

Administrator's Guide for
Avaya MultiVantage™ Software

Volumes 1, 2, and 3

Release 1.2
555-233-506
Issue 5
October 2002

Notice

Every effort was made to ensure that the information in this document was complete and accurate at the time of printing. However, information is subject to change.

Preventing Toll Fraud

“Toll fraud” is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company’s behalf). Be aware that there may be a risk of toll fraud associated with your system and that, if toll fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Fraud Intervention

If you suspect that you are being victimized by toll fraud and you need technical assistance or support, in the United States and Canada, call the Technical Service Center’s Toll Fraud Intervention Hotline at 1-800-643-2353.

How to Get Help

For additional support telephone numbers, go to the Avaya Web site: <http://www.avaya.com/support/>

If you are:

- Within the United States, click *Escalation Lists*, which includes escalation phone numbers within the USA.
- Outside the United States, click *Escalation Lists* then click *Global Escalation List*, which includes phone numbers for the regional Centers of Excellence.

Providing Telecommunications Security

Telecommunications security (of voice, data, and/or video communications) is the prevention of any type of intrusion to (that is, either unauthorized or malicious access to or use of) your company’s telecommunications equipment by some party.

Your company’s “telecommunications equipment” includes both this Avaya product and any other voice/data/video equipment that could be accessed via this Avaya product (that is, “networked equipment”).

An “outside party” is anyone who is not a corporate employee, agent, subcontractor, or is not working on your company’s behalf. Whereas, a “malicious party” is anyone (including someone who may be otherwise authorized) who accesses your telecommunications equipment with either malicious or mischievous intent.

Such intrusions may be either to/through synchronous (time-multiplexed and/or circuit-based) or asynchronous (character-, message-, or packet-based) equipment or interfaces for reasons of:

- Utilization (of capabilities special to the accessed equipment)
- Theft (such as, of intellectual property, financial assets, or toll-facility access)
- Eavesdropping (privacy invasions to humans)
- Mischief (troubling, but apparently innocuous, tampering)
- Harm (such as harmful tampering, data loss or alteration, regardless of motive or intent)

Be aware that there may be a risk of unauthorized intrusions associated with your system and/or its networked equipment. Also realize that, if such an intrusion should occur, it could result in a variety of losses to your company (including but not limited to, human/data privacy, intellectual property, material assets, financial resources, labor costs, and/or legal costs).

Responsibility for Your Company’s Telecommunications Security

The final responsibility for securing both this system and its networked equipment rests with you - Avaya’s customer system administrator, your telecommunications peers, and your managers. Base the fulfillment of your responsibility on acquired knowledge and resources from a variety of sources including but not limited to:

- Installation documents
- System administration documents
- Security documents
- Hardware-/software-based security tools
- Shared information between you and your peers
- Telecommunications security experts

To prevent intrusions to your telecommunications equipment, you and your peers should carefully program and configure:

- Your Avaya-provided telecommunications systems and their interfaces
- Your Avaya-provided software applications, as well as their underlying hardware/software platforms and interfaces
- Any other equipment networked to your Avaya products.

Voice Over Internet Protocol (VoIP)

If the equipment supports Voice over Internet Protocol (VoIP) facilities, you may experience certain compromises in performance, reliability and security, even when the equipment performs as warranted. These compromises may become more acute if you fail to follow Avaya’s recommendations for configuration, operation and use of the equipment. YOU ACKNOWLEDGE THAT YOU ARE AWARE OF THESE RISKS AND THAT YOU HAVE DETERMINED THEY ARE ACCEPTABLE FOR YOUR APPLICATION OF THE EQUIPMENT. YOU ALSO ACKNOWLEDGE THAT, UNLESS EXPRESSLY PROVIDED IN ANOTHER AGREEMENT, YOU ARE SOLELY RESPONSIBLE FOR (1) ENSURING THAT YOUR NETWORKS AND SYSTEMS ARE ADEQUATELY SECURED AGAINST UNAUTHORIZED INTRUSION AND (2) BACKING UP YOUR DATA AND FILES.

Standards Compliance

Avaya Inc. is not responsible for any radio or television interference caused by unauthorized modifications of this equipment or the substitution or attachment of connecting cables and equipment other than those specified by Avaya Inc. The correction of interference caused by such unauthorized modifications, substitution or attachment will be the responsibility of the user. Pursuant to Part 15 of the Federal Communications Commission (FCC) Rules, the user is cautioned that changes or modifications not expressly approved by Avaya Inc. could void the user’s authority to operate this equipment.

The equipment described in this manual complies with standards of the following organizations and laws, as applicable:

- Australian Communications Agency (ACA)
- American National Standards Institute (ANSI)
- Canadian Standards Association (CSA)
- Committee for European Electrotechnical Standardization (CENELEC) – European Norms (EN’s)
- Digital Private Network Signaling System (DPNSS)
- European Computer Manufacturers Association (ECMA)
- European Telecommunications Standards Institute (ETSI)
- FCC Rules Parts 15 and 68
- International Electrotechnical Commission (IEC)
- International Special Committee on Radio Interference (CISPR)
- International Telecommunications Union - Telephony (ITU-T)
- ISDN PBX Network Specification (IPNS)
- National ISDN-1
- National ISDN-2
- Underwriters Laboratories (UL)

Product Safety Standards

This product complies with and conforms to the following international Product Safety standards as applicable:

Safety of Information Technology Equipment, IEC 60950, 3rd Edition including all relevant national deviations as listed in Compliance with IEC for Electrical Equipment (IECEE) CB-96A.

Safety of Laser products, equipment classification and requirements:

- IEC 60825-1, 1.1 Edition
- Safety of Information Technology Equipment, CAN/CSA-C22.2 No. 60950-00 / UL 60950, 3rd Edition
- Safety Requirements for Customer Equipment, ACA Technical Standard (TS) 001 - 1997
- One or more of the following Mexican national standards, as applicable: NOM 001 SCFI 1993, NOM SCFI 016 1993, NOM 019 SCFI 1998

Electromagnetic Compatibility (EMC) Standards

This product complies with and conforms to the following international EMC standards and all relevant national deviations:

Limits and Methods of Measurement of Radio Interference of Information Technology Equipment, CISPR 22:1997 and EN55022:1998.

Information Technology Equipment – Immunity Characteristics – Limits and Methods of Measurement, CISPR 24:1997 and EN55024:1998, including:

- Electrostatic Discharge (ESD) IEC 61000-4-2
- Radiated Immunity IEC 61000-4-3
- Electrical Fast Transient IEC 61000-4-4
- Lightning Effects IEC 61000-4-5
- Conducted Immunity IEC 61000-4-6
- Mains Frequency Magnetic Field IEC 61000-4-8
- Voltage Dips and Variations IEC 61000-4-11
- Powerline Harmonics IEC 61000-3-2
- Voltage Fluctuations and Flicker IEC 61000-3-3

Federal Communications Commission Statement

Part 15:

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Part 68: Answer-Supervision Signaling. Allowing this equipment to be operated in a manner that does not provide proper answer-supervision signaling is in violation of Part 68 rules. This equipment returns answer-supervision signals to the public switched network when:

- answered by the called station,
- answered by the attendant, or
- routed to a recorded announcement that can be administered by the customer premises equipment (CPE) user.

This equipment returns answer-supervision signals on all direct inward dialed (DID) calls forwarded back to the public switched telephone network. Permissible exceptions are:

- A call is unanswered.
- A busy tone is received.
- A reorder tone is received.

Avaya attests that this registered equipment is capable of providing users access to interstate providers of operator services through the use of access codes. Modification of this equipment by call aggregators to block access dialing codes is a violation of the Telephone Operator Consumers Act of 1990.

This equipment complies with Part 68 of the FCC Rules. On the rear of this equipment is a label that contains, among other information, the FCC registration number and ringer equivalence number (REN) for this equipment. If requested, this information must be provided to the telephone company.

The REN is used to determine the quantity of devices which may be connected to the telephone line. Excessive RENs on the telephone line may result in devices not ringing in response to an incoming call. In most, but not all areas, the sum of RENs should not exceed 5.0. To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local telephone company.

REN is not required for some types of analog or digital facilities.

Means of Connection

Connection of this equipment to the telephone network is shown in the following table.

Manufacturer's Port Identifier	FIC Code	SOC/REN/A.S. Code	Network Jacks
Off/On premises station	OL13C	9.0F	RJ2GX, RJ21X, RJ11C
DID trunk	02RV2-T	0.0B	RJ2GX, RJ21X
CO trunk	02GS2	0.3A	RJ21X
CO trunk	02LS2	0.3A	RJ21X
Tie trunk	TL31M	9.0F	RJ2GX
Basic Rate Interface	02IS5	6.0F, 6.0Y	RJ49C
1.544 digital interface	04DU9-BN, 1KN, 1SN	6.0F	RJ48C, RJ48M
120A2 channel service unit	04DU9-DN	6.0Y	RJ48C

If the terminal equipment (for example, the MultiVantage™ Solution equipment) causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the telephone company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The telephone company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the telephone company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

If trouble is experienced with this equipment, for repair or warranty information, please contact the Technical Service Center at 1-800-242-2121 or contact your local Avaya representative. If the equipment is causing harm to the telephone network, the telephone company may request that you disconnect the equipment until the problem is resolved.

It is recommended that repairs be performed by Avaya certified technicians.

The equipment cannot be used on public coin phone service provided by the telephone company. Connection to party line service is subject to state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.

This equipment, if it uses a telephone receiver, is hearing aid compatible.

Canadian Department of Communications (DOC) Interference Information

This Class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

This digital apparatus does not exceed Class A limits for radio noise emission set out in the radio interference regulation of the Canadian Department of Communications.

Le Présent Appareil Numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils manucures de la class A prescrites dans le reglement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

This equipment meets the applicable Industry Canada Terminal Equipment Technical Specifications. This is confirmed by the registration number. The abbreviation, IC, before the registration number signifies that registration was performed based on a Declaration of Conformity indicating that Industry Canada technical specifications were met. It does not imply that Industry Canada approved the equipment.

DECLARATIONS OF CONFORMITY

United States FCC Part 68 Supplier's Declaration of Conformity (SDoC)

Avaya Inc. in the United States of America hereby certifies that the equipment described in this document and bearing a TIA TSB-168 label identification number complies with the FCC's Rules and Regulations 47 CFR Part 68, and the Administrative Council on Terminal Attachments (ACTA) adopted technical criteria.

Avaya further asserts that Avaya handset-equipped terminal equipment described in this document complies with Paragraph 68.316 of the FCC Rules and Regulations defining Hearing Aid Compatibility and is deemed compatible with hearing aids.

Copies of SDoCs signed by the Responsible Party in the U. S. can be obtained by contacting your local sales representative and are available on the following Web site:

<http://support.avaya.com/elmodocs2/DoC/SDoC/index.jhtml/>

All MultiVantage™ system products are compliant with FCC Part 68, but many have been registered with the FCC before the SDoC process was available. A list of all Avaya registered products may be found at:

<http://www.part68.org/>

by conducting a search using "Avaya" as manufacturer.

European Union Declarations of Conformity

Avaya Inc. declares that the equipment specified in this document bearing the "CE" (*Conformité Européenne*) mark conforms to the European Union Radio and Telecommunications Terminal Equipment Directive (1999/5/EC), including the Electromagnetic Compatibility Directive (89/336/EEC) and Low Voltage Directive (73/23/EEC). This equipment has been certified to meet CTR3 Basic Rate Interface (BRI) and CTR4 Primary Rate Interface (PRI) and subsets thereof in CTR12 and CTR13, as applicable.

Copies of these Declarations of Conformity (DoCs) signed by the Vice President of MultiVantage™ Solutions research and development, Avaya Inc., can be obtained by contacting your local sales representative and are available on the following Web site:

<http://support.avaya.com/elmodocs2/DoC/IDoC/index.jhtml/>

Japan

This is a Class A product based on the standard of the Voluntary Control Council for Interference by Information Technology Equipment (VCCI). If this equipment is used in a domestic environment, radio disturbance may occur, in which case, the user may be required to take corrective actions.

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

Network Connections

Digital Connections - The equipment described in this document can be connected to the network digital interfaces throughout the European Union.

Analogue Connections - The equipment described in this document can be connected to the network analogue interfaces throughout the following member states:

Belgium	Germany	Luxembourg
Netherlands	Spain	United Kingdom

LASER Product

The equipment described in this document may contain Class 1 LASER Device(s) if single-mode fiber-optic cable is connected to a remote expansion port network (EPN). The LASER devices operate within the following parameters:

- Maximum power output -5 dBm to -8 dBm
- Center Wavelength 1310 nm to 1360 nm
- CLASS 1 LASER PRODUCT IEC 60825-1: 1998

Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure. Contact your Avaya representative for more laser product information.

To order copies of this and other documents:

About this document

Overview

This document describes the October 2002 release of Avaya MultiVantage™ administration, and includes all incremental releases up to and including this release. You may also want to see the *Avaya Multivantage™ running on a DEFINITY® Server Change Description* to see what is new.

This document provides an overall reference for planning, operating, and administering your MultiVantage solution.

This document does not contain information about how to install, maintain, repair, or troubleshoot the switch.

Intended audience

This document is intended for MultiVantage system administrators and managers, users interested in information about specific features, and Avaya personnel responsible for planning, designing, configuring, selling, and supporting the system.

Using this book

Use this document as a guide to completing administrative procedures and as a reference document. If you are interested in information about a particular task, screen, or feature, use the index or table of contents to locate the page number where the information is described.

The book is divided into three volumes that present information on how to perform administrative tasks, how to complete administrative screens, and more detailed information on individual features.

Organization

The first volume of this document provides step-by-step tasks for the administrative procedures that implement MultiVantage features. The second volume explains how to fill out MultiVantage screens and defines the values for the fields on the screens. The third volume explains MultiVantage features and provides additional detail about switch operations.

The following list describes the sections in this book.

“[System basics](#)” tells you how to log in and log off, set permissions for others who use the administration terminal, set daylight savings rules, set the system date and time, post messages, and back up the information you administer.

“[Introduction to the MultiVantage system](#)” provides information on system-wide functions. It explains how to read, use, and make simple changes to your dial plan, and how to assign feature access codes.

“[Managing phones](#)” explains how to add, swap, and remove phones on your system, and how to customize a phone for a switch administrator.

“[Managing phone features](#)” explains how to administer feature buttons for your users’ phones.

“[Managing your attendant consoles](#)” explains attendant console feature buttons, and tells you how to change, move, or add attendant consoles.

“[Managing displays](#)” provides information on the messages that appear on the read-out screen on display phones.

“[Handling incoming calls](#)” shows you how to set up call coverage for incoming calls to be sure that incoming calls are answered when the called party is unavailable.

“[Routing outgoing calls](#)” explains how the switch handles outgoing calls and tells you how to modify call restrictions and your routing plan.

“[Managing multimedia calling](#)” describes the Multimedia Applications Server Interface (MASI), and provides instructions on administration, monitoring, and troubleshooting. This section also provides information on Multimedia Call Handling (MMCH), which enables users to control voice, video, and data transmissions using a telephone and PC.

“[Setting up telecommuting](#)” provides information on switch-wide settings and individual administration for telecommuting.

“[Enhancing system security](#)” provides information on analyzing and setting up basic system security, preventing toll fraud, using logins and permissions and passwords, and dealing with security violations.

“[Managing trunks](#)” contains procedures for working with analog and digital trunks. Specialized trunks such as APLT, tandem, release-link, DMI-BOS and ISDN trunk groups are not covered in this manual.

“[Managing announcements](#)” tells you how to record, save, copy, restore and delete announcements.

“[Managing group communication](#)” shows you how to administer your system so users can page other users or use their phones as intercoms. You can also give specific users permission to monitor other users’ calls or to interrupt active calls with important messages.

“[Managing data calls](#)” describes the system features available to enable data communications.

“[Collecting billing information](#)” provides information on account codes, and on tracking and collecting information about calls.

“[Administering Media Servers](#)” provides information on administering an Avaya G700 Media Gateway and the S8300 Media Server and the S8700 Media Server.

“[Screen reference](#)” provides a brief description and a graphic representation of the screens used for MultiVantage administration. It also lists the valid values for the fields on the screens, and describes when and why to use each value.

“[Command reference](#)” Use the commands in these tables to access each administration screen.

“[Phone reference](#)” describes many of the telephones that you can connect to the MultiVantage Solution. It also describes the unique features and buttons for each phone series to help you administer your user phones.

“[Features and technical reference](#)” is a comprehensive technical reference for feature information.

Task-related information

The information for each task is usually presented under the following headings:

- **Task**
Identifies the administrative procedure and gives a brief explanation of what is accomplished by completing the task.
- **Before you start**
Lists hardware that must be installed or other tasks that must be completed before starting the task.
- **Instructions**
Begins with a short introduction to set up an example, then provides step-by step, numbered instructions on how to complete the administrative task. Screen pictures and background or decision-making information are provided when appropriate.
- **Fixing problems**
This section is not included in all task sections. It provides a brief coverage of possible problems, possible causes, and suggested solutions.
- **More information**
Presents additional technical information that pertains directly to the completion of the current task.
- **Related topics**
Provides cross-references to related tasks or related feature references.

Feature-related information

The information for each feature is usually presented under four headings:

- **Feature title**
Gives the name and a brief overview of the feature. Tells what it does or how it serves the system.
- **Detailed description**
Provides more detailed, technical information about a feature. When appropriate, additional guidelines and examples are provided. In some cases, expanded technical information is provided on one or several aspects of the feature.
- **Interactions**
Lists and briefly discusses other features that may significantly affect a feature.
- **Related topics**
Provides cross-references to related tasks, features, or screens.

New product names

Use [Table 1](#) as a reference for new product names as you read this document.

Table 1. New product names

Previous Product Name	New Product Name
DEFINITY G3csi (or DEFINITY ProLogix)	Avaya MultiVantage™ software on an Avaya DEFINITY® Server CSI (hereafter called DEFINITY CSI)
DEFINITY G3si	Avaya MultiVantage™ software on an Avaya DEFINITY® Server SI (hereafter called DEFINITY SI)
DEFINITY G3r	Avaya MultiVantage™ software on an Avaya DEFINITY® Server R (hereafter called DEFINITY R)
DEFINITY ECS	Avaya DEFINITY Enterprise Communications Server (hereafter called Avaya MultiVantage™ Solutions)
DEFINITY ONE	Avaya™ S8100 Media Server with CMC1 (hereafter called S8100 Media Server with CMC1)
IP 600	Avaya™ S8100 Media Server with Avaya™ G600 Media Gateway (hereafter called S8100 Media Server with G600)
N/A - new product	Avaya™ S8300 Media Server with Avaya™ G700 Media Gateway
N/A - new product	Avaya™ S8700 Media Server for IP Connect Configurations (hereafter called S8700 IP-Connect)
N/A - new product	Avaya™ S8700 Media Server for Multi-Connect Configurations (hereafter called S8700 Multi-Connect)

Conventions used in this document

Become familiar with the following terms and conventions. They help you use this book with your MultiVantage system.

- Commands are printed in bold face as follows: **command**.

We show complete commands in this book, but you can usually type an abbreviated version of the command. For example, **list configuration station** can be typed as **list config sta**.

- Screen displays and names of fields are printed in constant width as follows: `screen display`.

A screen is any form displayed on your computer or terminal monitor.

- Variables are printed in italics as follows: *variable*.
- Keys and buttons are printed as follows: **KEY**.
- To move to a certain field, you can use the **TAB** key, arrows, or the **ENTER** key (the **ENTER** key may appear as the **RETURN** key on your keyboard).
- If you use terminal emulation software, you need to determine what keys correspond to **ENTER**, **RETURN**, **CANCEL**, **HELP**, **NEXT PAGE**, etc.
- In this book we use the terms “telephone” and “voice terminal” to refer to phones.
- We show commands and screens from the newest MultiVantage system and refer to the most current books. Please substitute the appropriate commands for your system and refer to the manuals you have available.
- If you need help constructing a command or completing a field entry, remember to use **HELP**.
 - When you press **HELP** at any point on the command line, the system displays a list of available commands.
 - When you press **HELP** with your cursor in a field on a screen, the system displays a list of valid entries for that field.
- The status line or message line can be found near the bottom of your monitor display. This is where the system displays messages for you. Check the message line to see how the system responds to your input. Write down the message if you need to call our helpline.

- When a procedure requires you to press ENTER to save your changes, the screen you were working on clears and the cursor returns to the command prompt.

The message line shows “command successfully completed” to indicate that the system accepted your changes.

Tip:

Draws attention to information that you may find helpful.

NOTE:

Draws attention to information that you must heed.

CAUTION:

Denotes possible harm to software, possible loss of data, or possible service interruptions.

WARNING:

Denotes possible harm to hardware or equipment.

DANGER:

Denotes possible harm or injury to your body.

SECURITY ALERT:

Indicates when system administration may leave your system open to toll fraud.

All trademarks identified by ® or ™ are registered trademarks or trademarks, respectively, of Avaya Inc. All other trademarks are the property of their respective owners.

How to get this book on the web

If you have internet access, you can view and download the latest version of the *Administrator's Guide for Avaya MultiVantage™ Software*. To view the book, you must have a copy of Acrobat Reader.

To access the latest version:

1. Access the Avaya web site at <http://avaya.com>
2. Click **Support**.
3. Click **Online Services**.
4. Click **Documentation**.
5. Click **Recent Documents**.
6. Scroll down to find the latest release of MultiVantage documents.
7. Search for **555-233-506** (the document number) to view the latest version of the book.

How to get help

If you need additional help, the following resources are available. You may need to purchase an extended service agreement to use some of these resources. See your Avaya representative for more information.

- **DEFINITY Helpline** (for help with feature administration and system applications) +1-800-225-7585
- **Avaya National Customer Care Center Support Line** (for help with maintenance and repair) +1-800-242-2121
- **Avaya Toll Fraud Intervention** +1-800-643-2353
- **Avaya Corporate Security** +1-800-822-9009
+1-925-224-3401
- **International Technical Assistance Center (ITAC)** 1-905-943-8801
- **Avaya Centers of Excellence**
 - North America 1-800-248-1111
 - CALA Hotline (for Caribbean and Latin America) - for vendor calls only 720-444-9998

This section provides the basic step-by-step procedures you need to manage your Avaya MultiVantage solution. It explains how to log in and log off, set permissions for others who use the administration terminal, set daylight savings rules, set date and time, post messages, and back up the information you administer.

Logging into the system

You must log in before you can administer your system. If you are performing remote administration, you must establish a remote administration link and possibly assign the remote administration extension to a hunt group before you log in. The members of this hunt group are the extensions of the data modules available to connect to the system administration terminal. For information about setting up remote administration, contact your Avaya representative.

⇒ NOTE:

Change your password frequently, at least once a month, to help keep hackers out of your system. For instructions on how to change your password, see [“Changing passwords” on page 399](#).

When not using the system, log off for security purposes.

Instructions

Logging into the system

This procedure provides instructions for logging in from the system terminal not a remote terminal.

To log into the system:

1. Enter your login name and press RETURN.
2. Enter your password and press RETURN.

For security, your password does not display as you type it.

3. Enter the kind of terminal you have or the type your system emulates and press RETURN.

The Command prompt displays.

NOTE:

If you enter the wrong terminal type, it can lock up your system. If the system is not responding to keyboard commands, type **newterm** and press RETURN. Enter the correct terminal type on the new screen and press RETURN. If this does not work, turn the power off only on the terminal and then turn it back on. The terminal reboots and you can log in again.

Logging in for remote administration

To log in for remote administration:

1. Dial the Uniform Call Distribution (“UCD”) group extension number.

NOTE:

The UCD group extension number is assigned when you set up remote administration.

- If you are off-premises, use the Direct Inward Dialing (“DID”) number, a Listed Directory Number (LDN) (you must use a phone), or the trunk number dedicated to remote administration.

- If you are on-premises, use an extension number.
If you dialed a DID number, dedicated trunk number, or extension, you receive data tone or visually receive answer confirmation.

If an LDN was dialed, the attendant will answer.

- a. Ask to be transferred to the UCD group extension number.
You receive data tone or visually receive answer confirmation.
- b. Transfer the voice call to your data terminal.

The Login prompt displays.

2. Complete the steps for [“Logging into the system”](#) on page 31.

For information about setting up remote administration, contact your Avaya representative.

Failed log-ins

You can administer your system for a maximum number of failed login attempts. For instance, if you set the maximum limit to 4 and there are 4 login failures in 10 minutes or less, the login will be locked out for 5 minutes. An account lockout event is logged to the security log.

Accessing the S8700 Media Server

To administer the S8700 Media Server, you must be able to access it. Personal computers and services laptop computers equipped with a network PCMCIA card, Avaya Site Administration ([“ASA”](#)), and a Web browser are the primary support access for system initialization, aftermarket additions, and continuing maintenance.

You can access the S8700 Media Server in one of three ways:

- directly
- remotely over the customer’s local area network ([“LAN”](#))
- over a modem

A direct connection and over the customer’s LAN are the preferred methods. Remote access over a modem is for Avaya maintenance access only.

Accessing the S8700 Media Server Directly

You can access the S8700 Media Server directly by plugging a computer into the services port which defaults to port 2 (Eth1) on the back of the media server. You must use a crossover cable with an RJ45 connector on each end. Plug the other end into the network connector (NIC card) on the your computer. You may need a NIC card adapter.

Once connected, you can administer the media server using three tools:

- Media server web interface for server-specific administration.
- ASA for Avaya MultiVantage software features
- A command line interface in a Telnet window for Avaya MultiVantage software features.

Media Server Web Interface

You can access the media server web interface either by connecting directly to the services port on the media server or connecting over the customer's network.

Connected to the services port

To use the media server web interface:

1. Open either the Netscape or MS Internet Explorer browser.
2. In the Location/Address field, type **192.11.13.6** and press ENTER.
3. When prompted, log in to administer the S8700 Media Server and the Avaya MultiVantageTM software features.

Connected to the customer network

To use the media server web interface:

1. Open either the Netscape or MS Internet Explorer browser.
2. In the Location/Address field, type the active server name or IP address and press ENTER.
3. When prompted, log in to administer the S8700 Media Server and the Avaya MultiVantageTM software features.

You may also connect directly to an individual server using its name or IP address.

Avaya Site Administration

To use ASA:

1. You must have a PC or laptop with Avaya™ Site Administration on it.
2. You must be connected over a LAN to either:
 - a dedicated LAN port for service technicians, or
 - a customer LAN port

Instructions

1. Start up ASA by double-clicking the ASA icon.
2. In the Target System field, use the pull-down menu to select the desired system.

If you have not set up the desired switch, click the **NEW SWITCH** icon (on the left of the toolbar row). Complete the Add Switch wizard to build the system record. When completed, the switch record will be available in the Target System pull-down list.

3. Click Start GEDI.

You now are connected to the desired system.

Accessing the S8700 Media Server Remotely over the network

You can access the S8700 Media Server from any computer connected through the LAN. To access either server, use the IP address assigned to the server you want to access. You can also use the **active server** address to connect automatically to the server that is active. Once connected, you can administer the media server using three tools:

- Media server web interface for server-specific administration and call processing features
- Avaya Site Administration for the MultiVantage software (Only available on the active server)
- A command line interface via a Telnet window for Linux shell commands

Installing Avaya Site Administration

If you do not have ASA on your computer, make sure your PC or laptop first meets the minimum requirements.

Table 2. Minimum requirements to run ASA

Operating systems	Processor/RAM
MS Windows 95	486SL/66/16 MB
MS Windows 98	Pentium/32 MB
MS Windows NT 4.0	Pentium/64 MB
MS Windows 2000	Pentium-class 300 MHz/64 MB
Graphics adapter	SVGA with minimum screen resolution of 800 x 600
Floppy disk drive	3-1/2 in. 1.44-MB floppy disk drive
CD-ROM	CD-ROM drive (required to install ASA from CD)
Available hard disk space	A minimum of 100-MB free hard disk space is required. The requirement for disk space depends on the size and number of configuration data sets.
Printer port	Standard PC or network printer port is required for connecting to a printer to produce station button labels.
Network adapter	Required for network access to the S8700 Media Server, AUDIX, and other network-connected systems.
Free serial ports	<p>One free serial port capable of 9600-bps operation is required for a connection to each serial device (UPS).</p> <p>Avaya recommends that PCs have at least a 16550A UART or 16550A UART simulator (capable of 56 kbps DTE-speed connections). USB and internal modems should emulate this hardware.</p> <p>A second serial port is required for simultaneous connection to AUDIX through a serial connection.</p>

You can install ASA on your computer two different ways: from the Avaya Site Administration CD, or from the S8700 Media Server.

From the ASA CD

Place the ASA CD in the CD-ROM drive and follow the installation instructions in the install wizard.

From the S8700 Media Server

1. Connect to one of the media servers either directly or through the network from the computer you want ASA to be installed on.
2. Access the media server web interface by typing in the Location/Address field **192.11.13.6** (direct connect) or the IP address or the domain name of the media server (over the network).
3. Log in and get to the main menu.
4. Click **DOWNLOAD ASA** to download Avaya Site Administration to your computer.
5. Follow the installation instructions in the install wizard.

To start ASA, click

Start > Programs > Avaya Site Administration.

ASA supports a terminal emulation mode, which is directly equivalent to using SAT commands on a dumb terminal or through a Telnet session. ASA also supports a whole range of other features, including the graphically enhanced MultiVantage interface (GEDI) and Data Import. For more information see the Help, Guided Tour, and Show Me accessed from the ASA Help menu.

Logging in with Access Security Gateway

Access Security Gateway (“**ASG**”) is an authentication interface used to protect the system administration and maintenance ports and logins on Avaya MultiVantage solution. ASG uses a challenge and response protocol to validate the user and reduce unauthorized access.

You can administer ASG authentication on either a port type or login ID. If you set ASG authentication for a specific port, it restricts access to that port for all logins. If you set ASG authentication for a specific login ID, it restricts access to that login, even when the port is not administered to support ASG.

Authentication is successful only when Avaya MultiVantage and ASG communicate with a compatible key. You must maintain consistency between the Access Security Gateway Key and the secret key assigned to the Avaya MultiVantage login. For more information about ASG, see [“Using access security gateway” on page 393](#).

Before you start

Before you can log into the system with ASG authentication, you need an Access Security Gateway Key, and you need to know your personal identification number (“ASG”). The Access Security Gateway Key must be pre-programmed with the same secret key (such as, ASG Key, ASG Passkey, or ASG Mobile) assigned to the Avaya MultiVantage login.

Verify that the Access Security Gateway (ASG) field on the System-Parameters Customer Options screen is set to **y**. If not, contact your Avaya representative.

Instructions

To log into the system with ASG:

1. Enter your login ID and press RETURN.

The system displays the challenge number (for example, 555-1234) and system Product ID number (for example, 1000000000). The Product ID provides Avaya Services with the specific Avaya MultiVantage system identifier.

2. Press ON to turn on your Access Security Gateway Key.
3. Type your PIN and press ON.

The Access Security Gateway Key displays a challenge prompt.

4. At the challenge prompt on the Access Security Gateway Key, type the challenge number without the “-” character (for example, 5551234) from your screen and press ON.

The Access Security Gateway Key displays a response number (for example, 999-1234).

5. At the response prompt on your terminal, type the ASG response number without the “-” character (for example, 9991234) and press RETURN.

The Command prompt displays.

NOTE:

If you make 3 invalid login attempts, the system terminates the session. For more information, see the appropriate maintenance book for your system.

Fixing problems

When logging in failures occur, if you are a super-user, you can use the **list asg-history** command to determine the cause. The ASG history log contains the last 100 or 250 records depending on your system. This log contains the date and time, the port mnemonic, the login ID entered (correct or incorrect), and the status for each session attempt. For specific information about the ASG history log, see *Reports for Avaya MultiVantage™ Software*.

Logging off the system

For security, log off any time you leave your terminal. If you use terminal emulation software to administer the switch, log off the system and exit the emulation application before switching to another software package.

Instructions

To log off:

1. Type **logoff** and press RETURN.

If the Facility Test Call or Remote Access features are administered, Alarm origination is disabled, or if you have busied out resources or active minor or major alarms, a security screen displays. You may want to take appropriate action (for example, disable these features or address any alarms) before you log off.

If none of the above special circumstances exist, the system logs you off.

```
Facility Test Call Administered
Remote Access Administered
Alarm Origination is currently disabled
Active major/minor alarm detected; be sure to resolve it

Proceed with Logoff? [n]
```

2. At the `Proceed with Logoff` prompt, type **y** to log off.

If you log off with alarm origination disabled and the system generates an alarm, Avaya support services will not receive any notification of the alarm. For more information about alarms, see the maintenance book for your system.

Setting command permissions

Avaya MultiVantage allows you to modify the permissions associated with a login. The system maintains default permissions for each level of login, but you may want to further restrict the login, or at least make sure the defaults are appropriate for the user. The default values for these fields vary based on the login type.

When set to **y**, the permissions on the Command Permission Categories screen apply for any object that is not restricted. The second and third pages of the Command Permission Categories screen allow you to restrict the user from any access to specified objects. If you want to limit a user's permissions beyond those on page one, enter the objects in this list. For example, if you want a user to be able to add and change stations, but not VDNs, you can enter **y** in the Administer Stations field and the Additional Restrictions field. Then on page 2 or 3, enter **vdn** as a restricted object.

Instructions

In our example, we set the permissions necessary to allow the user to administer daylight savings time rules.

To change command permissions:

1. Type **change permissions sup3ru** and press RETURN.

The [Command Permission Categories](#) screen displays.

```

                                COMMAND PERMISSION CATEGORIES
                                Login Name: sup3ru

COMMON COMMANDS
    Display Admin. and Maint. Data? y
    System Measurements? y

ADMINISTRATION COMMANDS
    Administer Stations? y           Administer Features? y
    Administer Trunks? y           Administer Permissions? y
    Additional Restrictions? n

MAINTENANCE COMMANDS
    Maintain Stations? n           Maintain Switch Circuit Packs? n
    Maintain Trunks? n           Maintain Process Circuit Packs? n
    Maintain Systems? n           Maintain Enhanced DS1? n
  
```

2. Type **y** in the Display Admin and Maint Data field.
3. Type **y** in the Administer Features field.
4. Press ENTER to save your work.

More information

There are 2 types of users — superuser and non-superuser.

- A superuser provides access to the add, change, display, list, and remove commands for all customer logins and passwords. The superuser can administer any mix of superuser/non-superuser logins. The superuser can administer between 10 and 19 logins depending on your system.

The S8100 Media Server with a CMC1 allows up to 14 simultaneous connections (logins) (MultiVantage can have 5 connections, AUDIX can have 4 connections, and the rest of the connections are reserved for shell commands.)

Logins must be 3 to 6 alphabetic/numeric characters, or a combination of both.

NOTE:

If several users are logging in and out at the same time, a user may see the message: `Transient command conflict detected; please try later`. After the users have completed logging in or out, the terminal is available for use.

- Non-superusers may change their password with permission set by the superuser. However, once a password has been changed, a non-superuser must wait 24 hours before changing the password again.

Establishing daylight savings rules

Avaya MultiVantage allows you to set the daylight savings time rules so that features, such as time-of-day routing and call detail recording (“CDR”), adjust automatically to daylight savings time. The correct date and time ensure that CDR records are correct. You can set daylight savings time rules to transition to and from daylight savings time outside of normal business hours, so the number of affected CDR records is small.

You can set up 15 customized daylight savings time rules. This allows administrators with switches in several different time zones to set up a rule for each. A daylight savings time rule specifies the exact time when you want to transition to and from daylight savings time. It also specifies the increment at which to transition (for example, 1 hour).

Instructions

Establishing daylight savings rules

In our example, we set daylight savings time rules.

To modify a daylight savings rule:

1. Type **change daylight-savings-rules** and press RETURN.

The [Daylight Savings Rules](#) screen displays.

DAYLIGHT SAVINGS RULES						
Rule	Change	Day	Month	Date	Time	Increment
0:	No Daylight Savings					
1:	Start:	first	<u>Sunday</u>	on or after	<u>April</u> 1 at <u>2:00</u>	<u>01:00</u>
	Stop:	first	<u>Sunday</u>	on or after	<u>October 25</u> at <u>2:00</u>	
2:	Start:	first	_____	on or after	_____ at _____	
	Stop:	first	_____	on or after	_____ at _____	
3:	Start:	first	_____	on or after	_____ at _____	
	Stop:	first	_____	on or after	_____ at _____	
4:	Start:	first	_____	on or after	_____ at _____	
	Stop:	first	_____	on or after	_____ at _____	
5:	Start:	first	_____	on or after	_____ at _____	
	Stop:	first	_____	on or after	_____ at _____	
6:	Start:	first	_____	on or after	_____ at _____	
	Stop:	first	_____	on or after	_____ at _____	
7:	Start:	first	_____	on or after	_____ at _____	
	Stop:	first	_____	on or after	_____ at _____	

2. Complete the Start fields for rule 1.

Rule 1 applies to all time zones in the U.S. and begins on the first Sunday on or after 1 April at 2:00 a.m. with a 01:00 increment. Daylight Savings Time stops on the first Sunday on or after 25 October at 2:00 a.m. also with a 01:00 increment (used as a decrement when switching back to Standard time).

The increment is added to standard time at the specified start time and the clock time shifts by that increment (for example, for 01:59:00 to 01:59:59 the clock time shows 01:59 and at 02:00 the clock shows 03:00).

On the stop date, the increment is subtracted from the specified stop time (for example, for 01:59:00 to 01:59:59 the clock time shows 01:59 and at 02:00 the clock shows 01:00).

- a. Type **Sunday** in the Change Day field.
- b. Type **April** in the Month field.
- c. Type **1** in the Date field.
- d. Type **2:00** in the Time field.

- e. Type **1:00** in the Increment field.

This information specifies the day, month, date, and time and increment at which you want the system clock to transition to daylight saving time.

NOTE:

You cannot delete a daylight savings rule if it is in use on either the Locations or Date and Time screens. However, you can change any rule except rule 0 (zero).

3. Complete the Stop fields for rule 1.

- a. Type **Sunday** in the Change Day field.
- b. Type **October** in the Month field.
- c. Type **25** in the Date field.
- d. Type **2:00** in the Time field.

This information specifies the day, month, date, and time you want the system clock to transition back to standard time.

4. Press ENTER to save your changes.

Displaying daylight savings time rules

To display daylight savings time rules:

1. Type **display daylight-savings-rules** and press RETURN.

The Daylight Savings Rule screen displays. Verify the information you entered is correct.

Setting the system date and time

Update the date and time for events such as a leap year, the change to or from daylight savings time, or a system restart after a power failure. The correct date and time assure that CDR records are correct. CDR does not work until the date and time have been entered.

NOTE:

Changing the date and time may modify CDR data by 9 hours and 59 minutes. Therefore, you should change the date and time after normal business hours. After you change the date and time, review the time settings for any adjunct (other than AUDIX) linked to your system that uses the system time.

Before you start

Before you can set the date and time, you need to know whether it is currently daylight savings or standard time and know which daylight savings rule number you want to use. Daylight savings rule numbers are located on the Daylight Savings Rule screen.

Setting the system date and time

In our example, we set the date and time to Tuesday, November 5 at 8:30 p.m. standard time.

To set the system date and time:

1. Type **set time** and press RETURN.

The **Date and Time** screen displays.

```
DATE AND TIME
DATE
Day of the Week: Tuesday      Month: November
Day of the Month: 5           Year: 2002
TIME
Hour: 20   Minute: 30   Second: XX   Type: standard
Daylight Savings Rule: 1
```

2. Complete the Date fields.
 - a. Type **Tuesday** in the Day of the Week field.
 - b. Type **November** in the Month field.
 - c. Type **5** in the Day of the Month field.
 - d. Type **2002** in the Year field.

3. Complete the Time fields.

Use the 24-hour clock to set the hour, so if the current time is 2:00 p.m., you enter **14:00**. You cannot update **Second** — it automatically resets to 0 when you save your changes.

- a. Type **20** in the Hour field.
- b. Type **30** in the Minute field (8:30 p.m.).
- c. Type **standard** in the Type field.
- d. Type **1** in the Daylight Savings Rule field.

4. Press ENTER to save your changes.

**NOTE:**

When you change the date or time, some display phones may not automatically refresh the display. If this occurs, have each user press the date/time button on their phone to update the display.

Displaying the system date and time

To display the system date and time:

1. Type **display time** and press RETURN.

The Date and Time screen displays. Verify the information you entered is correct.

Related topics

See [“Establishing daylight savings rules”](#) for more information about setting system time.

For additional information, see *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

Setting time of day clock synchronization

Time of Day Clock Synchronization enables a switch to synchronize its internal clock to UTC time provided by Internet time servers. Avaya uses the platform (LINUX or Windows) system clock connected to an Internet time server to provide time synchronization. The interface for these systems is web-based for LINUX and Windows, or command line, for Windows only.

LINUX is used in:

- S8700 IP-Connect
- S8700 Multi-Connect
- S8700 Media Server

Windows is used in:

- S8100 Media Server with a CMC1
- S8100 Media Server with G600

For additional information, see *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

The following systems use Avaya™ Site Administration (ASA) for time synchronization.

- DEFINITY R
- DEFINITY CSI
- DEFINITY SI

Before you start

- A standard TCP/IP LAN connection is required to connect to the Internet time servers. If a LAN connection is not available, time sync will be done by setting the platform clock manually through the command line or web interface.
- You can set the following NTP/SNTP configuration information.
- On the target switch, verify if Daylight Savings Time is on.

Instructions

NOTE:

These instructions are for the DEFINITY R, DEFINITY CSI, and DEFINITY SI systems. For additional information, see *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

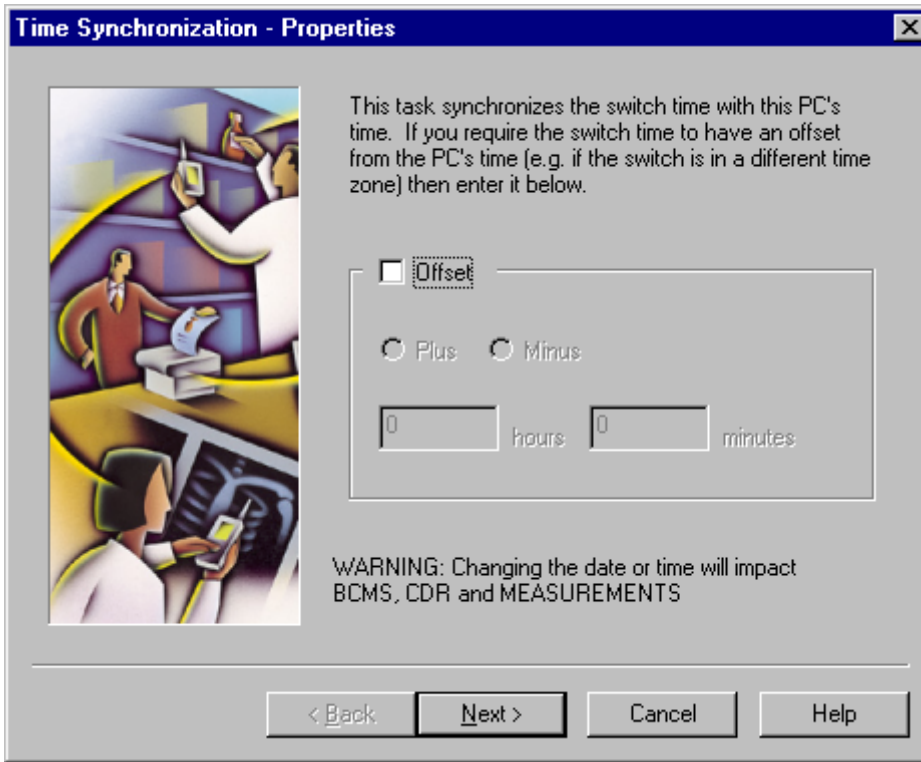

1. Activate the Avaya Site Administration screen.
2. Click the Fault & Performance tab.

The Fault & Performance icons display.

3. Click Time Synchronization.

The Time Synchronization - Properties screen displays.

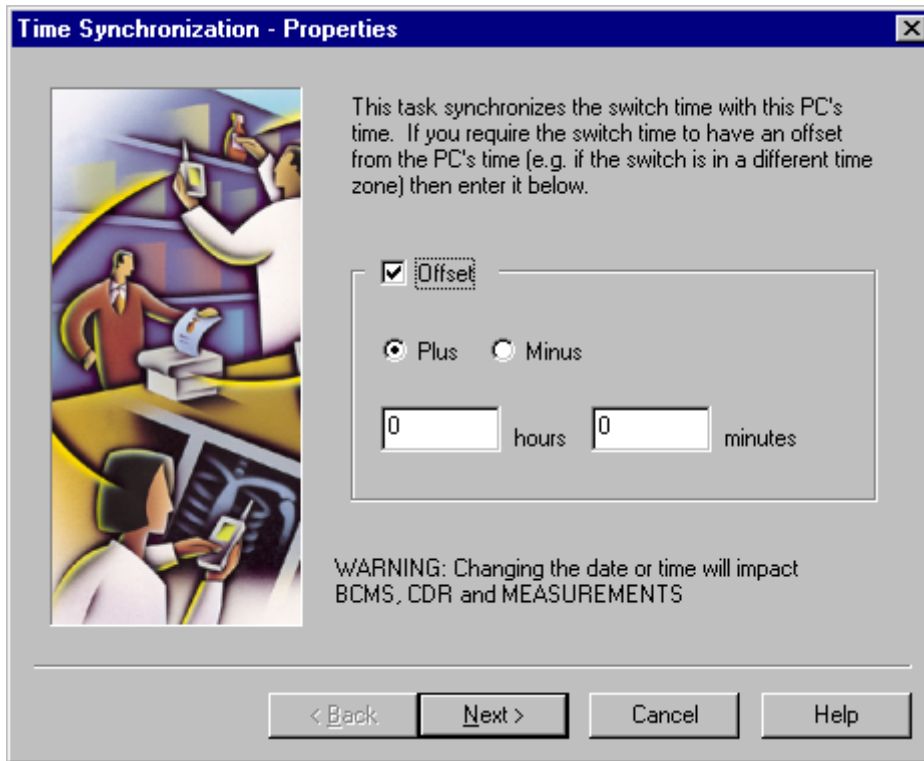

4. Click in the "Offset" box.

The Plus and Minus radio buttons and the Hours and Minutes fields display.

5. Click NEXT.

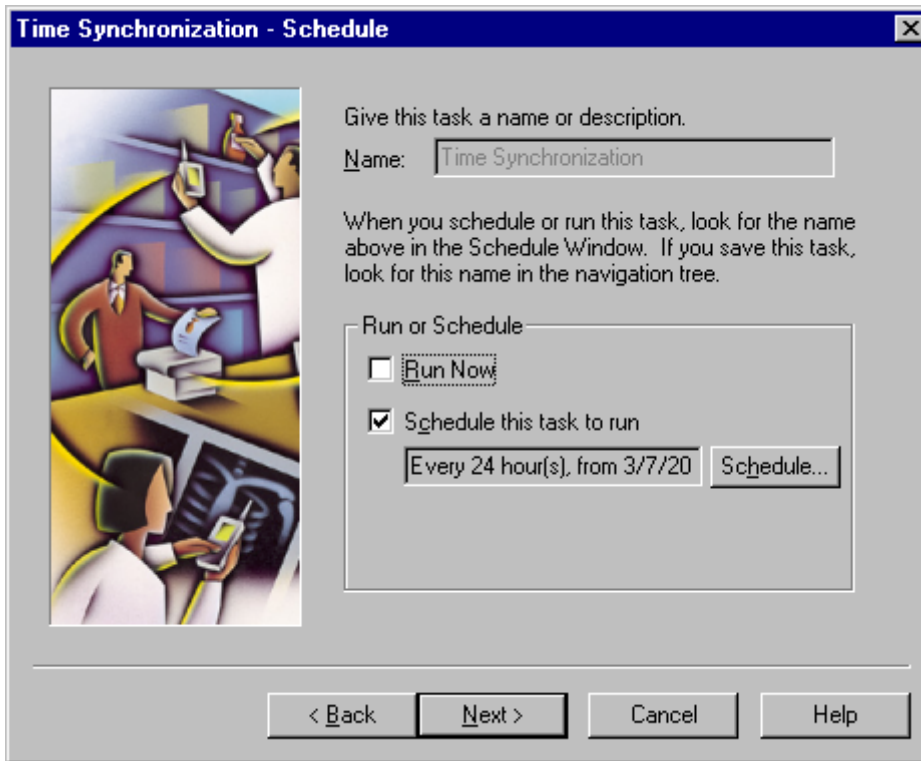

The Time Synchronization - Properties screen displays.

6. Click Plus to add hours to the remote station (located to the west of the system time) or click Minus to subtract hours to the remote station (located to the east of the system time).
7. In the hours field, enter the number of hours to be added or subtracted to synchronize with the remote site.

8. Click NEXT.

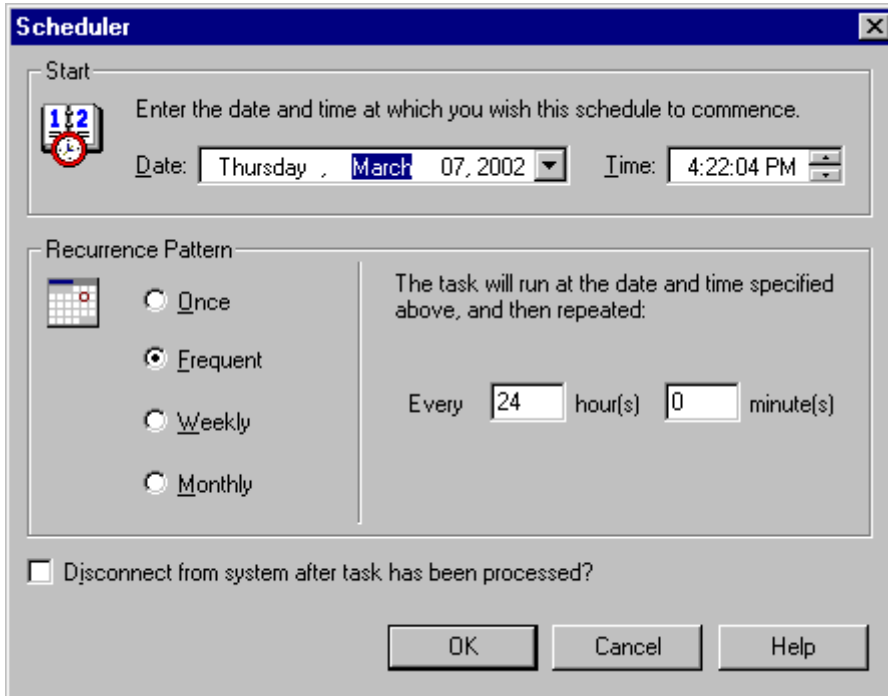

The Time Synchronization - Schedule displays.

9. Select either:

- “Run Now” to run this program immediately and click NEXT.
- “Schedule this task to run” and check the field below to determine if the default setting is satisfactory. If this setting is not satisfactory, click SCHEDULE.

The Scheduler screen displays.

10. In the Date field, highlight each object and use the pull-down menu to select the desired setting.
11. In the Time field, highlight each item of time and use the pull-down menu to select the desired time.
12. In the Recurrent Pattern area, select one radio button for the desired frequency. Notice that each radio button is explained in the area to the immediate right.
13. If there are times to be included, set to the desired frequency.
14. Click OK.

The Time Synchronization - Schedule displays.

15. Click NEXT.

The Time Synchronization - Summary displays.

16. If the time synchronization description is satisfactory, click FINISH.
If the time synchronization is not satisfactory, click BACK and revise the necessary information.

Related topics

See *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*, for more information about using time of day clock synchronization.

Using the bulletin board

Avaya MultiVantage allows you to post information to the bulletin board. You can also display and print messages from other switch administrators and Avaya personnel using the bulletin board. Anyone with the appropriate permissions can use the bulletin board for messages. Only one user can post or change a message at a time.

Whenever you log in, the system alerts you if you have any messages on the bulletin board and the date of the latest message. Also, if Avaya personnel post high-priority messages while you are logged in, you receive notification the next time you enter a command. This notification disappears after you enter another command and reoccurs at login until deleted by Avaya personnel.

You maintain the bulletin board by deleting messages you have already read. You cannot delete high-priority messages. If the bulletin board is at 80% or more capacity, a message appears at login indicating how much of its capacity is currently used (for example, 84%). If the bulletin board reaches maximum capacity, new messages overwrite the oldest messages.

NOTE:

The bulletin board does not lose information during a system reset at level 1 or level 2. If you save translations, the information can be restored if a system reset occurs at levels 3, 4, or 5.

Instructions

Displaying messages

To display the bulletin board:

1. Type **display bulletin-board** and press RETURN.

The [Bulletin Board](#) screen displays.

```
Message (* indicates high-priority)           Date
*Avaya is in the process of                   03/02/98
*investigating your trunk lockup problem.     03/02/98
*The Bulletin Board will be updated as        03/02/98
*we find information.                          03/02/98
*
*
*
*
*
We recently added a new trunk group (14)      03/02/98
and have had many of the members getting      03/02/98
locked up.                                    03/02/98
```

Posting a message

In our example, we post a message to the bulletin board about a problem with a new trunk group, and an Avaya representative replies to our message.

To post a message to the bulletin board:

1. Type **change bulletin-board** and press RETURN.

The Bulletin Board screen displays. There are three pages of message space within the bulletin board. The first page has 19 lines, but you can only enter text on lines 11-19. The first 10 lines on page 1 are for high-priority messages from Avaya personnel and are noted with an asterisk (*). The second and third pages each have 20 lines, and you can enter text on any line. The system automatically enters the date the message was posted or last changed to the right of each message line.

2. Type your message.

You can enter up to 40 characters of text per line. You also can enter one blank line. If you enter more than one blank line, the system consolidates them and displays only one. The system also deletes any blank line if it is line one of any page. You cannot indent text on the bulletin board. The TAB key moves the cursor to the next line.

3. Press ENTER to save your changes.

Deleting messages

To delete a message from the bulletin board:

1. Type **change bulletin-board** and press RETURN.

The **Bulletin Board** screen displays.

2. Enter a space as the first character on each line of the message you want to delete and press RETURN.
3. Press ENTER to save your changes.

Saving translations

 **NOTE:**

An alternate method of saving (backing up) and restoring translations is available for S8100 Media Server with a CMC1. See [“Backup via the Web interface \(S8100 Media Server only\)”](#) on page 58.

Avaya MultiVantage retains all translation data in memory while the system is operating. If the switch goes down, you lose all translation data. You must save in-memory translation data to the memory card (flash ROM), disk, or tape. Saving translation data to memory card or tape is the same as backing up your system.

 **NOTE:**

Save translations on a daily basis. You may want to save translations after business hours to prevent dial tone delays or during slow business hours if your business is open 24 hours.

The save translation command writes two time-stamped identical copies of the translation data to the selected memory card, disk, or tape. The save writes one complete copy first, then writes the second copy in a different area of the device — both with the same time-stamp. Failure during a save, including a system crash, usually affects only one copy. The affected copy is marked “bad” and should not be used for backup.

You can set save translation to be completed automatically as part of regularly scheduled maintenance or manually, as needed. For more information about saving translations automatically, see the maintenance book for your system.

 **Tip:**

*To determine if your system saves translations automatically, type **display system-parameters maintenance** to see if you have scheduled maintenance.*

Translation copy protection assigns a number to a specific phone system and to the flash card or set of flash cards that belong to that system. On an Avaya MultiVantage on a DEFINITY CSI or Avaya MultiVantage on a DEFINITY SI, this number is the same on both the translation storage device (flash card) and the Flash PROM (Programmable Read Only Memory) of the processor circuit pack. In a duplicated system, the Flash PROM of each processor circuit pack has a translation ID and both ID’s are stored on the memory card.

An attempt to initialize (boot) the system with translations that do not contain the same identification number as stored in the processor circuit pack raises a major alarm and disables access to the save translations command for all non-Avaya logins. You also receive a warning message on the copyright screen notifying you of the mismatch. Contact your Avaya representative to correct this mismatch and reset the save translations command. You must correct the mismatch before the end of the specified grace period, otherwise you cannot access system management commands (such as: add, change, remove, and duplicate) that modify translation data. Avaya specifies the grace period during a system installation or following an upgrade.

Before you start

If you are saving translations to a memory card or tape, you must verify the memory card or tape is in place and clear any active alarms from the alarms panel.

If your switch is an Avaya MultiVantage on a DEFINITY CSI or Avaya MultiVantage on a DEFINITY SI, verify the memory card translation ID matches the translation ID of your switch's Flash PROM.

Instructions

In our example, we save translations to the tapes on both processor A and B.

To save translations manually:

1. Type **save translation both tape** and press RETURN.

The save process can take up to 10 minutes. You cannot administer your system while the save is in process. The Save Translation screen displays.

SAVE TRANSLATION		
Processor	Command Completion Status	Error Code
SPE_A	Success	0
SPE_B	Success	0

2. If there is an error message in the Command Completion Status field and an error code in the Error Code field, clear the error and repeat the save process.

More information

When mass storage system (“MSS”) devices on both processors in a duplex system are specified, translation data is saved from the active processor to the active and standby MSS devices at the same time. If the save to one device fails or one device is out of service, the other save continues. You receive the status of each save separately.

⇒ NOTE:

If you have a duplex system and you save translation data to both MSS devices one at a time, translation data inconsistencies between the two devices can occur.

Fixing problems

⇒ NOTE:

You cannot see whether the translation ID on the flash card corresponds to the number on the Processor circuit packs. However, if the numbers do not match, the system issues an error message when you attempt a save translation operation.

When failures occur, the system responds with the following error codes.

Problem	Possible causes	Solution
1	Save translation cannot write to the active drive.	Repeat the save translation process for the active drive.
2	Save translation cannot write to the standby drive.	Repeat the save translation process for the standby drive.

For more information about error messages and how to correct them, see the maintenance book for your system.

Backup via the Web interface (S8100 Media Server only)

The following are web interface procedures:

1. Open internet explorer.
2. Enter **http://<IP address>** in the address area of the web browser.

The DEFINITY ONE Home page displays:

3. Click **Administer System**.

The login screen displays:

Enter your login ID and password.

The login ID must have the correct backup permissions and be a member of the S8100 Media Server Administrator's login group.

The Notice screen displays:

4. Click **Continue**.

The System Administration screen displays:

5. Click **Backup and Restore** to open main backup menu.

Backup and restore main menu (S8100 Media Server only)

- Immediate Backup
- Scheduled Backups
- Restore

- Last scheduled backup results
- Contents of backup location

From the backup and restore main menu, you can:

- Perform immediate backups
- Schedule multiple backups
- Restore backups
- Access last scheduled backup information
- View contents of backup location

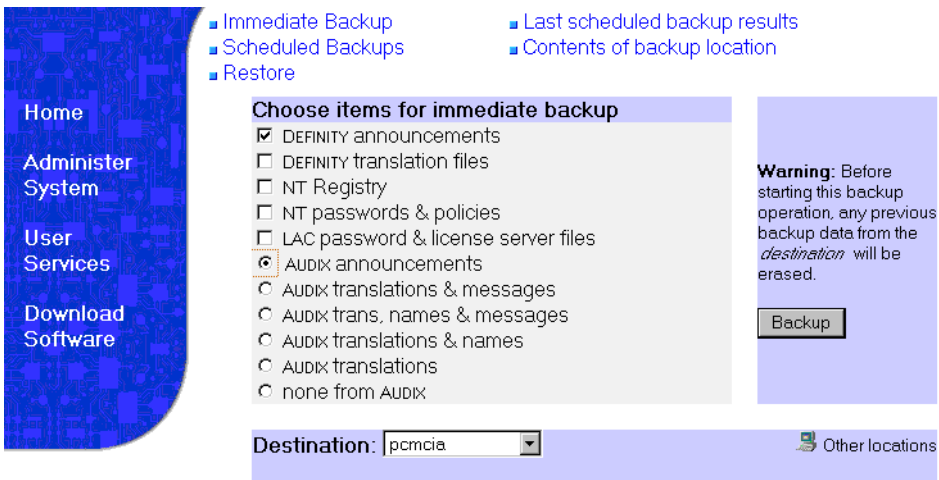

⇒ NOTE:

As you navigate the backup and restore screens, the main menu items remain available. If you are using the Web, use the Back button to return to previous screens.

