of its local directory files with those located on the configuration server and automatically update the local directory files if changes are detected. For the 6739i, the background image is redownloaded and updated at this time as well.

If the auto-resync mode is set to “Configuration Files (1)” or “Both (3)”, either through the IP phone’s Web UI or configuration files, when the phone reaches the configured auto-resync date/time, the phone will perform a comparison on the directory files and trigger a reboot if differences are found. For the 6739i, in addition to the directory file comparison, the background image will be redownloaded and updated. No reboot is necessary if the background image is the only file that has changed.

If the auto-resync mode is set to “None (0)” or “Firmware Info (2)” and the phone reaches the configured auto-resync date/time, the directory files will not be checked (and the background image for the 6739i will not be redownloaded/updated) .

Note:

Irrespective of the auto-resync feature, if the phone receives a check-sync NOTIFY, the directory file comparison (and background image update for the 6739i) will be performed and the applicable files will be automatically updated as required.

Enabling Auto-Resync Using the Configuration Files

Use the following procedure to configure automatic updates of the IP phone firmware, configuration files, or both.

Configuration Files

For specific parameters you can set in the configuration files for automatic update, see Appendix A, the section, “[Configuration Server Settings](#)” on [page A-16](#).

Notes:

- If a user is accessing the Aastra Web UI, they are not informed of an auto-reboot.
- Any changes made using the Aastra Web UI or the IP phone UI are not overwritten by an auto-resync update. Auto-resync affects the configuration files only. However, the settings in the Aastra Web UI take precedence over the IP phone UI and the configuration files.
- If the IP phone is in use (not idle) at the time of the resync check, the reboot occurs when the phone becomes idle.
- The resync time is based on the local time of the IP phone.
- The automatic update feature works with both encrypted and plain text configuration files.

Enabling Auto-Resync Using the Aastra Web UI

Use the following procedure to enable auto-resync for the phones in your network.

Aastra Web UI

1. Click on **Advanced Settings->Configuration Server->Auto-Resync.**

Auto-Resync	
Mode	None
Time (24-hour)	00:00
Maximum Delay	15
Days	0

2. In the **"Mode"** field, select the auto-resync mode you want to use to automatically update the phone.

Valid values are:

- **None** Disable auto-resync
- **Configuration Files** Updates the configuration files on the IP phone automatically at the specified time if the files on the server have changed.
- **Firmware** Updates the firmware on the IP phone automatically at the specified time if the files on the server have changed.
- **Both** Updates the configuration files and firmware automatically at the specified time if the files on the server have changed.

Notes:

- If a user is accessing the Aastra Web UI, they are not informed of an auto-reboot.
- Any changes made using the Aastra Web UI or the IP phone UI are not overwritten by an auto-resync update. Auto-resync affects the configuration files only. However, the settings in the Aastra Web UI take precedence over the IP phone UI and the configuration files.
- The resync time is based on the local time of the IP phone.
- If the IP phone is in use (not idle) at the time of the resync check, the reboot occurs when the phone becomes idle.

3. In the **"Time (24-hour)"** field, select the time that you want the update to take place.
Valid values are 00:00 to 23:30 (in 30 minute increments).

Notes:

- The resync time is based on the local time of the IP phone.
- The value of 00:00 is 12:00 A.M.
- When selecting a value for this parameter in the Aastra Web UI, the values are in 30-minute increments only.

4. In the **"Maximum Delay"** field, specify the maximum time, in minutes, the phone waits past the scheduled time before starting a checksync. The range is 0 to 1439. Default is 15.

5. In the **"Days"** field, specify the amount of days that the phone waits between checksync operations. The range is 0 to 364. Default is 0.

Note:

A value of 0 causes the phone to checksync every time the clock reads the proper time. A value of 1 forces the phone to wait 24 hours prior to doing the first checksync.

6. Click **Save Settings** to save your settings.

These changes are not dynamic.
You must restart your IP phone for the changes to take affect.

7. Click on **Operation->Reset.**

8. In the **"Restart Phone"** field click **Restart** to restart the IP phone and apply the update.

The update performs automatically at the time you designated.

Chapter 9

Troubleshooting

About this Chapter

This chapter describes tasks that a system administrator can perform on the IP phones for troubleshooting purposes. It also includes answers to questions you may have while using the IP phones.

Topics

This chapter covers the following topics:

Topic	Page
Troubleshooting	page 9-2
Log Settings	page 9-2
Module/Debug Level Settings	page 9-2
Support Information	page 9-4
WatchDog Task Feature	page 9-6
Error Messages Display	page 9-8
Warning Message Display	page 9-9
Configuration and Crash File Retrieval	page 9-9
Troubleshooting Solutions	page 9-12
Why does my phone display "Application missing"?	page 9-12
Why does my phone display the "No Service" message?	page 9-12
Why does my phone display "Bad Encrypted Config"?	page 9-13
Why is my phone not receiving the TFTP IP address from the DHCP Server?	page 9-13
How do I restart the IP phone?	page 9-14
How do I set the IP phone to factory default?	page 9-15
How do I erase the phone's local configuration?	page 9-16
How to reset a user's password?	page 9-17
How do I lock and unlock the phone?	page 9-19

Troubleshooting

This section describes tasks that a system administrator can perform on the IP phones for troubleshooting purposes. Using the Aastra Web UI, a system administrator can:

- Assign an IP address and IP port to which log information will be transmitted
- Filter the logs according to severity
- Save the current local configuration file to a specified location
- Save the current server configuration file to a specified location
- Show task and stack status (including “Free Memory” and “Maximum Memory Block Size”)

Aastra Technical Support can then use the information gathered to perform troubleshooting tasks.

Log Settings

Using the configuration files or the Aastra Web UI, you can specify the location where log information will be stored for troubleshooting purposes.

In the configuration files, you use the following parameters to configure log settings:

- **log server ip** - The IP address of the log server to which log information will be transmitted.
- **log server port** - The IP port of the log server.

In the Aastra Web UI, you use the following parameters to configure log settings:

- **Log IP** -The IP address of the log server to which log information will be transmitted
- **Log Port** - The IP port of the log server.

References

For more information about the log setting configuration parameters, see [Appendix A](#), the section, “[Troubleshooting Parameters](#)” on [page A-221](#).

For information about configuring the log settings using the Aastra Web UI, see “[Performing Troubleshooting Tasks](#)” on [page 9-5](#).

Module/Debug Level Settings

The Aastra IP phones provide blog module support that allows enhanced severity filtering of log calls sent as blog output. The blog, as used on the IP phones, is an online debugging tool that can be frequently updated and intended for technical support analysis. Blogs are defined by their format: a series of entries posted to a single page in reverse-chronological order. The IP Phone blogs are separated into modules which allow you to log specific information for analyzing.

The following table identifies the blog modules you can set.

Aastra Web UI Parameters	Configuration File Parameters
LINMGR (Line Manager information)	log module linemgr
UI (User Interface (UI) related)	log module user interface
MISC (Miscellaneous)	log module misc
SIP (Call control SIP stack)	log module sip
DIS (Display drivers)	log module dis
DSTORE (Delayed storage)	log module dstore
EPT (Endpoint module)	log module ept
IND (Indicator module)	log module ind

Aastra Web UI Parameters	Configuration File Parameters
KBD (Keyboard module)	log module kbd
NET (Network module)	log module net
PROVIS (Provisioning module)	log module provis
RTPT (Realtime Transport module)	log module rtpt
SND (Sound module)	log module snd
PROF (Profiler module)	log module prof
XML (Extension Markup Language)	log module xml
STUN (Simple Traversal of User Datagram Protocol (UDP) through Network Address Translation (NAT))	log module stun
LLDP (Link Layer Discovery Protocol)	log module lldp
BLUETOOTH (6739i only)	log module bluetooth

Setting Values for the Module/Debug Levels

There are 6 debug levels for the modules. Each debug level has a value you can use to turn individual levels ON and OFF. The following table identifies these debug levels and their values. The value of “1” (fatal errors) is the default setting for all modules.

Debug Level	Value
Fatal Errors	1 (default)
Errors	2
Warnings	4
Init	8
Functions	16
Info	32
All debug levels OFF	0
All Debug Levels ON	65535

Example 1

To turn two or more debug levels on at the same time, you add the value associated with each level. For example, Fatal Errors + Errors + Warnings = 1 + 2 + 4 = 7

```
log module linemgr: 7
log module user interface: 7
log module sip: 7
```

In the above example, fatal errors, general errors, and warnings are logged for the line manager, user interface, and SIP call control modules.

Example 2

Functions and Info = 16 + 32 = 48

```
log module dis: 48
log module net: 48
log module snd: 48
```

In the above example, functions and general information are logged for the display drivers, network, and sound modules.

Example 3

```
log module rtpt: 0
log module ind: 65535
```

In the above example, all debug levels are OFF for the Real Time Transport module. All debug levels are ON for the indicator module.

You can set the Module/Debug Levels using the configuration files or the Aastra Web UI.

References

For more information about the debug level configuration parameters, see [Appendix A](#), the section, “[Troubleshooting Parameters](#)” on [page A-221](#).

For information about configuring the log settings using the Aastra Web UI, see “[Performing Troubleshooting Tasks](#)” on [page 9-5](#).

Support Information

You can save the local and/or server configuration files of the IP phone to the location specified in the “Log Settings” section.

Performing this task allows Aastra Technical Support to view the current configuration of the IP phone and troubleshoot as necessary.

In the “Support Information” section, you can:

- **Get local.cfg**
- **Get server.cfg**
- **Show Task and Stack Status**

Aastra Technical Support uses this support information for troubleshooting the IP phone when required.

Using the Aastra Web UI and selecting “**Show Task and Stack Status**” displays the tasks and stack status on the IP phone. This screen also displays the **Free Memory** and the **Max Block Free Memory** currently on the phone as shown in the following illustration. This information is for troubleshooting purposes only.

SIGT	80033c38	DELAY	80d79980	396	4080	3684	0	1

Support Information

Get local.cfg

Get server.cfg

Get Crash Log

Show Task and Stack Status

To set log settings:

2. In the "**Log IP**" field, enter the IP address of the log server (i.e. the server to which log information will be transmitted).
3. In the "**Log Port**" field, enter the port number associated with the IP address specified in the "Log IP" field. This port passes the information from the IP phone to the IP address location.
4. Click **Save Settings** to save your settings.

Aastra Web UI

5. Click on **Operation->Reset**.
6. In the "**Restart Phone**" field click **Restart** to restart the IP phone.

To set log modules:

7. Select the applicable module.
8. Enter a debug level value in the "**Debug Level**" field for a module. Valid values are:

Debug Level	Value
Fatal Errors	1 (default)
Errors	2
Warnings	4
Init	8
Functions	16
Info	32
All debug levels OFF	0
All Debug Levels ON	65535

The value of "0" turns all debug levels OFF for a module. The value of "65535" turns all debug levels ON for a module.

To turn two or more debug levels on at the same time, you add the value associated with each level. For example, Fatal Errors + Errors + Warnings = 1 + 2 + 4 = 7

```
log module linemgr: 7
log module user interface: 7
log module sip: 7
```

In the above example, fatal errors, general errors, and warnings are logged for the line manager, user interface, and SIP call control modules.

9. Click **Save Settings** to save your settings.
10. Click on **Operation->Reset**.
11. In the "**Restart Phone**" field click **Restart** to restart the IP phone.

To perform support tasks:

12. To store the local configuration file to the specified location, click on **Save As** in the "**Get local.cfg**" field.
13. To store the server configuration file to the specified location, click on **Save As** in the "**Get server.cfg**" field.
14. To display task and stack status information, as well as Free Memory and Maximum Block Free Memory on the phone, click on **Show** in the "**Show Task and Stack Status**" field.

Note:

The local and server configuration file information and the task and stack status information is for use by Aastra Technical Support for troubleshooting purposes.

Reference

For information that describes solutions to most common problems using the IP phones, see the next section, "[Troubleshooting Solutions](#)" on page 9-12.

WatchDog Task Feature

The IP Phones include a troubleshooting feature called the "**WatchDog**" that monitors the status of the phone's tasks and provides the ability to get stack traces from the last time the phone failed. When the phone detects a failure (i.e., a crash), it automatically reboots. You can view a WatchDog crash file using the Aastra Web UI at the path, *Advanced Settings->Troubleshooting*. You can enable/disable the WatchDog task using the configuration files or the Aastra Web UI.

Enabling/Disabling WatchDog

Use the following procedure to enable/disable the WatchDog.

Configuration Files

For specific parameters you can set in the configuration files, see [Appendix A](#), the section, “WatchDog Settings” on page A-224.

Use the following procedure to enable/disable the WatchDog task for the IP Phones using the Aastra Web UI. You can also view the “Crash Log” generated by the WatchDog task using the Aastra Web UI.

Aastra Web UI

1. Click on **Advanced Settings->Troubleshooting**.

Show Task and Stack Status

Enable/Disable WatchDog Task

2. The “**WatchDog**” field is enabled by default. To disable the WatchDog task, click in the “Enabled” box to clear the check mark.
3. Click **Save Settings** to save your changes.

Aastra Web UI

View the Crash Log

4. To view a crash log, in the **“Get a Crash Log”** field, click the **SAVE AS** button. You can open the file immediately, or you can save the Crash Log to your PC.

Error Messages Display

An Administrator can view generated error messages that may have occurred during startup or reboot of the IP Phones. The IP Phone UI has a selection on the Phone Status page called, **“Error Messages”** at the location, *Options->Phone Status->Error Messages*. The Aastra Web UI also allows you to view these error messages at the location *Advanced Settings->Troubleshooting->Error Messages*. These options allow you to view error messages generated by modules during startup only (not after registration has completed). You can use this information for troubleshooting purposes or for reporting the errors to the Administrator.

The IP Phone stores and displays up to 10 error messages (any extra error messages beyond 10 are discarded). The time and date of each error message also displays. After a reboot, the previous error messages are discarded and, if applicable, new error messages display. If there are no error messages during startup or after a reboot, the message, *“No Error Messages”* displays on the screen. Error messages display in the language currently set on the phone.

The following table identifies the possible error messages that may display.

Possible Error Message	Description
Bad Certificate	A Transport Layer Security (TLS) certificate is not valid. The invalid certificate can be any of the following: <ul style="list-style-type: none"> • root and intermediate certificate • local certificate • private key filename • trusted certificate
802.1x Startup Failed	The Extensible Authentication Protocol TLS (EAP-TLS) certificates and/or the EAP-MD5 information has failed on the phone.
LLDP Startup Failed	Link Layer Discovery Protocol (LLDP) failed during startup of the phone.
HTTP Connection Manager Init Failed	The Hypertext Transfer Protocol (HTTP) connection manager initialization failed while updating the configuration on the phone.
Failed to Config Line Manager	The configuration of the Line Manager module on the phone has failed.

Viewing the Error Messages Using the IP Phone UI

Use the following procedure to view the error messages, if any, that generated during startup.

IP Phone UI

1. Press the **Options** key on the phone to enter the Options List.
2. Select **Phone Status**.
3. Select **Error Messages**.
4. If error messages display, use the UP and DOWN navigation keys to view the messages. If no error message exist, the message, *“No Error Messages”* displays on the screen.
5. When done viewing, press **Done** or **Exit** to exit the Error Messages screen.

Viewing the Error Messages Using the Aastra Web UI

Use the following procedure to view the error messages, if any, that generated during startup.

Aastra Web UI

1. Click on **Advanced Settings->Troubleshooting->Error Messages**.

Error Messages	Error Messages
Date/Time	No Error Messages
2. Scroll down to the **“Error Messages”** section to view the error messages that may have generated during startup or reboot of the IP Phone.

Warning Message Display

Previously when a phone fails to download from the first configuration server as listed in the Fully Qualified Domain Name (FQDN) server list, it attempts to download from the other servers from the list. If the phone successfully downloads from the alternate server, it would display an Error message on the idle screen. This Error message is now classified as a Warning message and is not displayed to the end user on the idle screen.

Administrators will see the warning message along with other error messages in the Web UI (**Advanced Settings -> Troubleshooting -> Error Messages**) or on the Phone UI (**Options Key -> Phone Status -> Error Messages**).

Configuration and Crash File Retrieval

In addition to using the Troubleshooting page in the Aastra Web UI, an Administrator can also use three new configuration parameters in the configuration files to enable/disable the uploading of support information to a pre-defined server. These parameters are:

- **upload system info server** - Specifies the server for which the phone sends the system and crash files.
- **upload system info manual option** - Enables and disables the ability to manually upload support information from the IP Phone UI and Aastra Web UI.
- **upload system info on crash** - Enables and disables the watchdog to automatically reboot the phone and send a crash file to the pre-defined server.

When this feature is enabled (configuration files only), support files can be automatically or manually generated and uploaded when the server detects a phone failure. An Administrator or User can manually send the files when required using the IP Phone UI or the Aastra Web UI. Each time the files are generated and uploaded, a new timestamp on the file name is created so that existing files are not overwritten on the server. File names are generated in the format **MAC ID_Date_Time_server.cfg**, **MAC ID_Date_Time_local.cfg**, and **MAC ID_Date_Time_crash.cfg**

Notes:

- The phone performs the generation and sending of Support Information in the background. This feature does not affect the use or operation of the phone.
- During a startup or reboot of the phone, an upload of Support Information is automatically generated and sent to the pre-defined server.
- This feature supports the TFTP, FTP, HTTP, and HTTPS protocols.

The following table identifies the methods you can use to retrieve support information from the phone to the pre-defined server when the above configuration parameters are enabled.

Method for Retrieving Support Info	Description
Configuration Files (automatic retrieval)	<ol style="list-style-type: none"> 1. Enter "upload system info server" parameter in the configuration files and specify the server for which the phone sends the system crash information 2. Enter "upload system info on crash: 1" to enable the phone to automatically send system crash information to the pre-defined server each time the watchdog reboots.
IP Phone UI (manual retrieval)	<ol style="list-style-type: none"> 1. On the phone, navigate to Options->Phone Status->Upload System Info. 2. Press "Select" or "Enter". The system information is immediately sent to the pre-defined server and the message "Files Sent" displays.
Aastra Web UI (manual retrieval)	<ol style="list-style-type: none"> 1. On the Aastra Web UI, navigate to Status->System Information->Support Information. 2. Press <Upload>. The system information is immediately sent to the pre-defined server and the message "Files Sent" displays.

When this feature is enabled, the phone sends the following support information files to the server:

- **Server.cfg** - File in the format **MAC ID_Date_Time_server.cfg** that contains configuration information from the aastra.cfg, the <model>.cfg, and the <mac>.cfg files. The MAC address, date, and time are specified in the file name to identify the phone sending the information, and the date and time the file was generated and sent to the server. (for example, **00093D435522_2010-02-25_1141am_server.cfg**)
- **Local.cfg** - File in the format **MAC ID_Date_Time_local.cfg** that contains information of locally modified values made using the Aastra Web UI and/or the IP Phone UI. The MAC address, date, and time are specified in the file name to identify the phone sending the information, and the date and time the file was generated and sent to the server. (for example, **00043D199345_2010-02-26_1030am_local.cfg**)
- **Crash.cfg** - (only generated if an error or crash occurs on the phone) File in the format **MAC ID_Date_Time_crash.cfg** that contains information about a current phone error/crash causing a reboot of the phone. The MAC address, date, and time are specified in the file name to identify the phone sending the information, and the date and time the file was generated and sent to the server. (for example, **00033D000111_2010-02-27_0204pm_crash.cfg**)

Configuring Crash File Retrieval Using the Configuration Files

Use the following procedure to configure crash file retrieval from the phone to a server.

Configuration Files

For specific parameters you can set in the configuration files, see [Appendix A](#), the section, "Crash File Retrieval" on page A-224.

Generating and Sending Support Information from the IP Phone UI

Use the following procedure to generate and send Support Information files to the server.

IP Phone UI

For 8 and 11-Line Phones:

1. Press  on the phone to enter the Options List.
2. Select **Phone Status**.
3. Select **Upload System Info** and press **<Select>**. The phone immediately generates the applicable Support Information files (server.cfg, local.cfg, and/or crash.cfg) and sends the files to the pre-defined server. The message "**Files Sent**" displays.

For 3-Line Phones:

1. Press  on the phone to enter the Options List.
2. Select **Phone Status**.

IP Phone UI

3. Select **Upload System Info** and press **<Enter>**. The phone immediately generates the applicable Support Information files (server.cfg, local.cfg, and/or crash.cfg) and sends the files to the pre-defined server. The message "Files Sent" displays.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Select **Status**.
3. Press **Upload**.
4. Press **Upload Sys Info**. The phone immediately generates the applicable Support Information files (server.cfg, local.cfg, and/or crash.cfg) and sends the files to the pre-defined server. The message "Files Sent" displays.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Select **Status**.
3. Press the **Sys Info** softkey. The following prompt displays:
"Upload System Info Files?"
4. Select **Yes** or press the **Upload** softkey. The phone immediately generates the applicable Support Information files (server.cfg, local.cfg, and/or crash.cfg) and sends the files to the pre-defined server. The message "Files Sent" displays.

Generating and Sending Support Information from the Aastra Web UI

Use the following procedure to generate and send Support Information files to the server.

Aastra Web UI

1. Click on **Status->System Information-> Support Information**.

2. Press **<Upload>**. The phone immediately generates the applicable Support Information files (server.cfg, local.cfg, and/or crash.cfg) and sends the files to the pre-defined server. The message "Files Sent" displays.

Limitations

- If sending the Support Information files to a folder on the server, then writing privileges must be allowed for that folder.
- If the Administrator password and username are configured in the Server.cfg file, a User can retrieve that information after the Server.cfg file is loaded to the server.
- TFTP does not report transmission failure if the destination server is down. In this case, the Support Information files are not sent.

Troubleshooting Solutions

Description

This section describes solutions to some most common problems that can occur while using the IP phones.

Why does my phone display “Application missing”?

If you have experienced networking issues while the phone was downloading the application from the TFTP server, it is possible that the phone can no longer retrieve the required firmware file. In the event that the phone is no longer able to communicate with the TFTP server in its attempt to re-download the firmware and the phone cannot locate the application locally, the message "Application missing" displays.

The phone also displays the following: "Recovery web-client at: <IP Address>". The IP Address displayed is the IP address of the phone. If the phone is unable to receive an IP from the DHCP server or has lost its record of its static IP, the phone auto-assigns itself the default IP 192.168.0.50.

To recover the firmware for your phone in this circumstance, please perform the following:

1. Launch your web browser on your computer.

Note:

Your computer needs to be on the same network as your IP Phone.

2. In the URL, type: "**http://<IP Address>**" (where IP Address is the IP Address displayed on the phone). Your browser launches the **Aastra IP Phone Firmware Recovery** page.
3. Call Customer Support and request a <phone model>.st file.
4. Copy the file to your TFTP server.
5. Enter the <phone model>.st file that is ready for download.
6. Enter the IP address or qualified domain name of the TFTP server.
7. Press the Download Firmware button.

Please ensure that the TFTP server is running and accessible on the network. If the firmware file is correctly located on the running TFTP server, the phone will locate the file and reload the application onto the phone.

Why does my phone display the “No Service” message?

The phone displays the "**No Service**" message if it is not able to successfully register with the Registrar. If the Registrar is up and running the SIP settings may not have not been set up correctly.

The Registrar server could be set to 0.0.0.0. A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone. The phone displays "**No Service**".

If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e., line 1, line 2, etc.), then the register request is not sent, the "**No Service**" message does not display, and the message waiting indicator (MWI) does not come on.

Check that the "**Registrar Server**" IP address in the Aastra Web UI at **Advanced Settings->Global SIP** is correct. Check the "**sip registrar ip**" parameter in the configuration files is correct.

Why does my phone display "Bad Encrypted Config"?

The IP phone displays "Bad Encrypted Config" because encrypted configuration files are enabled but the decryption process has failed. Specific cases where decryption fails are:

Reason

The site-specific password in *security.tuz* does not match the password used to encrypt the *<mac>.tuz* or *aastra.tuz* files.

Fix

Encrypt the *.cfg* files to *.tuz* using the correct password, or replace the *security.tuz* with the correct encrypted file.

Reason

Neither of the *<mac>.tuz* and *aastra.tuz* files are present on the configuration server (TFTP/FTP/HTTP).

Fix

Create the encrypted files using *anacrypt.exe* and copy them to the configuration server.

Reason

The encrypted *<mac>.tuz* or *aastra.tuz* file is encrypted using a different version of *anacrypt.exe* than the phone firmware.

Fix

Run "*anacrypt.exe -v*" and confirm that the correct version is reported, compared to the phone firmware version.

Why is my phone not receiving the TFTP IP address from the DHCP Server?

For DHCP to automatically populate the IP address or qualified domain name for the TFTP server, your DHCP server must support Option 66. Option 66 is responsible for forwarding the TFTP server IP address or domain name to the phone automatically. If your DHCP server does not support Option 66, you must manually enter the IP address or qualified domain name for the TFTP server into your IP phone configuration.

Additionally, the phone may not be receiving the TFTP IP address if there are other DHCP servers within the same broadcast domain providing different Option 66 (TFTP server) settings. See "DHCP" on [page 4-3](#) for more information on option precedence.

For procedures on configuring the TFTP server using the IP phone UI and the Aastra Web UI, see Chapter 4, the section, "Configuring the Configuration Server Protocol" on [page 4-87](#).

For specific protocol parameters you can set in the configuration files, see Appendix A, the section, "Configuration Server Settings" on [page A-16](#).

How do I restart the IP phone?

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Restart Phone**.
3. For 3-Line LCD Displays:
Press # to confirm.

Note:

To cancel the Restart, press the  key.

For 8 and 11-Line LCD Displays:

Press **Restart**.

Note:

To cancel the Restart, press **Cancel**.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press **Restart**. The following prompt displays:
"Restart the phone?"
3. Press **<Yes>** to restart the phone
or
Press **<No>** to go back to the Options Screen.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Select **Restart**. The following prompt displays:
"Restart phone?"
3. Select **Yes** or press the Restart softkey to restart the phone
or
Select **No** or press the Cancel softkey to go back to the Options Screen.

Aastra Web UI

1. Click on **Operation->Reset->Phone**.

2. Click **Restart** to restart the phone.

How do I set the IP phone to factory default?

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu** and enter your Administrator Password (default is **22222**).
3. Select **Factory Default**.
4. For 3-Line LCD Displays:
The “Restore Defaults?” prompt displays.
Press # to confirm.

For 8 and 11-Line LCD Phones
The “Reset phone to factory defaults?” prompt displays.
Press **Default** to confirm.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press **Advanced** and enter your Administrator password using the pop-up keyboard that displays. (Default is **22222**).
3. Press **Reset**.
The “Reset Configuration?” prompt displays.
4. Press **Factory Default**.
The phone immediately sets the phone to factory defaults and automatically restarts the phone.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the Advanced softkey and enter your Administrator password using the keypad keys. (Default is **22222**).
3. Select **Reset**.
The “Reset Configuration?” prompt displays.
4. Select **Factory Default**.
The “Factory Default?” prompt displays.
5. Select **Yes** or press the **Reset** softkey to factory default the phone.
The phone immediately sets the phone to factory defaults and automatically restarts the phone.

Aastra Web UI

1. Click on **Operation->Reset->Current Settings**.

2. In the **"Restore to Factory Defaults"** field, click **Restore**.

This restores all factory defaults, and removes any saved configuration and directory list files.

How do I erase the phone's local configuration?

IP Phone UI

1. Press  on the phone to enter the Options List.
2. Select **Administrator Menu** and enter your Administrator Password (default is **22222**).
3. Select **Erase Local Config**.
4. For 3-Line LCD Displays:
The *"Erase local config?"* prompt displays.
Press **#** to confirm.

For 8 and 11-Line LCD Displays:
The *"Erase local config?"* prompt displays.
Press **Erase** to confirm.

For the 6739i:

1. Press  on the phone to enter the Options List.
2. Press **Advanced** and enter your Administrator password using the pop-up keyboard that displays. (Default is **22222**).
3. Press **Reset**.
The *"Reset Configuration?"* prompt displays.
4. Press **Erase Local Cfg**.
The phone immediately erases the local configuration and automatically restarts the phone.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Press the Advanced softkey and enter your Administrator password using the keypad keys. (Default is **22222**).
3. Select **Reset**.
The *"Reset Configuration?"* prompt displays.

IP Phone UI

4. Select **Erase Local Config.**

The "Erase Local Configuration?" prompt displays.

5. Select **Yes** or press the **Reset** softkey to erase the local configuration.

The phone immediately erases the local configuration and automatically restarts the phone.

Aastra Web UI

1. Click on **Operation->Reset->Current Settings.**

2. In the "**Remove Local Configuration Settings**" field, click **Remove.**

This removes the last customized configuration settings made on the phone.

How to reset a user's password?

IP Phone UI

1. Press  on the phone to enter the Options List.

2. Select **User Password.**

3. Enter the current user password.

4. Press **Enter.**

5. Enter the new user password.

Note:

The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.

6. Press **Enter.**

7. Re-enter the new user password.

8. Press **Enter.**
A message, "Password Changed" displays on the screen.

For the 6739i:

1. Press  on the phone to enter the Options List.

2. Press **Password.**

3. Press the **<Current Password>** field. A keyboard displays on the screen.

IP Phone UI

4. Enter the current user password in the text box and press the <Enter> key on the keyboard.
5. Press the <New Password> field.
6. Enter the new user password in the text box and press the <Enter> key on the keyboard.
7. Press the <Re-enter Password> field.
8. Re-enter the new user password in the text box and press the <Enter> key on the keyboard.
9. Press <Save>.
A message, "**Password Changed**" displays on the screen.

For the 6867i:

1. Press  on the phone to enter the Options List.
2. Select **Lock > Password**.
3. Enter the current password in the <Current Password> field.
4. Press the down navigation key and enter the new password in the <New Password> field.
5. Press the down navigation key and enter the new password again in the <Re-enter Password> field.
6. Press the **Save** softkey.
A message, "**Password Changed**" displays on the screen.

Aastra Web UI

1. Click on **Operation->User Password**.

Reset User Password

Please enter the current and new passwords

Current Password	<input type="text"/>
New Password	<input type="text"/>
Password Confirm	<input type="text"/>

2. In the "**Current Password**" field, enter the current user password.
3. In the "**New Password**" field, enter the new user password.
4. In the "**Confirm Password**" field, enter the new user password again.
5. Click **Save Settings** to save your changes.

How do I lock and unlock the phone?

IP Phone UI

Lock the phone:

1. Press  on the phone to enter the Options List.
2. Select **Phone Lock**.
The prompt, "Lock the phone?" displays.
3. Press **Lock** to lock the phone.

Unlock the phone:

1. Press  on the phone to enter the Options List.
The prompt, "To unlock the phone...Password:"
2. Enter the user or administrator password and press **Enter**.
The phone unlocks.

For 6739i:

IP Phone UI

Lock the phone:

1. Press  on the phone to enter the Options List.
2. Select **Lock**.
The prompt, "Lock the phone?" displays.
3. Press **Yes** to lock the phone.
The phone locks.

Unlock the phone:

1. Press  on the phone to enter the Options List.
A "Phone is Locked" screen displays allowing you to press an "Unlock the Phone" button.
2. Press **Unlock the Phone**.
A prompt, "Enter Unlock Password" displays as well as a keyboard.
3. Enter the user or administrator password and press **Enter**. Default is "22222".
A prompt "Unlock the Phone?" displays.
4. Press **Yes** to unlock the phone.
The phone unlocks.

For 6867i:

IP Phone UI

Lock the phone:

1. Press  on the phone to enter the Options List.

IP Phone UI

2. Select **Lock > Phone Lock**.

The prompt, "Lock the phone?" displays.

3. Select **Yes** or press the **Lock** softkey to lock the phone.

Unlock the phone:

1. Press  on the phone to enter the Options List.
An "Enter Unlock Password" prompt displays.
2. Enter the user or administrator password and press **Enter**. Default is "22222".
A prompt "Unlock the Phone?" displays.
3. Select **Yes** or press the **Unlock** softkey to unlock the phone.

Aastra Web UI

1. Click on **Operation->Phone Lock**.

Phone Lock

Lock or unlock the phone

Emergency Dial Plan

Lock the phone?

Reset User Password

Lock the phone:

2. In the "Lock the Phone?" field, click **Lock**.

The phone locks dynamically and displays the following message:
"Phone is locked".

Unlock the phone:

3. Click on **Operation->Phone Lock**.

4. In the "Unlock the Phone?" field, click **Unlock**.

The phone unlocks dynamically and displays the following message:
"Phone is unlocked".

Appendix A

Configuration Parameters

About this Appendix

This appendix describes the parameters you can set in the configuration files for the IP phones. The configuration files include `aastra.cfg`, `<model>.cfg`, and `<mac.cfg>`.

Topics

This appendix covers the following topics:

Topic	Page
Setting Parameters in Configuration Files	page A-6
Operational, Basic, and Advanced Parameters	page A-6
Simplified IP Phone UI Options Menu	page A-7
Network Settings	page A-8
DHCP Option Settings	page A-12

Setting Parameters in Configuration Files

You can set specific configuration parameters in the configuration files for configuring your IP phone. The *aastra.cfg*, *<model>.cfg*, and *<mac>.cfg* files are stored on the server. The *aastra.cfg* file stores global IP phone configuration settings. The *<model>.cfg* file contains model specific information. The *<mac>.cfg* file stores configuration settings specific to the IP phone with that MAC address. When you restart the IP phone, these files are downloaded to the phone.

If you make changes to the phone configuration, the changes are stored in a local configuration on the phone (not on the server).

Configuration changes made to the *<model>.cfg* file override the configuration settings in the *aastra.cfg* file. Configuration changes made to the *<mac>.cfg* file override the configuration settings in the *<model>.cfg* and *aastra.cfg* files.

Note:

Configuration parameters that you enter in the configuration files are NOT case sensitive.

Reference

For information about configuration file precedence, see Chapter 1, the section, “[Configuration File Precedence](#)” on [page 1-51](#).

This section includes the following types of configurable parameters:

- [Operational, Basic, and Advanced Parameters](#) on [page A-6](#)
- [Mapping Key Settings](#) on [page A-152](#)
- [Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters](#) on [page A-156](#)
- [Advanced Operational Parameters](#) on [page A-205](#)
- [Troubleshooting Parameters](#) on [page A-221](#)

Operational, Basic, and Advanced Parameters

The following sections provide the configuration parameters you can configure on the IP phone. Each parameter table includes the name of the parameter, a description, the format, default value, range, and example. The table also provides in which configuration file the parameter can be defined (*aastra.cfg*, *<model>.cfg*, *<mac>.cfg*).

Simplified IP Phone UI Options Menu

Parameter – <i>options simple menu</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg																																									
Description	Allows you to enable a simplified options menu or enable the full menu on the IP Phone UI.																																									
	<table border="1"> <thead> <tr> <th data-bbox="500 359 824 394">Full Options Menu</th> <th data-bbox="833 359 1265 394">Simplified Options Menu</th> </tr> </thead> <tbody> <tr> <td data-bbox="500 405 824 436">Call Forward</td> <td data-bbox="833 405 1265 436">Call Forward</td> </tr> <tr> <td data-bbox="500 447 824 699">Preferences</td> <td data-bbox="833 447 1265 699"> Preferences <ul style="list-style-type: none"> • Tones • Display (8 and 11-Line LCD phones only) • Contrast Level (3-Line LCD phones only) • Set Audio (8 and 11-Line LCD phones only) • Handset Pairing (9480i CT and 6757i CT) </td> </tr> <tr> <td data-bbox="500 709 824 741">Phone Status</td> <td data-bbox="833 709 1265 741">Phone Status</td> </tr> <tr> <td data-bbox="500 751 824 783">Password</td> <td data-bbox="833 751 1265 783">Removed</td> </tr> <tr> <td data-bbox="500 793 824 825">Administrator Menu</td> <td data-bbox="833 793 1265 825">Removed</td> </tr> <tr> <td data-bbox="500 835 824 867">Restart Phone</td> <td data-bbox="833 835 1265 867">Accessible through Phone Status</td> </tr> <tr> <td data-bbox="500 877 824 909">Phone Lock</td> <td data-bbox="833 877 1265 909">Phone Lock</td> </tr> <tr> <td colspan="2" data-bbox="500 930 1265 961">For 6739i</td> </tr> <tr> <th data-bbox="500 972 824 1008">Full Options Menu</th> <th data-bbox="833 972 1265 1008">Simplified Options Menu</th> </tr> <tr> <td data-bbox="500 1018 824 1050">Audio</td> <td data-bbox="833 1018 1265 1050">Audio</td> </tr> <tr> <td data-bbox="500 1060 824 1092">Display</td> <td data-bbox="833 1060 1265 1092">Display</td> </tr> <tr> <td data-bbox="500 1102 824 1134">Set Time</td> <td data-bbox="833 1102 1265 1134">Removed</td> </tr> <tr> <td data-bbox="500 1144 824 1176">Language</td> <td data-bbox="833 1144 1265 1176">Removed</td> </tr> <tr> <td data-bbox="500 1186 824 1218">Bluetooth</td> <td data-bbox="833 1186 1265 1218">Bluetooth</td> </tr> <tr> <td data-bbox="500 1228 824 1260">Softkeys</td> <td data-bbox="833 1228 1265 1260">Removed</td> </tr> <tr> <td data-bbox="500 1270 824 1302">Status</td> <td data-bbox="833 1270 1265 1302">Status</td> </tr> <tr> <td data-bbox="500 1312 824 1344">Advanced</td> <td data-bbox="833 1312 1265 1344">Removed</td> </tr> <tr> <td data-bbox="500 1354 824 1386">Password</td> <td data-bbox="833 1354 1265 1386">Removed</td> </tr> <tr> <td data-bbox="500 1396 824 1428">Restart</td> <td data-bbox="833 1396 1265 1428">Accessible through Status</td> </tr> <tr> <td data-bbox="500 1438 824 1470">Lock</td> <td data-bbox="833 1438 1265 1470">Lock</td> </tr> </tbody> </table>	Full Options Menu	Simplified Options Menu	Call Forward	Call Forward	Preferences	Preferences <ul style="list-style-type: none"> • Tones • Display (8 and 11-Line LCD phones only) • Contrast Level (3-Line LCD phones only) • Set Audio (8 and 11-Line LCD phones only) • Handset Pairing (9480i CT and 6757i CT) 	Phone Status	Phone Status	Password	Removed	Administrator Menu	Removed	Restart Phone	Accessible through Phone Status	Phone Lock	Phone Lock	For 6739i		Full Options Menu	Simplified Options Menu	Audio	Audio	Display	Display	Set Time	Removed	Language	Removed	Bluetooth	Bluetooth	Softkeys	Removed	Status	Status	Advanced	Removed	Password	Removed	Restart	Accessible through Status	Lock

Dialpad	Removed																				
Restart	Restart																				
Warning: When using the simplified menu, you cannot change the Network settings from the IP Phone UI. If the network settings become mis-configured, you must “factory default” the phone and use the full menu to recover the network settings from the Phone UI OR use the Aastra Web UI to configure the network settings.																					
Format	Boolean																				
Default Value	0 (full options menu)																				
Range	0 (full options menu) 1 (simplified options menu)																				
Example	options simple menu: 1																				

Network Settings

Parameter – <i>dhcp</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enables or disables DHCP. Enabling DHCP populates the required network information. The DHCP server serves the network information that the IP phone requires. If the IP phone is unable to get any required information, then you must enter it manually. DHCP populates the following network information:</p> <p>IP Address, Subnet Mask, Gateway, Domain Name System (DNS) servers, TFTP, HTTP, HTTP Port, HTTPS, HTTPS Port, and FTP servers, and Timer servers.</p> <p>Note: For DHCP to automatically populate the IP address or qualified domain name for the TFTP server, your DHCP server must support Option 66.</p>
Format	Integer
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	dhcp: 1

Parameter – <i>ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter assigns a static IP address to the IP phone device. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address
Default Value	0.0.0.0
Range	Not Applicable
Example	ip: 192.168.0.25

Parameter – <i>subnet mask</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Subnet mask defines the IP address range local to the IP phone. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address
Default Value	255.255.255.0
Range	Not Applicable
Example	subnet mask: 255.255.255.224

Parameter – <i>default gateway</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address of the network's gateway or default router IP address. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address
Default Value	1.0.0.1
Range	Not Applicable
Example	default gateway: 192.168.0.1

Parameter – <i>dns1</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Primary DNS server IP address. For any of the IP address settings on the IP phone a domain name value can be entered instead of an IP address. With the help of the DNS servers the domain names for such parameters can then be resolved to their corresponding IP addresses. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address
Default Value	0.0.0.0
Range	Not Applicable
Example	dns1: 192.168.0.5

Parameter – <i>dns2</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	A service that translates domain names into IP addresses. To assign static DNS addresses, disable DHCP. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address
Default Value	0.0.0.0
Range	Not Applicable
Example	dns2: 192.168.0.6

Parameter – <i>ethernet port 0</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The send (TX) and receive (RX) method to use on Ethernet port 0 to transmit and receive data over the LAN.
Format	Integer
Default Value	0
Range	0 - Auto Negotiate 1 - Full Duplex, 10Mbps 2 - Full Duplex, 100Mbps 3 - Full Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only) 4 - Half Duplex, 10Mbps 5 - Half Duplex, 100Mbps 6 - Half Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)
Example	ethernet port 0: 4

Parameter – <i>ethernet port 1</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The send (TX) and receive (RX) method to use on Ethernet port 1 to transmit and receive data over the LAN. Note: PC Port parameters are not applicable to the 6730i IP Phone.
Format	Integer
Default Value	0
Range	0 - Auto Negotiate 1 - Full Duplex, 10Mbps 2 - Full Duplex, 100Mbps 3 - Full Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only) 4 - Half Duplex, 10Mbps 5 - Half Duplex, 100Mbps 6 - Half Duplex, 1000Mbps (applicable for the 6739i, 6735i, 6737, 6865i, and 6867i IP phones only)
Example	ethernet port 1: 2

Parameter – <i>pc port passthru enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the PC port. Note: PC Port parameters are not applicable to the 6730i IP Phone.
Format	Integer
Default Value	1 (enable)
Range	0 (disable) 1 (enable)
Example	pc port passthru enabled: 1

DHCP Option Settings

Option 12

Parameter– hostname	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the hostname DHCP Option 12 that the phone sends with the DHCP Request packet. Note: If you change this parameter, you must restart your phone for the change to take affect.
Format	String
Default Value	[<model><MAC IP Address>]
Range	Up to 64 alpha-numeric characters Note: The value for this parameter can also be a fully qualified domain name.
Example	hostname: aastra4

Option 77

Parameter– dhcp userclass	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the User Class DHCP Option 77 that the phone sends to the configuration server with the DHCP Request packet. Note: If you specify a value for this parameter, you must restart your phone for the change to take affect. Any change in its value during start-up results in an automatic reboot.
Format	String
Default Value	""
Range	Up to 64 alpha-numeric characters
Example	dhcp userclass: admin

Option 120

Parameter – use dhcp option 120	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables support for DHCP Option 120 on the IP phones. DHCP Option 120 allows SIP clients to locate a local SIP server (i.e. outbound proxy server) that can be used for all outbound SIP requests.
Format	Boolean
Default Value	0 (disabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	use dhcp option 120: 1

Options 159 and 160 - DHCP Option Override

Parameter – <i>dhcp config option override</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The value specified for this parameter overrides the precedence order for determining a configuration server. Note: You must restart the IP Phone for this parameter to take affect.
Format	Integer
Default Value	0 (Any - no override - uses normal precedence order of 43, 160, 159, 66)
Range	-1 (Disabled - ignores all DHCP configuration options (43, 66, 159, 160) 0 (Any) 43 66 159 160
Example	dhcp config option override: 66

Options 132 - Transfer VLAN ID Assignment Using DHCP

Parameter – <i>dhcp option 132 vlan id enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables the phone to transport the VLAN ID parameter in the DHCP protocol. When the phone receives the VLAN ID from the DHCP and the value is different from the one used by the phone to trigger the DHCP request, the phone reboots and then sends a new DHCP request in the new VLAN. The phone will remember the VLAN ID obtained by DHCP options so that on a reboot, the phone will send a DHCP request using the correct VLAN.
Format	Integer
Default value	1 (enabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	dhcp option 132 vlan id enabled: 0

Password Settings

Parameter – <i>admin password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to set a new administrator password for the IP phone. Note: The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.
Format	Integer
Default Value	22222
Range	0-4294967295
Example	admin password: 1234567890

Parameter – <i>user password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to set a new user password for the IP phone. Note: The IP phones support numeric characters only in passwords. If you enter a password with alpha characters, the phone uses the default password instead.
Format	Integer
Default Value	Default value is an empty string "" (left blank)
Range	0-4294967295
Example	user password: 123

Parameter – <i>options password enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables password protection of the Options key on the IP phone. If enabled, upon pressing the Options key, a user has to enter a password at the IP phone UI. If the password is entered correctly, the user is allowed to gain access to the Options Menu and no more password prompts display for other password protected screens. If the user fails to enter the correct password in three attempts, access to the Options Menu is denied and the IP phone returns to the idle screen. Note: The password to enter is the administrator password configured for that phone.
Format	Boolean
Default Value	0
Range	0 (false; not password protected) 1 (true; password protected)
Example	options password enabled: 1

Emergency Dial Plan Settings

Parameter – <i>emergency dial plan</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg												
Description	<p>Allows you to specify an emergency number to use on your IP phone so a caller can contact emergency services in the local area when required.</p> <p>The default emergency numbers on the IP phones is 911, 999, 112, and 110. 911 - A United States emergency number. 999 - A United Kingdom emergency number. 112 - An international emergency telephone number for GSM mobile phone networks. In all European Union countries it is also the emergency telephone number for both mobile and fixed-line telephones. 110 - A police and/or fire emergency number in Asia, Europe, Middle East, and South America.</p> <table> <thead> <tr> <th>Dial plan (characters)</th> <th>Length (bytes)</th> </tr> </thead> <tbody> <tr> <td>911</td> <td>14</td> </tr> <tr> <td>4xx</td> <td>18</td> </tr> <tr> <td>x+## xx+*</td> <td>35</td> </tr> <tr> <td>911 999 112 110 450</td> <td>54</td> </tr> <tr> <td>911 112 011XX+# 101XX+# 1[2-3]XXXXXXXXXX [4-5]XXXXXXXXXX [6-7]XXXXXXXXXX,3 [8-9]XXXXXXXXXX,2 XX+* XX+# *XXX+# #XX+# 4xx,2</td> <td>325</td> </tr> </tbody> </table> <p>Note: Contact your local phone service provider for available emergency numbers in your area.</p>	Dial plan (characters)	Length (bytes)	911	14	4xx	18	x+## xx+*	35	911 999 112 110 450	54	911 112 011XX+# 101XX+# 1[2-3]XXXXXXXXXX [4-5]XXXXXXXXXX [6-7]XXXXXXXXXX,3 [8-9]XXXXXXXXXX,2 XX+* XX+# *XXX+# #XX+# 4xx,2	325
Dial plan (characters)	Length (bytes)												
911	14												
4xx	18												
x+## xx+*	35												
911 999 112 110 450	54												
911 112 011XX+# 101XX+# 1[2-3]XXXXXXXXXX [4-5]XXXXXXXXXX [6-7]XXXXXXXXXX,3 [8-9]XXXXXXXXXX,2 XX+* XX+# *XXX+# #XX+# 4xx,2	325												
Format	Integer												
Default Value	911 999 112 110												
Range	Up to 512 characters												
Example	emergency dial plan: 911 999												

Emergency Call Behavior Settings

Parameter – <i>emergency call connection hold enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>If enabled, this parameter changes the behavior of the IP phones when an emergency call (i.e. a call made to an emergency number matching one of the values defined in the “emergency dial plan” parameter) is placed. The IP phones will ensure that the voice/audio path and other resources associated with the emergency call are continually active and any functions that could reduce the “continuous reachability” of the caller are disabled. Additionally, the only way the call can be terminated is if the emergency services agent ends the call.</p>
Format	Boolean
Default Value	0 (disabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	emergency call connection hold enabled: 1

User Dial Plan Setting

Parameter – <i>sip user parameter dial plan</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The dial plan that the network uses to distinguish between a real PSTN number and a number that looks like a PSTN number but is actually on an IP network. Note: You can configure the “sip user parameter dial plan” parameter on a global basis only. If it is misconfigured, then the parameter is ignored. Entering no value disables this feature.
Format	Alpha-numeric characters
Default Value	Blank
Range	Up to 512 characters (more than 512 characters disables this parameter).
Example	sip user parameter dial plan: 6xx 8xxxx 9xxxxxxxx

Aastra Web UI Settings

Parameter – <i>web interface enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Aastra Web UI interface for a single IP phone when this parameter is entered in the <mac>.cfg file. Enables or disables the Aastra Web UI interface for all phones when this parameter is placed in the <i>aastra.cfg</i> file.
Format	Integer
Default Value	1 (admin/user enabled)
Range	0 (admin/user disabled) 1 (admin/user enabled) 2 (only admin enabled)
Example	web interface enabled: 1

Configuration Server Settings

Parameter – <i>download protocol</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Protocol to use for downloading new versions of software to the IP phone.
Format	Text
Default Value	TFTP
Range	TFTP FTP HTTP HTTPS
Example	download protocol: HTTPS

Parameter – <i>tftp server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The TFTP server's IP address. If DHCP is enabled and the DHCP server provides the information, this field is automatically populated. Use this parameter to change the IP address or domain name of the TFTP server. This will become effective after this configuration file has been downloaded into the phone. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address or qualified domain name
Default Value	0.0.0.0
Range	Not Applicable
Example	tftp server: 192.168.0.130

Parameter – <i>tftp path</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the path name for which the configuration files reside on the TFTP server for downloading to the IP Phone. Note: Enter the path name in the form <i>folderX\folderX\folderX</i> . For example, <i>iphone\6757\configfiles</i> .
Format	String
Default Value	Not Applicable
Range	Up to 256 alphanumeric characters
Example	tftp path: configs\tftp

Parameter – <i>alternate tftp server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The alternate TFTP server's IP address or qualified domain name. This will become effective after this configuration file has been downloaded into the phone.
Format	IP address or qualified domain name
Default Value	0.0.0.0
Range	Not Applicable
Example	alternate tftp server: 192.168.0.132

Parameter – <i>alternate tftp path</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies a path name for which the configuration files reside on an alternate TFTP server for downloading to the IP Phone. Note: Enter the path name in the form <i>folderX\folderX\folderX</i> . For example, <i>iphone\6757i\configfiles</i> .
Format	String
Default Value	Not Applicable
Range	Up to 256 alphanumeric characters
Example	alternate tftp path: configs/alternate

Parameter – <i>use alternate tftp</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the alternate TFTP server. Valid values are "0" disabled and "1" enabled.
Format	Not Applicable
Default Value	0
Range	0 or 1
Example	use alternate tftp: 1

Parameter – <i>ftp server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The FTP server's IP address or network host name. This will become effective after this configuration file has been downloaded into the phone. Optional: You can also assign a username and password for access to the FTP server. See the following parameters for setting username and password. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	ftp server: 192.168.0.131

Parameter – <i>ftp path</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies a path name for which the configuration files reside on an FTP server for downloading to the IP Phone. Note: Enter the path name in the form <i>folderX\folderX\folderX</i> . For example, <i>ipphone\6757i\configfiles</i> .
Format	String
Default Value	Not Applicable
Range	Up to 256 alphanumeric characters
Example	ftp path: configs\ftp

Parameter – <i>ftp username</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The username to enter for accessing the FTP server. This will become effective after this configuration file has been downloaded into the phone. Note: The IP Phones support usernames containing dots ("").
Format	Text
Default Value	Not Applicable
Range	Up to 63 alphanumeric characters
Example	ftp username: 6757iaastra

Parameter – <i>ftp password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The password to enter for accessing the FTP server. This will become effective after this configuration file has been downloaded into the phone.
Format	Text
Default Value	Not Applicable
Range	Up to 63 alphanumeric characters
Example	ftp password: 1234

Parameter – <i>http server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The HTTP server's IP address. This will become effective after this configuration file has been downloaded into the phone. Optional: You can also assign an HTTP relative path to the HTTP server. See the next parameter (http path). Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	http server: 192.168.0.132

Parameter – <i>http path</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The HTTP path name to enter. If the IP phone's configuration and firmware files are located in a sub-directory beneath the server's HTTP root directory, the relative path to that sub-directory should be entered in this field.
Format	dir/dir/dir
Default Value	Not Applicable
Range	Up to 256 alphanumeric characters
Example	http path: ipphones/6757i

Parameter – <i>http port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the HTTP port that the server uses to load the configuration to the phone over HTTP. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	Integer
Default Value	80
Range	1 through 65535
Example	http port: 1025

Parameter – <i>https server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The HTTPS server's IP address. This will become effective after this configuration file has been downloaded into the phone. Optional: You can also assign an HTTPS relative path to the HTTPS server. See the next parameter (https path). Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address or Fully Qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	https server: 192.168.0.143

Parameter – <i>https path</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The HTTPS path name to enter. If the IP phone's configuration and firmware files are located in a sub-directory beneath the server's HTTPS root directory, the relative path to that sub-directory should be entered in this field.
Format	dir/dir/dir
Default Value	Not Applicable
Range	Up to 256 alphanumeric characters
Example	https path: ipphones/6755i

Parameter – <i>https port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the HTTPS port that the server uses to load the configuration to the phone over HTTPS. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	Integer
Default Value	443
Range	1 through 65535
Example	https port: 1025

Parameter – <i>auto resync mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Determines whether the configuration server automatically updates the configuration files only, the firmware only, both the firmware and configuration files, or disables automatic updates.</p> <p>This parameter works with TFTP, FTP, HTTP and HTTPS servers.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • None (0) - Disable auto-resync • Configuration Files (1) - Updates the configuration files on the IP phone automatically at the specified time if the files on the server have changed. • Firmware (2) - Updates the firmware on the IP phone automatically at the specified time if the files on the server have changed. • Both (3) - Updates the configuration files and firmware automatically at the specified time if the files on the server have changed. <p>Notes:</p> <ul style="list-style-type: none"> • If a user is accessing the Aastra Web UI, they are not informed of an auto-reboot. • Any changes made using the Aastra Web UI or the IP phone UI are not overwritten by an auto-resync update. Auto-resync affects the configuration files only. However, the settings in the Aastra Web UI take precedence over the IP phone UI and the configuration files. • The resync time is based on the local time of the IP phone. • If the IP phone is in use (not idle) at the time of the resync check, the reboot occurs when the phone becomes idle. • The automatic update feature works with both encrypted and plain text configuration files.
Format	Integer
Default Value	0
Range	0 (none) 1 (configuration files only) 2 (firmware only) 3 (configuration files and firmware)
Example	auto resync mode: 1

Parameter – <i>auto resync time</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the time of day in a 24-hour period for the IP phone to be automatically updated. This parameter works with TFTP, FTP, HTTP and HTTPS servers. Notes: <ul style="list-style-type: none"> • The resync time is based on the local time of the IP phone. • The value of 00:00 is 12:00 A.M. • When selecting a value for this parameter in the Aastra Web UI, the values are in 30-minute increments only. • When entering a value for this parameter using the configuration files, the value can be entered using minute values from 00 to 59 (for example, the auto resync time can be entered as 02:56). • Auto-Resync adds up to 15 minutes random time to the configured time. For example, if the auto resync time parameter is set to 02:00, the event takes place any time between 02:00 and 02:15. • When the language on the phone is set to French or Spanish, you must enter the time in the format "00h00" (configuration files only).
Format	hh:mm 00h00 (for French and Spanish configuration files)
Default Value	00:00
Range	hh = 00 to 23 mm = 00 to 59
Example	auto resync time: 03:24

Parameter– <i>auto resync max delay</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the maximum time, in minutes, the phone waits past the scheduled time before starting a checksync.
Format	Integer
Default Value	15
Range	0-1439
Example	auto resync max delay: 20

Parameter– <i>auto resync days</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the amount of days that the phone waits between checksync operations. Note: A value of 0 causes the phone to checksync every time the clock reads the proper time. A value of 1 forces the phone to wait 24 hours prior to doing the first checksync.
Format	Integer
Default Value	0
Range	0-364
Example	auto resync days: 1

Multiple Configuration Server Settings

Parameter – <i>firmware server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies either a full or partial URL of a server (other than the original configuration server) from which the phones in the network get their firmware. Note: The default method for the update of firmware to the phones is from the original configuration server. The Administrator must specify a correct server URL for the phones to get their firmware information from that server. If the URL is incorrect, no firmware download occurs to the phones from the specified server.
Format	String (up to 256 characters) FTP "ftp://username:password@0.0.0.0:port/path" TFTP "tftp://0.0.0.0:port/path" HTTP "http://0.0.0.0:port/path" HTTPS "https://0.0.0.0:port/path" Partial URL "/path"
Default Value	Blank
Range	Not Applicable
Example	firmware server: Leaving this parameter blank downloads all configuration and firmware files from the original configuration server. firmware server: tftp://10.30.102.158/test1 The above example uses TFTP to download all firmware files that exist in the "test1" directory on the specified server, to the phones. firmware server: /path The above example uses the configuration server that is linked to the partial path to load the firmware.

Additional Information

The directory files, language packs, TLS certificate files, 802.1x certificate files, and HTTPS files can also be downloaded to the phone from a server other than the configuration server. For each of these types of files, you can specify a URL (server IP address) from which the phone gets these files. You can use existing parameters on the phone to specify the URL. For more information about this feature, refer to [Chapter 1](#), the section, "Directory Files, Language Packs, TLS Certificates, 802.1x Certificates, HTTPS Files and Multiple Configuration Servers" on page 1-53.

For information on configuring the directory, language pack, TLS certificates, 802.1x certificates, and HTTPS parameters, see the applicable parameters in this Appendix.

Network Address Translation (NAT) Settings

Parameter – <i>sip nat ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	IP address of the network device that enforces NAT.
Format	IP Address
Default Value	0.0.0.0
Range	Not Applicable
Example	sip nat ip: 192.245.2.1

Parameter – <i>sip nat port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Port number of the network device that enforces NAT.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip nat port: 51620

Parameter – <i>sip nat rtp port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Indicates the port through which the RTP packets are sent. This value must specify the beginning of the RTP port range on the gateway or router.</p> <p>The RTP port is used for sending DTMF tones and for the audio stream. Your network administrator may close some ports for security reasons. You may want to use this parameter to send RTP data using a different port.</p> <p>Note: The phones support decoding and playing out DTMF tones sent in SIP INFO requests. The following DTMF tones are supported:</p> <ul style="list-style-type: none"> • Support signals 0-9, #, * • Support durations up to 5 seconds
Format	Integer
Default Value	51720
Range	Not Applicable
Example	sip nat rtp port: 51730

Rport Setting

Parameter – <i>sip rport</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to enable (1) or disable (0) the use of Rport on the IP phone. "Rport" in RFC 3581, allows a client to request that the server send the response back to the source IP address and the port from which the request came. Note: Configuring the Rport parameter is recommended for clients behind a Network Address Translation (NAT) or firewall.
Format	Boolean
Default Value	0
Range	0 (disable) 1 (enable)
Example	sip rport: 1

Local SIP UDP/TCP Port Setting

Parameter – <i>sip local port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the local source port (UDP/TCP) from which the phone sends SIP messages.
Format	Numeric
Default Value	5060
Range	Greater than 1024 and less than 65535 Notes: <ul style="list-style-type: none"> • It is recommended that you avoid the conflict RTP port range in case of a UDP transport. • By default, the IP phones use symmetric UDP signaling for outgoing UDP SIP messages. When symmetric UDP is enabled, the IP phone generates and listens for UDP messages using port 5060. If symmetric UDP signaling is disabled, the phone sends from random ports but it listens on the configured SIP local port.
Example	sip local port: 5060

Local SIP TLS Port

Parameter – <i>sip local tls port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the local source port (SIPS/TLS) from which the phone sends SIP messages.
Format	Numeric
Default Value	5061
Range	Greater than 1024 and less than 65535 Notes: <ul style="list-style-type: none"> It is recommended that you avoid the conflict with any TCP ports being used. For example: WebUI HTTP server on 80/tcp and HTTPS on 443/tcp. By default, the IP phones use symmetric TLS signaling for outgoing TLS SIP messages. When symmetric TLS is enabled, the IP phone uses port 5061 as the persistent TLS connection source port. When symmetric TLS signaling is disabled, the IP phone chooses a random persistent TLS connection source port from the TCP range (i.e. 49152...65535) for TLS messages after each reboot regardless of whether the parameter "sip outbound support" is enabled or disabled.
Example	sip local tls port: 5061

SIP STUN Parameters

Parameter – <i>sip stun ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	IP address and/or qualified domain name of the STUN server (also know as Simple Traversal of UDP through NAT). STUN is a protocol that governs the exchange of data over a UDP connection by communication devices operating behind a NAT or firewall. Since the behaviors of NATs can be different, the STUN protocol allows the exchange of data to be consistent over any type of NAT. The STUN/TURN configuration is only used for media (RTP traffic) that goes through the server - not for signaling. (For signaling, you need to enable Rport if the NAT device does not recognized SIP). The STUN/TURN configuration applies globally to each phone. If you configure both STUN and TURN on the phone, it discovers what type of NAT device is between the phone and the public network. If the NAT device is full cone, restricted cone, or port restricted cone, the phone uses STUN. If the NAT device is symmetric, the phone uses TURN. If you configure STUN only, the phone uses STUN without the NAT discovery process. Notes: <ul style="list-style-type: none"> The NAT IP configuration parameter takes precedence over the STUN and TURN parameters. STUN does not work if the NAT device is symmetric.
Format	IP Address or Fully Qualified Domain Name (FQDN)
Default Value	0.0.0.0
Range	Two (2) IP addresses or domain names separated by a comma Note: The first is the primary and the second is the backup.
Example	sip stun ip: 10.50.103.12, stunbackup.aastra.com

Parameter – <i>sip stun port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Port number of the STUN server (also know as Simple Traversal of UDP through NAT) Notes: <ul style="list-style-type: none"> • The NAT IP configuration parameter takes precedence over the STUN and TURN parameters. • STUN does not work if the NAT device is symmetric.
Format	Integer
Default Value	3478
Range	0 to 65535 (One (1) or two (2) port numbers separated by a comma) Note: The first is the primary and the second is the backup.
Example	sip stun port: 3478,3479

SIP TURN Parameters

Parameter – <i>sip turn ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	IP address and/or qualified domain name of the TURN server (also known as Traversal Using Relay NAT). TURN is a protocol that governs the reception of data over a Transmission Control Protocol (TCP) or a UDP connection by a single communications device operating behind a NAT or firewall. A TURN server relays packets from an external IP address towards an internal device only if that internal device has previously sent a packet through the same TURN server to that particular external IP address. The STUN/TURN configuration is only used for media (RTP traffic) that goes through the server - not for signaling. (For signaling, you need to enable Rport if the NAT device does not recognized SIP). The STUN/TURN configuration applies globally to each phone. If you configure both STUN and TURN on the phone, it discovers what type of NAT device is between the phone and the public network. If the NAT device is full cone, restricted cone, or port restricted cone, the phone uses STUN. If the NAT device is symmetric, the phone uses TURN. If you configure TURN only, the phone uses TURN with the NAT discovery process. TURN is compatible with all types of NAT devices but can be costly since all traffic goes through a media relay (which can be slow, can exchange more messages, and requires the TURN server to allocate bandwidth for calls). Note: The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.
Format	IP Address or Fully Qualified Domain Name (FQDN)
Default Value	0.0.0.0
Range	Two (2) IP addresses or domain names separated by a comma Note: The first is the primary and the second is the backup.
Example	sip turn ip: 10.50.103.12, turnbackup.aastra.com

Parameter – <i>sip turn port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Port number of the TURN server (also known as Traversal Using Relay NAT). Note: The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.
Format	Integer
Default Value	3479
Range	0-65535 (One (1) or two (2) port numbers separated by a comma) Note: The first is the primary and the second is the backup.
Example	sip turn port: 3479,3480

Parameter – <i>sip turn user</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Username that a user must enter when accessing an account on the TURN server. Note: The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Up to 63 alphanumeric characters
Example	sip turn user: 0412919146

Parameter – <i>sip turn pasx</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Password that a user must enter when accessing an account on the TURN server. Note: The NAT IP configuration parameter takes precedence over the STUN and TURN parameters.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Up to 63 alphanumeric characters
Example	sip turn pass: 42447208233b8b8b8a234

SIP Keep Alive Support

Parameter – <i>sip keepalive timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This value is how many seconds to wait before sending a SIP UDP keep alive packet to the configured SIP servers. A zero value disables this feature. Note: This is only for UDP transport protocol.
Format	Integer
Default Value	0
Range	Any positive integer
Example	sip keepalive timer: 6

HTTPS Client and Server Settings

Parameter – <i>https client method</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Defines the security method that the client advertises to the server during the Secure Socket Layer (SSL) handshake. Available options are: <ul style="list-style-type: none"> • TLS 1.0 - Transport Layer Security version 1 (TLS 1.0) is a protocol that ensures privacy between communicating applications and their users on the Internet. TLS is the successor to SSL. • SSL 3.0 - Secure Socket Layer version 3 (SSL 3.0) is a commonly-used protocol for managing the security of a message transmission on the Internet.
Format	Alphanumeric characters
Default Value	SSL 3.0
Range	TLS 1.0 SSL 3.0 (default)
Example	https client method: TLS 1.0

Parameter – <i>https redirect http get</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows or disallows redirection from the HTTP server to the HTTPS server.
Format	Boolean
Default Value	1 (enables redirection)
Range	0 (disables redirection) 1 (enables redirection)
Example	https redirect http get: 0

Parameter – <i>https block http post xml</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the blocking of XML scripts from HTTP POSTs. Some client applications use HTTP POSTs to transfer XML scripts. The phones's HTTP server accepts these POSTs even if server redirection is enabled, effectively bypassing the secure connection. When this parameter is enabled (blocking is enabled), receipt of an HTTP POST containing an XML parameter header results in the following response: "403 Forbidden". This forces the client to direct the POSTs to the HTTPS server through use of the "https://" URL.
Format	Boolean
Default Value	0 (disables blocking of XML HTTP POSTs)
Range	0 (disables blocking of XML HTTP POSTs) 1 (enables blocking of XML HTTP POSTs)
Example	https block http post xml: 1

HTTPS Server Certificate Validation Settings

Parameter– <i>https validate certificates</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the HTTPS validation of certificates on the phone. When this parameter is set to 1, the HTTPS client performs validation on SSL certificates before accepting them. Notes: <ul style="list-style-type: none"> • If you are using HTTPS as a configuration method, and use a self signed certificate, you must set this parameter to "0" (disabled) before upgrading to Release 2.3 of the IP Phones. • Defining this parameter as "0" (disabled) significantly reduces security for the provisioning process to encryption only. Validation of the chain-of-trust (i.e. the originator of the files) will not be performed if this feature is disabled. Therefore, disabling HTTPS validation of certificates is only recommended for troubleshooting purposes or when self-signed certificates are in use.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	https validate certificates: 0

Parameter – <i>https validate expires</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the HTTPS validation of the expiration of the certificates. When this parameter is set to 1, the HTTPS client verifies whether or not a certificate has expired prior to accepting the certificate. Note: If the “ https validate expires ” parameter is set to enable , the clock on the phone must be set for the phone to accept the certificates.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	https validate expires: 0

Parameter – <i>https validate hostname</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the HTTPS validation of hostnames on the phone.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	https validate hostname: 0

Parameter – <i>https user certificates</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Specifies a file name for a .PEM file located on the configuration server. This file contains the User-provided certificates in PEM format. These certificates are used to validate peer certificates.</p> <p>Note: You must disable the “https validate certificates” parameter in order for the phone to accept the User-provided certificates.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>https user certificates: ftp://admin:admin!@1.2.3.4:50/path/phonesHTTPSUserCert.pem</p> <p>where “path” is the directory and “phonesHTTPSUserCert.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p>
Format	Alphanumeric string in the format <filename.pem>
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no HTTPS user certificate file:</p> <p>https user certificates:</p> <p>The following example downloads the HTTPS user certificate file from the original configuration server.</p> <p>https user certificates: phonesHTTPSUserCert.pem</p> <p>The following example uses FTP to download the firmware file “phonesHTTPSUserCert.pem” (HTTPS user certificate file) from the “path” directory on server 1.2.3.4 using port 50:</p> <p>https user certificates:ftp://admin:admin!@1.2.3.4:50/path/phonesHTTPSUserCert.pem</p>

Virtual Local Area Network (VLAN) Settings

Global Parameters

Parameter – <i>tagging enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables VLAN on the IP phones. This is a global setting.
Format	Boolean
Default Value	0 (false)
Range	0 (false) 1 (true)
Example	tagging enabled: 1

Parameter – <i>priority non-ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the priority value for non-IP packets. This is a global setting.
Format	Integer
Default Value	5
Range	0 to 7
Example	priority non-ip: 7

Parameter – <i>vlan hpq</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables VLAN High Priority Queue (HPQ). Only effective when the parameter VLAN tagging (i.e. the “tagging enabled” parameter) is enabled.
Format	Boolean
Default Value	1 (true)
Range	0 (false) 1 (true)
Example	vlan hpq: 0

LAN Port (Ethernet Port 0) Parameters

Parameter – <i>vlan id</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to configure a VLAN ID that associates with the physical Ethernet Port 0 (LAN port).</p> <p>Notes:</p> <ul style="list-style-type: none"> Setting the “vlan id” to 4095 and “vlan id port 1” to any ID from 1 to 4094 will allow frames from the PC port (containing a VLAN ID) to be untagged before being forwarded to the LAN port and frames from the LAN port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC port. <p>Example: You enable tagging on the phone port as normal but set the “vlan id” to 4095 and the “vlan id port 1” to any ID from 1 to 4094. The following example sets the PC port to be on VLAN 3 but the LAN port is configured as untagged:</p> <pre>tagging enabled: 1 vlan id: 4095 vlan id port 1: 3</pre> <ul style="list-style-type: none"> Alternatively setting the “vlan id” to any ID from 1 to 4094 and “vlan id port 1” to 4095 will allow frames from the LAN port (containing a VLAN ID) to be untagged before being forwarded to the PC port and frames from the PC port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN port.
Format	Integer
Default Value	1
Range	1 to 4095
Example	vlan id: 300

Parameter – <i>tos priority map</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>This parameter is based on the Type of Service (ToS), Differentiated Services Code Point (DSCP) setting for SIP (tos sip parameter), RTP (tos rtp parameter) and RTCP (tos rtcp parameter). It is the mapping between the DSCP value and the VLAN priority value for SIP, RTP, and RTCP packets.</p> <p>You enter the tos priority map value as follows: (DSCP_1,Priority_1)(DSCP_2,Priority_2).....(DSCP_64,Priority_64) where the DSCP value range is 0-63 and the priority range is 0-7. Mappings not enclosed in parentheses and separated with a comma, or with values outside the ranges, are ignored.</p>
Format	Integer
Default Value	3 (based on the default ToS DSCP SIP setting of 26) 5 (based on the default ToS DSCP RTP setting of 46) 5 (based on the default ToS DSCP RTCP setting of 46)
Range	0 to 63 (for DSCP) 0 to 7 (for SIP, RTP, and RTCP priorities)
Example	tos priority map: (26,7)

The following table identifies the default DSCP-to-priority mapping structure.

DSCP Range	DSCP Priority
0-7	0
8-15	1
16-23	2
24-31	3
32-39	4
40-47	5
48-55	6
56-63	7

PC Port (Ethernet Port 1) Parameters

Parameter – <i>vlan id port 1</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to configure a VLAN ID that associates with the physical Ethernet Port 1 (PC port).</p> <p>Notes:</p> <ul style="list-style-type: none"> Setting the “vlan id port 1” to 4095 and “vlan id” to any ID from 1 to 4094 will allow frames from the LAN port (containing a VLAN ID) to be untagged before being forwarded to the PC port and frames from the PC port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the LAN port. <p>Example: You enable tagging on the phone port as normal but set the “vlan id port 1” to 4095 and the “vlan id” to any ID from 1 to 4094. The following example sets the LAN port to be on VLAN 3 but the PC port is configured as untagged:</p> <pre>tagging enabled: 1 vlan id: 3 vlan id port 1: 4095</pre> <ul style="list-style-type: none"> Alternatively setting the “vlan id port 1” to any ID from 1 to 4094 and “vlan id” to 4095 will allow frames from the PC port (containing a VLAN ID) to be untagged before being forwarded to the LAN port and frames from the LAN port (without a VLAN ID) to be tagged with the configured VLAN ID before being forwarded to the PC port. PC Port parameters are not applicable to the 6730i IP Phone.
Format	Integer
Default Value	4095
Range	1 to 4095
Example	vlan id port 1: 3

Parameter – <i>qos eth port 1 priority</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the priority value used for passing VLAN packets through to a PC via Port 1.
Format	Integer
Default Value	0
Range	0 to 7
Example	qos eth port 1 priority: 3

RTCP Summary Reports

Global Parameters

Parameter – <i>sip rtcp summary reports</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not to send of RTCP summary reports. Note: You must restart the phone after setting a value for this parameter.
Format	Boolean
Default Value	0
Range	0 (disabled - OFF) 1 (enabled - ON)
Example	sip rtcp summary reports: 1

Parameter – <i>sip rtcp summary report collector</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the hostname server for which to send (collect) the RTCP summary reports. Note: You must restart the phone after setting a value for this parameter.
Format	<username>@<server> Note: Hostname/server string must not exceed 128 characters in length.
Default Value	Not Applicable
Range	Not Applicable
Example	sip rtcp summary report collector: collector@example.org

Parameter – <i>sip rtcp summary report collector port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the port address of the hostname server receiving the RTCP summary reports. Note: You must restart the phone after setting a value for this parameter.
Format	Integer
Default Value	0
Range	0 to 65536
Example	sip rtcp summary report collector port: 5060

Line Parameters

Parameter – <i>sip lineN rtcp summary reports</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables the specified line number on the phone for which to send the RTCP summary reports. Note: You must restart the phone after setting a value for this parameter.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip line1 rtcp summary reports: 1

Parameter – <i>sip lineN rtcp summary report collector</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Per-line parameter specifying the hostname of the server receiving the RTCP summary reports. Note: You must restart the phone after setting a value for this parameter.
Format	<username>@<server> Note: Hostname/server string must not exceed 128 characters in length.
Default Value	Not Applicable
Range	Not Applicable
Example	sip line1 rtcp summary report collector: collector@example.org

Parameter – <i>sip lineN rtcp summary report collector port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Per-line parameter specifying the port address of the server receiving the RTCP summary reports. Note: You must restart the phone after setting a value for this parameter.
Format	Integer
Default Value	0
Range	0 to 65536
Example	sip line1 rtcp summary report collector port: 5060

Type of Service (ToS)/DSCP Settings

Parameter – <i>tos sip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The Differentiated Services Code Point (DSCP) for SIP packets.
Format	Integer
Default Value	26
Range	0-63
Example	tos sip: 3

Parameter – <i>tos rtp</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The Differentiated Services Code Point (DSCP) for RTP packets.
Format	Integer
Default Value	46
Range	0-63
Example	tos rtp: 2

Parameter – <i>tos rtcp</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The Differentiated Services Code Point (DSCP) for RTCP packets.
Format	Integer
Default Value	46
Range	0-63
Example	tos rtcp: 3

Time and Date Settings

Parameter – <i>time format</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter changes the time to 12 hour or 24 hour format. Use “0” for the 12 hour format and “1” for the 24 hour format.
Format	Integer
Default Value	0
Range	0 (12 hr format) 1 (24 hr format)
Example	time format: 0

Parameter – <i>date format</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter allows the user to change the date to various formats.
Format	Integer
Default Value	0
Range	0 (WWW MMM DD) (default) 1 (DD-MMM-YY) 2 (YYYY-MM-DD) 3 (DD/MM/YYYY) 4 (DD/MM/YY) 5 (DD-MM-YY) 6 (MM/DD/YY) 7 (MMM DD) 8 (DD MMM YYYY) 9 (WWW DD MMM) 10 (DD MMM) 11 (DD.MM.YYYY)
Example	date format: 7

Parameter – <i>dst config</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables the use of daylight savings time.
Format	Integer
Default Value	3
Range	0 - OFF 1 - 30 min summertime 2 - 1 hr summertime 3 - automatic
Example	dst config: 0

Time Zone Name

Parameter – <i>time zone name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Assigns a time zone name to the time server.</p> <p>The Custom option allows you to customize additional time zone parameters.</p> <p>The DP-Dhcp option allows you to enable and disable a DHCP Option 2 value for the phone to use as an offset from Coordinated Universal Time (UTC). If this parameter is enabled, the phone derives the time and date from UTC and the time offset offered by the DHCP server.</p> <p>Notes:</p> <ul style="list-style-type: none"> Assigning the name “Custom” (with initial cap) in the configuration files, allows you to create a custom time zone using the additional parameters in the section “Custom Time Zone and DST Settings” on page A-47. When DHCP Option 2 is enabled on the phone, the phone still uses the custom time-zone configuration settings to control daylight savings time. The default behavior for the phone is to use the NTP server from Option 42 (or current configuration setting) and the current timezone settings.
Format	Text
Default Value	US-Eastern
	If the time zone name parameter is set to a value other than Dhcp, then DHCP Option 2 is disabled.
Range	<p>See “Time Zone Name/Time Zone Code Table” on page A-42 for specific time zone names.</p> <p>Custom (allows you to create a customized time zone).</p> <p>DP-Dhcp (allows you to enable and disable a DHCP Option 2 value for the phone to use as an offset from Coordinated Universal Time (UTC))</p>
Example	<p>time zone name: US-Central</p> <p>time zone name: Custom</p> <p>time zone name: DP-Dhcp</p>

Time Server Settings

Parameter – <i>time server disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the time server. This parameter affects the time server1 , time server2 , and time server3 parameters. Setting this parameter to 0 allows the use of the configured Time Server(s). Setting this parameter to 1 prevents the use of the configured Time Server(s). Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	Integer
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	time server disabled: 0

Parameter – <i>time server1</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The primary time server's IP address or qualified domain name. If the time server is enabled, the value for time server1 will be used to request the time from. Note: For DHCP to automatically populate this parameter, your DHCP server must support Option 66.
Format	IP address or qualified domain name
Default Value	0.0.0.0
Range	Not Applicable
Example	time server1: 192.168.0.5

Parameter – <i>time server2</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The secondary time server's IP address or qualified domain name. If the time server is enabled, and the primary time server is not configured or cannot be accessed the value for time server2 will be used to request the time from.
Format	IP address or qualified domain name
Default Value	0.0.0.0
Range	Not Applicable
Example	time server2: 192.168.0.5

Parameter – <i>time server3</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The tertiary time server's IP address or qualified domain name. If the time server is enabled, and the primary and secondary time servers are not configured or cannot be accessed the value for time server3 will be used to request the time from.
Format	IP address or qualified domain name
Default Value	0.0.0.0
Range	Not Applicable
Example	time server3: 192.168.0.5

Custom Time Zone and DST Settings

Note:

To use the parameters in this section, the “time zone name” parameter must be set to “Custom”. See [page A-41](#) for more information.