Perform immediate backup

1. To perform an immediate backup, click **Immediate Backup**.

The following screen displays:

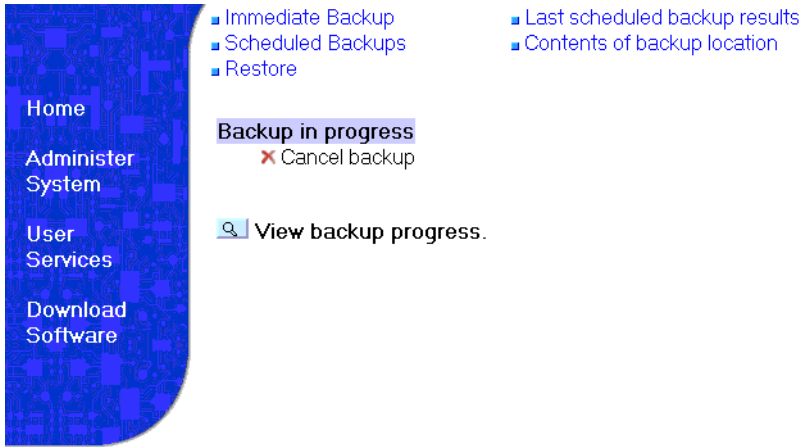

1. From the Destination menu, select a backup destination. This can be a LAN address or a PCMCIA Flash Disk
2. Select items for immediate backup.
3. Click **Backup**.

⇒ NOTE:

When backing up to a LAN address, a shared drive must be installed on a non- Avaya™ S8100 Media Server.

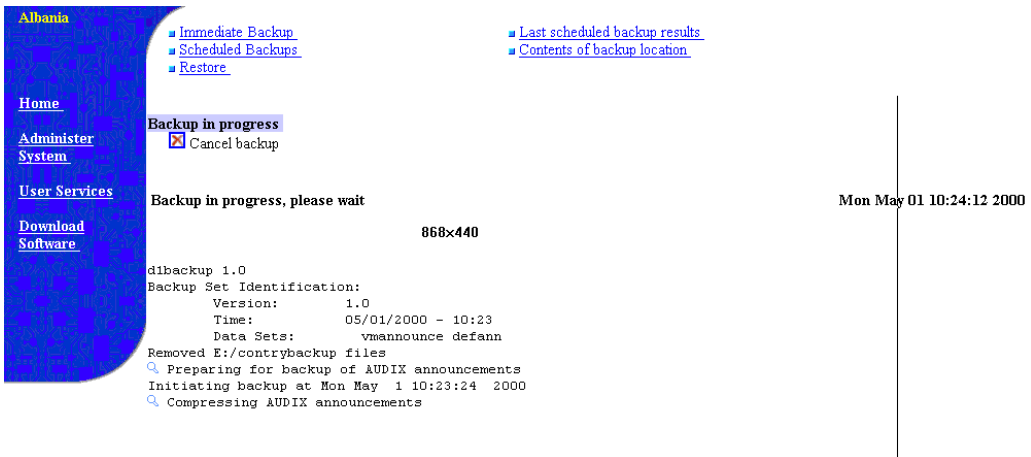

After you click **Backup**, the following screen displays:

Viewing backup progress

1. To view backup progress, click **View Backup Progress**.

The following screen displays:

Backing up to a LAN address

You can back up your data to a LAN address using the Other locations feature. To back up data to a LAN address:

1. Click **Other locations**.

■ Immediate Backup ■ Last scheduled backup results
 ■ Scheduled Backups ■ Contents of backup location
 ■ Restore

Home
 Administer System
 User Services
 Download Software

Choose items for immediate backup

- DEFINITY announcements
- DEFINITY translation files
- NT Registry
- NT passwords & policies
- LAC password & license server files
- AUDIX announcements
- AUDIX translations & messages
- AUDIX trans, names & messages
- AUDIX translations & names
- AUDIX translations
- none from AUDIX

Warning: Before starting this backup operation, any previous backup data from the *destination* will be erased.

 Administer System
 User Services
 Download Software

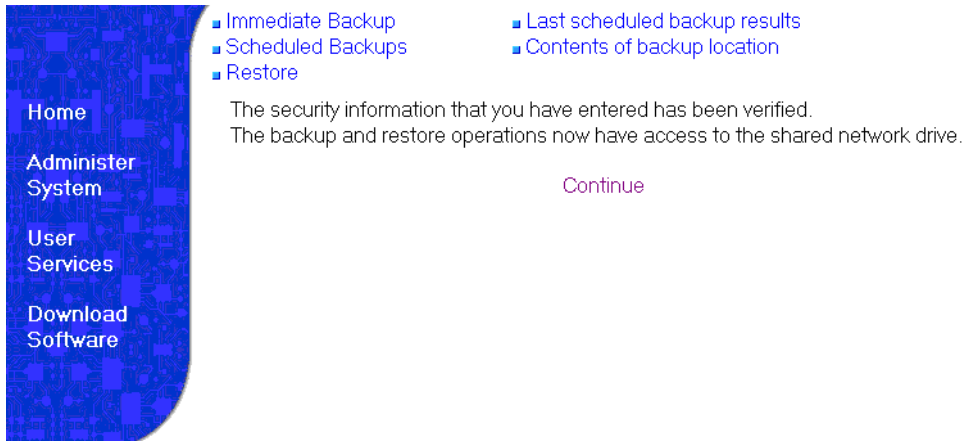

Enter security information to make a new network drive available for Backup and Restore operations.

Populate each field as shown in the *example* column. Do not include any extra characters like backslashes. The *Domain* field may be left empty if the computer does not participate in a domain.

		example
Computer	<input type="text" value="unifat2"/>	nero
Share name	<input type="text" value="backup"/>	bkdir
Domain	<input type="text"/>	drntdomain
User name	<input type="text" value="joe"/>	kfc
Password	<input type="password"/>	

2. Enter LAN location information.
3. Click **Verify**.

The following screen displays:

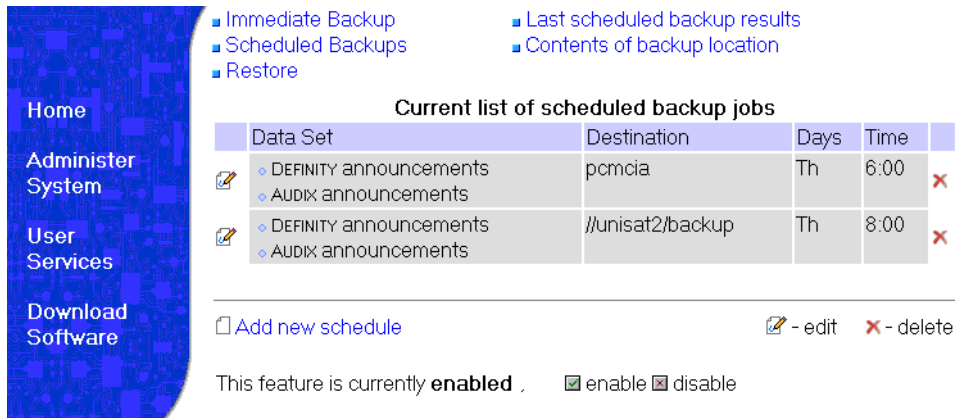

4. Click **Continue** to return to the Immediate backup screen.
5. Select items to back up and select **Backup**.

Viewing scheduled backups

To view scheduled backups:

1. Click **Scheduled Backups**.

The following screen displays:

From this screen, you can add, edit, or delete scheduled backups.

NOTE:

The backup feature can be disabled and later enabled to allow you to perform another function. If disabled, the current schedules remain intact.

Adding a new scheduled backup (multiple backup schedules)

To add a new scheduled backup to the list:

1. On the Current list of scheduled backup jobs screen, click **Add new schedule**.

The following screen displays:

■ Immediate Backup ■ Last scheduled backup results
■ Scheduled Backups ■ Contents of backup location
■ Restore

Home
Administer System
User Services
Download Software

Adding a new backup schedule

The Current list of scheduled backups displays. The changes are activated.

Checking Scheduled Backup Status

1. To review previous backups, click **Last scheduled backup results**.

The following screen displays:

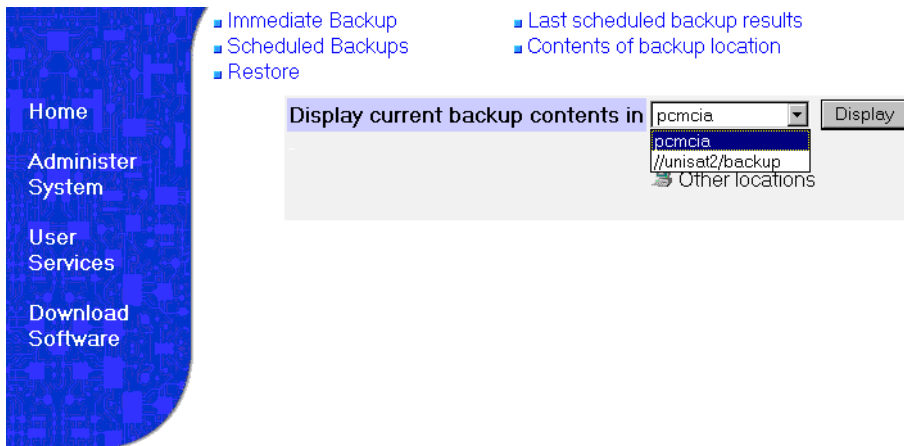

The screenshot shows a web interface with a blue sidebar on the left containing navigation links: Albania, Home, Administer System, User Services, Download Software. The main content area has a top navigation bar with links: Immediate Backup, Scheduled Backups, Restore, Last scheduled backup results, and Contents of backup location. Below this is a section titled "Results of last scheduled backup" containing a table.

Items backed up	File Size	Destination	Time started	Time finished
DEFINITY translation files	98185	E:/contrybackup	05/02/2000 01:00	
AUDIX translations & names	30837			
NT Registry	916501			05/02/2000 01:01

Checking the contents of a backup

1. To view contents click **Contents of backup location**.

The following screen displays:

The screenshot shows the same web interface as above, but with the "Contents of backup location" link selected. A dialog box is displayed with the text "Display current backup contents in" followed by a dropdown menu. The dropdown menu is open, showing options: pcmcia, //unisat2/backup, and Other locations. A "Display" button is to the right of the dropdown.

2. Scroll to the location of backup contents and click **Display** or click **Other locations**.

The following screen displays:

The screenshot shows a web interface for 'Albania'. On the left is a blue sidebar with navigation links: Home, Administer System, User Services, and Download Software. The main content area has several links: Immediate Backup, Scheduled Backups, Restore, Last scheduled backup results, and Contents of backup location. Below these links is a table titled 'Current Contents of Backup in pcmcia'.

Name	Size	Created
AUDX announcements	7594216	Mon May 01 10:23:25 2000
DEFINITY announcements	167	Mon May 01 10:24:45 2000

Perform restore

1. Click **Restore**.

The following screen displays:

The screenshot shows the 'Restore' screen in the Albania system. The left sidebar is the same as in the previous screenshot. The main content area has the same navigation links. Below them is a section titled 'Choose items to restore' with a list of items and checkboxes. A 'Warning' box on the right states that DEFINITY ONE applications will be stopped. At the bottom, there is a 'Source' pull-down menu set to 'pcmcia' and a link for 'Other locations'.

Choose items to restore

- DEFINITY announcements
- DEFINITY translation files
- NT Registry
- NT SAM database
- LAC password & license server files
- AUDX announcements
- AUDX translations & messages
- AUDX trans, names & messages
- AUDX translations & names
- AUDX translations
- none from AUDX

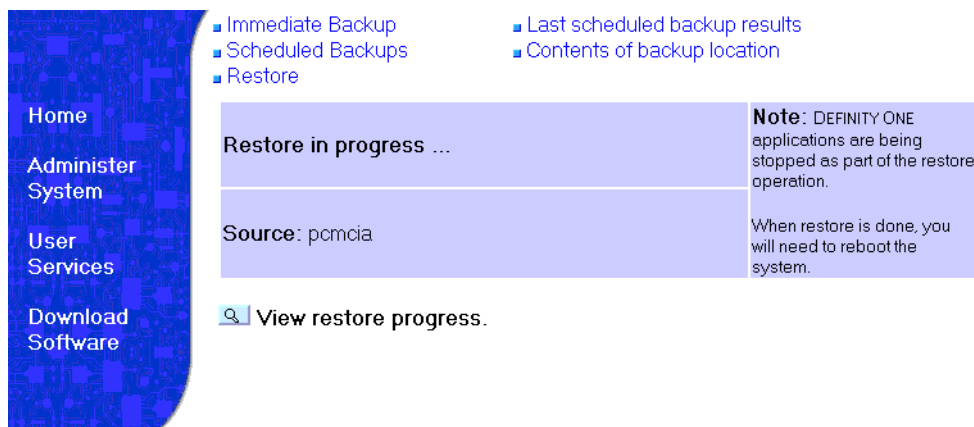

Warning:
DEFINITY ONE applications will be stopped as part of the restore operation.

Source:

2. Select the restore source from the Source pull down menu. The source is the media and/or location of the backup data. It could be a network or shared drive location, or the pcmcia flash card.
3. Select items to restore.

4. Click **Restore**.

The following screen displays:

5. After the restore is completed, reboot the system.

NOTE:

A reboot is required. The restored stations will not be used if the S8100 Media Server is not rebooted.

This section provides you with general information about Avaya MultiVantage and some of the system-wide functions. It explains how to understand your configuration, read and use your dial plan, and shows you how to make simple changes such as adding extension ranges. This section also explains how to assign feature access codes (“FAC”).

Understanding your configuration

At a very basic level, the Avaya MultiVantage consists of hardware to perform call processing, and the software to make it run. You use the administration interface to let the system know what hardware you have, where it is located, and what you want the software to do with it.

You can find out which circuit packs are in the system and which ports are available by entering the command **list configuration all**. There are variations on this command that display different types of configuration information. Use the help function to experiment, and see which command works for you.

1. To view a list of port boards on your system, type **list configuration port-network** and press RETURN.

The System Configuration screen appears.

Board Number	Board Type Code	Vintage	Assigned Ports								
			u=unassigned	t=tti	p=psa						
01A05	DIGITAL LINE	TN754B	000002	01	u	03	u	05	u	07	08
01A06	ANALOG LINE	TN742	000010	01	02	03	04	u	u	u	u
01B05	ANALOG LINE	TN746B	000008	u	u	u	u	u	u	u	u
01C04	ANALOG LINE	TN746B	000008	u	u	u	u	u	u	u	u
01C05	DIGITAL LINE	TN2224	000004	01	u	u	04	u	u	07	08
01C06	HYBRID LINE	TN762B	000004	u	u	u	u	u	u	u	u
01C10	DIGITAL LINE	TN754	000004	01	02	u	u	u	u	u	u
				u	u	u	u	u	u	u	u

The System Configuration screen shows all the boards on your system that are available for connecting phones, trunks, data modules and other equipment. You can see the board number, board type, circuit-pack type, and status of each board's ports. The **u** entries on this screen indicate unused ports that are available for you to administer. These may also appear as **p** or **t**, depending on settings in your system.

You will find many places in the administration interface where you are asked to enter a port or slot. The port or slot is actually an address that describes the physical location of the equipment you are using.

A port address is made up of four parts:

- cabinet — the main housing for all the switch equipment. Cabinets are numbered starting with 01.
- carrier — the rack within the cabinet that holds a row of circuit packs. Each carrier within a cabinet has a letter, A–E.
- slot — the space in the carrier that holds an individual circuit pack. Slots are numbered 01-16.
- port — the wire that is connected to an individual piece of equipment (such as a phone or data module). The number of ports on a circuit pack varies depending on the type.

So, if you have a single-carrier cabinet, the circuit pack in slot 06 would have the address 01A06. If you want to attach a phone to the 3rd port on this board, the port address is 01A0603 (01=cabinet, A=carrier, 06=slot, 03=port).

Understanding the dial plan

Your dial plan tells your system how to interpret dialed digits. For example, if you dial 9 on your system to access an outside line, it is actually the dial plan that tells the system to find an external trunk when a dialed string begins with a 9.

The dial plan also tells the system how many digits to expect for certain calls. For example, the dial plan may indicate that all internal extensions are 4-digit numbers that start with 1 or 2.

Let us take a look at an example dial plan so you'll know how to read your system's dial plan. The following figure shows an example of a simple dial plan.

change dialplan analysis

Page 1 of 1

DIAL PLAN ANALYSIS TABLE

Percent Full: 9

Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type
<u>0</u>	<u>1</u>	<u>attd</u>	—	—	—
<u>1</u>	<u>3</u>	<u>dac</u>	—	—	—
<u>3</u>	<u>5</u>	<u>ext</u>	—	—	—
<u>4</u>	<u>6</u>	<u>ext</u>	—	—	—
<u>5</u>	<u>7</u>	<u>ext</u>	—	—	—
<u>*</u>	<u>3</u>	<u>fac</u>	—	—	—
<u>#</u>	<u>3</u>	<u>fac</u>	—	—	—

The Dial Plan Analysis Table defines the dialing plan for your system.

The Call Type column in the Dial Plan Analysis Table indicates what the system does when a user dials the digit or digits indicated in the Dialed String column. The Total Length column indicates how long the dialed string will be for each type of call. For example, this dial plan shows that when users dial a 5-digit number that starts with 3, they are dialing an extension.

The Dial Plan Analysis Table in our example contains the following call types:

- Attendant (attd) — Defines how users call an attendant. Attendant access numbers can be any number from 0 to 9 and contain 1 or 2 digits.

In our example figure, the system calls an attendant when users dial 0.

- Dial access code (dac) — Allows you to use trunk access codes (“TAC”) and feature access codes (FAC) in the same range. For example, you could define the group 100–199, which would allow both FAC and TAC in that range. Dial access codes can start with any number from 1 to 9, * and #, and contain up to 4 digits.

In our example figure, dial access codes begin with 1 and must be 3 digits long.

NOTE:

The Dial Plan Analysis Table does not allow you to enter a range specifically for trunk access codes. However, the Trunk Group screen still allows you to assign a TAC to a trunk group. The TAC you enter on the Trunk Group screen must match the format you have administered for a DAC on the Dial Plan Analysis Table.

- Extensions (ext) — Defines extension ranges that can be used on your system. In our figure, extensions must be in the ranges 30000–39999, 40000–49999 and 50000–59999.
- Feature access codes (fac) only — FAC can be any number from 1 to 9 and contain up to 4 digits. You can use * or #, but only as a first digit. In our example, feature access codes can begin with * or # and are 3-digits long.

The Dial Plan Analysis Table works with the Dial Plan Parameters Table for fully defining your dial plan. The Dial Plan Parameters Table allows you to set system-wide parameters for your dial plan.

Displaying your dial plan

You might want to take this opportunity to look at and interpret your own dial plan. To display your system’s dial plan:

1. Type **display dialplan analysis** and press RETURN.

Modifying your dial plan

It is easy to make changes to your dial plan. For example, we will add a new range of dial access codes to the dial plan. We want to be able to assign both FAC and TAC in the 700–799 range.

1. Type **change dialplan analysis** and press RETURN.
The Dial Plan Analysis appears.
2. Move the cursor to an empty row.
3. Type **7** in the Dialed String column. Press TAB to move to the next field.
4. Type **3** in the Total Length Column. Press TAB to move to the next field.

5. Type **dac** in the Call Type Column.
6. Press ENTER to save your changes.

Adding extension ranges

You may find that as your needs grow you want a new set of extensions. Before you can assign a station to an extension, the extension must belong to a range that is defined in the dial plan. We will add a new set of extensions that start with 3 and are 4 digits long (3000–3999).

To add this set of extensions to the dial plan:

1. Type **change dialplan analysis** and press RETURN.
The “[Dial Plan Analysis Table](#)” on page 748 appears.
2. Move the cursor to an empty row.
3. Type **3** in the Dialed String column. Press TAB to move to the next field.
4. Type **4** in the Total Length Column. Press TAB to move to the next field.
5. Type **ext** in the Call Type Column.
6. Press ENTER to save your changes.

Uniform dial plan

You can also set up a Uniform Dialing Plan that can be shared among a group of switches. For more information, see “[Uniform Dial Plan](#)” on page 1913.

Other options for the dial plan

You can establish a dial plan so that users only need to dial one digit to reach another extension. You can also establish a dial plan that allows users to dial, for example, three digits to reach one extension, and four digits to reach another. This is particularly useful in the hospitality industry, where you want users to be able to simply dial a room number to reach another guest. For more information, see “[Single-Digit Dialing and Mixed Station Numbering](#)” on page 1821.

Adding feature access codes

As your needs change, you may want to add a new set of FAC for your system. Before you can assign a FAC on the Feature Access Code screen, it must conform to your dial plan.

In our example, if you want to assign a feature access code of 33 to Last Number Dialed, first you need to add a new FAC range to the dial plan.

To add a FAC range from 30–39:

1. Type **change dialplan analysis** and press RETURN.
The “[Dial Plan Analysis Table](#)” on page 748 appears.
2. Move the cursor to an empty row.
3. Type **3** in the Dialed String column. Press TAB to move to the next field.
4. Type **2** in the Total Length Column. Press TAB to move to the next field.
5. Type **fac** in the Call Type Column.
6. Press ENTER to save your changes.

Changing feature access codes

Feature access codes (FAC) allow users to activate and deactivate features from their phones. A user who knows the FAC for a feature does not need a programmed button to use the feature. For example, if you tell your users that the FAC for the Last Number Dialed is *33, then users can redial a phone number by entering the FAC, rather than requiring a Last Number Dialed button.

Many features already have factory-set feature access codes. You can use these default codes or you can change them to codes that make more sense to you. However, every FAC must conform to your dial plan and must be unique. For more information about the dial plan, refer to “[Understanding the dial plan](#)” on page 71.

Let us try an example. If you want to change the feature access code for Call Park to *72:

1. Type **change feature-access-codes** and press RETURN.
The [Feature Access Code](#) screen appears.
2. Move the cursor to the Call Park Access Code field.
3. Type ***72** in the access code field over the old code.
4. Press ENTER to save your changes.

If you try to enter a code that is assigned to a feature, the system warns you of the duplicate code and does not allow you to proceed until you change one of them.

Tip:

To remove any feature access code, merely delete the existing FAC and leave the field blank.

Controlling the calls your users can make and receive

The Avaya MultiVantage provides several ways for you to restrict the types of calls your users can make, and the features that they can access.

You use Class of Restriction (“COR”) to define the types of calls your users can place and receive. Your system may have only a single COR, a COR with no restrictions, or as many CORs as necessary to effect the desired restrictions.

You will see the COR field in many different places throughout the MultiVantage system - when administering phones, trunks, agent logins, and data modules, to name a few. You must enter a COR on these screens, although you control the level of restriction the COR provides.

Strategies for assigning CORs

The best strategy is to make it as simple as possible for you and your staff to know which COR to assign when administering your system. You can create a unique COR for each type of user or facility, for example, call center agents, account executives, administrative assistants, Wide Area Telecommunications Service (WATS) trunks, paging zones or data modules.

You can also create a unique COR for each type of restriction, for example, toll restriction, or outward restriction. If you have a number of people who help you administer your system, using this method would also require the additional step of explaining where you wanted to use each type of restriction. See [“CLAN and processor CLAN QoS and CIDR support”](#) on page 1637 for more information.

To find out what CORs are administered in your system already, type **list cor**. You can also display information for a single COR by typing **list cor #**.

Allowing users to change CORs

You can allow specific users to change their class of restriction COR from their telephones using a Change COR feature access code. You can also limit this feature by insisting that the user enter a password as well as a feature access code before they can change their COR.

Before you start

- Be sure that Change COR by FAC field is set to y on the System-Parameters Customer-Options screen. Note that you cannot have both Change COR by FAC and Tenant Partitioning enabled.
- Be sure that each user (who you want to allow to change a COR) has a class of service with console permissions. For more information about console permissions, refer to [“Class of Service” on page 672](#).

Instructions

To allow users to change their own class of restriction, you must define a feature access code and can, optionally, create a password. For example, we will create a change COR feature access code of *55 and a password of 12344321.

1. Type **change feature-access-codes** and press ENTER.
The [Feature Access Code](#) screen appears.
2. Move the cursor to the Change COR Access Code field.
3. Type ***55** in the access code field.
4. Press ENTER to save your changes.
Now we have to define the password.
5. Type **change system-parameters features** and press ENTER.
The [Feature-Related System Parameters](#) screen appears.

```
change system-parameters features                                     Page 10 of 10
                        FEATURE-RELATED SYSTEM PARAMETERS

AUTOMATIC EXCLUSION PARAMETERS

                        Automatic Exclusion by COS? y
                        Automatic Exclusion Coverage/Hold? y
                        Automatic Exclusion with Whisper Page? y

                        Password to Change COR by FAC: 12344321
```

6. Move to the Password to Change COR by FAC field and enter **12344321**.
This field determines whether or not the MultiVantage system requires the user to enter a password when they try to change their COR. Avaya recommends that you require a password.
7. Press ENTER to save your changes.

Controlling the features your users can access

The Avaya MultiVantage offers a wide range of features and functions. Some of these you can administer differently from one user to the next. For example, you can give one user a certain set of phone buttons, and the next user a completely different set, depending on what each person needs to get his/her job done. You decide on these things as you administer the phones for these individuals. Refer to [“Managing phones” on page 91](#) for more information.

You can also establish classes of service (“COS”) to control the switch features that users can access. For example, you can permit users to forward their calls, or restrict them from placing priority calls. Once you have set permissions for a class of service, you assign this COS to a user’s telephone or other device.

Classes of service are very similar to classes of restriction. COR and COS do not overlap in the access or restrictions they control. Refer to [“Class of Service” on page 672](#) for more information.

Class of service and class of restriction give you great flexibility with what you allow users to do. If you are in doubt about the potential security risks associated with a particular permission, read further in this document, consult the *Avaya Products Security Handbook*, or contact your Avaya representative.

System-wide settings

There are some settings that you enable or disable for the entire system, and these settings effect every user. You may want to look over the various System Parameters screens and decide which settings best meet the needs of your users.

To see a list of the different types of parameters that control your system, type **display system-parameters** and press HELP. You can change some of these parameters yourself. Type **change system-parameters** and press HELP to see which types of parameters you can change. In some cases, an Avaya representative is the only person who can make changes, such as to the [System-Parameters Customer-Options](#) screen.

This chapter offers a few examples of how you establish these system-wide settings. The [Screen reference](#) contains explanations of each of the system parameters screens, and how to use them.

Changing feature parameters

You can modify the system parameters that are associated with some of the system features. For example, you can use the system parameters to allow music to play if callers are on hold or to allow trunk-to-trunk transfers on the system.

Generally, Avaya sets your system parameters when your system is installed. However, you can change these parameters as your organization's needs change. For example, let us say that you are told that the number of rings between each point for new coverage paths should change from 4 to 2 rings.

To change the number of rings:

1. Type **change system-parameters coverage/forwarding** and press RETURN.

The [System Parameters Call Coverage / Call Forwarding](#) screen appears.

```

Page 1 of 2
SYSTEM PARAMETERS -- CALL COVERAGE / CALL FORWARDING

CALL COVERAGE/FORWARDING PARAMETERS
  Local Cvg Subsequent Redirection/CFWD No Ans Interval (rings): 2
  Off-Net Cvg Subsequent Redirection/CFWD No Ans Interval (rings): 2
  Coverage - Caller Response Interval (seconds): 4

COVERAGE
  Keep Held SBA At Coverage Point? y
  External Coverage Treatment For Transferred Incoming Calls? n

FORWARDING
  Call Forward Override? n
  Coverage After Forwarding? y

```

2. In the Local Coverage Subsequent Redirection/CFWD No Answer Interval field, type **2**.
3. Press ENTER to save your changes.

Each phone in a Call Coverage path now rings twice before the call routes to the next coverage point. The Local Cvg Subsequent Redirection/CFWD No Ans Interval field also controls the number of rings before the call is forwarded when you use Call Forwarding for busy/don't answer calls. This applies only to calls covered or forwarded to local extensions. Use Off-Net to set the number of rings for calls forwarded to public network extensions.

Administering treatment for denied or invalid calls

You can administer your system to reroute denied or invalid calls to an announcement, the attendant, or to another extension.

Instructions

In this example, we want:

- all outward restricted call attempts to route to an announcement at extension 2040
- all incoming calls that are denied to route to the attendant
- all invalid dialed numbers to route to an announcement at extension 2045
 1. Type **change system-parameters features** and press RETURN.
The [Feature-Related System Parameters](#) screen appears.
 2. In the Controlled Outward Restriction Intercept Treatment field, type **announcement**.
 3. Another blank field appears.
 4. In this blank field, type **2040**.
 5. This is the extension of an announcement you recorded earlier.
 6. In the DID/Tie/ISDN Intercept Treatment field, type **attd**.
 7. This allows the attendant to handle incoming calls that have been denied.
 8. In the Invalid Number Dialed Intercept field, type **announcement**.
 9. Another blank field appears.
 10. In this blank field, type **2045**.
 11. This is the extension of an announcement you recorded earlier.
 12. Press ENTER to save your changes.

Setting up Music-on-Hold

Music-on-Hold automatically provides music to a caller placed on hold. Providing music lets the caller know that the connection is still active. The system does not provide music to callers in a multiple-party connection who are in queue, on hold, or parked.

Before you start

You need to determine the music source you will use, and obtain the necessary circuit pack. Refer to AVAYA MultiVantage™ Hardware Solutions Guide for more information about required hardware.

⇒ NOTE:

If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from or pay fees to a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI).

Instructions

In this example, we administer the system to allow local callers and incoming trunk callers to hear music while on hold. Note that if you use Tenant Partitioning, you cannot set up Music on Hold this way. See [“Providing service for multiple tenants” on page 82](#) for more information.

1. Type **change system-parameters features** and press RETURN.

The [Feature-Related System Parameters](#) screen appears.

```
change system-parameters features                               Page 1 of 9
                                FEATURE-RELATED SYSTEM PARAMETERS

                                Trunk-to-Trunk Transfer? none
Automatic Callback - No Answer Timeout Interval (rings): 4_
                                Call Park Timeout Interval (minutes): 10
                                Off-Premises Tone Detect Timeout Interval (seconds): 20_
                                AAR/ARS Dial Tone Required? y
                                Music/Tone On Hold: music Port: _____
Music (or Silence) On Transferred Trunk Calls: all
                                DID/Tie/ISDN Intercept Treatment: attd
                                Messaging Service Adjunct (MSA) Connected? y
Internal Auto-Answer of Attd-Extended/Transferred Calls: y
                                Automatic Circuit Assurance (ACA) Enabled? y
                                ACA Referral Calls: local
                                ACA Referral Destination: _____
                                ACA Short Holding Time Originating Extension: _____
                                ACA Long Holding Time Originating Extension: _____
Abbreviated Dial Programming by Assigned Lists:
Auto Abbreviated/Delayed Transition Interval(rings):
```

2. In the Music/Tone On Hold field, type **music**.
The Port field appears.
3. In the Port field, type **6040**.
This is the port address of the music source.
4. In the Music (or Silence) on Transferred Trunk Calls, type **all**.
5. Press ENTER to save your changes.
6. Now administer a class of restriction with Hear System Music on Hold set to **y**, to allow your local users to hear music on hold.

More information

If a call with either Data Privacy or Data Restriction activated is placed on hold, the Music/Tone on Hold is withheld. This is to prevent transmission of a musical tone that a connected data service might falsely interpret as a data transmission.

If you administer the Music/Tone on Hold field to provide music, the system provides the music after a hunt group or Automatic Call Distribution (ACD) split delayed announcement.

Music on Hold may sound distorted when played to IP trunks or to IP phones through certain codecs, particularly the G.723 codec. You can provide different on-hold materials for these endpoints. Using the instructions for [“Providing service for multiple tenants”](#), create one tenant partition for all endpoints that do not use the G.723 codec and administer Music on Hold for this tenant. Create another tenant partition for endpoints that use the G.723 codec and administer silence, news, or other material that does not sound distorted for these endpoints.

Providing service for multiple tenants

If you manage the switching system for an entire office building, you may need to provide individualized phone service for each of the firms who are tenants. You can set up your system so that each tenant can have its own attendant, and can chose to have music or play special announcements while callers are on hold.

Before you start

Before you can administer tenants in your system, Tenant Partitioning must be enabled on the [System-Parameters Customer-Options](#) screen. To allow tenants to select their own Music on Hold, you must purchase and administer equipment. Refer to AVAYA MultiVantage™ Hardware Solutions Guide for more information about required hardware. Your Avaya representative can help you administer this hardware.

Instructions

In this example, we are going to administer the system to allow one tenant to play Country music for callers on hold, and another to play Classical music. We will assign these music types to two new tenants.

1. Type **change music-sources** and press return.

The [Music Sources](#) screen appears.

Music Sources				Page 1 of X
Source	Type	Port	Description	
1	music	01A1001	Country	
2	tone		Tone-on-Hold	
3	music	01A1003	Classical	
4	none			
5	none			
6	none			
7	music	12B1301	Oldies	
8	none			
9	none			
10	none			
11	music	04C2003	Rock	
12	none			
13	none			
14	none			
15	none			

2. For Source 1, enter **music** for the Type, **01A1001** for the Port, and **Country** for the Description.

3. Move to Source 3, and enter **music** for the Type, **01A1003** for the Port, and **Classical** for the Description.
4. Press ENTER to save your changes.
5. Type **change tenant 1** and press RETURN.
The [Tenant](#) screen appears.

```
Tenant 18

Tenant Description: _____
Attendant Group: 1
Ext Alert Port (TAAS): _____ Ext Alert (TAAS) Extension: ____
Night Destination: _____
Music Source: 1
```

6. In the Tenant Description field, type **Dentist**.
This identifies the client in this partition.
7. In the Attendant Group field, type **1**.
The attendant group number must also appear in the Group field of the attendant console screen for this tenant.
8. In the Music Source field, type **1**.
Callers to this tenant will now hear country music while on hold.
9. Press ENTER to save your changes.
10. To administer the next partition, type **change tenant 2** and press RETURN.
11. Administer this tenant, Insurance Agent, to use Attendant Group 2 and Music Source 3. Be sure to change the [Attendant Console](#) screen so that this attendant is in group 2.
12. This tenant's callers will hear classical music on hold.

Receiving notification in an emergency

If one of your users calls an emergency service such as the police or ambulance, someone, perhaps the receptionist, security or the front desk, needs to know who made the call. Thus, when the emergency personnel arrive, they can be directed to the right place.

You can set up the switch to alert the attendant and up to ten other extensions whenever an end-user dials an emergency number. The display on the notified user's phone shows the name and number of the person who placed the emergency call. The phones also ring with a siren-type alarm, which users must acknowledge to cancel.

Before you start

Decide if you want one user to be able to acknowledge an alert, or if all users must respond before an alert is cancelled.

Verify that the ARS field is **y** on the [System-Parameters Customer-Options](#) screen.

Make sure that the extensions you notify belong to physical digital display phones. Refer to "[Phone reference](#)" on page 1387 for a list of phone types. When you assign crisis alert buttons to the phones, check the type field on the station screen to be sure you are not using a virtual extension.

Instructions

In this example, we will set up the system to notify the attendant and the security guards at all 3 entrances when someone dials the emergency number 5555. All three guards must acknowledge the alert before it is silent.

1. Type **change ars analysis 5** and press RETURN.

The [AAR and ARS Digit Analysis Table](#) appears.

Finally, we make sure that all security personnel and the attendant will have to acknowledge the alert.

11. Type **change system-parameters crisis-alert** and press RETURN.

The “[Crisis Alert System Parameters](#)” screen appears.

12. Go to the Every User Responds field and type **y**.
13. Press ENTER to save your changes.

More information

Attendants cancel an alert by pressing the crisis alert button three times. The first button push turns off the siren, the second stops the lamp from flashing, and the third clears the display.

Digital phone users cancel the siren by pushing the crisis alert button. If you have set the system so that only one user needs to respond, this stops the alerting at all phones. If all users must respond, each phone continues to alert until that user presses the crisis alert button to acknowledge the alarm. The emergency caller’s name and extension remain on the display at this point. To completely cancel an alert and clear their displays, users press the Normal button.

Once you administer Crisis Alert, the switch still records each emergency call and sends a record to the journal printer, if available. If not, you can view the emergency log with the command **list emergency**.

Related topics

See “[Crisis Alert](#)” on page 1653 for more detailed information.

Notifying a digital pager of an emergency

You also have the option of having your emergency calls go to a digital pager. When someone dials an emergency number (for example, 911), the system sends the extension and location (that originated the emergency call) to the administered pager.

Before you start

- You need to administer a CRSS-ALRT button on at least one of the following.
 - Attendant Console (use the **change attendant** command)
 - Digital telephone set (use the **change station** command)
- The ARS Digit Analysis Table must have emergency numbers in the Call Type column set to **alrt** (crisis alert).
- You need a digital numeric pager.
- You need one of the following circuit packs:
 - Call Classifier
 - Tone-Clock (with Call Classification and Tone Detection)

Instructions

To set up crisis alert to a digital pager:

1. Type **change system-parameters crisis-alert** and press Return.
The [Crisis Alert System Parameters](#) screen appears.
2. In the Alert Pager field, type **y**.
This allows you to use the Crisis Alert to a Digital Pager feature and causes additional crisis alert administration fields to appear.
3. In the Originating Extension field, type a valid unused extension to send the crisis alert message.
We'll type **7768**.

4. In the Crisis Alert Code field, type 911.
This is the number used to call the crisis alert pager.
5. In the Retries field, type **5**.
This is the number of additional times the system tries to send out the alert message in case of an unsuccessful attempt.
6. In the Retry Interval (sec) field, type **30**.
This is length of time between retries.
7. In the Main Number field, type the number that is to be displayed at the end of the pager message.
We'll type **303-555-0800**.
8. In the Pager Number field, type the number for the pager.
We'll type **303-555-9001**.
9. In the Pin Number field, type **pp77614567890**.
This is the PIN number, if required, for the pager. Insert any pause digits (pp) as needed to wait for announcements from the pager service to complete before sending the PIN.
10. In the DTMF Duration - Tone (msec) field, type **100**.
This is the length of time the DTMF tone is heard for each digit.
11. In the Pause (msec) field, type **100**.
This is the length of time between DTMF tones for each digit.
12. Press ENTER to save your changes.

Related topics

Refer to [“Crisis Alert” on page 1653](#) for more detailed information.

Other useful settings

There are many settings that control how your system operates and how your users phones work. Most of these you administer through one of the System Parameters screens. This section describes a few of the items you can enable in your system to help your users work more efficiently. See [“Feature-Related System Parameters” on page 795](#) for a more detailed description of the available system settings.

Automatic callback if an extension is busy

You can allow users to request that the system call them back if they call a user whose telephone is busy. See [“Automatic callback” on page 1486](#).

Automatic hold

You can set a system-wide parameter that allows your users to initiate a call on a second line without putting the first call on Hold. This is called Automatic Hold, and you enable it on the [Feature-Related System Parameters](#) screen. If you do not turn this on, the active call drops when a the user presses the second line button.

Bridging onto a call that has gone to coverage

You can allow users to join (bridge) on to a call that rang at their extension and then went to coverage before they could answer. See [“Temporary Bridged Appearance” on page 1868](#).

Distinctive ringing

You can establish different ringing patterns for different types of calls. For example, you can administer your system so that internal calls ring differently from external calls or priority calls. See [“Distinctive ringing” on page 1658](#) for more information.

Warning when phones are off-hook

You can administer the system so that if a phone remains off-hook for a given length of time, the switch sends out a warning. This is particularly useful in hospitals, where the phone being off-hook may be an indication of trouble with a patient. See [“Class of Service” on page 672](#) for more information.

Warning users if their calls are redirected

You can warn analog phone users if they have features active that may redirect calls. For example, if the user has activated send all calls or call forwarding, you can administer the system to play a special dial tone when the user goes off-hook. See [“DISTINCTIVE AUDIBLE ALERTING” on page 826](#) for more information.

Fiber link administration

For information concerning system fiber link configurations, see *Upgrades and Additions for Avaya DEFINITY® Server R*.

This section explains how to add, swap, upgrade, and remove different kinds of phones on your system. This section also gives you tips for customizing your own phone (for system administration) so it has the feature buttons you need for many administration and troubleshooting tasks. Most of the information applies to traditional Digital Communications Protocol (DCP) phones, and headings specifically state that certain procedures apply to IP (internet protocol) phones.

Note that this section does not tell you how to administer an attendant console. If you need to add or modify an attendant console, see [“Managing your attendant consoles”](#) on page 163.

Installing new phones

Simple administration allows you to plug a telephone into a jack and dial a sequence to start up service to the phone. The dialing sequence sets up an association between the phone and the corresponding station administration.

SECURITY ALERT:

If you do not manage this feature carefully, its unauthorized use may cause you security problems. Consult the Avaya Products Security Handbook for suggestions on how to secure your system and find out about obtaining additional security information.

For traditional instructions, see [“Adding new phones”](#).

Before you start

On the Feature-Related System Parameters screen, be sure the Customer Telephone Activation (CTA) Enabled field is **y** and the TTI Enabled field is **y**.

Complete the station screen for the new phone and type **x** in the port field. Note that the phone type must match the board type. For example, match a two-wire digital phone with a port on a two-wire digital circuit pack. Use this procedure with all circuit-switched phones except BRI (ISDN) and model 7103A.

Tip:

See “Completing station screens” for more information. See Using templates if you want to add a number of phones with similar settings.

Instructions

CAUTION:

You can destroy your hardware if you attempt to connect an analog telephone to a digital port.

To associate a phone with existing x-port station administration, complete the following steps from the telephone you want to install:

1. Plug the phone into the wall jack.
2. Lift the receiver and continue if you hear dial tone.
3. Dial **#*nnnn**, where **nnnn** is the extension number of the phone you are installing.
4. Hang up after you receive confirmation tone.
5. Dial a test call to confirm that the phone is in service.
If possible, call a phone with a display so the person answering can confirm that you entered the correct extension number.
6. Repeat the process until all new phones have been installed.
7. For security reasons, you should disable this feature when you are done. At the system administration terminal type **change system-parameters features** to access the Feature-Related System Parameters screen.
8. Type **n** in the Customer Telephone Activation (CTA) Enabled field.
9. Press ENTER to save your changes.
10. Type **save translations** and press ENTER to permanently save the changes.
 - a. Fixing problems

If you misdial and the wrong extension is activated for the phone you are using, use the terminal translation initialization (TTI) unmerge feature access code to “uninstall” the phone before you try again. See “TTI separation from a telephone” for more information.

Adding new phones

When you are asked to add a new phone to the phone system, what do you do first? To connect a new phone you need to do three things:

- find an available port
- wire the port to the cross-connect field or termination closet
- tell the telephone system what you’re doing

Before you can determine which port to use for the new phone, you need to determine what type of phone you are installing, what ports are available, and where you want to install the phone.

To add an IP phone, see [“Adding an IP Telephone” on page 110](#).

Gathering necessary information

1. Determine whether the phone is an analog, digital, ISDN, or hybrid set. You may also administer a virtual phone, one without hardware at the time of administration.

You need this information to determine the type of port you need, because the port type and phone type must match. If you do not know what type of phone you have, see the Type field under [“Station” on page 1127](#) for a list of phones by model number.

2. Record the room location, jack number, and wire number.

You may find this information on the jack where you want to install the phone, recorded in your system records, or from the technician responsible for the physical installation.

3. Display the available boards (cards) and ports.

To view a list of boards on your system, type **list configuration station** and press RETURN.

Board Number	Board Type	SYSTEM CONFIGURATION		Assigned Ports									
		Code	Vintage	u=unassigned	t=tti	p=psa							
01A05	DIGITAL LINE	TN754B	000002	01	u	03	u	05	u	07	08		
01A06	ANALOG LINE	TN742	000010	01	02	03	04	u	u	u	u		
01B05	ANALOG LINE	TN746B	000008	u	u	u	u	u	u	u	u		
01C04	ANALOG LINE	TN746B	000008	u	u	u	u	u	u	u	u		
01C05	DIGITAL LINE	TN2224	000004	01	u	u	04	u	u	07	08		
01C06	HYBRID LINE	TN762B	000004	01	02	u	u	u	u	u	u		
01C10	DIGITAL LINE	TN754	000004	u	u	u	u	u	u	u	u		

The System Configuration screen shows all the boards on your system that are available for connecting phones. You can see the board number, board type, circuit-pack type, and status of each board's ports.

4. Choose an available port and record its port address.

Each port that is available or unassigned is indicated by a 'u.' Choose an available port from a board type that matches your phone type (such as a port on an analog board for an analog phone).

Every phone must have a valid port assignment, also called a port address. The combined board number and port number is the port address. So, if you want to attach a phone to the 3rd port on the 01C05 board, the port address is 01C0503 (01=cabinet, C=carrier, 05=slot, 03=port).

Tip:

*If you add several phones at one time, you may want to print a paper copy of the System Configuration screen. To print the screen to a printer attached to the system terminal, type **list configuration station print** and press RETURN. To print to the system printer that you use for scheduled reports, type **list configuration station schedule immediate** and press RETURN.*

5. Choose an extension number for the new phone.

The extension you choose must not be assigned and must conform to your dial plan. You should also determine whether this user needs an extension that can be directly dialed (DID) or reached via a central phone number.

Be sure to note your port and extension selections on your system's paper records.

Physically connecting the phone

Once you have collected all the information, you are ready to physically wire the port to the cross-connect field.

If you have an Avaya representative or on-site technician who completes the physical connections, you need to notify them that you are ready to add the phone to the system. To request that Avaya install the new connections, call your Avaya representative to place an order.

If you are responsible for making the connections yourself and if you have any questions about connecting the port to the cross-connect field, see your system installation guide.

Now you are ready to configure the system so that it recognizes the new phone.

Before you start

To download foreign language display labels for phones, set the Display Language field on the Station screen to **english, spanish, italian, french**, or **user-defined**.

For a Eurofont character display for the 2420 phone, set the Display Character Set field on the System-Parameters Country-Options screen to **Eurofont**.

For a Katakana character display for the 2420 phone, set the Display Character Set field on the System-Parameters Country-Options screen to **Katakana**.

Completing the station screens

The information that you enter on the station screen advises the system that the phone exists and indicates which features you want to enable on the phone.

To access the station screen for the new phone:

1. Type **add station *nnnn*** and press RETURN, where *nnnn* is the extension for the new phone.

Make sure the extension conforms to your dial plan. You can also use the **add station next** command to add a phone to the next available extension.

When the **Station** screen appears, you see the extension number and some default field values. For example, the following screen is for a new phone at extension 2345.

```

                                STATION
Extension: 2345                    Lock Messages? n          BCC: _
Type: 6480D+                      Security Code: _____ TN: 1
Port: _____                  Coverage Path 1: _____ COR: 1
Name: _____                  Coverage Path 2: _____ COS: 1
                                Hunt-to Station: _____

STATION OPTIONS
Loss Group: none                    Personalized Ringing Pattern: 1
Data Module? n                      Message Lamp Ext: 2345
Speakerphone: 2-way                 Mute Button Enabled? y
Display Language: english

                                MM Complex Data Ext: _____
                                IP SoftPhone? n

```

2. Type the model number of the phone into the Type field.
For example, to install a 8411D phone, type **6480D+** in the Type field. Note that the displayed fields may change depending on the model you add.
3. Type the port address in the Port field.
4. Type a name to associate with this phone in the Name field.
The name you enter displays on called phones that have display capabilities. Also, some messaging applications, such as INTUITY, recommend that you enter the user's name (last name first) and their extension to identify the phone.
5. Press ENTER to save your changes.

To make changes to this new phone, such as assigning coverage paths or feature buttons, type **change station nnnn** and press RETURN, where *nnnn* is the extension of the new phone. See [“Managing phone features”](#) on page 129 for more information.

Using templates to add phones

A quick way to add phones is to copy the information from an existing phone and modify it for each new phone. For example, you can configure one phone as a template for an entire work group. Then, you merely duplicate the template station screen to add all the other extensions in the group.

Note that only phones of the same model can be duplicated. The duplicate command copies all the feature settings from the template phone to the new phones.

To duplicate an existing phone:

1. Type **display station nnnn** and press RETURN.
nnnn is the extension of the station screen you want to duplicate to use as a template. Verify that this extension is the one you want to duplicate.
2. Press CANCEL to return to the command prompt.
3. Type **duplicate station nnnn** and press RETURN, where *nnnn* is the extension you want to duplicate.

The system displays a blank Duplicate Station screen.

STATION						
Ext.	Port	Name	Security Code	Room	Jack	Cable
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

4. Type in the extension, port address, and phone name for each new phone you want to add.
The rest of the fields are optional. You can complete them at any time.
5. Press ENTER to save your changes to system memory.

To make changes to these phones, such as assigning coverage paths or feature buttons, type **change station nnnn** and press ENTER, where *nnnn* is the extension of the phone that you want to modify.

Related topics

You can also add multiple call center agents, all with the same settings based on an agent that is already administered. Enter **command duplicate agent-loginID** and the extension of the agent you want to duplicate, then **start** and the extension you want to use for the first new agent, then **count** and the number of agents you want to add. Fill in the information on the Agent LoginID screen. For more information, see the *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

Using an alias

Not every phone model or device has a unique station screen in the system. You might have to use an available model as an “alias” for another. If you need to enter a phone type that the system does not recognize or support, use an alias. Defining aliases is also a useful method to identify items that act as analog stations on the switch, such as a fax machine, a modem, or other analog device.

If you purchase a phone model that is newer than your system, you can alias this phone to an available model type that best matches the features of your new phone. See your phone’s manual to determine which alias to use. If your manual does not have this information, you can contact the DEFINITY helpline for an appropriate alias.

For example, we will create two aliases: one to add a new 6220 phone and one to add modems to our system.

1. See your new phone’s manual to find the correct alias.

In our example, we find that the 6220 should be administered on an older system as a 2500 phone.

2. Type **change alias station** and press RETURN.

The [Alias Station](#) screen appears.

3. Enter **6220** in the Alias Set Type field.

This is the name or model of the unsupported phone.

4. Enter **2500** in the Supported Set Type field.

Enter the supported model in this field.

5. Enter **modem** in the second Alias Set Type field.

You can call the alias set anything you like. Once you define the alias, you can use the alias set in the Type field on the Station screen.

6. Enter **2500** in the second Supported Set Type field.

Entering 2500 indicates to the system that these models are basic analog devices.

7. Press ENTER to save your changes.

ALIAS STATION	
Alias Set Type	Supported Set Type
6220	2500
modem	2500
_____	_____
_____	_____
_____	_____
_____	_____
_____	_____
_____	_____
_____	_____
_____	_____

'#' indicates previously aliased set type is now native

Now you can follow the instructions for adding a new phone (or adding a fax or modem). Your switch now recognizes the new type (6220 or modem) that you enter in the Type field.

Be sure to see your phone's manual for instructions on how to set feature buttons and call appearance buttons. Note that if you need to use an alias for a phone, you may not be able to take advantage of all the features of the new phone.

Customizing your phone

This section provides recommendations for setting up or enhancing your personal phone. You need a phone that is powerful enough to allow you to use all the features you may give to other employees. You may want to add feature buttons that allow you to monitor or test the system, so that you can troubleshoot the system from your phone.

It will be much easier to monitor and test your system if you have a phone with:

- a large multi-button display (such as 8434D or 8410D)
- a class of service (cos) that has console permissions
- the following feature buttons
 - ACA and Security Violations (assign to lamp buttons)
 - Busy verify
 - Cover message retrieval button
 - Major/minor alarm buttons
 - Trunk ID buttons
 - Verify button

Once you select a phone, you'll want to determine if you want to place this phone at your desk or in the switch room. If the phone is in the switch room (near the system administration terminal), you can quickly add or remove feature buttons to test features and facilities. You may decide that you want a phone at both your desk and in the switch room — it's up to you.

You may also find it handy to set up multiple phones for testing applications and features before you provide them to users. You may want to have a phone that mimics each type of user phone in your organization. For example, if you have four basic phone templates, one for executives, one for marketing, one for technicians, and one for other employees, you may want to have examples of each of these phones so you can test new features or options. Once you are satisfied that a change works on the test phone, you can make the change for all the users in that group.

Upgrading phones

If you want to change phone types for a user and do not need to change locations, you can just access the station screen for that extension and enter the new model number.

This method can be used only if the new phone type matches the existing port type (such as digital phone with a digital port).

For example, if a user at extension 4556 currently has a 7410+ phone and you want to replace it with a new 8411D phone:

1. Type **change station 4556** and press RETURN.

The **Station** screen for 4556 appears.

2. Overwrite 7410+ with **8411D** in the Type field.

Now you can access the functions and feature buttons that correspond to an 8411D phone.

Swapping phones

You will often find that you need to move or swap phones. For example, employees moving from one office to another may want to bring their phones. In this case, you can use X ports to easily swap the phones.

In general, to swap one phone (phone A) with another phone (B), you change phone A's port assignment to **x**, change phone B's port assignment to A's old port, and, finally, change the **x** for phone A to B's old port. Note that these swapping instructions work only if the two phones are the same type (both digital or both analog, etc.).

For example, to swap phones for extension 4567 (port 01C0505) and extension 4575 (port 01C0516), complete the following steps:

1. Type **change station 4567** and press RETURN.
2. Record the current port address (01C0505) and type **x** in the Port field.
3. Press ENTER to save your changes.
4. Type **change station 4575** and press RETURN.
5. Record the current port address (01C0516).
6. Type **01C0505** in the Port field.
7. Update the Room and Jack fields.
8. Press ENTER to save your changes.
9. Type **change station 4567** again and press RETURN.
10. Type **01C0516** in the Port field.

This is the port that used to be assigned to extension 4575.

11. Update the Room and Jack fields.
12. Press ENTER to save your changes.
13. Physically unplug the phones and move them to their new locations.

When you swap phones, the system keeps the old button assignments. If you are swapping to a phone with softkeys, the phone could have duplicate button assignments, because softkeys have default assignments. You may want to check your button assignments and modify them as necessary.

Using ACTR to move phones

Automatic Customer Telephone Rearrangement (ACTR) allows a phone to be unplugged from one location and moved to a new location without additional switch administration. The switch automatically associates the extension to the new port. ACTR works with 6400 Serialized phones and to the 2420 phones. The 6400 Serialized phone is stamped with the word “Serialized” on the faceplate for easy identification. The 6400 Serialized phone memory electronically stores its own part ID (comcode) and serial number as does the 2420 phone. ACTR uses the stored information and associates the phone with new port when the phone is moved.

ACTR is an enhancement to Terminal Translation Initialization (TTI), Personal Station Access (PSA), Customer Telephone Activation (CTA). ACTR makes it easy to identify and move phones.

CAUTION:

When a phone is unplugged and moved to another physical location, the Emergency Location Extension field must be changed for that extension or the USA Automatic Location Identification data base must be manually updated. If the Emergency Location Extension field is not changed or if the USA Automatic Location Identification data base is not updated, the DID number sent to the Public Safety Network could send emergency response personnel to the wrong location.

Detailed description

On the Feature-Related System Parameters screen, set the Terminal Translation Initialization (TTI) Enabled field to **y** and the TTI State field to **voice**.

NOTE:

When a phone is moved, if there is any local auxiliary power (a power supply plugged into a local AC outlet), the phone must be plugged into an AC outlet at the phone’s new location. A phone with remote auxiliary power must be supplied remote auxiliary power at its new location. If you do not supply auxiliary power in either case after a phone is moved, some optional adjuncts (for example, an expansion module) do not operate.

When you enter **always** or **once** in the Automatic Moves field on the station screen, the switch adds the extension to its ACTR Move List database. When the phone is plugged in, the switch asks the phone for its serial number and records the serial number on the ACTR Move List. If you change the entry in the Automatic Moves field from **always** or **once** to **no**, the switch removes the extension from the Move List.

Call processing

When a phone is unplugged while on a call, and a 6400 Serialized phone or a 2420 phone that is administered for automatic moves is plugged into the port within 60 seconds:

- both extensions are placed in idle state
- active calls on either extension are dropped, unless the call is active on a bridged appearance at some other phone
- held calls remain in a hold state
- any calls ringing on either extension instantly proceed to the next point in coverage or station hunting path, unless the call is ringing on a bridged appearance at some other phone
- user actions that were pending when the new phone was plugged in are aborted

Design considerations

You can use the **list station movable** command to keep track of extensions on the move list. Once you reach the maximum number, the switch does not allow additional extensions.

Administration

Before you start

- Be sure the TTI field on the Feature-Related System Parameters screen is set to **y**.

Tasks

Before you move a phone in your system, set the TTI State field to voice on the Feature-Related System Parameters screen.

Moving phones

You can allow a phone to be unplugged from one location and moved to a new location without additional switch administration.

For example, to allow moves anytime for a phone at extension 1234:

1. Type **change station 1234** and press RETURN.
2. Move to the Automatic Moves field.

```

change station 1014                                     Page 2 of X
                                                    STATION

```

3. Type **always** in the Automatic Moves field.
4. Press ENTER to save your changes.

Using TTI to move phones

Terminal Translation Initialization (TTI) allows you to merge an x-ported station to a valid port by dialing a TTI merge code, a system-wide security code, and the x-port extension from a telephone connected to that port. TTI also allows you to separate an extension from its port by dialing a similar separate digit sequence. This action causes the station to revert to an x-port.

TTI can be used for implementing telephone and data module moves from office to office. That is, you can separate a telephone from its port with TTI, unplug the telephone from the jack, plug in the telephone in a jack in a different office, and merge the telephone to its new port with TTI.

If you are moving phones and concerned about security, you may also want to see [“Setting up Personal Station Access” on page 360](#) for more information about setting the security code for each extension.

SECURITY ALERT:

If you do not manage this feature carefully, its unauthorized use may cause you security problems. For example, someone who knows the TTI security code could disrupt normal business functions by separating telephones or data terminals. You can help protect against this action by frequently changing the TTI security code. You can further enhance system security by

removing the feature access code (FAC) from the system when it does not need to be used (for example, there are no moves going on at present). Consult the Avaya Products Security Handbook for additional steps to secure your system and find out about obtaining information regularly about security developments.

Before you start

Before you can merge a telephone, you must set the TTI State field to **voice** on the Feature-Related System-Parameters screen. You also must set the extension to match the port type of the TTI port making the merge request. For example, a digital telephone type can merge only to a port on a digital board.

CAUTION:

When a phone is unplugged and moved to another physical location, the Emergency Location Extension field must be changed for that extension or the USA Automatic Location Identification data base must be manually updated. If the Emergency Location Extension field is not changed or if the USA Automatic Location Identification data base is not updated, the DID number sent to the Public Safety Network could send emergency response personnel to the wrong location.

NOTE:

You cannot use TTI to change a virtual extension.

Instructions

TTI merge from a voice TTI port

CAUTION:

You can destroy your hardware if you attempt to connect an analog telephone to a digital port.

To merge an extension to a telephone with TTI, complete the following steps from the telephone you want to merge:

1. Dial the TTI merge FAC.
 - If the code is correct, you receive dial tone.
 - If the code is not correct, you receive intercept tone.

2. Dial the TTI security code from the telephone you want to merge.
 - If the code is correct, you receive dial tone.
 - If the code is not correct, you receive intercept tone.
3. Dial the extension of the telephone you want to merge.
 - If the extension is valid, you receive confirmation tone, which may be followed by dial tone. (It is possible to receive intercept tone immediately following the confirmation tone. If this happens, you need to attempt the merge again.)
 - If the extension is valid, but the extension is being administered, you receive reorder tone. Try the merge again later.
 - If the extension is invalid, you receive intercept tone.
 - If the system is busy and cannot complete the merge, you receive reorder tone. Try the merge again later.
 - If the telephone has a download status of pending, you receive reorder tone. You need to change the download status to complete to successfully complete the TTI merge.

TTI separation from a telephone

To complete a TTI separation, complete the following steps from the telephone that needs to be separated:

1. Dial the TTI separate FAC.
2. Dial the TTI security code.
 - If the code is correct, you receive dial tone.
 - If the code is not correct, you receive intercept tone.
3. Dial the extension of the telephone to be separated.
 - If you have dialed the extension of the telephone currently merged with this telephone, you receive confirmation tone.
 - If you have dialed the extension of the telephone currently merged with this telephone, but the extension is being administered, you receive reorder tone. Try the separation again later.
 - If you have not dialed the extension of the telephone currently merged with this telephone, you receive intercept tone.
 - If the system is busy and cannot complete the separation, you receive reorder tone. Try the separation again later.

Fixing problems

If you are having difficulty using TTI, you may want to review the following system restrictions:

- The TTI Ports field on the System Capacity screen shows the number of TTI ports used in a switch. This field shows only the number of TTI ports being administered. If a TTI exceeds the maximum number of ports, the port is not administered and cannot be added. In that case, a telephone cannot be added.

BRI endpoints are only counted as one TTI port. For example, for every two BRI endpoints, one TTI port is counted. As such, you can have two telephones assigned to one port. If either endpoint is administered, the TTI port count is reduced by 1.
- The total number of translated telephones and Voice TTI ports in a system is limited to the maximum number of administered telephones supported in the system. The total number of translated data terminals and Data TTI ports in a system is limited to the maximum number of administered data modules allowed in the system.
- Set the TTI State field to **voice** and then set the TTI State field to **data**. When you use this order, voice and then data, you reduce the chance of a user trying to use TTI on a data-only terminal that does not have TTI port translation. This can happen when the number of telephones allowed by the system is twice the number of data terminals. For example, if the system limit for telephones is 15,000 and 7,500 for data, then when TTI was turned on for data first, only the first 7,500 unadministered ports would get TTI port translations.
- When TTI is activated for the system, the following actions take place:
 - If the TTI State field was previously activated but in a different state (such as, a voice to data state), the old TTI translations are removed and the new ones added on a board by board basis.
 - If the TTI State field is set to **voice**, then default TTI translations are generated for every unadministered port on all digital, hybrid, and analog boards.
 - If the TTI State field is set to **data**, then default TTI translations are generated for every unadministered port on all digital and data line boards in the system.
 - Whenever a new digital board is inserted when the system is in TTI Data mode, or when a digital, hybrid, or analog board is inserted when the system is in TTI Voice mode, the unadministered ports on the board become TTI ports.
 - When TTI is deactivated, all translation for the TTI ports are removed in the system; the ports return to an unadministered state.

Removing phones

Before you physically remove a phone from your system, check the phone's status, remove it from any group or usage lists, and then delete it from the system's memory.

For example, to remove a phone at extension 1234:

1. Type **status station 1234** and press RETURN.
The General Status screen appears.
2. Make sure that the phone:
 - is plugged into the jack
 - is idle (not making or receiving calls)
 - has no messages waiting
 - has no active buttons (such as Send All Calls or Call Forwarding)
3. Type **list groups-of-extension 1234** and press RETURN.
The Extension Group Membership screen shows whether the extension is a member of any groups on the system.
4. Press CANCEL.
5. If the extension belongs to a group, access the group screen and delete the extension from that group.
For example, if extension 1234 belongs to pickup group 2, type **change pickup group 2** and delete the extension from the list.
6. Type **list usage extension 1234** and press RETURN.
The Usage screen shows where the extension is used in the system.
7. Press CANCEL.
8. If the extension appears on the Usage screen, access the appropriate feature screen and delete the extension.
For example, if extension 1234 is bridged onto extension 1235, type **change station 1235** and remove the appearances of 1234.
9. Type **change station 1234** and press RETURN.
10. Delete any bridged appearances or personal abbreviated dialing entries and press ENTER.

11. Type **remove station 1234** and press RETURN.

The system displays the station screen for this phone so you can verify that you are removing the correct phone.

Tip:

Be sure to record the port assignment for this jack in case you want to use it again later.

12. If this is the correct phone, press ENTER.

If the system responds with an error message, the phone is busy or still belongs to a group. Press CANCEL to stop the request, correct the problem, and enter **remove station 1234** again.

13. Remove the extension from voice mail service if the extension has a voice mailbox.
14. Type **save translations** and press RETURN to save your changes.

Note that you do not need to delete the extension from coverage paths. The system automatically adjusts coverage paths to eliminate the extension.

Now you can unplug the set from the jack and store it for future use. You do not need to disconnect the wiring at the cross-connect field. The extension and port address remain available for assignment at a later date.

Once you successfully remove a set, that set is permanently erased from system memory. If you want to reactivate the set, you have to add it again as though it were a new phone.

Adding a fax or modem

Connecting a fax machine or modem to your system is similar to adding a phone, with a few important exceptions. If you have not added a phone, you may want to read [“Adding new phones” on page 93](#).

Because the system does recognize the concept of “fax” or “modem,” you need to administer these items as basic analog stations. You can merely use the supported station type 2500 (analog, single line).

Alternatively, you can create aliases to the 2500 for fax machines and modems. If you want to be able to create reports that indicate which stations are faxes or modem, you should create aliases for these items. For more information about aliasing, see [“Using an alias” on page 98](#).

For this example, let us assume that we have already defined an alias for 'fax' as a 2500 and that we now want to add a fax machine to extension 4444.

To add a fax machine as extension 444, complete the following steps:

1. Type **add station 4444** and press RETURN.
2. In the Type field, type **fax**.
3. In the Port field, type the port address.
4. In the Name field, type a name to associate with this fax.
5. Move to the Data Restriction field and type **y**.

Entering y in this field prevents calls to and from this extension from being interrupted by tone signals. This is important for fax machines and modems as these signals can disrupt transmissions of data.

6. In the Distinctive Audible Alert field, type **n**.

This eliminates the distinct 2-burst ring for external calls, which often interferes with the auto-answer function on fax machines or modems.

7. Press ENTER to save your changes.

Adding an IP Telephone

The 4600-series IP Telephones are physical sets that connect to the MultiVantage system via TCP/IP.

CAUTION:

An Avaya IP endpoint can dial emergency calls (for example, 911 calls in the U.S.). It only reaches the local emergency service in the Public Safety Answering Point area where the telephone system has local trunks. Please be advised that an Avaya IP endpoint cannot dial to and connect with local emergency service when dialing from remote locations that do not have local trunks. You should not use an Avaya IP endpoint to dial emergency numbers for emergency services when dialing from remote locations. Avaya Inc. is not responsible or liable for any damages resulting from misplaced emergency calls made from an Avaya endpoint. Your use of this product indicates that you have read this advisory and agree to use an alternative telephone to dial all emergency calls from remote locations.

Before you start

Verify the system has a:

- TN2302 IP Media Processor circuit pack for audio capability
- TN799 Control-LAN circuit pack for signaling capability (for Servers R, CSI, and SI only)

Be sure that your system has been enabled to use IP Telephones. Display the System-Parameters Customer-Options screen and verify the following field settings:

- Maximum Concurrently Registered IP Stations is greater than **0**
- IP Stations field is **y**
- Information has been entered in the fields on the Maximum IP Registrations by Product ID page

Instructions for adding an IP Telephone

Let us add an IP telephone at extension 4005.

To assign an extension, complete the following steps:

1. Type **add station 4005** and press RETURN.

The **Station** screen appears.

```

                                STATION
Extension: 2345                    Lock Messages? n          BCC: _
Type: 4620+                       Security Code: _____ TN: 1
Port: IP                           Coverage Path 1: _____ COR: 1
Name: _____                   Coverage Path 2: _____ COS: 1
                                Hunt-to Station: _____

STATION OPTIONS
    Loss Group: none              Personalized Ringing Pattern: 1
                                Message Lamp Ext: 2345
    Speakerphone: 2-way           Mute Button Enabled? y
    Display Language: english      Expansion Module? y

                                MM Complex Data Ext:
                                IP SoftPhone? n
    
```

In the Type field, type **4620**.

2. The Port field is display-only, and **IP** appears.

3. In the Security Code field, enter a password for the IP phone user.

NOTE:

Although the system accepts a null password, the IP phone will not work unless you assign a password.

4. Press ENTER to save your work.

Changing from dual-connect to single-connect IP phones

When you have a dual extension phone and you upgrade to a single extension phone, you can remove the connection that is no longer used for that phone.

To remove the H.323 connection that is no longer needed, first record the media complex extension number:

1. Type **change station nnnn**, where nnnn is the extension number of the original dual-connect phone that you are replacing with a single-connect phone.

The Station screen appears.

2. Move to the Media Complex Extension field.
3. Write down the number in the Media Complex field, then delete the number from the field.
4. Press ENTER to save your changes.

Now remove the extension you recorded. Before you remove an H.323 extension from your system, check the status, remove it from any group or usage lists, and then delete it from the system's memory.

For example, if you wrote down extension 1234 before you removed it from the Media Complex field on the Station screen, then remove extension 1234 using these steps:

1. Type **status station 1234** and press RETURN.

The General Status screen appears.

2. Make sure that the extension:
 - is idle (not making or receiving calls)
 - has no messages waiting
 - has no active buttons (such as Send All Calls or Call Forwarding)

3. Type **list groups-of-extension 1234** and press RETURN.
The Extension Group Membership screen shows whether the extension is a member of any groups on the system.
4. Press CANCEL.
5. If the extension belongs to a group, access the group screen and delete the extension from that group.
For example, if extension 1234 belongs to pickup group 2, type **change pickup group 2** and delete the extension from the list.
6. Type **list usage extension 1234** and press RETURN.
The Usage screen shows where the extension is used in the system.
7. Press CANCEL.
8. If the extension appears on the Usage screen, access the appropriate feature screen and delete the extension.
For example, if extension 1234 belongs to hunt group 2, type **change hunt group 2** and delete the extension from the list.
9. Type **change station 1234** and press RETURN.
10. Delete any bridged appearances or personal abbreviated dialing entries and press ENTER.
11. Type **remove station 1234** and press RETURN.
The system shows the station screen for this phone so you can verify that you are removing the correct phone.
12. If this is the correct phone, press ENTER.
The system responds with **command successfully completed**.
If the system responds with an error message, the phone is busy or still belongs to a group. Press CANCEL to stop the request, correct the problem, and enter **remove station 1234** again.
13. Remove the extension from voice mail service if the extension has a voice mailbox.
14. Type **save translations** and press RETURN to save your changes.

Note that you do not need to delete the extension from coverage paths. The system automatically adjusts coverage paths to eliminate the extension.

Once you successfully remove the extension, it is permanently erased from system memory. If you want to reactivate the extension, you have to add it again as though it were new.

Tasks

Setting up emergency calls on IP phones

Set up which “calling number” to send to the public safety access point when an emergency call is placed from an IP phone.

Instructions

You use the Station screen to set up emergency call handling options for IP phones. As an example, we’ll administer the option that prevents emergency calls from an IP phone.

To prevent an emergency call from an IP phone:

1. Type **change station *nnnn*** and press enter, where ***nnnn*** is the extension of the phone you want to modify.

The station screen appears.

```

change station 1014                                     Page 1 of X
                                                    STATION
Extension: 1014          Lock Messages? n          BCC:
Type:                   Security Code:             TN:1
Port:                   Coverage Path 1:           COR: 1
Name:                   Coverage Path 2:

STATION OPTIONS
    Loss Group: 2          Personalized Ringing Pattern: 3
    Data Module? n        Message Lamp Ext: 1014
    Speakerphone: 2-way   Mute button enabled? y
    Display Language? English Media Complex Ext:
                                IP Softphone? y
                                Remote Office Station? n
                                IP Emergency calls: block
    
```

2. Type **block** in the IP Emergency calls field and press RETURN to save your changes.

Adding an IP Softphone

Avaya IP Softphones enable the end user to control telephone calls directly from a personal computer (PC). An end user can log into your company's MultiVantage server remotely and make and receive telephone calls from the telephone extension.

Avaya IP Softphone supports the following two configurations:

- road-warrior application

You typically use this configuration for laptop users who are travelling. In this configuration, the PC LAN connection carries both the call control signaling and the voice path. Because voice calls are routed over the connection to the PC, you'll need a headset connected to the PC or a handset that plugs into the PC's sound card, to speak and hear sounds.

- telecommuter application or Avaya IP Agent

For the telecommuter or Avaya IP Agent configuration, you make two separate connections to the DEFINITY server. The signaling path is carried over an IP network and the voice path is carried over the standard circuit-switched telephone network (PSTN). Since you are using a phone for audio, you do not need an H.323 PC audio application.

The telecommuter configuration uses the Avaya IP Softphone interface (on the user's PC) and a standard phone. The Avaya IP Agent configuration uses the Avaya IP Agent interface (on the agent's PC) and a call center phone, such as a CallMaster.

Tip:

Use status station to show the part (product) ID, serial number and the audio connection method used by existing stations.

Before you start

Be sure that your system has been enabled to use IP Softphones. Display the System Parameters Customer-Options screen and verify the following field settings:

- Maximum Concurrently Registered IP Stations is greater than 0
- IP Stations field is **y**
- Information has been entered in the fields on the Maximum IP Registrations by Product ID page

Be sure that your DEFINITY R, CSI, SI, and S8100 Media Server has a CLAN board and an IP Media Processor board.

Once you're finished administering your MultiVantage system, you need to install the IP Softphone software on each user's PC.

Instructions for adding a road-warrior application

You can use the road-warrior application when you have only a single telephone line available to access the MultiVantage system over the IP network.

You also can "take over" an IP phone. Typically you would not have a different extension for your softphone. When you log in, the softphone takes over the existing phone extension (turn the DCP or IP phone off). During this time, that DCP or IP phone is out of service. This is accomplished if, on the Station screen, the IP Softphone field is **y**.

We will add a road-warrior application at extension 3001. Except for single-connect IP phones, you have to actually administer two extensions for each road-warrior application. We will first add an H.323 extension at 3000.

To assign an H.323 extension, complete the following steps:

1. Type **add station 3000** and press RETURN.

The **Station** screen appears.

```

add station 3000                                     Page 1 of 3
                                                    STATION
Extension: 3000                                     Lock Messages? n      BCC: 0
  Type: H.323                                       Security Code:         TN: 1
  Port: IP                                           Coverage Path 1:      COR: 1
  Name:                                               Coverage Path 2:      COS: 1
                                                    Hunt-to Station:      Tests? y

STATION OPTIONS
  Loss Group: 2
    
```

2. In the Type field, enter **H.323**.
3. Press ENTER to save your work.

Now, you need to administer the phone (DCP) extension. To do so, complete the following steps:

1. Type **add station 3001** and press RETURN.

The **Station** screen appears. Note that you choose to change an existing DCP extension by using **change station nnnn** in this step, where *nnnn* is the existing DCP extension.

```

add station 3001                                     Page 1 of 4
                                                    STATION
Extension: 3001                                     Lock Messages? n      BCC: 0
Type: 6408D                                         Security Code: *      TN: 1
Port: X                                             Coverage Path 1:     COR: 1
Name:                                               Coverage Path 2:     COS: 1
                                                    Hunt-to Station:

STATION OPTIONS
    Loss Group: 2                                     Personalized Ringing Pattern: 1
    Data Module? n                                   Message Lamp Ext: 3000
    Speakerphone: 2-way                             Mute Button Enabled? y
    Display Language: english

                                                    Media Complex Ext: 3000
                                                    IP Softphone? y
    
```

2. In the Type field, enter the model of phone you want to use, such as **6408D**.
3. In the Port field, type **x** for virtual phone or enter the port number if there is hardware.
4. In the Security Code field, enter the password for this remote user, such as **1234321**.

This password can be up to 7 digits in length.

5. In the Media Complex Ext field, type **3000**.
This is the H.323 extension we just administered.
6. In the IP Softphone field, type **y**.
7. On page 2, in the Service Link Mode field, type **as-needed**.
Set this field to **permanent** only for extremely busy remote phone users, such as call center agents.
8. In the Multimedia Mode field, type **enhanced**.
9. Press ENTER to save your work.

Now you can install and configure the software on the user's PC. In this example, the user will login by entering their DCP extension (3001) and password (1234321).

Fixing problems

Problem	Possible causes	Solutions
Display characters on the phone can not be recognized.	Microsoft Windows is not set to use Eurofont characters.	Set the Microsoft Windows operating system to use Eurofont.

Instructions for adding a telecommuter application

Assign this configuration to remote users who have two available phone lines. For example, to administer a telecommuter application for a home user at extension 3010, complete the following steps:

1. Type **add station** 3010 and press RETURN.

The **Station** screen appears.

NOTE:

Use the **add station** command if this is a new DCP extension. Use the **change station** command for an existing DCP extension and ignore steps 2 and 3.)

2. In the Port field, type **x** for virtual phone or enter the port number if there is hardware.
3. In the Security Code field, enter the password for this remote user, such as **1234321**.

This password can be up to 7 digits in length.

4. In the IP Softphone field, type **y**.
5. On page 2, in the Service Link Mode field, type **as-needed**.
Set this field to **permanent** only for extremely busy remote phone users, such as call center agents.
6. In the Multimedia Mode field, type **enhanced**.
7. Press ENTER to save your work.

Now you can install and configure the software on the user's PC. In this example, the user will login by entering their DCP extension (3010) and password (1234321).

Setting up remote office

MultiVantage remote office provides IP processing capabilities to traditional call handling for voice and data between MultiVantage and offices with remote office hardware. You need to add the remote office information as a node on the MultiVantage, add extensions, set up the trunk and signaling groups.

Before you start

Be sure the following fields on the Feature Related System Parameters Customer Options screen are set to **y** or completed. If not, contact your Avaya representative.

- Maximum Administered Remote Office Trunks
- Maximum Administered Remote Office Stations
- Product ID registration limit
- Remote Office
- IP station
- ISDN-PRI
- IP trunks
- Softphone

Also, be sure your remote office hardware is installed and administered at the remote location. You need the following information from the remote administration:

- IP address
- Password

Adding remote office to Avaya MultiVantage Solution

In our example, we'll set up a remote office location using Avaya R300 Remote Office Communicator hardware in our branch office in Santa Fe. We'll add a new node, and set up the signaling group and trunk group.

Adding a node

Instructions

To add the remote office node to MULTIVANTAGE:

1. Type **change node-names IP** and press RETURN.

The Node Name screen appears.

```
change node-names ip                                     Page 1 of 1
                                     IP NODE NAMES
Name          IP Address          Name          IP Address
default       0 .0 .0 .0          _____    _____.____.____.____
remote office 134.23.107.22 _____    _____.____.____.____
_____       _____.____.____.____ _____    _____.____.____.____
_____       _____.____.____.____ _____    _____.____.____.____

```

Screen 1. IP Node Names

2. In the Name field, type in a word to identify the node.
In our example, type **Remote 6**.
3. In the IP address field, type in the IP address to match the one on the Avaya R300 administration.
4. Press ENTER to save your changes.

5. Type **add remote office** and the number for this remote office, and press RETURN.

The remote office screen appears.

```
add remote-office 6                                     Page 1 of 1
                                                    REMOTE OFFICE 6

Node Name: Remote Office 6
Network Region: 22
  Location: 1
Site Data: Contact: Joe Smith
           Phone: xxx-yyy-zzz
           _____
```

Screen 2. Remote Office

6. Fill in the following fields:
 - Node Name - match the name on the IP Node Names screen.
 - Network Region - this must match the network region on the IP-Interface screen for the circuit packs that connect this remote office. Use **display ip-interfaces** to find this information.
 - Location - match the one set up on the Location screen for this remote office.
 - Site Data - identify the street address or identifier you want to use
7. Press ENTER to save your changes.

Tip:

Use **status remote office** to verify that your switch recognizes the remote office information. It also displays the extensions and signaling group you administer next.

Setting up a trunk group

You can modify an existing trunk group or add a new one. In our example, we'll add trunk group 6.

Before you start

Perform [“Setting up a signaling group”](#) on page 122.

To set up the trunk group for your remote office:

1. Type **add trunk group 6**.

The Trunk Group screen appears.

```

add trunk-group next                                     Page 1 of x
                                     TRUNK GROUP
Group Number: 6                                     Group Type: ISDN           CDR Reports: _
Group Name: Remote office 6                       COR: _                   TN: _         TAC: 6
Direction: _____ Outgoing Display? _         Carrier Medium: IP
Dial Access? _                                     Busy Threshold: _         Night Service: _____
Queue Length: _____ Incoming Destination: _____
Comm Type: _____ Auth Code? _
                                     Trunk Flash? _
                                     BCC: _           ITC? _____

```

2. In the Group type field, type ISDN.
ISDN-PRI or ISDN-BRI must be y on the System Parameters Customer Options screen.
3. In the TAC field, type in the trunk access code that conforms to your dial plan.
4. In the Carrier Medium field, type **IP** (Medpro).
5. In the Dial Access field, type **y**.
6. In the Service type field, type **tie**.
7. In the Signaling Group field, type in the signaling group you created.
8. Press ENTER to save your changes.

Setting up a signaling group

Each Remote Office has own listen port and signaling group. Set up a new trunk group, or use an existing trunk group administered for H.323 signaling.

Instructions

Set up the signaling group for remote office:

1. Type **add signaling-group** and the number of the group you want to add.
The signaling group screen appears.

```

add signaling-group 6                                     Page 1 of 5
                                                    SIGNALING GROUP

Group Number 6           Group Type: H.323
                        Remote Office? y       Max Number of NCA TSC: ___
                                                    Max number of CA TSC: ___
                                                    Trunk Group for NCA TSC: ___

Trunk Group for Channel Selection: 6
Supplementary Service Protocol: _

Near-end Node Name:  clan           Far-end Node Name: remote office 6
Near-end Listen Port: 5001         Far-end Listen Port:5055

LRQ Required? _           Calls Share IP Signaling Connection? _
RRQ Required? y           Bypass If IP Threshold Exceeded? _

                                                    Interworking Message: _____
    
```

2. In the Group Type field, type **H.323**.
3. In the Remote Office field, type **y**.
4. In the Trunk Group for Channel Selection, type the number of the trunk you set up for the remote office.
5. In the Near-end Node Name, identify the node name assigned to the CLAN that supports the R300.
6. In the Far-end Node Name, identify the node name assigned to the CLAN that supports the R300.
7. In the Near-end Listen port, type a port number in the 5000-9999 range.
8. In the Far-end Listen Port field, type **1720**. See *DEFINITY® Enterprise Communications Server Release 1.1 Getting Started with the Avaya R300 Remote Office Communicator* for more details.
9. In the RRQ field, type **y**.
10. Tab to the Direct IP-IP Audio Connection field on another page of this screen and type **y**.
11. Press ENTER to save your changes.

Setting up remote office on network regions

Now we will set up a network region and show the connections between regions.

Instructions

Set up network region 1:

1. Type **add ip-network-region 1** and press ENTER.

The IP Network Region screen appears.

```

change ip-network-region 1                                     Page 1 of 2

                                IP Network Region

Region: 1
Name: Denver main

VoIP Media 802.1p Priority: 6                             Retry upon RSVP Failure Enabled? y
802.1Q VLAN: 0                                           RSVP Profile: guaranteed-service
    
```

2. In the Name field, describe the region you are setting up.
3. In the Codec Set field, type the codec set you want to use in this region.
4. In the UDP Port Range, type the range of the UDP port number to be used for audio transport.
5. In the Direct IP-IP Audio Connections field, type **y**.
6. Move to page 2 to set up connections between regions and assign codecs for inter-region connections.

```

change ip-network-region 1
Inter Network Region Connection Management
Page 2 of 2

Region
          (Group of 32)
1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2
001-032 1 - - 2 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
033-064 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
065-096 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
097-128 - - 5 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
129-160 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
161-192 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
193-224 6 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
225-250 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
  
```

The following connections are administered in this example:

- codec-set 2 is used between region 1 and region 4
- codec-set 5 is used between region 1 and region 99
- codec-set 6 is used between region 1 and region 193.

Now you need to assign the region number to the CLAN circuit pack. All the endpoints registered with a specific CLAN circuit pack belong to the CLAN's region. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

Adding phones to remote office

Be sure the extensions you add fit your dialing plan.

Instructions

1. Type **add station nnnn** and press ENTER, where nnnn is the extension you are adding.

The station screen appears.

```

add station 6001                                     Page 1 of X
                                                    STATION
Extension: 1014                                     Lock Messages? n      BCC: 0
Type: 8410D                                         Security Code: 1234567 TN: 1
Port: x                                              Coverage Path 1: ___  COR: 1
Name: Remote main                                   Coverage Path 2: ___  COS: 1
                                                    Map-to Station:
                                                    Hunt-to-Station: _____

STATION OPTIONS
    Loss Group: _                                     Personalized Ringing Pattern:
    Data Module? n                                   Message Lamp Ext: 6001
    Speakerphone: 2-way                             Mute button enabled? y
    Display Language? English
                                                    Media Complex Ext:
                                                    IP Station? n
                                                    Remote Office Phone? y
    
```

2. In the Type field, type in the model of the phone you are adding.
3. In the Port field, type **x**.
This indicates that there is no hardware associated with the port assignment.
4. In the Name field, identify the phone for your records.
5. In the Security Code field, match the password set up on the Remote Office administration.
6. In the Remote Office Phone field, type **y**.
7. Press ENTER to save your changes.

Tip:

*You can set up a telnet session on your remote office administration program to verify that the phone is registered. See **DEFINITY® Enterprise Communications Server Release 1.1 Getting Started with the Avaya R300 Remote Office Communicator** for details.*

2420 DCP telephone

Downloading firmware to a 2420 DCP telephone

You can copy updated application code into ACP via TFTP over a TCP/IP connection. This eliminates the need to physically remove the telephone and send it to the factory for the firmware update. This feature is available on all Avaya MultiVantage platforms.

Before you start

1. Type **change node-name ip** and press ENTER.
The IP Node Names screen appears.
2. Administer the TFTP server node name and the local node name (CLAN) and IP address.
3. Press ENTER to save your changes.
4. Type **change ip-interfaces** and press ENTER.
The IP Interfaces screen appears.
5. Administer the CLAN ethernet interface or processor CLAN.
6. Press ENTER to save your changes.

File download to the switch

1. File is placed on TFTP server using TFTP, FTP, HTTP or another file transfer program.
2. Log into SAT and enter **change tftp-server** and press ENTER.

The TFTP Server Configuration screen appears.

```
change tftp-server                                     Page 1 of 1
                                     TFTP Server Configuration

Local Node Name:
TFTP Server Node Name:
TFTP Server Port: 69
File to Retrieve:

File Status:
File Size:
Filename in Memory:
```

3. In the Local Node Name field, enter the valid local node name from the IP Node Names screen.

The node must be assigned to a CLAN ip-interface or **procr** (processor CLAN).

4. In the TFTP Server Node Name field, enter the valid TFTP server node name from the IP Nodes Names screen.
5. In the TFTP Server Port field, enter the TFTP server port number from where the file download begins.
6. In the File to Retrieve field, enter the name of the file to be retrieved.
7. Press ENTER to save your changes.
The file transfer begins.
8. Enter **display tftp-server** and press ENTER to view the status of the file transfer.
“File download successful” message appears when the file transfer completes. It also displays the file size and the file name in memory.

File download to the 2420 DCP telephone

Before you start

You must have console permissions to download someone else’s phones.

NOTE:

Steps 1 through 3 need be done only once to set up the FAC for file downloads. Thereafter, start at step 4 to download files.

1. Type change feature-access-codes and press ENTER.
2. In the Station Firmware Download Access Code field, enter *36.
This number can be any valid FAC as defined in the dial plan.
3. Press ENTER to save your changes.
4. Take the 2420 DCP phone off-hook.
5. Dial the Station Firmware Download FAC (for instance, *36).
6. Press # if you are dialing from the target station (or dial the phone’s extension to be downloaded).
7. Place the phone on-hook within 4 seconds after the confirmation tone.

The phone is placed in a busy-out state (not able to make or receive calls) and displays “Firmware Download in Progress”, the amount of the file downloaded, and a timer. The phone displays error messages and a success message before rebooting.

8. When the download completes, the phone reboots and is released from the busy-out state.

This section provides generic instructions for adding any feature button. Because you may need more information to decide which feature buttons you want to assign to a user or group of users, we included the [Telephone feature buttons](#) table in this section. This table lists all of the feature buttons that are available on the Avaya MultiVantage solution.

After the list of feature buttons, we included several procedures that explain how to set up the specific feature buttons that require special treatment or considerations.

Adding feature buttons

Once you add a phone to the system, you can use the station screen to change the settings for the phone, such as adding or changing feature button assignments. The system allows you to assign features or functionality to each programmable button. It is up to you to decide which features you want for each phone and which feature you want to assign to each button.

⇒ NOTE:

If you have 6400-series phones, your users can administer some of their own feature buttons. See [“Setting up Terminal Self Administration”](#) on page 160 for more information.

Instructions

To assign feature buttons:

1. Type **change station *nnnn*** and press ENTER, where *nnnn* is the extension for the phone you want to modify.

The **Station** screen appears.

2. Press NEXT PAGE until you locate the Feature Button Assignment fields.

Some phones have several feature button groups. Make sure that you are changing the correct button. If you do not know which button on the phone maps to which button-assignment field, see your phone's manual, or see ["Phone reference" on page 1387](#).

3. Move the cursor to the field you want to change.
4. Type the button name that corresponds to the feature you want to add.

To determine feature button names, press HELP or refer to ["Telephone feature buttons" on page 131](#).

5. Press ENTER to save your changes.

Some phones have default assignments for buttons. For example, the following figure shows that the 8411D includes defaults for 12 softkey buttons. It already has assignments for features like Leave Word Calling and Call Forwarding.

If you do not use an alias, you can easily assign different features to these buttons if you have different needs.

If you use an alias you must leave the default softkey button assignments. The system allows you to change the button assignments on the screen and the features work on the alias phone, however the labels on the display do not change.

```

                                     STATION
SOFTKEY BUTTON ASSIGNMENTS
1: lwc-store
2: lwc-cancel
3: auto-cback
4: timer

6: call-park
7: date-time
8: priority
9: abr-prog
10: abr-spchar Char: ~p
11: abr-spchar Char: ~m
12: abr-spchar Char: ~w
    
```

Telephone feature buttons

The following table provides descriptions of the feature buttons that you can administer on multiappearance telephones. It also lists the administrable software names and recommended button label names. Display buttons support telephones equipped with alphanumeric displays. Note that some buttons may require 1-lamp or 2-lamp buttons. Some buttons are not allowed on some systems and on some phones.

Table 3. Telephone feature buttons

Button name	Button label	Description	Maximum
abr-prog	AbrvDial Program	Abbreviated Dialing Program: allows users to program abbreviated dialing and autodial buttons or to store or change numbers in a personal list or group list associated with the station.	1 per station
abr-spchar	AbrvDial (char)	Abbreviated Dialing Special Character: allows users to enter an associated special character [~, ~m (mark), ~p (pause), ~s (suppress), ~w (wait for dial tone), or ~W (wait forever)] when programming an abbreviated dialing list entry.	1 each per station
abrdg-appr (Ext: ____)	(extension)	Bridged Appearance of an analog phone: allows the user to have an appearance of a single-line telephone extension. Assign to a 2-lamp appearance button.	Depends on station type
abrv-dial (List: __ DC: __)	AD	Abbreviated Dialing: dials the stored number on the specified abbreviated dialing list. List: specify the list number 1 to 3 where the destination number is stored DC: specify the dial code for the destination number	1 per AD list per dial code
abrv-ring	AR	Abbreviated and Delayed Ringing: allows the user to trigger an abbreviated or delayed transition for calls alerting at an extension.	

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
ac-alarm	AC Alarm	Administered Connection alarm notification: allows the user to monitor when the number of failures for an administered connection has met the specified threshold.	1 per station
aca-halt	Auto-Ckt Assure	Automatic Circuit Assurance (<i>display button</i>): allows users of display telephones to identify trunk malfunctions. The system automatically initiates a referral call to the telephone when a possible failure occurs. When the user presses ACA Halt, the system turns off ACA monitoring for the entire system. The user must press ACA Halt again to restart monitoring.	1 per system
account	Acct	Account: allows users to enter Call Detail Recording (“CDR”) account codes. CDR account codes allow the system to associate and track calls according to a particular project or account number.	
admin	Admin	Administration: allows a user to program the feature buttons on their 6400-series telephone.	
after-call Grp:___	After Call Work	After Call Work Mode: allows an agent to temporarily be removed from call distribution in order for the agent to finish ACD-related activities such as completing paperwork. Grp: specify the ACD split group number.	1 per split group
alrt-agchg	Alert Agent	Alert Agent: indicates to the agent that their split/skill hunt group changed while active on a call. This button blinks to notify the agent of the change.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
alt-frl	Alt FRL	Alternate Facility Restriction Level (“FRL”): activates or deactivates an alternate facility restriction level for the extension.	1 per system
ani-request	ANI Request	Automatic Number Identification Request: allows the user to display the calling party’s number from incoming trunks during the voice state of call. The trunk must support this functionality.	1 per station
assist (Group: __)	Assist	Supervisory Assistance: used by an ACD agent to place a call to a split supervisor. Group: specify the ACD split group number.	1 per split group
asvn-halt	asvn-halt	Authorization Code Security Violation Notification: activates or deactivates call referral when an authorization code security violation is detected.	1 per system
atd-qcalls	AQC	Attendant Queue Calls (display button): tracks the number of calls in the attendant group’s queue and displays the queue status. Assign this button to any user who you want to backup the attendant.	1 per station
atd-qtime	AQT	Attendant Queue Time (display button): tracks the calls in the attendant group’s queue according to the oldest time a call has been queued, and obtains a display of the queue status.	1 per station
aut-msg-wt (Ext: __)	Message (name or ext #)	Automatic Message Waiting: associated status lamp automatically lights when an LWC message has been stored in the system for the associated extension (can be a “VDN”). This lamp will not light on the mapped-to physical station for messages left for virtual extensions.	1 per aut-mst-ext

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
auto-cback	Auto CallBack	Automatic Call Back: when activated, allows inside user who placed a call to a busy or unanswered telephone to be called back automatically when the called telephone becomes available to receive a call.	1 per station
auto-icom (Group: __)	Auto (name or ext #)	Automatic Intercom: places a call to the station associated with the button. The called user receives a unique alerting signal, and a status lamp associated with a Intercom button flashes. Grp: Intercom — Auto-Icom group number. This extension and destination extension must be in the same group.	1 per group per dial code
auto-in (Group: __)	Auto In	Auto-In Mode: allows the user to become automatically available for new ACD calls upon completion of an ACD call. Grp: The split group number for ACD.	1 per split group
auto-wkup	Auto Wakeup	Automatic Wakeup (<i>display button</i>): allows attendants, front-desk users, and guests to request a wakeup call to be placed automatically to a certain extension (may not be a VDN extension) at a later time.	1 per station
autodial	Autodial	Allows a user to dial a number that is not part of a stored list.	
aux-work (Group: __)	Auxiliary Work	Auxiliary Work Mode: removes agent from ACD call distribution in order to complete non-ACD-related activities. Grp: The split group number for ACD.	1 per split group

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
brdg-appr (Btn: __ Ext: __)	(extension)	<p>Bridged Call Appearance: provides an appearance of another user's extension on this telephone. For example, an assistant might have a bridged appearance of their supervisor's extension. The bridged appearance button functions exactly like the original call appearance, for instance it indicates when the appearance is active or ringing.</p> <p>You can assign brdg-appr buttons only to 2-lamp appearance buttons. You must indicate which extension and which call appearance button the user wants to monitor at this phone.</p>	Depends on station type
btn-view	Button View	<p>Button View: allows users to view, on the phone's display, the contents of any feature button. Button View does more than the "View" or "stored-num" feature button; these only display what is contained in abbreviated dialing and autodial buttons.</p> <p>When the user presses the btn-view button and then a specific feature button, they see the feature name and any auxiliary data for that button. This allows users to review the programming of their feature buttons.</p> <p>You can assign this soft-key button to any 6400-, 7400-, or 8400-series display telephone.</p>

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
busy-ind (TAC/Ext: __)	Busy	<p>Busy Indication: indicates the busy or idle status of an extension, trunk group, terminating extension group (“TEG”), hunt group, or loudspeaker paging zone. Users can press the busy-ind button to dial the specified extension.</p> <p>You can assign this button to any lamp button and must specify which Trunk or extension the user wants to monitor.</p>	1 per TAC/Ext
call-appr	<i>extension</i>	Call Appearance: originates or receives calls. Assign to a 2-lamp appearance button.	Depends on station type
call-disp	Return Call	Call Displayed Number (<i>display button</i>): initiates a call to the currently displayed number. The number may be from a leave word calling message or a number the user retrieved from the Directory.	1 per station
call-fwd (Ext: ___)	Call Forwarding	Activates or deactivates Call Forwarding All Calls.	1 per station
call-park	Call Park	Allows the user to place the current call in the call park state so it can be retrieved from another phone.	1 per station
call-pkup	Call Pickup	Allows the user to answer a call that is ringing in the user’s pickup group.	1 per station
call-timer	CTime	Used only on the 6400 sets. Allows users to view the duration of the call associated with the active call appearance button.	1 per station
callr-info	Caller Info	(<i>display button</i>) Used with Call Prompting to allow users to display information collected from the originator.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
cas-backup	CAS Backup	Centralized Attendant Service Backup: used to redirect all “CAS” calls to a backup extension in the local branch if all RLTs are out-of-service or maintenance busy. The associated status lamp indicates if CAS is in the backup mode.	1 per station
cdr1-alm	CDR 1 Failure	CDR Alarm: associated status lamp is used to indicate that a failure in the interface to the primary CDR output device has occurred.	1 per station
cdr2-alm	CDR 2 Failure	CDR Alarm: associated status lamp is used to indicate that a failure in the interface to the secondary CDR output device has occurred.	1 per station
cfwd-bsyda	Call Forwarding bsyda (Ext)	Call Forward Busy/Don’t Answer: activates and deactivates call forwarding for calls when the extension is busy or the user does not answer.	
check-in	Check In	Check In (<i>display button</i>): changes the state of the associated guest room to occupied and turns off the outward calling restriction for the guest room’s station.	1 per station
check-out	Check Out	Check Out (<i>display button</i>): Changes the state of the associated guest room to vacant and turns on the outward calling restriction for the guest room’s station. Also clears (removes) any wake-up request for the station.	1 per station
clk-overid	Clocked Override	Clocked Manual Override (<i>display button</i>): used in association with Time of Day Routing to override the routing plan in effect for the activating user. The routing plan is overridden for a specified period of time.	1 per station

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
conf-dsp	Conference Display	Allows a user to display information about each party of a conference call. This button can be assigned to stations and attendant consoles.	1 per station
consult	Consult	The Consult button allows a covering user, after answering a coverage call, to call the principal (called party) for private consultation. Activating Consult places the caller on hold and establishes a private connection between the principal and the covering user. The covering user can then add the caller to the conversation, transfer the call to the principal, or return to the caller.	1 per station
cov-cback	Coverage Callback	Allows a covering party to store a leave word calling message for the principal (called party).	1 per station
cov-msg-rt	Covr Msg Retrieve	Coverage Message Retrieval (<i>display button</i>): places a covering station into the message retrieval mode for the purposes of retrieving messages for the group.	1 per station
cpn-blk	CPN Block	Blocks the sending of the calling party number for a call.	1 per station
cpn-unblk	CPN Unblock	Deactivates calling party number (“CPN”) blocking and allows the CPN to be sent for a single call.	1 per station

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
crss-alert	Crisis	<p>Crisis Alert (<i>display button</i>): provide this button to the telephones or consoles that you want to notify when any user makes an emergency call. (You define which calls are emergency calls on the AAR/ARS Analysis screen by setting the Call Type to alrt.)</p> <p>After a user receives an alert, they can press the crss-alert button to disable the current alert.</p> <p>If tenant partitioning is active, the attendants within a partition can receive emergency notification only from callers in the same partition.</p>	<p>1 per station</p> <p>10 per system</p>
data-ext	Data (data ext #)	Data Extension: sets up a data call. May be used to pre-indicate a data call or to disconnect a data call. May not be a VDN or ISDN-BRI extension.	1 per data-extension group
date-time	Date Time	Date and Time (<i>display button</i>): displays the current date and time. Do not assign this button to 6400-series display phones as they normally show the date and time.	1 per station
delete-msg	Delete Message	Delete message (<i>display button</i>): deletes a stored message that is currently on the display.	1 per station
dial-icom (Grp: ____)	Dial Icom	Dial Intercom: accesses the intercom group assigned to the button. Grp: Intercom — Dial (Dial Icom) group number.	1 per group
did-remove	DID Remove	DID Remove (<i>display button</i>): allows “DID” assignments to be removed.	1 per station
did-view	DID View	DID View (<i>display button</i>): allows DID assignments to be displayed and changed. Allows choice between XDID and XDIDVIP numbers.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
directory	Directory	<p>Directory (<i>display button</i>): allows users with display telephones to access the system directory, use the touch-tone buttons to key in a name, and retrieve an extension from the directory. The directory contains the names and extensions that you have assigned to the telephones administered in your system.</p> <p>If you assign a directory button, you should also assign a Next and Call-Disp button to the phone. These buttons allow the user to navigate within the directory and call an extension once they find the correct one.</p> <p>Note that Vector Directory Numbers do not appear in the Directory.</p>	1 per station
dir-pkup	dir-pkup	Directed call pickup: allows the user to answer a call ringing at another extension without having to be a member of a pickup group.	
disp-chnrg	Display Charge	Provides your display phone with a visual display of accumulated charges on your current telephone call. Used exclusively outside the U.S. and Canada.	1 per station
disp-norm	Local/ Normal	Normal (<i>display button</i>): Toggles between LOCAL display mode (displays time and date) and NORMAL mode (displays call-related data). LED off = LOCAL mode and LED on = NORMAL.	1 per station
dn-dst	Do Not Disturb	Places the user in the do not disturb mode.	1 per station
drop	Drop	Allows users to drop calls. Users can drop calls from automatic hold or drop the last party they added to a conference call.	

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
exclusion	Exclusion	<p>Exclusion: allows multiappearance telephone users to keep other users with appearances of the same extension from bridging onto an existing call.</p> <p>If the user press the EXCLUSION button while other users are already bridged onto the call, the other users are dropped.</p> <p>There are two means of activating exclusion.</p> <ul style="list-style-type: none"> ■ Manual Exclusion — when the user presses the EXCLUSION button (either before dialing or during the call). ■ Automatic Exclusion — as soon as the user picks up the handset. To turn off Automatic Exclusion during a call, the user presses the EXCLUSION button. To use Automatic Exclusion, set the Automatic Exclusion by COS field to y on the Feature-Related System Parameters screen. 	1 per station
ext-dn-dst	Do Not Disturb Ext	Extension — Do Not Disturb (<i>display button</i>): used by the attendant console or hotel front desk display phone to activate do not disturb and assign a corresponding deactivate time to an extension.	1 per station
fe-mute	Far End Mute for Conf	Allows a user to mute a selected party on a conference call. This button can be assigned to stations and attendant consoles.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
flash	Flash	1) Allows a station on a trunk call with Trunk Flash to send a Trunk Flash signal to the far end (e.g., Central Office); 2) allows a station on a CAS main call to send a Trunk Flash signal over the connected RLT trunk back to the branch to conference or transfer the call.	1 per station
goto-cover	Go To Cover	<p>Go To Coverage: sends a call directly to coverage instead of waiting for the called inside-user to answer. Go to Cover forces intercom and priority calls to follow a coverage path.</p> <p> NOTE: Go to Cover cannot be activated for calls placed to a Vector Directory Number extension. Go to Cover can be used to force a call to cover to a VDN if the called principal has a VDN as a coverage point.</p>	1 per station
grp-dn-dst	Do Not Disturb Grp	Group Do Not Disturb (<i>display button</i>): places a group of phones into the do not disturb mode.	1 per station
grp-page (Number:___)	GrpPg	Allows users to make announcements to groups of stations by automatically turning on their speakerphones. Number: The extension of the page group.	
headset	Headset	Signals onhook/offhook state changes to the switch. The green LED is on for offhook state and off (dark) for onhook state.	
hunt-ns (Grp: ___)	Hunt Group	Hunt-Group Night Service: places a hunt-group into night service. Grp: Hunt group number.	3 per hunt group

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
in-call-id (Type: __ Grp: ___)	Coverage (group #, type, name, or ext #)	<p>The Coverage Incoming Call Identification (“ICI”) button allows a member of a coverage answer group or hunt group to identify an incoming call to that group even though the member does not have a display telephone.</p> <p>In the Type field, enter c for coverage answer groups and type of h for a hunt group. In the Grp field, enter the group number.</p>	1 per group-type per group
inspect	Inspect Mode	Inspect (<i>display button</i>): allows users on an active call to display the identification of an incoming call. Inspect also allows users to determine the identification of calls they placed on Hold.	1 per station
int-aut-an	IntAutoAns	Internal Automatic Answer: causes any hybrid or digital station to automatically answer incoming internal calls.	1 per station
last-numb	LastNumb Dialed	Last Number Dialed (redial): originates a call to the number last dialed by the station.	1 per station
lic-error	License Error	License-Error: indicates a major License File alarm. Pressing the button does not make the light go out. The button goes out only after the error is cleared and the switch returns to License-Normal Mode. You can administer this button on phones and attendant consoles.	1 per phone 20 per system (Server CSI/ Server SI) 30 per system (Server R)

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
link-alarm (link# ___)	Link Failure (link #)	Link Alarm: associated status lamp indicates that a failure has occurred on one of the Processor Interface circuit pack data links. Link: Link number — 1 to 8 for multi-carrier cabinets or 1 to 4 for single-carrier cabinets.	8 per station
lsvn-halt	Login SVN	Login Security Violation Notification: activates or deactivates referral call when a login security violation is detected.	1 per system
lwc-cancel	Cancel LWC	Leave Word Calling Cancel: cancels the last leave word calling message originated by the user.	1 per station
lwc-lock	Lock LWC	Leave Word Calling Lock: locks the message retrieval capability of the display module on the station.	1 per station
lwc-store	LWC	Leave Word Calling Store: leaves a message for the user associated with the last number dialed to return the call to the originator.	1 per station
major-alm	Major Hdwe Failure	Major Alarm: assign to a status lamp to notify the user when major alarms occur. Major alarms usually require immediate attention.	1 per station
man-msg-wt (Ext: ___)	Msg Wait (name or ext #)	Manual Message Waiting: allows a multiappearance telephone user to press a button on their telephone in order to light the Manual Message Waiting button at another telephone. You can administer this feature only to pairs of telephones, such as an assistant and an executive. For example, an assistant can press the man-msg-wt button to signal the executive that they have a call.	None

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
man-overid (TOD: _)	Immediate Override	Immediate Manual Override (<i>display button</i>): allows the user (on a system with Time of Day Routing) to temporarily override the routing plan and use the specified “TOD” routing plan. TOD: specify the routing plan the user wants to follow in override situations.	1 per station
manual-in (Group: __)	Manual In	Manual-In Mode: prevents the user from becoming available for new ACD calls upon completion of an ACD call by automatically placing the agent in the after call work mode. Grp: The split group number for ACD.	1 per split group
mct-act	MCT Activation	Malicious Call Trace Activation: sends a message to the “MCT” control extensions that the user wants to trace a malicious call. MCT activation also starts recording the call, if your system has a MCT voice recorder.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
mct-contr	MCT Control	<p>Malicious Call Trace Control: allows the user to take control of a malicious call trace request. Once the user becomes the MCT controller, the system stops notifying other MCT control extensions of the MCT request.</p> <p> NOTE: To add an extension to the MCT control group, you must also add the extension on the “Extensions Administered to have an MCT-Control Button” screen.</p> <p>When the user presses the MCT Control button, the system first displays the called party information. Pressing the button again displays the rest of the trace information.</p> <p>The MCT controller must dial the MCT Deactivate feature access code to release control.</p>	1 per station
mf-da-intl	Directory Assistance	Multifrequency Operator International: allows users to call Directory Assistance.	1 per station
mf-op-intl	CO attendant	Multifrequency Operator International: allows users to make international calls to the CO attendant.	1 per station
mj/mn-alm	Maj/Minor Hdwe Failure	Minor Alarm: assign to a status lamp to notify the user when minor or major alarms occur. Minor alarms usually indicate that only a few trunks or a few stations are affected.	1 per station
mm-basic	MM Basic	Multimedia Basic: used to place a multimedia complex into the “Basic” mode or to return it to the “Enhanced” mode.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
mm-call	MM Call	Multimedia Call: used to indicate a call is to be a multimedia call.	1 per station
mm-cfwd	MM CallFwd	Multimedia Call Forward: used to activate forwarding of multimedia calls as multimedia calls, not as voice calls.	1 per station
mm-datacnf	MM Datacnf	Multimedia Data Conference: used to initiate a data collaboration session between multimedia endpoints; requires a button with a lamp.	1 per station
mm-multnbr	MM MultNbr	Indicate that the user wants to place calls to 2 different addresses using the 2 B-channels.	1 per station
mm-pcaudio	MM PCAudio	Switches the audio path from the telephone (handset or speakerphone) to the “PC” (headset or speakers/microphone).	1 per station
msg-retr	Message Retrieve	Message Retrieval (<i>display button</i>): places the station’s display into the message retrieval mode.	1 per station
mwn-act	Message Waiting Act.	Message Waiting Activation: lights a message waiting lamp on an associated station.	1 per station
mwn-deact	Message Waiting Deact	Message Waiting Deactivation: dims a message waiting lamp on an associated station.	1 per station
next	Next	Next (<i>display button</i>): steps to the next message when the phone’s display is in Message Retrieval or Coverage Message Retrieval mode. Shows the next name when the phone’s display is in the Directory mode.	1 per station
night-serv	Night Serv	Night Service Activation: toggles the system in or out of Night Service mode.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
noans-ahrt	RONA	Redirection on No Answer Alert: indicates a Redirection on No Answer timeout has occurred for the split.	1 per hunt group
no-hld-cnfr	No Hold Conference	No Hold Conference: can automatically conference another party while continuing the existing call.	1 per station
normal	Normal Mode	Normal (<i>display button</i>): places the station's display into normal call identification mode.	1 per station
off-bd-alm	Off board alarm	Off board Alarm: associated status lamp lights if an off-circuit pack major, minor, or warning alarm is active on a circuit pack. Off-board alarms (loss of signal, slips, misframes) relate to problems on the facility side of the DS1, ATM, or other interface.	1 per attendant
per-COLine (Grp: ___)	CO Line (line #)	Personal CO Line: allows the user to receive calls directly via a specific trunk. Grp: CO line group number.	1 per group
pms-alarm	PMS Failure	Property Management System alarm: associated status lamp indicates that a failure in the "PMS" link occurred. A major or minor alarm condition raises the alarm.	1 per station
pr-awu-alm	Auto Wakeup Alm	Automatic Wakeup Printer Alarm: associated status lamp indicates that an automatic wakeup printer interface failure occurred.	1 per station
pr-pms-alm	PMS Ptr Alarm	PMS Printer Alarm: associated status lamp indicates that a PMS printer interface failure occurred.	1 per station
pr-sys-alm	Sys Ptr Alarm	System Printer Alarm: associated status lamp indicates that a system printer failure occurred.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
print-msgs	Print Msgs	Print Messages: allows users to print messages for any extension by pressing the button and entering the extension and a security code.	1 per station
priority	Priority Call	Priority Calling: allows a user to place priority calls or change an existing call to a priority call.	1 per station
q-calls (Grp: ___)	NQC	Queue Calls: associated status lamp flashes if a call warning threshold has been reached. Grp: Group number of hunt group.	1 per hunt group per station
q-time (Grp: ___)	OQT	Queue Time: associated status lamp flashes if a time warning threshold has been reached. Grp: Group number of hunt group.	1 per hunt group per station
release	Release	Releases an agent from an ACD call.	1 per station
ringer-off	Ringer Cutoff	Ringer-Cutoff: silences the alerting ringer on the station.	1 per station
rs-alert	System Reset Alert	The associated status lamp lights if a problem escalates beyond a warm start.	1 per station
rsvn-halt	rsvn-halt	Remote Access Barrier Code Security Violation Notification Call: activates or deactivates call referral when a remote access barrier code security violation is detected.	1 per system
scroll	Scroll	Scroll (<i>display button</i>): allows the user to select one of the two lines (alternates with each press) of the 16-character LCD display. Only one line displays at a time.	1 per station

Continued on next page

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
send-calls (Ext: ___)	Send All Calls	Send All Calls allows users to temporarily direct all incoming calls to coverage regardless of the assigned call-coverage redirection criteria. Assign to a lamp button.	1 per station
send-term	Send All Calls-TEG	Send All Calls For Terminating Extension Group: allows the user to forward all calls directed to a terminating extension group.	1 per TEG
serv-obsrv	Service Observing	Service Observing: activates Service Observing. Used to toggle between a listen-only and a listen-talk mode.	1 per station
signal (Ext: ___)	Signal (name or ext #)	Signal: allows the user to use one button to manually signal the associated extension. The extension cannot be a VDN extension.	1 per signal extension
ssvn-halt	ssvn-halt	Toggle whether or not station security code violation referrals are made to the referral destination.	1 per station
sta-lock	Station Lock	Station Lock: when enabled, no outgoing calls can be made from the phone.	1 per station
stored-num	Stored Number	<i>(display button)</i> Places the station's display into the stored number mode.	1 per station
stroke-cnt	ACD SD Stroke Count	Automatic Call Distribution Single Digit Stroke Count: sends a message to CMS to increment a stroke count number.	1 per station
term-x-gr (Grp: ___)	Term Grp (name or ext #)	Terminating Extension Group: provides one or more extensions. Calls may be received but not originated with this button. Grp: TEG number.	1 per TEG
timer	Timer	<i>(display button)</i> Starts a clock on the station to display elapsed time.	1 per station
togle-swap	Conf/Trans Toggle-Swap	Allows a user to toggle between two parties before completing a conference or a transfer.	1 per station

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
trk-ac-alm	FTC Alarm	Facility Test Call Alarm: associated status lamp lights when a successful Facility Test Call (“FTC”) occurs.	1 per station
trk-id	Trunk ID	Trunk Identification (<i>display button</i>): identifies the tac (trunk access code) and trunk member number associated with a call.	1 per station
trunk-name	Trunk Name	(<i>display button</i>) Displays the name of the trunk as administered on the CAS Main or on a switch without CAS.	1 per station
trunk-ns (Grp: ____)	Trunk Grp	Trunk-Group Night Service: places a trunk-group into night service. Grp: Trunk group number.	3 per trunk group
verify	Verify	Busy Verification: allows users to make test calls and verify a station or a trunk.	1 per station
vip-chkin	VIP Check-in	VIP Check-in (<i>display button</i>): allows user to assign the XDIDVIP number to the room extension.	1 per station
vip-retry	VIP Retry	VIP Retry: starts to flash when the user places a VIP wakeup call and continues to flash until the call is answered. If the VIP wakeup call is not answered, the user can press the VIP Retry button to drop the call and reschedule the VIP wakeup call as a classic wakeup call. To assign this button, you must have both Hospitality and VIP Wakeup enabled.	1 per station
vip-wakeup	VIP Wakeup	VIP Wakeup: flashes when a VIP wakeup reminder call is generated. The user presses the button to place a priority (VIP) wakeup call to a guest. To assign this button, you must have both Hospitality and VIP Wakeup enabled.	1 per station

Table 3. Telephone feature buttons (Continued)

Button name	Button label	Description	Maximum
voa-repeat	VOA repeat	VDN of Origin Announcement. VDN of Origin Announcement must be enabled.	1 per station
vu-display (format: __ ID: __)	VuStats #	<p>VuStats Display: allows the agent to specify a display format for the statistics. If you assign a different VuStats display format to each button, the agent can use the buttons to access different statistics. You can assign this button only to display phones.</p> <p>format: specify the number of the format you want the button to display ID (optional): specify a split number, trunk group number, agent extension, or VDN extension</p>	limited to the number of feature buttons on the phone
whisp-act	Whisper Page Activation	<p>Whisper Page Activation: allows a user to make and receive whisper pages. A whisper page is an announcement sent to another extension who is active on a call where only the person on the extension hears the announcement; any other parties on the call cannot hear the announcement.</p> <p>The user must have a class of restriction (COR) that allows intraswitch calling to use whisper paging.</p>	1 per station
whisp-anbk	Answerback	Whisper Page Answerback: allows a user who received a whisper page to respond to the user who sent the page.	1 per station
whisp-off	Whisper Page Off	Deactivate Whisper Paging: blocks other users from sending whisper pages to this phone.	1 per station
work-code	Work Code	Call Work Code: allows an ACD agent after pressing “work-code” to send up to 16 digits (using the dial pad) to CMS.	1 per station

Adding abbreviated dialing lists

Abbreviated dialing is sometimes called speed dialing. It allows you to dial a short code in place of an extension or phone number.

When you dial abbreviated-dialing codes or press abbreviated-dialing buttons, you access stored numbers from special lists. These lists can be personal (a list of numbers for an individual phone), group (a department-wide list), system (a system-wide list), or enhanced numbers (allows for a longer list of numbers). The version and type of your system determine which lists are available and how many entries you can have on each list.

⇒ NOTE:

You can designate all group-number lists, system-number lists, and enhanced-number lists as “privileged.” Calls automatically dialed from a privileged list are completed without class of restriction (COR) or facility restriction level (FRL) checking. This allows access to selected numbers that some phone users might otherwise be restricted from manually dialing. For example, a user may be restricted from making long-distance calls. However, you can program the number of a branch office that is long distance into an AD list as privileged. Then, the user can call this office location using AD, while still being restricted from making other long-distance calls.

▲ SECURITY ALERT:

Privileged group-number, system-number, and enhanced-number lists provide access to numbers that typically would be restricted.

Instructions

As an example, we will program a new group list:

1. Type **add abbreviated-dialing group next** and press RETURN.

The [Abbreviated Dialing List](#) screen appears. In our example, the next available group list is group 3.

```

                ABBREVIATED DIALING LIST

                Group List: 3
    Size (multiple of 5): ___ Program Ext: _____ Privileged? _
    DIAL CODE
    01: _____
    02: _____
    03: _____
    04: _____
    05: _____
    
```

2. Enter a number (in multiples of 5) in the Size field. This number defines the number of entries on your dialing list.

For example, if you have 8 phone numbers you want to store in the list, type **10** in the Size field.

3. If you want another user to be able to add numbers to this list, enter their extension in the Program Ext field.

For example, if you want the user at 4567 to be able to change group list 3, enter **4567** in this field.

4. Enter the phone numbers you want to store, one for each dial code.

Each phone number can be up to 24 digits long.

5. Press ENTER to save your changes.

You can display your new abbreviated-dialing list to verify that the information is correct or print a copy of the list for your paper records.

Once you define a group list, you need to define which stations can use the list. For example, we will set up station 4567 so it has access to the new group list.

To give station 4567 access to the group list:

1. Type **change station 4567** and press RETURN.

The **Station** screen for extension 4567 appears.

2. Press NEXT PAGE to get to the Abbreviated Dialing List fields.

SITE DATA		STATION	
Room: _____		Headset? <u>n</u>	
Jack: _____		Speaker? <u>n</u>	
Cable: _____		Mounting? <u>d</u>	
Floor: _____		Cord Length: <u>0</u>	
Building: _____		Set Color: _____	
ABBREVIATED DIALING			
List1: <u>group</u> <u>3</u>	List2: _____	List3: _____	
BUTTON ASSIGNMENTS			
1: <u>call-appr</u>		4: _____	
2: <u>call-appr</u>		5: _____	
3: <u>call-appr</u>			

3. Type **group** in any of the List fields and press RETURN.

A blank list number field appears.

4. Type **3** in the list number field.

When you assign a group or personal list, you must also specify the personal list number or group list number.

5. Press ENTER to save your changes.

The user at extension 4567 can now use this list by dialing the feature access code for the list and the dial code for the number they want to dial. Alternatively, you can assign an abbreviated dialing button to this station that allows the user press one button to dial a specific stored number on one of their three assigned abbreviated lists.

Fixing problems

Problem	Possible causes	Solutions
A user cannot access a dial list.	<ul style="list-style-type: none"> ■ The specific list may not be assigned to the user's phone. 	<ol style="list-style-type: none"> 1. Type display station nnnn and press RETURN, where <i>nnnn</i> is the user's extension. 2. Review the current settings of the List1, List2, and List 3 fields to determine if the list the user wants to access is assigned to their phone.
	<ul style="list-style-type: none"> ■ If the user attempted to use a feature access code to access the list, they may have dialed the incorrect feature access code. 	<ol style="list-style-type: none"> 1. Type display feature-access-codes and press RETURN. 2. Verify that the user is dialing the appropriate feature access code.
	<ul style="list-style-type: none"> ■ If the user attempted to press a feature button, they may have pressed the incorrect feature button. 	<ol style="list-style-type: none"> 1. Type display station nnnn and press RETURN, where <i>nnnn</i> is the user's extension. 2. Review the current feature button assignments to determine if the user was pressing the assigned button.
	<ul style="list-style-type: none"> ■ If the user attempted to press the correct feature button, the button may not be set up correctly. 	<ol style="list-style-type: none"> 1. Type display station nnnn and press RETURN, where <i>nnnn</i> is the user's extension. 2. Review the current feature button assignments to see if the list number and dial code are correct.

Problem	Possible causes	Solutions
<p>A user complains that using an abbreviated dial list dials the wrong number.</p>	<ul style="list-style-type: none"> ■ The user could be using the wrong dial code. ■ The dial code could be defined incorrectly. 	<ol style="list-style-type: none"> 1. Ask the user what number they dialed or button they pressed to determine which list and dial code they attempted to call. 2. Access the dialing list and verify that the number stored for the specific dial code corresponds to the number the user wanted to dial. (For example to access a group list, type display abbreviated-dialing group x and press RETURN, where <i>x</i> is a group list number.) 3. If the user dialed the wrong code, give them the correct code. 4. If the dial code is wrong, press CANCEL and use the appropriate change command to re-access the abbreviated dialing list. Correct the number and press ENTER.

More information

There are limits to the total number of abbreviated dialing list entries, the number of personal dial lists, and the number of group dial lists that your system can store. Because of these limitations, you should avoid storing the same number in more than one list. Instead, assign commonly dialed numbers to the system list or to a group list. You can determine the abbreviated dialing storage capacity, by referring to the System Capacity screen for the abbreviated dialing values (**display capacity**).

Related topics

For more information, see [“Abbreviated dialing”](#) on page 1449.

Setting up bridged call appearances

Think of a bridged call appearance as a phone (the primary set) with an extension (the bridged-to appearance). Both phones can be used to call in and out and both show when a line is in use. A call to the primary phone is bridged to a specific appearance, or button, on the secondary phone. The secondary phone retains all its functions, and a specific button is dedicated as the bridged-to appearance from the primary phone.