Parameter – <i>time zone minutes</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The number of minutes the timezone is offset from UTC (Coordinated Universal Time). This can be positive (West of the Prime Meridian) or negative (East of the Prim Meridian). Eastern Standard Time (EST) has a value of 300 which is the default.
Format	Integer
Default Value	300
Range	Any positive or negative Integers: 720(GMT minus 12 hours) 660(GMT minus 11 hours) 600(GMT minus 10 hours) 540(GMT minus 9 hours - Alaska Standard Time North America) 480(GMT minus 8 hours - Pacific Standard Time North America) 420(GMT minus 7 hours - Mountain Standard Time North America) 360(GMT minus 6 hours - Central Standard Time North America) 300(GMT minus 5 hours - Eastern Standard Time North America) 270(GMT minus 4.5 hours - Venezuela) 240(GMT minus 4 hours) 210(GMT minus 3.5 hours - Newfoundland Standard Time North America) 180(GMT minus 3 hours) 150(GMT minus 2.5 hours - Newfoundland daylight time) 120(GMT minus 2 hours) 60(GMT minus 1 hour) 0(GMT = 0 hours - Greenwich Mean Time) -60(GMT + 1 hour - Central European Time) -120(GMT + 2 hours - Eastern European Time Europe) -180(GMT + 3 hours) -210(GMT + 3.5 hours) -240(GMT + 4 hours) -270(GMT + 4.5 hours) -300(GMT + 5 hours) -330(GMT + 5.5 hours) -345(GMT + 5.75 hours) -360(GMT + 6 hours) -390(GMT + 6.5 hours) -420(GMT + 7 hours - Christmas Island Time Australia) -480(GMT + 8 hours - Australian Western Standard Time) -540(GMT + 9 hours) -570(GMT + 9.5 hours - Australian Central Standard Time) -600(GMT + 10 hours - Australian Eastern Standard Time) -660(GMT + 11 hours) -720(GMT + 12 hours) -780(GMT + 13 hours)
Example	time zone minutes: 300

Parameter – <i>dst minutes</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The number of minutes to add during Daylight Saving Time. Valid values are a positive integer between 0 to 60.
Format	Integer
Default Value	Not Applicable
Range	0-60
Example	dst minutes: 60

Parameter – <i>dst [start end] relative date</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies how to interpret the start and end day, month, and week parameters - absolute (0) or relative (1).
Format	Boolean
Default Value	Not Applicable
Range	0 (absolute) 1 (relative)
Example	dst [start end] relative date: 1

Absolute Time

Parameter – <i>dst start month</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The month that DST starts. Valid values are 1 to 12 (January to December).
Format	Integer
Default Value	Not Applicable
Range	1 (January) 2 (February) 3 (March) 4 (April) 5 (May) 6 (June) 7 (July) 8 (August) 9 (September) 10 (October) 11 (November) 12 (December)
Example	dst start month: 7

Parameter – <i>dst end month</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The month that DST ends. Valid values are 1 to 12 (January to December).
Format	Integer
Default Value	Not Applicable
Range	1 (January) 2 (February) 3 (March) 4 (April) 5 (May) 6 (June) 7 (July) 8 (August) 9 (September) 10 (October) 11 (November) 12 (December)
Example	dst end month: 6

Parameter – <i>dst start day</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The day of the month that DST starts. Valid values are 1 to 31.
Format	Integer
Default Value	Not Applicable
Range	1-31
Example	dst start day: 1

Parameter – <i>dst end day</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The day of the month that DST ends. Valid values are 1 to 31.
Format	Integer
Default Value	Not Applicable
Range	1-31
Example	dst end day: 31

Parameter – <i>dst start hour</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The hour that DST starts. Valid values are an integer from 0 (midnight) to 23.
Format	Integer
Default Value	Not Applicable
Range	0 (midnight) to 23
Example	dst start hour: 0

Parameter – <i>dst end hour</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The hour that DST ends. Valid values are an integer from 0 (midnight) to 23.
Format	Integer
Default Value	Not Applicable
Range	0 (midnight) to 23
Example	dst end hour: 23

Relative Time

Parameter – <i>dst start month</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The month that DST starts. Valid values are 1 to 12 (January to December).
Format	Integer
Default Value	Not Applicable
Range	1 (January) 2 (February) 3 (March) 4 (April) 5 (May) 6 (June) 7 (July) 8 (August) 9 (September) 10 (October) 11 (November) 12 (December)
Example	dst start month: 6

Parameter – <i>dst end month</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The month that DST ends. Valid values are 1 to 12 (January to December).
Format	Integer
Default Value	Not Applicable
Range	1 (January) 2 (February) 3 (March) 4 (April) 5 (May) 6 (June) 7 (July) 8 (August) 9 (September) 10 (October) 11 (November) 12 (December)
Example	dst end month: 12

Parameter – <i>dst start week</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The week in the specified month in which DST starts. Valid value is a positive or negative integer from 1 to 5.
Format	Integer
Default Value	Not Applicable
Range	1 = first full week of month -1 = last occurrence "dst start day" in the month 2 = second full week of month -2 =second last occurrence "dst start day" in the month 3 = third full week of month -3 =third last occurrence "dst start day" in the month 4 = fourth full week of month -4 = fourth last occurrence "dst start day" in the month 5 = fifth full week of month -5 = fifth last occurrence "dst start day" in the month
Example	dst start week: 1

Parameter – <i>dst end week</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The week in the specified month in which DST ends. Valid value is a positive or negative integer from 1 to 5.
Format	Integer
Default Value	Not Applicable
Range	1 = first full week of month -1 = last occurrence "dst start day" in the month 2 = second full week of month -2 =second last occurrence "dst start day" in the month 3 = third full week of month -3 =third last occurrence "dst start day" in the month 4 = fourth full week of month -4 = fourth last occurrence "dst start day" in the month 5 = fifth full week of month -5 = fifth last occurrence "dst start day" in the month
Example	dst end week: 5

Parameter – <i>dst start day</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The day of the specified week in the specified month that DST starts on. Valid values are an integer from 1 to 7.
Format	Integer
Default Value	Not Applicable
Range	1 (Sunday) 2 (Monday) 3 (Tuesday) 4 (Wednesday) 5 (Thursday) 6 (Friday) 7 (Saturday)
Example	dst start day: 1

Parameter – <i>dst end day</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The day of the specified week in the specified month that DST ends on. Valid values are an integer from 1 to 7.
Format	Integer
Default Value	Not Applicable
Range	1 (Sunday) 2 (Monday) 3 (Tuesday) 4 (Wednesday) 5 (Thursday) 6 (Friday) 7 (Saturday)
Example	dst end day: 7

Parameter – <i>dst start hour</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The hour that DST starts. Valid values are an integer from 0 (midnight) to 23.
Format	Integer
Default Value	Not Applicable
Range	0 (midnight) to 23
Example	dst start hour: 0

Parameter – <i>dst end hour</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The hour that DST ends. Valid values are an integer from 0 (midnight) to 23.
Format	Integer
Default Value	Not Applicable
Range	0 (midnight) to 23
Example	dst end hour: 23

Backlight Mode Settings

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, 6757i CT, and 6865i IP Phones only.

Parameter – <i>backlight mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to turn the backlight on the LCD, Off (always off) or Auto. The "Auto" setting sets the phone to turn off the backlight after a period of inactivity. You can set the amount of time before the backlight goes off using the "Backlight on Time" option ("bl on time" parameter).
Format	Integer
Default Value	1 (Auto)
Range	0(Off - Turns the backlight off constant) 1(Auto - Turns the backlight off after a period of inactivity.) Note: In the IP Phone UI, the options for this parameter are "Off" and "Auto" only.
Example	backlight mode: 0

Parameter – <i>bl on time</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to set the amount of time, in seconds, that the backlight stays ON before turning OFF because of inactivity. This setting is applicable to the "Auto" mode only.
Format	Integer
Default Value	600 seconds (equals 10 minutes)
Range	1-7200 seconds
Example	bl on time: 15

Brightness Level Settings

Note:

Applicable to the 6739i and 6867i IP Phones only.

Parameter – <i>bl on time</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to set the amount of time, in seconds, that the backlight stays ON before turning OFF because of inactivity.
Format	Integer
Default Value	600 seconds (equals 10 minutes)
Range	1-7200 seconds
Example	bl on time: 15

Parameter – <i>brightness level</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the brightness level during phone activity (e.g. when a user touches the touchscreen).
Format	Integer
Default Value	1
Range	1-5
Example	brightness level: 3

Parameter – <i>inactivity brightness level</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the brightness level during phone inactivity.
Format	Integer
Default Value	1
Range	0..4 (where "0" represents screen off)
Example	inactivity brightness level: 0

Background Image on Idle Screen

Note:

Applicable to the 6739i and 6867i IP Phones only.

Parameter– <i>background image</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Set up background image for idle screen on 6739i and 6867i phones.
Format	String (up to 256 characters)
Default Value	NA
Range	ftp://server/image.png ftp://server/image.jpg http://server/image.png https://server/image/jpg
Example	background image: http://10.30.100.233/pics/image.png

Configurable Home/Idle Screen Modes

Note:

Applicable to the 6867i IP Phone only.

Parameter– <i>idle screen mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used to switch between the two Home/Idle screen modes. The primary screen mode provides users with a larger date and time and displays the Screen Name (" sip screen name ") parameter beside the line number in the top status bar. The secondary screen mode displays both the Screen Name and Screen Name 2 (" sip screen name 2 ") parameters above the smaller, repositioned date and time.
Format	Boolean
Default Value	0 (primary screen mode)
Range	0-1 0 (primary screen mode) 1 (secondary screen mode)
Example	idle screen mode: 1

Picture ID Feature

Note:

Applicable to the 6739i and 6867i IP Phones only.

Parameter – <i>image server uri</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify the server URI where pictures are stored for display to the phone during incoming and outgoing calls, and in the Directory, Callers List, and Redial List entries. The pictures are dynamically retrieved from the centralized server for each call and then locally cached in the phone to reduce network traffic.</p> <p>If there is no picture on the central server for the dialed number and/or Caller Id number, and Directory, Callers List, and/or Redial List entry, the generic blue figure image is shown.</p> <p>Pictures must be in “.png” format and 150pixels wide x 200pixels tall. For the 6739i, the png must be 24-bit. For the 6867i, the png can be 24-bit or 32-bit. The filenames for pictures must be stored using the phone number as the filename (for example, 9995551234.png).</p> <p>Notes:</p> <ul style="list-style-type: none"> • Entering no value for this parameter disables this feature. • The “image server uri” parameter supports TFTP, FTP, HTTP, andHTTPS.
Format	Server URI String
Default Value	N/A
Range	N/A
Example	image server uri: tftp://192.168.1.100

DHSG Settings

Note:

Applicable to the 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, 6757i CT, 6865i, and 6867i IP Phones only.

Parameter – <i>dhsg</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enables and disables the DHSG headset support on the phone.</p> <p>Note: The phones that support DHSG are 6735i, 6737i, 6753i, 6755i, 6757i, 6757i CT, 6865i, and 6867i. For more information about installing a DHSG headset on your phone, see your <i>IP Phone-Specific Installation Guide</i>.</p>
Format	Boolean
Default Value	0
Range	0 (disable - DHSG support is OFF) 1 (enable - DHSG support is ON)
Example	dhsg: 1

Bluetooth Support Settings

Note:

Applicable to the 6739i IP Phone only.

Parameter – <i>audio bluetooth</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the 6739i IP phone's Bluetooth functionality. When disabled, Bluetooth functionality will be completely disabled and all Bluetooth-related options in the 6739i's native UI, along with the Bluetooth-related references in the phone's Web UI, will be inaccessible.
Format	Integer
Default Value	1 (Enabled)
Range	0 - 1 0 (Disabled) 1 (Enabled)
Example	audio bluetooth: 0

Wideband Audio Equalizer Settings

Note:

Applicable to the 6739i IP Phone only.

Parameter – <i>handset rx wb equ filter</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the wideband audio equalizer setting the IP phone should use for the handset audio path.
Format	Integer
Default Value	1
Range	1 - 4
Example	handset rx wb equ filter: 2

Parameter – <i>speaker rx wb equ filter</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the wideband audio equalizer setting the IP phone should use for the speakerphone audio path.
Format	Integer
Default Value	1
Range	1 - 4
Example	speaker rx wb equ filter: 4

Live Dialpad Settings

Parameter – <i>live dialpad</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Turns the “Live Dialpad” feature ON or OFF. With live dial pad ON, the IP phone automatically dials out and turns ON Handsfree mode as soon as a dial pad key or softkey is pressed. With live dial pad OFF, if you dial a number while the phone is on-hook, lifting the receiver or pressing the  initiates a call to that number.
Format	Boolean
Default Value	0 (Off)
Range	0 (Off) 1 (On)
Example	live dialpad: 1

SIP Local Dial Plan Settings

Parameter – <i>sip dial plan</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg																				
Description	<p>A dial plan describes the number and pattern of digits that a user dials to reach a particular telephone number. The SIP local dial plan is as follows:</p> <table border="0"> <thead> <tr> <th>Symbol</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0, 1, 2, 3, 4, 5, 6, 7, 8, 9</td> <td>Digit symbol</td> </tr> <tr> <td>X</td> <td>Match any digit symbol (wildcard)</td> </tr> <tr> <td>*, #, .</td> <td>Other keypad symbol; # can terminate a dial string</td> </tr> <tr> <td> </td> <td>Expression inclusive OR</td> </tr> <tr> <td>+</td> <td>0 or more of the preceding digit symbol or [] expression</td> </tr> <tr> <td>[]</td> <td>Symbol inclusive OR</td> </tr> <tr> <td>-</td> <td>Used only with [], represent a range of acceptable symbols; For example, [2-8]</td> </tr> <tr> <td>"" (open/close quotes)</td> <td>In the configuration files, enter the sip dial plan value using quotes.</td> </tr> <tr> <td>.;</td> <td>Used when a secondary dial tone is required on the phone. (For example, "9;xxxxx", when a user has to dial "9" to get and outside line and needs a secondary dial tone presented.</td> </tr> </tbody> </table> <p>You can configure prefix dialing by adding a prepend digit to the dial string. For example, if you add a prepend map of "[2-9]XXXXXXXX,91", the IP phone adds the digits "91" to any 10-digit number beginning with any digit from 2 to 9 that is dialed out. Other examples of prepend mappings are:</p> <p>1X+#,9 (Prepends 9 to any digit string beginning with "1" and terminating with "#") 6XXX,579 (Prepends "579" to any 4-digit string starting with "6") [4-6]XXXXXX,78 (Prepends "78" to any 7-digit string starting with "4", "5", or "6".</p>	Symbol	Description	0, 1, 2, 3, 4, 5, 6, 7, 8, 9	Digit symbol	X	Match any digit symbol (wildcard)	*, #, .	Other keypad symbol; # can terminate a dial string		Expression inclusive OR	+	0 or more of the preceding digit symbol or [] expression	[]	Symbol inclusive OR	-	Used only with [], represent a range of acceptable symbols; For example, [2-8]	"" (open/close quotes)	In the configuration files, enter the sip dial plan value using quotes.	.;	Used when a secondary dial tone is required on the phone. (For example, "9;xxxxx", when a user has to dial "9" to get and outside line and needs a secondary dial tone presented.
Symbol	Description																				
0, 1, 2, 3, 4, 5, 6, 7, 8, 9	Digit symbol																				
X	Match any digit symbol (wildcard)																				
*, #, .	Other keypad symbol; # can terminate a dial string																				
	Expression inclusive OR																				
+	0 or more of the preceding digit symbol or [] expression																				
[]	Symbol inclusive OR																				
-	Used only with [], represent a range of acceptable symbols; For example, [2-8]																				
"" (open/close quotes)	In the configuration files, enter the sip dial plan value using quotes.																				
.;	Used when a secondary dial tone is required on the phone. (For example, "9;xxxxx", when a user has to dial "9" to get and outside line and needs a secondary dial tone presented.																				
Format	Alphanumeric characters																				
Default Value	X+# XX+*																				
Range	Up to 512 alphanumeric characters. If a User enters a dial plan longer than 512 characters, or a parsing error occurs, the phone uses the default dial plan of "x+# xx+*". If this is the case, the Administrator cannot change the dial plan from the configuration files. The dial plan must be changed from the Aastra Web UI.																				
Example	sip dial plan: "X+# XXX+*"																				

Parameter – <i>sip dial plan terminator</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not pressing the hash/pound (i.e. "#") key, while performing an outgoing call on an open line, should be sent as %23 to the proxy in the dial string or if the key should be used as a dial plan terminator (i.e. dials out the call immediately). When enabled, the hash/pound key does not act as a dial plan terminator and is instead sent as %23 to the proxy in the dial string. When disabled (default), the hash/pound key acts as a dial plan terminator.
Format	Boolean
Default Value	0 (Disabled)
Range	0 (Disabled - # used as a dial plan terminator) 1 (Enabled - # sent as %23 in dial string)
Example	sip dial plan terminator: 1

Parameter – <i>sip digit timeout</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Represents the time, in seconds, between consecutive key presses on the IP phone. The default for this parameter is 4 seconds. If you press a key on the phone and wait 4 seconds before pressing the next key, the key times out and cancels the digit selection. You must press consecutive keys before the timeout occurs.
Format	Integer
Default Value	4
Range	Not Applicable
Example	sip digit timeout: 6

SIP Outbound Support

Parameter – <i>sip outbound support</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enables and disables whether or not the phone uses Draft 15 (draft-ietf-sip-outbound-15) support for SIP outbound packets.</p> <p>A SIP User Agent (UA) behind a firewall, reuses an existing connection (usually the REGISTER outbound connection) for the inbound request if the proxy supports it. The UA uses keep-alive packets to monitor the connection status.</p> <p>Notes:</p> <ul style="list-style-type: none"> • If the Global SIP parameter “Persistent TLS” is set on the phone, then only one TLS persistent connection can be established since the phone uses the local port 5061 for connection. If the Global SIP parameter “TLS” is set on the phone, more than one connection can be setup since the phone uses a random local port for connection. • This parameter must be enabled for this feature to start keep-alive for a particular transport.
Format	Boolean
Default Value	0
Range	0 (disabled) 1 (enabled)
Example	sip outbound support: 1

Contact Header Matching

Parameter – <i>sip contact matching</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the method for which the phone uses to match the Contact header in a SIP registration packet.
Format	Integer
Default Value	2 (matching username only)
Range	0(default) URI matching of username, domain name, phone IP and port, and transport 1 matching of phone IP only 2 matching of username only 3 matching of phone IP and username only
Example	sip contact matching: 1

SIP Basic, Global Settings

SIP Global Authentication Settings

Parameter – <i>sip screen name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used to display text on the screen of the phone. You may want to set this parameter to display the user's name of the phone.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip screen name: Joe Smith

Parameter – <i>sip screen name 2</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used to display text on a second line on the screen of the phone. Notes: <ul style="list-style-type: none"> • If other status messages display on the phone, such as "Network Disconnected", the Screen Name 2 value does not display. • Symbol characters are allowed (such as "#"). • If the text is longer than the display width, than the display truncates the text to fit the display.
Format	Alphanumeric characters.
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters.
Example	sip screen name 2: Lab Phone

Parameter – <i>sip user name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used in the name field of the <i>SIP URI</i> for the IP phone and for registering the IP phone at the registrar. Note: The IP Phones support Usernames containing dots ("").
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip user name: 1010

Parameter – <i>sip display name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used in the display name field of the <i>From</i> SIP header field. Some IP PBX systems use this as the caller's ID and some may overwrite this with the string that is set at the PBX system.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip display name: Joe Smith

Parameter – <i>sip auth name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used in the username field of the Authorization header field of the <i>SIP REGISTER</i> request.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip auth name: 5553456

Parameter – <i>sip password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Password used to register the IP phone with the SIP proxy.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip password: 12345

Parameter – <i>mask sip password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables the enhanced security feature whereby a user's SIP account password is hidden/masked in the server.cfg and local.cfg files (downloaded from the IP phone's Web UI troubleshooting page for debug purposes).
Format	Boolean
Default Value	0 (disabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	mask sip password: 1

Parameter – <i>sip bla number</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to assign a phone number that is shared across all IP phones.
Format	Integer
Default Value	Not Applicable
Range	Not Applicable
Example	sip bla number: 1010

Parameter – <i>sip mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to configure the mode of the line. Applicable values are: <ul style="list-style-type: none"> • Generic - Normal line • BroadSoft SCA - Shared Call/Line Appearances (SCA) line for BroadWorks network (call activity can go to more than one phone) • BLA - Bridged Line Appearance (BLA) line.
Format	Integer
Default Value	0
Range	Valid values are: 0 - Generic 1 - BroadSoft SCA 2 - (reserved) 3 - BLA
Example	sip mode: 2

Call Waiting Settings

Parameter – call waiting	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to enable or disable Call Waiting on the IP phone.</p> <p>If you enable call waiting (default), the user has the option of accepting a second call while currently on the first call. If you disable call waiting, and a user is currently on a call, a second incoming call is automatically rejected by the phone with a busy message.</p> <p>If you disable call waiting on the phone, and the user is on a call, any further incoming calls will receive busy unless “Call Forward Busy” or “Call Forward No Answer and Busy” is configured on the phone. It will then forward the call according to the rule configured. The phone can only:</p> <ul style="list-style-type: none"> • transfer the currently active call <p>or</p> <ul style="list-style-type: none"> • accept transferred calls if there is no active calls. <p>If call waiting is disabled:</p> <ul style="list-style-type: none"> • on the 6757i CT base, and the handset is currently on a call, all additional incoming calls are rejected on the handset. • intercom calls are treated as regular incoming calls and are rejected. • pre-dialing with live dial pad disabled still accepts incoming calls. • the Missed Calls List does not get updated with details of calls. • the Blind Transfer feature on the phone may not work if two calls are made to the phone at one time.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	call waiting: 0

Parameter – call waiting tone	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enable or disables the playing of a call waiting tone when a caller is on an active call and a new call comes into the phone.</p> <p>The Call Waiting Tone feature works only if the Call Waiting parameter is enabled.</p>
Format	Boolean
Default Value	1 (enabled)
Range	0 (disable) 1 (enabled)
Example	call waiting tone: 0

Parameter – <i>call waiting tone period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the time period, in seconds, that the call waiting tone is audible on an active call when another call comes in. When enabled, the call waiting tone plays at regular intervals for the amount of time set for this parameter. For example, if set to “30” the call waiting tone plays every 30 seconds. When set to “0”, the call waiting tone is audible only once on the active call.
Format	Integer
Default Value	0
Range	0-4294967295
Example	call waiting tone period: 30

SIP Global Network Settings

Parameter – <i>sip proxy ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address of the SIP proxy server for which the IP phone uses to send all SIP requests. A SIP proxy is a server that initiates and forwards requests generated by the IP phone to the targeted user.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not applicable
Example	sip proxy ip: 192.168.0.101

Parameter – <i>sip proxy port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The proxy server's port number.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip proxy port: 5060

Parameter – <i>sip backup proxy ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address of the backup SIP proxy server for which the IP phone uses when the primary SIP proxy is unavailable.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip backup proxy ip: 192.168.0.102

Parameter – <i>sip backup proxy port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The backup proxy's port number.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip backup proxy port: 5060

Parameter – <i>sip outbound proxy</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the address of the outbound proxy server. All SIP messages originating from the phone are sent to this server. For example, if you have a Session Border Controller in your network, then you would normally set its address here.
Format	IP Address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip outbound proxy: 10.42.23.13

Parameter – <i>sip outbound proxy port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The proxy port on the proxy server to which the IP phone sends all SIP messages.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip outbound proxy port: 5060

Parameter – <i>sip registrar ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The address of the registrar for which the IP phone uses to send <i>REGISTER</i> requests. A SIP registrar is a server that maintains the location information of the IP phone. A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone. If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e, line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip registrar ip: 192.168.0.101

Parameter – <i>sip registrar port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The registrar's port number.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip registrar port: 5060

Parameter – <i>sip backup registrar ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The address of the backup registrar (typically, the backup SIP proxy) for which the IP phone uses to send <i>REGISTER</i> requests if the primary registrar is unavailable. A global value of 0.0.0.0 disables backup registration. However, the phone is still active and you can dial using username@ip address of the phone. If the backup registrar IP address is set to 0.0.0.0 for a per-line basis (i.e, line 1, line 2, etc.), then the backup register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip backup registrar ip: 192.168.0.102

Parameter – <i>sip backup registrar port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The backup registrar's (typically the backup SIP proxy) port number.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip backup registrar port: 5060

Parameter – <i>sip registration period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The requested registration period, in seconds, from the registrar.
Format	Integer
Default Value	0
Range	0 - 2147483647
Example	sip registration period: 3600

Backup Outbound Proxy (Global Settings)

Parameter – <i>sip backup outbound proxy</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address or domain name of the backup outbound SIP proxy server for which the IP phone uses when the primary SIP proxy is unavailable. Use this parameter to configure the sip backup outbound proxy on a global basis.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip backup outbound proxy: drax.us.aastra.com

Parameter – <i>sip backup outbound proxy port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The backup outbound proxy port on the backup outbound proxy server to which the IP phone sends all SIP messages. Use this parameter to configure the sip backup outbound proxy port on a global basis.
Format	Integer
Default Value	0
Range	0 - 65535
Example	sip backup outbound proxy port: 5060

SIP Basic, Per-Line Settings

The following parameters are SIP per-line settings. The value of "N" is 1 - 9 or 1-6 depending on your model phone.

SIP Per-Line Authentication Settings

Parameter – <i>sip lineN screen name</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used to display text on the screen of the phone. You may want to set this parameter to display the phone user's name.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip line1 screen name: Joe Smith

Parameter – <i>sip lineN screen name 2</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used to display text on a second line on the screen of the phone. Notes: <ul style="list-style-type: none"> • If other status messages display on the phone, such as "Network Disconnected", the Screen Name 2 value does not display. • Characters are allowed (such as "#"). • If the text is longer than the display width, than the display truncates the text to fit the display.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip line1 screen name 2: Lab Phone

Parameter – <i>sip lineN user name</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used in the name field of the <i>SIP URI</i> for the IP phone and for registering the IP phone at the registrar. When configuring per-line BLA on an ININ server, the username must be incremented as shown in the example for the "sip lineN bla number" parameter on page A-71 . Note: The IP Phones support Usernames containing dots ("").
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip line1 user name: 1010

Parameter – <i>sip lineN display name</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used in the display name field of the <i>From</i> SIP header field. Some IP PBX systems use this as the caller's ID and some may overwrite this with the string that is set at the PBX system.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip line1 display name: Joe Smith

Parameter – <i>sip lineN auth name</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Used in the username field of the Authorization header field of the <i>SIP REGISTER</i> request.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip line1 auth name: 5553456

Parameter – <i>sip lineN password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
(N is a line number from 1 to 9)	
Description	The password that will be used to register at the registrar.
Format	Text
Default Value	Not Applicable
Range	Up to 20 alphanumeric characters
Example	sip line1 password: 12345

Parameter – <i>sip lineN bla number</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
(N is a line number from 1 to 9)	
Description	<p>Allows you to assign a phone number that is shared on specific lines on the IP phone.</p> <p>For Sylanro Server: When configuring the BLA feature on a Sylanro server, the value set for the sip lineN bla number parameter shall be the same value set for the sip lineN user name parameter for all the phones in the group. For example, if sip lineN user name is 1010, you would configure BLA on a per-line basis for the Sylanro server as follows: sip line1 user name: 1010(# for all the phones) sip line1 bla number: 1010</p> <p>For ININ Server: When configuring the BLA feature on an ININ server, the value set for the sip lineN bla number parameter shall be the same value set for the sip lineN user name parameter without the incremented digit added to the phone #. For example, if the sip lineN user name for the first phone is 10101, and the sip lineN user name for the second phone is 10102, etc. you would configure BLA on a per-line basis for the ININ server as follows: sip line1 user name: 10101(# for phone 1 with) sip line1 bla number: 1010appearance of phone 3)</p> <p>sip line1 user name: 10102(# for phone 2 with) sip line1 bla number: 1010appearance of phone 3)</p> <p>sip line1 user name: 1010(# for phone 3) sip line1 bla number: 1010</p> <p>Note: The original phone number which has the bridged line appearance on other phones, will have the "sip lineN user name" parameter the same as the "sip lineN bla number" (1010 in the above example on Phone 3).</p>
Format	Integer
Default Value	Not Applicable
Range	Not Applicable
Example	<p>Sylanro Server: sip line1 bla number: 1010</p> <p>ININ Server: sip line 1 bla number: 1010</p>

Parameter – <i>sip lineN mode</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to configure the mode of the line. Applicable values are: <ul style="list-style-type: none"> • Generic - Normal line • BroadSoft SCA - Shared Call/Line Appearances (SCA) line for BroadWorks network (call activity can go to more than one phone) • BLA - Bridged Line Appearance (BLA) line. • If the softkeys on the 6757i/6757i CT or the programmable keys on the 6753i are set as line keys, and you configure that line key for BLA, the key is configured to use BLA.
Format	Integer
Default Value	0
Range	Valid values are: 0 - Generic 1 - BroadSoft SCA 2 - (Reserved) 3 - BLA
Example	sip line1 mode: 2

SIP Per-Line Call Waiting Setting

Parameter – <i>sip lineN call waiting</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to enable or disable Call Waiting on the IP phone on a per line basis.</p> <p>If you enable call waiting (default), the user has the option of accepting a second call while currently on the first call. If you disable call waiting, and a user is currently on a call, a second incoming call is automatically rejected by the phone with a busy message.</p> <p>If you disable call waiting on the phone, and the user is on a call, any further incoming calls will receive busy unless “Call Forward Busy” or “Call Forward No Answer and Busy” is configured on the phone. It will then forward the call according to the rule configured. The phone can only:</p> <ul style="list-style-type: none"> • transfer the currently active call <p>or</p> <ul style="list-style-type: none"> • accept transferred calls if there is no active calls. <p>If call waiting is disabled:</p> <ul style="list-style-type: none"> • on the 6757i CT base, and the handset is currently on a call, all additional incoming calls are rejected on the handset. • intercom calls are treated as regular incoming calls and are rejected. • pre-dialing with live dial pad disabled still accepts incoming calls. • the Missed Calls List does not get updated with details of calls. • the Blind Transfer feature on the phone may not work if two calls are made to the phone at one time.
Format	Boolean
Default Value	Global
Range	Global 0 (disabled) 1 (enabled)
Example	<pre> sip line1 call waiting: 0 sip line2 call waiting: 1 sip line3 call waiting: 0 </pre>

SIP Per-Line Network Settings

Parameter – <i>sip lineN proxy ip</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address of the SIP proxy server for which the IP phone uses to send all SIP requests. A SIP proxy is a server that initiates and forwards requests generated by the IP phone to the targeted user.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	<pre> sip line1 proxy ip: 192.168.0.101 </pre>

Parameter – <i>sip lineN proxy port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The proxy server's port number
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip line1 proxy port: 5060

Parameter – <i>sip lineN backup proxy ip</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address of the backup SIP proxy server for which the IP phone uses when the primary SIP proxy is unavailable.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip line1 backup proxy ip: 192.168.0.102

Parameter – <i>sip lineN backup proxy port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The backup proxy's port number.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip line1 backup proxy port: 5060

Parameter – <i>sip lineN outbound proxy</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the address of the outbound proxy server. All SIP messages originating from the phone are sent to this server. For example, if you have a Session Border Controller in your network, then you would normally set its address here.
Format	IP Address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip outbound proxy: 10.42.23.13

Parameter – <i>sip lineN outbound proxy port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The proxy port on the proxy server to which the IP phone sends all SIP messages.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip outbound proxy port: 5060

Parameter – <i>sip lineN registrar ip</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The address of the registrar for which the IP phone uses to send <i>REGISTER</i> requests. A SIP registrar is a server that maintains the location information of the IP phone. A global value of 0.0.0.0 disables registration. However, the phone is still active and you can dial using username@ip address of the phone. If the Registrar IP address is set to 0.0.0.0 for a per-line basis (i.e, line 1, line 2, etc.), then the register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip line1 registrar ip: 192.168.0.101

Parameter – <i>sip lineN registrar port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The registrar's port number
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip line1 registrar port: 5060

Parameter – <i>sip lineN backup registrar ip</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The address of the backup registrar (typically, the backup SIP proxy) for which the IP phone uses to send <i>REGISTER</i> requests if the primary registrar is unavailable. A global value of 0.0.0.0 disables backup registration. However, the phone is still active and you can dial using username@ip address of the phone. If the backup registrar IP address is set to 0.0.0.0 for a per-line basis (i.e, line 1, line 2, etc.), then the backup register request is not sent, the "No Service" message does not display, and the message waiting indicator (MWI) does not come on.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip line1 backup registrar ip: 192.168.0.102

Parameter – <i>sip lineN backup registrar port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The backup registrar's (typically the backup SIP proxy) port number.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip line1 backup registrar port: 5060

Parameter – <i>sip lineN registration period</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The requested registration period, in seconds, from the registrar.
Format	Integer
Default Value	0
Range	0 to 2147483647
Example	sip line1 registration period: 3600

Backup Outbound Proxy (Per-line Settings)

Parameter – <i>sip lineN backup outbound proxy</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The IP address or domain name of the backup outbound SIP proxy server for which the IP phone uses when the primary SIP proxy is unavailable. Use this parameter to configure the sip backup outbound proxy on a per-line basis.
Format	IP address or fully qualified Domain Name
Default Value	0.0.0.0
Range	Not Applicable
Example	sip line1 backup outbound proxy: drax.us.aastra.com

Parameter – <i>sip lineN backup outbound proxy port</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The backup outbound proxy port on the backup outbound proxy server to which the IP phone sends all SIP messages. Use this parameter to configure the sip backup outbound proxy port on a per-line basis.
Format	Integer
Default Value	0
Range	0 - 65535
Example	sip line1 backup outbound proxy port: 5060

BLA Support for MWI

Parameter – <i>sip mwi for bla account</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables a BLA configured line to send an MWI SUBSCRIBE message for the BLA account. Notes: <ul style="list-style-type: none"> • If you change the setting on this parameter, you must reboot the phone for it to take affect. • Both the "sip explicit mwi subscription" and "sip mwi for bla account" parameters must be enabled in order for the MWI subscription for BLA to occur. • The MWI re-subscription for the BLA account uses the value set for the "sip explicit mwi subscription period" parameter to re-subscribe. • Whether or not the "sip mwi for bla account" parameter is enabled, the priority for displaying MWI does not change.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip mwi for bla account: 1

Shared Call Appearance (SCA) Call Bridging

Global Setting

Parameter – <i>sip sca bridging</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables SCA bridging on the phone-side on a global basis. Note: You must restart the phone after setting a value for this parameter.
Format	Boolean
Default Value	0
Range	0 (disabled) 1 (enabled)
Example	sip sca bridging: 1

Per-Line Setting

Parameter – <i>sip lineN sca bridging</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables SCA bridging on the phone-side on a per-account basis using a specific SCA-configured line. Note: You must restart the phone after setting a value for this parameter.
Format	Boolean
Default Value	0
Range	0 (disabled) 1 (enabled)
Example	sip line1 sca bridging: 1

Centralized Conferencing Settings

Global Setting

Parameter – <i>sip centralized conf</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Globally enables or disables SIP centralized conferencing for an IP phone as follows:</p> <ul style="list-style-type: none"> To disable centralized conferencing, leave this field empty (blank). To enable SIP centralized conferencing, then do one of the following actions: <ul style="list-style-type: none"> If you have specified a proxy server/registrars server, then to reach the media server via the proxy server, set this field to one of the following: <p>conf (Sylantro server), or</p> <p>Conference (Broadsoft server)</p> <p>By setting this field to conf, you specify conf@<proxy_server_address>:<proxy_port>. For example, if the proxy server address is 206.229.26.60 and the proxy port used is 10060, then by setting this parameter to conf, you are specifying the following: conf@206.229.26.60:10060</p> To reach the media server using a different address/port than that specified by the proxy, set this field to the following: <p>conf@<media_server_address>: <media_port></p>
Format	String
Default Value	Blank
Example	sip centralized conf: conf

Per-Line Setting

Parameter – <i>sip lineN centralized conf</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
(N is a line number from 1 to 9)	
Description	<p>Enable or disable per-line SIP centralized conferencing for an IP phone as follows:</p> <ul style="list-style-type: none"> To disable centralized conferencing, leave this field empty (blank). To enable SIP centralized conferencing on a specific line, do one of the following actions: <ul style="list-style-type: none"> If you have specified a proxy server/registrars server, then to reach the media server via the proxy server, set this field to one of the following: <p>conf (Sylantro server), or</p> <p>Conference (Broadsoft server)</p> <p>By setting this field to conf, you specify conf@<proxy_server_address>:<proxy_port>. For example, if the proxy server address is 206.229.26.60 and the proxy port used is 10060, then by setting this parameter to conf, you are specifying the following: conf@206.229.26.60:10060.</p> To reach the media server using a different address/port than that specified by the proxy, set this field to the following: <p>conf@<media_server_address>: <media_port></p>
Format	String
Default Value	Blank
Examples	sip line3 centralized conf: conf

Custom Ad-Hoc Conference

Parameter – <i>custom adhoc conference</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables the phone to interoperate with Genband Call Manager for ad-hoc conference.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	custom adhoc conference: 1

SIP Join Feature for 3-Way Conference

Parameter – <i>sip join support</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the phone to allow a conference to be set up with a join header as described in RFC 3911.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip join support: 1

Conference/Transfer in Live Dial Mode

Parameter– <i>confxfer live dial</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	To enable or disable conference and transfer in live dial mode.
Format	Boolean
Default Value	0 (disabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	confxfer live dial: 1

HTTP/HTTPS Authentication Support for Broadsoft CMS

Parameter – <i>http digest username</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the username to use for HTTP/HTTPS digest authentication. The server uses this username for authentication purposes when loading configuration to the phone over HTTP/HTTPS. This parameter initiates a “Username/Password” screen after pressing the Log In softkey. Notes: <ul style="list-style-type: none"> • The Username field accepts special characters, such as, @, #, %, =, _ , etc. You can also specify domain names (i.e., user@domain). • You must reboot the phone after setting the HTTP/HTTPS digest authentication parameters.
Format	String
Default Value	aastra
Range	Up to 40 alphanumeric characters
Example	http digest username: myusername

Parameter – <i>http digest password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the password to use for HTTP/HTTPS digest authentication. The server uses this password for authentication purposes when loading configuration to the phone over HTTP/HTTPS. This parameter initiates a “Username/Password” screen after pressing the Log In softkey. Notes: <ul style="list-style-type: none"> • The Password field accepts special characters, such as, @, #, %, =, _ , etc. • You must reboot the phone after setting the HTTP/HTTPS digest authentication parameters.
Format	String
Default Value	aastra
Range	Up to 20 alphanumeric characters
Example	http digest password: mypassword

Parameter – <i>http digest force login</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables the display of a LOGIN key on the phone’s idle screen. Note: After the server has authenticated the phone, this parameter must be set to “0” in order for the server to send the default profile to the phone.
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	http digest force login: 1

Advanced SIP Settings

Parameter – <i>sip explicit mwi subscription</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	If the IP phone has a message waiting subscription with the Service Provider, a Message Waiting Indicator (MWI) (LED or display icon) tells the user there is a message on the IP Phone. You can enable and disable MWI by setting this parameter to the following: "0" to disable "1" to enable
Format	Boolean
Default Value	0
Range	0 (disable) 1 (enable)
Example	sip explicit mwi subscription: 1

Parameter – <i>sip explicit mwi subscription period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The requested duration, in seconds, before the MWI subscription times out. The phone re-subscribes to MWI before the subscription period ends.
Format	Integer
Default Value	86400
Range	30 - 2147483647
Example	sip explicit mwi subscription period: 30

Parameter – <i>sip send mac</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Adds an "Aastra-Mac:" header to the SIP REGISTER messages sent from the phone to the call server, where the value is the MAC address of the phone.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip send mac: 1

Parameter – <i>sip send line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Adds an "Aastra-Line:" header to the SIP REGISTER messages sent from the phone to the call server, where the value is the line number that is being registered.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip send line: 1

Parameter – <i>sip session timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The time, in seconds, that the IP phone uses to send periodic re- <i>INVITE</i> requests to keep a session alive. The proxy uses these re- <i>INVITE</i> requests to maintain the status' of the connected sessions. See RFC4028 for details. The minimum session timer is 90.
Format	Integer
Default Value	0
Range	0, 90 +
Example	sip session timer: 90

Parameter – <i>sip T1 timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This timer is a SIP transaction layer timer defined in RFC 3261. Timer 1 is an estimate, in milliseconds, of the round-trip time (RTT).
Format	Integer
Default Value	500
Range	Not Applicable
Example	sip T1 timer: 600

Parameter – <i>sip T2 timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This timer is a SIP transaction layer timer defined in RFC 3261. Timer 2 represents the amount of time, in milliseconds, a non- <i>INVITE</i> server transaction takes to respond to a request.
Format	Integer
Default Value	0
Range	Not Applicable
Example	sip T2 timer: 8

Parameter – <i>sip transaction timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The amount of time, in milliseconds that the phone allows the callserver (registrar/proxy) to respond to SIP messages that it sends. If the phone does not receive a response in the amount of time designated for this parameter, the phone assumes the message has timed out.
Format	Integer
Default Value	4000
Range	4000 to 64000
Example	sip transaction timer: 6000

Parameter – <i>sip transport protocol</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The protocol that the IP phone uses to send out SIP messages. Notes: <ul style="list-style-type: none"> • If you set the value of this parameter to 4 (TLS), the phone checks to see if the “sips persistent tls” is enabled. If it is enabled, the phone uses Persistent TLS on the connection. If “sips persistent tls” is disabled, then the phone uses TLS on the connection. If TLS is used, you must specify the Root and Intermediate Certificates, the Local Certificate, the Private Key, and the Trusted Certificates. • If the phone uses Persistent TLS, you MUST specify the Trusted Certificates; the Root and Intermediate Certificates, the Local Certificate, and the Private Key are optional. • This parameter implies keep-alive mechanism. <p>For more information about Persistent TLS, see “Transport Layer Security (TLS) Settings” on page A-89.</p>
Format	Integer
Default Value	1 (UDP)
Range	Valid values are: 0 - User Datagram Protocol (UDP) and Transmission Control Protocol (TCP) 1 - UDP 2 - TCP 4 - Transport Layer Security (TLS)
Example	sip transport protocol: 4

Parameter – <i>sip registration retry timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the time, in seconds, that the phone waits between registration attempts when a registration is rejected by the registrar.
Format	Integer
Default Value	1800 (30 minutes)
Range	30-1800
Example	sip registration retry timer: 30

Parameter – <i>sip registration timeout retry timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the length of time, in seconds, that the phone waits until it re-attempts to register after a REGISTER message times out. If this parameter is set lower than 30 seconds, the phone uses a minimum timer of 30 seconds.
Format	Integer
Default Value	120
Range	30 - 2147483647
Example	sip registration timeout retry timer: 150

Parameter – <i>sip registration renewal timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The threshold value, in seconds, prior to expiration, that the phone renews registrations. The phone will automatically send registration renewals half-way through the registration period, unless half-way is more than the threshold value. For example, if the threshold value is set to 60 seconds and if the registration period is 600 seconds, the renewal REGISTER message will be sent 60 seconds prior to the expiration, as half-way (600/2) > 60. If the registration period was 100 seconds, then the renewal would be sent at the half-way point as (100/2) < 60.
Format	Integer
Default Value	15
Range	0 - 2147483647 The value set for this parameter should be between 0 and the value set for the registration period.
Example	sip registration renewal timer: 10

Parameter – <i>sip subscription timeout retry timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Applicable for all event packages, this parameter controls how long the phone delays then retries a subscription when a SUBSCRIBE request is responded with a 408 (timeout) or 503 (service unavailable) error code. Note: If set to 0 or an invalid value is set, the parameter will not take effect.
Format	Seconds
Default Value	0
Range	1-3600
Example	sip subscription timeout retry timer: 60

Parameter – <i>sip subscription failed retry timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Applicable for all event packages, this parameter controls how long the phone delays then retries a subscription when a SUBSCRIBE request is responded with error codes other than 408 (timeout) or 503 (service unavailable). Note: If set to 0 or an invalid value is set, the parameter will not take effect.
Format	Seconds
Default Value	0
Range	1-3600
Example	sip subscription failed retry timer: 30

Parameter – <i>sip blf subscription period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The requested duration, in seconds, before the BLF subscription times out. The phone re-subscribes to the BLF subscription service before the defined subscription period ends. Note: This parameter is not applicable to BLF/List subscriptions.
Format	Integer
Default Value	3600
Range	120 - 2147483647
Example	sip blf subscription period: 2000

Parameter – <i>sip acd subscription period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the time period, in seconds, that the IP phone re-subscribes the Automatic Call Distribution (ACD) subscription service after a software/firmware upgrade or after a reboot of the IP phone.
Format	Integer
Default Value	3600
Range	120 - 2147483647
Example	sip acd subscription period: 2000

Parameter – <i>sip bla subscription period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the amount of time, in seconds, that the phone waits to receive a BLA subscribe message from the server. If you specify zero (0), the phone uses the value specified for the BLA expiration in the subscribe message received from the server. If no value is specified, the phone uses the default value of 300 seconds.
Format	Integer
Default Value	300
Range	0-3700 Note: When set to zero (0), the phone uses BLA expiry value specified in subscribe message.
Example	sip bla subscription period: 0

Missed Call Summary Subscription Settings

Global Parameters

Parameter – <i>sip missed call summary subscription</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enables or disables the Missed Call Summary Subscription feature. This feature allows missed calls that have been redirected by the server, to be incremented in the missed calls indicator on the phone it was initially directed to.</p> <p>For example, phones A, B, and C are connected to the server. You configure the server to direct calls coming into phone B (which has voicemail configured) to be forwarded to phone C. When phone A calls sip missed call summary subscription parameter, phone B receives notification from the server that the call was forwarded and the missed calls indicator is incremented on phone B.</p> <p>Note: You must configure voicemail on the phone that the call was initially directed to (phone B in the above example).</p>
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip missed call summary subscription: 1

Parameter – <i>sip missed call summary subscription period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Specifies the amount of time, in seconds, that the phone uses the Missed Calls Summary Subscription feature. This parameter is always enabled with a default value of 86400 seconds. When the phone reaches the limit set for this parameter, it sends the subscription again.</p> <p>To disable this parameter, leave the field blank or set the field to zero (0).</p>
Format	Integer
Default Value	86400
Range	0 - 99999999
Example	sip missed call summary subscription period: 70000

Per-Line Parameter

Parameter – <i>sip lineN missed call summary subscription</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Missed Call Summary Subscription feature. This feature allows missed calls that have been redirected by the server, to be incremented in the missed calls indicator on the phone it was initially directed to. For example, phones A, B, and C are connected to the server. You configure the server to direct calls coming into phone B (which has voicemail configured) to be forwarded to phone C. When phone A calls phone B, the server forwards the call to phone C. If you enable the sip missed call summary subscription parameter, phone B receives notification from the server that the call was forwarded and the missed calls indicator is incremented on phone B. Note: You must configure voicemail on the phone that the call was initially directed to (phone B in the above example).
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip line1 missed call summary subscription: 1

As-Feature-Event Subscription Settings

Parameter – <i>sip lineN as-feature-event subscription</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the specified line with the BroadSoft's server-side DND, CFWD, or ACD features.
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	sip line1 as-feature-event subscription: 1

Parameter – <i>sip as-feature-event subscription period</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the amount of time, in seconds, between re-subscribing. If the phone does not re-subscribe in the time specified for this parameter, it loses subscription.
Format	Integer
Default Value	3600
Range	5 - 2147483647
Example	sip as-feature-event subscription period: 600

Transport Layer Security (TLS) Settings

To configure TLS, you must enter the “**sip transport protocol**” parameter with a value of “**4**” (TLS). See the “sip transport protocol” description on [page A-84](#).