Bridged call appearances have to be assigned to phones with double-lamp buttons, or lights. The phone types do not need to match, but as much consistency as possible is recommended for all phones in a bridged group. When a call comes in on bridged phones, the buttons assigned to the bridged appearances flash. You can assign as many bridged appearances as there are line appearances on the primary phone, and you can assign ringing (alerting) to one or more of the phones.

Instructions

To create a bridged call appearance:

1. Note the extension of the primary phone.

A call to this phone lights the button and, if activated, rings at the bridged-to appearance on the secondary phone.

2. If you want to use a new phone for the bridged-to extension, duplicate a station.

For information, see [“Using templates to add phones”](#) on page 96.

3. Type **change station** and the bridged-to extension and press RETURN.

The **Station** screen appears.

FEATURE OPTIONS	STATION
LWC Reception? _____	Auto Select Any Idle Appearance? _
LWC Activation? _	Coverage Msg Retrieval? _
CDR Privacy? _	Auto Answer? _

	Select Last Used Appearance? _

4. Press NEXT PAGE until Per Button Ring Control appears (digital sets only).
 - If you want to assign ringing separately to each bridged appearance, type **y**.
 - If you want all bridged appearances to either ring or not ring, leave the default **n**.

5. Move to Bridge Call Alerting.

If you want the bridged appearance to ring when a call arrives at the primary phone, type **y**. Otherwise, leave the default **n**.

6. Complete the appropriate field for your phone type.

If . . .	Then . . .
your primary phone is analog	move to the Line Appearance field and enter abrdg-appr
your primary phone is digital	move to the Button Assignments field and enter brdg-appr

7. Press RETURN.

Btn and Ext fields appear. If Per Button Ring Control is set to **y** on the digital screen, Btn, Ext, and Ring fields appear.

Screen 4. Station screen (digital set)

8. Enter the primary phone's button number that you want to assign as the bridged call appearance.
This button flashes when a call arrives at the primary phone.
9. Enter the primary phone extension.
10. If the Ring field appears:
 - If you want the bridged appearance to ring when a call arrives at the primary phone, type **y**.
 - If you do not want the bridged appearance to ring, leave the default **n**.
11. Press ENTER to save your changes.

To see if an extension has any bridged call appearances assigned, type **list bridge** and the extension, and press RETURN.

More information

Following are a list of example situations where you might want to use bridged appearances.

- A secretary making or answering calls on an executive's primary extension
These calls can be placed on hold for later retrieval by the executive, or the executive can simply bridge onto the call. In all cases, the executive handles the call as if he or she had placed or answered the call. It is never necessary to transfer the call to the executive.

- Visitor telephones

An executive may have another telephone in their office that is to be used by visitors. It may be desirable that the visitor be able to bridge onto a call that is active on the executive's primary extension number. A bridged call appearance makes this possible.

- Service environments

It may be necessary that several people be able to handle calls to a particular extension number. For example, several users may be required to answer calls to a hot line number in addition to their normal functions. Each user may also be required to bridge onto existing hot line calls. A bridged call appearance provides this capability.

- A user frequently using telephones in different locations

A user may not spend all of their time in the same place. For this type of user, it is convenient to have their extension number bridged at several different telephones.

Setting up Terminal Self Administration

Terminal self-administration (“TSA”) allows users to administer some of their own feature buttons from their telephones. TSA is available only for 6400-series phones. Users are prompted, via the telephone's display, to choose features to assign to buttons on their telephones.

Before you start

To prevent users from changing another user's phone administration, you can enable the system-wide option that requires users to enter a station security code before they can administer their phone. To enable this option:

1. Set the Station Security Code for Terminal Self-Administration Required on the Security-Related System Parameters screen to **Y**.

If you enable this option, the user is prompted for the station security code when they press the Admin button. The user must enter the security code, followed by the pound (#) button or the Done softkey.

Instructions

You need to assign a security code to the user's Station screen for each user you want to enable access to TSA. You also need to assign the user an Admin feature button.

For example, to assign a security code of 12345678 to extension 4234, complete the following steps:

1. Type **change station 4234** and press RETURN.
The **Station** screen for extension 4234 appears.
2. In the Security Code field, type **12345678**.
You should assign unique security codes for each user. Once you enter the code and move off the field, the system changes the field to '*' for extra security.
3. In one of feature button fields, type **admin**.
You can assign this button to a feature button or a softkey.
4. Press ENTER to save your changes.

More information

Before a user can enter the TSA Admin mode, their telephone must be completely idle. After a user presses the Admin button and enters a security code (if necessary), they are prompted, via the telephone's display, to choose features to administer to buttons on their telephone.

The user can add, replace, or delete any of the following feature-button types from their telephone.

- CDR Account Code
- Automatic Dial
- Blank
- Call Forwarding
- Call Park
- Call Pickup
- Directed Call Pickup
- Group Page
- Send All Calls
- Activate Whisper Page
- Answerback for Whisper Page
- Whisper Page Off

End-user button changes are recorded to the switch's history log so that remote services can know what translations are changed.

Fixing problems

- When a telephone is in the Admin mode, the telephone cannot accept any calls — the telephone is treated as if it were busy. Also, a user cannot make calls while in the Admin mode.
- Any button state a telephone is in when the telephone enters the Admin mode stays active while the telephone is in the Admin mode.
- ACD agents who wish access to the Admin mode of TSA must be logged off before pressing the Admin button. If they are not logged off when they attempt to enter the Admin mode, they receive a denial (single-beep) tone.
- Call Forwarding can be active and works correctly in the Admin mode. An active Call Forwarding button cannot be removed when the telephone is in the Admin mode.
- Since the telephone must be on-hook to go into the Admin mode, the Headset On/Off button must be in the OFF position.
- A telephone that is in the Admin mode of TSA cannot be remotely unmerged by the PSA feature.

If a user has Abbreviated and Delayed Ringing active, a call can be silently ringing at a telephone and the user may not realize it. This ringing prevents the user from entering the Admin mode of TSA.

This section provides an overview to the Avaya attendant consoles. It also explains how to add new consoles, remove consoles, and how to set your system-wide console parameters.

Overview

The attendant console is the main answering position for your organization. The console operator is responsible for answering incoming calls and for efficiently directing or “extending” calls to the appropriate phone.

The attendant console also can allow your attendants to monitor:

- system problems
- toll fraud abuse
- traffic patterns

The number of consoles you can have in your organization varies depending on your MultiVantage system.

302 attendant consoles

MultiVantage supports the following 302 attendant consoles: the 302A/B, 302C, and 302D consoles. You may have a basic or enhanced version of these consoles. [Figure 1 on page 164](#) shows the 302A/B console and [Figure 2 on page 165](#) shows the 302C console. The next two figures show the button layouts on the Feature area and on the optional Selector console.

Figure 2. 302C attendant console

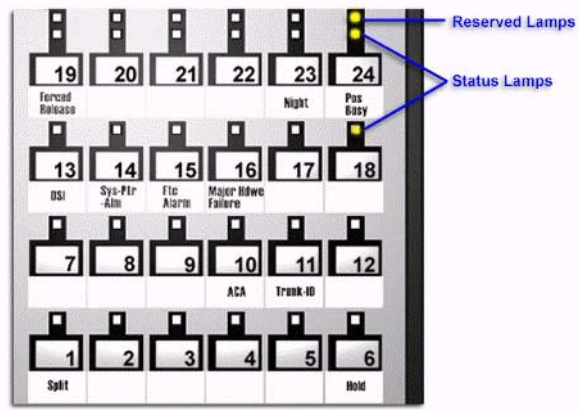

Figure 3. Console feature button layout

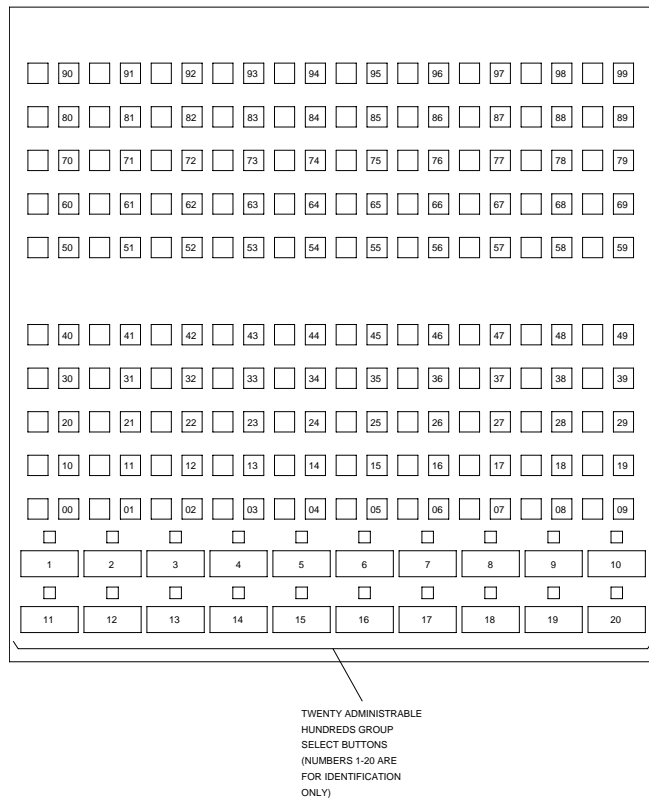

Figure 4. Enhanced Selector Console

302D Console

The 302D console provides the following enhancements to the 302C console:

- **Modular handset/headset connection**

The console accepts a standard RJ11, 4-pin modular handset or headset. This connection replaces the quarter-inch, dual-prong handset/headset connection.
- **Activate/deactivate push-button**

You can use the push-button on the left side of the console to activate or deactivate the console. A message appears on the console identifying that the button must be pressed to activate the console.
- **Two-wire DCP compatibility**

The console is compatible with two-wire “DCP” circuit packs only, not four-wire DCP circuit packs.
- **Headset volume control**

The console can now control the volume of an attached headset.
- **Noise expander option**

The console has circuitry to help reduce background noise during pauses in speech from the console end of a conversation. This option is normally enabled.
- **Support for Eurofont or Katakana character set**

The console can show the Eurofont or Katakana character set. Administration of these character sets must be coordinated with the characters sent from the switch.

Avaya PC consoles

The Avaya PC Console is a Microsoft Windows-based call handling application for MultiVantage system attendants. It provides an ideal way to increase your productivity and to better serve your customers.

PC Console offers all the call handling capabilities of the hardware-based Avaya 302 attendant console with a DXS module, plus several enhanced features and capabilities. The enhanced features provide you with the ability to see up to six calls at once, and to handle all calls more efficiently.

PC Console also provides a powerful directory feature. You are able to perform searches, display user information, including a photo. You are able to place a call immediately from the directory.

And, because PC Console resides on a Windows-based PC, you are able to use other software applications at the same time. If a call comes in while you are in another application, you are able to handle it immediately.

For more information about the Avaya PC Console, contact your Avaya account team.

SoftConsole IP Attendant

The SoftConsole is a Windows-based application that can replace the 302B hard console. The SoftConsole is similar to PC Console, but it performs call answering and routing through a PC interface via IP. For more information, contact your Avaya account team.

Adding an attendant console

Usually Avaya connects and administers your primary attendant console during cutover. However, you might find a need for a second attendant console, such as a backup console that is used only at night. Note that these instructions do not apply to adding a PC Console or SoftConsole. For more information, see the appropriate console documentation.

To add a night-only attendant console, complete the following steps:

1. Type **add attendant 2** and press RETURN.

The [Attendant Console](#) screen appears.

```
ATTENDANT CONSOLE 2

      Type: 302           Name: operator
      Extension:         Group: 1           Auto Answer: none

1:                       5:                       9:
2:                       6:                       10:
3:                       7:                       11:
4:                       8:                       12:

HUNDREDS SELECT BUTTON ASSIGNMENTS
1:           5:           9:           13:           17:
2:           6:           10:          14:           18:
3:           7:           11:          15:           19:
4:           8:           12:          16:           20:
```

2. In the Type field, enter **302**.

This is the type of attendant console.

3. If you want this attendant to have its own extension, enter one in the Extension field.

Tip:

If you assign an extension to the console, the class of restriction (“COR”) and class of service (“COS”) that you assign on this Console screen override the COR and COS you assigned on the Console Parameters screen. To avoid unexpected behavior, you should assign the same COR and same COS on both screens.

If you give your attendants an individual extension, users can call the attendant directly by dialing the extension.

Individual attendant extensions also allow attendants to use features that an attendant group cannot use — for example, you can assign them to hunt groups.

4. In the Console Type field, enter **night-only**.
This indicates how this console is used in your organization—as a principal, day only, night only, or day/night console. You can have only one night-time console (night only or day/night) in the system.
5. In the Port field, enter the port address for this console.
6. Type a name to associate with this console in the Name field.
7. In the Direct Trunk Group Select Button Assignments fields, enter trunk access codes for the trunks you want the attendant to be able to select with just one button.
8. If you are using the Enhanced Selector console, assign the Hundreds Select Buttons that you want this console to have.

If you want this console to be able to access extensions in the range 3500 to 3999, you need to assign them 5 Hundreds Select Buttons: **35** for extensions 3500 to 3599, **36, 37, 38, and 39**.

9. Assign the Feature Buttons that you want the 302 console to have.
To determine which buttons you can assign to a console, see [“Attendant console feature buttons”](#)

Tip:

Feature buttons are not numbered top-to-bottom on the attendant console, as you might expect. Button numbers map to physical positions on the console as shown in [Figure 3 on page 166](#).

10. Press ENTER to save your changes.

Attendant console feature buttons

The following table lists the feature buttons that you can assign to an attendant console.

- List: List number 1 to 3 where the destination number is stored.
DC: Dial codes of destination number.

2. Grp: The split group number for ACD.
 3. Code: Enter a stroke code (0 through 9).
 4. TAC: local-tgs — TAC of local TG
remote-tgs — (L-TAC) TAC of TG to remote PBX
remote-tgs — (R-TAC) TAC of TG on remote PBX
The combination of local-tgs/remote-tgs per console must not exceed 12 (maximum).
Label associated button appropriately so as to easily identify the trunk group.
 5. Grp: Enter a hundreds group number (1 through 20).
 6. Enhanced Hospitality must be enabled on the System-Parameters Customer-Options screen.
 7. Ext: May be a VDN extension.
 8. Link: A link number — 1 to 8 for multi-carrier cabinets, 1 to 4 for single-carrier cabinets.
 9. Grp: A trunk group number.
 10. Grp: Group number of the hunt group.
 11. Allows the attendant to alternate between active and split calls.
 12. VDN of Origin must be enabled.
-

Removing an attendant console

Before you physically remove an attendant from your system, check the attendant's status, remove it from any group or usage lists, and then delete it from the system's memory.

For example, to remove attendant 3, which also is assigned extension 4345:

1. Type **status attendant 3** and press RETURN.
The Attendant Status screen appears.
2. Make sure that the attendant:
 - is plugged into the jack
 - is idle (not making or receiving calls)
3. Type **list usage extension 4345** and press RETURN.
The Usage screen shows where the extension is used in the system.
4. Press CANCEL.
5. If the attendant extension appears on the Usage screen, access the appropriate feature screen and delete the extension.
For example, if extension 1234 belongs to hunt group 2, type **change hunt group 2** and delete the extension from the list.
6. Type **remove attendant 3** and press RETURN.
The system displays the [Attendant Console](#) screen so you can verify that you are removing the correct attendant.

7. If this is the correct attendant, press ENTER.

If the system responds with an error message, the attendant is busy or still belongs to a group. Press CANCEL to stop the request, correct the problem, and enter **remove attendant 3** again.

8. Remove the extension from voice mail service if the extension has a voice mailbox.
9. Type **save translations** and press RETURN to save your changes.

Note that you do not need to delete the extension from coverage paths. The system automatically adjusts coverage paths to eliminate the extension.

Now you can unplug the console from the jack and store it for future use. You do not need to disconnect the wiring at the cross-connect field. The extension and port address remain available for assignment at a later date.

Setting console parameters

You can define system-wide console settings on the Console Parameters screen.

For example, if you want to warn your attendants when there are more than 3 calls in queue or if a call waits for more than 20 seconds, complete the following steps:

1. Type **change console-parameters** and press RETURN.

The [Console Parameters](#) screen appears.

```

change console-parameters                                     Page 1 of 3
                                CONSOLE PARAMETERS

```

2. In the Calls in Queue Warning field, enter **3**.

The system lights the console's second call waiting lamp if the number of calls waiting in the attendant queue exceeds 3 calls.

3. In the Time in Queue Warning field, enter **20**.

The system issues a reminder tone if a call waits in the attendant queue for more than 20 seconds.

4. Press ENTER to save changes.

Note that some of the settings on the individual Attendant screens can override your system-wide settings.

Providing backup for an attendant

MultiVantage allows you to configure your system so that you have backup positions for your attendant. Attendant Backup Alerting notifies backup telephones that the attendant need assistance in handling calls. The backup telephones are alerted when the attendant queue reaches the queue warning level or when the console is in night service.

Once a backup telephone receive an alert, the user can dial the Trunk Answer Any Station (TAAS) feature access code (FAC) to answer the alerting attendant calls.

You can find more information about attendant backup in the GuestWorks Technician Handbook.

Before you start

- You can assign the attendant backup alerting only to multiappearance telephones that have a client room class of service (COS) set to No. For more information, see [“Class of Service” on page 672](#).
- If you have not yet defined a Trunk Answer Any Station (TAAS) feature access code, you need to define one and provide the feature access code to each of the attendant backup users. For more information, see [“Feature Access Code” on page 781](#).

Instructions

To enable your system to alert backup stations, you need to administer the Console Parameters screen for backup alerting. You also need to give the backup phones an attendant queue calls feature button and train your backup users how to answer the attendant calls.

To configure the system to provide backup alerts and to setup extension 4345 to receive these alerts, complete the following steps:

1. Type **change console-parameters** and press RETURN.

The [Console Parameters](#) screen appears.

2. In the Backup Alerting field, enter **y**.
3. Press ENTER to save changes.

The system will now notify anyone with an attendant queue calls button when the attendant queue reaches the warning level or when the console is in night service.

4. Type **change station 4345** and press RETURN.

The [Station](#) screen appears.

5. In one of the Button Assignment fields, enter **atd-qcalls**.

The atd-qcalls button provides the visual alerting for this telephone. When this button is dark (idle state), there are no calls in the attendant queue. When the button shows a steady light (busy state), there are calls in the attendant queue. When button shows a flashing light (warning state), the number of calls in the attendant queue exceeds the queue warning. The backup-telephone user also hears an alerting signal every 10 seconds.

6. Press ENTER to save changes.

Now you need to train the user how to interpret the backup alerting and give them the [“TAAS”](#) feature access code so that they can answer the attendant calls.

Displaying caller information

This chapter provides information on the messages that appear on the read-out screen on display phones.

Your system uses automatic incoming call display to provide information about incoming calls to a display phone that is in use, or active on a call. The information is displayed for 30 seconds on all phones except for CALLMASTER phones, where the display goes blank after 30 seconds. However, the information for each new call overrides the existing message.

Call information appears on the display only if the call terminates at the phone. For example, if the call is forwarded to another extension, no call information appears.

See [“Telephone displays” on page 1833](#) for more information on the buttons and languages you can set up for the messages that appear on the display.

Displaying ANI calling party information

Calling party information may consist of either a billing number that sometimes is referred to as Automatic Number Identification (“ANI”), or a calling party number. Your phone may display the calling party number and name, or the incoming trunk group name.

Instructions

We will set up tie trunk group 10 to receive calling party information and display the calling party number on the phone of the person called.

1. Type **change trunk group 10**.

The **Trunk Group** screen for trunk group 10 appears.

```

                                TRUNK GROUP

2. Type **tone** in the Incoming Dial Type field.
3. Press NEXT PAGE and type ***ANI*DNIS** in the Incoming Tone (DTMF) ANI field.
4. Press ENTER to save your changes.

Displaying ICLID Information

Your switch collects the calling party name and number (Incoming Call Line Identification, or “**ICLID**”) received from the central office (“**CO**”) on analog trunks.

Before you start

Be sure Analog Trunk Incoming Call ID field is set to **y** on the System-Parameters Customer-Options screen.

See the *Avaya MultiVantage™ Solutions Hardware Guide* for information on the required circuit pack.

Instructions

We will set up the analog diod trunk group 1 to receive calling party information and display the calling party number on the phone of the person called.

1. Type **change trunk group 1**.

The **Trunk Group** screen for trunk group 1 appears. The Group Type field is already set to diod.

2. Press NEXT PAGE to display the Trunk Features page.

```
change trunk-group 1                                     Page 2 of x

5. Type **120** in the Incoming Seizure (msec) field.

6. Press ENTER to save your changes.

Changing the display language

This section explains how to change the display language.

Before you start

- Make sure the Display Character Set field on the System Parameters Country-Options screen is set to the character type you want to display. This field is set by Avaya.

⇒ NOTE:

Note: If you change the Display Character Set field to **Roman** after you have administered non-Roman characters, you must change the display field values back to Roman characters on each administrable language display screen. See [“Feature information displays” on page 1840](#) for more information.

- Be sure the type of phone your company uses supports the characters you want to display. Each character set requires specific phones. Call your Avaya representative for details.

Instructions

We will change the display message language to German for the user at attendant console 1, a 40-character display model. Also change the “transfer completed” message from English to German.

- Type **change attendant 1** and press ENTER.

The **Attendant Console** screen appears.

```

change attendant 1                                     Page 1 of 3

2. Type **user-defined** in the Display Language field.

NOTE:

If “user-defined” is selected for the display language and no translations are defined on the Language Translation screens, all display messages appear as a string of asterisks.

3. Press ENTER to save your changes.
4. Type **change display-language transfer-conference** and press ENTER.

The [Language Translations](#) screen for Transfer Completed appears.

```
change display-language transfer-conference

Translation: abtretung abgeschlossen
```

5. Type **abtretung abgeschlossen** in the Translation field and press ENTER to save your changes.

**Tip:**

*To include European, Katakana, or Ukrainian fonts in your display message, use a tilde (~) before and after a Roman character that maps to the character you wish to display. For example, type ~i~ to create the character ä in your German display messages. See [“Mapping enhanced display characters” on page 1861](#) for character set maps.*

**Fixing problems**

| <b>Symptom</b>                                                                          | <b>Cause and Solution</b>                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Characters that display are not what you thought you entered.                           | This feature is case sensitive. Check the table to make sure that you entered the right case.                                                                                                                                   |
| You entered “~c”, and “*” appears on the display instead.                               | Lower-case “c” has a specific meaning in the MultiVantage system, and therefore cannot be mapped to any other character. An asterisk “*” appears in its place.                                                                  |
| You entered “~>” or “~<” and nothing appears on the display.                            | These characters do not exist as single keys on the standard US-English keyboard. Therefore the system is not programmed to handle them.                                                                                        |
| Enhanced display characters appear in fields that you did not update.                   | If an existing display field contains a tilde (~) followed by Roman characters, and you update and submit that screen after this feature is activated, that field will display the enhanced character set.                      |
| Nothing displays on the terminal at all.                                                | Some unsupported terminals do not display anything if a special character is presented. Check the model of display terminal that you are using.                                                                                 |
| You entered a character with a descender and part of it appears cut off in the display. | Some of the unused characters in Group2a have descenders that do not appear entirely within the display area. These characters are not included in the character map. For these characters (g,j,p,q,y), use Group1 equivalents. |

## Setting up directory buttons

Your switch directory contains the names and extensions that are assigned on each station screen. Display-phone users can use a phone button to access the directory, use the touch-tone buttons to key in a name, and retrieve an extension from the directory.

### Instructions

We will assign directory phone buttons for extension 2000. Our button assignment plan is set up so that phone buttons 6, 7, and 8 are used for the directory. Remember, the name you type in the Name field on the first page of the station screen is the name that appears when the directory is accessed on a phone display.

1. Type **change station 2000**.

The [Station](#) screen for extension 2000 appears.

2. Move to the Button Assignments section.

Page 3 of X

|                                                                                                                                                                                                                                                                                                                                                    |                     |                                                                                                       |              |    |              |              |              |         |              |                 |

| 2: call-appr                                                                                                                                                                                                                                                                                                                                       | 6: directory        |                                                                                                       |              |    |              |              |              |         |              |                 |
| 3: call-appr                                                                                                                                                                                                                                                                                                                                       | 7: next             |                                                                                                       |              |    |              |              |              |         |              |                 |
| 4: call-appr                                                                                                                                                                                                                                                                                                                                       | 8: call-display     |                                                                                                       |              |    |              |              |              |         |              |                 |

3. In Button Assignment field 6, type **directory**.
4. In Button Assignment field 7, type **next**.
5. In Button Assignment field 8, type **call-display**.
6. Press ENTER to save your changes.

---

### Setting up basic call coverage

This chapter shows you how to set up call coverage for incoming calls to be sure that incoming calls are answered when the called party is not available.

Basic incoming call coverage:

- provides for automatic redirection of calls to alternate destinations when the called party is not available or not accepting calls
- provides the order in which Avaya MultiVantage redirects calls to alternate phones or terminals
- establishes up to 6 alternate termination points for an incoming call
- establishes redirection criteria that govern when a call redirects
- redirects calls to a local telephone number (extension) or an off-switch telephone number (public network)

Call coverage allows an incoming call to redirect from its original destination to an extension, hunt group, attendant group, uniform call distribution (“UCD”) group, direct department calling (“DDC”) group, automatic call distribution (“ACD”) split, coverage answer group, AUDIX, or vector for a station not accepting calls.

## **Administering system-wide call coverage characteristics**

---

This section shows you how to set up system-wide call coverage characteristics that govern how coverage is handled.

### **Instructions**

The System-Parameters Call Coverage / Call Forwarding screen sets up the global parameters which direct the switch on how to act in certain situations.

1. Leave all default settings as they are set for your system.
2. If you desire to customize your system, carefully read and understand each field description before you make any changes.

See [“System Parameters Call Coverage / Call Forwarding”](#) on page 1167 for more information.

### **Related topics**

See [“Covering calls redirected to an off-site location”](#) on page 193 for more information on redirecting calls.

## **Creating coverage paths**

---

This section explains how to administer various types of call coverage. In general, call coverage refers to what happens to incoming calls. You can administer paths to cover all incoming calls, or define paths for certain types of calls, such as calls to busy phones. You can define where incoming calls go if they are not answered and in what order they reroute to other locations. For example, you can define coverage to ring the called phone, then move to a receptionist if the call is not answered, and finally access a voice mailbox if the receptionist is not available.

With call coverage, the system redirects a call to alternate answering extensions when no one answers at the first extension. An extension can have up to 6 alternate answering points. The system checks each extension in sequence until the call connects. This sequence of alternate extensions is called a coverage path.

The system redirects calls based on certain criteria. For example, you can have a call redirect to coverage without ever ringing on the principal set, or after a certain number of rings, or when one or all call appearances (lines) are busy. You can set coverage differently for internal (inside) and external (outside) calls, and you can define coverage individually for different criteria. For example, you can decide that external calls to busy phones can use the same coverage as internal calls to phones with Do Not Disturb active.

## Instructions

To create a coverage path:

1. Type **add coverage path next** and press RETURN.

The **Coverage Path** screen appears. The system displays the next undefined coverage path in the sequence of coverage paths. Our example shows coverage path number 2.

```

 COVERAGE PATH

 Coverage Path Number: 2
 Next Path Number: ____ Hunt After Coverage: n
 Linkage: ____ ____

COVERAGE CRITERIA
 Station/Group Status Inside Call Outside Call
 Active? n n
 Busy? Y Y
 Don't Answer? Y Y Number of Rings: 3
 All? n n
 DND/SAC/Goto Cover? Y Y

COVERAGE POINTS

 Terminate to Coverage Pts. with Bridged Appearance? n

 Point1: _____ Point2: _____ Point3: _____
 Point4: _____ Point5: _____ Point6: _____

```

2. Type a coverage path number in the Next Path field.

The next path is optional. It is the coverage path to which calls are redirected if the current path's coverage criteria does not match the call status. If the next path's criteria matches the call status, it is used to redirect the call; no other path is searched.

3. Fill in the Coverage Criteria fields.

You can see that the default sets identical criteria for inside and outside calls. The system sets coverage to take place from a busy phone, if there is no answer after a certain number of rings, or if the "DND" (do not disturb), "SAC" (send all calls), or Go to Cover button are pressed or feature-access codes are dialed.

4. Fill in the Point fields with the extensions, hunt group number, or coverage answer group number you want for coverage points.

Each coverage point can be an extension, hunt group, coverage answer group, remote number, or attendant.

5. Press ENTER to save your changes.

**Tip:**

If you want to see which extensions or groups use a specific coverage path, type **display coverage sender group n**, where *n* is the coverage path number. For example, you should determine which extensions use a coverage path before you make any changes to it.

## Assigning a coverage path to users

Now assign the new coverage path to a user. For example, we will assign this new coverage path to extension 2054.

**NOTE:**

A coverage path can be used for more than one extension.

## Instructions

To assign a coverage path:

1. Type **change station 2054** and press RETURN.

The [Station](#) screen for extension 2054 appears.

STATION

|                 |                        |        |
|-----------------|------------------------|--------|
| Extension: 2054 | Lock Messages? n       | BCC: 0 |
| Type: 7406D     | Security Code: _____   | TN: 1  |
| Port: _____     | Coverage Path 1: 2__   | COR: 1 |
| Name: _____     | Coverage Path 2: ____  | COS: 1 |
|                 | Hunt-to-Station: _____ |        |

STATION OPTIONS

|                   |                                 |
|-------------------|---------------------------------|
| Data Module? n    | Personalized Ringing Pattern: 1 |
| Display Module? n | Message Lamp Ext: _____         |
|                   | MM Complex Data Ext: _____      |

2. Type **2** in the Coverage Path 1 field.

To give extension 2054 another coverage path, you can type a coverage path number in the Coverage Path 2 field.

3. Press ENTER to save your changes.

## Related information

[“Assigning coverage options” on page 363](#)

## Setting up advanced call coverage

---

Advanced incoming call coverage:

- redirects calls based on time-of-day
- allows coverage of calls that are redirected to sites not on the local switch
- allows users to change back and forth between two coverage choices (either specific lead coverage paths or time-of-day tables).

### Covering calls redirected to an off-site location

---

You can provide coverage for calls that have been redirected to an off-site location (for example, your home). This capability, called Coverage of Calls Redirected Off-Net (“**CCRON**”) allows you to redirect calls onto the public network and bring back unanswered calls for further coverage processing.

#### Before you start

- On the [System-Parameters Customer-Options](#) screen, verify the Coverage of Calls Redirected Off-Net Enabled field is **y**. If not, contact your Avaya representative.
- You need call classifier ports for all situations except ISDN end-to-end signaling, in which case the ISDN protocol does the call classification. For all other cases, use one of the following:
  - Tone Clock with Call Classifier - Tone Detector circuit pack. See *Avaya MultiVantage™ Solutions Hardware Guide* for more information on the circuit pack.
  - Call Classifier - Detector circuit pack.

#### Instructions

To provide coverage of calls redirected to an off-site location:

1. Type **change system-parameters coverage-forwarding** and press RETURN.

The [System Parameters Call Coverage / Call Forwarding](#) screen appears.

SYSTEM PARAMETERS -- CALL COVERAGE / CALL FORWARDING

```
COVERAGE OF CALLS REDIRECTED OFF-NET (CCRON)
 Coverage of Calls Redirected Off-Net Enabled? y
Activate Answer Detection (Preserves SBA) On Final CCRON Cvg Point? y
 Ignore Network Answer Supervision? n
Immediate Redirection On Receipt Of PROGRESS Inband Information? n
```

2. In the Coverage of Calls Redirected Off-Net Enabled field, type **y**.  
This instructs Avaya MultiVantage to monitor the progress of an off-net coverage or off-net forwarded call and provide further coverage treatment for unanswered calls.
3. In the Activate Answer Detection (Preserves SBA) On Final CCRON Cvg Point field, leave the default as **y**.
4. In the Ignore Network Answer Supervision field, leave the default as **n**.
5. In the Immediate Redirection On Receipt Of PROGRESS Inband Information field, leave the default as **n**.
6. Press ENTER to save your changes.

### **Defining coverage for calls redirected to external numbers**

---

You can administer the system to allow calls in coverage to redirect to off-net (external) or public-network numbers.

Standard remote coverage to an external number allows you to send a call to an external phone, but does not monitor the call once it leaves your system. Therefore, if the call is busy or not answered at the external number, the call cannot be pulled back to the system. With standard remote call coverage, make the external number the last coverage point in a path.

With newer systems, you may have the option to use the Coverage of Calls Redirected Off-Net feature. If this feature is active and you use an external number in a coverage path, the system can monitor the call to determine whether the external number is busy or does not answer. If necessary, the system can redirect a call to coverage points that follow the external number. With this feature, you can have a call follow a coverage path that starts at the user's extension, redirects to the user's home phone, and if not answered at home, returns to redirect to their voice mail box.

The call will not return to the system if the external number is the last point in the coverage path.

To use a remote phone number as a coverage point, you need to define the number in the Remote Call Coverage Table and then use the remote code in the coverage path.

### Instructions

For example, to add an external number (303-538-1000) to coverage path 2:

1. Type **change coverage remote** and press RETURN.

The [Remote Call Coverage Table](#) appears.

| REMOTE CALL COVERAGE TABLE |           |           |
|----------------------------|-----------|-----------|
| 01: 93035381000_____       | 16: _____ | 31: _____ |
| 02: _____                  | 17: _____ | 32: _____ |
| 03: _____                  | 18: _____ | 33: _____ |
| 04: _____                  | 19: _____ | 34: _____ |
| 05: _____                  | 20: _____ | 35: _____ |
| 06: _____                  | 21: _____ | 36: _____ |
| 07: _____                  | 22: _____ | 37: _____ |
| 08: _____                  | 23: _____ | 38: _____ |
| 09: _____                  | 24: _____ | 39: _____ |
| 10: _____                  | 25: _____ | 40: _____ |
| 11: _____                  | 26: _____ | 41: _____ |
| 12: _____                  | 27: _____ | 42: _____ |
| 13: _____                  | 28: _____ | 43: _____ |
| 14: _____                  | 29: _____ | 44: _____ |
| 15: _____                  | 30: _____ | 45: _____ |

2. Type **93035381000** in one of the remote code fields.

If you use a digit to get outside of your network, you need to add the digit before the external number. In this example, the system requires a '9' to place outside calls.

3. Be sure to record the remote code number you use for the external number.

In this example, the remote code is r01.

4. Press ENTER to save your changes.
5. Type **change coverage path 2** and press RETURN.

The [Coverage Path](#) screen appears.

**Tip:**

*Before making changes, you can use **display coverage sender group 2** to determine which extensions or groups use path 2.*

```

 COVERAGE PATH
 Coverage Path Number: _
 Next Path Number: ___ Hunt After Coverage: y
 Linkage: ___ ___

COVERAGE CRITERIA
 Station/Group Status Inside Call Outside Call
 Active? n n
 Busy? y y
 Don't Answer? y y Number of Rings: 2
 All? n n
 DND/SAC/Goto Cover? y y

COVERAGE POINTS

 Terminate to Coverage Pts. with Bridged Appearance? n

 Point1: 4101_____ Point2: r1_____ Point3: h77_____
 Point4: _____ Point5: _____ Point6: _____

```

6. Type **r1** in a coverage Point field.

In this example, the coverage rings at extension 4101, then redirects to the external number. If you administer Coverage of Calls Redirected Off-Net and the external number is not answered or is busy, the call redirects to the next coverage point. In this example, the next point is Point 3 (h77 or hunt group 77).

If you do not have the Coverage of Calls Redirected Off-Net feature, the system cannot monitor the call once it leaves the network. The call ends at the remote coverage point.

7. Press ENTER to save your changes.

**Related topics**

See [“Call coverage” on page 1532](#) for more information on coverage.

**Defining time-of-day coverage**

The Time of Day Coverage Table on your system lets you redirect calls to coverage paths according to the time of day and day of the week when the call arrives. You need to define the coverage paths you want to use before you define the time of day coverage plan.

For example, let us say you want to administer the system so that incoming calls to extension 2054 redirect to a coworker in the office from 8:00 a.m. to 5:30 p.m., and to a home office from 5:30 p.m. to 8:00 p.m. on weekdays. You want to redirect the calls to voice mail after 8:00 p.m. weekdays and on weekends.

## Instructions

To set up a time-of-day coverage plan that redirects calls for our example above:

1. Type **add coverage time-of-day next** and press RETURN.

The [Time of Day Coverage Table](#) screen appears and the selects the next undefined table number in the sequence of time-of-day table numbers. If this is the first time-of-day coverage plan in your system, the table number is 1.

| TIME OF DAY COVERAGE TABLE 1__ |       |      |       |      |       |      |       |      |      |      |
|--------------------------------|-------|------|-------|------|-------|------|-------|------|------|------|
|                                | Act   | CVG  | Act   | CVG  | Act   | CVG  | Act   | CVG  | Act  | CVG  |
|                                | Time  | PATH | Time  | PATH | Time  | PATH | Time  | PATH | Time | PATH |
| Sun                            | 00:00 | 3__  | __:   | __   | __:   | __   | __:   | __   | __:  | __   |
| Mon                            | 00:00 | 3__  | 08:00 | 1__  | 17:30 | 2__  | 20:00 | 3__  | __:  | __   |
| Tue                            | 00:00 | 3__  | 08:00 | 1__  | 17:30 | 2__  | 20:00 | 3__  | __:  | __   |
| Wed                            | 00:00 | 3__  | 08:00 | 1__  | 17:30 | 2__  | 20:00 | 3__  | __:  | __   |
| Thu                            | 00:00 | 3__  | 08:00 | 1__  | 17:30 | 2__  | 20:00 | 3__  | __:  | __   |
| Fri                            | 00:00 | 3__  | 08:00 | 1__  | 17:30 | 2__  | 20:00 | 3__  | __:  | __   |
| Sat                            | 00:00 | 3__  | __:   | __   | __:   | __   | __:   | __   | __:  | __   |

Record the table number so that you can assign it to extensions later.

2. To define your coverage plan, enter the time of day and path number for each day of the week and period of time.

Enter time in a 24-hour format from the earliest to the latest. For this example, assume that coverage path 1 goes to the coworker, path 2 to the home, and path 3 to voice mail.

Define your path for the full 24 hours (from 00:01 to 23:59) in a day. If you do not list a coverage path for a period of time, the system does not provide coverage for that time.

3. Press ENTER to save your changes.

Now assign the time-of-day coverage to a user. For example, we use extension 2054:

1. Type **change station 2054** and press RETURN.

The **Station** screen for extension 2054 appears.

```

 STATION
Extension: 2054 Lock Messages? n BCC: 0
Type: 7406D Security Code: 4196__ TN: 1
Port: _____ Coverage Path 1: t1_ COR: 1
Name: _____ Coverage Path 2: ___ COS: 1
 Hunt-to-Station: _____

STATION OPTIONS
Data Module? n Personalized Ringing Pattern: 1
Display Module? n Message Lamp Ext: _____

 MM Complex Data Ext: _____
```

2. Move your cursors to Coverage Path 1 and type **t** plus the number of the Time of Day Coverage Table.
3. Press ENTER to save your changes.

Now calls to extension 2054 redirect to coverage depending on the day and time that each call arrives.

### Creating coverage answer groups

You can create a coverage answer group so that up to 8 phones simultaneously ring when calls cover to the group. Anyone in the answer group can answer the incoming call.

## Instructions

To add a coverage answer group:

1. Type **add coverage answer-group next** and press RETURN.

The [Coverage Answer Group](#) screen appears.

COVERAGE ANSWER GROUP

Group Number: \_\_\_\_  
Group Name: COVERAGE\_GROUP\_

GROUP MEMBER ASSIGNMENTS

| Ext      | Name (first 26 characters) | Ext      | Name (first 26 characters) |
|----------|----------------------------|----------|----------------------------|
| 1: _____ | _____                      | 5: _____ | _____                      |
| 2: _____ | _____                      | 6: _____ | _____                      |
| 3: _____ | _____                      | 7: _____ | _____                      |
| 4: _____ | _____                      | 8: _____ | _____                      |

2. In the Group Name field, enter a name to identify the coverage group.
3. In the Ext field, type the extension of each group member.
4. Press ENTER to save your new group list.

The system automatically completes the Name field when you press ENTER.

## Related topics

See [“Assigning a coverage path to users”](#) on page 192 for instructions on assigning a coverage path.

## Setting up call forwarding

---

This section explains how to administer various types of automatic call forwarding. To provide call forwarding to your users, assign each extension a class of service (“[COS](#)”) that allows call forwarding. Then assign call-forwarding buttons to the user phones (or give them the feature access code (“[FAC](#)”) for call forwarding) so that they can easily forward calls. You use the station screen to assign the COS and any call-forwarding buttons.

Within each class of service, you can determine whether the users in that COS have the following call forwarding features:

- **Call Forwarding All Calls** — allows users to redirect all incoming calls to an extension, attendant, or external phone number.
- **Call Forwarding Busy/Don't Answer** — allows users to redirect calls only if their extensions are busy or they do not answer.
- **Restrict Call Fwd-Off Net** — prevents users from forwarding calls to numbers that are outside your system network.

As the administrator, you can administer system-wide call-forwarding parameters to control when calls are forwarded. Use the System Parameters Call Coverage/Call Forwarding screen to set the number of times an extension rings before the system redirects the call because the user did not answer (CFWD No Answer Interval). For example, if you want calls to ring 4 times at an extension and, if the call is not answered, redirect to the forwarding number, set this parameter to 4.

You also can use the System Parameters Call Coverage/Call Forwarding screen to determine whether the forwarded-to phone can override call forwarding to allow calls to the forwarded-from phone (Call Forward Override). For example, if an executive forwards incoming calls to an attendant and the attendant needs to call the executive, the call can be made only if the Call Forwarding Override is set to yes.

### Instructions

To determine which extensions have call forwarding activated:

1. Type **list call-forwarding** and press RETURN.

This command lists all the extensions that are forwarded along with each forwarding number.

 **NOTE:**

If you have a V1, V2, or V3 system, you can see if a specific extension is forwarded only by typing **status station nnnn**, where nnnn is the specific extension.

[“Call forwarding” on page 1612](#)

## Setting up call forwarding for users

This section shows you how to give your users access to call forwarding.

### Instructions

We will change a call forwarding access code from a local phone with a Class of Service of 1:

1. Type **change feature-access-codes** and press RETURN.

The [Feature Access Code](#) screen appears.

```

 FEATURE ACCESS CODE (FAC)
Abbreviated Dialing List1 Access Code: ____
Abbreviated Dialing List2 Access Code: ____
Abbreviated Dialing List3 Access Code: ____
Abbreviated Dial - Prgm Group List Access Code: ____
Announcement Access Code: ____
Answer Back Access Code: ____
Auto Alternate Routing (AAR) Access Code: ____
Auto Route Selection (ARS) Access Code 1: ____ Access Code 2: ____
Automatic Callback Activation: ____ Deactivation: ____
Call Forwarding Activation Busy/DA: *70 All: *71 Deactivation: #72
Call Park Access Code: ____
Call Pickup Access Code: ____
CAS Remote Hold/Answer Hold-Unhold Access Code: ____
CDR Account Code Access Code: ____
Change Coverage Access Code: ____
Data Origination Access Code: ____
Data Privacy Access Code: ____
Directed Call Pickup Access Code: ____
Emergency Access to Attendant Access Code: ____
Extended Call Fwd Activate Busy D/A: ____ All: ____ Deactivation: ____

```

2. In the Call Forwarding Activation Busy/DA field, type **\*70**.

The **\*70** feature access code activates the call forwarding option so incoming calls forward when your phone is busy or does not answer.

3. In the Call Forwarding Activation All field, type **\*71**.

The **\*71** feature access code forwards all calls.

4. In the Call Forwarding Deactivation field, type **#72**.

The **#72** feature access code deactivates the call forwarding option.

5. Press ENTER to save your changes.

6. Type **change cos** and press RETURN.

The [Class of Service](#) screen appears.

| CLASS OF SERVICE                |                                       |

| QSIG Call Offer Originations    | n n n n n n n n n n n n n n n n       |

7. On the Call Fwd-All Calls line, in the 1 column, type **y**.  
 This allows the user with this Class of Service to forward their calls. The “1” column is for phones with a Class of Service of 1.
8. On the Restrict Call Fwd-Off Net line, in the 1 column, type **y**.  
 This restricts your users from forwarding calls off-site. If you want your users to be able to call off-site, leave this field as **n**.
9. On the Call Forward Busy/DA line, in the 1 column, type **y**.  
 This forwards your calls when your phone is busy or doesn’t answer after a programmed number of rings.
10. Press ENTER to save your changes.

### Allowing users to specify a forwarding destination

Now that you have set up system-wide call forwarding, have your users use this procedure if they want to change their call forwarding destination from their work (local) station.

1. They dial either their Call Forwarding Activation Busy/DA or Call Forwarding Activation All feature access code. If your users have buttons assigned, they press those buttons, listen for dial tone, and dial the digits.

**⇒ NOTE:**  
 Both Call Forwarding Activation Busy/DA or the Call Forwarding Activation All cannot be active for the same phone at the same time.

In this example, enter **\*71** for Call Forwarding Activation All.

2. They dial their “forwarding-to” off-site or on-site number.

In this example, enter **2081**. This is a local number; for off-site forwarding, include the AAR/ARS feature access code.

3. When they hear the 3-beep confirmation tone, they hang up.

### Changing the forwarding destination remotely

Now that you have set up all of the required system administration for call forwarding, have your users use this procedure if they want to change their call forwarding destination from a telecommuting (off-site) phone.

1. They dial their telecommuting extension.

See “[Telecommuting Access](#)” on page 1213 for more information. In this example, enter **555-9126**.

2. When they get dial tone, they dial either their Extended Call Forward Activate Busy/DA or the Extended Call Forward Activate All feature access code.

In this example, enter **\*61** for the Extended Call Forward Activate All number.

3. When they get dial tone, they dial their extension number and press the ‘#’ key.

In this example, enter **1014**, then **#**.

4. Even though there is no dial tone, they dial their security code and press the ‘#’ key.

In this example, enter **4196**, then **#**.

5. When they get dial tone, they dial their “forwarding-to” off-site or on-site number.

In this example, enter **9-555-2081**.

6. When they hear the 3-beep confirmation tone, they hang up.

### Allowing users to change coverage remotely

This section shows you how to allow users to change their call coverage path from a local or telecommuting (off-site) phone.

## Instructions

To change call coverage from off-site:

1. Type **change feature-access-codes** and press RETURN.  
The [Feature Access Code](#) screen appears.
2. In the Change Coverage Access Code field, type **\*85**.  
Use the **\*85** feature access code to change a coverage path from a phone or remote station.
3. Press ENTER to save your changes.
4. Type **change cor** and press RETURN.  
The [Class of Restriction](#) screen appears.
5. In the Can Change Coverage field, type **y**.  
This permits users to select one of two previously administered coverage paths.
6. Press ENTER to save your changes.
7. Type **change station 1014** and press RETURN.  
The [Station](#) screen for extension 1014 appears.
8. In the Security Code field, type **4196**.  
In this example, this is your security code. See “[Security-Related System Parameters](#)” on page 1105 for more information on setting the length of your security code.
9. In the Coverage Path 1 and Coverage Path 2 fields, verify that both are defined enabling your user to move from one coverage path to another.  
The **t1** and **t2** are the numbers of the Time of Day Coverage Tables.
10. Press ENTER to save your changes.

## Setting up night service

---

You can use night service to direct calls to an alternate location when the primary answering group is not available. For example, you can administer night service so that anyone in your marketing department can answer incoming calls when the attendant is at lunch or has left for the day.

Once you administer night service to route calls, your end-users merely press a button on the console or a feature button on their phones to toggle between normal coverage and night service.

There are five types of night service:

- Night Console Night Service — directs all attendant calls to a night or day/night console
- Night Station Night Service — directs all incoming trunk or attendant calls to a night service destination
- Trunk Answer from Any Station (“TAAS”) — directs incoming attendant calls and signals a bell or buzzer to alert other employees that they can answer the calls
- Trunk Group Night Service — directs incoming calls to individual trunk groups to a night service destination
- Hunt Group Night Service — directs hunt group calls to a night service destination

## Setting up night station service to voice mail

---

The night station service (also known as Listed Directory Number (“LDN”) Night Service) sends calls directed to an LDN to voice mail when the system is in night service.

### Instructions

What is described below is a common setup; however, you can use a regular extension in this field, but it will not follow coverage.

**NOTE:**

You can use a dummy hunt group (one with no members) or an exported station with a coverage path. The instructions below use a hunt group.

To set up a night station service to voice mail:

1. Type **add hunt-group next** and press RETURN.

The **Hunt Group** screen appears.

```

 Page 1 of X
 HUNT GROUP
Group Name: ldn nights
Group Number: 5 Group Extension: 51002___ Group Type:
MM Early Answer? _ Skill? _ ACD? _
Queue? _ Vector? _ AAS? _
Security Code: ___ COR: _
ISDN Caller Disp: ___ TN: _

Measured: _____ Supervisor: Extension: _____

Controlling Adjunct: _____
Multiple Call Handling: _____
Objective: _____

Queue Length: _____
Calls Warning Threshold: _____ Calls Warning Port: ___
Time Warning Threshold: _____ Time Warning Port: ___

Redirect on No Answer (rings): _ Redirect to VDN: _
Forced Entry of Stroke Counts or Call Work Codes? _

```

The Group Number field fills automatically with the next hunt group number.

2. In the Group Name field, type the name of the group.

In our example, type **ldn nights**. There should be no members in this hunt group.

3. Press ENTER to save your changes.

**⇒ NOTE:**

If you are using tenant partitioning, the command for the next step will be **change tenant x**. If you are using tenant partitioning, the Night Destination field does not appear on the Listed Directory Numbers screen. Instead, it is on the Tenant screen.

4. Type **change listed-directory-numbers** and press RETURN.

The **Listed Directory Numbers** screen appears.

```

 Page 1 of 2
 LISTED DIRECTORY NUMBERS

 Ext Name TN
 1: 51001 Attendant 1
 2: 1
 3: 1
 4: 1
 5: 1
 6: 1
 7: 1
 8: 1
 9: 1
 10: 1

 Night Destination: 51002

```

5. In the Night Destination field, add the night destination on the listed directory phone.

In our example, type **51002**.

6. Press ENTER to save your changes.

7. Type **change console-parameters** and press RETURN.

The [Console Parameters](#) screen appears.

```

 CONSOLE PARAMETERS
Attendant Group Name: 27 character name OPERATOR
 COS: 1 COR: 1
Calls in Queue Warning: 5 Attendant Lockout? y
Ext Alert Port (TAAS):
 CAS: none
 SAC Notification? n Night Service Act. Ext.: 1234
 IAS (Branch)? n IAS Tie Trunk Group No.:
IAS Att. Access Code: Alternate FRL Station:

 Secondary Alert on Held Reminder Calls? y

ABBREVIATED DIALING
List1: group 1 List2:
List3:

 COMMON SHARED EXTENSIONS
Starting Extension: Count:

```

8. In the DID-LDN Only to LDN Night Extension field, type **n**.

9. Press ENTER to save your changes.

10. From a phone with console permissions, dial the call forwarding feature access code, then the hunt group's extension, followed by the main number of AUDIX.

In our example, dial 51002.

**NOTE:**

You should receive the confirmation tone (3 beeps). This step is very important as calls to the LDN night service extension do not follow coverage.

11. In voice mail, build your auto attendant with the extension of the Listed Directory Number, not the hunt group.

The originally dialed number was the LDN. That is what the switch passes to the voice mail. In the case of the Intuity and newer embedded AUDIX Voice Mail systems, you can use the Auto Attendant routing table to send the calls to a common Auto Attendant mailbox.

### **Setting up night console service**

---

This section shows you how to set up night console service.

Night Console Service directs all calls for primary and daytime attendant consoles to a night console. When a user activates Night Console Service, the Night Service button for each attendant lights and all attendant-seeking calls (and calls waiting) in the queue are directed to the night console.

**NOTE:**

Activating night console service also puts trunk groups into night service, except those for which a night service button has been administered. See [“Setting up trunk answer from any station” on page 211](#) for more information.

To activate and deactivate Night Console Service, the attendant typically presses the NIGHT button on the principal attendant console or designated console.

Only the principal console can activate night service. In the absence of any console, a phone can activate night service.

## Instructions

We will put the attendant console (attendant 2) in a night service mode.

To set up Night Console Service:

1. Type **change attendant 2** and press RETURN.

The **Attendant Console** screen appears.

```

ATTENDANT CONSOLE 2

Type: console Name: 27 character attd cons name
Extension: 1000 Group: 1 Auto Answer: none
Console Type: principal TN: 1 Data Module? n
Port: 01C1106 COR: 1 Disp Client Redir? n
 COS: 1 Display Language: english

DIRECT TRUNK GROUP SELECT BUTTON ASSIGNMENTS (Trunk Access Codes)
 Local Remote Local Remote Local Remote
1: 9 5: 9:
2: 82 6: 10:
3: 7: 11:
4: 8: 12:

HUNDREDS SELECT BUTTON ASSIGNMENTS
1: 5: 9: 13: 17:
2: 6: 10: 14: 18:
3: 7: 11: 15: 19:
4: 8: 12: 16: 20:

```

2. In the Console Type field, type **principal**.

There can be only one night-only or one day/night console in the system unless you administer Tenant Partitioning. Night Service is activated from the principal console or from the one station set per-system that has a nite-serv button.

3. Press ENTER to save your changes.

## Setting up night station service

---

You can use night station service if you want to direct incoming trunks calls, DID-LDN (direct inward dialing-listed directory number) calls, or internal calls to the attendant (dialed 'O' calls) to a night service destination.

Let us say your attendant, who answers extension (LDN) 8100, usually goes home at 6:00 p.m. When customers call extension 8100 after hours, you would like them to hear an announcement that asks them to try their call again in the morning.

To set up night station service, you need to record the announcement (in our example, it is recorded at announcement extension 1234). See “[Managing announcements](#)” on page 439 for information on setting up the announcement.

**Tip:**

*All trunk groups that are routed through the attendant direct to this night service destination provided they already do not have a night service destination and, on the Console Parameters screen, the DID-LDN Only to DID-LDN Night Ext field is **n**. See “[Setting up trunk answer from any station](#)” on page 211.*

## Instructions

To set up night station service:

1. Type **change listed-directory-numbers** and press RETURN.

The [Listed Directory Numbers](#) screen appears.

| LISTED DIRECTORY NUMBERS |                |    |
|--------------------------|----------------|----|
| Ext                      | Name           | TN |
| 1: 8100                  | attendant 8100 |    |
| 2:                       |                |    |
| 3:                       |                |    |
| 4:                       |                |    |
| 5:                       |                |    |
| 6:                       |                |    |
| 7:                       |                |    |
| 8:                       |                |    |
| 9:                       |                |    |
| 10:                      |                |    |

Night Destination: 1234

2. Enter **1234** in the Night Destination field.

The destination can be an extension, a recorded announcement extension, a vector directory number, or a hunt group extension.

3. Press ENTER to save your changes.
4. Type **change console-parameters** and press RETURN.

The [Console Parameters](#) screen appears.

```

```

5. In the DID-LDN Only to LDN Night Extension field, type **n**.

6. Press ENTER to save your changes.

After you set up night station service, have the attendant use the night console button to activate and deactivate night service.

## Setting up trunk answer from any station

There may be situations where you want everyone to be able to answer calls when the attendant is away. Use trunk answer any station (TAAS) to configure the system so that it notifies everyone when calls are ringing. Then, you can give users the trunk answer any station feature access code so they can answer these calls.

When the system is in night service mode, attendant calls redirect to an alerting device such as a bell or a buzzer. This lets other people in the office know when they should answer the phone.

**⇒ NOTE:**

If no one answers the call, the call will not redirect to night service.

We will define a feature access code (we'll use 71) and configure the alerting device for trunk answer any station.

## Before you start

You need a ringing device and 1 port on an analog line circuit pack. See *Avaya MultiVantage™ Solutions Hardware Guide* for more information on the circuit pack.

## Instructions

To set the feature access code for TAAS:

1. Type **change feature-access-codes** and press RETURN.

The [Feature Access Code](#) screen appears.

```

Page 3 of X
FEATURE ACCESS CODE (FAC)
Station Security Code Change Access Code: ____
Terminal Dial-up Test Access Code: ____
Terminal Translation Initialization Merge Code: ____ Separation Code: ____
Transfer to AUDIX Access Code: ____
Trunk Answer Any Station Access Code: 71__
User Control Restrict Activation: ____ Deactivation: ____
Voice Coverage Message Retrieval Access Code: ____
Voice Principal Message Retrieval Access Code: ____

```

2. In the Trunk Answer Any Station Access Code field, type **71**.
3. Press ENTER to save your changes.

Once you set the feature access code, determine where the external alerting device is connected to the switch (we'll use port 01A0702).

To set up external alerting:

1. Type **change console-parameters** and press RETURN.

The [Console Parameters](#) screen appears.

```

CONSOLE PARAMETERS
Attendant Group Name: Operator
COS: 0 COR: 0
Calls in Queue Warning: 5 Attendant Lockout? y

Starting Extension: Count:

```

2. In the EXT Alert Port (TAAS) field, type **01A0702**.  
Use the port address assigned to the external alerting device.
3. Press ENTER to save your changes.

### Setting up external alerting night service

Calls redirected to the attendant via Call Forwarding or Call Coverage will not go to the LDN Night Station. If there is no night station specified, and the TAAS bell is being used, these calls ring the TAAS bell. A call following the coverage path rings the TAAS bell for the number of times indicated in the Coverage Don't Answer Interval for Subsequent Redirection (Rings) field. If not answered, the call proceeds to the next point in the station's coverage path. If the call was sent to the Attendant by Call Forwarding, it continues to ring the TAAS bell.

When night service is enabled, and there is a night service destination on the LDN screen, calls covering to the attendant attempt to ring the night destination instead of the attendant position even if the handset is plugged in.

### Instructions

To send LDN calls to the attendant during the day and to a guard's desk at night:

1. Type **change listed-directory-numbers** and press RETURN.  
The [Listed Directory Numbers](#) screen appears.

Page 1 of 2

LISTED DIRECTORY NUMBERS

| Ext     | Name      | TN |
|---------|-----------|----|

Time in Queue Warning (sec):
INCOMING CALL REMINDERS
No Answer Timeout (sec): 20 Alerting (sec): 40
 Secondary Alert on Held Reminder Calls? y
ABBREVIATED DIALING
List1: group 1 List2: List3:
 COMMON SHARED EXTENSIONS
Starting Extension: Count:
```

5. In the EXT Alert Port (TAAS) field, type **01A0702**.

This is the port address assigned to the external alerting device.

6. Press ENTER to save your changes.

The system is in Night Service.

Any calls to extension 2000 now go to extension 3000 (the guard's desk).

Any "0" seeking calls go to extension 3000 (the guard's desk).

To send LDN calls to the attendant during the day and to the TAAS bell at night:

1. Type **change console-parameters** and press RETURN.

The [Console Parameters](#) screen appears.

```

 CONSOLE PARAMETERS
Attendant Group Name: Operator
 COS: 0 COR: 0
Calls in Queue Warning: 5 Attendant Lockout? y
Ext Alert Port (TAAS): 01A0702
 CAS: none
 SAC Notification? n Night Service Act. Ext.:

2. In the DID-LDN Only to Night Ext. field, type **y**.

This allows only listed directory number calls (LDN) to go to the listed directory night service number extension.

3. In the Ext Alert Port (TAAS) field, type **01A070**.

This is the port address assigned to the external alerting device.

4. Press ENTER to save your changes.

The system is in night service.

Any DNIS extension 2000 calls now go to the TAAS bell.

Any “0” seeking calls now go to the TAAS bell.

## Setting up trunk group night service

You can use trunk group night service if you want to direct individual trunk groups to night service. The system redirects calls from the trunk group to the group’s night service destination.

Trunk group night service overrides night station service. For example, we will say you activate trunk group night service, and then your attendant activates night station service. In this case, calls to the trunk group use the trunk night service destination, rather than the station night service destination.

## Instructions

We will direct night calls for trunk group 2 to extension 1245.

To set up trunk group night service:

1. Type **change trunk-group 2** and press RETURN.

The **Trunk Group** screen appears.

```
TRUNK GROUP
Group Number: 2 Group Type: co CDR Reports: y
Group Name: outside calls COR: 1_ TN: 1__ TAC: ____
Direction: two-way_ Outgoing Display? n
Dial Access? n Busy Threshold: 99 Night Service: 1245

Prefix-1? y Trunk Flash? n Toll Restricted? y
BCC: _
TRUNK PARAMETERS
Trunk Type: loop-start
Outgoing Dial Type: tone
Trunk Termination: rc
Cut-Through? n
Disconnect Timing(msec): 500_
Auto Guard? n Call Still Held? n Sig Bit Inversion: none
Analog Loss Group: ____ Digital Loss Group: ____
Trunk Gain: high
Bit Rate: 1200 Synchronization: ____ Duplex: ____
Disconnect Supervision - In? y Out? n
Answer Supervision Timeout: 10 Receive Answer Supervision? n
```

2. Type **1245** in the Night Service field.

The destination can be a station extension, a recorded announcement extension, a vector directory number, a hunt group extension, a terminating extension group, or attd if you want to direct the call to the attendant.

3. Press ENTER to save your changes.

## Setting up night service for hunt groups

You can administer hunt group night service if you want to direct hunt group calls to a night service destination.

Let us say your helpline on hunt group 3 does not answer calls after 6:00 p.m. When customers call after hours, you would like them to hear an announcement that asks them to try their call again in the morning.

## Instructions

To set up night service for your helpline, you need to record the announcement (in our example, the announcement is on extension 1234) and then modify the hunt group to send calls to this extension.

To administer the hunt group for night service:

1. Type **change hunt-group 3** and press RETURN.

The [Hunt Group](#) screen appears for hunt group 3.

```

 HUNT GROUP

Group Number: 3 ACD? n
Group Name: Accounting Queue? y
Group Extension: 2011 Vector? n
Group Type: ucd-mia Coverage Path: 1
 TN: 1 Night Service Destination: 1234____
 COR: 1 MM Early Answer? n
Security Code: _____
ISDN Caller Disp: _____

Queue Length: 4
Calls Warning Threshold: ____ Port: x Extension: _____
Time Warning Threshold: ____ Port: x Extension: _____

```

2. In the Night Service Destination field, type **1234**.

The destination can be an extension, a recorded announcement extension, a vector directory number, a hunt group extension, or **attd** if you want to direct calls to the attendant.

Calls to hunt group 3 will follow the coverage path assigned to extension 1234.

3. Press ENTER to save your changes.
4. Now you need to program a night service button.

See [“Adding feature buttons”](#) on page 129 for more information.

## Related topics

[“Managing hunt groups”](#) on page 224.

## How do night service types interact?

---

Let us look at an example of how several types of night service might be used in one company.

Assume that you already administered the following night service settings:

- Night station night service redirects to extension 3000 and DID-LDN only to LDN Night Ext is set to **n**
- EXT Alert Port (TAAS) field is not defined
- Trunk group 4 redirects to extension 2000

Let us look at how calls for this company are directed after hours:

| <b>call type</b>                                               | <b>directs to</b>   |
|----------------------------------------------------------------|---------------------|
| An LDN call on a DID trunk                                     | extension 3000      |
| A call on trunk group 4                                        | extension 2000      |
| An internal call to '0'                                        | extension 3000      |
| A call that redirects to the attendant through a coverage path | the attendant queue |

## Adding call pickup

---

To give your users the ability to pickup other users' calls, you may want to use Call Pickup. To do this, you need to define a call pickup group.

Users may want to be able to pick up a call that is ringing at a nearby desk. Call Pickup provides 3 ways to pick up calls ringing at another phone:

- With Call Pickup, you create a call pickup group. All group members can answer a call ringing at another phone in the group from their own phone. If more than one phone is ringing, the one that has been ringing the longest is picked up.
- With Directed Call Pickup, users specify which ringing phone they want to answer from their own phone. A call pickup group is not required.
- With Group Call Pickup, users within an "extended" group can answer calls outside of their immediate group by entering a feature access code (FAC) followed by the 1- or 2-digit pickup (index) number.

## Creating pickup groups

A pickup group is a list of phones where each member of the group can answer another member's calls. For example, if you want everyone in the payroll department to be able to answer calls to any payroll extension (in case someone is away from their desk), create a pickup group that contains all of the payroll extensions. Members of a pickup group should be located in the same area so that they can hear when the other extensions in the group ring.

Note that each extension may belong to only one pickup group. Also, the maximum number of pickup groups may be limited by your system configuration.

To create a pickup group:

1. Type **add pickup-group next** and press RETURN.

The **Pickup Group** screen appears. The system selects the next Group Number for the new pickup group.

2. Enter the extension of each group member.

Up to 50 extensions can belong to one group.

3. Press ENTER to save your new group list.

The system automatically completes the name field when you press ENTER to save your changes.

```

 PICKUP GROUP

 Group Number: Extended Group Number: ____

GROUP MEMBER ASSIGNMENTS

 Ext Name (first 26 characters) Ext Name (first 26 characters)
 1:
 2:
 3:
 4:
 5:

 16:
 17:
 18:
 19:
 20:
 21:
 22:
 23:
 24:
 25:

```

Once you define a pickup group, you can assign call-pickup buttons for each phone in the group or you can give each member the call-pickup feature-access code. Use the Station screen to assign call-pickup buttons.

To allow users to answer calls that are not in their pickup group, you may be able to use Directed Call Pickup.

## Setting up directed call pickup

---

To set up a phone so that the user can pick up calls with Directed Call Pickup, you need to determine if directed call pickup is enabled on your system and make sure that the user's phone has a COR that allows directed call pickup.

To determine if Directed Call Pickup is enabled on your system:

1. Type **change system-parameters features** and press RETURN.  
The [Feature-Related System Parameters](#) screen appears.
2. Move to the Directed Call Pickup? field and enter **Y**.
3. Press ENTER to save the changes.

Now we will modify extension 4444 to allow directed call pickup. For this example, assume that the Can Use Directed Call Pickup field for COR 5 is set to Y.

1. Type **change station 4444** and press RETURN.  
The [Station](#) screen appears.
2. In the COR field, enter **5**.
3. Press ENTER to save your changes.

## Setting up "simple" extended group pickup

---

Let us add a pickup group to an existing extended group where all members of the extended group pick up each other's calls. We will add pickup group 6 to the existing extended group 56.

To create a simple extended pickup group:

1. Type **change system-parameters features** and press RETURN.  
The [Feature-Related System Parameters](#) screen appears.
2. In the Extended Group Call Pickup field, type **simple**.  
Permits feature access codes to be administered.
3. Press ENTER to save your changes.
4. Type **change feature-access-codes** and press RETURN.  
The [Feature Access Code](#) screen appears.
5. In the Extended Group Call Pickup Access Code field, type the desired FAC.  
See the dial plan to enter the correct sequence and number of digits.
6. Press ENTER to save your changes.

7. Type **add pickup-group next** and press RETURN.

The **Pickup Group** screen appears.

```

 PICKUP GROUP

 Group Number: 1 Extended Group Number: ____

GROUP MEMBER ASSIGNMENTS

 Ext Name (first 26 characters) Ext Name (first 26 characters)
 1:51001 station 51001 14:51001 station 51002
 2:
 3:
 4:
 5:
 6:
 7:
 8:
 9:
 10:
 11:
 12:
 13:
 15:
 16:
 17:
 18:
 19:
 20:
 21:
 22:
 23:
 24:
 25:

```

8. Enter the primary extensions of the users desired in the pickup group.  
Administer all the pickup groups that will be grouped together in the same extended pickup group.

9. Type **change extended-pickup-group n** and press RETURN, where n is the number of the extended pickup group to change.

The **Extended Pickup Group** screen appears.

```

change extended-pickup-group 1 Page 1 of 2
 EXTENDED PICKUP GROUP

 Extended Group Number: 56

Pickup Pickup Group Pickup Pickup Group
Number Number Number Number

 0: 345 13: ____
 1: 25 14: ____
 2: 2 15: ____
 3: ____ 16: ____
 4: ____ 17: ____
 5: ____ 18: ____
 6: ____ 19: ____
 7: ____ 20: ____
 8: ____ 21: ____
 9: ____ 22: ____
 10: ____ 23: ____
 11: ____ 24: ____
 12: ____ 25: ____

```

10. In the Pickup Group Number column, enter the pickup group number of the pickup groups that belong to the extended group being administered.

The Pickup Number associated with the entered Pickup Group Number is the number users will enter following the FAC when pickup group. In the above listed example, a user in Pickup Group 2 will enter “0” following the FAC to pick up a call from pickup group 345.

To minimize the number of digits entered by users, the Pickup Numbers should be the lowest available Pickup Numbers.

11. Press ENTER to save your changes.

### **Setting up “flexible” extended group pickup**

---

To create a flexible extended pickup group:

1. Type **change system-parameters features** and press RETURN.

The [Feature-Related System Parameters](#) screen appears.

2. In the Extended Group Call Pickup field, type **flexible**.
3. Press ENTER to save your changes.

4. Type **change feature-access-codes** and press RETURN.

The [Feature Access Code](#) screen appears.

5. In the Extended Group Call Pickup Access Code field, type the desired FAC.

See the dial plan to enter the correct sequence and number of digits.

6. Press ENTER to save your changes.
7. Type **add pickup-group next** and press RETURN.

The [Pickup Group](#) screen appears.

8. In the Extended Group Number field, type the number of the extended pickup group that can answer calls to this group.

For each administered pickup group, indicate an extended group by entering the extended pickup group number. This extended pickup group number identifies the other pickup groups that can have calls picked up by the pickup group.

9. Add extended members as for other pickup features.

10. Type **change extended-pickup-group n** and press RETURN, where n is the number of the extended pickup group to change.

The **Extended Pickup Group** screen appears.

```

change extended-pickup-group 1 Page 1 of 2
 EXTENDED PICKUP GROUP
 Extended Group Number: 56

Pickup Number Pickup Group Number Pickup Number Pickup Group Number
0: 345 13: _____
1: 25 14: _____
2: 2 15: _____
3: _____ 16: _____
4: _____ 17: _____
5: _____ 18: _____
6: _____ 19: _____
7: _____ 20: _____
8: _____ 21: _____
9: _____ 22: _____
10: _____ 23: _____
11: _____ 24: _____
12: _____ 25: _____
13: _____

```

11. In the Pickup Group Number column, type the pickup group numbers of the pickup group that can answer each others calls.

This screen groups together the pickup groups that can have their calls picked up by the pickup groups with identical extended pickup group numbers. The pickup groups numbers are listed using the lowest available Pickup Numbers. A unique “Extended Pickup Group number can be assigned to each pickup group on this screen. The entries in the Extended Group are the groups that can have calls picked up by the group with the matching Extended Group number in the Pick Group screen. Thus, a particular group’s calls may be picked up by members of many extended pickup groups.

**⇒ NOTE:**

On the Feature-Related System Parameters screen, if the Extended Group Call Pickup field is **flexible**, you can administer a pickup group in multiple extended pickup groups.

12. Press ENTER to save your changes.

## **Managing hunt groups**

---

This section shows you how to set up hunt groups. It explains how calls to a hunt group are handled and shows you different call distribution methods.

### **What are hunt groups?**

---

A hunt group is a group of extensions that receive calls according to the call distribution method you choose. When a call is made to a certain phone number, the system connects the call to an extension in the group.

Use hunt groups when you want more than one person to be able to answer calls to the same number. For example, set up a hunt group for:

- a benefits department within your company
- a travel reservations service

### **Setting up hunt groups**

---

Let us set up a hunt group for an internal helpline. Before making changes to the switch, we'll decide:

- the phone number for the hunt group
- the number of people answering calls
- the way calls are answered

Our dial plan allows 4-digit internal numbers that begin with 1. The number 1200 is not in use. So, we'll set up a helpline hunt group so anyone within the company can call extension 1200 for help with a phone.

We will assign 3 people (agents) and their extensions to our helpline. We want calls to go to the first available person.

## Instructions

To set up our helpline hunt group:

1. Type **add hunt-group next** and press RETURN.

The **Hunt Group** screen appears. The Group Number field is automatically filled in with the next hunt group number.

```

 HUNT GROUP
 Page 1 of X

Group Number: 4_ ACD? _
Group Name: internal helpline_____ Queue? _
Group Extension: 1200_____ Vector? _
Group Type: ucd-loa Coverage Path: ____
 TN: _____ Night Service Destination: ____
 COR: _ MM Early Answer? _

Security Code: _____
ISDN Caller Disp: _____

```

2. In the Group Name field, type the name of the group.

In our example, type **internal helpline**.

3. In the Group Extension field, type the phone number.

We'll type **1200**.

4. In the Group Type field, type the code for the call distribution method you choose.

We'll type **ucd-loa** so a call goes to the agent with the lowest percentage of work time since login.

### NOTE:

The COS for all hunt groups defaults to 1. Therefore, any changes to COS 1 on the Class of Service screen changes the COS for all your hunt groups. A COS field does not appear on the Hunt Group screen.

5. Press NEXT PAGE to find the Group Member Assignments page.

```
HUNT GROUP
 Group Number: 4 Group Extension: 3001 Group Type: ucd
 Member Range Allowed: 1 - 999 Administered Members (min/max): 1 /9
 Total Administered Members: 9

More Members Exist
```

6. In the Ext field, type the extensions of the agents you want in the hunt group.

We'll type **1011**, **1012**, and **1013**.

**Tip:**

*For a ddc group type (also known as “hot seat” selection), the call is sent to the extension listed in the first Ext field. The system uses this screen to determine the hunting sequence.*

7. Press ENTER to save your changes.

The Name fields are display-only and do not appear until the next time you access this hunt group.

**Related topics**

See [“\*\*Hunt Group\*\*” on page 875](#) for more information on an **“ACD”** and non-ACD hunt group.

**Changing a hunt group**

---

To make changes to a hunt group:

1. Type **change hunt-group n** and press RETURN, where n is the number of the hunt group.
2. Change the necessary fields.
3. Press ENTER to save your changes.

## Setting up a queue

You can tell your switch how to handle a hunt-group call when it cannot be answered right away. The call waits in a “queue.”

We will tell the switch that up to 10 calls can wait in the queue, but that you want to be notified if a call waits for more than 30 seconds.

You also want the switch to send a warning when 5 or more calls are waiting in the queue. This warning flashes queue-status buttons on phones that have a status button for this hunt group. When the buttons flash, everyone answering these calls can see that the help-line calls need more attention.

### Instructions

To set up our helpline queue:

1. Type **change hunt-group n** and press RETURN, where n is the number of the hunt group to change.

In our example, type **change hunt-group 5**. The [Hunt Group](#) screen appears.

Page 1 of X

HUNT GROUP

|                                    |                                  |

| Calls Warning Threshold: 5         | Calls Warning Port: __           |

2. In the Queue field, type **y**.
3. In the Queue Length field, type the maximum number of calls that you want to wait in the queue.

In our example, type **10**.

4. In the Calls Waiting Threshold field, type the maximum number of calls that can be in the queue before the system flashes the queue status buttons.  
In our example, type **5**.
5. In the Time Warning Threshold field, type the maximum number of seconds you want a call to wait in the queue before the system flashes the queue status buttons.  
In our example, type **30**.
6. Press ENTER to save your changes.

## **Adding hunt group announcements**

---

You can add recorded announcements to a hunt group queue. Use announcements to encourage callers to stay on the line or to provide callers with information. You can define how long a call remains in the queue before the caller hears an announcement.

See [“Recording announcements” on page 442](#) for information on how to record an announcement.

Let us add an announcement to our internal helpline. We want the caller to hear an announcement after 20 seconds in the queue, or after approximately 4 or 5 rings. Our announcement is already recorded and assigned to extension 1234.

**Tip:**

*You can use **display announcements** to find the extensions of your recorded announcements.*

## **Instructions**

To add an announcement to our helpline queue:

1. Type **change hunt-group n** and press RETURN, where n is the number of the hunt group to change.

In our example, type **change hunt-group 5**.

The [Hunt Group](#) screen appears.

2. Press NEXT PAGE to find the First Announcement Extension field.

```
HUNT GROUP

Message Center: _____
AUDIX Extension: _____
Message Center AUDIX Name: _____
Primary? _____
Calling Party Number to INTUITY AUDIX? _____
LWC Reception: _____
AUDIX Name: _____
Messaging Server Name: _____

First Announcement Extension: 1234 ___ Delay (sec): 20
Second Announcement Extension: _____ Delay (sec): ___ Recurring? _
```

3. In the First Announcement Extension field, type the extension of the announcement you want callers to hear.

In our example, type **1234**.

4. In the First Announcement Delay (sec) field, type the number of seconds you want the caller to wait before hearing the first announcement.

In our example, type **20**.

**Tip:**

*If you set the delay announcement interval to 0, callers automatically hear the announcement before anything else. This is called a “forced first announcement.”*

5. Press ENTER to save your changes.

You can use the same announcement for more than one hunt group.

## Managing vectors and VDNs

---

This section provides an introduction to vectors and Vector Directory Numbers (“VDN”). It gives you basic instructions for writing simple vectors.

### SECURITY ALERT:

*Vector fraud is one of the most common types of toll fraud because vectors route calls based on the Class of Restriction (COR) assigned to the VDN. See BCS Products Security Handbook for more information.*

This section references announcements, hunt groups, queues, splits, and skills, which are covered in detail in other sections of this book. You can also find information about these topics in the *Avaya MultiVantage™ Call Center Software Call Vectoring and Expert Agent Selection (EAS) Guide*.

### NOTE:

The Client Room field on the Class of Service screen will affect VDN displays. If a local station that has a COS with the Client Room field set to **y** calls a local VDN, the agent’s display that receives the call will look as if it is a direct station call rather than the expected VDN display of “station name to vdn name.”

## What are vectors?

---

A vector is a series of commands that you design to tell the system how to handle incoming calls. A vector can contain up to 32 steps and allows customized and personalized call routing and treatment. Use call vectoring to:

- play multiple announcements
- route calls to internal and external destinations
- collect and respond to dialed information

### Tip:

*The vector follows the commands in each step in order. The vector “reads” the step and follows the command if the conditions are correct. If the command cannot be followed, the vector skips the step and reads the next step.*

Your system can handle calls based on a number of conditions, including the number of calls in a queue, how long a call has been waiting, the time of day, day of the week, and changes in call traffic or staffing conditions.

## Writing vectors

Writing vectors is easy, but Avaya recommends that you set up and test your vectors before you use them across the system.

We'll write a vector to handle calls to our main number. It is the first vector so we'll use number 1.

**Tip:**

Use **list vector** to see a list of existing vectors.

### Before you start

- On the [System-Parameters Customer-Options](#) screen, verify the Basic Call Vectoring field is **y**. If not, contact your Avaya representative.
- To provide announcements, you need an Announcement circuit pack. See [Avaya MultiVantage™ Hardware Solutions Guide](#) for more information on the circuit pack.
- Use one of the following:
  - Tone Clock with Call Classifier - Tone Detector circuit pack.
  - Call Classifier - Detector circuit pack.

### Instructions

To write a vector:

1. Type **change vector 1** and press RETURN.

The [Call Vector](#) screen appears.

```

 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 _____
02 _____
03 _____
04 _____
05 _____
06 _____
07 _____
08 _____
09 _____
10 _____
11 _____

```

The vector Number field on the left side of the screen is filled in automatically.

2. In the Name field, type a description for the vector.

In our example, type **main number calls**.

**Tip:**

*The information in the heading of the Call Vector screen is display only. Use **display system-parameters customer-options** to see the features that are turned on in your switch.*

3. Type your vector steps in the numbered column on the left of the screen.

**Tip:**

*When you type in your vector steps, the switch automatically completes some of the vector step information for you. For example, if you type “q” in a vector step field, the switch fills in “queue-to.” Also, additional fields appear when you complete a field and press TAB. This makes it very easy to type in your vector steps.*

Now that vector 1 is set up, we will add a vector step to it to tell the switch how to handle the calls to our main number.

### **Putting a call in a queue**

Write a vector so that calls that come into the main business number redirect to a queue.

We will use a vector-controlled hunt group for the main number queue. This hunt group was set up as main split 47. When calls first arrive, all calls to our main number should be queued as “pri 1” for low priority.

To queue calls, write the following vector (step 2). (Please note, we started our example on step 2 because step 1 is used later in this chapter.)

```

 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 _____
02 queue-to main split 47 pri 1
03 _____
04 _____
05 _____
06 _____
07 _____
08 _____
09 _____
10 _____
11 _____

```

**Tip:**

*Remember, the switch automatically fills in some of the information when you type your vector step and press TAB.*

### Playing an announcement

Write a vector to play an announcement for callers in a queue. Use the announcement to ask callers to wait. You need to record the announcement before the vector can use it.

Let us play our announcement 4001, asking the caller to wait, then play music for 60 seconds, then repeat the announcement and music until the call is answered. The **goto** command creates the loop to repeat the announcement and the music. **Unconditionally** means under all conditions.

**Tip:**

*Rather than loop your vectors directly back to the announcement step, go to the previous queue-to step. This way, if for some reason the call does not queue the first time, the switch can attempt to queue the call again. If the call successfully queued the first time though, it merely skips the queue-to step and plays the announcement. The system cannot queue a call more than once in the exact same priority level.*

To play and repeat an announcement, write this vector (steps 3-5):

```

 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 _____
02 queue-to main split 47 pri 1
03 announcement 4001 (All agents are busy, please wait...)
04 wait-time 60 secs hearing music
05 goto step 2 if unconditionally
06 _____
07 _____
08 _____
09 _____
10 _____
11 _____

```

### Routing based on time of day

Write a vector for calls that come in after your office closes.

Assume that your business is open 7 days a week, from 8:00 a.m. to 5:00 p.m. When calls come in after business hours, you want to play your announcement 4002, which states that the office is closed and asks callers to call back during normal hours. Write the vector so the call disconnects after the announcement is played.

For after hours treatment, write this vector (steps 1, 6, and 7):

```

 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 goto step 7 if time-of-day is all 17:00 to all 8:00
02 queue-to main split 47 pri 1
03 announcement 4001 (All agents are busy, please wait...)
04 wait-time 60 secs hearing music
05 goto step 2 if unconditionally
06 stop
07 disconnect after announcement 4002 ("We're sorry, our office is closed...")
08 _____
09 _____
10 _____
11 _____

```

If the **goto** command in step 5 fails, the switch goes to the next step. The **stop** in step 6 prevents callers from incorrectly hearing the “office is closed” announcement in step 7. **Stop** keeps the call in the state it was in before the command failed. In this case, if step 5 fails, the call remains in step 4 and the caller continues to hear music.

**CAUTION:**

*Add a stop vector step only after calls are routed to a queue. If a stop vector is executed for a call not in queue, the call drops.*

### **Allowing callers to leave a message**

Write a vector that allows callers to leave messages. This type of vector uses a hunt group called a messaging split. For our example, we send after-hours calls to the voice mailbox at extension 2000 and use messaging split 99.

Once the vector routes a call to the mailbox, the caller hears a greeting (that was recorded with the voice mail for mailbox 2000) that tells them they can leave a message.

To let callers leave messages, write this vector (step 7):

```
 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

 Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 goto step 7 if time-of-day is all 17:00 to all 8:00
02 queue-to main split 47 pri 1
03 announcement 4001 (All agents are busy, please wait...)
04 wait-time 60 secs hearing music
05 goto step 2 if unconditionally
06 stop
07 messaging split 99 for extension 2000
08 _____
09 _____
10 _____
11 _____
```

### Redirecting calls during an emergency or holiday

You can provide a quick way for a supervisor or agent to redirect calls during an emergency or holiday. Use a special mailbox where you can easily change announcements. This vector is also an alternative to making sure all agents log out before leaving their phones.

In our example, no agents are normally logged in to split 10. We'll use split 10 for an emergency. We preset buttons on our agents' phones so people with these phones can log in at the touch of a button.

To quickly redirect calls:

1. Create a special mailbox with the appropriate announcement such as "We are unable to answer your call at this time" or "Today is a holiday, please call back tomorrow."

In our example, we recorded the mailbox greeting for extension 2001.

2. Insert the following bold steps (steps 1, 10, and 11).

See ["Inserting a step"](#) on page 238 for more information.

```
 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 goto step 10 if staff agents split 10 > 0
02 goto step 8 if time-of-day is all 17:00 to all 8:00
03 queue-to main split 47 pri 1
04 announcement 4001 (All agents are busy, please wait...)
05 wait-time 60 secs hearing music
06 goto step 2 if unconditionally
07 stop
08 messaging split 99 for extension 2000
09 stop
10 messaging split 99 for extension 2001
11 stop
```

When there is an emergency, fire drill, or holiday, the supervisor or agent logs into this split.

When an agent logs into split 10, the system looks at vector step 1, sees that more than 0 people are logged into split 10, and sends calls to step 10 (which sends to messaging split 99).

When your business returns to normal and the agent logs out of split 10, call handling returns to normal.

### **Giving callers additional choices**

You can give your callers a list of options when they call. Your vector tells the switch to play an announcement that contains the choices. The switch collects the digits the caller dials in response to the announcement and routes the call accordingly.

We'll create a vector that plays an announcement, then lets callers dial an extension or wait in the queue for an attendant.

Please note, the following example of this "auto attendant" vector is a new vector and is not built on the vector we used in the previous example.

To let callers connect to an extension, write this kind of vector:

```
 CALL VECTOR
Number: 1 Name: main number calls _____ Multimedia? n Lock? n

Basic? y EAS? n G3V4 Enhanced? n ANI/II-Digits? n ASAI Routing? n
Prompting? y LAI? n G3V4 Adv Route? n CINFO? n BSR? n

01 wait-time 0 seconds hearing music
02 collect 4 digits after announcement 4004 (You have reached our company.
 Please dial a 4-digit extension or wait for the attendant.)
03 route-to digits with coverage y
04 route-to number 0 with cov n if unconditionally
05 stop
06 _____
07 _____
08 _____
09 _____
10 _____
```

### Inserting a step

It is easy to change a vector step and not have to retype the entire vector. We will add announcement 4005 between step 3 and step 4 in vector 20.

To insert a new vector step in vector 20:

1. Type **change vector 20** and press RETURN.  
The **Call Vector** screen appears.
2. Press EDIT.
3. Type **i** followed by a space and the number of the step you want to add.  
In our example, type **i 4**.
4. Type the new vector step.  
We will type **announcement 4005 (Please wait...)**.
5. Press ENTER to save your changes.

**Tip:**

*When you insert a new vector step, the system automatically renumbers the rest of the vector steps and all references to the vector steps. The switch inserts a "\*" when the numbering needs more attention.*

## Deleting a step

To delete vector step 5 from vector 20:

1. Type **change vector 20** and press RETURN.  
The **Call Vector** screen appears.
2. Press EDIT.
3. Type **d** followed by a space and the number of the step you want to delete.

In our example, type **d 5**.

### Tip:

*You can delete a range of vector steps. For example, to delete steps 2 through 5, type **d 2-5** and press ENTER.*

4. Press ENTER to save your changes.

### Tip:

*When you delete a vector step, the system automatically renumbers the rest of the vector steps and all references to the vector steps. The switch inserts a "\*" when the numbering needs more attention.*

## More information

See *Avaya MultiVantage™ Call Center Software Call Vectoring and Expert Agent Selection (EAS) Guide* for more information.

Automated Attendant competes with several features for ports on the Call Classifier — Detector circuit pack or equivalent. See *Avaya MultiVantage™ Solutions Hardware Guide* for more information on the circuit pack.

## Fixing problems

If there is a problem with a vector, the switch records the error as a vector event. Vector events occur for a number of reasons including problems with a trunk, full queue slots, or the vector reaching the maximum 1000 steps allowed.

Use **display events** to access the Event Report screen and see the event record. Use the event record to see why the vector failed.

To view the Event Report:

1. Type **display events** and press RETURN.

The Event Report screen appears.

```
 EVENT REPORT
The following option control which events will be displayed:
EVENT CATEGORY
 Category: Vector
REPORT PERIOD
 Interval: _a_ From: __/__/__:__ To: __/__/__:__
SEARCH OPTIONS
 Vector Number: __
 Event Type: ____
```

2. To see all current vector events, press RETURN.

OR

Indicate the events that you want to see by completing the Report Period and Search Option fields. See *Avaya MultiVantage™ Call Center Software Call Vectoring and Expert Agent Selection (EAS) Guide* for more information.

3. Press ENTER to view the report.

The Event Report (detail) screen appears.

```
 EVENT REPORT
Event Event Event Event First Last Event
Type Description Data 1 Data 2 Occur Occur Cnt
 20 Call not queued 12/5 B 09/28/13:43 09/28/13:43 21
 541 Not a messaging split Split 4C 09/28/13:43 09/28/13:43 136
```

Look at the information in Event Data field to diagnose the vector event. In this example, there was a problem with:

- Vector 12, step 5
- Split 89

## **Vector directory numbers**

---

A VDN is an extension that directs an incoming call to a specific vector. This number is a “soft” extension number not assigned to an equipment location. VDNs must follow your dial plan.

We will create VDN 5011 for our sales department. A call into 5011 routes to vector 11. This vector plays an announcement and queues calls to the sales department.

**SECURITY ALERT:**

*Vector fraud is one of the most common types of toll fraud because vectors route calls based on the class of restriction (COR) assigned to the VDN. See BCS Products Security Handbook for more information.*

**Adding a vector directory number**

To add a vector directory number:

1. Type **add VDN 5011** and press RETURN.

You enter the VDN extension you want to add. The [Vector Directory Number](#) screen appears.

```
VECTOR DIRECTORY NUMBER

 Extension: 5011
 Name: Sales Department
 Allow VDN Override? n
 COR: 1
 TN: 1
 Vector Number: 11
 AUDIX Name:
 Messaging Server Name:
 Measured: both
Acceptable Service Level (sec):
 VDN of Origin Annc. Extension: 301
 1st Skill:
 2nd Skill:
 3rd Skill:

 Return Destination:
 VDN Timed ACW Interval:
 BSR Application:
 BSR Available Agent Strategy: 1st-found
```

2. Type a description for this VDN in the Name field.

In our example, type **Sales Department**.

The information in the VDN Name field appears on a display phone. This allows the agent to recognize the nature of the call and respond accordingly.

**Tip:**

*The VDN Override on the Vector Directory Number screen controls the operation of the display.*

3. Enter the vector number.

In our example, type **11**.

4. In the Measured field, indicate how you want to measure calls to his VDN.

In our example, type **both** (for both CMS and BCMS).

**Tip:**

*BCMS must be enabled to use “both.” Use **display system-parameters customer-options** to see if BCMS is enabled.*

5. Press ENTER to save your changes.

### Viewing vector directory numbers

To see the VDNs already associated with your vectors:

1. Type **list VDN** and press RETURN.

The [Vector Directory Number](#) screen appears.

| Name           | VDN  |      | Vec |    |     |      | Orig<br>Annc | Event        |               |     |
|----------------|------|------|-----|----|-----|------|--------------|--------------|---------------|-----|
|                | Ext  | Ovrd | COR | TN | Num | Meas |              | Notif<br>Adj | Skills<br>1st | 2nd |
| Tech Support   | 5000 | y    | 59  | 1  | 234 | none | 301          |              |               |     |
| Customer Serv. | 5001 | n    | 1   | 1  | 1   | none | 302          |              |               |     |
| New Orders     | 5002 | y    | 23  | 1  | 5   | none | 303          |              |               |     |

Each VDN maps to one vector. Several VDNs can map to the same vector.

## Understanding Automatic Call Distribution

---

Automatic Call Distribution (ACD) is MultiVantage feature used in many call centers. ACD gives you greater flexibility to control call flow and to measure the performance of agents.

ACD systems operate differently from non-ACD systems, and they can be much more complex. ACD systems can also be more powerful because they allow you to use features and products that are not available in non-ACD systems. See *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers* for more information on ACD call centers.

### Enhancing an ACD system

---

First, all call center management systems (such as Avaya's Basic Call Management System ("BCMS"), BCMSVu, and the sophisticated Avaya IP Agent Call Management System) require ACD. These management systems give you the ability to measure more aspects of your center's operation, and in more detail, than is possible with standard Avaya MultiVantage reports.

Call vectoring greatly enhances the flexibility of a call center, and most vectoring functions require ACD. Vectoring is a simple programming language that allows you to custom design every aspect of call processing. See "[What are vectors?](#)" on [page 230](#) for more information.

Together, ACD and vectoring allow you to use Expert Agent Selection ("EAS"). For a variety of reasons, you may want certain agents to handle specific types of calls. For example, you may want only your most experienced agents to handle your most important customers. You may have multilingual agents who can serve callers in a variety of languages.

EAS allows you to classify agents according to their specific skills and then to rank them by ability or experience within each skill. Avaya MultiVantage uses these classifications to match each call with the best available agent. See *Avaya MultiVantage™ Call Center Software Call Vectoring and Expert Agent Selection (EAS) Guide* for more information on call vectoring and EAS.

## Assigning a terminating extension group

A Terminating Extension Group (“**TEG**”) allows an incoming call to ring as many as 4 phones at one time. Any user in the group can answer the call.

Once a member of the TEG has answered a group call, the TEG is considered busy. If a second call is directed to the group, it follows a coverage path if one has been assigned.

### Instructions

Now assign a terminating extension group to the advertising department. For example, we will assign this TEG to extension 6725.

1. Type **add term-ext-group next** and press RETURN.

The **Terminating Extension Group** screen appears.

```

 TERMINATING EXTENSION GROUP

Group Number: 1 Group Extension: 6725
Group Name: advertising Coverage Path: 5
Security Code: COR: 1
 TN: 1
ISDN Caller Disp: mbr-name LWC Reception: none
AUDIX Name: Messaging Server Name:

GROUP MEMBER ASSIGNMENTS

Ext Name (first 26 characters) Ext Name (first 26 characters)
1: 5101 26 character name sta 5101 3:
2: 4: 5102 26 character name sta 5102

```

2. In the Group Extension field, type **6725**.  
This is the extension for the advertising group.
3. In the Group Name, type **advertising**.  
This is the name of the group.
4. In the Coverage Path field, type **5**.  
This is the number of the call coverage path for this group.
5. In the COR field, leave the default as **1**.
6. In the TN field, leave the default as **1**.

7. In the ISDN Call Display field, type **mbr-name**.

This specifies that the member name (member of the TEG where the call terminated) is sent to the originating user.

8. In the Ext field, in the 1st place, type **5101**.
9. In the 4th place, type **5102**.
10. Press ENTER to save your changes.
11. Type **change station 6725** and press RETURN.

The **Station** screen for extension 6725 appears.

```

 Page 2 of X
FEATURE OPTIONS STATION
LWC Reception? msa-spe Auto Select Any Idle Appearance? n
LWC Activation? y Coverage Msg Retrieval? y
 CDR Privacy? n Auto Answer: none
Redirect Notification? y Data Restriction? n
Per Button Ring Control? n Idle Appearance Preference? n
PCOL/TEG Call Alerting? n
Active Station Ringing: single Restrict Last Appearance? y
 Per Station CPN - Send Calling Number? _
H.320 Conversion? n
 AUDIX Name: _____
Messaging Server Name: _____ Audible Message Waiting? n
 Display Client Redirection? n
 Select Last Used Appearance? n

```

12. In the Bridged Call Alerting field, type **y**.  
This provides audible ringing for TEG calls.
13. In the Button Assignments section, type **term-x-gr 1**.  
This is the TEG button for the advertising group.
14. Press ENTER to save your changes.

### World class routing

Your system uses Automatic Alternate Routing (“AAR”) and Automatic Route Selection (“ARS”) to direct outgoing calls.

- AAR routes calls within your company over your own private network.
- ARS routes calls that go outside your company over public networks. ARS also routes calls to remote company locations if you do not have a private network.

Automatic routing begins when a user dials a feature access code (“FAC”) followed by the number the user wants to call. The switch analyzes the digits dialed, selects the route for the call, deletes and inserts digits if necessary, and routes the call over the trunks you specify in your routing tables. ARS and AAR can access the same trunk groups and share the same route patterns and other routing information. ARS calls can be converted to AAR calls and vice-versa.

The FAC for AAR is usually the digit 8. The FAC for ARS is usually the digit 9 in the US and 0 outside of the US. Your Avaya technician sets up AAR on your switch and usually assigns the AAR FAC at the same time. You can administer your own ARS FAC.

This section describes only ARS call routing.

## Managing calling privileges

---

Each time you set up a phone, you use the station screen to assign a class of restriction (“COR”). You can create different CORs for different groups of users. For example, you may want executives in your company to have different calling privileges than receptionists.

When you set up a COR, you specify a facility restriction level (“FRL”) on the Class of Restriction screen. The FRL determines the calling privileges of the user. Facility Restriction Levels are ranked from 0–7, where 7 has the highest level of privileges.

You also assign an FRL to each route pattern preference in the route pattern screen. When a user makes a call, the system checks the user’s COR. The call is allowed if the caller’s FRL is higher than or equal to the route pattern preference’s FRL.

## Instructions

---

Let us say we are setting up a new phone for an executive. The current translations assign COR 1, with outward restrictions and an FRL 0, which is the lowest permission level available. We want to assign a COR with the highest level of permissions, FRL 7, to station 1234.

To change station 1234 from COR 1 to COR 7:

1. Type **change station 1234** and press RETURN.  
The **Station** screen appears.
2. In the COR field, type **7** and press ENTER to save your changes.
3. To change from FRL 0 to FRL 7, type **change cor 7** and press RETURN.  
The **Class of Restriction** screen appears.
4. In the FRL field, type **7** and press ENTER to save your changes.  
Now all users with COR 7 will have the highest level of calling permissions.

## Assigning ARS FAC

---

Be sure the ARS feature access code (FAC) is set up on your system. In the U.S., 9 is usually the ARS FAC. Users dial 9 to make an outgoing call.

When a user dials 9 to access ARS and make an outgoing call, the ARS access code 9 is dropped before digit analysis takes place. will not be part of the digit analysis.

### Instructions

---

To assign the ARS FAC:

1. Type **change dialplan** and press ENTER.  
The [DCS to QSIG TSC Gateway screen](#) screen appears.
2. Move to the 9 row and type **fac** in the first column. Press ENTER to save your changes.
3. Type **change features** and press ENTER.  
The [Feature Access Code](#) screen appears.
4. Type **9** in the ARS - access code field and press ENTER to save your changes.

## Displaying ARS analysis information

---

### Instructions

---

You will want to become familiar with how your system currently routes outgoing calls. To display the ARS Digit Analysis Table that controls how the system routes calls that begin with 1:

1. Type **display ars analysis 1** and press RETURN.  
The ARS Digit Analysis Table for dialed strings that begin with 1 appears. Note that the switch displays only as many dialed strings as can fit on one screen at a time.

To see all the dialed strings that are defined for your system, run an ARS Digit Analysis report:

1. Type **list ars analysis** and press RETURN.  
The ARS Digit Analysis Report appears. You may want to print this report to keep in your paper records.

## Understanding ARS analysis

With ARS, the switch checks the digits in the number called against the ARS Digit Analysis Table to determine how to handle the dialed digits. Your switch also uses Class of Restriction (COR) and Facility Restriction Level (FRL) to determine the calling privileges.

Let us look at a very simple [AAR and ARS Digit Analysis Table](#). Your system likely has more defined dialed strings than our example.

| ARS DIGIT ANALYSIS TABLE |       |     |           |      |                 |     |  |
|--------------------------|-------|-----|-----------|------|-----------------|-----|--|
| Dialed String            | Total |     | Location: | all  | Percent Full: 6 |     |  |
|                          | Min   | Max | Route     | Call | Node            | ANI |  |
|                          |       |     | Pattern   | Type | Num             | Req |  |
| 1_____                   | 1     | 1   | 12        | svcl | ___             | n   |  |
| 1_____                   | 11    | 11  | 30        | fnpa | ___             | n   |  |
| 1_____                   | 12    | 23  | 17        | intl | ___             | n   |  |
| 10xxx_____               | 5     | 5   | deny      | op   | ___             | n   |  |
| 1800_____                | 11    | 11  | 30        | fnpa | ___             | n   |  |
| 2_____                   | 7     | 7   | 2         | hnpa | ___             | n   |  |
| 3_____                   | 7     | 7   | 2         | hnpa | ___             | n   |  |
| 4_____                   | 7     | 7   | 2         | hnpa | ___             | n   |  |
| 5_____                   | 7     | 7   | 2         | hnpa | ___             | n   |  |
| 6_____                   | 7     | 7   | 2         | hnpa | ___             | n   |  |
| 7_____                   | 7     | 7   | 2         | hnpa | ___             | n   |  |

The far-left column of the ARS Digit Analysis Table lists the first digits in the dialed string. When a user makes an outgoing call, the system analyzes the digits, looks for a match in the table, and uses the information in the matching row to determine how to route the call.

Let us say a caller places a call to 1-303-233-1000. The switch matches the dialed digits with those in the first column of the table. In this example, the dialed string matches the '1'. Then the systems matches the length of the entire dialed string (11 digits) to the minimum and maximum length columns. In our example, the 11-digit call that started with 1 follows route pattern 30 as an fnpa call.

 **Tip:**

*The first dialed digit for an external call is often an access code. If '9' is defined as the ARS access code, the switch drops this digit and analyzes the remaining digits with the ARS Analysis Table.*

The Route Pattern points to the route that handles the calls that match this dial string.

Call Type tells what kind of call is made with this dial string. Call type helps the switch decide how to handle the dialed string.

## **Examples of digit conversion**

---

Your system uses the AAR or ARS Digit Conversion Table to change a dialed number for more efficient routing. Digits may be inserted or deleted from the dialed number. For instance, you can tell the switch to delete a 1 and an area code on calls to one of your locations, and avoid long-distance charges by routing the call over your private network.

The table below reflects these values:

- ARS feature access code = 9
- AAR feature access code = 8
- Private Network Office Code (also known as Home RNX) = 222
- Prefix 1 is required on all long-distance DDD calls
- Dashes (-) are for readability only

The switch maps the dialed digits to the matching pattern that most closely matches the dialed number. Example: If the dialed string is 957-1234 and matching patterns 957-1 and 957-123 are in the table, the match is on pattern 957-123.

**Table 5. ARS digit conversion examples**

| Operation                                                                                          | Actual Digits Dialed           | Matching Pattern     | Replacement String | Modified Address | Notes                                                                                                                           |
|----------------------------------------------------------------------------------------------------|--------------------------------|----------------------|--------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------|
| DDD call to ETN                                                                                    | 9-1-303-538-1345               | 1-303-538            | 362                | 362-1345         | Call routes via AAR for RNX 362                                                                                                 |
| Long-distance call to specified carrier                                                            | 9-10222+DDD                    | 10222                | (blank)            | (blank)          | Call routes as dialed with DDD # over private network                                                                           |
| Terminating a local DDD call to an internal station                                                | 9-1-201-957-5567 or 9-957-5567 | 1-201-957-5 or 957-5 | 222-5              | 222-5567.        | Call goes to home RNX 222, ext. 5567                                                                                            |
| Unauthorized call to intercept treatment                                                           | 9-1-212-976-1616               | 1-XXX-976            | #                  | (blank)          | "#" means end of dialing. ARS ignores digits dialed after 976. User gets intercept treatment.                                   |
| International calls to an attendant                                                                | 9-011-91-672530                | 011-91               | 222-0111#          | 222-0111         | Call routes to local switch (RNX 222), then to attendant (222-0111).                                                            |
| International call to announcement (This method may also be used to block unauthorized IDDD calls) | 9-011-91-672530                | 011-91               | 222-1234#          | 222.1234-        | Call routes to local switch (RNX 222), then to announcement extension (222-1234).                                               |
| International call from certain European countries needing dial tone detection                     | 0-00-XXXXXXXX                  | 00                   | +00+               | 00+XXXX          | The first 0 denotes ARS, the second pair of 0s denotes an international call, the pluses denote "wait" for dial tone detection. |

**Defining operator assisted calls**

Let us look at how the switch routes an ARS call that begins with 0 and requires operator assistance. Remember, the user dials 9 to access ARS, then a 0, then the rest of the number.

To see how your switch handles a call to an operator:

1. Type **display ars analysis 0** and press ENTER.

The [AAR and ARS Digit Analysis Table](#) screen starting with 0 appears.

| ARS DIGIT ANALYSIS TABLE |       |     |               |      |               |     |   |
|--------------------------|-------|-----|---------------|------|---------------|-----|---|
| Dialed String            | Total |     | Location: all |      | Percent Full: |     | 6 |
|                          | Min   | Max | Route         | Call | Node          | ANI |   |
|                          |       |     | Pattern       | Type | Num           | Req |   |
| 0                        | 1     | 1   | 1             | svcl | ___           | n   |   |
| 0                        | 8     | 8   | 1             | op   | ___           | n   |   |
| 0                        | 11    | 11  | 1             | op   | ___           | n   |   |
| 00                       | 2     | 2   | 1             | op   | ___           | n   |   |
| 01                       | 10    | 23  | deny          | op   | ___           | n   |   |
| 011                      | 10    | 23  | deny          | iop  | ___           | n   |   |
| 1                        | 11    | 11  | 3             | intl | ___           | n   |   |

The table in our example shows 6 translations for calls that begin with 0.

### Instructions

We will use the ARS digit analysis table shown above and follow the routing for an operator assisted a call to NJ.

- A user dials 9 0 908 956 1234.
- The switch drops the ARS FAC (9 in our example), looks at the ARS Digit Analysis Table for 0, and analyzes the number. The switch:
  - determines that more than 1 digit was dialed
  - rules out the plan for 00, 01, and 011
  - determines that 11 digits were dialed
- The switch routes the call to route pattern 1 as an operator assisted call

### Defining Inter-exchange carrier calls

Let us look at how the switch routes an ARS call to an inter-exchange (long-distance) carrier (“IXC”). IXC numbers directly access your long-distance carrier lines.

IXC numbers begin with 1010, followed by three digits, plus the number as it is normally dialed including 0, 00, or 1+ 10 digits. These numbers are set up on your default translations.

Remember, the user dials 9 to access ARS, then the rest of the number.

## Instructions

To see how your switch handles a call to an IXC:

1. Type **display ars analysis 1** and press ENTER.

The [AAR and ARS Digit Analysis Table](#) screen starting with 1 appears.

| ARS DIGIT ANALYSIS TABLE |       |     |               |          |           |     |                 |
|--------------------------|-------|-----|---------------|----------|-----------|-----|-----------------|
| Dialed String            | Total |     | Location: all |          | Call Node | ANI | Percent Full: 6 |
|                          | Min   | Max | Route Pattern | Type Num |           |     |                 |
| 1_____                   | 11    | 11  | ___           | 3        | intl      | ___ | n               |
| 1010xxx_____             | 7     | 7   | ___           | 5        | op        | ___ | n               |
| 1010xxx0_____            | 8     | 8   | ___           | 5        | op        | ___ | n               |
| 1010xxx0_____            | 18    | 18  | ___           | 5        | op        | ___ | n               |
| 1010xxx00_____           | 9     | 9   | ___           | 5        | op        | ___ | n               |
| 1010xxx01_____           | 17    | 25  | ___           | 3        | iop       | ___ | n               |
| 2_____                   | 7     | 7   | ___           | 2        | hnpa      | ___ | n               |
| 3_____                   | 7     | 7   | ___           | 2        | hnpa      | ___ | n               |
| 4_____                   | 7     | 7   | ___           | 2        | hnpa      | ___ | n               |

This table shows 5 translations for IXC calls.

When you use x in the Dialed String field, the switch recognizes x as a wildcard. The x represents any digit, 0 - 9. If I dial 1010, the next 3 digits will always match the x wild cards in the dialed string.

Use the ARS digit analysis table shown above and follow the routing for an IXC call to AT&T. 1010288 is the carrier access code for AT&T.

- A user dials 9 1010288 plus a public network number.
- The switch drops the ARS FAC (9 in our example), looks at the ARS Digit Analysis Table for 1010, and analyzes the number.
- The switch matches 288 with xxx and sends the call over route pattern 5.

## Restricted area codes and prefixes

Certain area code numbers are set aside in the North American Numbering Plan. These numbers are 200, 300, 400, 500, 600, 700, 800, 877, 888, 900. You need to specifically deny calls made to area codes 200 through 900 (except 800 and 888).

You can also deny access to the 976 prefix, which is set aside in each area code for pay-per call services, if you do not want to incur charges. You can block 976 or any other prefix in all NPAs with a single entry in the digit analysis table. See [“Using wild cards” on page 255](#) for more information.

## Instructions

Set the 200 area code apart from other area codes 201 through 209. We use the digit analysis table 120 because it defines long distance calls that begin with 1 and all area codes from 200 through 209.

To deny long distance calls to the 200 area code:

1. Type **change ars analysis 120** and press ENTER.

The [AAR and ARS Digit Analysis Table](#) screen beginning with 120 appears.

| ARS DIGIT ANALYSIS TABLE |               |       |              |           |               |     |
|--------------------------|---------------|-------|--------------|-----------|---------------|-----|
|                          |               |       | Location:    | all       | Percent Full: | 6   |
| Dialed String            | Total Min Max | Route | Call Pattern | Node Type | ANI Num       | Req |
| 120_____                 | 11 11         | 4     | fnpa         | ___       | n             |     |
| 1200_____                | 11_ 11___     | deny  | fnpa         | ___       | n             |     |

The table in our example shows 2 translations for calls that begin with 120.

First, follow the routing for a long-distance call that begins with 120 and is allowed. The 120 translation handles all dial strings 1-201 through 1-209, and there are many matches.

- A user dials 9 120 plus 8 digits (the first of the 8 digits is not 0).
- The switch drops the ARS FAC (9 in our example), looks at the ARS Digit Analysis Table for 120, and analyzes the number. The switch determines that the call is a long-distance call and sends the call over route pattern 4.

Now we will follow a call that begins with the restricted area code 200. Only one string matches this translation.

- A user dials 9 1200 plus 7 digits.
- The switch drops the ARS FAC (9), and looks at the ARS Digit Analysis Table for 1200. The switch determines that the call type is deny and the call does not go through.

## Using wild cards

You can use wild cards to help separate out calls to certain numbers. Remember, when you use the wild card x in the Dialed String field, the switch recognizes x as any digit, 0 - 9. For example, you can restrict users from making calls to a 555 information operator where you might incur charges.

## Instructions

To prevent callers from placing calls to long-distance 555 information numbers:

1. Type **change ars analysis 1** and press RETURN.

The [AAR and ARS Digit Analysis Table](#) screen beginning with 1 appears.

| ARS DIGIT ANALYSIS TABLE |         |         |      |           |     |               |   |
|--------------------------|---------|---------|------|-----------|-----|---------------|---|
|                          |         |         |      | Location: | all | Percent Full: | 6 |
| Dialed                   | Total   | Route   | Call | Node      | ANI |               |   |
| String                   | Min Max | Pattern | Type | Num       | Req |               |   |
| 1_____                   | 11_ 11_ | ___ 1   | intl | ___       | n   |               |   |
| 1xxx555_____             | 11_ 11_ | ___ 1   | intl | ___       | n   |               |   |
| 1010xxx_____             | 7_ 7_   | ___ 1   | op   | ___       | n   |               |   |

- Use the arrow keys to move to a blank Dialed String field.
- Enter **1xxx555** in the Dialed String field.
- Enter **11** in the Total Mn and **11** in Total Mx fields.
- Enter **deny** (denied) in the Route Pattern field.
- Enter **fnhp** in the Call Type field.
- Press ENTER to save your changes.

### Defining local information calls

You can set up your switch to allow calls to local information, or 411.

### Instructions

To allow 411 service calls:

- Type **change ars analysis 4** and press RETURN.

The [AAR and ARS Digit Analysis Table](#) screen beginning with 4 appears.

| ARS DIGIT ANALYSIS TABLE |         |         |      |           |     |               |   |
|--------------------------|---------|---------|------|-----------|-----|---------------|---|
|                          |         |         |      | Location: | all | Percent Full: | 6 |
| Dialed                   | Total   | Route   | Call | Node      | ANI |               |   |
| String                   | Min Max | Pattern | Type | Num       | Req |               |   |
| 411_____                 | 3_ 3_   | ___ 1   | svcl | ___       | n   |               |   |
| 5_____                   | 7_ 7_   | ___ 2   | hnpa | ___       | n   |               |   |
| 6_____                   | 7_ 7_   | ___ 2   | hnpa | ___       | n   |               |   |
| 7_____                   | 7_ 7_   | ___ 2   | hnpa | ___       | n   |               |   |
| 911_____                 | 3_ 3_   | ___ 1   | svcl | ___       | n   |               |   |

- Use the arrow keys to move to a blank Dialed String field.
- Enter **411** in the Dialed String field.
- Enter **3** in the Total Mn and **3** in Total Mx fields.
- Enter **1** in the Route Pattern field.
- Enter **svcl** (service call) in the Call Type field.
- Press ENTER to save your changes.

## Setting up multiple locations

---

When you define a location number for:

- cabinets in DEFINITY R
- Remote offices on DEFINITY CSI, SI, and R
- media gateways on S8300 Media Servers
- IP phones and softphones according to IP network region

you can create numbering plans and time zone and daylight savings plans that are specific for each cabinet. Choose the location you want to use as your main location, and offset the system clock time on each cabinet according to their its location. For more information about defining location numbers with the change cabinet command, see your system's Maintenance manual.

### Before you start

---

Be sure the Multiple Locations field on the System-Parameters Customer-Options screen is set to **y**. If this field is set to **n**, contact your Avaya representative for more information.

Be sure your daylight savings rules are administered. Daylight Savings Rule numbers are located on the Daylight Savings Rule Screen

Each cabinet in a switch and each port network in the cabinet must be assigned a location number. See the maintenance information for your switch for more information.

### Instructions

---

For example, we will set up multiple locations for a switch with cabinets in Chicago and New York. Location 1 is assigned to the cabinet in Chicago, our main office, so Central Standard Time is used for our main location. Location 2 is assigned to the cabinet in New York. We'll define the numbering plan area ("NPA") for the Chicago and New York locations, and set the time zone offset for NY to show the difference in time between Eastern Standard Time and Central Standard Time.

Type **list cabinets** to see the cabinet screen and a list of cabinets and their locations.

To define locations for cabinets in Chicago and New York:

1. Type **change multiple locations** and press ENTER.

The **Locations** screen appears.

| LOCATIONS                                      |               |                    |                          |                          |
|------------------------------------------------|---------------|--------------------|--------------------------|--------------------------|
| ARS Prefix 1 required for 10-digit NANP calls? |               |                    |                          |                          |

| 7                                              | _____         | - _: _             | __                       | __                       |
| 8                                              | _____         | - _: _             | __                       | __                       |
| 9                                              | _____         | - _: _             | __                       | __                       |
| 10                                             | _____         | - _: _             | __                       | __                       |
| 11                                             | _____         | - _: _             | __                       | __                       |
| 12                                             | _____         | - _: _             | __                       | __                       |
| 13                                             | _____         | - _: _             | __                       | __                       |
| 14                                             | _____         | - _: _             | __                       | __                       |

2. Type **y** in the ARS Prefix 1 required for 10-digit NANP calls field.

Our dial plan requires users to dial a 1 before all 10-digit (long distance) NANP calls.

3. Type **Chicago** in the Name field in the Number 1 row.

Use this field to identify the location.

4. Type **+00:00** in the TimeZone Offset field in the Number 1 row.

In our example, the system time and the Chicago location time are the same.

5. Type **1** in the Daylight Savings Rule field in the Number 1 row.

In our example, daylight savings rule 1 applies to U.S. daylight savings time.

**Tip:**

Use **display daylight-savings-rules** to see what rules have been administered on your switch.

6. Type **312** in the Number Plan Area Code field in the Number 1 row.

In our example, 312 is the local area code for Chicago, location 1.

7. Type **New York** in the Name field in the Number 2 row.

8. Type **-01:00** in the TimeZone Offset field in the Number 2 row.  
In our example, subtract one hour from the system clock in Chicago to provide the correct time for the location in New York.
9. Type **1** in the Daylight Savings Rule field in the Number 2 row.  
In our example, daylight savings rule 1 applies to U.S. daylight savings time, and both locations use the same rule.
10. Type **212** in the NANP field in the Number 2 row.  
In our example, 212 is the local area code for New York, location 2.
11. Press ENTER to save your changes.

### Related topics

---

See [“Setting the system date and time” on page 43](#) for more information about how to set your system clock and specify the daylight savings rule for the location.

See [“Establishing daylight savings rules” on page 41](#) for more information about how to specify the dates and times of daylight savings rules.

## Routing with multiple locations

---

When you set up multiple locations, you can define call routing that covers all locations as well as call routing specific to each individual location. Use your routing tables to define local routing for 911, service operators, local operator access, and all local calls for each location. Leave long-distance and international numbers that apply across all locations on the routing tables with location field set to **all**.

### Before you start

---

Be sure the Multiple Locations field on the System-Parameters Customer-Options screen is set to **y**. If this field is set to **n**, contact your Avaya representative for more information.

AAR or ARS must be administered.

- For AAR, verify that either the Private Networking field or the Uniform Dialing Plan field is **y** on the System-Parameters Customer-Options screen.
- For ARS, verify that the ARS field is **y** on the System-Parameters Customer-Options screen.

Each cabinet in a switch must be assigned a location number. See the maintenance information for your switch for more information.

**Instructions**

For example, we will use ARS to set up local call routing for two switch locations. Our Chicago switch is assigned to location 1, and our New York switch is assigned to location 2.

Our example shows a simple local dialing plan. Each location already contains location-specific routing tables. We'll use route pattern 1 for local service calls and route pattern 2 for local HNPA calls in the Chicago location.

**Tip:**

*Create location-specific routing by assigning different route patterns for each location.*

To define local calls for switches in Chicago and New York:

1. Type **change ars analysis location 1** and press ENTER.

The [AAR and ARS Digit Analysis Table](#) screen for location 1 appears.

change ars analysis
Page 1 of X

ARS DIGIT ANALYSIS TABLE  
Location: 1\_\_ Percent Full: \_\_

| Dialed String | Total<br>Min Max | Route Pattern | Call Type | Node Num | ANI Reqd |
|---------------|------------------|---------------|-----------|----------|----------|
| 2_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 3_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 4_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 411_____      | 3 3              | 1_____        | svcl      | __       | n        |
| 5_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 555_____      | 7 7              | deny_         | hnpa      | __       | n        |
| 6_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 611_____      | 3 3              | 1_____        | svcl      | __       | n        |
| 7_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 8_____        | 7 7              | 2_____        | hnpa      | __       | n        |
| 811_____      | 3 3              | 1_____        | svcl      | __       | n        |
| 9_____        | 7 7              | 2_____        | hnpa      | __       | n        |

2. Type the information for local dialed strings and service calls in each row on the screen.

In our example, for location 1 (Chicago) local HNPA calls:

- Type the appropriate digit in the Dialed String field
- Type **7** in the Total Min field
- Type **7** in the Total Max field
- Type **2** in the Route Pattern field
- Type **hnpa** in the Call Type field

In our example, for location 1 (Chicago) local service calls:

- Type the appropriate digits in the Dialed String field
  - Type **3** in the Total Min field
  - Type **3** in the Total Max field
  - Type **1** in the Route Pattern field
  - Type **svcl** in the Call Type field
3. Press ENTER to save your changes.
  4. Type **change ars analysis 4 location 2** and press ENTER.  
The ARS Digit Analysis Table for location 2 appears.
  5. Type in the local HNPA and service call routing information for New York.
  6. Press ENTER to save your changes.

### Related topics

---

See [“Automatic routing — general”](#) on page 1499 for more information on ARS.

See [“AAR and ARS Digit Analysis Table”](#) on page 577, [“AAR and ARS Digit Conversion Table”](#) on page 582, and [“Toll Analysis”](#) on page 1230 for general information on ARS administration. You can define location specific entries in addition to the global entries on these screens.

## Modifying call routing

---

If your system uses ARS Digit Analysis to analyze dialed strings and select the best route for a call, you must change the digit analysis table to modify call routing. For example, you'll need to update this table to add new area codes or to restrict users from calling specific areas or countries.

### Adding a new area code or prefix

---

A common task for system administrators is to configure their system to recognize new area codes or prefixes.

When you want to add a new area code or prefix, you look up the settings for the old area code or prefix and enter the same information for the new one.

**Tip:**

Use **display toll xxx** (where *xxx* is the prefix you want to add) to see if the new area code or prefix number is set up as a toll call (y) or not. Some users may not be allowed to dial toll call numbers.

**Instructions**

We will add a new area code. When the California area code, 415, splits and portions change to 650, you'll need to add this new area code to your system.

 **Tip:**

*If you do not need to use 1 for area code calls, omit the **1** in steps 1, 3, and 5 in our example. Also, enter **10** in the Total Min and Total Max fields (instead of 11) in step 6.*

To add this non-local area code:

1. Type **list ars route-chosen 14152223333** and press RETURN.

You can use any 7-digit number after 1 and the old area code (415). We used 222-3333.

The ARS Route Chosen Report screen appears.

| ARS ROUTE CHOSEN REPORT |           |           |                             |           |             |          |
|-------------------------|-----------|-----------|-----------------------------|-----------|-------------|----------|
| Location: 1             |           |           | Partitioned Group Number: 1 |           |             |          |
| Dialed String           | Total Min | Total Max | Route Pattern               | Call Type | Node Number | Location |
| 141                     | 11        | 11        | 30                          | fnpa      |             | all      |

2. Write down the Total Min, Total Max, Route Pattern, and Call Type values from this screen.

In this example, the Total Min is 11, Total Max is 11, Route Pattern is 30, and the Call Type is fnpa.

3. Type **change ars analysis 1650** and press RETURN.

The [AAR and ARS Digit Analysis Table](#) screen appears.

| ARS DIGIT ANALYSIS TABLE |           |           |               |           |          |                 |  |
|--------------------------|-----------|-----------|---------------|-----------|----------|-----------------|--|
|                          |           |           | Location: all |           |          | Percent Full: 6 |  |
| Dialed String            | Total Min | Total Max | Route Pattern | Call Type | Node Num | ANI Req         |  |
| 1_____                   | 11        | 11        | 30            | fnpa      | ___      | n               |  |
| 167_____                 | 11        | 11        | 30            | fnpa      | ___      | n               |  |
| 1800_____                | 11        | 11        | 30            | fnpa      | ___      | n               |  |
| 2_____                   | 7         | 7         | 2             | hnpa      | ___      | n               |  |
| 3_____                   | 7         | 7         | 2             | hnpa      | ___      | n               |  |
| 4_____                   | 7         | 7         | 2             | hnpa      | ___      | n               |  |
| 5_____                   | 7         | 7         | 2             | hnpa      | ___      | n               |  |
| 7_____                   | 7         | 7         | 2             | hnpa      | ___      | n               |  |
| 8_____                   | 7         | 7         | 2             | hnpa      | ___      | n               |  |
| 911_____                 | 3         | 3         | 1             | emer      | ___      | n               |  |
| 976_____                 | _11       | 11        | deny          | hnpa      | ___      | n               |  |

4. Move to a blank Dialed String field.

If the dialed string is already defined in your system, the cursor appears in the appropriate Dialed String field, where you can make changes.

5. Enter **1650** in the Dialed String field.
6. Enter the minimum and maximum values from step 2 in the Total Mn and Total Mx fields.

In our example, enter **11** in each field.

7. Enter the route pattern from step 2 in the Route Pattern field.

In our example, enter **30**.

8. Enter **fnpa** in the Call Type field.
9. Enter the node number from step 2 in the Node Num field.

For our example, leave the node number blank.

10. Press ENTER to save your changes.

To add a new prefix, follow the same directions, except use a shorter dial string (such as **list ars route-chosen 2223333**, where **222** is the old prefix) and a dial type of **hnpa**.

**Tip:**

*If you change an existing area code for a network with multiple locations, be sure to change the Number Plan Area Code field on the Locations screen. See [“Setting up multiple locations”](#) on page 257.*

## Using ARS to restrict outgoing calls

ARS allows you to block outgoing calls to specific dialed strings. For example, you can restrict users from making international calls to countries where you do not do business, or in the U.S. you can restrict access to 900 and 976 pay-per-call numbers.

**SECURITY ALERT:**

*To prevent toll fraud, deny calls to countries where you do not do business. The following countries are currently concerns for fraudulent calling.*

| country     | code | country  | code |
|-------------|------|----------|------|
| Colombia    | 57   | Pakistan | 92   |
| Ivory Coast | 225  | Peru     | 51   |
| Mali        | 23   | Senegal  | 221  |
| Nigeria     | 234  | Yemen    | 967  |

## Instructions

---

To prevent callers from placing calls to Colombia (57):

1. Type **change ars analysis 01157** and press RETURN.

You enter 011 (international access) and the country code (57). The ARS Digit Analysis Table screen appears.

2. Move to a blank Dialed String field.

If the dialed string is already defined in your system, the cursor appears in the appropriate Dialed String field. Skip to step 5 to deny calls to this dialed string.

3. Enter **01157** in the Dialed String field.
4. Enter **10** in the Total Mn and **23** in Total Mx fields.
5. Enter **deny** (denied) in the Route Pattern field.
6. Enter **intl** in the Call Type field.
7. Press ENTER to save your changes.

## Overriding call restrictions

---

You can use authorization codes to enable callers to override a station's calling privileges. For example, you can give a supervisor an authorization code so they can make calls from a phone that is usually restricted for these calls. Since each authorization code has its own COR, the system uses the COR assigned to the authorization code (and FRL assigned to the COR) to override the privileges associated with the employee's phone.

Note that authorization codes do not override dialed strings that are denied. For example, if your ARS tables restrict users from placing calls to Colombia, a caller cannot override the restriction with an authorization code.

## Before you start

---

Verify that the Authorization Codes field on the System Parameters Customer Options screen is set to **y**.

### **SECURITY ALERT:**

*You should make authorization codes as long as possible to increase the level of security. You can set the length of authorization codes on the Feature-Related System Parameters screen.*

## Instructions

We will create an authorization code 4395721 with a COR of 2.

1. Type **change authorization-code 4395721** and press RETURN.  
The [Authorization Code — COR Mapping](#) screen appears.
2. In the AC field, type **4395721**.
3. In the COR field, enter **2**.
4. Press ENTER to save your changes.

| Authorization Code - COR Mapping                             |     |    |     |    |     |    |     |    |     |    |     |
|--------------------------------------------------------------|-----|----|-----|----|-----|----|-----|----|-----|----|-----|
| NOTE: 2 codes administered. Use 'list' to display all codes. |     |    |     |    |     |    |     |    |     |    |     |

| 9260839                                                      | 3   |    |     |    |     |    |     |    |     |    |     |
| 2754609                                                      | 4   |    |     |    |     |    |     |    |     |    |     |
|                                                              |     |    |     |    |     |    |     |    |     |    |     |
|                                                              |     |    |     |    |     |    |     |    |     |    |     |

## Defining ARS Partitions

Most companies want all their users to be able to make the same calls and follow the same route patterns. However, you may find it helpful to provide special calling permissions or restrictions to a group of users or to particular phones.

ARS partitioning allows you to provide different call routing for a group of users or for specific phones.

### ⇒ NOTE:

If you used partitioning on a prior release of Avaya MultiVantage and you want to continue to use partitioning, please read this section carefully. In this release of Avaya MultiVantage, partition groups are defined on the Partition Route Table. If you want to define routing based on partition groups, use the Partition Route Table. Partition groups are no longer defined on the Digit Analysis Table.

### Before you start

Verify that the Tenant Partitioning field on the System Parameters Customer Options screen is **y**.

Verify that the Time of Day Routing field on the System Parameters Customer Options screen is **n**.

## Setting up partition groups

Let us say you allow your employees to make local, long distance, and emergency calls. However, you have a lobby phone for visitors and you want to allow users to make only local, toll-free, and emergency calls from this phone.

To restrict the lobby phone, you modify the routing for a partition group to enable only specific calls, such as U.S. based toll-free 1-800 calls, and then assign this partition group to the lobby phone.

## Instructions

To enable 1-800 calls for partition group 2:

1. Type **list ars route-chosen 18002221000** and press RETURN.

You can use any 7-digit number following the 1800 to create an example of the dialed string.

The ARS Route Chosen Report for partition group 1 appears.

| ARS ROUTE CHOSEN REPORT |           |           |                             |           |             |          |
|-------------------------|-----------|-----------|-----------------------------|-----------|-------------|----------|
| Location : 1            |           |           | Partitioned Group Number: 1 |           |             |          |
| Dialed String           | Total Min | Total Max | Route Pattern               | Call Type | Node Number | Location |
| 1800_____               | 11        | 11        | p1__                        | fnpa      | _____       | all      |

2. Record the route pattern for the selected dialed string.

In our example, the route pattern for 1800 is p1. This indicates that the system uses the Partition Routing Table to determine which route pattern to use for each partition.

**⇒ NOTE:**

If there was a number (with no p) under Route Pattern on the Route Chosen Report, then all partitions use the same route pattern. You need to use the Partition Routing Table only if you want to use different route patterns for different partition groups.

3. Press CANCEL to return to the command prompt.

4. Type **change partition-route-table index 1** and press RETURN.

The **Partition Route Table** screen appears. In our example, partition group 1 can make 1800 calls and these calls use route pattern 30.

| Partition Routing Table |                  |       |       |       |       |       |       |       |
|-------------------------|------------------|-------|-------|-------|-------|-------|-------|-------|
| Route Index             | Routing Patterns |       |       |       |       |       |       |       |
|                         | PGN 1            | PGN 2 | PGN 3 | PGN 4 | PGN 5 | PGN 6 | PGN 7 | PGN 8 |
| 1                       | __30             | _____ | _____ | _____ | _____ | _____ | _____ | _____ |
| 2                       | _____            | _____ | _____ | _____ | _____ | _____ | _____ | _____ |
| 3                       | _____            | _____ | _____ | _____ | _____ | _____ | _____ | _____ |
| 4                       | _____            | _____ | _____ | _____ | _____ | _____ | _____ | _____ |
| 5                       | _____            | _____ | _____ | _____ | _____ | _____ | _____ | _____ |
| 6                       | _____            | _____ | _____ | _____ | _____ | _____ | _____ | _____ |
| 7                       | _____            | _____ | _____ | _____ | _____ | _____ | _____ | _____ |

5. In the PGN2 column that corresponds to Route Index 1, type **30** and press ENTER.

This tells the system to use route pattern 30 for partition group 2 and allow partition group 2 members to make calls to 1800 numbers.

### Assigning a phone to a partition group

To assign an extension to a partition group, first assign the partition group to a COR, and then assign that COR to the extension.

### Instructions

To assign a Class of Restriction (COR) to partition group 2:

1. Type **list cor** and press RETURN.

The Class of Restriction Information screen appears.

| CLASS OF RESTRICTION INFORMATION |                 |
|----------------------------------|-----------------|
| COR                              | COR Description |
| 0                                |                 |
| 1                                | supervisor      |
| 2                                | telecommuting   |
| 3                                |                 |

2. Choose a COR that has not been used and press CANCEL.

In our example, select **3**.

3. Type **change cor 3** and press RETURN.

The **Class of Restriction** screen appears.