Also enter the following parameters in the configuration files to configure TLS:

Parameter – <i>sips persistent tls</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the use of Persistent Transport Layer Security (TLS). Persistent TLS sets up the connection to the server once and re-uses that connection for all calls from the phone. The setup connection for Persistent TLS is established during the registration of the phone. If the phones are set to use Persistent TLS, and a call is made from the phone, this call and all subsequent calls use the same authenticated connection. This significantly reduces the delay time when placing a call. Notes: <ul style="list-style-type: none"> • There can be only one persistent TLS connection created per phone. • If you configure the phone to use Persistent TLS, you must also specify the Trusted Certificate file to use. The Root and Intermediate Certificates, Local Certificate, and Private Key files are optional.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sips persistent tls: 1

Parameter – <i>sip persistent tls keep alive</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When enabled, the configured value indicates frequency (in seconds) that phone will send the keep alive messages.
Format	Integer
Default Value	0 (Disabled)
Range	0-3600
Example	sip persistent tls keep alive: 10

Parameter– <i>sip send sips over tls</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows administrators the ability to manually configure the IP phones to use either the SIP or SIPS URI scheme when TLS or persistent TLS is enabled
Format	Integer
Default Value	1 (Enabled)
Range	0-1 0 (Disabled - Use SIP URI scheme) 1 (Enabled - Use SIPS URI scheme)
Example	sip send sips over tls: 0

Parameter – <i>sips root and intermediate certificates</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify the SIP Root and Intermediate Certificate files to use when the phone uses the TLS transport protocol to setup a call.</p> <p>The Root and Intermediate Certificate files contain one root certificate and zero or more intermediate certificates which must be placed in order of certificate signing with root certificate being the first in the file. If the local certificate is signed by some well known certificate authority, then that authority provides the user with the Root and Intermediate Certificate files (most likely just CA root certificate).</p> <p>This parameter is required when configuring TLS (optional for Persistent TLS.)</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>sips root and intermediate certificates: ftp://admin:admin!@1.2.3.4:50/path/phonesRoot-Cert.pem</p> <p>where “path” is the directory and “phonesRootCert.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p> <p>Note: The certificate files must use the format “.pem”. To create custom certificate files to use on your IP phone, contact Aastra Technical Support.</p>
Format	<filename>.pem
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no root and intermediate certificate file:</p> <p>sips root and intermediate certificates:</p> <p>The following example downloads the root and intermediate certificate file from the original configuration server.</p> <p>sips root and intermediate certificates: phonesRootCert.pem</p> <p>The following example uses FTP to download the firmware file “phonesRootCert.pem” (root and intermediate certificate file) from the “path” directory on server 1.2.3.4 using port 50.</p> <p>sips root and intermediate certificates: ftp://admin:admin!@1.2.3.4:50/path/phonesRoot-Cert.pem</p>

Parameter – <i>sips local certificate</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify the Local Certificate file to use when the phone uses the TLS transport protocol to setup a call.</p> <p>This parameter is required when configuring TLS (optional for Persistent TLS.)</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>sips local certificate:ftp://admin:admin!@1.2.3.4:50/path/phonesLocalCert.pem</p> <p>where “path” is the directory and “phonesLocalCert.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p> <p>Note: The certificate file must use the format “pem”. To create specific certificate files to use on your IP phone, contact Aastra Technical Support.</p>
Format	<filename>.pem
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no local certificate file:</p> <p>sips local certificate:</p> <p>The following example downloads the local certificate file from the original configuration server.</p> <p>sips local certificate: phonesLocalCert.pem</p> <p>The following example uses FTP to download the firmware file “phonesLocalCert.pem” (local certificate file) from the “path” directory on server 1.2.3.4 using port 50:</p> <p>sips local certificate: ftp://admin:admin!@1.2.3.4:50/path/phonesLocalCert.pem</p>

Parameter – <i>sips private key</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify a Private Key file to use when the phone uses the TLS transport protocol to setup a call.</p> <p>This parameter is required when configuring TLS (optional for Persistent TLS.)</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no private key • To download a private key from the original configuration server • To download a private key from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>sips private key: ftp://admin:admin!@1.2.3.4:50/path/phonesPrivatekey.pem</p> <p>where “path” is the directory and “phonesPrivateKey.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p> <p>Note: The key file must use the format “.pem”. To create specific private key files to use on your IP phone, contact Aastra Technical Support.</p>
Format	<filename>.pem
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no private key file:</p> <p>sips private key:</p> <p>The following example downloads the private key file from the original configuration server.</p> <p>sips private key: phonesPrivateKey.pem</p> <p>The following example uses FTP to download the firmware file “phonesPrivateKey.pem” (private key file) from the “path” directory on server 1.2.3.4 using port 50:</p> <p>sips private key: ftp://admin:admin!@1.2.3.4:50/path/phonesPrivateKey.pem</p>

Parameter – <i>sips trusted certificates</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify the Trusted Certificate files to use when the phone uses the TLS transport protocol to setup a call.</p> <p>The Trusted Certificate files define a list of trusted certificates. The phone's trusted list must contain the CA root certificates for all the servers it is connecting to. For example, if the phone is connecting to server A which has a certificate signed by CA1, and server B that has a certificate signed by CA2, the phone must have CA1 root certificate and CA2 root certificate in its Trusted Certificate file.</p> <p>This parameter is required when configuring TLS or Persistent TLS.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>sips trusted certificates: ftp://admin:admin!@1.2.3.4:50/path/phonesTrustedCert.pem</p> <p>where "path" is the directory and "phonesTrustedCert.pem" is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p> <p>Note: The certificate files must use the format ".pem". To create custom certificate files to use on your IP phone, contact Aastra Technical Support.</p>
Format	<file name>.pem
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no trusted certificate file:</p> <p>sips trusted certificates:</p> <p>The following example downloads the trusted certificate file from the original configuration server.</p> <p>sips trusted certificates: phonesTrustedCert.pem</p> <p>The following example uses FTP to download the firmware file "phonesTrustedCert.pem" (trusted certificate file) from the "path" directory on server 1.2.3.4 using port 50:</p> <p>sips trusted certificates: ftp://admin:admin!@1.2.3.4:50/path/phonesTrustedCert.pem</p>

802.1x Support Settings

Use the following parameters to configure the 802.1x Protocol on your phone using the configuration files.

For EAP-MD5 use:

- **eap type**
- **identity**
- **md5 password**
- **pc port passthrough enabled**

For EAP-TLS use:

- **eap type**
- **identity**
- **802.1x root and intermediate certificates**
(use 1 root and 0 or 1 intermediate certificates)
- **802.1x local certificate**
(use 1 local certificate)
- **802.1x private key**
(1 private key that corresponds to local certificate)
- **802.1x trusted certificates**
(0 or more trusted certificates (a maximum of 2))
- **pc port passthrough enabled**

Parameter – <i>pc port passthru enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the PC port.
Format	Integer
Default Value	1 (enable)
Range	0 (disable) 1 (enable)
Example	pc port passthru enabled: 1

Parameter – <i>eap type</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the type of authentication to use on the IP Phone.
Format	Integer
Default Value	0 (disable)
Range	0 (disable) 1 (MD5) 2 (TLS)
Example	eap type: 1

Parameter – <i>identity</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the identity or username used for authenticating the phone. Note: The value you enter for this parameter also displays in the Aastra Web UI at the path Advanced Settings->802.1x Support->General->Identity .
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	identity: phone1

Parameter – <i>md5 password</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the password used for the MD5 authentication of the phone. Note: The value you enter for this parameter also displays in the Aastra Web UI at the path Advanced Settings->802.1x Support->EAP-MD5 Settings->MD5 Password . The password displays as "*****".
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	md5 password: password1

Parameter – 802.1x root and intermediate certificates	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Specifies the file name that contains the root and intermediate certificates related to the local certificate.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>802.1x root and intermediate certificates:ftp://admin:admin!@1.2.3.4:50/path/phones802RootCert.pem</p> <p>where “path” is the directory and “phones802RootCert.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p>
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no 802.1x root and intermediate certificate file:</p> <p>802.1x root and intermediate certificates:</p> <p>The following example downloads the 802.1x root and intermediate certificate file from the original configuration server.</p> <p>802.1x root and intermediate certificates: phones802RootCert.pem</p> <p>The following example uses FTP to download the firmware file “phones802RootCert.pem” (802.1x root and intermediate certificate file) from the “path” directory on server 1.2.3.4 using port 50:</p> <p>802.1x root and intermediate certificates:ftp://admin:admin!@1.2.3.4:50/path/phones802RootCert.pem</p>

Parameter – 802.1x local certificate	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Specifies the file name that contains the local certificate.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>802.1x local certificate:ftp://admin:admin!@1.2.3.4:50/path/phones802LocalCert.pem</p> <p>where “path” is the directory and “phones802LocalCert.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p>
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no local certificate file:</p> <p>802.1x local certificate:</p> <p>The following example downloads the local certificate file from the original configuration server.</p> <p>802.1x local certificate: phones802LocalCert.pem</p> <p>The following example uses FTP to download the firmware file “phones802LocalCert.pem” (802.1x local certificate file) from the “path” directory on server 1.2.3.4 using port 50:</p> <p>802.1x local certificate:ftp://admin:admin!@1.2.3.4:50/path/phones802LocalCert.pem</p>

Parameter – 802.1x private key	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the file name that contains the private key.
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	802.1x private key: filename.pem

Parameter – 802.1x trusted certificates	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Specifies the file name that contains the trusted certificates.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no certificates • To download a certificate from the original configuration server • To download a certificate from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <pre>802.1x trusted certificates:ftp://admin:admin!@1.2.3.4:50/path/phones802TrustedCert.pem</pre> <p>where “path” is the directory and “phones802TrustedCert.pem” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p>
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no 802.1x trusted certificate file:</p> <pre>802.1x trusted certificates:</pre> <p>The following example downloads the 802.1x trusted certificate file from the original configuration server.</p> <pre>802.1x trusted certificates: phones802TrustedCert.pem</pre> <p>The following example uses FTP to download the firmware file “phones802TrustedCert.pem” (802.1x trusted certificate file) from the “path” directory on server 1.2.3.4 using port 50:</p> <pre>802.1x trusted certifi- cates:ftp://admin:admin!@1.2.3.4:50/path/phones802TrustedCert.pem</pre>

RTP, Codec, DTMF Global Settings

Global Settings

Parameter – <i>sip rtp port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Indicates the port through which the RTP packets are sent. This value must specify the beginning of the RTP port range on the gateway or router.</p> <p>The RTP port is used for sending DTMF tones and for the audio stream. Your network administrator may close some ports for security reasons. You may want to use this parameter to send RTP data using a different port.</p> <p>Note: The phones support decoding and playing out DTMF tones sent in SIP INFO requests. The following DTMF tones are supported:</p> <ul style="list-style-type: none"> • Support signals 0-9, #, * • Support durations up to 5 seconds
Format	Integer
Default Value	3000
Range	Not Applicable
Example	sip rtp port: 3000

Parameter – <i>sip use basic codecs</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables basic codecs (G.711 u-Law, G.711 a-Law, G.729). Enabling this parameter allows the IP phone to use the basic Codecs when sending/receiving RTP packets.
Format	Boolean
Default Value	0
Range	0 - Disable 1 - Enable
Example	sip use basic codecs: 1

Parameter – <i>sip amr codec payload format</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the payload format for the AMR/AMR-WB codec.
Format	Integer
Default Value	0
Range	0-2 0 (Enable bandwidth efficient mode per RFC, no octet-aligned header is in the INVITE SDP [default]). 1 (Enable octet-aligned mode and add octet-align:1 in SDP, negotiate mode for incoming calls). 2 (Disable octet-aligned mode and add octet-align:0 in SDP, negotiate mode for incoming calls).
Example	sip amr codec payload format: 1

Parameter – <i>sip amr codec mode set</i>	Configuration Files aastra.cfg, <model>.cfg <mac>.cfg
Description	Specifies the list of mode sets supported and also the preferred mode to use if multiple modes are supported by both sides.
Format	Integer
Default Value	0
Range	0-7 0 (4.75 kbps) 1 (5.15 kbps) 2 (5.90 kbps) 3 (6.70 kbps) 4 (7.40 kbps) 5 (7.95 kbps) 6 (10.2 kbps) 7 (12.2 kbps)
Example	sip amr codec mode set: 2,1,0,3,4

Parameter – <i>sip amr wb codec mode set</i>	Configuration Files aastra.cfg, <model>.cfg <mac>.cfg
Description	Specifies the list of mode sets supported and also the preferred mode to use if multiple modes are supported by both sides.
Format	Integer
Default Value	0
Range	0-8 0 (6.60 kbps) 1 (8.85 kbps) 2 (12.65 kbps) 3 (14.25 kbps) 4 (15.85 kbps) 5 (18.25 kbps) 6 (19.85 kbps) 7 (23.05 kbps) 8 (23.85 kbps)
Example	sip amr wb codec mode set: 2,1,0

Parameter – <i>sip out-of-band dtmf</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables out-of-band DTMF. Enabling this parameter forces the IP phone to use out-of-band DTMF according to RFC2833. Note: See “Out-of-Band DTMF and DTMF Method” on page 4-79” for DTMF behavior information when this parameter is used in conjunction with the “sip dtmf method” parameter.
Format	Boolean
Default Value	1
Range	0 - Disable 1 - Enable
Example	sip out-of-band dtmf: 0

Parameter – <i>sip customized codec</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg																																								
Description	Specifies a customized codec preference list which allows you to select the preferred codecs for this IP phone. You can enter up to 10 codec preferences. Note: Enabling or disabling silence suppression (sil supp) enables/disables it for all codecs in the customized list. When mismatch occurs in the configured silsupp parameter, the first one specified in the parameter value will be used.																																								
Format	Comma-separated list of semicolon-separated values																																								
Default Value	Not Applicable																																								
Range	Valid values for the syntax are: payload: <table border="0"> <tr> <td>Configuration Files</td> <td>Web UI</td> </tr> <tr> <td>0 - G711u/8000</td> <td>G.711u (8K)</td> </tr> <tr> <td>8 - G711a/8000</td> <td>G.711a (8K)</td> </tr> <tr> <td>9 - G722/8000</td> <td>G.722</td> </tr> <tr> <td>18 - G729/8000</td> <td>G.729</td> </tr> <tr> <td>96 - G726-40/8000</td> <td>G.726-40</td> </tr> <tr> <td>97 - G726-24/8000</td> <td>G.726-24</td> </tr> <tr> <td>98 - G726-16/8000</td> <td>G.726-16</td> </tr> <tr> <td>106 - BV16/8000</td> <td>BV16 (8K)</td> </tr> <tr> <td>107 - BV32/16000</td> <td>BV32 (16K)</td> </tr> <tr> <td>110 - G711u/16000</td> <td>G711u (16K)</td> </tr> <tr> <td>111 - G711a/16000</td> <td>G711a (16K)</td> </tr> <tr> <td>112 - L16/8000</td> <td>L16 (8K)</td> </tr> <tr> <td>113 - L16/16000</td> <td>L16 (16K)</td> </tr> <tr> <td>115 - G726-32/8000</td> <td>G.726-32</td> </tr> <tr> <td>118 - AMR G.722.2</td> <td>AMR (Licensed feature for 6735i , 6737i, 6863i, 6865i, and 6867i only)</td> </tr> <tr> <td>119 - AMR-WB G.722.2</td> <td>AMR-WB (Licensed feature for 6735i , 6737i, 6863i, 6865i, and 6867i only)</td> </tr> </table> <table border="0"> <tr> <td>Leave blank for all codecs</td> <td>All (Codec 1 only)</td> </tr> <tr> <td></td> <td>Basic (Codec 1 only)</td> </tr> <tr> <td></td> <td>None (Codecs 2 thru 10 only)</td> </tr> </table> ptime (in milliseconds) 5, 10, 15, 20.....90 silsupp on, off Note: The "silsupp" value is either ON for all codecs or OFF for all codecs.	Configuration Files	Web UI	0 - G711u/8000	G.711u (8K)	8 - G711a/8000	G.711a (8K)	9 - G722/8000	G.722	18 - G729/8000	G.729	96 - G726-40/8000	G.726-40	97 - G726-24/8000	G.726-24	98 - G726-16/8000	G.726-16	106 - BV16/8000	BV16 (8K)	107 - BV32/16000	BV32 (16K)	110 - G711u/16000	G711u (16K)	111 - G711a/16000	G711a (16K)	112 - L16/8000	L16 (8K)	113 - L16/16000	L16 (16K)	115 - G726-32/8000	G.726-32	118 - AMR G.722.2	AMR (Licensed feature for 6735i , 6737i, 6863i, 6865i, and 6867i only)	119 - AMR-WB G.722.2	AMR-WB (Licensed feature for 6735i , 6737i, 6863i, 6865i, and 6867i only)	Leave blank for all codecs	All (Codec 1 only)		Basic (Codec 1 only)		None (Codecs 2 thru 10 only)
Configuration Files	Web UI																																								
0 - G711u/8000	G.711u (8K)																																								
8 - G711a/8000	G.711a (8K)

Leave blank for all codecs	All (Codec 1 only)																																								
	Basic (Codec 1 only)																																								
	None (Codecs 2 thru 10 only)																																								
Example	sip customized codec: payload=18;ptime=10;silsupp=on,payload=0;ptime=10;silsupp=on																																								

Parameter – <i>sip dtmf method</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the Dual-tone multifrequency (DTMF) method to use on the IP phone. Note: See “Out-of-Band DTMF and DTMF Method on page 4-79” for DTMF behavior information when this parameter is used in conjunction with the “sip out-of-band dtmf” parameter.
Format	Boolean
Default Value	0 (RTP)
Range	0 (RTP) 1 (SIP INFO) 2 (BOTH)
Example	sip dtmf method: 1

Parameter – <i>sip srtp mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter determines if SRTP is enabled on this IP phone, as follows: <ul style="list-style-type: none"> • If set to 0, then disable SRTP. • If set to 1 then SRTP calls are preferred. • If set to 2, then SRTP calls only are generated/accepted.
Format	Integer
Default Value	0 (SRTP Disabled)
Range	0 (SRTP Disabled) 1 (SRTP Preferred) 2 (SRTP Only)
Example	sip srtp mode: 1

Parameter – <i>sip silence suppression</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Silence suppression is enabled by default on the IP phones. The phone negotiates whether or not to use silence suppression. Disabling this feature forces the phone to ignore any negotiated value.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	sip silence suppression: 0

Parameter – <i>sip remove silence suppression offer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not the silence suppression attribute should be included in the Session Description Protocol (SDP) offer. If enabled, the silence suppression attribute will be removed from the SDP offer. If disabled, the attribute will not be removed from the SDP offer. Note: If the value of this parameter has changed, a reboot will be required for the change to take effect.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip remove silence suppression offer: 1

Per-Line Settings

Parameter – <i>sip lineN dtmf method</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the Dual-tone multifrequency (DTMF) method to use on the IP phone for a specific line.
Format	Integer
Default Value	0 (RTP)
Range	0 (RTP) 1 (SIP INFO) 2 (BOTH)
Example	sip line1 dtmf method: 1

Parameter – <i>sip lineN srtp mode</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter determines if SRTP is enabled on this line, as follows: <ul style="list-style-type: none"> • If set to -1, then use the global setting for this line. (This is the default setting.) • If set to 0, then disable SRTP. • If set to 1 then SRTP calls are preferred. • If set to 2, then SRTP calls only are generated/accepted.
Format	Integer
Default Value	0 (disabled)
Range	-1 0 1 2
Example	sip line1 srtp mode: 1

Autodial Settings

Global Settings

Parameter – <i>sip autodial number</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Globally specifies the SIP phone number that the IP phone autodial when the handset is lifted from the phone cradle. An empty (blank) value disables autodial on the phone.
Format	Integer
Default Value	Blank
Range	Any valid SIP number
Examples	sip autodial number: 8500

Parameter – <i>sip autodial timeout</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Globally specifies the time, in seconds, that the phone waits to dial a pre-configured number after the handset is lifted from the IP phone cradle. If this parameter is set to 0 (hotline), the phone immediately dials a pre-configured number when you lift the handset. If this parameter is set to a value greater than 0, the phone waits the specified number of seconds before dialing the pre-configured number (warmline) when you lift the handset. Default is 0 (hotline).
Format	Integer
Default Value	0
Range	0-120
Examples	sip autodial timeout: 30

Per-Line Settings

Parameter – <i>sip lineN autodial number</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	On a per-line basis, this parameter specifies the SIP phone number that the IP phone autodial when the handset is lifted from the phone cradle. Valid values can be: <ul style="list-style-type: none"> • -1 (Default): The phone uses the global autodial setting for this line. • Blank (Empty field): Disables autodial on this line. • Valid SIP Number: Dials the SIP number specified for this line.
Format	Integer
Default Value	-1
Range	Any valid SIP number.
Examples	sip line1 autodial number: 8500

Parameter – <i>sip lineN autodial timeout</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	On a per-line basis, this parameter specifies the time, in seconds, that the phone waits to dial a pre-configured number after the handset is lifted from the IP phone cradle. If this parameter is set to 0 (hotline), the phone immediately dials a pre-configured number when you lift the handset. If this parameter is set to a value greater than 0, the phone waits the specified number of seconds before dialing the pre-configured number (warmline) when you lift the handset. Default is 0 (hotline).
Format	Integer
Default Value	0
Range	0-120
Examples	sip line1 autodial timeout: 30

Voicemail Settings

Parameter – <i>sip lineN vmal</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Use this parameter in the <mac>.cfg file to configure the phone to dial a specific number to access an existing voicemail account on a Service Provider's server. The user then follows the voicemail instructions for listening to voicemails. Note: The phone must have a registered voicemail account from a server for this feature to be enabled. When no registered voicemail accounts are registered to the phone, the display shows "List Empty". The phone displays up to 99 voicemails for an account even if the number of voicemails exceeds the limit. Registered account numbers/URIs that exceed the length of the screen, either with or without the voicemail icon and the message count, are truncated with an ellipsis character at the end of the number/URI string.
Format	String
Default Value	Not Applicable
Range	0-99
Example	sip line1 vmal: *97 Note: In the above example, the user would dial *97 to access the voicemail account.

Parameter – sip vmail	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the phone number of the voicemail system connected to the sip account. This parameter specifies the phone number you dial from your phone to retrieve your voicemail. Configuring this parameter allows you to call the voicemail system directly from the "voicemail" application via the IP Phone UI under the "Services" menu of the IP Phone.
Format	Integer
Default Value	Not Applicable
Range	Not Applicable
Example	sip vmail: 5553435

SCA Voicemail Indicator Settings

Parameter – voice mail indicator	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Controls which visual indicators are displayed on the IP phone when voicemail messages are pending on SCA-configured lines. Applicable to the 9480i, 9480i CT, 6735i, 6737i, 6755i, 6757i, and 6757i CT model IP phones (as well as expansion modules).
Format	Integer
Default Value	0
Range	0-2 0: Do not display any visual indicators. 1: Display an envelope icon and the number of pending messages beside the respective softkey's label and illuminate the softkey's LED (if available). 2: Display only an envelope icon beside the respective softkey's label (no indication of the number of pending messages) and illuminate the softkey's LED (if available).
Example	voice mail indicator: 1

Directory Settings

Parameter – <i>directory 1</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The name of a directory list that you can download from the configuration server.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no directory • To download a directory from the original configuration server • To download a directory from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>directory 1: tftp://10.30.102.158/path/companylist.csv</p> <p>where “path” is the directory and “companylist.csv” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p>
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no directory:</p> <p>directory 1:</p> <p>The following example downloads a company directory from the original configuration server:</p> <p>directory 1:companylist.csv</p> <p>The following example downloads a company directory file from the specified server in the “path” directory:</p> <p>directory 1: tftp://10.30.102.158/path/companylist.csv</p>

Parameter – <i>directory 2</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The name of a directory list that you can download from the configuration server.</p> <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no directory • To download a directory from the original configuration server • To download a directory from another specified server <p>To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example:</p> <p>directory 1: tftp://10.30.102.158/path/companylist.csv</p> <p>where “path” is the directory and “companylist.csv” is the filename. If you do not specify a filename, the download fails.</p> <p>See examples for each below.</p>
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Not Applicable
Example	<p>The following example downloads no directory:</p> <p>directory 2:</p> <p>The following example downloads a company directory from the original configuration server:</p> <p>directory 2:companylist.csv</p> <p>The following example downloads a company directory file from the specified server in the “path” directory:</p> <p>directory 2: tftp://10.30.102.158/path/companylist.csv</p>

Parameter – <i>directory disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enables or disables the Directory on the IP phone.</p> <p>If this parameter is set to 0, users can access the Directory List via the IP phone UI. If this parameter is set to 1, the Directory List does not display on the IP phone and the Directory key is disabled. On the 6757i and 6757i CT the “Directory” option is also removed from the “Services” menu.</p>
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	directory disabled: 1

Parameter – <i>directory digits match</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The phone will take the last n digits of the incoming call to perform the lookup.
Format	Integer
Default Value	0 (No Exact Matching)
Range	0-10
Example	directory digits match: 9

Customizable Directory List Key

Parameter – <i>directory script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to specify a specific URI for accessing the Directory List after pressing the Directory List key. When this parameter is set, it overrides the standard function of the Directory List key.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Not Applicable
Example	directory script: http://10.50.100.234/test.xml

Callers List Settings

Parameter – <i>callers list disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Callers List. If this parameter is set to 0, the Callers List can be accessed by all users. If this parameter is set to 1, the IP phone does not save any caller information to the Caller List. For example, for the 6757i and 6757i CT phones, the "Caller List" option on the IP phone is removed from the Services menu, and the Caller List key is ignored if pressed by the user.
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	callers list disabled: 1

Customizable Callers List and Services Key

Parameter – <i>services script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to specify a specific URI for accessing services after pressing the Services key. When this parameter is set, it overrides the standard function of the Services key.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Not Applicable
Example	services script: http://10.50.100.234/test.xml

Parameter – <i>callers list script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to specify a specific URI for accessing the Callers List after pressing the Callers List key. When this parameter is set, it overrides the standard function of the Callers List key.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Not Applicable
Example	callers list script: http://10.50.100.234/test.xml

Call Forward Settings

Parameter – <i>call forward disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the ability to configure Call Forwarding. If this parameter is set to 0, a user and administrator can configure Call Forwarding via the Aastra Web UI and the IP Phone UI using the "Call Forward" options. If this parameter is set to 1, all "Call Forward" options are removed from the Aastra Web UI and the IP Phone UI, preventing the ability to configure Call Forwarding.
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	call forward disabled: 1

Call Forward Key Mode Settings

Parameter – call forward key mode	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Sets the mode for how the phone uses “call forwarding” (CFWD)</p> <ul style="list-style-type: none"> • account The account mode allows you to configure CFWD on a per account basis. Pressing a configured CFWD key applies to the account in focus. • phone The Phone mode allows you to set the same CFWD configuration for all accounts (All, Busy, and/or No Answer). When you configure the initial account, the phone applies the configuration to all other accounts. (In the Aastra Web UI, only the account you configured is enabled. All other accounts are grayed out but set to the same configuration.) Using the Aastra Web UI, if you make changes to that initial account, the changes apply to all accounts on the phone. • custom The Custom mode allows you to configure CFWD for a specific account or all accounts. You can configure a specific mode (All, Busy, and/or No Answer) for each account independently or all accounts. On 3-Line LCD phones, you can set all accounts to ALL On or ALL Off. On 8 and 11-Line LCD phones, you can set all accounts to All On, All Off, or copy the configuration for the account in focus to all other accounts using a CopytoAll softkey. <p>Notes:</p> <ul style="list-style-type: none"> • If there is no CFWD key configured on the phone or it is removed, you can still set the CFWD modes via the IP Phone UI at the path <i>Options->Call Forward</i>. • If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to “Phone”. • When configuring a CFWD mode (All, Busy, No Answer) for an account, you must configure a CFWD number for that mode in order for the mode to be enabled.
Format	Integer
Default Value	0 (account)
Range	0 (account) 1 (phone) 2 (custom)
Example	call forward key mode: 2

Example:

The following is an example of configuring the CFWD key mode in the configuration files:

```
call forward key mode: 2
softkey1 type: callforward
softkey1 states: idle connected incoming outgoing busy
```

In the above example, softkey 1 is configured for CFWD on line 1 (account 1) with a “**custom**” configuration. Pressing softkey 1 displays CFWD screens for which you can customize on the phone.

PIN Suppression

Parameter– <i>pin suppression dial plan</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg																				
Description	Allows a pattern based configuration of the PIN suppression.																				
Format	Alphanumeric characters <table border="0"> <tr> <td><u>Symbol</u></td> <td><u>Description</u></td> </tr> <tr> <td>0, 1, 2, 3, 4, 5, 6, 7, 8, 9</td> <td>Digit symbol</td> </tr> <tr> <td>X</td> <td>Match any digit symbol (wildcard)</td> </tr> <tr> <td>*, #, .</td> <td>Other keypad symbol; # can terminate a dial string</td> </tr> <tr> <td> </td> <td>Expression inclusive OR</td> </tr> <tr> <td>+</td> <td>0 or more of the preceding digit symbol or [] expression</td> </tr> <tr> <td>[]</td> <td>Symbol inclusive OR</td> </tr> <tr> <td>-</td> <td>Used only with [], represent a range of acceptable symbols; For example, [2-8]</td> </tr> <tr> <td>"" (open/close quotes)</td> <td>In the configuration files, enter the sip dial plan value using quotes.</td> </tr> <tr> <td>()</td> <td>Controls the masking of the pin. In the configuration files, enter the pin inside the brackets ().</td> </tr> </table>	<u>Symbol</u>	<u>Description</u>	0, 1, 2, 3, 4, 5, 6, 7, 8, 9	Digit symbol	X	Match any digit symbol (wildcard)	*, #, .	Other keypad symbol; # can terminate a dial string		Expression inclusive OR	+	0 or more of the preceding digit symbol or [] expression	[]	Symbol inclusive OR	-	Used only with [], represent a range of acceptable symbols; For example, [2-8]	"" (open/close quotes)	In the configuration files, enter the sip dial plan value using quotes.	()	Controls the masking of the pin. In the configuration files, enter the pin inside the brackets ().
<u>Symbol</u>	<u>Description</u>																				
0, 1, 2, 3, 4, 5, 6, 7, 8, 9	Digit symbol																				
X	Match any digit symbol (wildcard)																				
*, #, .	Other keypad symbol; # can terminate a dial string																				
	Expression inclusive OR																				
+	0 or more of the preceding digit symbol or [] expression																				
[]	Symbol inclusive OR																				
-	Used only with [], represent a range of acceptable symbols; For example, [2-8]																				
"" (open/close quotes)	In the configuration files, enter the sip dial plan value using quotes.																				
()	Controls the masking of the pin. In the configuration files, enter the pin inside the brackets ().																				
Default value	NA																				
Range	Up to 512 alphanumeric characters																				
Example	pin suppression dial plan: "*11*(x+)*(x+)#"																				

LLDP-MED and ELIN Settings

Parameter– <i>lldp</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) on the IP Phone.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	lldp: 0

Parameter– <i>lldp interval</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The amount of time, in seconds, between the transmission of LLDP Data Unit (LLDPDU) packets. The value of zero (0) disables this parameter.
Format	Integer
Default Value	30
Range	0 - 2147483647
Example	lldp interval: 60

Parameter– <i>use lldp elin</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the use of an Emergency Location Identification Number (ELIN) received from LLDP as a caller ID for emergency numbers.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	use lldp elin: 0

Parameter– <i>lldp startinterval</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Aastra IP Phones have a 32 second time-out interval for listening to LLDP-MED responses when the phone is booting up. If LLDP-MED responses are received after this initial listening period, the phone will ignore the response. This "lldp startinterval" parameter can be used to configure the time-out interval. This parameter is only valid during the phone bootup process.
Format	Integer
Default Value	32 (seconds)
Range	0- 65535 (seconds)
Example	lldp startinterval: 7

Parameter– <i>lldp optional inventory management tlv</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Implements either all of the LLDP-MED Inventory Management TLV sets or none of the sets.
Format	Integer
Default Value	1 (send all LLDP-MED Inventory Management TLV sets)
Range	0-1 0 (do not send any LLDP-MED Inventory Management TLV sets) 1 (send all LLDP-MED Inventory Management TLV sets)
Example	lldp optional inventory management tlv: 0

Missed Calls Indicator Settings

Parameter – <i>missed calls indicator disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Missed Calls Indicator. If the "missed calls indicator disabled" parameter is set to 0, the indicator increments as unanswered calls come into the IP phone. If the "missed calls indicator disabled" parameter is set to 1, the indicator is disabled and will NOT increment as unanswered calls come into the IP phone.
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	missed calls indicator disabled: 1

XML Settings

Parameter – <i>xml get timeout</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to specify a timeout value, in seconds, that the phone waits for the far side to return a response after accepting the HTTP GET connection. If the far side accepts the GET connection but never returns a response, it blocks the phone until it is rebooted. If you enter a value greater than 0 for this parameter, the phone times out and will not be blocked.
Format	Integer
Default Value	0 (never timeout)
Range	0 to 2147483647 seconds
Example	xml get timeout: 20

Parameter – <i>xml application URI</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the XML application you are loading into the IP phone configuration.
Format	HTTP server path or fully qualified Domain Name
Default Value	Not Applicable
Range	Not Applicable
Example	xml application URI: http://172.16.96.63/aastra/internet.php

Parameter – <i>xml application title</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter allows you to rename the XML application in the IP phone UI (Services->4. Custom Feature). By default, when you load an XML application to the IP phone, the XML application title is called "Custom Feature". The "xml application title" parameter allows you to change that title. For example, if you are loading a traffic report XML application, you could change this parameter title to "Traffic Reports", and that title will display in the IP phone UI as Services->4. Traffic Reports.
Format	Alphanumeric characters
Default Value	Not Applicable
Range	Not Applicable
Example	xml application title: Traffic Reports

Parameter – <i>xml application post list</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The HTTP server that is pushing XML applications to the IP phone.
Format	IP address in dotted decimal format and/or Domain name address
Default Value	Not Applicable
Range	Not Applicable
Example	xml application post list: 10.50.10.53, dhcp10-53.ana.aastra.com

Parameter – <i>xml beep notification</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables a BEEP notification on the phone when a status message object (AastraIPPhoneStatus) containing a "beep" attribute arrives to the phone. Changes to this parameter are applied immediately.
Format	Boolean
Default Value	1 (ON)
Range	0 (OFF)No beep is audible even if the beep attribute is present in the XML object. 1 (ON)The phone beeps when an XML object with the "beep" attribute arrives to the phone.
Example	xml beep notification: 0

Parameter – <i>xml status scroll delay</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the length of time, in seconds, that each XML status message displays on the phone. Note: Changes to this parameter are applied immediately.
Format	Integer
Default Value	5
Range	1 to 25
Example	xml status scroll delay: 3

Action URI Settings

Parameter – <i>action uri startup</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI for which the phone executes a GET on when a startup event occurs. This parameter can use any of the following variables: \$\$DISPLAYNAME\$\$ \$\$SIPUSERNAME\$\$ \$\$SIPAUTHNAME\$\$ \$\$PROXYURL\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$ \$\$REGISTRATIONSTATE\$\$ \$\$REGISTRATIONCODE\$\$
Format	Fully qualified URI
Default Value	Not Applicable
Range	Up to 128 ASCII characters
Example	action uri startup: http://10.50.10.140/startup

Parameter – <i>action uri registered</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI for which the phone executes a GET on when a successful registration event occurs. This parameter can use the following variables: \$\$SIPUSERNAME\$\$ \$\$SIPAUTHNAME\$\$ \$\$PROXYURL\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$ Note: The “ action uri registered ” parameter executes on the first successful registration of each unique line configured on the phone.
Format	Fully qualified URI
Default Value	Not Applicable
Range	Up to 128 ASCII characters
Example	action uri registered: http://10.50.10.14/registered.php?auth name=\$\$SIPAUTHNAME\$\$