```

 CLASS OF RESTRICTION
 COR Number: 3
 COR Description: lobby_____

 FRL: 0 APLT? y
Can Be Service Observed? n Calling Party Restriction: none
Can Be A Service Observer? n Called Party Restriction: none
 Partition Group Number: _ Forced Entry of Account Codes? n
 Priority Queuing? n Direct Agent Calling? n
 Restriction Override: none Facility Access Trunk Test? n
 Restricted Call List? n Can Change Coverage? n
Unrestricted Call List? _ _ _ _ _
 Access to MCT? y Fully Restricted Service? n
 Category For MFC ANI: 7 Hear VDN of Origin Annc.? n
 Send ANI for MFE? n_ Add/Remove Agent Skills? n
 MF ANI Prefix: _____ Automatic Charge Display? n
Hear System Music on Hold? y PASTE (Display PBX Data on Phone)? n
 Can Be Picked Up By Directed Call Pickup? n
 Can Use Directed Call Pickup? n

```

4. Type a name for this COR in the COR Description field.  
In our example, type **lobby**.
5. Enter **2** in the Partition Group Number field.
6. Press ENTER to save your changes.

Now assign COR 3 to the lobby phone at extension 1234:

1. Type **change station 1234** and press RETURN.  
The **Station** screen for 1234 appears.
2. In the COR field, enter **3**.
3. Press ENTER to save your changes.

## Setting up time of day routing

Time of Day Routing lets you redirect calls to coverage paths according to the time of day and day of the week. You need to define the coverage paths you want to use before you define the time of day coverage plan.

You can route calls based on the least expensive route according to the time of day and day of the week the call is made. You can also deny outgoing long-distance calls after business hours to help prevent toll fraud. Time of Day Routing applies to all AAR or ARS outgoing calls and trunks used for call forwarding to external numbers.

## Before you start

AAR or ARS must be administered on your switch before you use Time of Day Routing.

- For AAR, verify that either the Private Networking field or the Uniform Dialing Plan field is **y** on the System-Parameters Customer-Options screen.
- For ARS, verify that the ARS field is **y** and the Time of Day Routing field is **y** on the System-Parameters Customer-Options screen.

## Instructions

As an example, we will allow our executives to make long distance calls during business hours. Let us look at the Time of Day Routing Plan before we make any changes.

To display your Time of Day Routing Plan:

1. Type **display time-of-day 1** and press RETURN.

The [Time of Day Routing Plan 1](#) appears.

Page 1 of 1

TIME OF DAY ROUTING PLAN 1

|     | Act   | PGN | Act   | PGN | Act   | PGN | Act   | PGN | Act   | PGN | Act  | PGN |
|-----|-------|-----|-------|-----|-------|-----|-------|-----|-------|-----|------|-----|
|     | Time  | #   | Time  | #   | Time  | #   | Time  | #   | Time  | #   | Time | #   |
| Sun | 00:01 | 1   | __:   | __  | __:   | __  | __:   | __  | __:   | __  | __:  | __  |
| Mon | 00:01 | 1   | 08:00 | 2   | 12:00 | 1   | 13:00 | 2   | 17:00 | 1   | __:  | __  |
| Tue | 00:01 | 1   | 08:00 | 2   | 12:00 | 1   | 13:00 | 2   | 17:00 | 1   | __:  | __  |
| Wed | 00:01 | 1   | 08:00 | 2   | 12:00 | 1   | 13:00 | 2   | 17:00 | 1   | __:  | __  |
| Thu | 00:01 | 1   | 08:00 | 2   | 12:00 | 1   | 13:00 | 2   | 17:00 | 1   | __:  | __  |
| Fri | 00:01 | 1   | 08:00 | 2   | 12:00 | 1   | 13:00 | 2   | 17:00 | 1   | __:  | __  |
| Sat | 00:01 | 1   | __:   | __  | __:   | __  | __:   | __  | __:   | __  | __:  | __  |

Make a note of the routing plan that is currently in effect. In our example, this plan is for employees who can only make local calls.

You can see that in our example, two partition group numbers control time of day routing. PGN 1 begins one minute after midnight (00:01) every day of the week, and is used for after-business hours and all day Saturday and Sunday. PGN 2 is assigned to office hours Monday through Friday, not including noon (12:00) to 1:00 p.m. (13:00).

2. Press CANCEL to clear the screen.

Now we will create a new time of day routing plan for long-distance calls for our executives.

1. Type **change time-of-day 2** and press RETURN.

The Time of Day Routing Plan 2 appears.

2. Type **1** in each field as shown on Time of Day Routing Plan 1.

In our example, this is the PGN used for after hours and the lunch hour.

3. Type **3** in all other fields.

In our example, PGN 3 uses the route pattern for long-distance calls during business hours. We can save money by using the trunk lines provided by our new long-distance carrier.

4. Press ENTER to save your changes.

Now assign your new Time of Day Routing Plan 2 to the COR assigned to your executives. See [“Class of Restriction” on page 658](#) to see where to assign this field.

### Example

---

For this example, assume the following:

- Jim is the user at extension 1234.
- Extension 1234 is assigned a COR of 2.
- COR 2 is assigned a Time of Day Plan Number of 1.
- The Time of Day Routing Plan 1 is administered as shown in the example above.

When Jim comes into work on Monday morning at 8:30 and makes an ARS call (dials the ARS access code followed by the number of the person he is calling), the system checks the Time of Day Plan Number assigned to Jim’s COR.

Because Jim has a COR of 2 with Time of Day Plan Number 1, the system uses Time of Day Routing Plan 1 to route the call.

According to Time of Day Routing Plan 1, calls made between 8:00 a.m. and 11:59 a.m. route according to the route pattern set up on PGN 1.

If Jim makes a call between 12:00 p.m. and 1:00 p.m. on Monday, the Time of Day Routing Plan 1 is used again. However, this time the call is routed according to PGN 2.

## Related topics

---

See “[Route Pattern](#)” on page 1096 screens for more information.

See “[Defining ARS Partitions](#)” on page 265 to see how to set up partition groups.

## Location by region

---

Location by Region provides a way to administer location by IP network region. This allows for the correct date and time information and trunk routing based on the IP network region.

### Setting up a remote user in a network region that is correct for their time zone

#### Instructions

---

With your system located in New York and a remote user located in Germany, to create the correct time zone settings:

1. Type **change locations** and press ENTER.

The Locations screen displays.

```
change locations Page 1 of 3
 LOCATIONS
 ARS Prefix 1 Required for 10-Digit NANP Calls? _
Number Name Timezone Daylight-Savings Number Plan
 Name Offset Rule Area Code
1 New York_____ + 00:00 1_ ___
2 _____ - :__ ___ ___
3 _____ - :__ ___ ___
4 _____ - :__ ___ ___
5 _____ - :__ ___ ___
6 _____ - :__ ___ ___
7 _____ - :__ ___ ___
8 _____ - :__ ___ ___
9 _____ - :__ ___ ___
10 _____ - :__ ___ ___
11 Germany_____ + 08:___ ___ ___
12 _____ - :__ ___ ___
13 _____ - :__ ___ ___
14 _____ - :__ ___ ___
```

2. On line 11, in the Name field, enter switch associated with the location (for instance, **Germany**).

3. In the first Timezone Offset field, enter **+** to indicate the time is ahead of the system time.
4. In the second Timezone Offset field, enter **08** for the number of hours difference between this location and system time.
5. In the Daylight Savings field, enter **1** if this country has daylight savings.
6. Press ENTER to save your changes.
7. Type **change ip-network-map** and press ENTER.

The IP Address Mapping screen displays.

```
change ip-network-map 1 of X
 IP ADDRESS MAPPING
 Subnet
From IP Address (To IP Address or Mask) Region
.
```

8. In the From IP Address field, enter the IP address for the remote station in Germany.
9. In the To IP Address field, enter the IP address of your system.
10. In the Subnet or Mask field, enter the subnet mask value of your network.
11. In the Region field, enter a number that is not being used. In this example, enter **100**.
12. Press ENTER to save your changes.
13. Type **change ip-network-region 100** and press ENTER.

The IP Network Region screen displays.

```

change ip-network-region 100 Page 1 of 2
 IP Network Region

Region: 100
Name: Germany

Audio Parameters Direct IP-IP Audio Connections? n
Codec Set: 1 IP Audio Hairpinning? y
Location: 11
UDP Port Range RTCP Enabled? y
Min: 2048 RTCP Monitor Server Parameters
Max: 65535 Use Default Server Parameters? n
Server IP Address: ____ . ____ . ____ . ____
Server Port: ____
RTCP Report Period(secs): ____

VoIP Media 802.1p Priority: RSVP Profile: guaranteed-service
802.1Q VLAN:

```

14. In the Name field, enter the location name for familiarity.
15. In the Location field, enter the number from the Locations screen. In this example, it was **11**.
16. Press Next Page.

Page 2 (Inter Network Region Connection Management) displays.

```

change ip-network-region 100 Page 2 of 2
 Inter Network Region Connection Management

Region (Group of 32)
1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2
001-032 1
033-064
065-096
097-128 1
129-160
161-192
193-224

```

17. Notice in the Region column 001-032, that a “1” displays under column 1 indicating that Network Region 100 (Germany) is connected to Network Region 1 (New York) using Codec Set 1.
18. In row 001-032, under column 1, enter 1 for New York.
19. Press ENTER to save your changes.

---

### Multimedia Applications Server Interface

---

The Multimedia Applications Server Interface (“MASI”) defines a protocol and a set of operations that are used to extend Avaya MultiVantage feature functionality to a Multimedia Communications Exchange (“MMCX”) system. MASI architecture fits the client/server model, where the Avaya MultiVantage functions as a server for MMCX clients. Examples of features supported by MASI include call detail recording (“CDR”), AUDIX/INTUITY voice mail integration, and Automatic Alternate Routing/Automatic Route Selection (AAR/ARS).

MMCX can make use of both MASI features and MMCX autonomous features. Autonomous features are those that MMCX provides, even if MASI is not enabled. This document does not discuss them unless there is a consideration for MASI administration.

Some autonomous MMCX features:

- Basic Call (Place/Drop)
- Call Coverage
- Conference
- Transfer

MultiVantage/MASI features:

- Basic Call (Place/Drop) — Avaya MultiVantage tracks the status of all calls placed to or from a MASI terminal.
- Call Detail Recording — Avaya MultiVantage tracks calls to and from MASI terminals and can produce call records that indicate if a call uses MASI.
- Call Coverage — Avaya MultiVantage tracks MMCX calls that are sent to coverage. A MultiVantage coverage path can contain both MASI terminals and MultiVantage stations.
- Conference — Avaya MultiVantage tracks conference calls that involve MASI terminals, if a MultiVantage station originates the conference. Conferences that involve MASI terminals and MultiVantage stations are voice-only. If the MultiVantage station originates the call, the caller can use the consultative form of conference or transfer.
- World Class Routing (“AAR” or “ARS”) — Calls from MASI terminals can take advantage of Avaya MultiVantage World Class Routing capabilities.
- Voice messaging access to AUDIX/INTUITY — MMCX users can take advantage of AUDIX voice messaging, and receive message waiting indication.
- MMCX trunking — By assigning MultiVantage trunk access codes to interfaces from the MMCX to other MMCXs or the PSTN, Avaya MultiVantage can monitor traffic over those interfaces.

## Before you start

---

### CAUTION:

*Avaya MultiVantage offers a wide range of features, and MMCX users may want to take advantage of this. In some cases, these features will operate as expected. However, some features are not supported for use over the MASI link, and their behavior is unpredictable. You may cause harm to your system by attempting to use these features. The Interactions section contains a list of features, and lists those features that are absolutely not supported for use with MASI. If you administer features on the DO NOT ADMINISTER list, Avaya cannot be responsible for the result.*

For purposes of administration, there are feature buttons and groups of users that you must not administer with MASI terminal extensions. There are also features that you simply cannot administer for a MASI terminal, because the software does not allow it.

## About this document

---

The following section describes the Multimedia Applications Server Interface, and provides instructions on how to set it up, including administration and monitoring. It also includes a section on troubleshooting.

You need to use both the DEFINITY Server system administration terminal (“SAT”) and the MMCX administration terminal to administer MASI. This document describes what you need to do at the DEFINITY Server SAT. It also occasionally mentions administration that you must do at the MMCX administration terminal. For more detailed MMCX information, see the *MMCX Technical Reference*.

## List of terms

---

This is a list of terms that are specific to MASI, or that have meanings in the context of MASI that are not standard.

- **chgmasi** — The command you use to administer MASI at the MMCX administration terminal.
- **Interserver** — Connections between MMCX terminals on different MMCX servers/nodes.
- **MASI domain** — A MASI domain consists of a MultiVantage system and one or more MASI nodes that share the same dial plan. That is, the extension numbers on the MMCX are known to MultiVantage, and fit in the MultiVantage dial plan.
- **MASI interworking** — MASI interworking refers to the completion of a voice connection within a MultiVantage system, involving at least one MASI terminal and a MASI path.
- **MASI link** — The connection between the MMCX and the Avaya MultiVantage.
- **MASI node** — A single MMCX server. You may connect more than one MASI node to a MultiVantage system. Each node has a separate number. This node number needs to be consistent whenever referring to a specific MMCX server.
- **MASI non-interworking** — MASI non-interworking refers to the completion of a call by MMCX, not involving a MASI path.
- **MASI path** — The Integrated Services Digital Network (ISDN) B-channels between MMCX and Avaya MultiVantage in a MASI environment. Paths are used for voice and data connections between Avaya MultiVantage and MMCX.

- **MASI signaling link** — ISDN D-channel used to transport a new ISO protocol called the MASI protocol between the Avaya MultiVantage and the MMCX.
- **MASI terminal** — The MultiVantage system representation of MMCX terminals in a MASI environment.
- **MMCX interface** — PRI interface for connecting an MMCX server to other public, private or wide area network (WAN) switching systems or equipment that is part of the public network. Similar to a MultiVantage trunk group. These may include non-MASI trunks connecting the Avaya MultiVantage and the MMCX.
- **MMCX trunk** — The MultiVantage system representation of trunk or network facilities terminating on MMCX. For purposes of MASI, they are called “interfaces.”

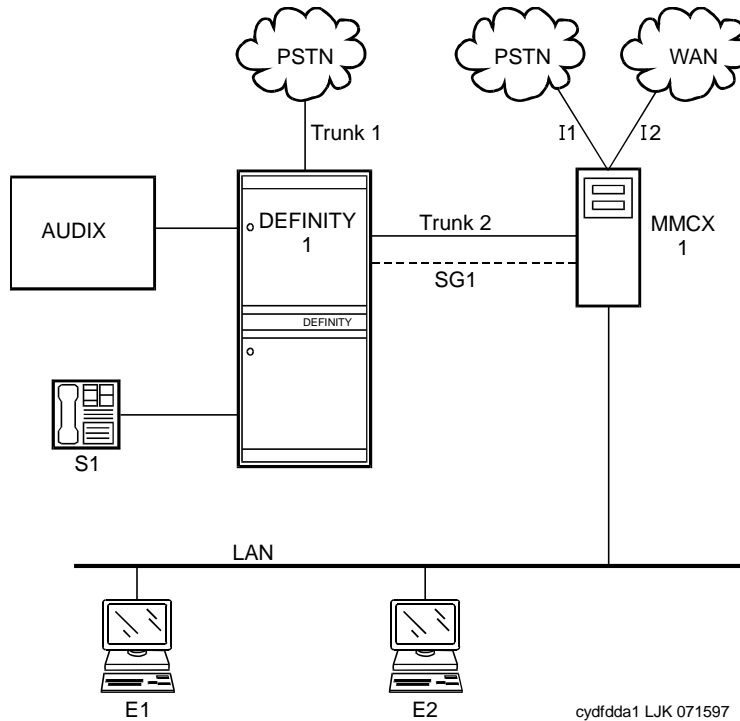

## Planning for MASI

Before you start to administer MASI, you should make a plan for how to do it. Among the configurations on the following pages, there is probably one that matches the configuration of your system fairly closely. You might want to either write on these pages, or draw up your own configuration. It may help you if you have already determined trunk group and signaling group numbers, unused extensions, and so on. The following are things you need to consider:

- Establish the dial plan on the MMCX to agree with that of the Avaya MultiVantage. If you use Universal Dial Plan and MMCX, you may need to make adjustments for the MMCX dial plan.
- Find unused extensions and trunk group numbers. You need:
  - one trunk group number for each ISDN-PRI connection to the MMCX
  - one signaling group number for each MASI node and an unused MultiVantage extension for the signaling group
  - one unused MultiVantage extension for the Near-End Path Termination number for all MASI Paths to this ECS. You can use the same number for all MASI nodes in the domain.
  - two unused MMCX extensions for the nearpath and tscnum arguments to the **chgmasi** command. This is the command you use to administer MASI on the MMCX.

## MASI configurations

There are several ways to set up combinations of MASI nodes and DEFINITY servers. The following figures depict several possible configurations.

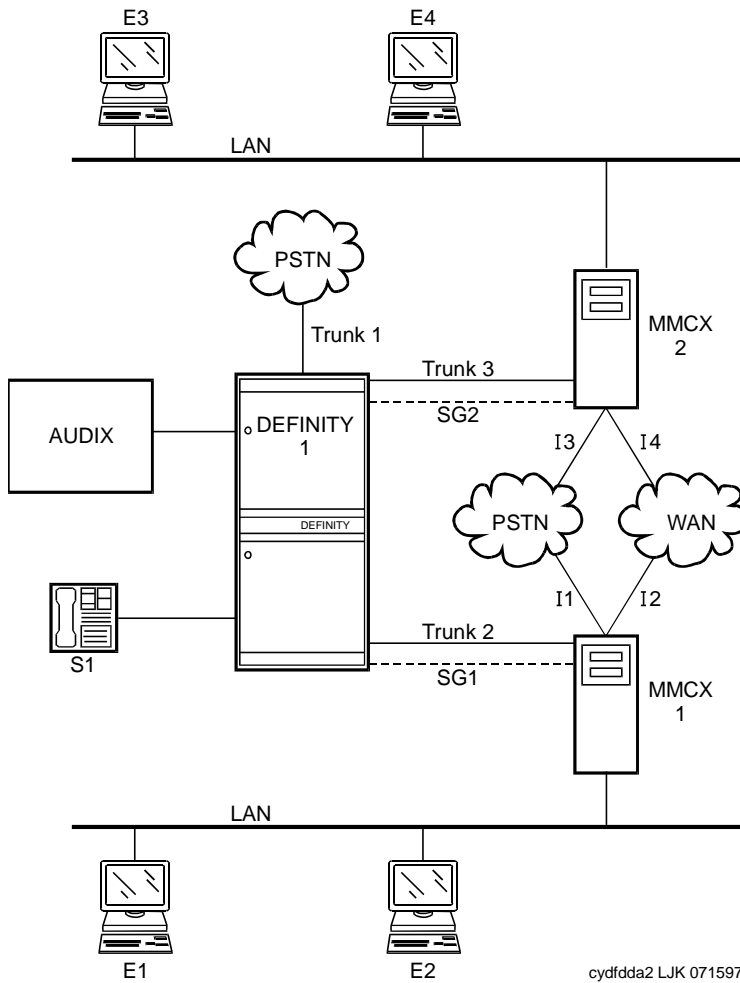

**Figure 5. MASI domain of one Avaya MultiVantage running on a DEFINITY Server and one MMCX**

The parts of this drawing, for MASI, are as follows:

- Trunk 1 — This is any type of trunk connection to the public network.
- Trunk 2 — This is the link between the Avaya MultiVantage solution and the MMCX, and requires a TN464C or later DS1 circuit pack. You administer this link as an ISDN-PRI trunk group, a MASI path and an NCA-TSC.
- I1 and I2 — These are MMCX interfaces to destinations other than Avaya MultiVantage solutions. Administer as MASI trunks.
- E1 and E2 — Endpoints (terminals) belonging to the MMCX. Administer as MASI terminals.

- MMCX — Determine a node number for each MMCX server. This can be any number from 1–15. Once established, Avaya MULTIVANTAGE informs the MMCX of its node number.
- S1 — MultiVantage station.

**Figure 6. MASI domain of one Avaya MultiVantage running on a DEFINITY Server and two (or more) MMCXs**

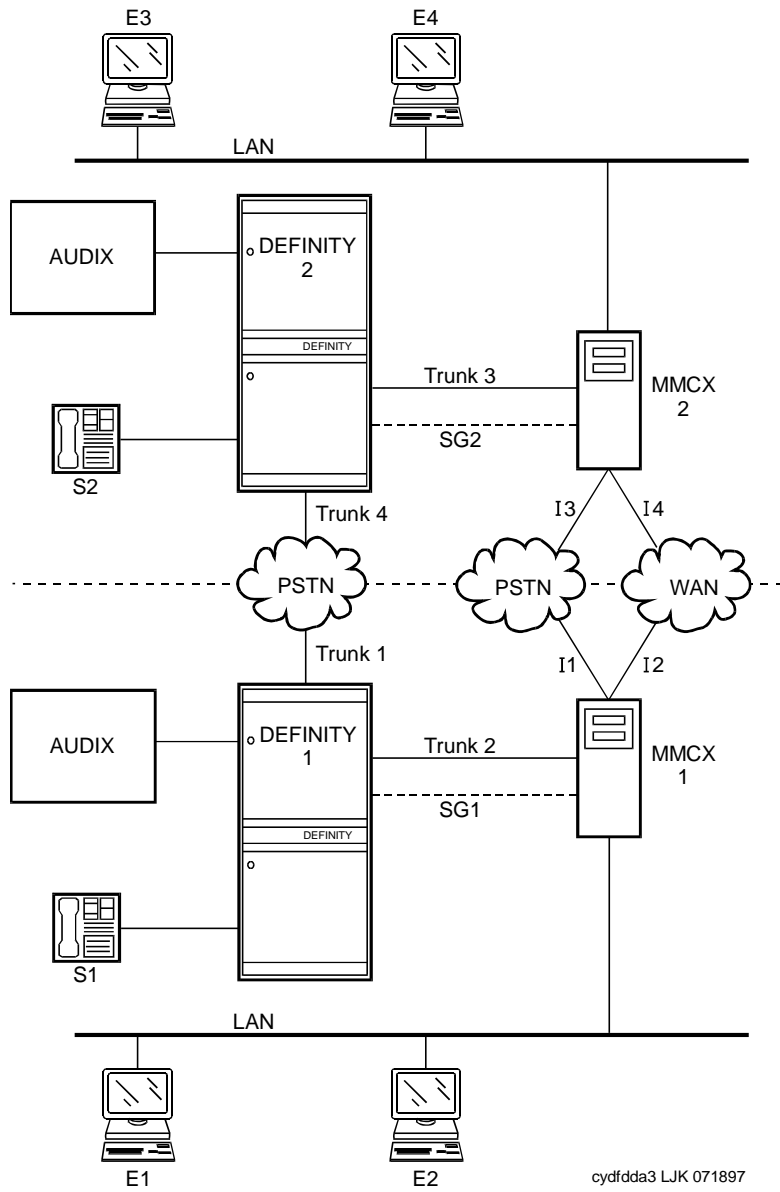

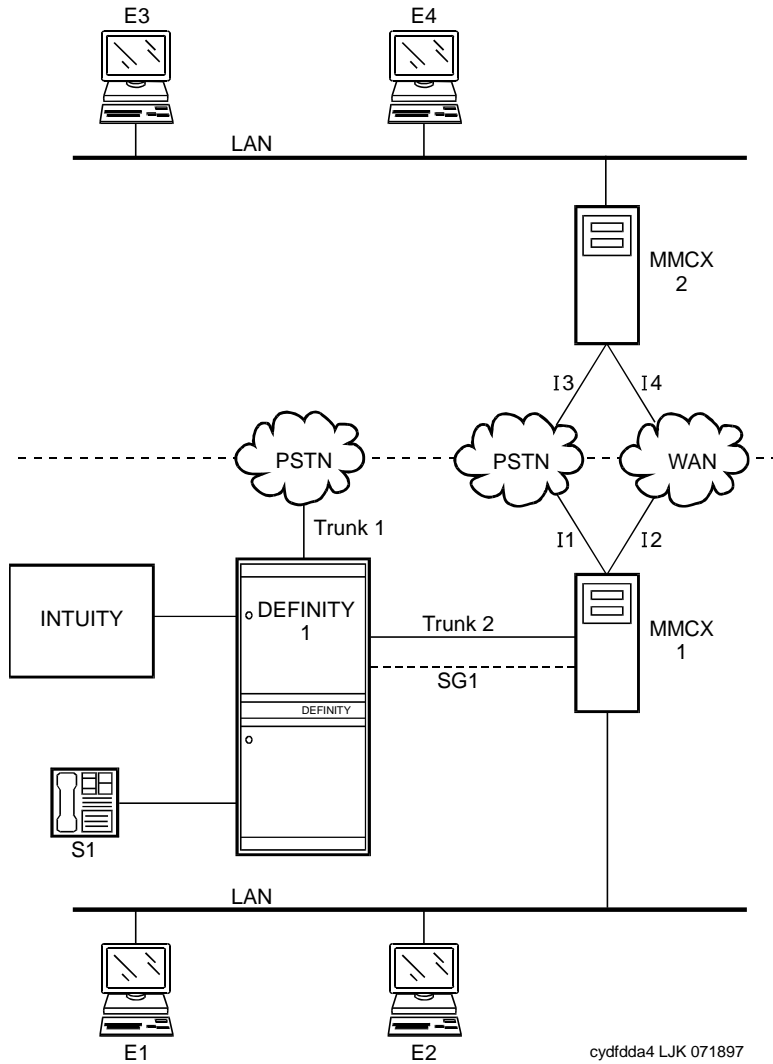

Figure 7. Two separate MASI domains

**Figure 8. One MASI domain, and one non-MASI MMCX**

The MASI node must be directly connected to the Avaya DEFINITY Server for MASI features to work. In this configuration, terminals that belong to MMCX 2 (E3 and E4), do not take advantage of MASI capabilities.

## How to administer MASI

---

This section discusses the administration required to make MASI work. You perform most of this administration from the DEFINITY Server administration terminal. However, there are a few things you must do at the MMCX administration terminal. This section sometimes refers to the **chgmasi** command. This is the command you use to administer MASI parameters on the MMCX. For more information about using the **chgmasi** command, see your *MMCX Technical Reference*.

### Step 1 — Establish customer options (Avaya)

An Avaya representative must activate MASI using the System-Parameters Customer-Options screen. The representative should also verify that ISDN-PRI (Avaya MultiVantage™ on a DEFINITY R configuration) or ISDN-PRI over PACCON (DEFINITY SI/DEFINITY CSI configurations), and AAR/ARS are enabled.

On the MMCX, MASI must be enabled using the **chgmasi** command.

### Step 2 — Establish maintenance parameters and alarming options (Avaya)

Ensure that on the Maintenance-Related System Parameters screen, the Packet Bus Activated field is **y**.

Using the **set options** command (Avaya init or inads logins only), set MASI alarming options. For more information, see the *Avaya MultiVantage Maintenance and DEFINITY Server* for the appropriate model.

### Step 3 — Establish the physical connection

Establish the physical connection between the Avaya DEFINITY Server and the MMCX. For more information about installing the cables, see *Installation for Adjuncts and Peripherals for Avaya MultiVantage™ Solutions*.

### Step 4 — Administer circuit pack

Using the DS1 Circuit Pack screen, verify that the DS1 circuit pack you use to establish the MASI link is administered as follows:

- Bit Rate = 1.544
- Line Coding = b8zs
- Line Compensation = 1
- Signaling Mode = isdn-pri

- Interface = network
- Country Protocol = 1
- Protocol Version = a

### Step 5 — Administer a signaling group

For each MASI node, you need to establish a unique signaling group. Use the command **add signaling-group xxx** to access the Signaling Group screen.

Page 1 of 5

SIGNALING GROUP

|                                       |                          |                             |
|---------------------------------------|--------------------------|-----------------------------|
| Group Number: _                       | Associated Signaling? y  | Max number of NCA TSC: __   |
|                                       | Primary D-Channel: _____ | Max number of CA TSC: __    |
|                                       |                          | Trunk Group for NCA TSC: __ |
| Trunk Group for Channel Selection: __ |                          |                             |

### Screen 5. Signaling Group (Page 1 of 5)

For each link, establish a Non-Call Associated Temporary Signaling Connection (NCA-TSC) with the following attributes:

- **Associated Signaling** — MASI requires Facility Associated Signaling, so this field must be set to **y**.
- **Primary D-channel** — Enter a 6- to 7-character port number associated with the DS1 Interface circuit pack port. The port address of the PRI that carries D-channel signaling.  
  
The port number is used to assign the primary D-channel in the Signaling Group. For 24-channel facilities, the 24th port is assigned as the D-channel. For 32-channel facilities, the 16th port is assigned as the D-channel.
- **Max Number of NCA TSC** — For MASI, this must be 1.
- **Max number of CA TSC** — Leave the default of 0.
- **Trunk Group For NCA TSC** — This can be left blank.
- **Trunk Group for Channel Selection** — This can be left blank.

| ADMINISTERED NCA TSC ASSIGNMENT |            |         |             |              |            |                 |          |
|---------------------------------|------------|---------|-------------|--------------|------------|-----------------|----------|
| Service/Feature:                | _____      |         |             | As-needed    | Inactivity | Time-out (min): | _____    |
| TSC Index                       | Local Ext. | Enabled | Established | Dest. Digits | Appl.      | Adj. Name       | Mach. ID |
| 1:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 2:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 3:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 4:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 5:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 6:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 7:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |

| 9:                              | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 10:                             | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 11:                             | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 12:                             | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 13:                             | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 14:                             | _____      | ___     | _____       | _____        | _____      | _____           | ___      |
| 15:                             | _____      | ___     | _____       | _____        | _____      | _____           | ___      |

Screen 6. Administered NCA TSC Assignment page of the Signaling Group screen

- **Service/Feature** — Leave blank.
- **As-needed Inactivity Time-out (min)** — This field only applies to as-needed NCA-TSCs. Since MASI requires a permanent connection, leave blank.
- **TSC Index** — This display-only field specifies the administered NCA-TSCs assigned.
- **Local Ext** — Enter a valid, unassigned Avaya MultiVantage extension. This extension does not need a port assignment and does not need to correspond to any other administration.
- **Enabled** — Enter **y** to enable the administered NCA-TSC. You may want to wait to enable this link until all other administration is in place. If this is **y**, Avaya MultiVantage attempts to establish the connection as soon as you submit the form. This may cause your system to alarm, if other administration is not finished.
- **Establish** — Used to indicate the strategy for establishing this administered NCA-TSC. Enter **permanent** for MASI.
- **Dest. Digits** — A valid MMCX extension. This must correspond to the value of the *tscnum* argument to the **chgmasi** command.

**NOTE:**

These digits are sent as entered to the destination MMCX; no routing or other digit manipulation is performed.

- **Appl.** — Specifies the application this administered NCA-TSC is going to be used for. Enter **masi**.
- **Machine ID** — Used to indicate the MASI node to which this administered NCA-TSC is connected. This number should be the same as the MASI node number found on other screens.

### How to list TSCs or determine status of the TSC

To determine which TSCs are designated for MASI, use the **list masi tsc** command.

| MASI TEMPORARY SIGNALING CONNECTIONS (TSC) |                |           |            |         |             |                      |          |
|--------------------------------------------|----------------|-----------|------------|---------|-------------|----------------------|----------|
| Sig. Grp                                   | Primary D-Chan | TSC Index | Local Ext. | Enabled | Established | Dest. Digits         | Mach. ID |
| xxx                                        | xxxxxxxx       | xxx       | xxxxx      | x       | xxxxxxxx    | xxxxxxxxxxxxxxxxxxxx | xx       |
| xxx                                        | xxxxxxxx       | xxx       | xxxxx      | x       | xxxxxxxx    | xxxxxxxxxxxxxxxxxxxx | xx       |
| xxx                                        | xxxxxxxx       | xxx       | xxxxx      | x       | xxxxxxxx    | xxxxxxxxxxxxxxxxxxxx | xx       |

### Screen 7. MASI Temporary Signaling Connections (TSC) Display

This command displays the following:

- **Sig Grp** — The number of the signaling group to which this TSC belongs
- **Primary D-Channel** — Port location of the Primary D-channel
- **TSC Index** — The number of the MASI TSC within the signaling group
- **Local Ext.** — MultiVantage extension associated with the TSC
- **Enabled** — Indicates the state of the connection - enabled (y/n)
- **Established** — Value of established flag (as-needed/permanent)
- **Dest. Digits** — The MMCX extension that indicates the TSC destination
- **Mach. ID** — MASI node number

Once you establish and enable the signaling group, you need to verify that it is active. Use the command **status signaling-group signaling-group#** or **status tsc-administered signaling-group# [/tsc-index] [print]** to determine if the link is active.

### Step 6 — Administer ISDN-PRI trunk group

Use the command **add trunk-group xxx** to access the Trunk Groups screen. For a more detailed description of the ISDN-PRI trunk group, see “[ISDN trunk group](#)” on page 936.

Establish an ISDN-PRI trunk group with the following attributes:

#### Page 1

- Group Type = **isdn-pri**
- TAC = valid TAC that conforms to your existing dial plan
- Direction = **two-way**
- Service Type = **tie**
- CDR Reports = **n**

You must also administer the PRI link from the MMCX to the ECS, using the MMCX administration terminal. See the *MMCX Technical Reference* for information on the **addpri** command.

### Step 7 — Administer MASI Path Parameters

Use the **change masi path-parameters** command to access the MASI Path Parameters screen.

MASI PATH PARAMETERS

Near-End Path Extension: \_\_\_\_\_

| MASI Node | Trunk Group | Far-End Path Termination Number |
|-----------|-------------|---------------------------------|
| 1         | ---         | _____                           |
| 2         | ---         | _____                           |
| 3         | ---         | _____                           |
| 4         | ---         | _____                           |
| 5         | ---         | _____                           |
| 6         | ---         | _____                           |
| 7         | ---         | _____                           |
| 8         | ---         | _____                           |
| 9         | ---         | _____                           |
| 10        | ---         | _____                           |
| 11        | ---         | _____                           |
| 12        | ---         | _____                           |
| 13        | ---         | _____                           |
| 14        | ---         | _____                           |
| 15        | ---         | _____                           |

**Screen 8. MASI Path Parameters screen**

Establish a MASI Path with the following attributes:

- **Near-End Path Extension** — An unassigned MultiVantage extension. When using the **chgmasi** command to administer the MMCX, this is the farpath extension. See the *MMCX Technical Reference* for more information.
- **MASI Node** — The node number for the MMCX. For each MMCX/MASI node, this number must be the same everywhere it occurs (signaling group, masi trunk group, and masi terminal screens).
- **Trunk Group** — This is the MultiVantage trunk group number for the ISDN-PRI trunk that will be used to establish call paths.
- **Far-End Path Termination Number** — This is an unassigned MMCX extension. When using the **chgmasi** command to administer the MMCX, this is the nearpath extension. See the *MMCX Technical Reference* for more information.

## Step 8 — Administer MASI trunk groups

You use the MASI trunk group screen to define MMCX interfaces that interconnect MASI nodes, or that connect MMCX nodes to another private switch or central office. Examples of MMCX interfaces include:

- PRI trunks linking MMCX servers
- PRI trunks linking MMCX to the PSTN
- PRI trunks from MMCX to a MultiVantage system that are used for purposes other than MASI
- “LAN” interfaces linking MMCX servers

Use the command **add masi trunk-group xxx (or ‘next’)** to access the MASI Trunk Group screen. The trunk group number must not be assigned, and you cannot exceed the maximum total trunks for your system. Valid values for xxx are unused MultiVantage trunk group numbers between 1–96 for DEFINITY SI/DEFINITY CSI configurations, and 1–120 for DEFINITY R configurations.

```
MASI TRUNK GROUP
Group Number: 15 CDR Reports? y
Group Name: INCOMING CALL_____ COR: 1_ TN: 1 TAC: 915_
MASI Node Number: __ Remote Group Number: _
```

### Screen 9. MASI Trunk Group screen

- **Group Number** — This field displays the MASI trunk group number. This is the number assigned when executing the **add masi trunk-group** command.
- **CDR Reports** — Valid entries are **y**, **n**, and **r**. Default is **y**.
  - If you enter **y**, CDR records will be generated by completed outgoing calls terminated on this trunk group. If incoming calls are being recorded (the Record Outgoing Calls Only field on the CDR System Parameters screen is set to **n**), then a single CDR record will be generated for answered calls with the call duration.
  - If you enter **n**, no CDR records will be generated by calls originated by or terminated on this trunk group.
- **Group Name** — Enter a unique name that identifies the trunk group. Up to 27 characters can be used; default is “INCOMING CALL.”
- **COR** — Enter a class of restriction (COR) number (0–95) that reflects the desired restriction; default is “1.”
- **TN** — This field displays the Tenant Partition number. All MASI trunks are associated with Tenant 1.
- **TAC** — Enter the trunk access code (“**TAC**”) that identifies the trunk group on CDR reports. You must assign a different TAC to each MMCX interface. Valid entries conform to the dial plan (1–4 digits, \* and # are valid first digits).
- **MASI Node Number** — The node number assigned to this MMCX machine.
- **Remote Group Number** — This is the number of the remote trunk group. For ISDN-PRI interfaces, valid values are any number 1–8; for local area network (LAN) or WAN calling interfaces, the value must be 9. The

combination of MASI Node Number and Remote Group Number must be unique. Remote group number corresponds to the group number on the MASI node.

### How to view a list of all MASI trunk groups

To view a list of all the MASI trunks administered on the ECS, use the command **list masi trunk-group**.

```
MASI TRUNK GROUP
```

| Group Number | TAC  | Group Name                               | Node Number | Remote Grp No. | CDR | COR | TN  |
|--------------|------|------------------------------------------|-------------|----------------|-----|-----|-----|
| xxx          | xxxx | xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx | xx          | x              | x   | xx  | xxx |

Screen 10. List masi trunk-group output

### How to determine the status of MASI trunk groups

To determine the status of a specific MASI trunk, use the command **status masi trunk-group xxx**, where xxx is the trunk group number. This command provides descriptive information about the trunk, and the number of currently active trunk calls.

```
MASI TRUNK GROUP STATUS
```

|                          |                                        |
|--------------------------|----------------------------------------|
| Group Number: xxx        | Number of Active MMCX Trunk Calls: xxx |
| MASI Node Number: xx     |                                        |
| Remote Group Number: xxx |                                        |

Screen 11. Status masi trunk-group output

## Step 9 — Administer MASI terminals

Use the **add masi terminal xxxxx** or **next** command to administer each MASI terminal as a MASI terminal. You use available extensions on the ECS, so they need to conform to the Avaya MultiVantage dial plan. The extension must match the MultiVantage dial plan, and for the add command, the extension must not already be in use. The extension of the MASI terminal must match the number of the MASI terminal.

Avaya MultiVantage users dial the MASI Terminal Extension to reach MMCX users.

### ⇒ NOTE:

Anytime you add a terminal or other extension to the MMCX, you must administer a corresponding MASI terminal on the Avaya MultiVantage solution. If you do not, you will not be able to dial this extension from the Avaya MultiVantage solution.

```

MASI TERMINAL

Extension: 1000 BCC: 0
 MASI Node Number: __ TN: 1__
 COR: 1_

Name: _____

TERMINAL OPTIONS

Send Display Info? y

```

### Screen 12. MASI Terminal screen — page 1

- **Extension** — This field displays the extension that you entered on the command line.
- **BCC** — This field displays the bearer capability class of the terminal, and identifies the type of traffic the terminal supports. For MASI, this is always 0, for voice or voice-grade data.
- **MASI Node Number** — The number of the node on which this terminal resides.
- **TN** — The tenant partition in which this terminal resides. At present, all MASI terminals must reside within tenant 1. This field is display-only, and always 1.
- **COR** — The class of restriction associated with this terminal.

- **Name** — The name associated with the terminal. This can be any alphanumeric string up to 27 characters.
- **Send Display Info** — Indicates whether Avaya MultiVantage should forward display information associated with a call. Set to **y**.

```

MASI TERMINAL

FEATURE OPTIONS
 LWC Reception: none___

 CDR Privacy? n

 AUDIX Name: _____
```

**Screen 13. MASI Terminal screen — page 2**

- **LWC Reception** — This field indicates whether the terminal can receive Leave Word Calling (“LWC”) messages. Valid values are none, audix, and spe (for DEFINITY R configurations) or mas-spe (for DEFINITY SI/DEFINITY CSI configurations). SPE-based LWC is not supported for MASI terminals. However, if embedded AUDIX is used without a Data Control Link, you must administer MASI terminals to receive SPE-based LWC messages. For such cases, the LWC feature is used by AUDIX to activate and deactivate message waiting lamps on MASI terminals.
- **CDR Privacy** — Indicates whether CDR Privacy is supported for this terminal. See [“Call detail recording” on page 1553](#) for more information.

- **AUDIX Name** — This field only appears on DEFINITY R configurations. This field contains the name of the AUDIX adjunct for LWC messages. If LWC reception field is set to audix, this field must contain a name. The name must match a machine name on the Adjunct Names screen.

```

 MASI TERMINAL
SITE DATA
Room: _____
Jack: _____
Cable: _____
Floor: _____
Building: _____

BUTTON ASSIGNMENTS
1: call-appr
```

**Screen 14. MASI Terminal screen — page 3**

- **Room** — Enter up to 10 characters to identify the MASI terminal location. This field may be blank.
- **Jack** — Enter up to 5 characters to identify the location where the MASI terminal is connected. This field may be left blank.
- **Cable** — Enter up to 5 characters to identify the cable that connects the MASI terminal to the system. This field may be left blank.
- **Floor** — Enter up to 7 characters to identify the floor where the MASI terminal is located.
- **Building** — Enter up to 7 characters to identify the building where the MASI terminal is located. Valid entries are listed in the site table.
- **Button Assignments** — This field contains a call appearance button and is display only.

### Duplicate MASI terminal

Once you have one MASI terminal administered to your liking, you can use the **duplicate masi terminal** command to administer other stations with the same characteristics.

| MASI TERMINAL |       |       |       |       |
|---------------|-------|-------|-------|-------|
| Ext           | Name  | Room  | Jack  | Cable |
| 77777         | _____ | _____ | _____ | _____ |
| 77778         | _____ | _____ | _____ | _____ |
| 77779         | _____ | _____ | _____ | _____ |
| 77781         | _____ | _____ | _____ | _____ |

| _____         | _____ | _____ | _____ | _____ |
| _____         | _____ | _____ | _____ | _____ |

Screen 15. Duplicate MASI Terminal screen

### How to list and status MASI terminals

To view a list of all the MASI terminals administered on the ECS, use the command **list masi terminals**. This command only lists terminals within the domain of the Avaya DEFINITY Server from whose SAT you issue the command.

| MASI TERMINALS |                                          |                |     |     |     |
|----------------|------------------------------------------|----------------|-----|-----|-----|
| Ext            | Name                                     | Node<br>Number | CDR | COR | TN  |
| xxxxx          | xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx | xx             | x   | xx  | xxx |
| xxxxx          | xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx | xx             | x   | xx  | xxx |
| xxxxx          | xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx | xx             | x   | xx  | xxx |
| xxxxx          | xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx | xx             | x   | xx  | xxx |

Screen 16. List MASI Terminal output

To view the active or idle status of a specific MASI terminal, use the command **status masi terminal (extension)**.

```

 GENERAL STATUS

 TYPE: MASI Service State: active
 Extension: 54001
 MASI Node Number: 14

```

**Screen 17. Status MASI terminal command**

To determine which extension you assigned as the MASI Near-End Path Termination extension, use the command **list extension-type**. This command displays the extension number and type (attendant, masi-terminal, etc.), as well as other information about the extension.