Parameter – <i>action uri registration event</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI that the phone executes a GET on, when a registration event change occurs. This parameter uses the following variables to determine the state of the event: \$\$REGISTRATIONSTATE\$\$ \$\$REGISTRATIONCODE\$\$ This action URI is not called when the same event is repeated (for example, a timeout occurs again when registration is already in a timeout state.)
Format	String
Default Value	Not Applicable
Range	Any valid URI
Example	action uri registration event: http://10.30.100.39/PHP-tests/actionuri.php?action=RegEvt®state=\$\$REGISTRATIONSTATE\$\$®code=\$\$REGISTRATIONCODE\$\$

Parameter – <i>action uri incoming</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI for which the phone executes a GET on when an incoming call event occurs. This parameter can use the following variables: \$\$REMOTENUMBER\$\$ \$\$DISPLAYNAME\$\$ \$\$SIPUSERNAME\$\$ \$\$INCOMINGNAME\$\$ \$\$LINESTATE\$\$ \$\$CALLDURATION\$\$ \$\$CALLDIRECTION\$\$ \$\$LOCALIP\$\$
Format	Fully qualified URI
Default Value	Not Applicable
Range	Up to 128 ASCII characters
Example	action uri incoming: http://10.50.10.140/incoming.php?number=\$\$REMOTENUMBER\$\$

Parameter – <i>action uri outgoing</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI for which the phone executes a GET on when an outgoing call event occurs. This parameter can use the following variables: \$\$REMOTENUMBER\$\$ \$\$SIPUSERNAME\$\$ \$\$LINESTATE\$\$ \$\$LOCALIP\$\$
Format	Fully qualified URI
Default Value	Not Applicable
Range	Up to 128 ASCII characters
Example	action uri outgoing: http://10.50.10.140/outgoing.php?number=\$\$REMOTENUMBER\$\$

Parameter – <i>action uri offhook</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI for which the phone executes a GET on when an offhook event occurs. This parameter can use the following variables: \$\$LINESTATE\$\$ \$\$LOCALIP\$\$
Format	Fully qualified URI
Default Value	Not Applicable
Range	Up to 128 ASCII characters
Example	action uri offhook: http://10.50.10.140/offhook

Parameter – <i>action uri onhook</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI for which the phone executes a GET on when an onhook event occurs. This parameter can use the following variables: \$\$LOCALIP\$\$ \$\$CALLDURATION\$\$ \$\$CALLDIRECTION\$\$ \$\$LINESTATE\$\$ Note: The “LocalIP”, “CallDuration”, and “CallDirection” variables allow for enhanced information in call records and billing applications.
Format	Fully qualified URI
Default Value	Not Applicable
Range	Up to 128 ASCII characters
Example	action uri onhook: http://10.50.10.140/onhook

Parameter– <i>action uri disconnected</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI that the phone executes a GET on, when it transitions from the incoming, outgoing, calling, or connected state into the idle state. This parameter uses the following variables to determine the state of the line: \$\$LINESTATE\$\$ \$\$LOCALIP\$\$
Format	String
Default Value	Not Applicable
Range	Any valid URI
Example	action uri disconnected: http://fargo.ana.aastra.com/disconnected.xml?state=\$\$LINESTATE\$\$

XML SIP Notify Settings

Parameter – <i>sip xml notify event</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the phone to accept or reject an aastra-xml SIP NOTIFY message. Note: To ensure the SIP NOTIFY is coming from a trusted source, it is recommended that you enable the Whitelist feature (Whitelist Proxy parameter) on the IP phone. If enabled, and the phone receives a SIP NOTIFY from a server that is NOT on the whitelist (i.e. untrusted server), the phone rejects the message.
Format	Boolean
Default Value	0
Range	0 - disabled 1 - enabled
Example	sip xml notify event: 1

Parameter – <i>action uri xml sip notify</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI to be called when an empty XML SIP NOTIFY is received by the phone. This parameter can use the following variable: \$\$LOCALIP\$\$ Note: The sip xml notify event parameter must be enabled.
Format	HTTP(s) server path or Fully Qualified Domain Name
Default Value	Not Applicable
Range	Not Applicable
Example	action uri xml sip notify: http://myserver.com/myappli.xml

Polling Action URI Settings

Parameter – <i>action uri poll</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI to be called every "action uri poll interval" seconds.
Format	HTTP(s) server path or Fully Qualified Domain Name
Default Value	Not Applicable
Range	Not Applicable
Example	action uri poll: http://myserver.com/myappli.xml

Parameter – <i>action uri poll interval</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the interval, in seconds, between calls from the phone to the "action uri poll".
Format	Integer
Default Value	0 (disabled)
Range	Not Applicable
Example	action uri poll interval: 60

Ring Tone and Tone Set Global Settings

Parameter – <i>ring tone</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Globally sets the type of ring tone on the IP phone. Ring tone can be set to one of six distinct rings.
Format	Integer
Default Value	0 (Tone 1)
Range	Configuration Files 0 (Tone 1) 1 (Tone 2) 2 (Tone 3) 3 (Tone 4) 4 (Tone 5) 5 (Silent)
Example	ring tone: 3

Parameter – <i>tone set</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Globally sets a tone set for a specific country.
Format	Text
Default Value	US
Range	Australia Brazil Europe (generic tones) France Germany Italy Italy2 Malaysia Mexico Russia Slovakia United Kingdom (UK) US (also used in Canada)
Example	tone set: Germany

Ring Tone Per-Line Settings

Parameter – <i>lineN ring tone</i> (N is a line number from 1 to 9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the type of ring tone on the IP phone on a per-line basis. Ring tone can be set to one of six distinct rings. Note: LineN is applicable to lines 1 through 9.
Format	Integer
Default Value	-1 (Global)
Range	-1 (Global) 0 (Tone 1) 1 (Tone 2) 2 (Tone 3) 3 (Tone 4) 4 (Tone 5) 5 (Silent)
Example	line1 ring tone: 3

Ring Tone via Speaker During Active Calls Settings

Parameter – <i>ring audibly enable</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables the feature whereby the ring tone of an incoming call is played through the IP phone's speaker if a user is on an active call or in the process of dialing out. Notes: <ul style="list-style-type: none"> • Feature compatibility is dependant on the IP phone model (see Ring Tone via Speaker During Active Calls on page 5-90 for more information). • This feature is not supported when utilizing the headset audio mode. • With this feature enabled and when the phone's speaker is playing the incoming call's ring tone, call-waiting tones will not be played.
Format	Boolean
Default Value	0 (disabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	ring audibly enable: 1

No Service Congestion Tone Settings

Parameter – <i>no service congestion tone</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	If enabled, the congestion tone will replace the conventional dial tone when the handset is off hook, a headset is employed, or the speakerphone is engaged. The congestion tone is played on a per line basis whereby only the specific lines that are without service are affected.
Format	Boolean
Default Value	0 (disabled)
Range	0-1 0 (disabled) 1 (enabled)
Example	no service congestion tone: 1

Status Code on Ignoring Incoming Calls

Parameter – <i>sip ignore status code</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the status code that is sent in the response to the server when a user ignores an incoming call.
Format	Integer
Default Value	486
Range	Valid SIP final negative response code (Refer to RFC3261)
Example	sip ignore status code: 486

Switch Focus to Ringing Line

Parameter – <i>switch focus to ringing line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not the UI focus is switched to a ringing line while the phone is in the connected state.
Format	Boolean
Default Value	1 (enable)
Range	0 (disable) 1 (enable)
Example	switch focus to ringing line: 1

Call Hold Reminder Settings

Parameter – <i>call hold reminder</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the reminder ring splash timer to start as soon as you put a call on hold (even when no other calls are active on the phone). When enabled, the phone initiates a reminder ring splash periodically for the single call on hold. When disabled, no reminder ring splash is audible.
Format	Boolean
Default Value	0
Range	0 (disable) 1 (enable)
Example	call hold reminder: 1

Parameter – <i>call hold reminder during active calls</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the ability for the phone to initiate a continuous reminder tone on the active call when another call is on hold. For example, when the call on Line 1 is on hold, and the User answers a call on Line 2 and stays on that line, a reminder tone is played in the active audio path on Line 2 to remind the User that there is still a call on hold on Line 1. When this feature is disabled, a ring splash is heard when the active call hangs up and there is still a call on hold.
Format	Boolean
Default Value	0
Range	0 (disable) 1 (enable)
Example	call hold reminder during active calls: 1

Parameter – <i>call hold reminder timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the time delay, in seconds, that a ring splash is heard on an active call when another call was placed on hold. For example, if a call comes into Line 1, and then a call comes into Line 2 and you answer Line 2, Line 1 is automatically placed on hold. While on the active Line 2, after 7 seconds, a ring splash audio sounds on the line reminding you that the call on Line 1 is still on hold. This timer begins to increment after Line 2 is answered. Notes: <ul style="list-style-type: none"> • This parameter is used with the “call hold reminder frequency” parameter. • You must enable this “call hold reminder timer” parameter for it to work. • A value of “0” disables the call hold reminder feature.
Format	Integer
Default Value	7
Range	0-4294967295 seconds
Example	call hold reminder timer: 10

Parameter – <i>call hold reminder frequency</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the time interval, in seconds, between each ring splash sound on the active line. For example, if a call comes into Line 1, and then a call comes into Line 2 and you answer Line 2, Line 1 is automatically placed on hold. While on the active Line 2, after 7 seconds, a ring splash audio sounds on the line reminding you that the call on Line 1 is still on hold (determined by the “call hold reminder timer” parameter), and then the ring splash is heard again after 60 seconds (determined by this parameter). Notes: <ul style="list-style-type: none"> • You must enable the “call hold reminder” and/or “call hold reminder during active calls” parameter(s), and the “call hold reminder timer” parameter, for this parameter to work. • A value of “0” prevents additional rings.
Format	Integer
Default Value	60
Range	0-4294967295
Example	call hold reminder frequency: 50

Preferred Line and Preferred Line Timeout

Parameter – <i>preferred line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the preferred line to switch focus to when incoming or outgoing calls end on the phone.
Format	Integer
Default Value	1
Range	0 (none - disables the preferred line focus feature) 1-9
Example	preferred line: 2

Parameter – <i>preferred line timeout</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the time, in seconds, that the phone switches back to the preferred line after a call (incoming or outgoing) ends on the phone, or after a duration of inactivity on an active line.
Format	Integer
Default Value	0 (the phone returns the line to the preferred line immediately)
Range	0-999
Example	preferred line timeout: 30

Goodbye Key Cancels Incoming Call

Parameter – goodbye cancels incoming call	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enable or disables the behavior of the Goodbye Key on the IP phone.</p> <p>When you enable this parameter (1 = enable), the Goodbye key rejects the incoming call. When you disable this parameter (0 = disable), the Goodbye key hangs up the active call.</p> <p>For 8-Line and 11-Line LCD phones: If you enable this parameter, and the phone receives another call when an active call is already present, the phone displays softkey 1 as “answer” and softkey 2 as “ignore”. You can press the required softkey as applicable.</p> <p>For 3-Line LCD phones: If you disable this parameter, and the phone receives another call when an active call is already present, the “ignore” option displays in the LCD window. The phone will ignore the incoming call if you press the DOWN arrow navigation key. The phone will hang up on the active call if you press the Goodbye key.</p> <p>Note: After enabling or disabling this feature, it takes affect on the phone immediately.</p>
Format	Boolean
Default Value	1 (true)
Range	0 (false) 1 (true)
Example	goodbye cancels incoming call: 0

Stuttered Dial Tone Setting

Parameter – stutter disabled	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enable or disables the playing of a stuttered dial tone when there is a message waiting on the IP phone.
Format	Boolean
Default Value	0 (false)
Range	0 (false) 1 (true)
Example	stutter disabled: 1

Message Waiting Indicator Settings

Parameter – <i>mwi led line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to enable the Message Waiting Indicator (MWI) on a single line or on all lines on the phone. For example, if you set this parameter to 3, the LED illuminates if a voicemail is pending on line 3. If you set this parameter to 0, the LED illuminates if a voicemail is pending on any line on the phone (lines 1 through 9). Note: To enable MWI for all lines in the configuration files, set this parameter to zero (0). To enable MWI for all lines in the Aastra Web UI, select "All" in the "Message Waiting Indicator Line" field.
Format	Integer
Default Value	0 (all lines)
Range	0-9
Example	mwi led line: 3

Message Waiting Indicator Request URI Setting

Parameter – <i>sip linex mwi request uri</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI to use when specifying which proxy server Notes: <ul style="list-style-type: none"> • Quotes (") must be used to enclose the value when specifying it with this parameter. • Sip Explicit MWI Subscription must be enabled to use this feature.
Format	"sip:user@host:port"
Default Value	Not Applicable
Range	Not Applicable
Example	sip line1 mwi request uri: "sip:1020@10.50.224.53"

DND Key Mode Settings

Parameter – <i>dnd key mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Sets the mode for how the phone uses “do not disturb” (DND):</p> <ul style="list-style-type: none"> • account Sets DND for a specific account. DND key toggles the account in focus on the IP Phone UI, to ON or OFF. • phone Sets DND ON for all accounts on the phone. DND key toggles all accounts on the phone to ON or OFF. • custom Sets the phone to display custom screens after pressing the DND key, that list the account(s) on the phone. The user can select a specific account for DND, turn DND ON for all accounts, or turn DND OFF for all accounts. <p>Notes:</p> <ul style="list-style-type: none"> • If there is only one account configured on the phone, then the mode setting is ignored and the phone behaves as if the mode was set to “Phone”. • You must configure a DND key on the phone to use this feature. To configure a DND key, see “Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters” on page A-156.
Format	Integer
Default Value	1 (phone)
Range	0 (account) 1 (phone) 2 (custom)
Example	dnd key mode: 2

The following is an example of configuring the mode for DND in the configuration files:

```
dnd key mode: 2
softkey1 type: dnd
softkey1 states: idle connected incoming outgoing busy
```

In the above example, softkey 1 is configured for DND for line 1 only, with a “**custom**” configuration. Pressing softkey 1 displays DND screens for which you can customize on the phone.

Priority Alert Settings

Parameter – <i>priority alerting enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables distinctive ringing on the IP phone for incoming calls and call-waiting calls.
Format	Boolean
Default Value	1 (true)
Range	0 (false) 1 (true)
Example	priority alerting enabled: 0

For Sylantrio Server only

Parameter – <i>alert auto call distribution</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert-acd" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert auto call distribution: 2

Parameter – <i>alert community 1</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert community-1" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert community 1: 3

Parameter – <i>alert community 2</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert community-2" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert community 2: 4

Parameter – <i>alert community 3</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert community-3" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert community 3: 1

Parameter – <i>alert community 4</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert community-4" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert community 4: 2

Parameter – <i>alert external</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert external" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert external: 4

Parameter – <i>alert emergency</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert emergency" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert emergency: 4

Parameter – <i>alert group</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert group" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert group: 4

Parameter – <i>alert internal</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert-internal" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert internal: 4

Parameter – <i>alert priority</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When an "alert priority" keyword appears in the header of the INVITE request, the configured Bellcore ring tone is applied to the IP phone.
Format	Integer
Default Value	0Normal ringing
Range	0Normal ringing (default) 1Bellcore-dr2 2Bellcore-dr3 3Bellcore-dr4 4Bellcore-dr5 5Silent
Example	alert priority: 4

Bellcore Cadence Settings

Parameter– <i>bellcore cadence dr2</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the cadence for Bellcore-dr2. Note: You can define up to 8 cadence rings. The value of -1 indicates "do not repeat".
Format	Integer
Default Value	800,400, 800,4000
Range	Not Applicable
Example	bellcore cadence dr2: 800, 400, 800, 4000

Parameter– <i>bellcore cadence dr3</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the cadence for Bellcore-dr3. Note: You can define up to 8 cadence rings. The value of -1 indicates "do not repeat".
Format	Integer
Default Value	400,200,400,200,800,4000
Range	Not Applicable
Example	bellcore cadence dr3: 400,200,400,200,800,4000

Parameter – <i>bellcore cadence dr4</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the cadence for Bellcore-dr4. Note: You can define up to 8 cadence rings. The value of -1 indicates “do not repeat”.
Format	Integer
Default Value	300,200,1000,200,300,4000
Range	Not Applicable
Example	bellcore cadence dr4: 300,200,1000,200,300,300,200,4000

Parameter – <i>bellcore cadence dr5</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the cadence for Bellcore-dr5. Note: You can define up to 8 cadence rings. The value of -1 indicates “do not repeat”.
Format	Integer
Default Value	500,-1
Range	Not Applicable
Example	bellcore cadence dr5: 500,-1

SIP Diversion Display

Global Setting

Parameter – <i>sip diversion display</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Global parameter that enables/disables the display of the Caller ID and/or caller name, and reason for diversion on the phones LCD for an outgoing call that is being diverted to another destination. The phone that receives the diverted call displays the Caller ID of the original call destination. Note: You must restart the phone after setting a value for this parameter.
Format	Boolean
Default Value	1
Range	0 (disabled - do not display diversion information to the phone's LCD) 1 (enabled - display diversion information to the phone's LCD)
Example	sip diversion display: 0

Per-Line Setting

Parameter – <i>sip lineN diversion display</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
(N is a line number from 1 to 9)	
Description	For a specific line on the phone, this parameter enables/disables the display of the Caller ID and/or caller name, and reason for diversion on the phone's LCD for an outgoing call that is being diverted to another destination. The phone that receives the diverted call displays the Caller ID of the original call destination. Note: You must restart the phone after setting a value for this parameter.
Format	Boolean
Default Value	1
Range	0 (disabled - do not display diversion information to the phone's LCD) 1 (enabled - display diversion information to the phone's LCD)
Example	sip line1 diversion display: 0

Display of Call Destination for Incoming Calls

Parameter – <i>show call destination name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enable/disables the display of the call destination name to the LCD on the phone during incoming calls.
Format	Boolean
Default Value	0
Range	0 (disabled) 1 (enabled)
Example	show call destination name: 1

Display Name Customization Settings

Parameter – <i>directory lookup suppression pattern</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows a pattern-based configuration whereby if the configured pattern is found in the From header display name of an incoming call, the phone bypasses the local directory lookup and shows the display name as intended by the call manager (i.e. as specified in the From header). Patterns that can be defined include: <ul style="list-style-type: none"> • "-->x+" • "==">x+" • "@@x@" • "aaax+" Notes: <ul style="list-style-type: none"> • Use to specify multiple OR combined patterns. • Quotation marks must be used when defining the pattern.
Format	String
Default Value	NA
Range	NA
Example	directory lookup suppression pattern: "-->x+ ==">x+ aaax+"

Language Settings

Parameter – <i>language</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The language you want to display for the IP Phone UI.</p> <p>Valid values for all phones are: 0 (English) default 1-4</p> <p>The values 1-4 are dependent on the "Language N" parameter. For example, if "language 1: lang_fr.txt", then "language: 1" would set the IP phone UI language to French.</p> <p>Valid values for CT cordless handsets are: 0 (English) 1-2</p> <p>Notes:</p> <ul style="list-style-type: none"> • Values 1-2 can only be set to either French or Spanish. • All languages may not be available for selection. The available languages are dependent on the language packs currently loaded to the IP phone. For more information about loading language packs, see "Loading Language Packs" on page 5-38.
Format	Integer
Default Value	0
Range	0 to 4 (all phones) 0 to 2 (for CT handsets)
Example	language: 1

Parameter – <i>web language</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The language you want to display for the IP Phone UI and the Aastra Web UI.</p> <p>Valid values for all phones are: 0 (English) default 1-4</p> <p>The values 1-4 are dependent on the "Language N" parameter. For example, if "language 1: lang_fr.txt", then "language: 1" would set the webpage language to French.</p> <p>Notes:</p> <ul style="list-style-type: none"> • All languages may not be available for selection. The available languages are dependent on the language packs currently loaded to the IP phone. For more information about loading language packs, see "Loading Language Packs" on page 5-38.
Format	Integer
Default Value	0
Range	0 to 4
Example	language: 1

Parameter – <i>input language</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to specify the language to use for inputs on the IP Phone. Entering a language value for this parameter allows users to enter text and characters in the IP Phone UI, Aastra Web UI, and in XML applications via the keypad on the phone, in the language(s) specified.
Format	Text
Default Value	English
Range	Valid values are: <ul style="list-style-type: none"> • English • French • Français • German • Deutsch • Italian • Italiano • Spanish • Español • Portuguese • Português • Russian • Русский • Nordic
Example	input language: French

Language Pack Settings

<p>Parameter – <i>language N</i></p> <p>Where “N” can be 1, 2, 3, or 4</p>	<p>Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg</p>
<p>Description</p>	<p>The language pack you want to load to the IP phone.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • lang_cs.txt (Czech - UTF-8) • lang_cs_op.txt (Czech - ASCII) • lang_ct.txt (Catalan) • lang_ct_va.txt (Valencian) • lang_cy.txt (Welsh) • lang_de.txt (German) • lang_da.txt (Danish) • lang_es.txt (Spanish) • lang_es_mx.txt (Mexican Spanish) • lang_fi.txt (Finnish) • lang_fr.txt (French) • lang_fr_ca.txt (Canadian French) • lang_it.txt (Italian) • lang_nl.txt (Dutch) • lang_nl_nl.txt (Dutch - Netherlands) • lang_no.txt (Norwegian) • lang_pl.txt (Polish - ASCII) • lang_pl_pl.txt (Polish - UTF-8) • lang_pt.txt (Portuguese) • lang_pt_br.txt (Brazilian Portuguese) • lang_ro.txt (Romanian) • lang_ru.txt (Russian) • lang_sk.txt (Slovak - UTF-8) • lang_sk_op.txt (Slovak - ASCII) • lang_sv.txt (Swedish) • lang_tr.txt (Turkish) <p>You can use this parameter in three ways:</p> <ul style="list-style-type: none"> • To download no language packs • To download a language pack(s) from the original configuration server • To download a language pack(s) from another specified server <p>Notes:</p> <ul style="list-style-type: none"> • The 6753i does not support UTF-8 encoded language files. • The languages packs you load are dependant on available language packs from the configuration server. For more information about loading language packs, see “Loading Language Packs” on page 5-38. • You must reboot the phone to load a language pack. • To download a specific file, the string value MUST HAVE A FILENAME at the end of the string. For example: <pre>language 1:ftp://admin:admin!@1.2.3.4:50/path/lang_de.txt</pre> where “path” is the directory and “lang_de.txt” is the filename. If you do not specify a filename, the download fails. <p>See examples for each below.</p>
<p>Format</p>	<p>lang_<ISO 639>_<ISO 3166>.txt or lang_<ISO 639>.txt</p> <p>Note: For valid values for <ISO 639> and <ISO 3166>, see “Language Codes (from Standard ISO 639)” on page A-137 and “Country Codes (from Standard ISO 3166)” on page A-138.</p>
<p>Default Value</p>	<p>Not Applicable</p>
<p>Range</p>	<p>Not Applicable</p>

Example	<p>The following example downloads no language pack file: language 1:</p> <p>The following example downloads the German language pack to the phones from the original configuration server: language 1: lang_de.txt</p> <p>The following example uses FTP to download the firmware file "lang_de.txt" (German language pack) from the "path" directory on server 1.2.3.4 using port 50: language 1:ftp://admin:admin!@1.2.3.4:50/path/lang_de.txt</p>
----------------	---

The following table identifies the language code to use for the IP phone language packs.

Language Codes (from Standard ISO 639)

Language	Language Code
English	en
Czech (UTF-8)	cs
Czech (ASCII)	cs_op
Catalan	ct
Valencian*	ct_va
Welsh	cy
German	de
Danish	da
Spanish	es
Mexican Spanish	es_mx
Finnish	fi
French	fr

Suppress DTMF Playback Setting

Parameter – <i>suppress dtmf playback</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables suppression of DTMF playback when a number is dialed from the softkeys or programmable keys. When you disable the suppression of DTMF playback and you press a softkey or programmable key, the IP phone dials the stored number and displays each digit as dialed in the LCD window. When you enable the suppression of DTMF playback, the IP phone dials the stored number and displays the entire number immediately in the LCD window, allowing the call to be dialed faster.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	suppress dtmf playback: 0

Display DTMF Digits Setting

Parameter – <i>display dtmf digits</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables the display of DTMF digits when dialing on the IP phone. DTMF is the signal sent from the phone to the network that you generate when you press the phone's touch keys. This is also known as "touchtone" dialing. Each key you press on your phone generates two tones of specific frequencies. One tone is generated from a high-frequency group of tones and the other from a low frequency group. If enabled, this parameter displays the digits on the IP phone display if you are dialing from the keypad, or from a softkey or programmable key. This parameter is disabled by default (no digits display when dialing).
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	display dtmf digits: 1

Filter Out Incoming DTMF Events

Parameter – <i>suppress incoming dtmf playback</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Suppress playback of both SIP INFO and RFC2833 DTMF tones.
Format	Boolean
Default Value	0
Range	0-1 0 (Disabled) 1 (Enabled)
Example	suppress incoming dtmf playback:1

Intercom, Auto-Answer, and Barge In Settings

Outgoing Intercom Settings

Parameter – <i>sip intercom type</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Determines whether the IP phone or the server is responsible for notifying the recipient that an Intercom call is being placed.
Format	Integer
Default Value	3 - Off
Range	1 - Phone-Side 2 - Server-Side 3 - Off
Example	sip intercom type: 1

Parameter – <i>sip intercom prefix code</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The prefix to add to the phone number for server-side outgoing Intercom calls. This parameter is required for all server-side Intercom calls. Note: The example below shows *96 for the prefix code which is used for Sylanro servers.
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	sip intercom prefix code: *96

Parameter – <i>sip intercom line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the line for which the IP phone uses the configuration from, when making the Intercom call. The IP phone uses the first available line for physically making the call but uses the configuration from the line you set for this parameter. Note: The " <i>sip intercom type</i> " parameter must be set with the Server-Side option to enable the " <i>sip intercom line</i> " parameter.
Format	Integer
Default Value	1
Range	Line 1 through 9
Example	sip intercom line: 1

Incoming Intercom Settings

Parameter – <i>sip allow auto answer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the IP phone to allow automatic answering for an Intercom call. If auto-answer is enabled on the IP phone, the phone plays a tone to alert the user before answering the intercom call. If auto-answer is disabled, the phone treats the incoming intercom call as a normal call.
Format	Boolean
Default Value	1 (true)
Range	0 (false - do not allow auto-answer) 1 (true - allow auto-answer)
Example	sip allow auto answer: 0

Parameter – <i>sip intercom mute mic</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the microphone on the IP phone for Intercom calls made by the originating caller.
Format	Integer
Default Value	1 (true)
Range	0 (false - microphone is not muted) 1 (true - microphone is muted)
Example	sip intercom mute mic: 1

Parameter – <i>sip intercom warning tone</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables a warning tone to play when the phone receives an incoming intercom call on an active line.
Format	Integer
Default Value	1 (true)
Range	0 (false - warning tone will not play) 1 (true - warning tone will play)
Example	sip intercom warning tone: 0

Parameter – <i>sip intercom allow barge in</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Enable or disables how the phone handles incoming intercom calls while the phone is on an active call.</p> <p>When you enable this parameter (1 = enable), which is the default value, an incoming intercom call takes precedence over any active call, by placing the active call on hold and automatically answering the intercom call.</p> <p>When you disable this parameter (0 = disable), and there is an active call, the phone treats an incoming intercom call like a normal call and plays the call warning tone.</p> <p>Note: After enabling or disabling this feature, it takes affect on the phone immediately.</p>
Format	Boolean
Default Value	1 (true)
Range	0 (false) 1 (true)
Example	sip intercom allow barge in: 0

Enable Microphone During Early Media

Parameter – <i>sip early media mute mic</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the microphone while in early media.
Format	Boolean
Default Value	1 (disabled)
Range	0-1 0 (enables mic during early media) 1 (disables mic during early media)
Example	sip early media mute mic: 0

Group Paging RTP Settings

Parameter – <i>paging group listening</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the multicast address(es) and the port(s) on which the phone listens for incoming multicast RTP packets. Note: If this field is blank, Paging listening capability is disabled on the phone.
Format	IP Address in dotted decimal format/Port #
Default Value	Not Applicable
Range	The valid port range is from 1 to 65535.
Example	paging group listening: 224.0.0.2:10000,239.0.1.20:15000

Example

The following is an example of configuring RTP streaming for Paging applications using the configuration files:

```
paging group listening: 224.0.0.2:10000,239.0.1.20:15000
softkey1 type: paging
softkey1 label: group 1
softkey1 value: 224.0.0.2:10000
```

Audio Transmit and Receive Gain Adjustment Settings

Parameter – <i>headset tx gain</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the increased (+db) or decreased (-db) amount of signal transmitted from the headset microphone to the far-end party. The amount of Tx gain in the IP phone firmware has been reduced to avoid side-tone and echo on the local and far-end equipment. This parameter allows you to adjust the Tx gain settings to best suit your comfort level and deployment environment.
Format	Integer
Default Value	0
Range	-10 db to +10 db
Example	headset tx gain: -5

Parameter – <i>headset sidetone gain</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the is the increased (+db) or decreased (-db) amount of sidetone signal from the headset microphone to the headset speaker. The amount of sidetone gain in the IP phone firmware has been reduced to avoid side-tone and echo on the local and far-end equipment. This parameter allows you to adjust the sidetone gain settings to best suit your comfort level and deployment environment.
Format	Integer
Default Value	0
Range	-10 db to +10 db
Example	headset sidetone gain: -1

1.

Parameter – <i>handset tx gain</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the increased (+db) or decreased (-db) amount of signal transmitted from the handset microphone to the far-end party. The amount of Tx gain in the IP phone firmware has been reduced to avoid side-tone and echo on the local and far-end equipment. This parameter allows you to adjust the Tx gain settings to best suit your comfort level and deployment environment.
Format	Integer
Default Value	0
Range	-10 db to +10 db
Example	handset tx gain: -5

Parameter – <i>handset sidetone gain</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the increased (+db) or decreased (-db) amount of sidetone signal from the handset microphone to the handset speaker. The amount of sidetone gain in the IP phone firmware has been reduced to avoid side-tone and echo on the local and far-end equipment. This parameter allows you to adjust the sidetone gain settings to best suit your comfort level and deployment environment.
Format	Integer
Default Value	0
Range	-10 db to +10 db
Example	handset sidetone gain: -1

Parameter – <i>handsfree tx gain</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the increased (+db) or decreased (-db) amount of signal transmitted from the base microphone to the far-end party. The amount of Tx gain in the IP phone firmware has been reduced to avoid side-tone and echo on the local and far-end equipment. This parameter allows you to adjust the Tx gain settings to best suit your comfort level and deployment environment. Note: The example below increases the speakerphone mic transmit gain by 10 db.
Format	Integer
Default Value	0
Range	-10 db to +10 db
Example	handsfree tx gain: 10

Parameter – <i>audio mode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to configure how the "handsfree" key on the IP phone operates.
Format	Integer
Default Value	0
Range	0 Speaker - Calls can be made or received using the handset or handsfree speakerphone and can be switched between the two modes by pressing the d /fkey. When on speaker, you can return to using the handset by placing the handset on the cradle and picking it up again. 1 Headset - Calls can be made or received using the headset. Calls can be switched between the headset and handset by pressing the d /fkey. 2 Speaker/headset - Incoming calls are sent to the speakerphone. By pressing the d /fkey, you can switch between the handsfree speakerphone, the headset, and the handset. 3 Headset/speaker - Incoming calls are sent to the headset. By pressing the d /fkey, you can switch between the headset, the handsfree speakerphone, and the handset.
Example	audio mode: 2

Disable User Login to Aastra Web UI

Parameter – <i>web interface enabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not to disable the web user interface
Format	Integer
Default Value	1 (admin/user enabled)
Range	0 (admin/user disabled) 1 (admin/user enabled) 2 (only admin enabled)
Example	web interface enabled: 0

Minimum Ringer Volume

Parameter – <i>ringer volume minimum</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the minimum ringer volume level
Format	Integer
Default Value	0
Range	0-9
Example	ringer volume minimum: 1

Terminated Calls Indicator

Parameter – <i>far end disconnect timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not the phone displays an indication of a terminated call. If set to 0, this feature is disabled and the phone does not display the "Call Terminated" screen. If you specify a value for this parameter other than "0", the "Call Terminated" screen displays for the configured time interval. The audible busy tone also plays for the configured time interval specified.
Format	Integer
Default Value	0 (disable)
Range	0 to 86400 seconds
Example	far end disconnect timer: 5

Directed Call Pickup (BLF or XML Call Interception) Settings

Parameter – <i>directed call pickup</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the use of "directed call pickup" feature.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	directed call pickup: 1

Parameter – <i>directed call pickup prefix</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to enter a specific prefix string (depending on what is available on your server), that the phone automatically dials when dialing the Directed Call Pickup number.</p> <p>For example, for Broadsoft servers, you can enter a value of *98 for the “directed call pickup prefix”. For Asterisk servers, you can enter a value of *76. For sipXecs proxy servers, you can enter a value of *78. When the phone performs the Directed Call Pickup after pressing a BLF or BLF/List softkey, the phone prepends the *98 value to the designated extension of the BLF or BLF/List softkey when dialing out.</p> <p>Notes:</p> <ul style="list-style-type: none"> • The default method for the phone to use is Directed Call Pickup over BLF if the server provides applicable information. If the Directed Call Pickup over BLF information is missing in the messages to the server, the Directed Call Pickup by Prefix method is used if a value for the prefix code exists in the configuration. • You can define only one prefix, which will be applicable to all BLF- or BLF/List-monitored extensions. • The phone that picks up displays the prefix code + the extension number (for example, *981234 where prefix key = *98, extension = 1234). • Symbol characters are allowed (for example “*”).
Format	Integer
Default Value	Not Applicable
Range	Not Applicable
Example	directed call pickup prefix: *98

ACD Auto-Available Timer Settings

Parameter – <i>acd auto available</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the use of the ACD Auto-Available Timer.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	acd auto available: 1

Parameter – <i>acd auto available timer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the length of time, in seconds, before the IP phone status switches back to “available.”
Format	Integer
Default Value	60 (seconds)
Range	0 to 120 (seconds)
Example	acd auto available timer: 60

Mapping Key Settings

This section provides the hard key settings you can use to enable and disable the Redial, Conf, and Xfer keys on the IP phone.

Parameter – <i>redial disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Redial key on the IP phone. If this parameter is set to 0, the key is active and can be pressed by the user. If this parameter is set to 1, pressing the Redial key is ignored, and the dialed number is not saved to the "Redial List".
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	redial disabled: 1

Parameter – <i>conference disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Conf key on the IP phone. If this parameter is set to 0, the key is active and can be pressed by the user. If this parameter is set to 1, pressing the Conf key is ignored.
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	conference disabled: 1

Parameter – <i>call transfer disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the Xfer key on the IP phone. If this parameter is set to 0, the key is active and can be pressed by the user. If this parameter is set to 1, pressing the Xfer key is ignored.
Format	Boolean
Default Value	0 (false)
Range	0 (false), 1 (true)
Example	call transfer disabled: 1

Parameter – <i>map redial key to</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the Redial key as a Speeddial key if a value is entered for this parameter. If you leave this parameter blank, the Redial key returns to its original functionality. Note: If you configure the Redial key for speeddialing on the 6757i CT Base Station, the Redial key on the 6757i CT handset retains its original functionality. The Redial key on the handset is not configured for speeddial.
Format	Integer
Default Value	Not Applicable
Range	Not Applicable
Example	map redial key to: 5551234

Parameter – <i>map conf key to</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Sets the Conf key as a Speeddial key if a value is entered for this parameter. If you leave this parameter blank, the Conf key returns to its original functionality. Note: If you configure the Conf key for speeddialing on the 6757i CT Base Station, the Conf key on the 6757i CT handset retains its original functionality. The Conf key on the handset is not configured for speeddial.
Format	Integer
Default Value	Not Applicable
Range	Not Applicable
Example	map conf key to: 5551267

Send DTMF for Remapping Conference or Redial Key

Parameter – <i>map redial as dtmf</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows the phone to send the stored number as DTMF using the phone configured DTMF method when the "Redial" key is pressed.
Format	Boolean
Default Value	0
Range	0-1 0 (Disabled) 1 (Enabled)
Example	map redial as dtmf:1

Parameter – <i>map conf as dtmf</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows the phone to send the stored number as DTMF using the phone configured DTMF method when the “Conf” key is pressed.
Format	Boolean
Default Value	0
Range	0-1 0 (Disabled) 1 (Enabled)
Example	map conf as dtmf: 1

Park and Pickup Settings

Parameter – <i>sip park pickup config</i> (global) <i>sip lineN park pickup config</i> (per line)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Specifies the code to enter before entering the extension for where you want to park an incoming call. The applicable value is dependant on the type of server in the network:</p> <p>Server/Park & Pickup Values*</p> <p>Asterisk 70;70;asterisk</p> <p>Sylantro *98;*99;sylantro</p> <p>BroadWorks *68;*88;broadworks</p> <p>ININ PBX callpark;pickup;inin</p> <p>*Leave “value” fields blank to disable the park and pickup feature.</p> <p>For BroadSoft BroadWorks the following syntax is applicable: <park_code> , <park_dial_code> ; <pickup_code> , <pickup_dial_code> ;broadworks</p> <p>Note: Pauses can be introduced in the park and pick up dial codes by adding commas. Each comma amounts to approximate 500ms.</p>
Format	Alphanumeric characters
Default Value	<Blank>
Range	See applicable values in table above.
Example	<p>sip lineN park pickup config: *68;*88;broadworks</p> <p>or</p> <p>sip park pickup config: *68,,,,,42;*88,,,,,42;broadworks</p>

Parameter– <i>sprecode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the code to enter before entering the extension for where you want to park an incoming call. The applicable value is dependant on the type of server in the network: Server/Park Values** Asterisk 70 Sylantro *98 BroadWorks *68 ININ PBX callpark **Leave “value” fields blank to disable the static park and pickup feature.
Format	Alphanumeric characters
Default Value	<Blank>
Range	See applicable values in table above.
Example	sprecode: *68

Parameter– <i>pickupsprecode</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the code to enter before entering the extension for where you want to pickup a parked call. The applicable value is dependant on the type of server in the network: Server/Pickup Values** Asterisk 70 Sylantro *99 BroadWorks *88 ININ PBX pickup **Leave “value” fields blank to disable the static park and pickup feature.
Format	Alphanumeric characters
Default Value	<Blank>
Range	See applicable values in table above.
Example	pickupsprecode: *88

Softkey/Programmable Key/Keypad Key/Feature Key/Expansion Module Key/Hard Key Parameters

This section provides the softkey, programmable key, keypad key, feature key, and expansion module key parameters you can configure on the IP phones. The following table provides the number of keys you can configure for each model phone and expansion module, and the number of lines available for each type of phone.

Notes:

Hard keys parameters are also available in this section but are only applicable to the 6867i IP phone.

9 keypad keys are available to be configured as press-and-hold speeddials on all IP phone models.

IP Phone Model	Softkeys	Expansion Module Keys	Programmable Keys	Lines Available	Handset Keys Available
9143i	-	Not Applicable	7	9	-
9480i	6	Not Applicable	-	9	-
9480i CT	6	Not Applicable	-	9	15
6730i	-	Not Applicable	8	6	-
6731i	-	Not Applicable	8	6	-
6735i	6 Bottom Keys	36 to 108* (Model M670i) 60 to 180** (Model M675i)	6 Top Keys	9	-
6737i	12 Top and Bottom Softkeys	36 to 108* (Model M670i) 60 to 180** (Model M675i)	-	9	-
6739i	55	36 to 108* (Model M670i) 60 to 180** (Model M675i)	-	9	-
6753i	-	36 to 108* (Model M670i)	6****	9	-
6755i	6 Bottom Keys	36 to 108* (Model M670i) 60 to 180** (Model M675i)	6 Top Keys	9	-
6757i	12 Top and Bottom Softkeys	36 to 108* (Model M670i) 60 to 180** (Model M675i)	-	9	-
6757i CT	12 Top and Bottom Softkeys	36 to 108* on Base Station 60 to 180** on Base Station (Model M675i)	-	9	15
6863i	-	Not Applicable	3	2	-

6865i	-	16 to 48*** (Model M680i)	8	9	-
6867i	10 Top and Bottom Softkeys	16 to 48*** (Model M680i)	-	9	-

*The M670i expansion module consists of 36 softkeys. You can have up to 3 expansion modules on an IP phone totalling 108 softkeys. Valid for 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, and 6757i CT phones.

**The M675i expansion module consists of 60 softkeys. You can have up to 3 expansion modules on an IP phone totalling 180 softkeys. Valid for 6735i, 6737i, 6739i, 6755i, 6757i, and 6757i CT phones.

***The M680i expansion module consists of 16 softkeys. You can have up to 3 expansion modules on an IP phone totalling 48 softkeys. Valid for 6865i and 6867i phones.

****On the 6753i, two of the 6 programmable keys are the DELETE and SAVE keys and can be programmed only if Administrator allows.

Note:

When entering definitions for softkeys, the “#” sign must be enclosed in quotes.