```

 EXTENSION TYPE

Ext Type Name COR TN COS Cv1/
--- --- --- --- -- --- ---
1234 masi-terminal 1 1 1
4077 term-masi-path-call

```

**Screen 18. List extension type**

**Step 10 — Administer features**

**AAR/ARS**

1. AAR/ARS is an optional feature on Avaya MultiVantage, and you need to purchase this option to use it with MMCX. To verify that this feature is enabled, use the command **display system-parameters customer-options**. If it is not enabled, contact your Avaya representative.

2. The MMCX dial plan must use the same feature access codes as Avaya MultiVantage. If this is not already the case, modify the MMCX dial plan using the **chgdp** command. See the *MMCX Technical Reference* for more information.
3. Include this feature access code in the **chgmasi** command.

## CDR

1. To get call detail records for calls over MMCX interfaces, set CDR Reports = **y** on the MASI Trunk Group screen.
2. To get call records for calls over the ISDN-PRI trunk group, set CDR Reports = **y** on the ISDN-PRI Trunk Group screen.
3. To track calls between a MASI terminal and other MASI terminals or MultiVantage stations, enter the MASI terminal extension on the Intraswitch CDR screen.
4. Enter **n** in the Record Non-Call Assoc TSC field on the CDR System Parameters screen.

### NOTE:

If you use the same PRI trunks for MASI and non-MASI calls, Avaya strongly recommends that you do not enable CDR for these calls. Establish a separate trunk group for non-MASI calls and set CDR Reports = **n**.

## Coverage

To establish coverage from a MASI terminal to AUDIX:

1. Use the MMCX user interface to enter the AUDIX hunt group extension as the coverage point. You cannot use MultiVantage coverage administration for MASI terminals.
2. If AUDIX ports are not administered on MultiVantage, do so.
3. Set up the MASI terminal as an AUDIX subscriber. Enter the MASI terminal extension in the extension field on the Subscriber Administration screen.

To establish coverage from a MASI terminal to another MMCX terminal or MultiVantage station:

1. Use the MMCX user interface to enter the desired extension as the coverage point for the MASI terminal. You cannot use MultiVantage coverage administration for MASI terminals.

## Step 11 — Verify administration

Make test calls from MultiVantage to MMCX, ensure that you can indeed place and receive calls.

Call an unattended MASI terminal. Verify that the call goes to AUDX. Retrieve the call from the MASI terminal. Verify that all works as expected.

## MASI command permissions

If you are the super-user for your system, you can restrict other administrative logins from changing MASI administration. To do this, use the **change permissions (login-ID)** command. Enter **y** in the Additional Restrictions field, then move to the Restricted Object List page of the screen.

You may restrict the following MASI-related objects:

- masi-path-parameters
- masi-terminal
- masi-trunk-group
- masi-tsc

## Detailed description of features

### AAR/ARS

MMCX can take advantage of advanced routing features for voice-only calls to the public switched telephone network (PSTN) or a DEFINTY system private network. Users must enter the AAR/ARS access code before the rest of the dialed digits. MASI will route the call over the MultiVantage private network (AAR) or the public network (ARS), based on the digits supplied by the MMCX user.

Routing patterns must contain only trunk groups that actually terminate on the Avaya MultiVantage solution. Calls from one MMCX to another do not use AAR/ARS. Authorization codes are not supported.

### Call Detail Recording

Using the MASI link, MultiVantage is able to track call detail information for calls made using MMCX terminals and interfaces. CDR records all calls originating from or terminating at a MASI terminal. MASI CDR does not record ineffective call attempts when all MASI paths are busy.

The Resource Flag value of 8 indicates a MASI call. This field appears in unformatted, int-isdn, expanded and customized CDR formats. For formats other than these, you can determine that a call involves a MASI terminal or trunk by the TAC, dialed number or calling number fields.

The following are the CDR capabilities of MASI. Administration information is under the heading “[How to administer MASI](#)” on page 283.

- Incoming/Outgoing Trunk Call Splitting  
Call splitting does not produce separate records for MMCX calls that are transferred or conferenced.
- Intraswitch CDR  
You can administer intraswitch CDR to monitor MASI terminals. To do this, simply add the MASI terminal extension on the Intraswitch CDR screen. MultiVantage then monitors calls from MASI terminals to other MASI terminals, and calls between MASI terminals and MultiVantage stations.
- CDR Privacy  
You can administer a MASI terminal for CDR Privacy.
- Account Code Dialing and Forced Entry of Account Codes  
This is not supported for MASI terminals. Therefore, make sure the COR you assign does not force entry of account codes.
- Trunk CDR  
You can get call detail records for all incoming and outgoing calls made over MMCX interfaces.

## Call redirection / Voice-messaging access

MMCX users can enter a MultiVantage extension, including an AUDIX hunt group, Callmaster agent, attendant console or telephone as their coverage point.

If AUDIX is established as the MASI terminal’s coverage point, the MASI terminal receives message waiting indication, and dials the AUDIX hunt group extension to retrieve messages. Once connected to AUDIX, operation for the MMCX user is the same as for a MultiVantage station user, including use of # to identify the extension, if desired.

### NOTE:

It is not possible to determine the call coverage status of a MASI terminal.

MultiVantage tracks calls to MASI terminals that follow the autonomous coverage path from the MASI terminal. MMCX calls redirected to MultiVantage stations contain display information.

MASI terminals that dial AUDIX directly, or that place calls to MASI terminals that cover to AUDIX, do not receive ringback if all AUDIX ports are busy. Instead, these callers see a message that the called party is busy, and the call drops.

## Transfer

MASI terminals cannot transfer calls to MultiVantage stations, and cannot transfer a call to another MASI terminal if the call involves a MultiVantage station.

## Conferencing

Conferences can involve both MASI terminals and MultiVantage stations, and either one may initiate the conference. MultiVantage stations participate in such conferences in voice-only mode. If an MMCX user initiates a conference that involves MultiVantage stations, the conference will drop when the initiator drops from the call. If a MultiVantage station initiates the conference, that station may drop without affecting the other conferees.

## Status tracking - terminals and trunks

Avaya MultiVantage tracks the active/idle status of all MASI terminals, and monitors traffic over MMCX interfaces.

## Trunk groups

For MASI purposes, there are two kinds of trunk groups: the ISDN-PRI trunk groups that serve as paths for establishing calls between MultiVantage stations or trunks and MASI terminals or interfaces, and the remote trunks that are interfaces from the MMCX to other entities. Each MASI remote trunk group appears to the switch as a single unit, with no concept of members within the group.

### NOTE:

You cannot test, busy out, or release MASI remote trunk groups, since you cannot dial a MASI remote trunk TAC from the Avaya DEFINITY Server. The TAC merely identifies the trunk to the switch for status and CDR.

*You cannot administer MASI trunks as part of MultiVantage route patterns.*

## Interactions & Unsupported Features

We can generalize feature interactions to some extent. For example, since there are no buttons available to a MASI terminal, any feature that requires a button is also not available. MASI cannot support features that require the user to dial a trunk access code for a MASI remote trunk, or a feature access code other than AAR/ARS. The MMCX dial plan may contain only those feature access codes that are supported.

### CAUTION:

*DO NOT ADMINISTER the following features! The following features are not supported for use over the MASI link, and Avaya cannot be responsible for the results if you attempt to administer them.*

### **Unsupported Call Center features**

- **ASAI** — You must not administer a MASI terminal in an ASAI domain. MASI terminals and MMCX trunks are not monitored by ASAI. It may be possible for a MASI terminal to place a call to a MultiVantage station that is part of an ASAI domain. ASAI will not be blocked from controlling this call, but there may be unpredictable results. The same is true for calls originating from an ASAI domain terminating at MASI terminals, and for ASAI-monitored hunt groups that contain MASI terminals.
- **Automatic Call Distribution** — You must not include a MASI terminal extension as part of an ACD hunt group. You must not mix MASI administration with anything related to ACD, including Outbound Call Management and PASTE.
- **Call Vectoring** — You must not include MASI terminal extensions in any step of a vector.

### **Unsupported Basic features**

- **Bridged Call Appearances** — You must not administer a bridged appearance that involves a MASI terminal.
- **Call Coverage** — You must not administer a MASI terminal in a MultiVantage station's coverage path.
- **Call Forwarding** — You must not forward a MultiVantage station to a MASI terminal.
- **Call Pickup** — You must not administer a MASI terminal as part of a pickup group.
- **Intercom** — You must not administer MASI terminals as members of any type of intercom group.
- **Manual Message Waiting** — You must not administer a manual message waiting button (man-msg-wt) with a MASI terminal as the referenced extension.
- **Manual Signaling** — You must not administer a manual signaling button (signal) with a MASI terminal as the referenced extension.
- **Night Service** — You must not administer a MASI terminal as a night service destination.
- **Pull transfer** — MASI terminals cannot perform a pull transfer operation. You must not administer this feature on an ECS where MASI is active. This applies only in Italy.
- **Station Hunting** — You must not administer a MASI terminal as part of a station hunting path.
- **Terminating Extension Groups** — You must not administer a MASI terminal as part of a TEG.

## Other interactions

The following section describes feature behaviors that may not be as expected, but that are not likely to be destructive.

### Attendant features

- Dial Access to the Attendant — MASI terminals will be able to dial the attendant access code, if it is administered in the MMCX dial plan.
- Attendant Direct Extension Selection — Attendants are able to access MASI terminals via DXS buttons and busy lamp indicates status of the MASI terminal.
- Emergency Access to the Attendant — MASI terminals have emergency access using the attendant access code, if it is administered in the MMCX dial plan. However, off-hook alerting is not administrable.
- Attendant Intrusion — Attendants are able to activate intrusion towards MASI terminals.
- Attendant Override — Attendants are not able to activate override towards MASI terminals.
- Attendant Recall — MASI terminals cannot activate attendant recall.
- Attendant Remote Trunk Group Select — Attendants cannot use this feature to select MASI remote trunks.
- Attendant Return Call — Operates normally if a MASI terminal is the called party.
- Attendant Serial Call — Serial calls are denied if the calling party is an MMCX interface.
- Attendant Straightforward Outward Completion — The attendant is able to complete calls to MultiVantage trunks for MASI terminals.
- Attendant Through Dialing — The attendant can use Through Dialing to pass dial tone to MASI terminals.
- Attendant Timers — Attendant timers work the same no matter what kind of terminal is involved.
- Attendant Trunk Group Busy/Warning Indicators — You cannot administer Busy/Warning indicators for MASI trunks because they are not standard MultiVantage trunks. However, you can administer these indicators for the trunk group administered for MASI paths.
- Attendant Trunk Identification — The attendant is not able to identify the trunk name via button pushes.

## Basic features

- Abbreviated Dialing — A MultiVantage station can enter an MMCX extension in an AD list. However, MASI terminals cannot use AD.
- Administered Connections — MASI terminals must not be the originator nor the destination of an administered connection.
- Automatic Callback — Automatic callback does not work towards a MASI terminal.
- Automatic Circuit Assurance — You must not administer a MASI terminal as an ACA referral destination. You cannot administer ACA for MASI remote trunks.
- Busy Verification of Terminals and Trunks — You cannot use Busy Verification for MASI terminals or remote trunks.
- Call Detail Recording — CDR Account Code Dialing and Forced Entry of Account Codes are not supported for MASI terminals. See Call Detail Recording in Detailed Description for more information.
- Call Park — The attendant can park calls at the extension of a MASI terminal, but users can only retrieve these calls from a MultiVantage station, since MASI terminals cannot dial the Answer Back FAC.
- Data Call Setup — MultiVantage users cannot place data calls to MASI terminals.
- Facility Busy Indication — You can use FBI to track the status of MASI terminals. The FBI button and indicator lamp must be on a MultiVantage station. You cannot use FBI to track MMCX interfaces.
- Facility Test Calls — MultiVantage users cannot make test calls to MMCX interfaces.
- Go to Cover — MASI terminals cannot activate this feature.
- Leave Word Calling — The only valid LWC destination for a MASI terminal is AUDIX. You cannot administer SPE-based LWC. MASI terminals cannot send LWC messages to MultiVantage stations or MASI terminals.
- Loudspeaker paging — You can administer a MASI terminal as a code calling extension.
- Malicious Call Trace — MASI terminals cannot initiate malicious call trace.
- Message Retrieval — MMCX users can only retrieve messages through AUDIX.
- Music on Hold — Music on hold will only be available if a MultiVantage station has placed the call on hold.

- **Override** — Executive override does not work towards MASI terminals.
- **Priority Calling** — Priority calling is not supported for calls to or from MASI terminals.
- **Ringback Queueing** — Ringback Queueing is not supported for MASI terminals.
- **Send All Calls** — MMCX has an autonomous SAC function. See Call Redirection for more information.
- **Tenant Partitioning** — All MASI terminals exist in tenant 1, and you cannot change the tenant number.
- **Time of Day coverage** — As with all coverage, MultiVantage does not control coverage of the MASI terminal.
- **Transfer out of AUDIX** — A MASI terminal cannot use \*T to transfer from AUDIX to another MASI terminal.

### **Hospitality features**

- **Do Not Disturb** — MASI terminals cannot activate Do Not Disturb.

### **Multimedia features**

- **Multimedia Call Handling** — Avaya MMCH users are not able to make H.320 calls to MASI terminals over the MASI link. Calls between MMCX terminals and MMCH terminals are voice only.

## **Troubleshooting**

---

Verify proper operation using the following commands and follow normal escalation procedures to resolve any failures detected by the demand test.

1. Verify the DS1 trunk using the **test board <board location> long** command.
2. Verify the ISDN Signaling Group using the **test signaling-group <group number>** command. Also verify proper administration.
3. Verify the temporary signaling connection using the **test tsc-administered <group number>** command. Also verify proper administration.

### **Common error conditions**

If the cable from the ECS to the MMCX becomes disconnected, you should see alarms raised against ISDN-SGRP and UDS1-BD. In particular, you should observe ISDN-SGRP errors such as 769, 1793, and 257. To resolve, reconnect the cable and follow normal test procedures.

If the far-end path termination number is incorrect, you should observe MASI-PTH error 513. To resolve, correct administration using the MASI Path Parameters screen.

If the Layer 3 TSC is not administered properly or is out of service, you should observe errors (but no alarms) raised against TSC-ADM. Verify the signaling group administration and follow normal escalation procedures for TSC-ADM. See the appropriate Avaya MultiVantage Maintenance manual for more information.

If the TSC fails to come up even through Layer 2 Signaling Group and below pass tests, you may run **test tsc-administered <group number>** to force a switch heartbeat test, or simply wait 5–10 minutes for the link to recover. This situation may happen if the switch is rebooted or if the MASI interface is administered before the MMCX is properly administered.

You may want to use busy port and release port commands to unlock things if features are not working.

## **Multimedia Call Handling**

---

Multimedia Call Handling (MMCH) enables users to control voice, video, and data transmissions using a telephone and PC. Users can conduct video conferences and route calls like a standard voice call. They can also share PC applications to collaborate with others working from remote sites.

### **Operations in Basic or Enhanced modes**

There are two distinct levels of functionality: Basic and Enhanced. The Basic mode of operation treats a standard-protocol H.320 multimedia call as a data call. If the call is redirected, it is converted to a voice call. As a voice call, certain features are enabled, such as coverage, voice mail, and multiparty video conferencing.

The Enhanced mode of operation allows a multifunction telephone to control a multimedia call as if it were a standard voice call. Spontaneous video conferencing, call forwarding, call coverage, hold, transfer and park, along with many routing features, are available to multimedia calls. Both modes of operation allow data collaboration between multiple parties using the T.120 standard protocol.

**Definitions: MMCH features and components**

**Multimedia call**

A multimedia call, for MMCH, is one that conforms to the H.320 and T.120 suite of protocol standards. These standards allow video-conferencing packages from different vendors to communicate with one another. The capabilities of the individual multimedia-endpoint package can vary, however.

- An H.320 call can contain voice, video and data.
- The bandwidth for MMCH calls is limited to 2 B-channels.

**Figure 9. MMCH multimedia complex**

**Basic multimedia complex**

A Basic multimedia complex consists of a BRI-connected multimedia-equipped PC and a non-BRI-connected multifunction telephone administered in Basic mode. With a Basic multimedia complex, users place voice calls at the multifunction telephone and multimedia calls from the multimedia equipped PC. Voice calls will be answered at the multifunction telephone and multimedia calls will alert first at the PC and, if unanswered, will next alert at the voice station. A Basic multimedia complex provides a loose integration of the voice station and H.320 DVC system.

### Enhanced multimedia complex

An Enhanced multimedia complex consists of a BRI-connected multimedia-equipped PC and a non-BRI-connected multifunction telephone administered in Enhanced mode. The Enhanced multimedia complex acts as though the PC were directly connected to the multifunction telephone. Thus, voice call control, multimedia call control and call status are enabled at the telephone. An Enhanced multimedia complex provides a tight integration of the voice station and H.320 DVC system.

### Multimedia endpoint

The multimedia endpoint is a user's PC that has been equipped with an H.320 multimedia package. The PC is physically connected to the Avaya MultiVantage solution with a BRI line.

Figure 10. Enhanced MMCH service link

## Enhanced mode service link

The service link is the combined hardware and software multimedia connection between the user's multimedia endpoint and the Avaya DEFINITY Server which terminates the H.320 protocol. The service link provides video, data, and, optionally, voice streams to augment the capabilities of the telephone and PC. A service link only applies to an Enhanced multimedia complex, never to a Basic multimedia complex. The service link is administered on the station screen and can be either "permanent" or "as-needed."

## Feature Description

---

MMCH's two levels of functionality for a multimedia complex, Basic and Enhanced mode, are enabled either by switch administration or by an mm-basic feature button or FAC.

## Basic Mode Operation

### In Basic Mode:

- All voice-only calls originate at the voice station.
- All multimedia calls originate with the H.320 DVC system.
- All incoming voice calls attempt to alert at the voice station and receive all standard voice call treatment.
- All incoming H.320 multimedia calls attempt to alert on the H.320 DVC system initially. If answered, a 2-way video call will result. The Basic multimedia complex voice station will not be involved in the call in any way.

If the H.320 multimedia call is not answered at the H.320 DVC system and the Basic multimedia complex voice station has the H.320 field administered to "y", the call will:

- timeout at the DVC system
- alert at the associated voice station set as a voice-only call
- receive all standard voice call treatment.
- Call control depends on what type of call is being originated.
  - Video is received and controlled at the PC.
  - Voice is received and controlled at the telephone set.
- The voice station of a Basic multimedia complex must manually add their multimedia endpoint to a multimedia conference. There is limited support for multimedia feature interactions. A specific set of voice features work for multimedia calls.

- Service Links are not used by Basic mode complexes.
- A single number may be used to reach the Basic multimedia complex for voice or H.320 multimedia calls.

### **Enhanced Mode Operation**

The Enhanced multimedia complex provides a much more tightly coupled integration of the complex voice station and H.320 DVC system. In Enhanced Mode:

- Both multimedia and voice calls must originate at the telephone set.
- Voice and multimedia calls can be controlled at the telephone set.
- Conferencing is spontaneous and established just like a voice-only conference call.
- There is extensive support for multimedia feature interaction. Most voice features work the same for multimedia calls.
- Service Links can be either “permanent” or “as-needed.”

### **Physical Installation**

---

The physical components necessary to utilize MMCH capabilities include:

- H.320 DVC systems that are BRI connected to the Avaya DEFINITY Server.
- Non-BRI multifunction telephones.
- Avaya TN787 MultiMedia Interface (MMI) and TN788 Voice Conditioner (VC) boards.
- A T.120 Enhanced Services Module (ESM) server (necessary only if you plan to do T.210 data collaboration). Connectivity of the ESM requires an additional TN787 along with a TN2207 DS1 circuit pack.

### **Dual Port Desktop**

Both Basic and Enhanced multimedia complexes are dual-port desktops that consist of:

- a BRI-connected multimedia-equipped PC that supports the H.320 protocol
- a non-BRI-connected multifunction telephone set.

The PC and the multifunction telephone are individually wired to the Avaya DEFINITY Server. These two pieces of equipment can be administratively associated to form a Basic or ENHANCED multimedia complex

MMCH works with any H.320 system that is fully H.320 compliant and operates at the 2B or 128K rate.

**⇒ NOTE:**

If you intend to share applications among users or whiteboard capabilities, the endpoint software you choose must also support the T.120 protocol.

The following endpoint-software packages have been tested:

- PictureTel PCS 50 & PCS 100, Release 1.6T
- Proshare 2.0a, 2.1
- Zydacron Z250 Ver. 2.02, Z350 Ver. 1.2 (With Netmeeting 2.0)

## **MMI & VC hardware**

The MMCH feature requires the use of two additional circuit packs:

- Multi Media Interface (MMI) TN787J.
- Voice Conditioner (VC) TN788B.

The TN787 and TN788 are service circuit packs. The TN787 supports simultaneous operation of 16 2B H.320 calls. The TN788 supports the voice processing for 4 H.320 endpoints.

- These service circuit packs may be located in any Port Network.
- These packs do not require any translations as part of their implementation.
- The MMI and VC circuit packs are resource circuit packs akin to the Tone Detector circuit packs.
- These circuit packs require no switch administration and may be located in multiple port networks.

## **T.120 Data Collaboration Server**

The Expansion Services Module (ESM) provides T.120 data collaboration capability on a MMCH multipoint H.320 video conference.

- Each person in the conference who wants to participate in the data collaboration session, must have a personal computer with an H.320 video application that supports the T.120 protocol.
- The Avaya DEFINITY Server must have an ESM installed.

## ESM Installation

### Figure Notes

1. Port B Y-cable connector to a TN787 multimedia interface (MMI) circuit pack
2. Port A Y-cable connector to a TN2207 PRI circuit pack
3. 25-pair Y-cable
4. 356A adapter
5. D8W cord connected to 356A adapter S/B port 8
6. Expansion service module (ESM)
7. Port B on compatible primary rate interface (PRI) card

### Figure 11. Typical Multimedia Call handling ESM Connections

Use the following procedure and [Figure 11](#) to connect to the ESM equipment:

1. Install the TN2207 primary rate interface (PRI) circuit pack and the TN787 multimedia interface (MMI) circuit pack in the MultiVantage System port carrier.

#### NOTE:

These two circuit packs should be co-located in the cabinet since they must be connected by a Y-cable on the back plane of the Avaya DEFINITY Server.

2. Record the circuit pack locations.
3. Connect the ESM Y-cable as shown.
4. Administer the DS1 screen and the signaling-group screen for the ESM (see [“ESM T.120 Server Administration”](#) on page 321).
5. Configure the ESM adjunct.

## Planning for MMCH

---

The following are some of the tasks you perform in planning and administering MMCH.

### Planning the system

This is a list of questions to help you use Avaya MultiVantage for multimedia.

- How many MMCH users are you going to have?
- How many multimedia calls do you expect to have at any given time?

With the information above you can determine how many Voice Conditioner (VC) and Multimedia Interface (MMI) circuit packs you need.

- Will users need data collaboration capabilities? If so, you need to install the Expansion Service Module (ESM).
- Which stations, hunt groups or vectors need early answer?
- Do you have ISDN-PRI trunks? It is possible to use separate DS1 trunks for data, but ISDN-PRI trunks are recommended.

### Installation checklist

1. Purchase MMCH right-to-use.
2. Avaya — enable MMCH on System Parameters Customer-Options screen.
3. Administer default multimedia outgoing trunk parameter selection on the Feature-Related System-Parameters Features screen.
4. Administer MMCH related feature access codes on the Feature Access Code screen.
5. Install and administer hardware:
  - Install MMIs, VCs and ESM.
  - Administer ESM to ECS connection — DS1 Circuit Pack and Signaling Group screens.
  - Establish maintenance parameters — Maintenance-Related System Parameters screen.
6. Administer multimedia complexes:
  - Administer data modules — Data Module screen, or Data Module page of the Station screen.
  - Administer stations as part of a multimedia complex, assign associated data module extension, multimedia mode, service link mode and appropriate multimedia buttons — Station screen.

7. Administer early answer and H.320 flag for stations, the early answer flag for hunt groups, and the multimedia flag for vectors as appropriate.
8. Train end users.
9. Monitor traffic and performance.

## Related screens

---

- System-Parameters Customer-Options
  - Multimedia Call Handling (Basic)
  - Multimedia Call Handling (Enhanced)
- Feature Related System-Parameters
  - Default Multimedia Outgoing Trunk Parameter Selection (p.2)
- Maintenance-Related System Parameters
  - Packet Bus Activated = **y**
  - Minimum Maintenance Thresholds - MMIs, VCs
- Data Module (type = 7500 or WCBRI)
  - Multimedia (p. 1) = **y**
  - XID (p. 2) = **n**
  - MIM Support (p. 2) = **n**
- Station
  - MM Complex Data Ext (p. 1)
  - H.320 Conversion (p. 2)
  - Multimedia Early Answer (p. 2)
  - Multimedia Mode (p.2)
  - Service Link Mode (p.2)
  - Feature Buttons (p.3) (optional)
- Hunt Group
  - MM Early Answer (optional)
- Call Vector
  - Multimedia (optional)

  - Basic Mode Activation (p.5)
  - Enhanced Mode Activation (p.5)
  - Multimedia Call Access Code (p.5)
  - Multimedia Data Conference Activation & Deactivation (p.5)

The Multimedia Data Conference Deactivation FAC must be entered after you are active on a multimedia call. To enter the FAC:

1. Select TRANSFER
  2. Receive a dialtone
  3. Dial the FAC
  4. Receive a confirmation tone
  5. Re-select the call appearance for the held multimedia call.
    - Multimedia Multi-Address Access Code (p.5)
    - Multimedia Parameter Access Code (p.5)
- DS1 Circuit Pack (ESM Only)
    - Bit Rate=**2.048**
    - Line Coding=**hdb3**
    - Signaling Mode=**isdn-pri**
    - Connect=**pbx**
    - Interface=**network**
    - Country Protocol=**1**
    - CRC=**y**
    - MMI Cabling Board
  - Signaling group (ESM Only)
    - Primary D-Channel

## Administration commands

---

### System-Parameters Customer-Options screen:

To enable the MMCH release 6.3 feature, you need to purchase a new license file.

### System-Parameters Features screen:

The default bandwidth for MMCH calls is defined on the System-Parameters Features screen shown below.

#### NOTE:

Originating a multimedia call with the mm-call button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen.

- This default parameter will be either 2x56 or 2x64.
- The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

### Data module screen

The H.320 DVC system should contain a BRI interface. You must connect this BRI interface to a port on a TN556 BRI circuit pack and administer it as a BRI data module.

- You may administer the data endpoint type as 7500 (recommended) or WCBRI.
- The fields for multimedia are the same on either screen.
- The administration for a Basic mode and an Enhanced mode data module are exactly the same.

```

```

 Page 2 of 2
DATA MODULE
BRI LINK/MAINTENANCE PARAMETERS
 XID? n Fixed TEI? n TEI: ____
 MIM Support? n

```

**Screen 20. Data Module screen (Page 2 of 2)**

- **Type** — Set the data module type to 7500 or WCBRI.
- **Multimedia** — This field appears on the data module screen only if MM is set to **y** on the System-Parameters Customer Options screen. Enter **y** to enable this data module to be multimedia compliant.
- **MM Complex Voice Ext:** (display only) — This field contains the number of the associated telephone in the complex. This is a display-only field, and is blank until you enter the data module extension in the Station screen MM Complex Data Ext field. Once you have done that, these two extensions are associated as two parts of a multimedia complex.
- **XID and MIM Support** — Valid entries are **y** (default) and **n**. These fields must be set to **n**.

## Station screen

After you have administered the BRI data module, use the Station screen to associate it with a voice station to screen a multimedia complex. This is a one-to-one relationship: you can administer only one station and one data endpoint per multimedia complex. Neither the voice station, nor the data endpoint can be a member of another multimedia complex.

### NOTE:

A BRI station cannot be part of a multimedia complex.

- **H.320 Conversion** — **Valid entries are y and n** (default). This field is optional for non-multimedia complex voice stations and for Basic multimedia complex voice stations. It is mandatory for Enhanced multimedia complex voice stations. Because the system can only handle a limited number of conversion calls, you may need to limit the number of telephones with H.320 conversion. Enhanced multimedia complexes must have this flag set to **y**.

For non-multimedia complex voice stations, setting this field to **y** allows H.320 calls to convert to voice and alert at the stand-alone voice station. If the call is unanswered at the voice station, the call will follow standard voice treatment. Any subsequent station that is reached in the routing of this call, that is, coverage points, forwarded destinations, call pickup members, and so forth, do not need to have the H.320 field enabled. The H.320 field is only needed at the **first** station that may receive the H.320 call.

For Basic multimedia complex voice stations, setting this field to **y** allows H.320 calls to convert to voice and alert at the Basic multimedia complex voice station **after** an attempt has been made to offer the call to the H.320 DVC system. If the call is unanswered at the H.320 DVC system, the call will alert at the voice station after 5 seconds or after the administered number of rings as specified in the voice station's coverage path. If the call is unanswered at the voice station, the call will follow standard voice treatment. Any subsequent station that is reached in the routing of this call, that is, coverage points, forwarded destinations, call pickup members, and so forth, do not need to have the H.320 field enabled. The H.320 field is only needed at the **first** station that may receive the H.320 call.

- **Service Link Mode** — The service link is the combined hardware and software multimedia connection between an Enhanced mode complex's H.320 DVC system and the Avaya DEFINITY Server which terminates the H.320 protocol. A service link is never used by a Basic mode complex H.320 DVC system. Connecting a service link will take several seconds. When the service link is connected, it uses MMI, VC and system timeslot resources. When the service link is disconnected it does not tie up any resources. The Service Link Mode can be administered as either 'as-needed' or 'permanent' as described below:
  - As-Needed - Most non-call center multimedia users will be administered with this service link mode. The as-needed mode provides the Enhanced multimedia complex with a connected service link whenever a multimedia call is answered by the station and for a period of 10 seconds after the last multimedia call on the station has been disconnected. Having the service link stay connected for 10 seconds allows a user to disconnect a multimedia call and then make another multimedia call without having to wait for the service link to disconnect and re-establish.
  - Permanent - Multimedia call center agents and other users who are constantly making or receiving multimedia calls may want to be administered with this service link mode. The permanent mode service link will be connected during the station's first multimedia call and will remain in a connected state until the user disconnects from their PC's multimedia application or the Avaya DEFINITY Server switch restarts. This provides a multimedia user with a much quicker video cut-through when answering a multimedia call from another permanent mode station or a multimedia call that has been early answered.
- **Multimedia Mode** — There are two multimedia modes, Basic and Enhanced, as described below:
  - Basic — A Basic multimedia complex consists of a BRI-connected multimedia-equipped PC and a non-BRI-connected multifunction telephone set. When in Basic mode, users place voice calls at the multifunction telephone and multimedia calls from the multimedia equipped PC. Voice calls will be answered at the multifunction telephone and multimedia calls will alert first at the PC and if unanswered will next alert at the voice station if it is administered with H.320 = **y**. A Basic mode complex has limited multimedia feature capability as described in "[Basic Mode Operation](#)" on page 307).

— **Enhanced** — An Enhanced multimedia complex consists of a BRI-connected multimedia-equipped PC and a non-BRI-connected multifunction telephone. The Enhanced mode station acts as though the PC were directly connected to the multifunction telephone; the service link provides the actual connection between the Avaya DEFINITY Server and the PC. Thus, voice and multimedia calls are originated and received at the telephone set. Voice and multimedia call status are also displayed at the telephone set. An Enhanced mode station allows multimedia calls to take full advantage of most call control features as described in [“Enhanced Mode Operation”](#) on page 308.

- **Multimedia Early Answer** — Valid entries are **y** and **n** (default). This field lets you set this phone for early answer of multimedia calls. The system will answer the incoming multimedia call on behalf of the station and proceed to establish the H.320 protocol. After audio path has been established to the caller, the call will then alert at the voice station. The station may then answer by going off-hook and will have immediate audio path. No hourglass tone will be heard by the answering party (see [“Hourglass Tone”](#) on page 328).

Example: An administrative assistant who does not have a multimedia PC, but may get multimedia mode calls from forwarding or coverage, may want to set the H.320 flag to **y** and the early answer flag to **y** on their voice station. This allows any multimedia call to be presented to the station with immediate voice path rather than hourglass tone. The answered call could then be transferred as voice to voice mail or transferred as multimedia to a user equipped with a multimedia endpoint.

## Multimedia Buttons

There are six new multimedia specific buttons that may be added to a voice station. Most of them may be placed on any voice station, whether it is part of a Basic multimedia complex, an Enhanced multimedia complex or not part of any multimedia complex. Two feature buttons, mm-basic and mm-pcaudio, may only be placed on stations which are part of an Enhanced multimedia complex.

All of the multimedia specific feature buttons have a corresponding feature access code except mm-pcaudio and mm-cfwd.

- The mm-pcaudio feature can only be used via button.
- The mm-cfwd button may be replaced by the standard *“call forward”* FAC followed by the *“multimedia call”* FAC.

- **mm-call** — This button may exist on any voice station. Most multimedia enabled users will want an mm-call button. This button (or it's corresponding FAC) must be used to indicate that the user is placing a multimedia mode call. To place a multimedia mode call the user would go off-hook, select an idle call appearance, and press the mm-call button followed by the destination extension digits. If the user has a speakerphone they can simply press the mm-call button, which preselects an idle call appearance, followed by the destination extension digits.

The mm-call button lamp lights when you press this button during call origination. The lamp also lights to indicate that the selected call appearance is a multimedia mode call.

- **mm-basic** — This button is only allowed on the voice station of a multimedia complex. The mm-basic button toggles a station between Basic and Enhanced modes. This button can NOT be used to change the station's multimedia mode when the station has an active multimedia call appearance.

Toggling between Basic and Enhanced mode changes the station's administered Multimedia mode. When in Basic mode this field on the station screen will show `basic`. When in Enhanced mode this field on the station screen will show `enhanced`. The current station Multimedia mode will be saved to translation when a **save translation** command is executed.

- **mm-pcaudio** — This button only works for an Enhanced multimedia complex voice station. When originating or receiving a multimedia call, the audio path is connected to the voice station's handset or speakerphone device. The mm-pcaudio button allows a user to switch the audio portion of any call to their PC's audio input/output device (if available). To switch the audio path to the PC while active on a call, the user presses the mm-pcaudio button (if off-hook you may now hang up the handset). The mm-pcaudio button's status lamp will light up when the button is pushed to move the audio path to the PC and remain lit while the audio path is at the PC device.

 **NOTE:**

If you are on a voice only call, the voice path will switch to the PC device but you will get muted or loopback video depending on the multimedia endpoint software.

A user may simply go off-hook on their voice station or press the speakerphone button to move the audio path of a multimedia call from the PC back to the voice station. Pressing the mm-pcaudio button while the status lamp is lit and the voice station's handset is on-hook will disconnect the user from the active call.

- **mm-datacnf** — Pressing the mm-datacnf button from any voice station that is participating in a multimedia call will light the status lamp and alert the Avaya DEFINITY Server that you want to enable T.120 data collaboration with the other parties on the call. The button status lamp will also light for other participants in the multimedia call who have mm-datacnf buttons.

Pressing this button from the voice station that enabled data collaboration on a multimedia mode call will deactivate the data session and revert to a voice and video call. If you are participating on a multimedia call with data collaboration, but did not initiate the data collaboration, and you press this button, the status lamp led will flash momentarily and the T.120 data services will not be terminated, (only the station that activated the collaboration session can deactivate it). This button only works for stations connected to an Avaya DEFINITY Server equipped with an ESM adjunct.

- **mm-cfwd** — The mm-cfwd button allows a user to indicate that multimedia mode calls will be forwarded as multimedia mode calls to a specific forwarded-to destination. If voice call forwarding is active and multimedia call forwarding is not active then multimedia calls going off of the Avaya DEFINITY Server will be forwarded as voice only calls.

The mm-cfwd button status lamp will be lit to indicate that multimedia call forwarding is activated. Pressing the mm-cfwd button when the lamp is lit will deactivate multimedia call forwarding.

Note - pressing the mm-cfwd button is the same as dialing the regular call-fwd FAC followed by the mm-call button or FAC followed by the desired forwarded-to extension digits.

- **mm-multinbr** — The mm-multinbr call button is similar to the mm-call button. It allows origination of a multimedia call from any voice station. It is used when the destination being dialed requires a different address for each of the 2 B-channels. An example of this is Central Office provided ISDN-BRI. This type of BRI line is provisioned with separate listed directory numbers for each B-channel. In order to make a 2B multimedia call to such a device, two sets of address must be entered.

Originating a multimedia call with the mm-multinbr button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

## ESM T.120 Server Administration

```

change ds1 1c09 Page 1 of 1
 DS1 CIRCUIT PACK

 Location: 01C09 Name:
 Bit Rate: 2.048 Line Coding: hdb3

 Signaling Mode: isdn-pri Interface: network
 Connect: pbx Country Protocol: 1

 CRC? y

 Idle Code: 11111111 DCP/Analog Bearer Capability: 3.1kHz
 MMI Cabling Board: 01C10 MMI Interface: ESM

 Slip Detection? n Near-end CSU Type: other

```

### Screen 21. DS1 screen (Page 1 of 1)

From the system administration terminal:

1. Enter **list configuration all**, and a list of the installed carriers, circuit packs, and ports appears.
2. Record the location (board number) of the MMI board cabled to the TN2207 slot and verify that all other required circuit packs are present.
3. Enter **add DS1 xxxxx**, (where xxxxx is the location of the TN2207 PRI circuit pack recorded in step 2), and the DS1 circuit pack administration screen appears.
4. Set the Name field to **ESM DS1**
5. Set the Bit Rate field to **2.048**

The TN2207 DS1 must have a bit rate of 2.048, even if all other DS1 boards in the system are operating at 1.544. Verify the 24/32 channel switch on the circuit pack is in the 32 channel position.
6. Set the Line Coding field to **hdb3**
7. Set the Signaling Mode field to **isdn-pri**
8. Set the Connect field to **pbx**
9. Set the Interface field to **network**
10. Set the Country Protocol field to **1**
11. Set the CRC field to **y**
12. The Idle Code default is 11111111.

13. The DCP/Analog Bearer Capability default is 3.1 kHz.
14. Set the MMI Cabling Board field to **xxxxx** (where xxxxx is the location of the TN787 MMI circuit pack recorded in step 2). This must be the slot for port B of the Y-cable.
15. The MMI Interface field **ESM** appears.

```

change signaling-group 6 Page 1 of 5
 SIGNALING GROUP

Group Number: 6
 Associated Signaling? y Max number of NCA TSC: 0
 Primary D-Channel: 01C0916 Max number of CA TSC: 0
 Trunk Group for Channel Selection: Trunk Group for NCA TSC:
 Supplementary Service Protocol: a

```

**Screen 22. Signaling-Group screen (Page 1 of 5)**

1. Enter **add signaling-group next** and the signaling-group screen appears.
2. Change Associated Signaling field to **y**.
3. Change Primary D-Channel Port field to **xxxx16** (where xxxx is the address of the TN2207 PRI circuit pack, for example: 1B0516).
4. The Max Number of NCA TSC default is 0.
5. The Max Number of GA TSC default is 0.
6. Trunk Group for NCA TSC \_\_\_\_ (leave blank)
7. Trunk Group for Channel Selection\_\_\_\_ (leave blank)
8. Logoff the terminal and then log back on the terminal to view your changes.

**Troubleshooting.** To determine ESM link status enter the following commands from the system administration terminal:

1. **Status esm**
2. **Status signaling-group**
3. **List MMI**

**⇒ NOTE:**

When you move ESM circuit packs, you **MUST** remove the DS1 and signaling group translations. You cannot use the **change circuit pack** command.

When a vector is used to route video (56K/64K) calls to a hunt group comprised of data extensions, the vector **must** have the multimedia field set to **n**. This field causes multimedia calls routed through the vector to receive early answer treatment prior to processing the vector steps. This provides a talk path to the caller for announcements or immediate conversation with an agent and starts network billing for the incoming call when vector processing begins.

## Understanding the multimedia complex

---

**1-number access.** 1-number access permits originating users to make voice or multimedia calls to a Basic multimedia complex by dialing the same number for either type of call. The number may be the voice station extension or the data module extension. If the incoming call is a voice call, Avaya MultiVantage directs it to the telephone. If the incoming call is 56K or 64K data call, Avaya MultiVantage recognizes it as such and sends it to the multimedia endpoint. Likewise, if a voice call is addressed to the data extension, the system recognizes this and directs the call to the voice station.

Calls originating on the same switch as the Basic mode complex destination may always use 1-number access for voice or video. In order to take advantage of 1-number access for calls originating from a remote location, the incoming calls must arrive over ISDN-PRI trunks. If the system is setup with separate data non-PRI digital facilities multimedia calls must be made to the data extension.

AVD (Alternate voice/data) trunk groups cannot be used to provide 1-number access with MMCH. If the AVD trunk group has a BCC of 0, all calls arriving over the AVD trunk to the Basic mode complex will be assumed to be voice calls. If the AVD trunk group has a BCC of 1 or 4, all calls arriving over the AVD trunk to the Basic mode complex will be assumed to be multimedia calls.

**Originating voice calls.** All voice calls are originated at the voice station.

**Originating multimedia calls.** For a Basic mode complex, multimedia calls are normally originated at the user's multimedia equipped PC. These multimedia calls use the associated station's COR/COS.

The voice station of a Basic multimedia complex may also use the "mm-call" button or FAC, and the "mm-multibr" button or FAC to originate multimedia calls. When these methods are used, a multimedia call is originated from the voice station. In order for the Basic multimedia complex to receive video, the user must make a call from the H.320 DVC system to the voice station of the complex or must make a multimedia call from the voice station to the H.320 DVC. This allows the station to spontaneously add themselves or other parties to a multimedia conference.

1. **H.320 DVC system GUI.** The normal way for a Basic multimedia complex endpoint to originate a multimedia call is through the vendor provided user interface. Generally, digits to dial are entered, speed is selected and the call originates from the DVC system. The voice station is not involved in such as origination.

Any voice station may use the following mechanisms to originate a multimedia call from the voice station. For stations that are not part of a multimedia complex, video cannot be provided. For voice stations that are part of a Basic multimedia complex, video is not provided until a multimedia call is made from the complex's H.320 DVC system to the voice station or a multimedia call is made from the voice station to the H.320 DVC system. Video is automatically included for Enhanced multimedia complexes.

2. **mm-call (Multimedia Call) button.** If the station has an mm-call button administered, the user goes off-hook and selects the mm-call button. The user may select the mm-call button and then go off-hook. If the user has a speakerphone on the station, the user may originate the call simply by selecting the mm-call button. The speakerphone will automatically be placed off-hook and dialtone will be heard. Upon selection of the mm-call button, the mm-call status lamp (green LED) should become solid.

The user now dials the destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, station busy indicators, etc. Originating a multimedia call with the mm-call button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

For calls with a bandwidth of 2B, use of the mm-call button to originate will cause the same destination address to be used for both channels of the 2B call. See the section below on the mm-multinbr button/FAC for information on originating a 2B call where the destination has a different address for each B-channel.

 **NOTE:**

The mm-call feature button is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a multimedia call.

3. **Multimedia Call feature Access Code.** For stations that do not have an administered mm-call button, the Multimedia call feature access code may be used instead. The user goes off-hook on the station, waits for dialtone, then dials the MM-call FAC, receives dialtone again and then dials the call normally. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, station busy indicators, etc.

Originating a multimedia call with the mm-call button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

For calls with a bandwidth of 2B, use of the mm-call button to originate will cause the same destination address to be used for both channels of the 2B call. See the section below on the mm-multinbr button/FAC for information on originating a 2B call where the destination has a different address for each B-channel.

 **NOTE:**

The mm-call feature access code is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a multimedia call.

4. **mm-multinbr (Multimedia Multi-number) button.** The mm-multinbr button is similar to the mm-call button. It allows origination of a multimedia call from a voice station. It is used when the destination being dialed requires a different address for each of the 2 B-channels. An example of this is Central Office provided ISDN-BRI. This type of BRI line is provisioned with separate listed directory numbers for each B-channel. In order to make a 2B multimedia call to such a device, two sets of addresses must be entered.

The user goes off-hook and selects the mm-multinbr button. The user may select the mm-multinbr button and then go off-hook. If the user has a speakerphone on the station, the user may originate the call simply by selecting the mm-multinbr button. The speakerphone will automatically be placed off-hook and dialtone will be heard. Upon selection of the mm-multinbr button, the mm-multinbr and mm-call (if present) status lamp (green led) should light steadily. The user now dials the first destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc. The system will provide dialtone after the first address has been completed. The user now dials the second destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc. After the 2nd address has been collected the mm-multinbr status lamp will go off.

Originating a multimedia call with the mm-multinbr button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

 NOTE:

The mm-multinbr feature button is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a dual address multimedia call.

5. **Multimedia Multi-number Call feature Access Code.** For stations that do not have an administered mm-multinbr button, the Multimedia Multi-number call feature access code may be used instead. It allows origination of a multimedia call from a voice station. It is used when the destination being dialed requires a different address for each of the 2 B-channels. An example of this is Central Office provided ISDN-BRI. This type of BRI line is provisioned with separate listed directory numbers for each B-channel. In order to make a 2B multimedia call to such a device, two sets of addresses must be entered.

The user goes off-hook and dials the MM-multinbr feature access code. Upon dialing of the MM-multinbr FAC, the mm-call (if present) status lamp (green led) should become solid. The user now dials the first destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc. The system will provide dialtone after the first address has been completed. The user now dials the second destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc.

Originating a multimedia call with the MM-multinbr FAC will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

 NOTE:

The mm-multinbr FAC is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a dual address multimedia call.

6. **Multimedia parameter selection feature access code.** This FAC is used to originate a multimedia call that wishes to use a different bearer and bandwidth than the system default. For example, if the system has a default multimedia parameter of 2x64 and the user wishes to make a call to a destination that is known to only have 56K digital facilities, the MM parameter selection FAC can be used to select a bearer and bandwidth of 2x56 for this specific call.

The MM parameter selection FAC may be used in conjunction with the mm-multinbr button or FAC to make a single or dual address multimedia call at the desired bearer and bandwidth. The user goes off-hook and dials the MM-parameter selection feature access code. Dialtone is returned. The user enters a single digit, 1 or 2, where 1 = 2x64, 2 = 2x56. All other digits will produce reorder. Dialtone is returned. Upon dialing of the MM-parameter selection FAC, the mm-call (if present) status lamp (green led) should become solid. The user may indicate a dual-address call at this point with the mm-multinbr button or FAC. The user now dials one or two sets of destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc.

**NOTE:**

The mm-parameter selection FAC is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a dual address multimedia call.

7. Dialing sequences that include TACs, AAR, ARS, Authorization codes, CDR account codes, FRLs
  1. Single address with TAC
    - **Dial** mm-call button or FAC, **Hear** dialtone
    - **Dial** TAC, **Dial** destination digits
  2. Dual address with TAC
    - **Dial** mm-multinbr button or FAC, **Hear** dialtone
    - **Dial** TAC, **Dial** 1st dest. digits, **Hear** dialtone
    - **Dial** TAC, **Dial** 2nd dest. digits
  3. Single address with AAR/ARS
    - **Dial** mm-call button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** destination digits
  4. Dual address with AAR/ARS
    - **Dial** mm-multinbr button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** 1st dest. digits, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** 2nd dest. digits
  5. Single address with AAR/ARS and authorization code
    - **Dial** mm-call button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS FAC, **Dial** destination digits, **Hear** stutter dialtone
    - **Dial** authorization code

6. Dual address with AAR/ARS and authorization code
  - **Dial** mm-multinbr button or FAC, **Hear** dialtone
  - **Dial** AAR/ARS FAC, **Dial** 1st dest. digits, **Hear** dialtone
  - **Dial** AAR/ARS FAC, **Dial** 2nd dest. digits, **Hear** stutter dialtone
  - **Dial** authorization code
7. Single address with TAC or AAR/ARS and CDR account code
  - **Dial** mm-call button or FAC, **Hear** dialtone
  - **Dial** CDR FAC, **Hear** dialtone
  - **Dial** CDR account code, **Hear** dialtone
  - **Dial** TAC or AAR/ARS, **Dial** destination digits
8. Dual address with TAC or AAR/ARS and CDR account code
  - **Dial** mm-multinbr button or FAC, **Hear** dialtone
  - **Dial** CDR FAC, **Hear** dialtone
  - **Dial** CDR account code, **Hear** dialtone
  - **Dial** TAC or AAR/ARS, **Dial** 1st dest. digits
  - **Dial** TAC or AAR/ARS, **Dial** 2nd dest. digits

**Receiving voice calls.** Any voice calls directed to the voice or data extension of a Basic multimedia complex will ring at the voice station.

**Receiving multimedia calls.** Any data calls directed to the voice or data extension of a Basic multimedia complex will ring at the multimedia equipped PC if it is available. You may answer the multimedia call at the PC and voice and video will connect to the PC. If the data endpoint is unavailable, the system verifies that the telephone of the complex is administered with the H.320 field set to **y**. If so, the system converts the call to voice and sends it to the telephone of the multimedia complex, where the call then alerts.

**Hourglass Tone.** When a voice station answers a converted multimedia call, the answering party may hear different things depending on the nature of the originator. If the origination is directly from an H.320 DVC system or if the originator is an Enhanced mode complex on a remote switch, an immediate audio path will not exist between the two parties. This is because the H.320 protocol must be established after the call is answered. It takes several seconds for the H.320 protocol to establish an audio path. During this interval the answering party will hear special ringback. When the audio path exists the special ringback will be removed and replaced with a short incoming call tone indicating that audio now exists. The combination of special ringback followed by incoming call tone is referred to as “**hourglass tone**.” Hourglass tone is an indication to the answering party that they should wait for the H.320 call to establish audio.

**Early Answer.** The answering party may administer their station to avoid hearing hourglass tone. With the station screen **Early Answer** field set to **y**, the system answers the incoming multimedia call on behalf of the station and establishes the H.320 protocol. After audio path has been established, the call will then alert at the voice station of the Basic complex destination. The station may then answer by going off-hook and will have immediate audio path. No hourglass tone will be heard by the answering party.

If the H.320 field is not set to **y** for the telephone of a Basic multimedia complex, H.320 calls alert at the multimedia endpoint until the caller drops. If an H.320 call is directed to a telephone with H.320 set to **n**, the system denies the call.

You can assign H.320 conversion to any voice station.

**Authorization.** Multimedia complexes require the same types of authorization (COR/COS) as standard telephones. If a call is addressed to the voice extension, the system checks the COR/COS of the telephone, whether the call is voice-only or multimedia. If a call is addressed to the data extension, the system checks the COR/COS of the data endpoint. If the call is subsequently redirected to the voice station, the system does a second COR/COS check for the authorization of the voice station. Calls originated from the PC use the COR/COS of the voice station.

**Adjunct Switch Applications Interface .** ASAI is not expected to support call-association for data calls. Therefore Avaya does not recommend that you use ASAI for multimedia.

**Administered Connections.** Basic Multimedia endpoints may serve as the origination point or destination of an administered connection.

**Authorization and Barrier Codes.** Basic Mode multimedia users or off-premises PC users may not be able to respond to prompts for authorization or barrier codes. Multimedia endpoints do not recognize the prompts.

An on-premises user might be able to use Remote Access and enter the entire digit string at once before launching the call, but it would be better to eliminate the need for such codes for multimedia users who need to call off premises.

**Bridged Appearances.** Voice users can bridge onto a call if the user has a bridged appearance of a voice member of the call.

**Call redirection.** Calls directed to either member of the Basic multimedia complex are subject to redirection (coverage, forwarding). Avaya MultiVantage converts calls to voice before sending them to coverage. Calls redirected through call forwarding maintain multimedia status if forwarded from the data endpoint.

**Conferencing** . A multimedia conference can consist of multimedia and voice-only conferees. All multimedia conferees are added to a multimedia conference by a voice-terminal user on the switch, who acts as the controller of the multimedia conference. When the controller is a Basic complex voice station, the controller must remain on the conference until all parties have joined. Once all endpoints are on the conference, the voice-terminal user may put the call on hold or drop, if the user wishes.

Video conferees can see only their local video and one other party. If more than two people are involved in a video conference, the person who is speaking is the one whose video appears to other conferees. The speaker's video shows the previous speaker. This changes dynamically as the speaker changes.

### **Creating a multi-party video conference**

All multimedia conferences must be controlled by a voice phone. Multimedia conferees may be added by calling the voice phone or by having the voice phone make a multimedia call to other DVC endpoints. The controller can then conference together individual parties to create a multimedia conference.

To set up a multimedia conference:

1. Determine who is going to be the conference controller.
2. At the appointed time, the conference controller calls his or her telephone from the multimedia endpoint by dialing the 1-number extension. Once this call is established, the controller conferences in other calls as if this were a voice conference. The controller continues to add conferees in this manner until all conferees have joined, or until the number of conferees reaches the administered limit.
3. The conference controller may also add voice or multimedia parties to the conference spontaneously. The controller hits CONFERENCE, makes a voice or multimedia call to a new party. To make a multimedia call, the controller must originate a call using the mm-call button or FAC or the mm-multibr button or FAC. After the new party begins alerting, the controller may hit CONFERENCE to add the party to the existing conference on hold.

**Coverage.** Multimedia calls to a Basic mode complex are subject to the same coverage criteria as voice calls and follow the coverage path administered for the voice station of the Basic multimedia mode complex.

If a plain voice station or a Basic mode complex is the covering party, the answering voice station will receive audio only. If all voice stations in the coverage path have the station screen Early Answer field set to **n** and the originator of the multimedia call was not a local Enhanced mode complex, the answering station will hear hourglass tone.

If an Enhanced mode complex is the covering party, the answering voice station will receive voice and video. If all voice stations in the coverage path have the station screen Early Answer field set to **n** and the originator of the multimedia call was not a local Enhanced mode complex, the answering station will hear hourglass tone.

**Coverage: Multimedia calls and off-net call coverage.** If the principal station's coverage path include a remote coverage point, the multimedia call will cover off-switch as voice only. If the call is unanswered off-switch and proceeds to the next coverage point on-switch, the multimedia nature of the call is preserved.

**Coverage: Multimedia calls and coverage to voice mail.** Voice mail systems such as AUDIX are typically the last point in a coverage path and are usually implemented as a hunt group. In order to guarantee that the originator of an H.320 multimedia call hears the voice mail greeting, the hunt group that defines the list of voice mail ports should have the Early Answer field on the hunt group set to **y**. This field will have no effect on voice calls to the voice mail system.

**Call Detail Recording.** Each channel of a 2-channel call generates a separate CDR record.

## Data Collaboration

Once you have established a multi-point video conference, multi-point T.120 data collaboration may be enabled for that call. This will allow all video parties on the current conference to collaborate.

T.120 Data conferencing is made possible through the Expansion Services Module (ESM) which is an adjunct to the Avaya MultiVantage. Up to six parties may participate in a single data conference, and up to 24 parties may use ESM facilities for data collaboration at any given time.

Adding data sharing to a video conference

1. Set up a multimedia conference.
2. Once a multimedia call is active, any voice station in the conference, can initiate data collaboration by pressing the mm-datacnf button. Or, to use the feature access code to initiate a data conference, press the Transfer button. A second line-appearance becomes active and you hear dial tone. Dial the multimedia data conference feature access code. Confirmation tone is heard and the system automatically reselects the held call appearance of the multimedia conference. The Avaya MultiVantage solution will select a data rate which is acceptable to all H.320 DVC systems in the current call.

If the system does not have sufficient ESM resources available for all parties currently in the call, activation of T.120 data sharing will be denied. The mm-datacnf status lamp will flash denial or the mm-datacnf FAC will produce reorder.

3. Each H.320 DVC system in the conference call is joined to the data conference. On many DVC systems, the provided GUI may prompt the user with a dialog box, requesting the user to select a specific conference to join. With MMCH, there should only be one conference available to select.
4. The user must now use the PC's GUI to begin application sharing. The method for beginning application sharing or file transfer is different for each H.320 multimedia application. One of the H.320 DVC systems activates data sharing from the H.320 DVC vendor provided GUI. See your H.320 DVC system documentation for details.
5. The same H.320 DVC system as in step 4, opens an application, whiteboard, etc. to share and the image of the application is displayed on all H.320 DVC systems in the conference.

For details on how multiple users may control the shared application, see the vendor provided documentation for your specific H.320 DVC system.

6. To end the data collaboration session and retain the voice/video conference, the station that selected the mm-datacnf button or FAC may press the mm-datacnf button or hit transfer and dial the mm-datacnf deactivation FAC.

 **NOTE:**

As of this writing, many endpoints do not respond correctly to ending the data collaboration session and retaining voice/video. Some H.320 DVC systems drop the entire call. Avaya recommends that once T.120 data sharing has been enabled for a conference, that it remain active for the duration of the conference call. When all endpoints have dropped from the call, the T.120 resources will be released.

**Joining a multimedia conference after T.120 data sharing has been enabled.**

If a multimedia conference with T.120 data sharing is already active and it is desired to conference in a new video endpoint, the new video endpoint can be conferenced into the existing call. The new endpoint will be allowed into the data conference if there exists sufficient ESM resources for the new endpoint. The new endpoint will get voice/video and data sharing if the new endpoint supports the MLP data rate chosen by the system when T.120 data collaboration was activated. If the endpoint does not support the pre-existing MLP data rate, the new endpoint will only receive voice and video.

**Single switch data collaboration.** When all parties involved in data collaboration conference are located on the same physical Avaya DEFINITY Server, there is no restriction on the type of user. The parties may be any combination of Enhanced multimedia complexes, Basic multimedia complexes or stand-alone H.320 DVC systems.

**Multi-switch data collaboration.** When all parties involved in data collaboration conference are **not** located on the same physical Avaya DEFINITY Server, the parties located on the Avaya DEFINITY Server hosting the data conference (i.e. the switch that activated mm-datacnf) may be any combination of Enhanced multimedia complexes, Basic multimedia complexes or stand-alone H.320 DVC systems. **All parties on remote switches must not be Enhanced multimedia complexes:** they must be Basic multimedia complexes or stand-alone H.320 DVC systems. Prior to originating or receiving a multimedia mode call, the mm-basic feature button or feature access code can be used to dynamically change an Enhanced mode complex into a Basic mode complex and back again.

**Forwarding of voice/multimedia calls.** In Basic mode you can forward calls from either the telephone or the multimedia endpoint. To forward a call from the multimedia endpoint:

1. At the PC's multimedia application, enter the call-forwarding feature access code (FAC)
2. Enter the forward-to number in the dialed number field on the endpoint software
3. Click the Dial button (or equivalent)

 **NOTE:**

The PC multimedia software will probably respond with a message that the call failed, since it does not recognize the FAC. In fact, Avaya MultiVantage *does receive* the message, and forwards all multimedia calls addressed to the I-number.

If a call is forwarded from the telephone, the call converts to voice first. If using the multimedia endpoint to forward, the calls arrive at the forwarded-to extension as a data call. Such calls continue to ring until answered or abandoned, rather than follow a coverage path.

Users can forward calls from the multimedia endpoint using the call forward FAC. You can also assign a call-forward button at the voice station to forward calls for the data endpoint. If a Basic multimedia complex has console permissions, that user can forward calls for others by dialing the FAC, the data extension, and then the forwarded-to number.

**Call Park.** A voice-terminal user can park any active call, voice or multimedia, and unpark the call from another telephone. Users cannot park or unpark calls using multimedia endpoints.

**Call Pickup.** Members of a pickup group can answer an H.320 call using a telephone after the call has been converted to voice. This is true for standard or directed call pickup.

**Consult.** After a call is converted to voice, consult may be used when transferring or conferencing the call.

**COR/COS.** The Class of Restriction and Class of Service for H.320 calls originated from a 1-number complex are the same as those of the telephone in the complex.

**Data Call Setup.** Basic complex multimedia endpoints are BRI data endpoints, and may use data call-setup procedures as provided by the software vendor.

**Data Hotline.** If endpoint software allows users to select the dial function without entering a number, the endpoint can be used for hotline dialing.

**Dial Access to Attendant.** Access to Attendant is blocked for a data call from a Basic mode multimedia endpoint.

**Data Trunk Groups.** Data trunk groups may be used to carry H.320 calls of a fixed (administered) bearer capability.

**Hold.** The voice station and multimedia endpoint of a Basic complex are each independent devices with respect to call control. When a Basic multimedia complex voice station executes hold only the voice station is held. If the user has conferenced their multimedia endpoint into a multimedia conference, activating hold will *not* disconnect the multimedia endpoint from the conference, it will only disconnect the Basic multimedia complex voice station. Executing hold with an Enhanced mode complex will fully disconnect voice and video from the current active call.

**Hunt Groups using Basic Mode complexes.** Since Basic mode complexes may receive point to point multimedia calls at the DVC system and voice calls to the station simultaneously, the voice station extension may be placed in any normal voice hunt group or ACD skill and the data extension may be placed in a simple hunt group made up of only data extensions.

Basic mode complex data extensions or stand-alone data extensions may be used to create simple data hunt groups. Data extensions are not allowed in ACD hunt groups. Avaya recommends that you do not mix voice and data stations in a hunt group.

If you want multimedia calls to hunt to multimedia endpoints (i.e. 2B point to point data hunting), put the data extension in the hunt group. If you place the voice extension in a hunt group, only voice calls hunt to that extension. Multimedia calls to a hunt group with a Basic mode voice station as the hunt group member will *not* be offered to the DVC system of the Basic mode complex. If either the voice or data extension of a Basic mode complex is busy, the entire complex is considered busy for hunting purposes.

In order to guarantee that all members of a voice hunt group or skill can receive voice or multimedia calls, all members should have the H.320 field on the station screen set to **y**. Simple voice stations and Basic complex mode voice stations will receive voice only. Enhanced mode stations will receive voice and video.

The MM Early Answer field (on the Hunt Group screen) tells the system to answer the incoming multimedia call and establish audio before it reaches the first member of the hunt group. Thus, when the talk path is established, the caller is able to speak with an agent immediately. This is not necessary for hunt groups comprised of data extensions.

**Hunting, Other considerations.** Agents that are part of a Basic mode complex may dial a feature access code to remove themselves from availability (and to indicate that they are available again) from both the multimedia endpoint and the telephone independently. This allows the voice member or the data member to be individually made unavailable. To make the data extension unavailable, the agent must dial the FAC from the DVC system.

CMS measurements may indicate unusually slow ASA, because of the time required for the system to establish early-answer before offering the call to an agent.

**Hunting Call association (routing).** Typically incoming voice calls consist of 2 B-channel calls to the same address, to provide greater bandwidth and better video resolution. Avaya MultiVantage attempts to correctly pair up incoming calls and offer them as a unit to a single agent. MMCH uses call association to route both calls to the extension that answered the first call, regardless of how the call was routed internally.

Two 56K/64K data calls with the same calling party number to the same destination number are considered to be associated. The system makes every attempt to route both calls of a 2-channel call to the same answering party. If the first call terminates at a member of a hunt group, the second call does not have to hunt, but goes directly to the same member. In order for 2B multimedia calls to be correctly given to a single agent, incoming calls to the hunt group must have ANI information. The ANI information may be in the form of ISDN calling party number or DCS calling party number. Multimedia calls made on the same switch as the hunt group are easily associated. If multimedia calls into a hunt group have incorrect ANI information (i.e. all calls from switch X to switch Y include the LDN for switch X), then as the volume of calls increases, the number of mis-associated calls will increase. If multimedia calls into a hunt group have no ANI information, the switch will never associate pairs of calls and all calls will be treated independently and routed to separate agents. This is not a recommended configuration.

**Hunting with Multimedia vectors.** Very often, calls are routed to hunt groups or skills via a vector. The existing VDNs and vectors which exist for routing voice calls can be used to route multimedia calls.

In order to use a vector for multimedia calls that will terminate to voice stations, you must set the Multimedia field on the vector screen to **y**. This field has no effect on voice calls routing through the vector. This field will cause multimedia calls routed through the vector to receive early answer treatment prior to processing the vector steps. This provides a talk path to the caller for announcements or immediate conversation with an agent.

**⇒ NOTE:**

Vectors which have the Multimedia field set to **y** must eventually route to hunt groups, skills or numbers which are voice extensions. A vector with the multimedia field set to **y** should never be set up to route to a hunt group or number which is a data extension.

When a vector is used to route video (56K/64K) calls to a hunt group comprised of data extensions, the vector **must** have the multimedia field set to **n**.

**Intercept Treatment.** H.320 calls that receive intercept treatment are treated like other data calls. H.320 calls cannot be directed to an attendant for service because the attendant cannot have H.320 conversion service.

**ISDN Trunk Groups.** Avaya highly recommends that you use ISDN trunks for multimedia calls. ISDN PRI trunks allow complete 1-number access for an Enhanced multimedia complex. ANI provided over PRI trunks allows correct routing of multiple bearer channels to the correct destination device. ISDN also provides the bearer capability on a call by call basis which can be used to distinguish voice calls from multimedia calls.

**Malicious Call Trace.** If a malicious call terminates at a Basic multimedia complex endpoint, the user can dial the feature access code from the telephone to activate malicious call trace, followed by the extension of the multimedia endpoint. If the user does not dial the multimedia extension, MCT traces any call held on the telephone.

**Message Waiting.** Message Waiting indication is handled at the telephone. Because H.320 calls are converted to voice before going to coverage, all messages are voice only.

**Night Service.** Incoming Basic mode data calls follow established night-service processing for data calls.

**Remote Access.** The switch does not prevent Basic multimedia complexes from attempting to use remote access. However, these Basic mode endpoints will most likely not be able to dial the necessary codes.

**Station Hunting** . Basic mode data calls to endpoints that have an extension administered in the hunt-to-station field hunt based on established hunting criteria. The call is converted to voice before station hunting.

**Tenant Partitioning.** Permission to make multimedia calls or add parties of any type to a conference is subject to standard tenant-partitioning restrictions.

**Terminating Extension Groups.** Basic mode data calls to a TEG are converted to voice and can terminate only at a voice endpoint. Effectively, Avaya MultiVantage treats the multimedia-complex extension as a voice-only endpoint.

**Telephone Display.** Display information for calls to or from a Basic multimedia complex contains the 1-number.

## **Enhanced Mode MM complex**

---

The Enhanced multimedia complex provides a much greater unified and integrated interface for control of voice and multimedia calls. The multifunction voice station is used to control all calls, whether voice or multimedia. The H.320 desktop video system is used to present the video stream, data stream and (optionally) audio stream to the user. The H.320 desktop video system is **not** used for call control. The Enhanced multimedia complex allows the multifunction voice station to handle voice or multimedia calls in an almost identical manner. Each call appearance on the voice station may represent a voice or multimedia call, allowing multiple voice or multimedia calls to be present simultaneously on the station. The user may manage the separate call appearances without regard to the voice or multimedia nature of the specific call. The standard HOLD/TRANSFER/CONFERENCE/DROP actions may be applied to any call without regard to the voice or multimedia nature of the call.

### **1-number access**

1-number access permits originating users to make voice or multimedia calls to an Enhanced multimedia complex by dialing the same number for either type of call. The number may be the voice station extension or the data module extension. If the incoming call is a voice call, Avaya MultiVantage alerts the station of an incoming voice call. If the incoming call is 56K or 64K data call, Avaya MultiVantage recognizes it as a multimedia call and inserts resources to terminate the H.320 protocol and then alerts the voice station with a multimedia call.

Calls originating on the same switch as the Enhanced mode complex destination may always use 1-number access for voice or video. In order to take advantage of 1-number access for calls originating from a remote location, the incoming calls must arrive over ISDN-PRI trunks. If the system is setup with separate non-PRI digital facilities for data, multimedia calls must be made to the data extension of the Enhanced mode complex.

AVD (Alternate voice/data) trunk groups cannot be used to provide 1-number access with MMCH. If the AVD trunk group has a BCC of 0, all calls arriving over the AVD trunk to the Basic mode complex will be assumed to be voice calls. If the AVD trunk group has a BCC of 1 or 4, all calls arriving over the AVD trunk to the Basic mode complex will be assumed to be multimedia calls.

## ORIGINATION

The basic call sequence from an Enhanced mode complex is to originate a multimedia call and alert the destination. When the destination answers the call, the originating station's H.320 desktop video system will be alerted (that is, called by the switch to establish the service link). If the H.320 desktop video system is not configured for auto-answer, the user must answer the H.320 calls via the DVC GUI. If the H.320 DVC is configured for auto-answer, no action is needed via the DVC GUI. **Avaya recommends, but does not require, that Enhanced mode complexes place their desktop video system into an auto-answer mode of operation.** If the far-end is providing a video signal, the 2-way video will be observed. If the destination is not providing a video signal (call was answered by a simple voice station), then loopback video will be provided at the Enhanced mode complex originator. The audio signal will exist at the handset of the voice station. The audio signal may be moved to the H.320 DVC system via activation of a mm-pcaudio button on the voice station. See the section below on mm-pcaudio.