Softkey Settings

The value of "N" for the following parameters is dependent on the number of softkeys available on the 9480i, 9480i CT, 6735i, 6737i, 6755i, 6757i, 6757i CT, and 6867i models. See the table above for applicable values. Available softkey types are dependent on the IP phone model. Please refer to the respective model's User Guide for the model's available softkey types.

Parameter – softkeyN type	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The type of softkey to configure. Valid types are:</p> <ul style="list-style-type: none"> • none - Indicates key is disabled. • line - Indicates key is configured for line use. • speeddial - Indicates key is configured for speeddial use. Speeddial is applicable to the M670i, M675i, and M680i also. You can configure a key to speeddial a specific number by pressing that key. Optionally, you can also configure a Speeddial key to dial prefix numbers. With this option, the prefix numbers automatically dial when you press the key, and the phone waits for you to enter the remaining numbers to dial out. Note: When there is an active call, the Speeddial keys send DTMF digits through the active voice path. To dial out, you have to first put the active call on hold and then press the Speeddial key. • dnd - Indicates key is configured for do not disturb on the phone. This option is "Do Not Disturb" in the Aastra Web UI). You must also set the DND key mode (see "DND Key Mode Settings" on page A-127 for details). • blf - Indicates key is configured for Busy Lamp Field (BLF) use. User can dial out on a BLF configured key. A maximum of 50 BLFs are applicable to the M670i, and M675i also and a maximum of 48 BLFs are applicable to the M680i. • list - Indicates key is configured for BLF/List use. (This option is BLF/List in the Aastra Web UI). User can dial out on a BLF/List configured key. You can also use the "BLF List URI" parameter to specify a URI for the phone to access for the BLF/List. • acd - (for Sylanro Servers only) Indicates the key is configured for Auto Call Distribution (called "Auto Call Distribution" in the Aastra Web UI). The ACD feature allows the Sylanro server to distribute calls from a queue to registered IP phone users (agents). • dcp - (for Sylanro Servers only) Indicates the key is configured for either Directed Call Pickup or Group Call Pickup (called "Directed Call Pickup" in the Aastra Web UI). The Directed Call Pickup/Group Call Pickup feature allows you to intercept or pickup a call on a monitored extension or a group of monitored extensions (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • xml - Indicates the key is configured to accept an XML application for accessing customized XML services. You can also specify an XML key URL for this option. • flash - Indicates the key is set to generate a flash event when it is pressed, or a feature key is pressed on the CT handsets. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold). • sprecode - Indicates the key is configured to automatically activate specific services offered by the server. For example, if the sprecode value of *82 is configured, then by pressing the key, *82 automatically activates a service provided by the server. • park - Indicates the key is configured to park incoming calls when pressed. • pickup - Indicates the key is configured to pick up parked calls when pressed. • lcr - Indicates the key is configured for "last call return" when pressed. • callforward - Indicates the key is configured for accessing the Call Forward features on the phone. A Call Forwarding Mode must be enabled to use this tkey. "Account" mode is the default. • blfxfer - Indicates the key is configured to transfer calls AND configured for BLF on a single key. • speeddialxfer - Indicates the key is configured to transfer calls AND configured for speeddialing to a specific number. • speeddialconf - Indicates the key is configured to be used as a Speeddial key AND as a Conference key. • speeddialmwi - Indicates the key is configured to be used as a Speeddial key for a voicemail account (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • directory - Indicates the key is configured to access the Directory List. • filter - Indicates the key is configured to activate/deactivate Executive Call Filtering (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3).

	<ul style="list-style-type: none"> • callers - Indicates the key is configured to access the Callers List. • redial - Indicates the key is configured to access the Redial List. • conf - Indicates the key is configured as a Conference key. • xfer - Indicates the key is configured as a Transfer key for transferring calls. • icom - Indicates the key is configured to be used as the Intercom key. • services - Indicates the key is configured to be used as the Services key. • phonelock - Indicates the key is configured to be used to lock/unlock the phone. • paging - Indicates the key is configured for Group Paging on the phone. Pressing this key automatically sends a Real Time Transport Protocol (RTP) stream to pre-configured multicast address(es) without involving SIP signaling. • empty - Indicates the key is configured to force a blank entry on the IP phone display for a specific key. <p>The softkeys are added in order (from softkey1 to softkey20) after any hardcoded keys have been added. If a particular softkey is not defined, it is ignored.</p>
Format	Text
Default Value	none
Range	<p>none line speeddial dnd ("Do Not Disturb" in the Aastra Web UI) blf list ("BLF/List" in the Aastra Web UI) acd ("Auto call distribution" in the Aastra Web UI) dcp ("Directed Call Pickup" in the Aastra Web UI) xml flash sprecode park pickup lcr callforward blxfer speeddialxfer speeddialconf speeddialmwi directory filter callers ("Callers List" in Aastra Web UI) redial conf xfer icom services phonelock paging empty</p>
Example	<p>softkey1 type: line softkey2 type: speeddial softkey3 type: lcr softkey4 type: xml</p> <p>Directed Call Pickup on Extension 2200 softkey2 type: dcp softkey2 label: dcp2200 softkey2 value: 2200 softkey2 states: incoming outgoing idle connected</p> <p>Group Call Pickup on group_A softkey3 type: dcp softkey3 label: gcp_A softkey3 value: groupcallpickup softkey3 states: incoming outgoing idle connected</p>

Parameter – <i>softkeyN label</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The text label that displays on the IP phone for the softkey.</p> <p>The “softkeyN label” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • line • speeddial • blf • acd • dcp • xml • flash • sprecode • park • pickup • blxfxfer • speeddialxfer • speeddialconf • speeddialmwi • filter • directory • callers • redial • conf • xfer • icom • services • paging <p>Notes:</p> <ul style="list-style-type: none"> • For 8 and 11-Line LCD phones, an icon appears beside the softkey label that indicates the status of the line. • If the <i>softkeyN type</i> parameter is set to “flash”, and no label value is entered for the <i>softkeyN label</i> parameter, the label of “Flash” is used.
Format	Text
Default Value	Not Applicable
Range	For line, blf - Up to 9 characters. For speeddial - Up to 11 characters.
Example	softkey1 label: “Line 9” softkey2 label: “info” softkey3 label: flash softkey4 label: “johnsmith”

Parameter – softkeyN value	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>This is the value you assign to the softkey.</p> <p>The “softkeyN value” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • speeddial (you can enter a speeddial number for this field; optionally, you can also enter a prefix for the speeddial value to allow the phone to dial the prefix after you press the Speeddial key; you then enter the rest of the number from the keypad on the phone). • line • blf • sprecode • dcp • xml • park • pickup • blxfxfer • speeddialxfer • speeddialconf • speeddialmwi • redial • filter • paging <p>Notes:</p> <ul style="list-style-type: none"> • For speeddial the value is the phone number, extension, or prefix number to enter for the softkey. • For line the value is optional; for example L4. • For blf the value is the extension you want to monitor. • For sprecode the value is dependent on services offered by server. • For park and pickup valid values, see Chapter 5, the section, “Park/Pickup Call Server Configuration Values” on page 5-182. • For xml you can specify a URI to use for this XML softkey. The variables you can use with the XML softkey URI are: <ul style="list-style-type: none"> • \$\$SIPUSERNAMES\$ • \$\$SIPAUTHNAMES\$ • \$\$PROXYURL\$ • \$\$LINESTATE\$ • \$\$LOCALIP\$ • \$\$RE MOTENUMBER\$ • \$\$DISPLAYNAMES\$ • \$\$SIPUSERNAMES\$ • \$\$INCOMINGNAME\$ • \$\$CALLDURATION\$ • \$\$CALLDIRECTION\$ • For paging the value is the ip and port (the port range is from 1 to 65535).
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	softkey1 value: 9 softkey2 value: 411 softkey4 value: http://10.50.10.140 script.pl?name=\$\$SIPUSERNAMES\$ softkey5 value: 123456+ (example of a speeddial prefix)

Parameter – <i>softkeyN line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>This is the line associated with the softkey you are configuring. The number of applicable lines available is dependent on the specific IP phone model.</p> <p>The “softkeyN line” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • speeddial • blf • list • acd • dcp • lcr • blxfxfer • speeddialxfer • speeddialconf • speeddialmwi • redial • filter
Format	Integer
Default Value	1
Range	1 through 9
Example	softkey1 line: 1 softkey2 line: 5

Parameter – softkeyN states	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Displays the status of the phone when a softkey is pressed. You can enter multiple values (idle, connected, incoming, outgoing, busy) for the "softkeyN state" parameter.</p> <p>You must associate the softkeyN state parameter with a specific softkey. In the following example, the softkeyN states parameter is associated with softkey 12:</p> <pre>softkey12 type: speeddial softkey12 label: voicemail softkey12 value *89 softkey12 states: outgoing</pre> <p>Note: The IP phone idle screen condenses the softkeys. So in the previous example, softkey 12 will appear in position 1 if no other softkeys are set. A softkey type of "empty" does not display on the idle screen at all.</p>
Format	Text
Default Value	<p>For softkey type none, flash, phonelock, paging: All states disabled</p> <p>For softkey types line, dnd, speeddial, blf, list, dcp, xml, lcr, callforward, blfxf, speeddialxfer, speeddialconf, speeddialmwi, directory, filter, callers, redial, conf, xfer, icom, services, empty: idle, connected, incoming, outgoing, busy</p> <p>For softkey type flash: All states disabled</p> <p>For softkey type park, sprecodes: connected</p> <p>For softkey type pickup: idle, outgoing</p> <p>For softkey type acd: idle</p>
Range	<p>Valid values are:</p> <p>idle: The phone is not being used.</p> <p>connected: The line currently being displayed is in an active call (or the call is on hold)</p> <p>incoming: The phone is ringing.</p> <p>outgoing: The user is dialing a number, or the far-end is ringing.</p> <p>busy: The current line is busy because the line is in use or the line is set as "Do Not Disturb".</p> <p>Note: For softkey type, Pickup, values can be: just idle, just outgoing, or idle outgoing.</p>
Example	<pre>softkey1 states: idle incoming outgoing softkey2 states: connected</pre>

Shifting of Softkey Positions for Busy States

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, 6757iCT, 9480i, and 9480iCT IP Phones only.

Parameter – <i>collapsed context user softkey screen</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When enabled, user programmable softkeys on the applicable phones will collapse and fill in any unused softkeys starting on the first page of softkeys during the following states: <ul style="list-style-type: none"> • outgoing • ringing • connected • hold
Format	Boolean
Default Value	0
Range	0-1 0 (Disabled) 1 (Enabled)
Example	collapsed context user softkey screen:1

Option to Remove the “More” Softkey when Not Required

Note:

Applicable to the the 9480i, 9480i CT, 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT IP, and 6867i IP phones only.

Parameter – <i>collapsed more softkey screen</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Controls how softkeys are displayed on the 9480i, 9480i CT, 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT IP, and 6867i IP phones' screens when the number of softkeys configured matches the exact number of softkey buttons on the phone. By default, when a total of six softkeys are configured for the 9480i, 9480i CT, 6735i, and 6755i IP phones, the screen displays five softkeys and offers a “More” option to access the remaining softkey. When this parameter is enabled, the “More” softkey is removed allowing the phones to display all six configured softkeys on one screen. The same behavior is applied to the 6735i, 6757i and 6757i CT IP phones when six top softkeys or six bottom softkeys are configured, when a total of 12 softkeys are configured for the 6739i IP phone, as well as when 6 top softkeys or 4 bottom softkeys are configured for the 6867i.
Format	Integer
Default Value	0 (Disabled)
Range	0-1 0 (Disabled) 1 (Enabled)
Example	collapsed more softkey screen: 1

Increase of Displayed Characters for Softkey Line Labels

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, and 6757iCT IP Phones only.

Parameter– <i>line icon disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Disable the line icon (circle) displayed in front of the softkey line label. This allows the softkey line label to be displayed with up to 10 characters (label will not be shortened and no ellipsis characters will appear).
Format	Boolean
Default value	0
Range	0-1 0 (disabled) 1 (enabled)
Example	line icon disabled: 1

Programmable Key Settings

Note:

Applicable to the 6730i, 6731i, 6735i, 6753i, 6863i, and 6865i IP Phones only.

The value of "N" for the following parameters is dependent on the number of programmable keys available on the 9143i, 6730i, 6731i, 6735i, 6753i, 6755i, 6863i, and 6865i phone models. See the table on [page A-156](#) for the applicable values. Available programmable key types are dependent on the IP phone model. Please refer to the respective model's User Guide for the model's available programmable key types.

Parameter – prgkeyN type	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The type of programmable key to configure. Valid types are:</p> <ul style="list-style-type: none"> • none - Indicates key is disabled. • line - Indicates key is configured for line use. • speeddial - Indicates key is configured for speeddial use. Speeddial is applicable to the M670i and M675i also. You can configure a key to speeddial a specific number by pressing that key. Optionally, you can also configure a Speeddial key to dial prefix numbers. With this option, the prefix numbers automatically dial when you press the key, and the phone waits for you to enter the remaining numbers to dial out. Note: When there is an active call, the Speeddial keys send DTMF digits through the active voice path. To dial out, you have to first put the active call on hold and then press the Speeddial key. • dnd - Indicates key is configured for do not disturb on the phone. This option is "Do Not Disturb" in the Aastra Web UI). You must also set the DND key mode (see "DND Key Mode" on page 5-73 and "DND Key Mode Settings" on page A-127 for details). • blf - Indicates key is configured for Busy Lamp Field (BLF) use. User can dial out on a BLF configured key. A maximum of 50 BLFs are applicable to the M670i , and M675i also and a maximum of 48 BLFs are applicable to the M680i. • list - Indicates key is configured for BLF/List use. (This option is BLF/List in the Aastra Web UI). User can dial out on a BLF/List configured key. You can also use the "BLF List URI" parameter to specify a URI for the phone to access for the BLF/List. • acd - (for Sylanro Servers only) Indicates the key is configured for Auto Call Distribution (called "Auto Call Distribution" in the Aastra Web UI). The ACD feature allows the Sylanro server to distribute calls from a queue to registered IP phone users (agents). • dcp - (for Sylanro Servers only) Indicates the key is configured for either Directed Call Pickup or Group Call Pickup (called "Directed Call Pickup" in the Aastra Web UI). The Directed Call Pickup/Group Call Pickup feature allows you to intercept or pickup a call on a monitored extension or a group of monitored extensions (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • xml - Indicates the key is configured to accept an XML application for accessing customized XML services. You can also specify an XML key URL for this option. • flash - Indicates the key is set to generate a flash event when it is pressed, or a feature key is pressed on the CT handsets. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold). • sprecode - Indicates the key is configured to automatically activate specific services offered by the server. For example, if the sprecode value of *82 is configured, then by pressing the key, *82 automatically activates a service provided by the server. • park - Indicates the key is configured to park incoming calls when pressed. • pickup - Indicates the key is configured to pick up parked calls when pressed. • lcr - Indicates the key is configured for "last call return" when pressed. • callforward - Indicates the key is configured for accessing the Call Forward features on the phone. A Call Forwarding Mode must be enabled to use this tkey. "Account" mode is the default. • blfxfer - Indicates the key is configured to transfer calls AND configured for BLF on a single key. • speeddialxfer - Indicates the key is configured to transfer calls AND configured for speeddialing to a specific number. • speeddialconf - Indicates the key is configured to be used as a Speeddial key AND as a Conference key. • speeddialmwi - Indicates the key is configured to be used as a Speeddial key for a voicemail account (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • directory - Indicates the key is configured to access the Directory List.

	<ul style="list-style-type: none"> • filter - Indicates the key is configured to activate/deactivate Executive Call Filtering (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • callers - Indicates the key is configured to access the Callers List. • redial - Indicates the key is configured to access the Redial List. • conf - Indicates the key is configured as a Conference key. • xfer - Indicates the key is configured as a Transfer key for transferring calls. • icom - Indicates the key is configured to be used as the Intercom key. • services - Indicates the key is configured to be used as the Services key. • phonelock - Indicates the key is configured to be used to lock/unlock the phone. • paging - Indicates the key is configured for Group Paging on the phone. Pressing this key automatically sends a Real Time Transport Protocol (RTP) stream to pre-configured multicast address(es) without involving SIP signaling. • empty - Indicates the key is configured to force a blank entry on the IP phone display for a specific key.
Format	Text
Default Value	Not Applicable
Range	none line speeddial dnd ("Do Not Disturb" in the Aastra Web UI) blf list ("BLF/List" in the Aastra Web UI) acd ("Auto Call Distribution" in the Aastra Web UI) dcp ("Directed Call Pickup" in the Aastra Web UI) xml flash sprecode park pickup lcr callforward blfxfer speeddialxfer speeddialconf speeddialmwi directory filter callers ("Callers List" in Aastra Web UI) redial conf xfer icom services phonelock paging empty
Example	prgkey3 type: speeddial

Parameter – prgkeyN value	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>This is the value you assign to the programmable key.</p> <p>The “prgkeyN value” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • speeddial (you can enter a speeddial number for this field; optionally, you can also enter a prefix for the speeddial value to allow the phone to dial the prefix after you press the speeddial programmable key; you then enter the rest of the number from the keypad on the phone). • line • blf • sprecode • dcp • xml • park • pickup • blfxfer • speeddialxfer • speeddialconf • speeddialmwi • redial • filter • paging <p>Notes:</p> <ul style="list-style-type: none"> • For speeddial the value is the phone number, extension, or prefix number to enter for the softkey. • For line the value is optional; for example L4. • For blf the value is the extension you want to monitor. • For sprecode the value is dependent on services offered by server. • For park and pickup valid values, see Chapter 5, the section, “Park/Pickup Call Server Configuration Values” on page 5-182. • For xml you can specify a URI to use for this XML softkey. The variables you can use with the XML softkey URI are: <ul style="list-style-type: none"> • \$\$SIPUSERNAME\$\$ • \$\$SIPAUTHNAME\$\$ • \$\$PROXYURL\$\$ • \$\$LINESTATE\$\$ • \$\$LOCALIP\$\$ • \$\$REMOTENUMBER\$\$ • \$\$DISPLAYNAME\$\$ • \$\$SIPUSERNAME\$\$ • \$\$INCOMINGNAME\$\$ • \$\$CALLDURATION\$\$ • \$\$CALLDIRECTION\$\$ • For paging the value is the ip and port (the port range is from 1 to 65535).
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	prgkey3 value: 411 prgkey4 value: 123456+ (example of a speeddial prefix)

Parameter– <i>prgkeyN line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the line associated with the programmable key you are configuring. The “ prgkeyN line ” parameter can be set for the following softkey types only: <ul style="list-style-type: none">• speeddial• blf• list• acd• dcp• lcr• blfxfer• speeddialxfer• speeddialconf• speeddialmwi• redial• filter
Format	Integer
Default Value	1
Range	1 through 9
Example	prgkey3 line: 1 prgkey4 line: 5

Top Softkey Settings

Note:

Applicable to the 6737i, 6757i, 6757i CT, and 6867i IP Phones only.

Parameter – topsoftkeyN type	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The type of softkey to configure. Valid types are:</p> <ul style="list-style-type: none"> • none - Indicates key is disabled. • line - Indicates key is configured for line use. • speeddial - Indicates key is configured for speeddial use. Speeddial is applicable to the M670i and M675i also. You can configure a key to speeddial a specific number by pressing that key. Optionally, you can also configure a Speeddial key to dial prefix numbers. With this option, the prefix numbers automatically dial when you press the key, and the phone waits for you to enter the remaining numbers to dial out. Note: When there is an active call, the Speeddial keys send DTMF digits through the active voice path. To dial out, you have to first put the active call on hold and then press the Speeddial key. • dnd - Indicates key is configured for do not disturb on the phone. This option is "Do Not Disturb" in the Aastra Web UI). You must also set the DND key mode (see "DND Key Mode" on page 5-73 and "DND Key Mode Settings" on page A-127 for details). • blf - Indicates key is configured for Busy Lamp Field (BLF) use. User can dial out on a BLF configured key. A maximum of 50 BLFs are applicable to the M670i, and M675i also and a maximum of 48 BLFs are applicable to the M680i. • list - Indicates key is configured for BLF/List use. (This option is BLF/List in the Aastra Web UI). User can dial out on a BLF/List configured key. You can also use the "BLF List URI" parameter to specify a URI for the phone to access for the BLF/List. • acd - (for Sylanro Servers only) Indicates the key is configured for Auto Call Distribution (called "Auto Call Distribution" in the Aastra Web UI). The ACD feature allows the Sylanro server to distribute calls from a queue to registered IP phone users (agents). • dcp - (for Sylanro Servers only) Indicates the key is configured for either Directed Call Pickup or Group Call Pickup (called "Directed Call Pickup" in the Aastra Web UI). The Directed Call Pickup/Group Call Pickup feature allows you to intercept or pickup a call on a monitored extension or a group of monitored extensions (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • xml - Indicates the key is configured to accept an XML application for accessing customized XML services. You can also specify an XML key URL for this option. • flash - Indicates the key is set to generate a flash event when it is pressed, or a feature key is pressed on the CT handsets. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold). • sprecode - Indicates the key is configured to automatically activate specific services offered by the server. For example, if the sprecode value of *82 is configured, then by pressing the key, *82 automatically activates a service provided by the server. • park - Indicates the key is configured to park incoming calls when pressed. • pickup - Indicates the key is configured to pick up parked calls when pressed. • lcr - Indicates the key is configured for "last call return" when pressed. • callforward - Indicates the key is configured for accessing the Call Forward features on the phone. A Call Forwarding Mode must be enabled to use this tkey. "Account" mode is the default. • blxfxfer - Indicates the key is configured to transfer calls AND configured for BLF on a single key. • speeddialxfer - Indicates the key is configured to transfer calls AND configured for speeddialing to a specific number. • speeddialconf - Indicates the key is configured to be used as a Speeddial key AND as a Conference key. • speeddialmwi - Indicates the key is configured to be used as a Speeddial key for a voicemail account (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • directory - Indicates the key is configured to access the Directory List. • filter - Indicates the key is configured to activate/deactivate Executive Call Filtering (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • callers - Indicates the key is configured to access the Callers List. • redial - Indicates the key is configured to access the Redial List. • conf - Indicates the key is configured as a Conference key. • xfer - Indicates the key is configured as a Transfer key for transferring calls. • icom - Indicates the key is configured to be used as the Intercom key. • services - Indicates the key is configured to be used as the Services key.

	<ul style="list-style-type: none"> • phonelock - Indicates the key is configured to be used to lock/unlock the phone. • paging - Indicates the key is configured for Group Paging on the phone. Pressing this key automatically sends a Real Time Transport Protocol (RTP) stream to pre-configured multicast address(es) without involving SIP signaling. • empty - Indicates the key is configured to force a blank entry on the IP phone display for a specific key. <p>The softkeys are added in order (from softkey1 to softkey20) after any hardcoded keys have been added. If a particular softkey is not defined, it is ignored.</p>
Format	Text
Default Value	none
Range	<ul style="list-style-type: none"> • none • line • speeddial • dnd • blf • list ("BLF/List" in the Aastra Web UI) • acd ("Auto Call Distribution" in the Aastra Web UI) • dcp ("Directed Call Pickup" in the Aastra Web UI) • xml • flash • sprecode • callforward • park • pickup • blfxfer • speeddialxfer • speeddialconf • speeddialmwi • lcr • directory • filter • callers ("Callers List" in Aastra Web UI) • redial • conf • xfer • icom • services • phonelock • paging • empty
Example	topsoftkey1 type: line topsoftkey2 type: speeddial topsoftkey3 type: lcr topsoftkey4 type: xml

Parameter – <i>topsoftkeyN label</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The text label that displays on the IP phone for the softkey.</p> <p>The “topsoftkeyN label” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • line • speeddial • blf • acd • dcp • xml • flash • sprecode • park • pickup • blfxfer • speeddialxfer • speeddialconf • speeddialmwi • filter • directory • callers • redial • conf • xfer • icom • services • paging <p>Notes:</p> <ul style="list-style-type: none"> • For the 6737i, 6757i and 6757i CT phones, an icon appears beside the soft key label that indicates the status of the line. • If the <i>topsoftkeyN type</i> parameter is set to “flash”, and no label value is entered for the <i>topsoftkeyN label</i> parameter, the label of “Flash” is used.
Format	Text
Default Value	Not Applicable
Range	For line, blf - Up to 9 characters. For speeddial - Up to 11 characters.
Example	topsoftkey1 label: “Line 9” topsoftkey2 label: “info” topsoftkey4 label: “johnsmith”

Parameter – topsoftkeyN value	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>This is the value you assign to the softkey.</p> <p>The “topsoftkeyN value” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • speeddial (you can enter a speeddial number for this field; optionally, you can also enter a prefix for the speeddial value to allow the phone to dial the prefix after you press the Speeddial key; you then enter the rest of the number from the keypad on the phone). • line • blf • sprecode • dcp • xml • park • pickup • blxfxfer • speeddialxfer • speeddialconf • speeddialmwi • redial • filter • paging <p>Notes:</p> <ul style="list-style-type: none"> • For speeddial the value is the phone number, extension, or prefix number to enter for the softkey. • For line the value is optional; for example L4. • For blf the value is the extension you want to monitor. • For sprecode the value is dependent on services offered by server. • For park and pickup valid values, see Chapter 5, the section, “Park/Pickup Call Server Configuration Values” on page 5-182. • For xml you can specify a URI to use for this XML softkey. The variables you can use with the XML softkey URI are: <ul style="list-style-type: none"> • \$\$SIPUSERNAMES\$ • \$\$SIPAUTHNAMES\$ • \$\$PROXYURL\$ • \$\$LINESTATE\$ • \$\$LOCALIP\$ • \$\$REMOTENUMBER\$ • \$\$DISPLAYNAMES\$ • \$\$SIPUSERNAMES\$ • \$\$INCOMINGNAMES\$ • \$\$CALLDURATION\$ • \$\$CALLDIRECTION\$ • For paging the value is the ip and port (the port range is from 1 to 65535).
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	topsoftkey1 value: 9 topsoftkey2 value: 411 topsoftkey4 value: http://10.50.10.140 script.pl?name=\$\$SIPUSERNAMES\$ topsoftkey5 value: 12345+ (example of a speeddial prefix)

Parameter – <i>topsoftkeyN line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This is the line associated with the softkey you are configuring. The number of applicable lines available is dependent on the specific IP phone model. The “ topsoftkeyN line ” parameter can be set for the following softkey types only: <ul style="list-style-type: none"> • speeddial • blf • list • acd • dcp • lcr • blxfxfer • speeddialxfer • speeddialconf • speeddialmwi • redial • filter
Format	Integer
Default Value	1
Range	1 through 9
Example	topsoftkey1 line: 1 topsoftkey2 line: 5

Press-and-Hold Speeddial Keypad Key Settings

Parameter – <i>pnhkeypadN value</i> (where N corresponds to the keypad keys 1-9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The speeddial number that is dialed out when you press and hold the corresponding keypad key.
Format	Integer
Default Value	N/A
Range	N/A
Example	pnhkeypad7 value: 5557605123

Parameter – <i>pnhkeypadN line</i> (where N corresponds to the keypad keys 1-9)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The line associated with the press and hold speeddial number configured on the keypad key.
Format	Integer
Default Value	1
Range	1 through 9
Example	pnhkeypad7 line: 2

Handset Feature Key Settings

Note:

Applicable to the 9480i CT and 6757i CT IP Phones only.

Parameter – <i>featurekeyN type</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The type of feature key to configure. Valid types are:</p> <ul style="list-style-type: none"> • none - Indicates key is disabled. • line - Indicates key is configured for line use. Value can be: line1, line2, line3, line4, line5, line6, line7, line8, or line9. • xfer - Indicates key is configured for transferring a call. • conf - Indicates key is configured for conference calling. • public - Indicates key is configured to toggle from public to private mode. A public and private softkey can be used when at a line item in the Directory List. The Private key toggles a number in the Directory List to private. The Public key allows a number in the Directory List to be sent to the handsets. A 6757i CT accepts a maximum of 50 entries with the public attribute. • icom - Indicates key is set to be used to make an intercom call. • directory - Indicates key is set for accessing the Directory List. • callers - Indicates key is set for accessing the Callers List. • park - Indicates key is configured to park incoming calls when pressed. • pickup - Indicates key is configured to pick up parked calls when pressed. • flash - Indicates key is set to generate a flash event when it is pressed CT handsets. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold).
Format	Text
Default Value	None
Range	none line1, line2, line3, line4, line5, line6, line7, line8, line9 transfer conference public icom directory callers (“Callers List” in Aastra Web UI) park pickup flash
Example	featurekey1 type: line3 featurekey2 type: public featurekey3 type: park featurekey4 type: pickup

Parameter – <i>featurekeyN label</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The text label that displays on the IP phone for the feature key. Notes: <ul style="list-style-type: none">• For the 6757i CT phones, an icon appears beside the feature key label that indicates the status of the line.• If a feature key is configured but no label is set, the IP phone sets the label to the English, French, or Spanish translation of the chosen action. The language used is based on the current language of the cordless handset.
Format	Text
Default Value	Not Applicable
Range	Not Applicable
Example	featurekey1 label: Line 9 featurekey2 label: Public featurekey4 label: John Smith

Expansion Module Key Settings for M670i, M675i, and M680i

Parameter – <i>expmodX keyN type</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The type of softkey to configure. Valid types are:</p> <ul style="list-style-type: none"> • none - Indicates key is disabled. • line - Indicates key is configured for line use. • speeddial - Indicates key is configured for speeddial use. Speeddial is applicable to the M670i and M675i also. You can configure a key to speeddial a specific number by pressing that key. Optionally, you can also configure a Speeddial key to dial prefix numbers. With this option, the prefix numbers automatically dial when you press the key, and the phone waits for you to enter the remaining numbers to dial out. Note: When there is an active call, the Speeddial keys send DTMF digits through the active voice path. To dial out, you have to first put the active call on hold and then press the Speeddial key. • dnd - Indicates key is configured for do not disturb on the phone. This option is "Do Not Disturb" in the Aastra Web UI). You must also set the DND key mode (see "DND Key Mode" on page 5-73 and "DND Key Mode Settings" on page A-127 for details). • blf - Indicates key is configured for Busy Lamp Field (BLF) use. User can dial out on a BLF configured key. A maximum of 50 BLFs are applicable to the M670i, and M675i also and a maximum of 48 BLFs are applicable to the M680i. • list - Indicates key is configured for BLF/List use. (This option is BLF/List in the Aastra Web UI). User can dial out on a BLF/List configured key. You can also use the "BLF List URI" parameter to specify a URI for the phone to access for the BLF/List. • acd - (for Sylanro Servers only) Indicates the key is configured for Auto Call Distribution (called "Auto Call Distribution" in the Aastra Web UI). The ACD feature allows the Sylanro server to distribute calls from a queue to registered IP phone users (agents). • dcp - (for Sylanro Servers only) Indicates the key is configured for either Directed Call Pickup or Group Call Pickup (called "Directed Call Pickup" in the Aastra Web UI). The Directed Call Pickup/Group Call Pickup feature allows you to intercept or pickup a call on a monitored extension or a group of monitored extensions (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • xml - Indicates the key is configured to accept an XML application for accessing customized XML services. You can also specify an XML key URL for this option. • flash - Indicates the key is set to generate a flash event when it is pressed, or a feature key is pressed on the CT handsets. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold). • sprecode - Indicates the key is configured to automatically activate specific services offered by the server. For example, if the sprecode value of *82 is configured, then by pressing the key, *82 automatically activates a service provided by the server. • park - Indicates the key is configured to park incoming calls when pressed. • pickup - Indicates the key is configured to pick up parked calls when pressed. • lcr - Indicates the key is configured for "last call return" when pressed. • callforward - Indicates the key is configured for accessing the Call Forward features on the phone. A Call Forwarding Mode must be enabled to use this tkey. "Account" mode is the default. • blfxf - Indicates the key is configured to transfer calls AND configured for BLF on a single key. • speeddialxf - Indicates the key is configured to transfer calls AND configured for speeddialing to a specific number. • speeddialconf - Indicates the key is configured to be used as a Speeddial key AND as a Conference key. • speeddialmwi - Indicates the key is configured to be used as a Speeddial key for a voicemail account (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • directory - Indicates the key is set for accessing the Directory List.

	<ul style="list-style-type: none"> • filter - Indicates the key is set for activating/deactivating Executive Call Filtering (This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3). • callers - Indicates the key is configured to access the Callers List. • redial - Indicates the key is configured to access the Redial List. • conf - Indicates the key is configured as a Conference key. • xfer - Indicates the key is configured as a Transfer key for transferring calls. • icom - Indicates the key is configured to be used as the Intercom key. • services - Indicates the key is set to be used as the Services key. • phonelock - Indicates the key is set to be used to lock/unlock the phone. • paging - Indicates the key is set for Group Paging on the phone. Pressing this key automatically sends a Real Time Transport Protocol (RTP) stream to pre-configured multicast address(es) without involving SIP signaling. • empty - Indicates the key is configured to force a blank entry on the IP phone display for a specific key.
Format	Text
Default Value	none
Range	<ul style="list-style-type: none"> • none • line • speeddial • dnd • blf • list ("BLF/List" in the Aastra Web UI) • acd ("Auto call distribution" in the Aastra Web UI) • dcp ("Directed Call Pickup" in the Aastra Web UI) • xml • flash • sprecode • park • pickup • lcr • callforward • blxfer • speeddialxfer • speeddialconf • speeddialmwi • directory • filter • callers ("Callers List" in Aastra Web UI) • redial • conf • xfer • icom • services • phonelock • paging • empty
Example	<pre> expmod1 key1 type: line expmod1 key2 type: speeddial expmod1 key3 type: blf expmod1 key4 type: list </pre>

Parameter – <i>expmodX keyN label</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The text label that displays on the softkey for the Expansion Module.</p> <p>The “expmodX keyN label” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • line • speeddial • blf • acd • dcp • xml • flash • sprecode • park • pickup • blfxfer • speeddialxfer • speeddialconf • speeddialmwi • filter • directory • callers • redial • conf • xfer • icom • services • paging <p>Notes:</p> <ul style="list-style-type: none"> • For 8 and 11-Line LCD phones, an icon appears beside the soft key label that indicates the status of the line. • If the <i>expmodXkeyN type</i> parameter is set to “flash”, and no label value is entered for the <i>expmodXkeyN label</i> parameter, the label of “Flash” is used.
Format	Text
Default Value	Not Applicable
Range	For line, blf types - Up to 9 characters. For speeddial type - Up to 11 characters.
Example	expmod1 key1 label: “Line 9” expmod2 key1 label: “info” expmod3 key1 label: “johnsmith”

Parameter – <i>expmodX keyN value</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The text label that displays on the IP phone for the softkey on the Expansion Module.</p> <p>The “expmodX keyN value” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none"> • speeddial (you can enter a speeddial number for this field; optionally, you can also enter a prefix for the speeddial value to allow the phone to dial the prefix after you press the Speeddial key; you then enter the rest of the number from the keypad on the phone). • line • blf • sprecode • dcp • xml • park • pickup • blfxfer • speeddialxfer • speeddialconf • speeddialmwi • redial • filter • paging <p>Notes:</p> <ul style="list-style-type: none"> • For the 6757i and 6757i CT phones, an icon appears beside the softkey label that indicates the status of the line. • For speeddial the value is the phone number, extension, or prefix number to enter for the softkey. • For line the value is optional; for example L4. • For blf the value is the extension you want to monitor. • For sprecode the value is dependent on services offered by server. • For park and pickup valid values, see Chapter 5, the section, “Park/Pickup Call Server Configuration Values” on page 5-182. • For xml you can specify a URI to use for this XML softkey. The variables you can use with the XML softkey URI are: <ul style="list-style-type: none"> • \$\$SIPUSERNAME\$\$ • \$\$SIPAUTHNAME\$\$ • \$\$PROXYURL\$\$ • \$\$LINESTATE\$\$ • \$\$LOCALIP\$\$ • \$\$REMOTENUMBER\$\$ • \$\$DISPLAYNAME\$\$ • \$\$SIPUSERNAME\$\$ • \$\$INCOMINGNAME\$\$ • \$\$CALLDURATION\$\$ • \$\$CALLDIRECTION\$\$ • For paging the value is the ip and port (the port range is from 1 to 65535).
Format	String
Default Value	Not Applicable
Range	Not Applicable
Example	expmod1 key1 value: 9 expmod1 key2 value: 411 expmod1 key3 value: 123456+ (example of a speeddial prefix)

Parameter – <i>expmodX keyN line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>This is the line associated with the softkey you are configuring on the Expansion Module. The number of applicable lines available is dependent on the specific IP phone model.</p> <p>The “expmodX keyN line” parameter can be set for the following softkey types only:</p> <ul style="list-style-type: none">• speeddial• blf• list• acd• dcp• lcr• blxfxfer• speeddialxfer• speeddialconf• speeddialmwi• redial• filter
Format	Integer
Default Value	1
Range	1 through 9
Example	expmod1 key1 line: 1 expmod1 key2 line: 5

Hard Key Settings for 6867i

Parameter– hardkeyN type	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The type of key to which you would like to change the hard key. Valid types include:</p> <ul style="list-style-type: none"> • none - Indicates no setting for the key. • line - Indicates the key is configured for line use. • speeddial - Indicates the key is configured for speeddial use. You can configure a key to speeddial a specific number by pressing that key. Optionally, you can also configure a Speeddial key to dial prefix numbers. With this option, the prefix numbers automatically dial when you press the key, and the phone waits for you to enter the remaining numbers to dial. Note: When there is an active call, the Speeddial keys send DTMF digits through the active voice path. To dial out, you have to first put the active call on hold and then press the Speeddial key. • dnd - Indicates the key is configured for Do Not Disturb on the phone. • blf - Indicates the key is configured for Busy Lamp Field (BLF) use. • list - Indicates the key is configured for BLF/List use. • acd - (for Sylanro Servers only) Indicates the key is configured for Auto Call Distribution. The ACD feature allows the Sylanro server to distribute calls from a queue to registered IP phone users (agents). • xml - Indicates the key is configured to accept an XML application for accessing customized XML services. You can also specify an XML softkey URL for this option. • flash - Indicates the key is set to generate a flash event when it is pressed. The IP phone generates flash events only when a call is connected and there is an active RTP stream (for example, when the call is not on hold). • sprecode - Indicates the key is configured to automatically activate specific services offered by the server. For example, if the sprecode value of *82 is configured, then by pressing the softkey, *82 automatically activates a service provided by the server. • park - Indicates the key is configured to park incoming calls when pressed. • pickup - Indicates the key is configured to pick up parked calls when pressed. • lcr - Indicates the key is configured for the Last Call Return function when pressed. • callforward - Indicates the key is configured for accessing the Call Forward features on the phone. A Call Forwarding Mode must be enabled to use this key. "Account" mode is the default. • blfxf - Indicates the key is configured to transfer calls AND configured for BLF on a single key. • speeddialxf - Indicates the key is configured to transfer calls AND configured for speeddialing to a specific number. • speeddialconf - Indicates the key is configured to be used as a Speeddial key AND as a Conference key. • directory - Indicates the key is configured to access the Directory List. • callers - Indicates key is configured to access the Callers List. • redial - Indicates key is configured to access the Redial List. • conf - Indicates the key is configured as a Conference key. • xf - Indicates the key is configured as a Transfer key for transferring calls. • icom - Indicates the key is set to be used as the Intercom key. • phonelock - Indicates the key is set to be used to lock/unlock the phone. • paging - Indicates the key is set for Group Paging on the phone. Pressing this key automatically sends a Real Time Transport Protocol (RTP) stream to pre-configured multicast address(es) without involving SIP signaling.
Format	Text
Default Value	N/A

Range	none line speeddial dnd blf list acd xml flash sprecode park pickup lcr callforward blxfcr speeddialxfer speeddialconf directory callers redial conf xfer icom phonelock paging
Example	hardkey1 type: speeddial

Parameter– <i>hardkeyN value</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>The value you would like to assign to the hard key you are configuring. The “hardkeyN value” parameter can be set for the following key types only:</p> <ul style="list-style-type: none"> • speeddial (you can enter a speeddial number for this field; optionally, you can also enter a prefix for the speeddial value to allow the phone to dial the prefix after you press the speeddial programmable key; you then enter the rest of the number from the keypad on the phone). • blf • sprecode • xml • park • pickup • blfxf • speeddialxf • speeddialconf • paging <p>Notes:</p> <ul style="list-style-type: none"> • For speeddial the value is the phone number, extension, or prefix number to enter for the key. • For line the value is optional; for example L4. • For blf the value is the extension you want to monitor. • For sprecode the value is dependent on services offered by server. • For xml you can specify a URI to use for this XML key. The variables you can use with the XML softkey URI are: <ul style="list-style-type: none"> • \$\$SIPUSERNAMES\$ • \$\$SIPAUTHNAMES\$ • \$\$PROXYURL\$ • \$\$LINESTATE\$ • \$\$LOCALIP\$ • \$\$RE MOTENUMBER\$ • \$\$DISPLAYNAMES\$ • \$\$SIPUSERNAMES\$ • \$\$INCOMINGNAMES\$ • \$\$CALLDURATION\$ • \$\$CALLDIRECTIONS\$
Format	String
Default Value	N/A
Range	N/A
Example	hardkey1 value: 123456+ (example of a speeddial prefix)

Parameter – <i>hardkeyN line</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The line associated with the hard key you are configuring. The “hardkeyN line” parameter can be set for the following key types only: <ul style="list-style-type: none"> • speeddial • blf • list • acd • park • pickup • lcr • blfxfers • speeddialxfers • speeddialconf
Format	Integer
Default Value	N (where N = line number)
Range	1 to 9
Example	hardkey1 line: 9

Customizing the Key Type List

Softkeys, Programmable Keys, Expansion Module Keys

Parameter – <i>softkey selection list</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify which key types to display and the order in which to display them in the “Type” list for softkeys, programmable keys, and/or expansion module keys when configuring the keys in the Aastra Web UI.</p> <p>If no value is specified for this “softkey selection list” parameter, the key “Type” list displays ALL of the key types by default in the Aastra Web UI.</p> <p>Notes:</p> <ul style="list-style-type: none"> • Any key types configured that do not apply to the phone’s environment are ignored. • The SAVE and DELETE keys appear by default as Keys 1 and 2 on the 6753i and 9143i, and as 5 and 6 on the 6730i , 6731i, and 6865i unless specifically changed by your Administrator. • An Administrator must use the English value when configuring the key types in the configuration files. • Any key type already configured on a phone displays in that key’s “Type” list, in addition to the values specified for this parameter. • After configuring specific key types for a phone, the key types in the Aastra Web UI display the same for both the User and Administrator Web interfaces for that phone.
Format	Alpha Characters in a comma separated list

<p>Default Value</p>	<ul style="list-style-type: none"> • none • line • speeddial • dnd • blf • list • acd • dcp • xml • flash • sprecode • park • pickup • lcr • callforward • blf/xfer • speeddial/xfer • speeddial/conf • speeddial/mwi • directory • filter • callers • redial • conf • xfer • icom • services • phonerlock • paging • empty
<p>Range</p>	<p>Any of the key types in the "Default Value" field above.</p>
<p>Example</p>	<p>softkey selection list: blf, speeddial, line, xml</p>

Handset Feature Keys (for CT Models ONLY)

Parameter – <i>feature key selection list</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg												
Description	<p>Allows you to specify which key types to display and the order in which to display them in the “Type” list for the feature keys (CT models only) when configuring the keys in the Aastra Web UI.</p> <p>If no value is specified for this “feature key selection list” parameter, the key “Type” list displays ALL of the key types by default in the Aastra Web UI.</p> <p>Notes:</p> <ul style="list-style-type: none"> • Any key types configured that do not apply to the phone’s environment are ignored. • An Administrator must use the English value when configuring the key types in the configuration files. • Any key type already configured on a phone displays in that key’s “Type” list, in addition to the values specified for this parameter. • After configuring specific key types for a phone, the key types in the Aastra Web UI display the same for both the User and Administrator Web interfaces for that phone. 												
Format	Alpha Characters in a comma separated list												
Default Value	<table border="0"> <tr><td>• none</td><td>• park</td></tr> <tr><td>• line</td><td>• pickup</td></tr> <tr><td>• icom</td><td>• conf</td></tr> <tr><td>• directory</td><td>• private</td></tr> <tr><td>• callers</td><td>• public</td></tr> <tr><td>• xfer</td><td>• flash</td></tr> </table>	• none	• park	• line	• pickup	• icom	• conf	• directory	• private	• callers	• public	• xfer	• flash
• none	• park												
• line	• pickup												
• icom	• conf												
• directory	• private												
• callers	• public												
• xfer	• flash												
Range	Any of the key types in the “Default Value” field above.												
Example	feature key selection list: line, directory, callers												

Locking Keys

Parameter– <i>softkeyN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Locks the specified softkey on the 9480i, 9480i CT, 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT, or 6867i IP phone. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key.</p> <p>Note:</p> <p>If no settings are configured locally but the “softkeyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “softkeyN” parameters (i.e. “softkeyN label”, “softkeyN value”, “softkeyN line”, “softkeyN states”).</p>
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	softkey1 locked: 1

Parameter– <i>topsoftkeyN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Locks the specified top softkey on the 6737, 6757i , 6757i CT, or 6867i IP phone. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. Note: If no settings are configured locally but the “topsoftkeyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “topsoftkeyN” parameters (i.e. “topsoftkeyN label”, “topsoftkeyN value”, “topsoftkeyN line”).
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	topsoftkey1 locked: 1

Parameter– <i>prgkeyN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Locks the specified programmable key on the 9143i, 6730i, 6731i, 6735i, 6753i, 6755i, 6863i, or 6865i IP phone. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. Note: If no settings are configured locally but the “prgkeyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “prgkeyN” parameters (i.e. “prgkeyN value”, “prgkeyN line”).
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	prgkey1 locked: 1

Parameter– <i>featurekeyN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Locks the specified feature key on the CT handset. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. Note: If no settings are configured locally but the “featurekeyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “featurekeyN” parameter (i.e. “featurekeyN label”).
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	featurekey1 locked: 1

Parameter– <i>expmodX keyN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Locks the specified softkey on the Expansion Module attached to the IP phone. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. Note: If no settings are configured locally but the “expmodX keyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “expmodX keyN” parameters (i.e. “expmodX keyN label” [M675i only], “expmodX keyN value”, “expmodX keyN line”).
Format	Boolean
Default Value	0 (disable)
Range	0 (disable) 1 (enable)
Example	expmod1 key4 locked: 1

Parameter– <i>pnhkeypadN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Locks the specified keypad key on the IP phones. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. Note: If no settings are configured locally but the “pnhkeypadN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “pnhkeypadN” parameters (i.e. “pnhkeypadN value” and “pnhkeypadN line”).
Format	Integer
Default Value	0 (Disabled)
Range	0 (Disabled) 1 (Enabled)
Example	pnhkeypad1 locked: 1

Parameter– <i>hardkeyN locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	(6867i only) Locks the specified hard key on the IP phones. When enabled, the phone locks the key with the provisioned local settings and prevents users from changing or configuring the key. Note: If no settings are configured locally but the “hardkeyN type” is defined in a configuration file, the phone will lock the key with the key type defined in the configuration file along with any values associated with the additional “hardkeyN” parameters (i.e. “hardkeyN value” and “hardkeyN line”).
Format	Integer
Default Value	0 (Disabled)
Range	0 (Disabled) 1 (Enabled)
Example	hardkey1 locked: 1

Locking the SAVE and DELETE Keys

Note:

Applicable to the 6730i, 6731i, 6753i, and 6865i IP Phones only.

Parameter– <i>prgkey1 locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to lock or unlock the Save key on the 6753i IP Phone. When the Save key is unlocked, a User can change the function of the key using the Aastra Web UI. An Administrator can change the function of the key using the Aastra Web UI or the configuration files. Note: <ul style="list-style-type: none"> • The save function on the 6753i IP Phone is limited to Key 1 only. • Changing the function from the Save key to another function, removes the ability to save items on the IP phone.
Format	Boolean
Default Value	1 (lock)
Range	0 (unlock) 1 (lock)
Example	prgkey1 locked: 0

Parameter– <i>prgkey2 locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to lock or unlock the Delete key on the 6753i IP Phone. When the Delete key is unlocked, a User can change the function of the key using the Aastra Web UI. An Administrator can change the function of the key using the Aastra Web UI or the configuration files. Note: <ul style="list-style-type: none"> • The delete function on the 6753i IP Phone is limited to Key 2 only. • Changing the function from the Delete key to another function, removes the ability to delete items on the IP phone.
Format	Boolean
Default Value	1 (lock)
Range	0 (unlock) 1 (lock)
Example	prgkey2 locked: 0

Parameter – <i>prgkey5 locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to lock or unlock the Save key on the 6730i, 6731i, or 6865i IP Phone. When the Save key is unlocked, a User can change the function of the key using the Aastra Web UI. An Administrator can change the function of the key using the Aastra Web UI or the configuration files. Note: <ul style="list-style-type: none"> • The save function on the 6730i, 6731i, and 6865i IP Phone is limited to Key 5 only. • Changing the function from the Save key to another function, removes the ability to save items on the IP phone.
Format	Boolean
Default Value	1 (lock)
Range	0 (unlock) 1 (lock)
Example	prgkey5 locked: 0

Parameter – <i>prgkey6 locked</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to lock or unlock the Delete key on the 6730i or 6731i IP Phone. When the Delete key is unlocked, a User can change the function of the key using the Aastra Web UI. An Administrator can change the function of the key using the Aastra Web UI or the configuration files. Note: <ul style="list-style-type: none"> • The delete function on the 6730i, 6731i, and 6865i IP Phones are limited to Key 6 only. • Changing the function from the Delete key to another function, removes the ability to delete items on the IP phone.
Format	Boolean
Default Value	1 (lock)
Range	0 (unlock) 1 (lock)
Example	prgkey6 locked: 0

Enabling/Disabling Ability to Add/Edit Speeddial Keys

Parameter – <i>speeddial edit</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to enable or disable the ability to add a Speeddial key or edit a Speeddial key. The default is enabled (Yes) allowing you to create and edit Speeddial keys on the phone using the Press-and-hold feature, softkeys, programmable keys, expansion module keys and key pad, Speeddial menu in the IP Phone UI, and the SAVE TO key. If this parameter is set to disabled (No), it blocks the user from using any of the features on the phone to create or edit a Speeddial key.
Format	Boolean
Default Value	1 (Enabled)
Range	0 (Disabled) 1 (Enabled)
Example	speeddial edit: 0

BLF List URI Settings

Parameter– <i>list uri</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the URI that the phone uses to access the BLF list on the Broadsoft server when the BLF list key is pressed. When you specify a URI for this parameter, the phone uses the Internet to access the BLF list on the Broadsoft server.
Format	HTTP server path or Fully Qualified Domain Name
Default Value	Not Applicable
Range	Not Applicable
Example	list uri: sip:9@192.168.104.13

BLF Page Switch

Note:

Applicable to the 6735i, 6737i, 6739i, 6755i, 6757i, 6757i CT, and 6867i IP Phones only.

Parameter– <i>blf activity page switch</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables the phone to automatically switch the screen focus to an expansion module or softkey page that has BLF activity.
Format	Integer
Default value	0 (disabled)
Range	0-3 0 (disabled) 1 (switch page if monitored extension transitions to ringing (fast flashing) state) 2 (switch page if monitored extension transitions to either ringing (fast flashing) or hold (slow flashing) state) 3 (switch page if monitored extension transitions to either ringing or hold state OR from idle (off) state to "in call" (solid) state)
Example	blf activity page switch: 1

Configurable Display for Blank BLF/List Softkeys

Note:

Applicable to the 6735i, 6737i, 6755i, 6757i, and 6757i CT IP Phones only.

Parameter – <i>keys noname hidden</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	If this parameter is set to "0" (disabled) then a series of question marks will be displayed on the screen indicating blank BLF/List softkeys. If this parameter is set to "1" (enabled) then the series of question marks will be hidden and nothing will be shown on the screen beside the affected softkeys.
Format	String
Default value	0
Range	0-1 0 (disabled) 1 (enabled)
Example	keys noname hidden: 1

Ring Splash Settings

Parameter – <i>play a ring splash</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the playing of a short ring splash when there is an incoming call on a BLF-monitored extension.
Format	Boolean
Default Value	0 (Disabled)
Range	0 - 2 0 (Disabled) 1 (Enabled for idle state only) 2 (Enabled for idle state and active call state) Notes: <ul style="list-style-type: none"> This global parameter is not dynamic. Changes to this parameter will take effect only after the phone has been rebooted. Playing a BLF ring splash while in an active call state (i.e. defining the parameter as "2") is only available to the 6739i, 6755i, 6757i, and 6757i CT IP phones.
Example	play a ring splash: 2

Parameter – <i>prgkeyN ring splash</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg	
Description	<p>When a key is configured for BLF functionality, this parameter controls the ring splash alert pattern per key. The following alerting patterns are available:</p> <ul style="list-style-type: none"> • 0: Silence (ring splash off). • 1: Normal (same as current BLF ring splash). • 2: Normal delayed (After a delay of [x] seconds, the ring signal that is the same as the current BLF ring splash is played [use the “ring splash delay” parameter to define the delay]). • 3: Periodic (similar to the normal ring signal that is used by the phone itself. The actual ring melody is based on the current melody set for the line to which the BLF key is associated [use the “ring splash frequency” parameter to define the frequency interval]). • 4: Periodic delayed (same as Periodic but after a delay of [x] seconds, the ring signal that is used by the phone is played [use the “ring splash frequency” parameter to define the frequency interval and the “ring splash delay” parameter to define the delay]). • 5: Low volume (same as the current BLF ring splash but at a lower level to be less intrusive). • 6: Low volume delayed (after a delay of [x] seconds, the ring signal that is the same as the current BLF ring splash is played at a lower level [use the “ring splash delay” parameter to define the delay]). • 7: The behavior is determined by the global parameter “play a ring splash”. <ul style="list-style-type: none"> – If “play a ring splash” is defined as 0 then the feature is disabled. – If “play a ring splash” is defined as 1 then the behavior is the same as Normal. – If “play a ring splash” is defined as 2 then the behavior is the same as Normal but the ring splash plays when idle and also during the active call state. • 8: In call delayed (same as Normal delayed but ring splash plays when idle and also during the active call state [use the “ring splash delay” parameter to define the delay]). • 9: In call periodic (same as Periodic but ring splash plays when idle and also during the active call state [use the “ring splash frequency” parameter to define the frequency interval]). • 10: In call periodic delayed (same as Periodic delayed but ring splash plays when idle and also during the active call state [use the “ring splash frequency” parameter to define the frequency interval and the “ring splash delay” parameter to define the delay]). • 11: In call low volume (same as Low volume but ring splash plays when idle and also during the active call state). • 12: In call low volume delayed (same as Low volume delayed but ring splash plays when idle and also during the active call state [use the “ring splash delay” parameter to define the delay]). <p>Notes:</p> <ul style="list-style-type: none"> • Ring tones are based on the current ring tone set configured on the IP phone. • BLF alerting patterns 7 - 11 are applicable to the 6739i, 6755i, 6757i, and 6757i CT IP phones only. <p>When a key is configured for BLF/List functionality, this parameter controls the ring tone per key. The following ring tones are available:</p> <ul style="list-style-type: none"> • Ring tone 1 • Ring tone 2 • Ring tone 3 • Ring tone 4 • Ring tone 5 • Silence (ring tone off) <p>Note: Ring tones are based on the current ring tone set configured on the IP phone.</p>	
Format	Integer	
Default value	For BLF 0 (Silence)	For BLF/List 100 (Ring tone 1)

Range	For BLF	For BLF/List
Example	<p>For BLF: prgkey1 ring splash: 1</p> <p>For BLF/List: prgkey1 ring splash: 101</p>

Format	Integer	
Default value	For BLF 0 (Silence)	For BLF/List 100 (Ring tone 1)

Range	For BLF	For BLF/List
Example	<p>For BLF: expmod1 key1 ring splash: 1</p> <p>For BLF/List: expmod1 key1 ring splash: 101</p>	

Parameter – <i>hardkeyN ring splash</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg	
Description	<p>(6867i only) When a key is configured for BLF functionality, this parameter controls the ring splash alert pattern per key. The following alerting patterns are available:</p> <ul style="list-style-type: none"> • Silence (ring splash off). • Normal splash (same as current BLF ring splash). • Normal - delayed (After a delay of (x) seconds, the normal ring splash is played). • Periodic (similar to the normal ring signal that is used by the phone itself. The actual ring melody is based on the current melody set for the line where the BLF key is associated to). • Periodic - delayed (after a delay of (x) seconds, the ring signal that is used by the phone is played - see above). • One low volume splash (same as the current BLF ring splash but at a lower level to be less intrusive). • One low volume splash - delayed (after a delay of (x) seconds, the ring signal that is the same as the current BLF ring splash is played at a lower level). <p>When a key is configured for BLF/List functionality, this parameter controls the ring tone per key. The following ring tones are available:</p> <ul style="list-style-type: none"> • Ring tone 1 • Ring tone 2 • Ring tone 3 • Ring tone 4 • Ring tone 5 • Silence (ring tone off) <p>Note: Ring tones are based on the current ring tone set configured on the IP phone.</p>	
Format	Integer	
Default Value	For BLF 0 (Silence)	For BLF/List 105 (Silence)
Range	For BLF 0-6 0 (Silence) 1 (Normal) 2 (Normal delayed) 3 (Periodic) 4 (Periodic delayed) 5 (Low volume) 6 (Low volume delayed)	For BLF/List 100 (Ring tone 1) 101 (Ring tone 2) 102 (Ring tone 3) 103 (Ring tone 4) 104 (Ring tone 5) 105 (Silence)
Example	<p>For BLF: hardkey1 ring splash: 1</p> <p>For BLF/List: hardkey1 ring splash: 101</p>	

Parameter – <i>ring splash delay</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Indicates the delay (in seconds) between the target ringing and the ring splash played when the “...keyN ring splash” parameter is set to a “delayed” alerting pattern. Note: If defined as “0”, the ring splash is played immediately.
Format	Numeric
Default Value	7 (seconds)
Range	NA
Example	ring splash delay: 10

Parameter – <i>ring splash volume</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Indicates the volume of the ring splash from 1 (loudest) to 9 (softest) when the “...keyN ring splash” parameter is set to a “low volume” alerting pattern.
Format	Numeric
Default Value	5
Range	1-9
Example	ring splash volume: 2

Parameter – <i>ring splash frequency</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Indicates the frequency interval (in seconds) when the “...keyN ring splash” parameter is set to a “periodic” alerting pattern. Note: If defined as “0”, the ring splash alerting pattern is treated as Normal or Normal - delayed.
Format	Numeric
Default Value	4 (seconds)
Range	N/A
Example	ring splash frequency: 8

Customizing M675i Expansion Module Column Display

Expansion Module 1 through 3

Parameter– <i>expmodXpageNleft</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify a customized heading for the M675i expansion module, in the left column of a specific page. You can specify the following options for this parameter:</p> <p>Expansion Module 1 expmod1page1left (Expansion Module 1, Page 1, left column) expmod1page2left (Expansion Module 1, Page 2, left column) expmod1page3left (Expansion Module 1, Page 3, left column)</p> <p>Expansion Module 2 expmod2page1left (Expansion Module 2, Page 1, left column) expmod2page2left (Expansion Module 2, Page 2, left column) expmod2page3left (Expansion Module 2, Page 3, left column)</p> <p>Expansion Module 3 expmod3page1left (Expansion Module 3, Page 1, left column) expmod3page2left (Expansion Module 3, Page 2, left column) expmod3page3left (Expansion Module 3, Page 3, left column)</p>
Format	Text String
Default Value	Not Applicable
Range	Not Applicable
Example	expmod1page1left: Personnel Ext

Parameter– <i>expmodXpageNright</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	<p>Allows you to specify a customized heading for the M675i expansion module, in the right column of a specific page. You can specify the following options for this parameter:</p> <p>Expansion Module 1 expmod1page1right (Expansion Module 1, Page 1, right column) expmod1page2right (Expansion Module 1, Page 2, right column) expmod1page3right (Expansion Module 1, Page 3, right column)</p> <p>Expansion Module 2 expmod2page1right (Expansion Module 2, Page 1, right column) expmod2page2right (Expansion Module 2, Page 2, right column) expmod2page3right (Expansion Module 2, Page 3, right column)</p> <p>Expansion Module 3 expmod3page1right (Expansion Module 3, Page 1, right column) expmod3page2right (Expansion Module 3, Page 2, right column) expmod3page3right (Expansion Module 3, Page 3, right column)</p>
Format	Text String
Default Value	Not Applicable
Range	Not Applicable
Example	expmod1page1right: Operations Ext

Advanced Operational Parameters

The following parameters in this section allow the system administrator to set advanced operational features on the IP phones.

Blind Transfer Setting

Parameter – <i>sip cancel after blind transfer</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Forces the phone to use the Blind Transfer method available in software prior to release 1.4. This method sends the CANCEL message after the REFER message when blind transferring a call.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip cancel after blind transfer: 1

Semi-Attended Transfer Settings

Parameter – <i>sip refer-to with replaces</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Flag for controlling the mode of a semi-attended transfer.
Format	Boolean
Default Value	0
Range	0 or 1
Example	sip refer-to with replaces: 1

Update Caller ID Setting

Parameter – <i>sip update callerid</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the updating of the Caller ID information during a call.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip update callerid: 1

Boot Sequence Recovery Mode Settings

Parameter – <i>force web recovery mode disabled</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the forcing web recovery mode feature. If this parameter is set to "1", you cannot force web recovery. If this parameter is set to "0", press 1 and # keys during boot up when the logo displays to force the web recovery mode.
Format	Boolean
Default Value	0 (false)
Range	0 (false) 1 (true)
Example	force web recovery mode disabled: 1

Parameter – <i>max boot count</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the number of faulty boots that occur before the phone is forced into Web recovery mode.
Format	Integer
Default Value	10
Range	0 to 32767 Zero (0) disables the max boot count feature.
Example	max boot count: 0

Single Call Restriction Setting

Parameter – <i>two call support</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the single media path restriction between the 6757i CT and 9480i CT base unit and the handset. When this feature is enabled (set to 1), you can make separate active calls from the 6757i CT and 9480i CT base unit and from the cordless handset. If this feature is disabled (set to 0), only one call can be active at a time either from the base unit or from the handset. When this feature is disabled, and you make an active call on either the base unit or the handset, any other attempt to make an active call is put on hold. Also, when this feature is disabled, more than one call can negotiate complex audio codecs since only a single call is decoding audio at a time.
Format	Boolean
Default Value	1
Range	0 - Disable 1 - Enable
Example	two call support: 0

Blacklist Duration Setting

Parameter – <i>sip blacklist duration</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the length of time, in seconds, that a failed server remains on the server blacklist. The IP phone avoids sending a SIP message to a failed server (if another server is available) for this amount of time. Note: The value of “0” disables the blacklist feature.
Format	Integer
Default Value	300 (5 minutes)
Range	0 to 9999999
Example	sip blacklist duration: 600

Whitelist Proxy Setting

Parameter – <i>sip whitelist</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	This parameter enables/disables the whitelist proxy feature, as follows: <ul style="list-style-type: none"> Set to 0 to disable the feature. Set to 1 to enable the feature. When this feature is enabled, an IP phone accepts call requests from a trusted proxy server <i>only</i>. The IP phone rejects any call requests from an untrusted proxy server.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip whitelist: 1

XML Key Redirection Settings (for Redial, Xfer, Conf, Icom, Voicemail)

Parameter– <i>redial script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies a redial script for the phone to use. When this parameter is set, pressing the Redial key GETs the specified URI from the server to use in performing the redial action.
Format	String
Default Value	empty
Range	Any valid URI
Example	redial script: http://bluevelvet.ana.aastra.com/redial.php

Parameter– <i>xfer script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies an Xfer script for the phone to use. When this parameter is set, pressing the Xfer key GETs the specified URI from the server instead of starting the transfer action.
Format	String
Default Value	empty
Range	Any valid URI
Example	xfer script: http://bluevelvet.ana.aastra.com/xfer.php

Parameter– <i>conf script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies an Conf script for the phone to use. When this parameter is set, pressing the Conf key GETs the specified URI from the server to use in performing the conference action.
Format	String
Default Value	empty
Range	Any valid URI
Example	conf script: http://bluevelvet.ana.aastra.com/conf.php

Parameter– <i>icom script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies an Icom script for the phone to use. When this parameter is set, pressing the Icom key GETs the specified URI from the server to use in performing the Intercom action.
Format	String
Default Value	empty
Range	Any valid URI
Example	icom script: http://bluevelvet.ana.aastra.com/icom.php

Parameter– <i>voicemail script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies a Voicemail script for the phone to use. When this parameter is set, selecting the voicemail option from the Services Menu GETs the specified URI from the server instead of starting the Voicemail application.
Format	String
Default Value	empty
Range	Any valid URI
Example	voicemail script: http://bluevelvet.ana.aastra.com/voicemail.php

Options Key Redirection Setting

Parameter – <i>options script</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies an Options script for the phone to use. When this parameter is set, pressing the Options Key GETs the specified URI from the server. Note: Pressing and holding the Options key displays the local Options Menu on the phone.
Format	String
Default Value	empty
Range	Any valid URI
Example	options script: http://fargo.ana.aastra.com/options.xml

Off-Hook and XML Application Interaction Setting

Parameter – <i>auto offhook</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies whether or not the phone is prevented from entering the off-hook/dialing state, if the handset is off-hook for more than 2 seconds, and the call ends.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled - phone is prevented from entering the off-hook dialing state) 1 (enabled - allows phone to enter the off-hook dialing state)
Example	auto offhook: 1

XML Override for a Locked Phone Setting

Parameter – <i>xml lock override</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the method to use for overriding a locked phone when XML applications are sent to the phone. There are three settings for this parameter: <ul style="list-style-type: none"> • 0 Phone prevents XML POSTs and XML GETs from being received or sent. • 1 Phone allows XML POSTs; however, XML GETs by pressing the XML keys (softkeys/programmable keys/extension module keys) are not allowed. • 2 Phone allows XML POSTs to the phone as well as XML GETs to/from the phone by pressing the XML keys (softkeys/programmable keys/extension module keys).
Format	Integer
Default Value	0
Range	0 to 2
Example	xml lock override: 1

Symmetric UDP Signaling Setting

Parameter – <i>sip symmetric udp signaling</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to enable or disable the phone to use port 5060 to send SIP UDP messages. The value "1" (which is the default) enables the phone to use port 5060. The value "0" (zero) disables the phone from using port 5060 and allows the phone to choose a random port to send SIP UDP messages. Note: This parameter should be disabled according to MST.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	sip symmetric udp signaling: 0

Symmetric TLS Signaling Setting

Parameter – <i>sips symmetric tls signaling</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to enable or disable the phone to use port 5061 as the persistent TLS connection source port. The value "1" (default) enables the phone to use port 5061. The value "0" disables the phone from using port 5061 and allows the phone to choose a random persistent TLS connection source port from the TCP range (i.e. 49152...65535) regardless of whether the parameter "sip outbound support" is enabled or disabled.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	sips symmetric tls signaling: 0

User-Agent Setting

Parameter – <i>sip user-agent</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Allows you to enable or disable the addition of the User-Agent and Server SIP headers in the SIP stack. The value of "0" prevents the UserAgent and Server SIP header from being added to the SIP stack. The value of "1" allows these headers to be added.
Format	Boolean
Default Value	1 (true)
Range	0 (false) 1 (true)
Example	sip user-agent: 0

GRUU and sip.instance Support

Parameter – <i>sip gruu</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables Globally Routable User-Agent URI (GRUU) support on the IP Phone according to draft-ietf-sip-gruu-15. If this parameter is disabled, parsing of inbound GRUU's for transfer are still enabled.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	sip gruu: 0

DNS Query Setting

Parameter– <i>sip dns query type</i>	Configuration Files aastra.cfg, <mac>.cfg
Description	Specifies the Domain Name Service (DNS) query method to use when the IP Phones issue requests for DNS records using one of three methods: "A" only, SRV& A, and NAPTR & SRV & A.
Format	Integer
Default Value	1
Range	<p>A only - The phone issues requests for "A" (Host IP Address) records from the DNS server to get the IP address, and uses the default port number of 5060.</p> <p>SRV & A - The phone issues requests for "SRV" (Service Location Record) records from the DNS server to get the port number. Most often, the IP address is included in the response from the DNS server to avoid extra queries. If there is no IP address returned in the response, the phones send out the request for "A" records from the DNS server to find the IP address.</p> <p>NAPTR & SRV & A - First, the phone sends "NAPTR" (Naming Authority Pointer) lookup to get the "SRV" pointer and service type. For example, if Global SIP transport protocol on the phone is "UDP", and Proxy server on the phone is "test.aastra.com", then:</p> <ul style="list-style-type: none"> • If the NAPTR record is returned empty, the phone will use the default value "_sip_udp.test.aastra.com" for the "SRV" lookup. • If the NAPTR record is returned "test.aastra.com SIP+D2U _sip_udp.abc.aastra.com", the phone will use "_sip_udp.abc.aastra.com" for the "SRV" lookup. • If the NAPTR record is returned "test.aastra.com SIP+D2T _sip_tcp.test.aastra.com", where the service type TCP mismatches the phone configured transport protocol "UDP", the phone will ignore this value and use the default value "_sip_udp.test.aastra.com" for the "SRV" lookup.
	<p>Note: The phone does not use the service type sent by the NAPTR response to switch its transport protocol, nor does it use the NAPTR response to determine whether to use a secure or unsecure communication path. The phone will always use a global sip protocol that is configured on the phone via configuration files or web user interface.</p> <p>After performing NAPTR, the phone sends "SRV" lookup to get the IP address and port number. If there is no IP address in the "SRV" response, then it sends out an "A" lookup to get it.</p> <p>Note: On the phone side, if you configure the phone with a Fully- Qualified Domain Name (FQDN) proxy and specified port, the phone always sends "A only" lookups to find the Host IP Address of the proxy.</p>
Example	sip dns query type: 2

Ignore Out of Order SIP Requests

Parameter – <i>sip accept out of order requests</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables a workaround for non-compliant SIP devices (for example, Asterisk) which do not increment the CSeq numbers in SIP requests sent to the phone.
Format	Boolean
Default Value	0 (disabled)
Range	0 (disabled) 1 (enabled)
Example	sip accept out of order requests: 1

Optional “Allow” and “Allow-Event” Headers

Parameter – <i>sip notify opt headers</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables whether or not the “Allow” and Allow-Events” optional headers are included in the SIP NOTIFY messages sent from the phone to the server.
Format	Boolean
Default Value	1
Range	0 (disabled - optional headers are removed from the SIP NOTIFY message) 1 (enabled - no change; optional headers are included in SIP NOTIFY message)
Example	sip notify opt headers: 0

P-Asserted Identity (PAI)

Parameter – <i>sip pai</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables whether the SIP PAI displays to the IP phone.
Format	Boolean
Default Value	1
Range	0 (disabled) 1 (enabled)
Example	sip pai: 0

Route Header in SIP Packet

Parameter – <i>sip remove route</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables the addition of the Route header in a SIP packet. Enable this parameter for outbound proxies that do not support Route headers. Note: When enabled this will break all support for SIP routing, so if some other device in the network attempts to add itself to the route it will fail.
Format	Boolean
Default Value	0
Range	0 (disable - adds the Route header to the packet) 1 (enable - removes the Route header from the packet)
Example	sip remove route: 1

Compact SIP Header

Parameter – <i>sip compact headers</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables or disables the IP phones to use compact SIP headers in the SIP packets sent from the phone.
Format	Boolean
Default Value	0 (disabled- uses long SIP header format)
Range	0 (disabled- uses long SIP header format) 1 (enabled- uses short (compact) SIP header format)
Example	sip compact headers: 1

Rejection of INV or BYE

Parameter – <i>sip enforce require hdr</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables the rejection of an INV or BYE with a “420 Bad Extension” if the INV or BYE contains an unsupported value in the REQUIRE header.
Format	Integer
Default Value	0
Range	0 (disable) 1 (enable)
Example	sip enforce require hdr: 1

Configuration Encryption Setting

Parameter – <i>config encryption key</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the phone-specific encryption key that the configuration server uses to encrypt in a MAC-specific configuration file.
Format	String
Default Value	Not applicable
Range	String length of 4 to 32 alphanumeric characters
Example	config encryption key: 123abcd

DNS Host File

Parameter – <i>sip dns host file</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The UNIX-format host file on the configuration server. The phone(s) download this file to perform DNS lookups on the local network instead of the service provider's public network. Note: If using a text file on a PC to enter this value, you must enter a carriage return (CR) after entering the host file name.
Format	UNIX format using Carriage Return (CR) or Carriage Return + Line Feed (CRLF) to terminate each line
Default Value	Not Applicable
Range	File name allows Alpha-numeric characters
Example	sip dns host file: hostfile.txt

DNS Server Query

Parameter – <i>sip dns srvX name</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Note: The "X" indicate a record number with values from 1 to 4.	
Description	The fully qualified URI of the DNS SRV record
Format	Fully qualified URI including service prefix
Default Value	Not Applicable
Range	Not Applicable
Example	sip dns srv1 name: _sip_udp.example.com

Parameter – <i>sip dns srvX priority</i> Note: The “X” indicate a server number with values from 1 to 4.	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The priority level assigned to this DNS server. After this parameter is downloaded from the configuration server to the phone, the phone uses the DNS server with the lowest numbered priority first to perform DNS lookups.
Format	Integer
Default Value	0
Range	0 to 65535
Example	sip dns srv1 priority: 10

Parameter – <i>sip dns srvX weight</i> Note: The “X” indicate a server number with values from 1 to 4.	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The weight level assigned to this server. If a service has multiple SRV records with the same priority value, the phones use the weight field to determine which host to use. The weight value is relevant only in relation to other weight values for the service, and only among records with the same priority value. Note: The “sip dns srvX weight” parameter must be configured but the phones will support this feature in a future release.
Format	Integer
Default Value	0
Range	0 to 65535
Example	sip dns srv1 weight: 60

Parameter – <i>sip dns srvX port</i> Note: The “X” indicate a server number with values from 1 to 4.	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	The port number on the target host.
Format	Integer
Default Value	0
Range	0 to 65535
Example	sip dns srv1 port: 5060

Parameter – <i>sip dns srvX target</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Note: The “X” indicate a server number with values from 1 to 4.	
Description	The host name of the target.
Format	Host name or fully qualified domain name
Default Value	Not Applicable
Range	Not Applicable
Example	sip dns srv1 target: bigbox.example.com

SIP Services/RTCP Summary Reports Transport Protocol Settings

SIP Services

Parameter – <i>sip services transport protocol</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the transport protocol used for SIP services. By default, this parameter is set to -1 (invalid) whereby SIP services use the same transport protocol as defined in the “sip transport protocol” parameter.
Format	Numeric
Default Value	-1 (Invalid)
Range	-1 (Invalid) 0 (TCP/UDP) 1 (UDP) 2 (TCP)
Example	sip services transport protocol: 1

Parameter – <i>sip services port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the port used for SIP services.
Format	Numeric
Default Value	5060
Range	Greater than 1024 and less than 65535
Example	sip services port: 7300

RTCP Summary Reports

Parameter – <i>sip rtcp summary reports transport protocol</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the transport protocol used for sending RTCP summary reports. This parameter takes effect when at least one line has RTCP summary reports enabled. Note: The parameter "sip symmetric udp signaling" is effective when the transport protocol for RTCP summary reports is set to UDP.
Format	Numeric
Default Value	1 (UDP)
Range	0 (TCP/UDP) 1 (UDP) 2 (TCP)
Example	sip rtcp summary reports transport protocol: 2

Alphanumeric Input Order for Username Prompts

Parameter – <i>username alphanumeric input order</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	When enabled, this parameter changes the default behavior of the keypad input order during username prompts from uppercase letters > digit > lowercase letters to digit > uppercase letters > lowercase letters. For example, when pressing "2" on the keypad during a username prompt with this parameter disabled (default) each key press will successively enter the letter/digit A, B, C, 2, a, b, c. When enabled, each key press will successively enter 2, A, B, C, a, b, c.
Format	Integer
Default Value	0 (Uppercase letters first)
Range	0-1 0 (Uppercase letters first) 1 (Digit first)
Example	username alphanumeric input order: 1

Active VoIP Recording Settings

Warning!

When a recording session is in progress, the respective IP phones display a recording icon on screen. The recording icon is displayed on the IP phones to indicate the recording session is active and that a duplicate copy of the RTP/SRTP stream is to be sent from the phone to the recording server. The overall recording and its quality is dependent on the recording server and the network.

Parameter – <i>recorder addressN</i> (N is a number from 1 to 6)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies a trusted IP address (maximum of six) corresponding to the voice recording system. The IP phone will check and respond to SIP messages coming from these IP addresses on the port defined by the "sip services port" parameter. Note: If all of the "recorder addressN" parameters are left undefined, the active IP voice recording feature is disabled.
Format	IP Address
Default Value	N/A
Range	N/A
Example	recorder address1: 192.168.1.20 recorder address2: 192.168.1.21 recorder address3: 192.168.1.22 recorder address4: 192.168.1.23 recorder address5: 192.168.1.24 recorder address6: 192.168.1.25

Parameter – <i>recording destinationN</i> (N is a number from 1 to 6)	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies trusted IP addresses (maximum of six) corresponding to the destination where the RTP/SRTP packets should be sent. The IP phone will check to see if the destination IP addresses are trusted before sending the duplicated RTP/SRTP packets. Note: If all of these parameters are left undefined, no authentication checks will be performed.
Format	IP Address
Default Value	N/A
Range	N/A
Example	recorder address1: 192.168.1.20 recorder address2: 192.168.1.21 recorder address3: 192.168.1.22 recorder address4: 192.168.1.23 recorder address5: 192.168.1.24 recorder address6: 192.168.1.25

Parameter – <i>recording periodic beep</i>	Configuration Files aastra.cfg, <mac>.cfg
Description	Specifies how often (in seconds) the periodic beep tone (notifying users that their call is being recorded) should be played.
Format	Integer
Default Value	15 (seconds)
Range	0 (Disabled) 15 30 45 60
Example	recording periodic beep: 30

Parameter – <i>recording beep direction</i>	Configuration Files aastra.cfg, <mac>.cfg
Description	Specifies where the periodic beep tone (notifying users that their call is being recorded) should be played.
Format	Integer
Default Value	1 (Network)
Range	0-2 0 (Local) 1 (Network) 2 (Both Local and Network)
Example	recording beep direction: 2

BroadSoft BroadWorks Executive and Assistant Services Settings

Notes:

- This feature is not supported for the 6735i, 6737i, 6863i, 6865i, and 6867i in Release 3.3.1 SP3.
- Applicable to the 6730i, 6731i, 6753i, 6755i, 6757i, 6757i CT, 9143i, 9840i, and 9840i CT IP Phones only.

Parameter – <i>sip execassist filter call prefix</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the prefix of the Alerting Custom Calling Line ID name configured for Executives. For an incoming call, the phone will treat the call as a filtered call if the prefix is found in the front of the display name of the FROM header of the INVITE. The prefix from the display name of the FROM header or PAI header will be stripped before it is displayed on the phone's screen. For example, if the From header sent by the BroadWorks call manager SIP INVITE message is: From:"[F] Filtrage -> Dupont, Francois"<sip:5551234567@as.aastra.com;user=phone> then the IP phone displays the calling name as "Filtrage -> Dupont, Francois" since the "[F]" prefix is removed.
Format	String (in quotations)
Default Value	"[F]"
Range	N/A
Example	sip execassist filter call prefix: "[F]"

Parameter – <i>sip execassist fac call push</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the Feature Access Code (FAC) for the BroadSoft Executive- Assistant Call Push feature.
Format	String (in quotations)
Default Value	"#63"
Range	N/A
Example	sip execassist fac call push: "#63"

Parameter – <i>sip execassist fac initiate call</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the Feature Access Code (FAC) for the BroadSoft Executive- Assistant Initiate Call feature.
Format	String (in quotations)
Default Value	"#64"
Range	N/A
Example	sip execassist fac initiate call: "#64"

Troubleshooting Parameters

The following parameters in this section allow the system administrator to set logging and support settings for troubleshooting purposes.

Log Settings

Parameter – <i>log server ip</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the IP address of the log server to which log information will be transmitted.
Format	IP address
Default Value	0.0.0.0
Range	Not Applicable
Example	log server ip: 192.168.3.2

Parameter – <i>log server port</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the IP port of the log server. This is the IP port that transmits information from the IP phone to the IP address location.
Format	Integer
Default Value	0
Range	Any valid IP port
Example	log server port: 2

Parameters – <i>log module <module name></i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg																		
Description	<p>Allows enhanced severity filtering of log calls sent as blog output.</p> <p>The blog, as used on the IP phones, is a an online debugging tool that can be frequently updated and intended for technical support analysis. Blogs are defined by their format: a series of entries posted to a single page in reverse-chronological order. The IP Phone blogs are separated into modules which allow you to log specific information for analyzing:</p> <p>Module Name (configuration files)</p> <ul style="list-style-type: none"> • linemgr (line manager information) • user interface • misc (miscellaneous) • sip (call control SIP stack) • dis (display driver) • dstore (delayed storage) • ept (endpoint) • ind (indicator) • kbd (keyboard) • net (network) • provis (provisioning) • rtpt (Real Time Transport) • snd (sound) • prof (profiler) • xml (Extension Markup Language) • stun (Simple Traversal of User Datagram Protocol (UDP) through Network Address Translation (NAT)) • lldp (Link Layer Discovery Protocol) • bluetooth (6739i only) 																		
Format	Integer																		
Default Value	1 (fatal errors)																		
Range	<table border="1"> <thead> <tr> <th>Debug Level</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>Fatal Errors</td> <td>1 (default)</td> </tr> <tr> <td>Errors</td> <td>2</td> </tr> <tr> <td>Warnings</td> <td>4</td> </tr> <tr> <td>Init</td> <td>8</td> </tr> <tr> <td>Functions</td> <td>16</td> </tr> <tr> <td>Info</td> <td>32</td> </tr> <tr> <td>All debug levels OFF</td> <td>0</td> </tr> <tr> <td>All Debug Levels ON</td> <td>65535</td> </tr> </tbody> </table>	Debug Level	Value	Fatal Errors	1 (default)	Errors	2	Warnings	4	Init	8	Functions	16	Info	32	All debug levels OFF	0	All Debug Levels ON	65535
Debug Level	Value																		
Fatal Errors	1 (default)																		
Errors	2																		
Warnings	4																		
Init	8																		
Functions	16																		
Info	32																		
All debug levels OFF	0																		
All Debug Levels ON	65535																		

Examples	<p>Enter a debug level value in the “Debug Level” field for a module.</p> <p>Example 1</p> <p>To turn two or more debug levels on at the same time, you add the value associated with each level. For example,</p> <p>Fatal Errors + Errors + Warnings = 1 + 2 + 4 = 7</p> <p>log module linemgr: 7 log module user interface: 7 log module sip: 7</p> <p>In the above example, fatal errors, general errors, and warnings are logged for the line manager, user interface, and SIP call control modules.</p> <p>Example 2</p> <p>Functions and Info = 16 + 32 = 48</p> <p>log module dis: 48 log module net: 48 log module snd: 48</p> <p>In the above example, functions and general information are logged for the display drivers, network, and sound modules.</p> <p>Example 3</p> <p>log module rtpt: 0 log module ind: 65535</p> <p>In the above example, all debug levels are OFF for the Real Time Transport module. All debug levels are ON for the indicator module.</p> <p>You can set the Module/Debug Levels using the configuration files or the Aastra Web UI.</p>
-----------------	---

WatchDog Settings

Parameter– <i>watchdog enable</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables/disables the use of the WatchDog task for the IP Phones.
Format	Boolean
Default Value	1 (enabled)
Range	0 (disabled) 1 (enabled)
Example	watchdog enable: 0

Crash File Retrieval

Parameter– <i>upload system info server</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Specifies the server for which the phone sends the system and crash files (server.cfg, local.cfg, and crash.cfg).
Format	IP address or qualified domain name. Supported protocols are TFTP, FTP, HTTP, and HTTPS. Example: tftp://0.0.0.0:port/path ftp://username:password@0.0.0.0:port/path http://0.0.0.0:port/path https://0.0.0.0:port/path
Default Value	Not Applicable
Range	Not Applicable
Example	upload system info server: tftp://132.432.0.43:69/sysinfo

Parameter– <i>upload system info manual option</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables the ability to manually upload support information from the IP Phone UI and Aastra Web UI. IP Phone UI: <i>Options->Phone Status->Upload System Info</i> Aastra Web UI: <i>Status->System Information->Support Information</i> When this parameter is enabled, an “ Upload System Info ” option displays on the IP Phone UI AND an < Upload > button displays on the System Information page in the Aastra Web UI.
Format	Boolean
Default Value	1
Range	0 (disabled) 1 (enabled)
Example	upload system info manual option: 1

Parameter – <i>upload system info on crash</i>	Configuration Files aastra.cfg, <model>.cfg, <mac>.cfg
Description	Enables and disables the watchdog to automatically reboot the phone and send a crash file to the pre-defined server.
Format	Boolean
Default Value	0
Range	0 (disabled) 1 (enabled)
Example	upload system info on crash: 1

Appendix B

Configuring the IP Phone at the Asterisk IP PBX

About this Appendix

This appendix describes how to setup a user's phone with an extension to make and receive calls using the Asterisk as the PBX.

Topics

This appendix covers the following topics:

Topic	Page
IP Phone at the Asterisk IP PBX	page B-2

IP Phone at the Asterisk IP PBX

The following configuration illustrates how to create a user with an extension to make and receive calls using the Asterisk as the PBX. This configuration is defined in the *sip.conf* file present along with the other configuration files that are created when Asterisk is installed. Usually, the configuration files can be found at the */etc/asterisk* directory.

```
;This is used in the "extensions.conf" file to identify this
;physical phone when issuing Dial commands.
[phone1]

;The type to use for the 6757i is "friend".
;"Peer" is used when the Asterisk is contacting a proxy,
;"user" is used for phones that can only make calls
;and "friend" acts as both a peer and a user.
type=friend

;If your host has an entry in your DNS then you just enter the
;machines name in the host= field.
host=dynamic
defaultip=192.168.1.1 ;default IP address that the phone is
;configured to

;The password that phone1 will use to register with this PBX
secret=1234

dtmfmode=rfc2833;Choices are inband, rfc2833, or info
mailbox=1000 ;Mailbox for message waiting indicator

;If a phone is not in a valid context you will not be
;able to use it. In this example ' sip' is used. You can use
;whatever you like, but make sure they are the same, you will
;need to make an entry in your extensions.conf file (which we
;will get to later)
context=sip
callerid="Phone 1" <1234>
```

After this is defined in the "sip.conf" file, some information has to be entered in the "extensions.conf" file present in the same directory as the "sip.conf" file. The following definition in the file under the [sip]section/context completes defining the extension for the 6757i phone:

```
exten -> 1234,1,Dial(SIP/phone1,20)
```

This definition completes configuring the 6757i phone at the IP PBX system.

To verify whether the extension has been successfully registered at the IP PBX system, enter the Asterisk console and reload Asterisk. Use the command "sip show peers" at the console. This will display the extensions that are registered at the IP PBX system.

Name/username	HostMask	Mask	Port	Status
phone1/phone1	192.168.1.1	(D)255.255.255.255	5060	Unmonitored

This completes the basic set-up for the 6757i phone with 1234 extension at the Asterisk IP PBX system. Refer to Asterisk documentation for set-up on extended or advanced features such as voicemail and call forwarding, etc.

Appendix C

Sample Configuration Files

About this Appendix

This appendix provides sample configuration files for the 6757i, 6757i CT, and 6753i.

Topics

This appendix covers the following topics:

Topic	Page
Sample Configuration Files	page C-2
6757i Sample Configuration File	page C-2
6757i CT Sample Configuration File	page C-9
6753i Sample Configuration File	page C-20

Sample Configuration Files

This section consists of the sample configuration files necessary to configure the IP phones. The general format is similar to configuration files used by several Unix-based programs. Any text following a number sign (#) on a line is considered to be a comment, unless the # is contained within double-quotes. Currently, Boolean fields use 0 for false and 1 for true.

6757i Sample Configuration File

```
# Sample Configuration File
# =====

# Date: October 20th, 2005

# Phone Model: 6757i

# Notes:
#
# The general format used here is similar to configuration files
# used by several UNIX-based programs. Any text following a number
# sign (#) is considered to be a comment, unless the number sign is
# contained within double-quotes ("#") where it is considered to be
# a pound. For Boolean fields, 0 = false, 1 = true.

# Comments:
#
# This file contains sample configurations for the "aastra.cfg", <model>.cfg, or
# "<mac>.cfg" file. The settings included here are examples only.
# You should change/comment the values to suit your requirements.
#
# Not all possible parameters are shown, refer to the admin guide for
# the full list of supported parameters, their defaults and valid
# ranges.
#
# The Aastra 6737i, 6757i, 6757iCT, and 6753i phones will download 2
# configuration files from the TFTP server while restarting, the
# "aastra.cfg" file, the "<model>.cfg" file, and the "<mac>.cfg" file. These three configuration
# files can be used to configure all of the settings of the phone with
# the exception of assigning a static IP address to a phone and line
# settings, which should only be set in the "<mac>.cfg" file.
#
# The "aastra.cfg" file configures the settings server wide, the "<model>.cfg" file contains model specific
# information (for example, "6757i.cfg"), while the "<mac>.cfg" file configures only the phone with the MAC
# address for which the file is named (for example, "00085d0304f4.cfg"). The
# settings in the "aastra.cfg" file will be overridden by settings in the <model>.cfg file, and settings in the
# "<mac>.cfg" file override both settings in the "<model>.cfg" and the "aastra.cfg" files.
#-----
```

```
# DHCP Setting
# =====

#dhcp: 1 # DHCP enabled.

# DHCP:
# 0 = false, means DHCP is disabled.
# 1 = true, means DHCP is enabled.
#
# Notes:
#
# DHCP is normally set from the Options list on the phone or
# the web interface
#
# If DHCP is disabled, the following network settings will
# have to be configured manually either through the configuration
# files, the Options List in the phone, or the Web Client: IP
# Address (of the phone), Subnet Mask, Gateway, DNS, and TFTP
# Server.
#-----

# Network Settings
## = = = = =

# Notes: If DHCP is enabled, you do not need to set these network
# settings. Although depending on you DHCP server configuration you
# may still have to set the dns address.

#ip:      # This value is unique to each phone on a server
          # and should be set in the "<mac>.cfg" file if
          # setting this manually.

# Softkey Settings
#

# Softkeys can be set either server wide or unique to each phone.
# Setting softkeys as line/call appearances should be done in the
# "<mac>.cfg" file, since these are unique to each phone.

# Notes:
#
# There are a maximum of 18 softkeys that can be configured on the
# 6737i, 6757i, or 6757iCT phone. These can be set up through either of the 2
# configuration files, depending on whether this is to be server wide
# ("aastra.cfg"), or model specific ("<model>.cfg), or phone specific ("<mac>.cfg"). Each softkey needs
# to be numbered from 1 - 18, for example "softkey12 type:
# speeddial". Softkeys can be set up as speeddials or as additional
# call/line appearances and have a type, label and value associated
# with it as seen here in the default softkey settings.

# SOFTKEY TYPES: "line", "speeddial", "blf", "list", "dnd"
# SOFTKEY LABEL: Alpha numeric name for the softkey. The maximum
# number of characters for this value is 10 for
# speeddials and dnd, 9 chars for lines, blf
# SOFTKEY VALUE: If softkey type is a speeddial, any DTMFs (from
# 0 - 9, *, "#") or a comma (,) for 500ms pause and
# 'E' for On-hook can be set for the value.
# If softkey type is blf it is the extension you want
# to monitor.
# SOFTKEY LINE: This is line associated with the softkey. For line
# softkeys the value must be between 5 and 9 (1 - 4
# are already hardcoded as the L1, L2, L3 and L4 hard
# key line/call appearances)

# Speed Dials
softkey1 type: speeddial
softkey1 label: "Ext Pickup"
softkey1 value: *8
softkey2 type: speeddial
softkey2 label: "Call Return"
softkey2 value: *69

6757i CT Sample Configuration File

```
# Sample Configuration File
# =====

# Date: October 26th, 2005

# Phone Model: 6757iCT

# Notes:
#
# The general format used here is similar to configuration files
# used by several UNIX-based programs. Any text following a number
# sign (#) is considered to be a comment, unless the number sign is
# contained within double-quotes ("#") where it is considered to be
# a pound. For Boolean fields, 0 = false, 1 = true.

# Comments:
#
# This file contains sample configurations for the "aastra.cfg", "<model>.cfg", or
# "<mac>.cfg" file. The settings included here are examples only.
# You should change/comment the values to suit your requirements.
#
# Not all possible parameters are shown, refer to the admin guide for
# the full list of supported parameters, their defaults and valid
# ranges.
#
# The Aastra 6737i, 6757i, 6757iCT, and 6753i phones will download 2
# configuration files from the TFTP server while restarting, the
# "aastra.cfg" file, the "<model>.cfg" file, and the "<mac>.cfg" file. These three configuration
# files can be used to configure all of the settings of the phone with
# the exception of assigning a static IP address to a phone and line
# settings, which should only be set in the "<mac>.cfg" file.
#
# The "aastra.cfg" file configures the settings server wide, the "<model>.cfg" file contains model specific
# information (for example, "6757i.cfg"), while the "<mac>.cfg" file configures only the phone with the MAC
# address for which the file is named (for example, "00085d0304f4.cfg"). The
# settings in the "aastra.cfg" file will be overridden by settings in the <model>.cfg file, and settings in the
# "<mac>.cfg" file override both settings in the "<model>.cfg" and the "aastra.cfg" files.
#-----
```

```
# DHCP Setting
# =====

#dhcp: 1 # DHCP enabled.

# DHCP:
# 0 = false, means DHCP is disabled.
# 1 = true, means DHCP is enabled.
#
# Notes:
#
# DHCP is normally set from the Options list on the phone or
# the web interface
#
# If DHCP is disabled, the following network settings will
# have to be configured manually either through the configuration
# files, the Options List in the phone, or the Web Client: IP
# Address (of the phone), Subnet Mask, Gateway, DNS, and TFTP
# Server.
#-----

# Network Settings
# =====

# Notes: If DHCP is enabled, you do not need to set these network
# settings. Although depending on you DHCP server configuration you
# may still have to set the dns address.

#ip:      # This value is unique to each phone on a server
          # and should be set in the "<mac>.cfg" file if
          # setting this manually.

#subnet mask:

# Cordless Handset Feature Keys  
# =====  
  
# Notes:  
#  
# In addition to the configuration parameters that exist on the 6757i  
# phone, following are the parameters specific to the 6757i Cordless  
# phones' handset. These parameters can be defined either in the  
# aastra.cfg, <model>.cfg, or the <mac>.cfg files.  
#  
# The feature keys are displayed when the user presses the F button  
# on the cordless phone's hand set. If any changes to the features  
# keys are made using these parameters the feature keys that exist on  
# the hand set have to be refreshed. To refresh the feature keys  
# simply open a new line or press one of the feature keys that are  
# available from the hand set. After a couple of seconds the cordless  
# should get the new list from the base set. There are 15 feature  
# keys that can be configured for the cordless hand set. Each feature  
# key has the following settings. N corresponds to the feature key  
# that is being configured for and ranges from 0-14. Feature key N  
# En label: "String" Feature key N Fr label: "Fr-String" Feature key  
# N Sp label: "Sp-String" Feature key N control: 1 #Takes an  
# integer value Feature key N hs event: 1 #Takes an integer value  
# Feature key N base event: 1 #Takes an integer value  
  
#key list version: 1  
# The parameter value has to be incremented by one whenever the  
# parameters that carry the feature keys change. The range is from  
# 1-254. After reaching 254 start over from 1.  
  
#Feature key 0 En label: "Line 1"  
# English label for the key. Displayed when the phone's language is  
# set to use English  
  
#Feature key 0 Fr label: "Fr-Line 1"  
# French label for the key. Displayed when the phone's language  
# is set to use French  
  
#Feature key 0 Sp label: "Sp-Line 1"  
# Spanish label for the key. Displayed when the phone's language  
# is set to use Spanish  
  
Feature key 0 Gr label: "Gr-Line 1"  
# German label for the key. Displayed when the phone's language  
# is set to use German  
  
Feature key 0 It label: "It-Line 1"  
# Italian label for the key. Displayed when the phone's language  
# is set to use Italian
```

```
#Feature key 0 control: 1
# 1 - Make the key configurable by the user through the phone and
#     the phone's web client
# 2 - Locks the key from user modifications. User cannot modify
#     this key from the handset or the phone's web client.
# 4 - Hide this key. Do not show it in the Feature keys list in the
#     cordless handset
# 6 - Lock and hide this key. Do not show it in the Feature keys
#     list in the cordless handset and do not let the user modify
#     this key using the phone or the web client.
```

```
#Feature key 0 hs event: 7
# These events are for handset specific events. Events can be local
# to the handset like directory/caller's list, intercom etc. or may
# be an event that is sent to the base set for further processing.
# When this key is configured as a base event then the base set
# will process the value of this key in conjunction with the value
# configured for the "Feature key N base event". Where N is the
# feature key is being configured for.
# In addition to the values listed below the valid values are
# [7-23]. The values [7-23] indicate generic handset events. If
# you are using values within this range make sure to use the value
# only once.
# The events local to the handset are as follows:
#
# 58 - Menu (Options)
# 59 - Feature Key
# 60 - Redial
# 61 - Directory
# 62 - Callers' list
# 63 - Services
# 86 - Icom
```

```
#Feature key 0 base event: 1
# Indicates a corresponding action to perform on the base set when
# the "Feature key N hs event" is set to any value between 7-23.
#
# 1 - Seize base set's line1
# 2 - Seize base set's line2
# 3 - Seize base set's line3
# 4 - Seize base set's line4
# 5 - Seize base set's line5
# 6 - Seize base set's line6
# 7 - Seize base set's line7
# 8 - Seize base set's line8
# 9 - Seize base set's line9
# 10 - Seize base set's line0
# 11 - Send the base set's transfer event
# 12 - Send the base set's conference event
# 13 - Make feature list public
```

```

Feature key 9 base event: 13

6753i Sample Configuration File

```

# Sample Configuration File
# = = = = =

# Date: October 26th, 2005

# Phone Model: 6753i

# Notes:
#
# The general format used here is similar to configuration files
# used by several UNIX-based programs. Any text following a number
# sign (#) is considered to be a comment, unless the number sign is
# contained within double-quotes ("#") where it is considered to be
# a pound. For Boolean fields, 0 = false, 1 = true.

# Comments:
#
# This file contains sample configurations for the "aastra.cfg", "<model>.cfg, or
# "<mac>.cfg" file. The settings included here are examples only.
# You should change/comment the values to suit your requirements.
#
# Not all possible parameters are shown, refer to the admin guide
# for the full list of supported parameters, their defaults and
# valid ranges.
#
# The Aastra 6737i, 6757i, 6757iCT, and 6753i phones will download 2
# configuration files from the TFTP server while restarting, the
# "aastra.cfg" file, the "<model>.cfg" file and the "<mac>.cfg" file. These three
# configuration files can be used to configure all of the settings
# of the phone with the exception of assigning a static IP address
# to a phone and line settings, which should only be set in the "<mac>.cfg" file.
#
# The "aastra.cfg" file configures the settings server wide, the "<model>.cfg" file contains model specific
# information (for example, "6757i.cfg"), while the "<mac>.cfg" file configures only the phone with the MAC
# address for which the file is named (for example, "00085d0304f4.cfg"). The settings in the "aastra.cfg"
# file will be overridden by settings that also appear in the "<model>.cfg" file.
# Settings in the "<mac>.cfg" file override setting that appear in the "aastra.cfg" and "<model>.cfg" files.
#-----

```

```
# DHCP Setting
# =====

#dhcp: 1 # DHCP enabled.

# DHCP:
#0 = false, means DHCP is disabled.
#1 = true, means DHCP is enabled.
#
# Notes:
#
# DHCP is normally set from the Options list on the phone or
# the web interface
#
# If DHCP is disabled, the following network settings will
# have to be configured manually either through the configuration
# files, the Options List in the phone, or the Web Client: IP
# Address (of the phone), Subnet Mask, Gateway, DNS, and TFTP
# Server.
#-----

# Network Settings
# = = = = =

# Notes: If DHCP is enabled, you do not need to set these network
# settings. Although depending on you DHCP server configuration
# you may still have to set the dns address.

#ip:      # This value is unique to each phone on a server
#         # and should be set in the "<mac>.cfg" file if
#         # setting this manually.

#subnet mask:
#default gateway:
#dns1:
#dns2:

# Time Server Settings
# =====

#time server disabled: 1 # Time server disabled.
#time server1:          # Enable time server and enter at
#time server2:          # least one time server IP address or
#time server3:# qualified domain name.

# Time Server Disabled:
# 0 = false, means the time server is not disabled.
# 1 = true, means the time server is disabled.
```

```
# NAT Settings
# = = = = =

# Option 2:
#
# If you are using a session border controller, you should set the
# outbound proxy to the session border controller address

#sip outbound proxy: sbc.aastra.com
#sip outbound proxy port: 0          # a value of 0 enables SRV
                                   # lookups for the address of
                                   # the proxy.

# Option 3:
#
# If you know the public IP address of your NAT device and have
# opened up a port for the SIP messages then you can statically
# assign this information.

#sip nat ip: 67.123.122.90
#sip nat port: 5890

# Additional Network Settings
# =====

#sip rtp port: 3000      # Eg. RTP packets are sent to port 3000.

#-----

# Configuration Server Settings
# = = = = =

# Notes: This section defines which server the phone retrieves new
# firmware images and configuration files from. Three protocols
# are supported TFTP, FTP and HTTP

download protocol: TFTP  # valid values are TFTP, FTP and HTTP

## TFTP server settings
tftp server: 192.168.0.130
#alternate tftp server:
#use alternate tftp server: 1 # If your DHCP server assigns
# a TFTP server address which
# you do not use, you can use
# the alternate tftp server.

## FTP server settings
#ftp server: 192.168.0.131  # can be IP or FQDN
#ftp username: aastra
#ftp password: 6757iaastra

## HTTP server settings (for http://bogus.aastra.com/firmware/)
#http server: bogus.aastra.com  # can be IP or FQDN
#http path: firmware

```

```

# Dial Plan Settings
# =====
#
# Notes:
#
# As you dial a number on the phone, the phone will initiate a call
# when one of the following conditions are meet:
#
# (1) The entered number is an exact match in the dial plan
# (2) The "#" symbol has been pressed
# (3) A timeout occurs
#
# The dial plan is a regular expression that supports the following:
# syntax:
#
# 0,1,2,3,4,5,6,7,8,9,*,# : matches the keypad symbols
# x                       : matches any digit (0..9)
# +                       : matches 0 or more repetitions of the
#                          : previous expression
# []                      : matches any number inside the brackets
#                          : can be used with a "-" to represent a
#                          : range
# ()                      : expression grouping
# |                       : either or
#
# If the dialled number doesn't match the dial plan then the call
# is rejected.

sip digit timeout: 3      # set the inter-digit timeout in seconds

# Example dial plans
sip dial plan: "x+#|xx+*" # this is the default dial string, note
                          # that is must be quoted since it contains
                          # a '#' character

#sip dial plan: [01]xxx|[2-8]xxxx|91xxxxxxxxxxx
                          # accept any 4 digit number beginning
                          # with a 0 or 1, any 5 digit number
                          # beginning with a number between 2 and 8
                          # (inclusive) or a 12 digit number
                          # beginning with 91

#sip dial plan terminator: 1 # enable sending of the "#" symbol to
                              # to the proxy in the dial string

#-----

```

```
# General SIP Settings
# =====

#sip session timer: 90      # enable support of RFC4028, the default
                           # value of 0 disables this functionality

#sip transport protocol: 0 # use UDP (1), TCP (2) or both (0) for
                           # sip messaging

#sip use basic codecs: 1   # limit codecs to G711 and G729
#sip out-of-band dtmf: 0   # turn off support for RFC2833 (on by
                           # default)

# Global SIP User Settings
# =====
#
# Notes:
#   These settings are used as the default configuration for the
#   hard key lines on the phone.  That is:
#
#   L1 to L4 on the 6757i and 6757iCT
#   L1 to L3 on the 6753i
#
#   These can be over-ridden on a per-line basis using the per-line
#   settings.
#
#   See the Admin Guide for a detailed explanation of how this works

sip screen name: Joe Smith # the name display on the phone's screen
sip user name: 4256 # the phone number
sip display name: Joseph Smith # the caller name sent out when making
# a call.
sip vmail: *78 # the number to reach voicemail on

sip auth name: jsmith # account used to authenticate user

sip line5 registrar ip: 10.50.10.102
sip line5 registrar port: 5060
sip line5 registration period: 60

#-----

Programmable Key Settings

=====

Programmable keys can be set either server wide or unique to each phone.
Setting programmable keys as line/call appearances should be done
in the "<mac>.cfg" file, since these are unique to each phone.

Notes:

#

There are a maximum of 7 programmable keys that can be configured
on the 6753i phone, and only 2 on the phone. These can be
set up through either of the 2 configuration files, depending on
whether this is to be server wide ("aastra.cfg"), or model specific ("
model>.cfg"), or phone
specific ("<mac>.cfg"). Each prgkey needs to be numbered from
1 - 7, for example "prgkey2 type:
speeddial". Programmable keys can be set up as speeddials or as
additional call/line appearances or as feature keys and have a
type, value and line associated with it as seen here in the
default programmable settings.

```
# PRGKEY TYPES: "line", "speeddial", "blf", "list", "dnd"
# PRGKEY VALUE: If prgkey type is a speeddial, any DTMFs (from
#               0 - 9, *, "#") or a comma (,) for 500ms pause and
#               'E' for On-hook can be set for the value.
#               If prgkey type is blf it is the extension you want
#               to monitor.
# PRGKEY LINE:  This is line associated with the prgkey. For line
#               prgkeys the value must be between 4 and 9 (1 - 3
#               are already hardcoded as the L1, L2 and L3 hard
#               key line/call appearances).
```

```
# Speed Dials
prgkey1 type: speeddial
prgkey1 value: *8
prgkey2 type: speeddial
prgkey2 value: *69
```

```
# DND Key
prgkey3 type: dnd
```

```
# Line appearance
prgkey4 type: line
prgkey4 line: 5
```

```
# blf
prgkey5 type: blf
prgkey5 value: 4559
prgkey5 line: 1
```

```
# list
prgkey6 type: list
prgkey7 type: list
```

Appendix D

Sample BLF Softkey Settings

About this Appendix

This appendix provides sample BLF softkey settings for both the Asterisk server and the BroadSoft BroadWorks server.

Topics

This appendix covers the following topics:

Topic	Page
Sample BLF Softkey Settings	page D-2
Asterisk/sipXecs BLF	page D-2
BroadSoft BroadWorks BLF	page D-3

Sample BLF Softkey Settings

Asterisk/sipXecs BLF

The following are sample softkey and programmable key configurations to enable Asterisk/sipXecs BLF support on Aastra IP phones.

Softkey Configuration Parameters for Asterisk/sipXecs BLF

```
softkey1 type: blf
softkey1 value: 9995551212
softkey1 label: John
softkey1 line: 1
```

Programmable Key Configuration Parameters for Asterisk/sipXecs BLF

```
prgkey1 type: blf
prgkey1 value: 9995551212
prgkey1 label: John
prgkey1 line: 1
```

```
prgkey7 type: blf
prgkey7 value: 9995551313
prgkey7 label: Jane
prgkey7 line: 1
```

BroadSoft BroadWorks BLF

The following are sample softkey and programmable key configurations to enable Broadsoft BroadWorks Busy Lamp Field support on Aastra IP phones.

Softkey Configuration Parameters for Broadsoft BroadWorks BLF

Note:

One softkey must be defined of type "list" for EACH monitored user. So if there are 2 users being monitored, 2 softkeys must be defined of type list.

```
softkey1 type: list
softkey1 label:
softkey1 value:
softkey1 line: 1
```

```
softkey2 type: list
softkey2 label:
softkey2 value:
softkey2 line: 1
```

```
list uri: sip:9@192.168.104.13
```

Programmable Key Configuration Parameters for Broadsoft BroadWorks BLF

Note:

One prgkey must be defined of type "list" for each monitored user. So if there are 2 users being monitored, 2 prgkeys must be defined of type list.

```
prgkey5 type: list
prgkey5 line: 1
```

```
prgkey6 type: list
prgkey6 line: 1
```

```
list uri: sip:9@192.168.104.13
```

Appendix E

Sample Multiple Proxy Server Configuration

About this Appendix

This appendix provides a sample multiple proxy server configuration.

Topics

This appendix covers the following topics:

Topic	Page
Multiple Proxy Server Configuration	page E-2

Multiple Proxy Server Configuration

Multiple proxy servers can be configured in the *aastra.cfg* file, *<model>.cfg* file, or the *<mac>.cfg* file. In the example below, the default proxy setting is used if no specific setting is specified in the line configuration. Line2 and line3 are used for the global proxy configurations, while line1 and line4 use their own specific settings.

Note:

The phones include support for a feature referenced in RFC3327, a SIP extension header called "PATH" for phones to discover intermediate proxies. This feature is always enabled on the phone.

```
#sip settings
sip proxy ip: #.#.#.#
sip proxy port: 5060

Limited Warranty

(Not applicable in Australia – see below for Limited Warranty in Australia)

Aastra warrants this product against defects and malfunctions in accordance with Aastra's authorized, written functional specification relating to such products during a one (1) year period from the date of original purchase ("Warranty Period"). If there is a defect or malfunction, Aastra shall, at its option, and as the exclusive remedy, either repair or replace the product at no charge, if returned within the Warranty Period. If replacement parts are used in making repairs, these parts may be refurbished, or may contain refurbished materials. If it is necessary to replace the product, it may be replaced with a refurbished product of the same design and color. If it should become necessary to repair or replace a defective or malfunctioning product under this warranty, the provisions of this warranty shall apply to the repaired or replaced product until the expiration of ninety (90) days from the date of pick up, or the date of shipment to you, of the repaired or replacement product, or until the end of the original Warranty Period, whichever is later. Proof of the original purchase date is to be provided with all products returned for warranty repairs.

Exclusions

Aastra does not warrant its products to be compatible with the equipment of any particular telephone company. This warranty does not extend to damage to products resulting from improper installation or operation, alteration, accident, neglect, abuse, misuse, fire or natural causes such as storms or floods, after the product is in your possession. Aastra will not accept liability for any damages and/or long distance charges, which result from unauthorized and/or unlawful use.

Aastra shall not be liable for any incidental or consequential damages, including, but not limited to, loss, damage or expense directly or indirectly arising from the customer's use of or inability to use this product, either separately or in combination with other equipment. This paragraph, however, shall not apply to consequential damages for injury to the person in the case of products used or bought for use primarily for personal, family or household purposes.

This warranty sets forth the entire liability and obligations of Aastra with respect to breach of warranty, and the warranties set forth or limited herein are the sole warranties and are in lieu of all other warranties, expressed or implied, including warranties or fitness for particular purpose and merchantability.

Warranty Repair Services

Should the product fail during the Warranty Period;

- **In North America**, please call 1-800-574-1611 for further information.
- **Outside North America**, contact your sales representative for return instructions.

You will be responsible for shipping charges, if any. When you return this product for warranty service, you must present proof of purchase.

After Warranty Service

Aastra offers ongoing repair and support for this product. This service provides repair or replacement of your Aastra product, at Aastra's option, for a fixed charge. You are responsible for all shipping charges. For further information and shipping instructions:

- **In North America**, contact our service information number: 1-800-574-1611.
- **Outside North America**, contact your sales representative.

Note:

Repairs to this product may be made only by the manufacturer and its authorized agents, or by others who are legally authorized. This restriction applies during and after the Warranty Period. Unauthorized repair will void the warranty.

Limited Warranty (Australia Only)

The benefits under the Aastra Limited Warranty below are in addition to other rights and remedies to which you may be entitled under a law in relation to the products.

In addition to all rights and remedies to which you may be entitled under the *Competition and Consumer Act 2010* (Commonwealth) and any other relevant legislation, Aastra warrants this product against defects and malfunctions in accordance with Aastra's authorized, written functional specification relating to such products during a one (1) year period from the date of original purchase ("Warranty Period"). If there is a defect or malfunction, Aastra shall, at its option, and as the exclusive remedy under this limited warranty, either repair or replace the product at no charge, if returned within the Warranty Period.

Repair Notice

To the extent that the product contains user-generated data, you should be aware that repair of the goods may result in loss of the data. Goods presented for repair may be replaced by refurbished goods of the same type rather than being repaired. Refurbished parts may be used to repair the goods. If it is necessary to replace the product under this limited warranty, it may be replaced with a refurbished product of the same design and color.

If it should become necessary to repair or replace a defective or malfunctioning product under this warranty, the provisions of this warranty shall apply to the repaired or replaced product until the expiration of ninety (90) days from the date of pick up, or the date of shipment to you, of the repaired or replacement product, or until the end of the original Warranty Period, whichever is later. Proof of the original purchase date is to be provided with all products returned for warranty repairs.

Exclusions

Aastra does not warrant its products to be compatible with the equipment of any particular telephone company. This warranty does not extend to damage to products resulting from improper installation or operation, alteration, accident, neglect, abuse, misuse, fire or natural causes such as storms or floods, after the product is in your possession. Aastra will not accept liability for any damages and/or long distance charges, which result from unauthorized and/or unlawful use.

To the extent permitted by law, Aastra shall not be liable for any incidental damages, including, but not limited to, loss, damage or expense directly or indirectly arising from your use of or inability to use this product, either separately or in combination with other equipment. This paragraph, however, is not intended to have the effect of excluding, restricting or modifying the application of all or any of the provisions of Part 5-4 of Schedule 2 to the Competition and Consumer Act 2010 (**the ACL**), the exercise of a right conferred by such a provision or any liability of Aastra in relation to a failure to comply with a guarantee that applies under Division 1 of Part 3-2 of the ACL to a supply of goods or services.

This express warranty sets forth the entire liability and obligations of Aastra with respect to breach of this express warranty and is in lieu of all other express or implied warranties other than those conferred by a law whose application cannot be excluded, restricted or modified. Our goods come with guarantees that cannot be excluded under the Australian Consumer Law. You are entitled to a replacement or refund for a major failure and for compensation for any other reasonably foreseeable loss or damage. You are also entitled to have the goods repaired or replaced if the goods fail to be of acceptable quality and the failure does not amount to a major failure.

Warranty Repair Services

Procedure: Should the product fail during the Warranty Period and you wish to make a claim under this express warranty, please contact the Aastra authorized reseller who sold you this product (details as per the invoice) and present proof of purchase. You will be responsible for shipping charges, if any.

Manufacturer: Aastra Telecom Australia Pty Ltd
745 Springvale Road
Mulgrave VIC 3170
ABN 16 140 787 195
Phone: +61 3 8562 2700

Limitation of Liability for Products not of a kind ordinarily acquired for personal, domestic or household use or consumption (e.g. goods/services ordinarily supplied for business-use)

- 1.1** To the extent permitted by law and subject to clause 1.2 below, the liability of Aastra to you for any non-compliance with a statutory guarantee or loss or damage arising out of or in connection with the supply of goods or services (whether for tort (including negligence), statute, custom, law or on any other basis) is limited to:
- a)** in the case of services:
 - i)** the resupply of the services; or
 - ii)** the payment of the cost of resupply; and
 - b)** in the case of goods:
 - i)** the replacement of the goods or the supply of equivalent goods; or
 - ii)** the repair of the goods; or
 - iii)** the payment of the cost of replacing the goods or of acquiring equivalent goods; or
 - iv)** the payment of the cost of having the goods repaired.
- 1.2** Clause 1.1 is not intended to have the effect of excluding, restricting or modifying:
- a)** the application of all or any of the provisions of Part 5-4 of Schedule 2 to the Competition and Consumer Act 2010 (**the ACL**); or
 - b)** the exercise of a right conferred by such a provision; or
 - c)** any liability of Aastra in relation to a failure to comply with a guarantee that applies under Division 1 of Part 3-2 of the ACL to a supply of goods or services.

After Warranty Service

Aastra offers ongoing repair and support for this product. If you are not otherwise entitled to a remedy for a failure to comply with a guarantee that cannot be excluded under the Australian Consumer Law, this service provides repair or replacement of your Aastra product, at Aastra's option, for a fixed charge. You are responsible for all shipping charges. For further information and shipping instructions contact:

Aastra Telecom Australia Pty Ltd
745 Springvale Road
Mulgrave VIC 3170
ABN 16 140 787 195
Phone: +61 3 8562 2700

Note:

Repairs to this product may be made only by the manufacturer and its authorized agents, or by others who are legally authorized. Unauthorized repair will void this express warranty.

OpenSSL

License Issues

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

OpenSSL License

Wind River Systems - VxWorks software

The VxWorks Run-Time software module is Copyright (c) WindRiver Systems Inc, all rights reserved. It is licensed for use, not sold. All use of this product and the VxWorks Run-Time module is subject to agreement with the following EULA terms

With respect to the Run-Time Module, Wind River and its licensors are third party beneficiaries of the End User License Agreement and that the provisions related to the Run-Time Module are made expressly for the benefit of, and are enforceable by, Wind River and its licensors.

Activities expressly prohibited: (i) copying the Run-Time Module, except for archive purposes consistent with the End User's archive procedures; (ii) transferring the Run-Time Module to a third party apart from the Target Application; (iii) modifying, decompiling, disassembling, reverse engineering or otherwise attempting to derive the Source Code of the Run-Time Module; (iv) exporting the Run-Time Module or underlying technology in contravention of applicable U.S. and foreign export laws and regulations; and (v) using the Run-Time Module other than in connection with operation of the Target Application.

Aastra and Wind River Systems: (i) Retain ownership of all copies of the Run-Time Module; (ii) expressly disclaim all implied warranties, including without limitation the implied warranties of merchantability, fitness for a particular purpose, title and non-infringement; (iii) exclude liability for any special, indirect, punitive, incidental and consequential damages; and (iv) require that any further distribution of the Run-Time Module be subject to the same restrictions set forth herein.

UPnP - Intel

INTEL SOFTWARE LICENSE AGREEMENT (Final, Site License)

IMPORTANT - READ BEFORE COPYING, INSTALLING OR USING.

Do not use or load this software and any associated materials (collectively, the "Software") until you have carefully read the following terms and conditions. By loading or using the Software, you agree to the terms of this Agreement. If you do not wish to so agree, do not install or use the Software.

LICENSE. You may copy the Software onto your organization's computers for your organization's use, and you may make a reasonable number of back-up copies of the Software, subject to these conditions:

1. You may not copy, modify, rent, sell, distribute or transfer any part of the Software except as provided in this Agreement, and you agree to prevent unauthorized copying of the Software.
2. You may not reverse engineer, decompile, or disassemble the Software.
3. You may not sublicense the Software.
4. The Software may include portions offered on terms in addition to those set out here, as set out in a license accompanying those portions.

OWNERSHIP OF SOFTWARE AND COPYRIGHTS. Title to all copies of the Software remains with Intel or its suppliers. The Software is copyrighted and protected by the laws of the United States and other countries, and international treaty provisions. You may not remove any copyright notices from the Software. Intel may make changes to the Software, or to items referenced therein, at any time without notice, but is not obligated to support or update the Software. Except as otherwise expressly provided, Intel grants no express or implied right under Intel patents, copyrights, trademarks, or other intellectual property rights. You may transfer the Software only if the recipient agrees to be fully bound by these terms and if you retain no copies of the Software.

LIMITED MEDIA WARRANTY. If the Software has been delivered by Intel on physical media, Intel warrants the media to be free from material physical defects for a period of ninety days after delivery by Intel. If such a defect is found, return the media to Intel for replacement or alternate delivery of the Software as Intel may select.

EXCLUSION OF OTHER WARRANTIES. EXCEPT AS PROVIDED ABOVE, THE SOFTWARE IS PROVIDED "AS IS" WITHOUT ANY EXPRESS OR IMPLIED WARRANTY OF ANY KIND INCLUDING WARRANTIES OF MERCHANTABILITY, NONINFRINGEMENT, OR FITNESS FOR A PARTICULAR PURPOSE.

Intel does not warrant or assume responsibility for the accuracy or completeness of any information, text, graphics, links or other items contained within the Software.

LIMITATION OF LIABILITY. IN NO EVENT SHALL INTEL OR ITS SUPPLIERS BE LIABLE FOR ANY DAMAGES WHATSOEVER (INCLUDING, WITHOUT LIMITATION, LOST PROFITS, BUSINESS INTERRUPTION, OR LOST INFORMATION) ARISING OUT OF THE USE OF OR INABILITY TO USE THE SOFTWARE, EVEN IF INTEL HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME JURISDICTIONS PROHIBIT EXCLUSION OR LIMITATION OF LIABILITY FOR IMPLIED WARRANTIES OR CONSEQUENTIAL OR INCIDENTAL DAMAGES, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU. YOU MAY ALSO HAVE OTHER LEGAL RIGHTS THAT VARY FROM JURISDICTION TO JURISDICTION. **TERMINATION OF THIS AGREEMENT.**

Intel may terminate this Agreement at any time if you violate its terms. Upon termination, you will immediately destroy the Software or return all copies of the Software to Intel.

APPLICABLE LAWS. Claims arising under this Agreement shall be governed by the laws of California, excluding its principles of conflict of laws and the United Nations Convention on Contracts for the Sale of Goods. You may not export the Software in violation of applicable export laws and regulations. Intel is not obligated under any other agreements unless they are in writing and signed by an authorized representative of Intel.

GOVERNMENT RESTRICTED RIGHTS. The Software is provided with "RESTRICTED RIGHTS."

Use, duplication, or disclosure by the Government is subject to restrictions as set forth in FAR52.227-14 and DFAR252.227-7013 et seq. or its successor. Use of the Software by the Government constitutes acknowledgment of Intel's proprietary rights therein. Contractor or Manufacturer is Intel Corporation, 2200 Mission College Blvd., Santa Clara, CA 95052.