**Hourglass tone.** The originating party may hear different things when the incoming multimedia call is answered depending on the nature of the answering party. If the call is being answered directly by an H.320 DVC system or if the answering party is an Enhanced mode complex on a remote switch, an immediate audio path will not exist between the two parties. This is because the H.320 protocol must be established after the call is answered. It takes several seconds for the H.320 protocol to establish an audio path. During this interval the originating party will hear special ringback. When the audio path exists the special ringback will be removed and replaced with a short incoming call tone indicating that audio path now exists. The combination of special ringback followed by incoming call tone is referred to as "hourglass tone." Hourglass tone is an indication to the originating party that they should wait for the H.320 call to establish audio.

### - originating voice calls

Voice calls are originated from the voice station of an Enhanced mode complex in the normal manner as for any voice station.

### - originating multimedia calls

Multimedia calls from an Enhanced multimedia complex are originated from the VOICE STATION, NOT the H.320 desktop video system. All multimedia originations require the user to indicate the multimedia nature of the call prior to providing any address digits. There are several different ways to originate a multimedia call from the voice station.

1. **mm-call (Multimedia Call) button.** If the station has an mm-call button administered, the user goes off-hook and selects the mm-call button. The user may select the mm-call button and then go off-hook. If the user has a speakerphone on the station, the user may originate the call simply by selecting the mm-call button. The speakerphone will automatically be placed off-hook and dialtone will be heard. Upon selection of the mm-call button, the mm-call status lamp (green LED) will light steadily, indicating a multimedia call.

The user now dials the destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, station busy indicators, etc. Originating a multimedia call with the mm-call button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

For calls with a bandwidth of 2B, use of the mm-call button to originate will cause the same destination address to be used for both channels of the 2B call. See the section below on the mm-multinbr button/FAC for information on originating a 2B call where the destination has a different address for each B-channel.

 **NOTE:**

The mm-call feature button is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a multimedia call.

2. **Multimedia Call feature Access Code.** For stations that do not have an administered mm-call button, the Multimedia call feature access code may be used instead. The user goes off-hook on the station, waits for dialtone, then dials the MM-call FAC, receives dialtone again and then dials the call normally. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, station busy indicators, etc.

Originating a multimedia call with the mm-call button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

For calls with a bandwidth of 2B, use of the mm-call button to originate will cause the same destination address to be used for both channels of the 2B call. See the section below on the mm-multinbr button/FAC for information on originating a 2B call where the destination has a different address for each B-channel.

 **NOTE:**

The mm-call feature access code is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a multimedia call.

3. **mm-multinbr (Multimedia Multi-number) button.** The mm-multinbr button is similar to the mm-call button. It allows origination of a multimedia call from a voice station. It is used when the destination being dialed requires a different address for each of the 2 B-channels. An example of this is Central Office provided ISDN-BRI. This type of BRI line is provisioned with separate listed directory numbers for each B-channel. In order to make a 2B multimedia call to such a device, two sets of addresses must be entered.

The user goes off-hook and selects the mm-multinbr button. The user may select the mm-multinbr button and then go off-hook. If the user has a speakerphone on the station, the user may originate the call simply by selecting the mm-multinbr button. The speakerphone will automatically be placed off-hook and dialtone will be heard. Upon selection of the mm-multinbr button, the mm-multinbr and mm-call (if present) status lamp (green led) should become solid. The user now dials the first destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc. The system will provide dialtone after the first address has been completed. The user now dials the second destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc. After the 2nd address has been collected the mm-multinbr status lamp will go off.

Originating a multimedia call with the mm-multinbr button will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

 **NOTE:**

The mm-multinbr feature button is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a dual address multimedia call.

- 4. Multimedia Multi-number Call feature Access Code.** For stations that do not have an administered mm-multinbr button, the Multimedia Multi-number call feature access code may be used instead. It allows origination of a multimedia call from a voice station. It is used when the destination being dialed requires a different address for each of the 2 B-channels. An example of this is Central Office provided ISDN-BRI. This type of BRI line is provisioned with separate listed directory numbers for each B-channel. In order to make a 2B multimedia call to such a device, two sets of addresses must be entered.

The user goes off-hook and dials the MM-multinbr feature access code. Upon dialing of the MM-multinbr FAC, the mm-call (if present) status lamp (green led) should become solid. The user now dials the first destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc. The system will provide dialtone after the first address has been completed. The user now dials the second destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc.

Originating a multimedia call with the MM-multinbr FAC will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen. This default parameter will be either 2x56 or 2x64. The bearer capability of the multimedia calls will either be 56K or 64K and the bandwidth will be 2B channels.

 **NOTE:**

The mm-multinbr FAC is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a dual address multimedia call.

- 5. Multimedia parameter selection feature access code.** This FAC is used to originate a multimedia call that wishes to use a different bearer and bandwidth than the system default. For example, if the system has a default multimedia parameter of 2x64 and the user wishes to make a call to a destination that is known to only have 56K digital facilities, the MM parameter selection FAC can be used to select a bearer and bandwidth of 2x56 for this specific call.

The MM parameter selection FAC may be used in conjunction with the mm-multinbr button or FAC to make a single or dual address multimedia call at the desired bearer and bandwidth. The user goes off-hook and dials the MM-parameter selection feature access code. Dialtone is returned. The user enters a single digit, 1 or 2, where 1 = 2x64, 2 = 2x56. All other digits will produce reorder. Dialtone is returned. Upon dialing of the MM-parameter selection FAC, the mm-call (if present) status lamp (green led) should become solid. The user may indicate a dual-address call at this

point with the mm-multinbr button or FAC. The user now dials one or two sets of destination address digits. The destination address may be provided by dialing digits, using abbreviated dial entries, last number dialed, etc.

 **NOTE:**

The mm-parameter selection FAC is generally used by stations that are part of an Enhanced multimedia complex, but may be used by any station to originate a dual address multimedia call.

6. Dialing sequences that include TACs, AAR, ARS, Authorization codes, CDR account codes, FRLS
  1. Single address with TAC
    - **Dial** mm-call button or FAC, **Hear** dialtone
    - **Dial** TAC, **Dial** destination digits
  2. Dual address with TAC
    - **Dial** mm-multinbr button or FAC, **Hear** dialtone
    - **Dial** TAC, **Dial** 1st dest. digits, **Hear** dialtone
    - **Dial** TAC, **Dial** 2nd dest. digits
  3. Single address with AAR/ARS
    - **Dial** mm-call button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** destination digits
  4. Dual address with AAR/ARS
    - **Dial** mm-multinbr button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** 1st dest. digits, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** 2nd dest. digits
  5. Single address with AAR/ARS and authorization code
    - **Dial** mm-call button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS FAC, **Dial** destination digits, **Hear** stutter dialtone
    - **Dial** authorization code
  6. Dual address with AAR/ARS and authorization code
    - **Dial** mm-multinbr button or FAC, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** 1st dest. digits, **Hear** dialtone
    - **Dial** AAR/ARS, **Dial** 2nd dest. digits, **Hear** stutter dialtone
    - **Dial** authorization code

7. Single address with TAC or AAR/ARS and CDR account code
  - **Dial** mm-call button or FAC, **Hear** dialtone
  - **Dial** CDR FAC, **Hear** dialtone
  - **Dial** CDR account code, **Hear** dialtone
  - **Dial** TAC or AAR/ARS, **Dial** destination digits
8. Dual address with TAC or AAR/ARS and CDR account code
  - **Dial** mm-multibr button or FAC, **Hear** dialtone
  - **Dial** CDR FAC, **Hear** dialtone
  - **Dial** CDR account code, **Hear** dialtone
  - **Dial** TAC or AAR/ARS, **Dial** 1st dest. digits
  - **Dial** TAC or AAR/ARS, **Dial** 2nd dest. digits

## Answering

The user actions required to answer voice or multimedia calls at an Enhanced multimedia complex are identical if the H.320 DVC system is configured for auto-answer. If the H.320 DVC system is not configured for auto-answer an additional step is required. See answering multimedia calls below. **Avaya recommends, but does not require, that Enhanced mode complexes place their desktop video system into an auto-answer mode of operation.**

### Answering voice calls

Incoming voice calls will alert at the voice station of the Enhanced multimedia complex in the normal manner. Standard alerting and call appearance flashing will occur. They are answered in the normal manner by selecting the alerting call appearance and going off-hook on the voice station.

### Answering multimedia calls

Incoming multimedia calls will alert at the voice station of the Enhanced multimedia complex in the same manner as voice calls with one addition. If the alerting station has an administered mm-call button and the alerting call appearance is the selected call appearance (for instance, the red LED is lit, on the alerting call appearance), then the mm-call button status lamp will go on indicating that the call on the selected call appearance is a multimedia call.

The incoming multimedia call is answered in the normal manner by selecting the alerting call appearance and going off-hook on the voice station. If the H.320 DVC system for the answering party is configured for auto-answer, no other action is needed to complete the multimedia call. If the H.320 DVC system for the answering party is not configured for auto-answer, the H.320 DVC system will alert and must also be answered by the user. **Avaya recommends, but does not require, that Enhanced mode complexes place their desktop video system into an auto-answer mode of operation.**

If the originating party is providing a video signal, then a complete 2-way multimedia call will exist. If the originating party is not providing a video signal, the answering party will receive loopback video. The audio signal will exist at the handset of the voice station. The audio signal may be moved to the H.320 DVC system via activation of a **mm-pcaudio** button on the voice station.

**Hourglass Tone.** The answering party may hear different things when the incoming multimedia call is answered depending on the nature of the originator. If the origination is directly from an H.320 DVC system or if the originator is an Enhanced mode complex on a remote switch, an immediate audio path will not exist between the two parties. This is because the H.320 protocol must be established after the call is answered. It takes several seconds for the H.320 protocol to establish an audio path. During this interval the answering party will hear special ringback. When the audio path exists the special ringback will be removed and replaced with a short “incoming call tone” indicating that audio now exists. The combination of special ringback followed by incoming call tone is referred to as “**hourglass tone.**” Hourglass tone is an indication to the answering party that they should wait for the H.320 call to establish audio.

**Early Answer.** The answering party may administer their station in such a way as to avoid hearing hourglass tone. If the station screen has set the **Early Answer** field to **y**, then the system will answer the incoming multimedia call on behalf of the station and proceed to establish the H.320 protocol. After audio path has been established, the call will then alert at the voice station of the Enhanced mode complex destination. The station may then answer by going off-hook and will have immediate audio path. No hourglass tone will be heard by the answering party.

### **- multiple call appearance operation**

With an Enhanced mode complex all calls to or from the complex are controlled via the voice station. Each voice or multimedia call has its own call appearance which may be selected without regard for the nature of the call using the specific call appearance. This allows a multifunction station to control multiple voice or multimedia calls in exactly the same way they would control multiple voice calls.

As an example, a user may originate a simple voice call on the first call appearance. A multimedia call may then arrive on the second call appearance. The user activates HOLD on the first call appearance and selects the second call appearance to answer the multimedia call. The user may then activate HOLD on the second call appearance and reselect the first call appearance or select a third call appearance and originate another call.

### - creating a multi-party video conference

An Enhanced multimedia complex can create a spontaneous video conference in the same way that a spontaneous voice conference is created. Given an active call, the user activates the CONFERENCE button. This puts the current call on HOLD and activates a new call appearance. The user makes a multimedia call according to the instructions for originating a multimedia call and then selects CONFERENCE to combine or merge the two call appearances. This results in a 3-way conference.

If all three parties are video equipped, then a 3-way video conference results. Conference members see the current speaker on video. The current speaker sees the last speaker on video. If one of the parties is not video equipped, then a 3-way audio conference exists and the two video equipped parties have 2-way video. The CONFERENCE action may be repeated until 6 parties have been conferenced together. The 6 parties may be any mix of voice or video, local or remote parties.

The following steps create a multi-party voice/video conference:

1. Enhanced mode complex station A originates a multimedia call to, or receives a multimedia call from, party B. Station A and party B have 2-way voice and video.
2. Station A, activates CONFERENCE.
3. Station A originates a multimedia call (i.e. uses the mm-call button/FAC/etc.) and dials the party to be added, Enhanced multimedia complex C.
4. Party C, answers the call from station A.
5. Station A selects CONFERENCE to complete the 3-way conference. Parties A,B and C will be in a 3-way voice/video conference.

#### NOTE:

If party C is **another Enhanced mode complex on the same switch as station A**, station A does not need to indicate a multimedia call prior to dialing the new party in step 3. While A consults with C, the call will be audio only. When A completes the conference in step 5, party C's video will be activated.

A multi-party video conference uses voice activated switching to determine which parties are seen. The current speaker is seen by all other parties. The current speaker sees the previous speaker.

Additional voice or video parties may be added by repeating these steps.

## Data Collaboration

Once you have established a multi-point video conference, multi-point T.120 data collaboration may be enabled for that call. This will allow all video parties on the current conference to collaborate.

T.120 Data conferencing is made possible through the Expansion Services Module (ESM) which is an adjunct to the Avaya DEFINITY Server. Up to six parties may participate in a single data conference, and up to 24 parties may use ESM facilities for data collaboration at any given time.

The following steps add data sharing to a video conference:

1. Set up a multimedia conference.
2. Once a multimedia call is active, any member can initiate data collaboration by pressing the mm-datacnf button. Or, to use the feature access code to initiate a data conference, press the Transfer button. A second line-appearance becomes active and you hear dial tone. Dial the multimedia data conference feature access code. Confirmation tone is heard and the system automatically reselects the held call appearance of the multimedia conference. Avaya MultiVantage will select an MLP data rate which is acceptable to all H.320 DVC systems in the current call.

If the system does not have sufficient ESM resources available for all parties currently in the call, activation of T.120 data sharing will be denied. The mm-datacnf status lamp will flash denial or the mm-datacnf FAC will produce reorder.

3. Each H.320 DVC system in the conference call is joined to the data conference. On many DVC systems, the provided GUI may prompt the user with a dialog box, requesting the user to select a specific conference to join. With MMCH, there should only be one conference available to select.
4. The user must now use the PC's GUI to begin application sharing. The method for beginning application sharing or file transfer is different for each H.320 multimedia application. One of the H.320 DVC systems activates data sharing from the H.320 DVC vendor provided GUI. See your H.320 DVC system documentation for details.
5. The same H.320 DVC system as in step 4, opens an application, whiteboard, etc. to share and the image of the application is displayed on all H.320 DVC systems in the conference.

For details on how multiple users may control the shared application, see the vendor provided documentation for your specific H.320 DVC system.

6. To end the data collaboration session and retain the voice/video conference, the station that selected the mm-datacnf button or FAC may press the mm-datacnf button or hit transfer and dial the mm-datacnf deactivation FAC.

**NOTE:**

Currently, many endpoints do not respond correctly to ending the data collaboration session and retaining voice/video. Some H.320 DVC systems drop the entire call. Avaya recommends that once T.120 data sharing has been enabled for a conference, that it remain active for the duration of the conference call. When all endpoints have dropped from the call, the T.120 resources will be released.

**Joining a multimedia conference after T.120 data sharing has been enabled.**

If a multimedia conference with T.120 data sharing is already active and it is desired to conference in a new video endpoint, the new video endpoint can be conferenced into the existing call. The new endpoint will be allowed into the data conference if there exists sufficient ESM resources for the new endpoint. The new endpoint will get voice/video and data sharing if the new endpoint supports the data rate chosen by the system when T.120 data collaboration was activated. If the endpoint does not support the pre-existing data rate, the new endpoint will only receive voice and video.

**Activating HOLD while on a T.120 data collaboration conference.**

If an Enhanced multimedia complex is active on a multimedia call and the call has activated T.120 data collaboration, the user should be receiving voice/video and data. If the station places this existing call on hold, audio and video will be disconnected for the current call. The data collaboration portion of the call will remain intact and unaffected. While this T.120 data conference is on hold, the user will only be allowed to receive audio on all other call appearances. Thus a user is limited to one call appearance that has T.120 data collaboration active.

**Single switch data collaboration.** When all parties involved in data collaboration conference are located on the same physical Avaya DEFINITY Server, there is no restriction on the type of user. The parties may be any combination of Enhanced multimedia complexes, Basic multimedia complexes or stand-alone H.320 DVC systems.

**Multi- switch data collaboration.** When all parties involved in data collaboration conference are *not* located on the same physical Avaya DEFINITY Server, the parties located on the Avaya DEFINITY Server hosting the data conference (i.e. the switch that activated mm-datacnf) may be any combination of Enhanced multimedia complexes, Basic multimedia complexes or stand-alone H.320 DVC systems.

 **NOTE:**

All parties on remote switches must not be Enhanced multimedia complexes. They must be Basic multimedia complexes or stand-alone H.320 DVC systems.

Prior to originating or receiving a multimedia mode call, the mm-basic feature button or feature access code can be used to dynamically change an Enhanced mode complex into a Basic mode complex and back again.

### **Voice station audio vs. H.320 DVC system audio**

When an Enhanced mode complex originates or receives a voice or multimedia call, the call is originated with the station handset or answered with the station handset. The audio path will be through the handset. If the user's H.320 DVC system has speakers and a microphone, the user may wish to use the H.320 DVC system for audio in much the same manner as a built-in or separate telephone speakerphone. The user can move the station's audio to the H.320 DVC system by selecting an **mm-pcaudio** feature button on the voice station. There is no feature access code for this function.

The mm-pcaudio feature button works very much like a speakerphone on/off button. If the station is off-hook and selects mm-pcaudio, audio is directed to the PC DVC system. The switch-hook may be placed on-hook. If the handset is taken off-hook, the audio moves back to the handset. If the mm-pcaudio button is selected while audio is already on the DVC system and the handset is on-hook, this acts as a speakerphone off action and disconnects the current call.

The mm-pcaudio feature button may be used for voice as well as multimedia calls. If the mm-pcaudio feature button is selected while on a voice only call, the DVC system is alerted and brought into the call. No video will be transmitted or displayed. Audio will be directed through the PC DVC system.

## Switching between Basic and Enhanced modes

There may exist occasions when an Enhanced mode complex needs to switch to Basic mode operation temporarily. One example is when a user wishes to make a direct point to point multimedia call originated directly from the H.320 DVC. Basic mode operation allows this functionality at the expense of losing multimedia call handling capabilities (i.e. hold/xfer/conf). To switch from Enhanced mode to Basic mode, the station may either select a mm-basic feature button or dial the mm-basic feature access code. Both of these actions are valid only if the Enhanced mode station has no multimedia calls active.

When in Basic mode, the status lamp for the mm-basic button, if present, will be on solid. The mm-basic feature button acts as a toggle. If the status lamp is on, when the button is selected, the lamp will go off and the station will return to Enhanced mode. The mm-enhanced feature access code will set the state of the station back to Enhanced. Switching to Enhanced mode is only valid if the associated H.320 DVC system is idle.

### NOTE:

Toggleing between Basic and Enhanced mode changes the station's administered Multimedia mode. When in Basic mode this field on the station screen will show `basic`. When in Enhanced mode this field on the station screen will show `enhanced`. The current station Multimedia mode will be saved to translation when a **save translation** command is executed.

## Forwarding of voice and multimedia calls

The Enhanced multimedia mode complex voice station may use the existing standard call forwarding mechanisms to activate forwarding for voice calls. If the forwarding destination is on the same switch then this will also forward multimedia calls as multimedia calls to the destination. If the forwarding destination is off switch, multimedia calls will forward off switch as voice only calls. This is appropriate when the user will be at a location that is not able to receive multimedia calls.

To forward multimedia calls off switch as multimedia calls, the user must activate multimedia call forwarding. This may be done with an mm-cfwd button or feature access code. The user may also activate standard voice call forwarding and select the mm-call button prior to entering the forwarding address.

## Coverage

Multimedia calls to an Enhanced mode complex are subject to the same coverage criteria as voice calls and follow the coverage path administered for the voice Station of the Enhanced multimedia mode complex.

If a plain voice station or a Basic mode complex is the covering party, the answering voice station will receive audio only. If all voice stations in the coverage path have the Station screen Early Answer field set to **n** and the originator of the multimedia call was not a local Enhanced mode complex, the answering station will hear hourglass tone.

If an Enhanced mode complex is the covering party, the answering voice station will receive voice and video. If all voice stations in the coverage path have the Station screen Early Answer field set to **n** and the originator of the multimedia call was not a local Enhanced mode complex, the answering station will hear hourglass tone.

**Multimedia calls and off-net call coverage.** If the principal station's coverage path include a remote coverage point, the multimedia call will cover off-switch as voice only. If the call is unanswered off-switch and proceeds to the next coverage point on-switch, the multimedia nature of the call is preserved.

**Multimedia calls and coverage to voice mail.** Voice mail systems such as AUDIX are typically the last point in a coverage path and are usually implemented as a hunt group. In order to guarantee that the originator of an H.320 multimedia call hears the voice mail greeting, the hunt group that defines the list of voice mail ports should have the Early Answer field on the hunt group set to **y**. This field will have no effect on voice calls to the voice mail system.

### **Hunt Groups using Enhanced Mode Complexes**

When creating hunt groups with Enhanced multimedia mode complexes, only the station extension should ever be entered as a hunt group member. Any hunt group or ACD skill can include the voice station of an Enhanced multimedia complex as a member. The data extension of an Enhanced mode complex should never be entered as any hunt group member. A hunt group or skill may have a mix of members that are stand-alone stations and Enhanced mode complex stations. In order to guarantee that all members of the hunt group or skill can receive voice or multimedia calls, all members should have the H.320 field on the station screen set to **y**. Simple voice stations will receive voice only. Enhanced mode stations will receive voice and video.

The MM Early Answer field (on the Hunt Group screen) tells the system to answer an incoming multimedia call and establish audio before it reaches the first member of the hunt group. Thus, when the talk path is established, the caller is able to speak with an agent immediately.

**Other considerations.** CMS measurements may indicate unusually slow ASA, because of the time required for the system to establish early-answer before offering the call to an agent.

**Call association (routing).** Typically incoming voice calls consist of 2 B-channel calls to the same address, to provide greater bandwidth and better video resolution. Avaya MultiVantage attempts to correctly pair up incoming calls and offer them as a unit to a single agent. MMCH uses call association to route both calls to the extension that answered the first call, regardless of how the call was routed internally.

Two 56K/64K data calls with the same calling party number to the same destination number are considered to be associated. The system makes every attempt to route both calls of a 2-channel call to the same answering party. If the first call terminates at a member of a hunt group, the second call does not have to hunt, but goes directly to the same member.

In order for 2B multimedia calls to be correctly given to a single agent, incoming calls to the hunt group must have ANI information. The ANI information may be in the form of ISDN calling party number or “DCS” calling party number. Multimedia calls made on the same switch as the hunt group are easily associated. If multimedia calls into a hunt group have insufficient ANI information (i.e. all calls from switch X to switch Y include the LDN for switch X), then as the volume of calls increases the number of mis-associated calls will increase. If multimedia calls into a hunt group have no ANI information, the switch will never associate pairs of calls and all calls will be treated independently and routed to separate agents. This is not a recommended configuration.

**Multimedia vectors.** Very often, calls are routed to hunt groups or skills via a vector. The existing VDNs and vectors which exist for routing voice calls can be used to route multimedia calls.

In order to use a vector for multimedia calls, you must set the Multimedia field on the Vector screen to **y**. This field has no effect on voice calls routing through the vector. This field will cause multimedia calls routed through the vector to receive early answer treatment prior to processing the vector steps. This provides a talk path to the caller for announcements or immediate conversation with an agent.

**NOTE:**

Vectors which have the Multimedia field set must eventually route to hunt groups, skills or numbers which are voice extensions. A vector with the multimedia field set to y should never be set up to route to a hunt group or number which is a data extension.

## Interactions

Interactions are listed here only if the operation is different from standard.

- Administered Connections

An Enhanced multimedia complex voice station may serve as the origination point or destination of an administered connection. If the Multimedia call feature access code is included in the administration of the administered connection, this will result in a video AC.

An Enhanced multimedia complex H.320 DVC system may not serve as the origination point of an administered connection.

- X-porting

You cannot use X in the port field when administering a data module or the data endpoint in a multimedia complex. However, you can use this to administer the telephone.

- Bridged Appearances

Enhanced multimedia complex voice station users can bridge onto a call if the user has a bridged appearance. If the bridged appearance is for a multimedia call, selecting the bridged appearance will result in a multimedia call.

- Call Detail Recording

Each channel of a 2-channel multimedia call generates a separate CDR record that is tagged as data.

- Call forwarding

Users cannot forward calls from a multimedia complex using multi-number dialing, either by mm-multnmbr button or feature access code.

- Call Park

Any station can park a multimedia call, and unpark the call from another telephone. If a multimedia call is unparked by an Enhanced mode complex station, a multimedia call will result. Users cannot park or unpark calls using multimedia endpoints.

- Call Pickup

Any member of a pickup group can answer a multimedia call after the call has begun alerting at a station call appearance. If the station picking up the call is an Enhanced mode complex station and the call is multimedia, a multimedia call will result. This is true for standard or directed call pickup.

- Consult

After a multimedia call has been answered, consult may be used when transferring or conferencing the call.

- **COR/COS**

The Class of Restriction and Class of Service for a multimedia call originated from an Enhanced multimedia complex are those of the voice station in the complex.

- **Data Call Setup**

An Enhanced mode multimedia H.320 DVC system may not originate calls from the DVC system. All calls, both voice or video are originated from the voice station.

- **Data Hotline**

An Enhanced multimedia complex H.320 DVC endpoint may not be used to originate a call for hotline dialing. In order to setup a video hotline function with an Enhanced mode complex, the hotline number administered for the voice station should include the Multimedia call feature access code.

- **Data Trunk Groups**

Data trunk groups may be used to carry H.320 calls of a fixed (administered) bearer capability.

- **ISDN Trunk Groups**

Avaya highly recommends that you use ISDN trunks for multimedia calls. ISDN PRI trunks allow complete 1-number access for an Enhanced multimedia complex. ANI provided over PRI trunks allows correct routing of multiple bearer channels to the correct destination device. ISDN also provides the bearer capability on a call by call basis that can be used to distinguish voice calls from multimedia calls.

- **Night Service**

Incoming H.320 calls follow established night-service processing for data calls.

- **Remote Access**

The switch does not prevent Enhanced multimedia complexes from attempting to use remote access. However, these endpoints will most likely not be able to dial the necessary codes.

- **Station Hunting**

Multimedia calls to Enhanced mode complex voice stations that have an extension administered in the hunt-to-station field hunt based on established hunting criteria. If the hunt-to-station is also an Enhanced mode complex station, a multimedia call will result when the call is answered.

- Terminating Extension Groups

A multimedia call to a TEG may be answered by any member of the TEG. If the member answering the call is an Enhanced mode complex station, a multimedia call will result.

- Telephone Display

Display information for calls to or from an Enhanced multimedia complex contains the display information associated with the voice station.

## Troubleshooting

If one channel of a 2 B-channel call goes down, your choices are to continue with reduced transmission quality, or to hang up the call and start over. It is not possible to re-establish the second channel while the call is still active.

If you cannot share data with others, it may be that both parties do not have the same endpoint software. This is true for some data collaboration, but most whiteboard and file transfer software implementations are compatible.

## Monitoring MMCH

This section briefly discusses some of the commands you can use to monitor multimedia complexes and conferences. The Maintenance manual for your system discusses these commands and their output in detail.

| Action  | Objects                                                                                           | Qualifier                                                                                                                                                                                   |
|---------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| display | station<br>data module                                                                            | xxxxx (extension)<br>xxxxx (extension)                                                                                                                                                      |
| list    | mmi<br>measurements<br><br>multimedia                                                             | multimedia-interface<br>voice-conditioner<br>esm<br><br>endpoints ['print' or 'schedule']<br>h.320-stations ['print' or 'schedule']                                                         |
| status  | attendant<br>conference<br>conference<br>conference<br>data module<br>station<br>trunk<br><br>esm | xxxx (console number)<br>all<br>xxx (conference ID)<br>xxx (conference ID) endpoint (endpoint ID)<br>xxxxx (extension)<br>xxxxx (extension)<br>(group number or group number/member number) |

## Status commands

The **status** commands for data module, station, trunk, and attendant provide the conference ID and endpoint ID for any of these involved in an active multimedia conference.

```

status station 1002

 GENERAL STATUS

 Type: 7405D Service State: in-service/on-hook
 Extension: 1002 Maintenance Busy? no
 Port: 01C0702 SAC Activated? no
 Call Parked? no User Cntrl Restr: none
 Ring Cut Off Act? no Group Cntrl Restr: none
 Active Coverage Option: 1 CF Destination Ext:

```

### Screen 23. Status Station 1002 — General Status screen

The following fields specific to multimedia appear on the status station, attendant, data module and trunk screens.

- **MM Conference ID** — This field appears only if the station is active on a multimedia conference. It displays the ID for the conference. Enter this number with the status conference command to get more information about this conference.
- **MM Endpoint ID** — This field appears only if the station is active on a multimedia conference. It displays the endpoint ID for the station. Enter this number with the status conference endpoint command to learn more about this endpoint's involvement in the conference.

### List commands

The **list multimedia endpoints** command shows you all the multimedia data modules that exist in your system, and their associated telephones, if any. The **list multimedia H.320-stations** command shows you all the stations that are administered for H.320 conversion.

| MULTIMEDIA ENDPOINTS |            |           |                   |
|----------------------|------------|-----------|-------------------|
| Data Ext             | MM Complex | Voice Ext | H.320 Conversion? |
| 100                  |            | 87654     | y                 |
| 1321                 |            |           |                   |
| 15683                |            | 738       | n                 |

**Screen 24. List Multimedia Endpoints screen**

| MULTIMEDIA H.320-STATIONS |             |
|---------------------------|-------------|

| 100                       | 87654       |
| 1321                      |             |
| 15683                     | 738         |

**Screen 25. List Multimedia H.320-Stations screen**

### Considerations

---

Each channel of a 2-channel BRI call takes one port on an MMI circuit pack. This alone limits the number of multimedia calls your system can handle. In addition, each conference takes one port on a voice-conditioner circuit pack.

Also, there is a limit to the number of conversion calls that the system can handle simultaneously. If you experience traffic problems after installing multimedia, you may want to lower the number of stations that use H.320 conversion.

### Configuring Avaya MultiVantage for telecommuting

Telecommuting emphasizes the ability to perform telephony activities while remote from the Avaya MultiVantage solution. It is a combination of four features which permit you to remotely perform changes to your station's Coverage and Call Forwarding.

**⇒ NOTE:**

If you are operating in a Distributed Communications System (“DCS”) environment, you need to assign a different telecommuting-access extension to each switch and tell your users which extension they should use. A user can set up call coverage from any of the DCS nodes, but needs to dial the telecommuting-access extension of the node on which their station is defined before using the feature access code.

You can also set up telecommuting with an IP (internet protocol) phone. See “[Adding an IP Softphone](#)” for more information.

- Coverage of Calls Redirected Off Net (“CCRON”) allows you to redirect calls off-net onto the public network and bring back unanswered calls for further coverage.

**⇒ NOTE:**

If a call covers or forwards off net and an answering machine answers the call or it is directed to a cellular phone and a cellular announcement is heard, the switch views this call as an answered call. The switch does not bring the call back to the switch for further routing.

- The Extended User Administration of Redirected Calls feature allows you to change the direction of calls to your station. This activates the capability to have 2 coverage path options. These 2 path options can be specified on the station screen; however, unless the Can Change Coverage field is set to **y** on the Class of Restriction screen the second path option cannot be populated.
- The Personal Station Access feature gives you an extension number, a Merge feature access code, and a personalized security code and tells you which office phone you can use. This allows you to take your phone, as long as the phones are the same type, anywhere on the same switch.
- The Answer Supervision feature provides supervision of a call directed out of the switch either by coverage or forwarding and determines whether the switch should bring the call control back.

### **Before you start**

---

Ensure you have the following equipment:

- Call Classifier — Detector
- 1264-TMx software
- MultiVantage extender — switch module or standalone rack mount (Digital Communications Protocol (“DCP”) or Integrated Services Digital Network (“ISDN”))

For more information about this equipment, see the *Avaya MultiVantage™ Solutions Hardware Guide*.

Verify the following fields on the [System-Parameters Customer-Options](#) screen are set to **y**.

- Cvg Of Calls Redirected Off-Net
- Extended Cvg/Fwd Admin
- Personal Station Access
- Terminal Translation Initialization (“TTI”)

If neither MultiVantage extender nor the System Parameters Customer Options fields are configured, contact your Avaya representative.

Verify the telecommuting access extension is a direct inward dialing (“DID”) or a central office (“CO”) trunk destination for off-premises features to work.

Configure TTI for personal station access (PSA). For information about configuring TTI, see [“Setting up Personal Station Access”](#) on page 360.

Configure Security Violation Notification for Station Security Codes. For information about Security Violation Notification, see [“Setting up security violations notification”](#) on page 401.

### Instructions

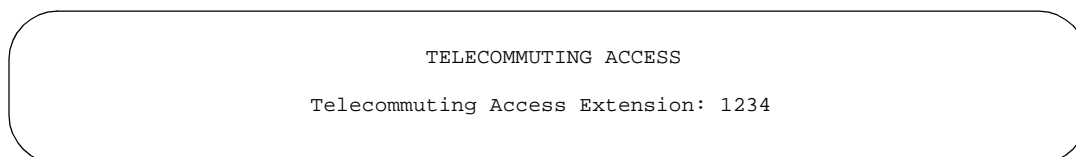

---

In our example, we set up the telecommuting extension and enable coverage of calls redirected off-net.

To configure Avaya MultiVantage for telecommuting:

1. Type **change telecommuting-access** and press RETURN.

The [Telecommuting Access](#) screen appears.

```
TELECOMMUTING ACCESS
Telecommuting Access Extension: 1234
```

2. In the Telecommuting Access Extension field, type **1234** and press ENTER.  
This is the extension you are configuring for telecommuting.
3. Type **change system-parameters coverage** and press RETURN.  
The [System Parameters Call Coverage / Call Forwarding](#) screen appears.
4. In the Coverage Of Calls Redirected Off-Net Enabled field, type **y** and press ENTER.

### Related topics

---

See [“Telecommuting Access”](#) on page 1213 for information about and field descriptions on the Telecommuting Access screen.

## Setting up Personal Station Access

---

Personal Station Access (“PSA”) allows you to associate the preferences and permissions assigned to your own extension with any other compatible phone. When you request a PSA associate, the system automatically dissociates another extension from the phone.

Preferences and permissions include the definition of terminal buttons, abbreviated dial lists, and class of service “COS” and class of restriction (“COR”) permissions assigned to your station. Extensions without a COS, such as Expert Agent Selection (“EAS”) agents or hunt groups, cannot use PSA.

PSA requires you to enter a security code and can be used on-site or off-site. Invalid attempts to associate a phone generate referral calls and are recorded by Security Violation Notification, if that feature is enabled. If you interrupt the PSA dialing sequence by pressing the release button or by hanging up, the system does not log the action as an invalid attempt.

The disassociate function within PSA allows you to restrict the features available to a phone. When a phone has been dissociated using PSA, it can be used only to call an attendant, or to accept a TTI or PSA request. You can enable a dissociated set to make other calls by assigning a special class of restriction.

When a call that goes to coverage from a PSA-disassociated extension, the switch sends a message to the coverage point indicating that the call was not answered. If the coverage point is a display phone, the display shows “da” for “don't answer.” If the coverage point is a voice messaging system, the VM system receives an indication from the switch that this call was not answered, and treats the call accordingly.

### NOTE:

Once a phone has been associated with an extension, anyone using the terminal has the capabilities of the associated station. Be sure to execute a dissociate request if the terminal can be accessed by unauthorized users. This is particularly important if you use PSA and DCP extenders to permit remote DCP access.

### Before you start

---

Verify that the Personal Station Access field is set to **y** on the Class of Service screen.

Verify that the extension has a COS that allows PSA.

## Instructions

---

In our example, we specify the TTI State, the Record PSA/TTI Transactions, the class of service, and the feature access codes set up PSA.

To set up Personal Station Access:

1. Type **change system-parameters features** and press RETURN.  
The [Feature-Related System Parameters](#) screen appears.
2. Complete the following fields and press ENTER.
  - a. Type **voice** in the TTI State field.
  - b. (Optional) Type **y** on the Record PSA/TTI Transactions in History Log field.  
  
These fields display only when the Terminal Translation Initialization (TTI) Enabled field on this screen is set to **y**.
3. Type **change cos** and press RETURN.  
The [Class of Service](#) screen appears.
4. Type **y** in the Personal Station Access (PSA) 1 field and press ENTER.
5. Type **change feature-access-codes** and press RETURN.  
The Feature Access Code (FAC) screen appears.
6. Complete the following fields and press ENTER.
  - a. Type **#4** in the Personal Station Access (PSA) Associate Code field.  
This is the feature access code you will use to activate Personal Station Access at a phone.
  - b. Type **#3** in the Dissociate Code field.  
This is the feature access code you will use to deactivate Personal Station Access at a phone.

## More information

---

You can allow users to place emergency and other calls from phones that have been dissociated. To enable this, you must first assign a class of restriction (COR) for PSA-dissociated phones. You do this on the [“Feature-Related System Parameters”](#) screen. In addition, you must set the restrictions for this COR on the [“Class of Restriction”](#) screen.

If you want users to be able to place emergency calls from dissociated phones, it is also a good idea to have the system send calling party number (CPN) or automatic number identification ([“ANI”](#)) information for these calls. To do this, you must set the CPN, ANI for PSA Dissociated Sets field to **y** on the [“Feature-Related System Parameters”](#) screen.

## Related topics

---

See [“Training users” on page 373](#) for information on how to associate or disassociate PSA.

## Creating a station security code

---

Station Security Codes (“[SREPN](#)”) provide security to station users by preventing other users from accessing functions associated with the user’s station. Each station user can change their own SSC if they know the station’s current settings.

You must create a system-wide SSC change feature access code (“[FAC](#)”) before users can change their SSC. You must also provide users with their individual SSC. A user cannot change a blank SSC.

## Instructions

---

In our example, we set the station security code for a user.

To create a station security code:

1. Type **change feature-access-codes** and press RETURN.  
The [Feature Access Code](#) screen appears.
2. Type **#5** in the Station Security Code Change Access Code field and press ENTER.  
This sets the access codes for this features. The Command prompt appears.
3. Type **change system-parameters security** and press RETURN.  
The [Security-Related System Parameters](#) screen appears.
4. Type **4** in the Minimum Station Security Code Length field and press ENTER.

This determines the minimum required length of the Station Security Codes you enter on the Station screen. Longer codes are more secure. If station security codes are used for external access to telecommuting features, the minimum length should be 7 or 8.

5. Type change station **1234** and press RETURN.

This is the station extension you configured for telecommuting. The [Station](#) screen appears.

Page 1 of X

STATION

|                 |                  |        |                        |        |
|-----------------|------------------|--------|------------------------|--------|
| Extension: 1234 | Lock Messages? n | BCC: 0 | Security Code: 4321__  | TN: 1  |
| Type: 406D      |                  |        | Coverage Path 1: ___   | COR: 1 |
| Port: _____     |                  |        | Coverage Path 2: ___   | COS: 1 |
| Name: _____     |                  |        | Hunt-to-Station: _____ |        |

STATION OPTIONS

6. Type **4321** in the Security Code field and press ENTER.

## Related topics

---

See [“Station” on page 1127](#) for information about and field descriptions on the Station screen.

See [“Station security codes” on page 1832](#) for a description of the Station Security Codes feature.

## Assigning coverage options

---

Avaya MultiVantage allows you to assign two previously administered coverage paths and/or time of day coverage tables on the Station screen. This allow telecommuters to alternate between the two coverage paths and/or time of day coverage tables administered to better control how their telephone calls are handled.

For information about creating a coverage path, see [“Creating coverage paths” on page 190](#). For information about creating a time of day coverage table, see [“Assigning a coverage path to users” on page 192](#).

## Instructions

---

In our example, we assign two coverage options so a user can choose from either option to control how their calls are handled.

To assign 2 coverage options:

1. Type **change feature-access-codes** and press RETURN.  
The [Feature Access Code](#) screen appears.
2. Type **#9** in the Change Coverage Access Code field and press ENTER.
3. Type **change cor 1** and press RETURN.  
The [Class of Restriction](#) screen appears.
4. In the Can Change Coverage field, type **y** and press ENTER to save your work.  
The Command prompt appears.
5. Type change station **1234** and press RETURN.  
This is the station extension you configured for telecommuting. The [Station](#) screen appears.
6. Complete the following fields:
  - a. Type **2** in the Coverage Path 1 field.
  - b. Type **t8** in the Coverage Path 2 field.

## Related topics

---

See [“Coverage Path” on page 696](#) for information about and field descriptions on the Coverage Path screen.

See [“Call coverage” on page 1532](#) for a description of the Call Coverage feature.

See [“Training users” on page 373](#) for information on how to alternate your coverage path option.

See [“Extended user administration of redirected calls” on page 1673](#) for information about the Extended User Administration of Redirected Calls feature.

## Setting up call forwarding

---

Avaya MultiVantage allows you to change your call forwarding from any on-site or off-site location.

## Instructions

---

In our example, we assign the feature access codes and class of service to set up call forwarding. This allows your users to forward their calls to another extension.

To set up call forwarding:

1. Type **change feature-access-codes** and press RETURN.  
The [Feature Access Code](#) screen appears.
2. Set a 2-digit access code for the following fields and press ENTER.
  - a. Type **\*8** in the Extended Call Fwd Activate Busy D/A field.
  - b. Type **\*7** in the Extended Call Fwd Activate All field.
  - c. Type **\*6** in the Extended Call Fwd Activate Deactivation field.  
This sets the access codes for these features. The Command prompt appears.
3. Type **change cos** and press RETURN.  
The [Class of Service](#) screen appears.
4. Set the following fields to **y**.
  - Extended Forwarding All
  - Extended Forwarding B/DAThis allows you to change the forwarding of all your calls from an off-site location.
5. Set the Restrict Call Fwd-Off Net field to **n** and press ENTER.  
This allows your users to forward calls off-site.

## Interactions

---

- Bridged Appearance

When the pound key (#) is pressed from a bridged appearance immediately following any of this feature's four FACs, the system assumes that the currently active bridged extension will be administered. The station security code of the currently active bridged extension must be entered after the initial # to successfully complete the command sequence.

If the station has only bridged appearances, the station's extension must be dialed after the FAC to successfully complete the command sequence, since the station's extension is not associated with any appearances.

- **Distributed Communications System**

Assign a different telecommuting access extension for each switch. You can use Extended User Administration of Redirected Calls from any of the DCS nodes, but you must dial the extension of the node on which your station is defined before dialing the FAC.

- **Tenant Partitioning**

The telecommuting access extension is always automatically assigned to Tenant Partition 1, so it can be accessed by all tenants.

The tenant number of the extension being administered must be accessible by the tenant number from which the Extended User Administration of Redirected Calls FAC is dialed or the request is denied. If the FAC is dialed on site, the tenant number of the station or attendant must have access to the tenant number of the extension administered. If the FAC is dialed off site, the tenant number of the incoming trunk must have access to the tenant number of the extension administered.

## **Related topics**

---

See [“Training users” on page 373](#) for information on how to change call forwarding.

See [“Call forwarding” on page 1612](#) for a description of the Call Forwarding feature.

## **Assigning an extender password**

---

Avaya MultiVantage allows you assign an extender password to a user. You can assign one password for each port on your MultiVantage solution.

## **Before you start**

---

Use the Remote Extender PC in the switch room to perform this procedure.

## **Instructions**

---

In our example, we set a system generated random password for John Doe.

To assign an extender password:

1. Double-click the Security icon.  
The Password Manager screen appears.
2. Double-click User Password for User 01.

3. Select **Enable Password** to enable the password.
4. Click **random**.

This means that the password is a system generated random number. The system displays a 10-digit number in the Password field. Take note of this number, your user will need it to access the switch from home.
5. Type **Doe, John** and click **OK**.

This is the last name and first name of the user. The system returns you to the Password Manager screen.
6. Select **CommLink:Select Cards**.

A screen containing a list of cards (for example, Card A, Card B, and so on) appears. Each card corresponds to a port on your switch.
7. Select **Card A** and click **OK**.

The system returns you to the Password Manager screen.
8. Select **CommLink:Upload Password**.

The error message screen appears with the message “Administrator password not loaded”.
9. Click **OK**.

The Administrator screen appears.
10. Type **123456** and click **OK**.

This is the administrator’s password.
11. Select **CommLink:Upload Password**.

The password is uploaded.
12. When upload is complete, click **OK**.

The system returns you to the Password Manager screen.
13. Select **File:Save As**.

The Save As screen appears.
14. Type **doe.fil** in the File field and click **OK**.

The system saves the User01 information.

## Installing home equipment

---

Avaya MultiVantage allows you to install equipment in your home so that you can utilize system facilities from off-site.

### Before you start

---

You need the following equipment:

- MultiVantage extender remote module
- DCP sets (office and home must match)

Configure a feature access code for associating your home number to your office number. For information about configuring an associate feature access code, see [“Setting up Personal Station Access”](#) on page 360.

### Instructions

---

#### Installing home equipment

To install your home equipment:

1. Plug the phone cord into the slot labeled line on the back of the module and into the wall jack.
2. Plug the phone cord into the slot labeled port on the back of the module and into the slot labeled line on the phone.
3. Plug the power cord into slot labeled power on the back of the module and the wall socket.

The phone display Go Online appears.

4. Press 3 (Nxt).

The phone display Set Phone Number appears.

5. Press 2 (OK) to set the phone number.
6. Type **5551234** and press DROP.

This is the assigned analog phone number. In some areas, you may need to include your area code (for example, 3035551234). The phone display Set Phone Number appears.

7. Press 1(Prv).

This returns you to the Go Online phone display.

8. Press 2 (OK).

The module dials the number. When the modules connect, the phone display Enter Password appears.

9. Type **0123456789** and press DROP.

### **Associating your office phone number to the home station**

To associate your phone number:

1. On your home station, type **#4**.  
This is the associate feature access code.
2. Type **4321** and press **#**.  
This is your extension number.
3. Type **1996** and press **#**.  
This is your password.

### **Disassociating your home station**

To disassociate your home station:

1. Press HOLD four times.

### **Related topics**

---

See [“Configuring Avaya MultiVantage for telecommuting” on page 357](#) for step-by-step instructions on how to configure your office equipment.

See [“Training users” on page 373](#) for step-by-step instructions on how to use your home station.

## Setting up remote access

---

Remote Access permits a caller located outside the system to access the switch through the public or private network and then use the features and services of the system.

Remote Access users can dial into the system using central office (CO), Foreign Exchange (“FX”), Wide Area Telecommunications trunks (“WATS”), and Integrated Services Digital Network Primary Rate Interface (ISDN-PRI) trunks. In addition, a dedicated Remote Access Direct Inward Dialing number can be provided.

### **SECURITY ALERT:**

*Avaya has designed the Remote Access feature incorporated in this product that, when properly administered by the customer, will enable the customer to minimize the ability of unauthorized persons to gain access to the network. It is the customer’s responsibility to take the appropriate steps to properly implement the features, evaluate and administer the various restriction levels, protect access codes and distribute them only to individuals who have been advised of the sensitive nature of the access information. Each authorized user should be instructed concerning the proper use and handling of access codes.*

*In rare instances, unauthorized individuals make connections to the telecommunications network through use of remote access features. In such an event, applicable tariffs require that the customer pay all network charges for traffic. Avaya cannot be responsible for such charges, and will not make any allowance or give any credit for charges that result from unauthorized access.*

If you do not intend to use Remote Access now or in the future, you can permanently disable the feature. If you do decide to permanently disable the feature, it will require Avaya Services intervention to activate the feature again.

### **Before you start**

---

Configure the Incoming Destination and Night Service fields on the CO trunk screen. For information about configuring a CO trunk, see [“Adding a CO, FX, or WATS trunk group” on page 414](#).

Verify that the Authorization Codes field on the System Parameters Customer Options screen is set to **y**.

Verify that the SVN Authorization Code Violation Notification Enabled field on the Security-Related System Parameters screen is set to **y**.

## Instructions

### Setting up remote access

In our example, we set up a remote access extension with maximum security. This assists you in blocking unauthorized people from gaining access to your network.

To set up remote access:

1. Type **change remote-access** and press RETURN.

The [QSIG to DCS TSC Gateway screen](#) screen appears.

| REMOTE ACCESS                                                          |     |    |     |                            |              |            |
|------------------------------------------------------------------------|-----|----|-----|----------------------------|--------------|------------|
| Remote Access Extension 1234                                           |     |    |     | Barrier Code Length 7      |              |            |
| Authorization Code Required? y                                         |     |    |     | Remote Access Dial Tone: y |              |            |
| Barrier Code                                                           | COR | TN | COS | Expiration Date            | No. of Calls | Calls Used |
| 1:1234567                                                              | 1   | 1  | 1   | 01/01/99                   | _____        | _____      |
| 2:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 3:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 4:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 5:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 6:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 7:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 8:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 9:_____                                                                | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| 10:_____                                                               | 1   | 1  | 1   | ___/___/___                | _____        | _____      |
| Permanently Disable? ___ Disable Following A Security Violation? y     |     |    |     |                            |              |            |
| (NOTE: You must logoff to effect permanent disabling of Remote Access) |     |    |     |                            |              |            |

2. Type **1234** in the Remote Access Extension field.

This is the extension specified in the Incoming Destination field on the CO trunk screen.

3. Type **7** in the Barrier Code Length field.

This is the number of digits your barrier code must be when entered.

4. Type **y** in the Authorization Code Required field.

This means you must also enter an authorization code when you access the system's Remote Access facilities. For information about setting up access codes, see [“Setting up authorization codes”](#) on page 404.

5. Type **y** in the Remote Access Dial Tone field.

This means you hear dial tone as a prompt to enter your authorization code.

6. Type **1234567** in the Barrier Code field.  
This is the 7-digit barrier code you must enter to access the system's Remote Access facilities.
7. Type **1** in the COR field.  
This is the class of restriction (COR) number associated with the barrier code that defines the call restriction features.
8. Type **1** in the TN field.  
This is the Tenant Partition (TN) number.
9. Type **1** in the COS field.  
This is the class of service (COS) number associated with the barrier code that defines access permissions for Call Processing features.
10. Type **01/01/99** in the Expiration Date field.  
This is the date the barrier code expires. A warning message is displayed on the system copyright screen seven days before the expiration date. The system administrator can modify the expiration date to extend the time interval, if necessary.
11. Type **y** in the Disable Following A Security Violation field.  
This disables the remote access feature following detection of a remote access security violation.
12. Press ENTER to save your work.

### Disabling remote access permanently

To disable remote access permanently:

1. Type **change remote-access** and press RETURN.  
The [QSIG to DCS TSC Gateway screen](#) screen appears.
2. Type **y** in the Permanently Disable field.  
If you permanently disable this feature, it requires Avaya Services intervention to reactivate the feature. There is a charge for reactivation of this feature.
3. Press ENTER to save your work.

#### CAUTION:

*Your attempt to disable the Remote Access feature will be lost if the switch is rebooted without saving translations. Therefore, execute a **save translation** command after permanently disabling the Remote Access feature.*

## More information

---

Remote Access provides you with access to the system and its features from the public network. This allows you to make business calls from home or use Recorded Telephone Dictation Access to dictate a letter. If authorized, you can also access system features from any on-site extension.

With Remote Access you can dial into the system using Direct Inward Dialing (DID), Central Office (CO), Foreign Exchange (FX), or 800 Service trunks. When a call comes in on a trunk group dedicated to Remote Access, the system routes the call to the Remote Access extension you have assigned. If DID is provided and the Remote Access extension is within the range of numbers that can be accessed by DID, Remote Access is accessed through DID.

Barrier codes provide your system security and define calling privileges through the administered COR. You can administer up to 10 barrier codes, each with a different COR and COS. Barrier codes can be from 4 to 7 digits, *but all codes must be the same length*. You can also require that users enter an authorization code to use this feature. Both barrier codes and authorization codes are described under [“Setting up authorization codes”](#) on page 404.

## Related topics

---

See [“QSIG to DCS TSC Gateway screen”](#) on page 1085 for information about and field descriptions on the Remote Access screen.

See [“Remote Access”](#) on page 1800 for a description of the Remote Access feature.

## Training users

---

DEFINITIY ECS allows you to associate and disassociate PSA, change the coverage path for your station, change the extension to which you forward your calls, and change your personal station's security code.

## Before you start

---

Configure PSA. For information about configuring PSA, see [“Setting up Personal Station Access”](#) on page 360

Assign two coverage options for your system. For information on how to assign coverage options, see [“Assigning coverage options”](#) on page 363.

Configure call forwarding for your system. For information about configuring call forwarding, see [“Setting up call forwarding”](#) on page 364.

Configure security codes for a station. For information about configuring personal station security codes, see [“Assigning an extender password”](#) on page 366.

## Instructions

---

### Associating PSA

In this example, we associate PSA (preferences and permissions) assigned to your station with another compatible terminal.

To associate PSA:

1. Dial **#4**.  
This is the associate PSA feature access code. You hear dial tone.
2. Type **1234** and press #.  
This is your extension.
3. Type **4321** and press #.  
This is your Station Security Code. You hear a confirmation tone.

### Disassociating PSA

In our example, we disassociate PSA from the station you are using.

To disassociate PSA:

1. Dial **#3**.  
This is the disassociate PSA feature access code. You are no longer PSA associated to this station.

### Changing a coverage option

In this example, we change the coverage option from path 1 to path 2 from a remote location.

To change a coverage option:

1. Dial **1234**.  
This is the extension you configured for telecommuting. You hear dial tone.
2. Dial **#9** and press #.  
This is the feature access code you set for changing a coverage path. You hear dial tone.
3. Dial **4321** and press #.  
This is the extension for which you want to change the coverage path.
4. Dial **87654321** and press #.  
This is the extension security code.
5. Dial **2**.  
This is the new coverage path. You hear confirmation tone.

## Changing call forwarding

In this example, we change call forwarding to extension 1235.

To change call forwarding:

1. Dial **1234**.

This is the extension you configured for telecommuting.

2. Dial **#8** and press #.

This is the feature access code you set for activating extended call forward. You hear dial tone.

3. Dial **4321** and press #.

This is the extension from which you want to forward calls.

4. Dial **87654321** and press #.

This is the extension security code. You hear dial tone.

5. Dial **1235**.

This is the extension to which you want to forward calls. You hear the confirmation tone.

## Changing your personal station security codes

In this example, we change the security code for extension 1235 from 98765432 to 12345678.

To change your security code:

1. Dial **#5**.

This is the feature access code you set for changing your security code. You hear dial tone.

2. Dial **1235** and press #.

This is the extension for which you want to change the security code.

3. Dial **98765432** and press #.

This is the current security code for the extension. You hear dial tone.

4. Dial **12345678** and press #.

This is the new security code. Security codes can be 4- to 8-digits long.

5. Dial **12345678** and press #.

This is to confirm your new security code. You hear the confirmation tone.

### NOTE:

If you cannot change your security code, Manager 1 can clear the problem using the Clear Audit Summary command.

## Interrupting the command sequence for personal station security codes

To interrupt the command sequence for personal station security codes:

1. To interrupt the command sequence before step 3, choose one of these options:
  - Hang up or press the disconnect or recall button before hearing intercept tone in step 3.  
The system does not log an invalid attempt. You must restart the process at step 1.
  - Type \* before the second # in step 3.  
You must begin the change sequence at the point of entering your extension in step 2. (You should not enter the FAC again.)
  - Type \* after the FAC has been entered and before the final #.  
You must restart the process at step 1.
2. To interrupt the command sequence after step 3, type \* in steps 4 or 5, you must begin the change sequence at the point of entering the new station security code (SSC) in step 4.

If you hear intercept tone in any step, the command sequence has been invalidated for some reason and you must restart the process at step 1.

If you hear intercept tone after step 3, the system logs an invalid attempt via the Security Violation Notification (SVN) feature. This is true even if you attempt to interrupt the change sequence with an asterisk.

Toll fraud is the theft of long distance service and can come from both internal and external sources. When toll fraud occurs, your company is responsible for usage charges. In addition, unauthorized use may tie up your system, preventing your customers from reaching you and your employees from doing business.

Avaya designed Avaya MultiVantage to help you to limit toll fraud. However, there are steps that you, as the administrator, must also take to keep your system secure from unauthorized use.

### **Need help quickly?**

---

- For assistance with toll fraud prevention (including systems and products), call the Avaya Toll Fraud Intervention Hotline at 800-643-2353 or contact your Avaya representative.
- If you have identified fraudulent calling in progress, and require assistance in stopping the fraud, call the Avaya Technical Service Center at 800-242-2121 and select the toll fraud help option or contact your Avaya representative.

## Basic security

---

### Keeping your system secure

---

The following is a partial list you can use to help secure your system. It is not intended as a comprehensive security checklist. See the *BCS Products Security Handbook* for more information about these and other security-related features.

- Secure the system administration and maintenance ports and/or logins on Avaya MultiVantage using the Access Security Gateway. This optional password authentication interface program is provided to customers with maintenance contracts.
- Activate Security Violation Notification to report unsuccessful attempts to access the system. Security Violation Notification lets you automatically disable a valid login ID following a security violation involving that login ID and disable remote access following a security violation involving a barrier code or authorization code.
- Use the **list history** command to determine if unauthorized changes have been made to the system. To assist in identifying unauthorized use of the system, the History report lists each time a user logs on or off the system. See the *Reports for Avaya MultiVantage™ Software* for more information about this report.
- Secure trunks using Automatic Route Selection (ARS), class of restriction (COR), Facility Restriction Levels (FRLs) and Alternate Facility Restriction Levels (AFRLs), Authorization Codes, Automatic Circuit Assurance (ACA), and Forced Entry of Account Codes (see [“Call detail recording”](#) on page 1553 for more information).
- Activate Enhanced Call Transfer for your voice messaging system, if available. This limits transfers to valid extensions, but you also need to restrict transfers to extensions that may offer dial tone to the caller, such as screen extensions.

## **Preventing toll fraud**

---

### **Top 15 tips to help prevent toll fraud**

---

1. Protect system administration access

Make sure secure passwords exist for all logins that allow System Administration or Maintenance access to the system. Change the passwords frequently.

Set logoff notification and forced password aging when administering logins. You must assign passwords for these logins at setup time.

Establish well-controlled procedures for resetting passwords.

2. Prevent voice mail system transfer to dial tone

Activate “secure transfer” features in voice mail systems.

Place appropriate restrictions on voice mail access/egress ports.

Limit the number of invalid attempts to access a voice mail to five or less.

3. Deny unauthorized users direct inward system access (screen)

If you are not using the Remote Access features, deactivate or disable them.

If you are using Remote Access, require the use of barrier codes and/or authorization codes set for maximum length. Change the codes frequently.

It is your responsibility to keep your own records regarding who is allowed to use which authorization code.

4. Place protection on systems that prompt callers to input digits

Prevent callers from dialing unintended digit combinations at prompts.

Restrict auto attendants and call vectors from allowing access to dial tone.

5. Use system software to intelligently control call routing

Create Automatic Route Selection or World Class Routing patterns to control how each call is to be handled.

Use “Time of Day” routing capabilities to limit facilities available on nights and weekends.

Deny all end-points the ability to directly access outgoing trunks.

6. Block access to international calling capability

When international access is required, establish permission groups.

Limit access to only the specific destinations required for business.

7. Protect access to information stored as voice
  - Password restrict access to voice mail mailboxes.
  - Use non-trivial passwords and change passwords regularly.
8. Provide physical security for telecommunications assets
  - Restrict unauthorized access to equipment rooms and wire connection closets.
  - Protect system documentation and reports data from being compromised.
9. Monitor traffic and system activity for abnormal patterns
  - Activate features that “turn off” access in response to unauthorized access attempts.
  - Use Traffic and Call Detail reports to monitor call activity levels.
10. Educate system users to recognize toll fraud activity and react appropriately
  - From safely using calling cards to securing voice mailbox password, train your users on how to protect themselves from inadvertent compromises to the system’s security.
11. Monitor access to the dial-up maintenance port. Change the access password regularly and issue it only to authorized personnel. Consider activating Access Security Gateway.
12. Create a switch system management policy concerning employee turnover and include these actions:
  - a. Delete any unused voice mailboxes in the voice mail system.
  - b. Immediately delete any voice mailboxes belonging to a terminated employee.
  - c. Immediately remove the authorization code if a terminated employee had screen calling privileges and a personal authorization code.
  - d. Immediately change barrier codes and/or authorization codes shared by a terminated employee. Notify the remaining users of the change.
  - e. Remove a terminated employee’s login ID if they had access to the system administration interface. Change any associated passwords immediately.
13. Back up system files regularly to ensure a timely recovery. Schedule regular, off-site backups.

14. Callers misrepresenting themselves as the “phone company,” “AT&T,” “RBOCS,” or even known employees within your company may claim to be testing the lines and ask to be transferred to “900,” “90,” or ask the attendant to do “start 9 release.” This transfer reaches an outside operator, allowing the unauthorized caller to place a long distance or international call. Instruct your users to never transfer these calls. Do not assume that if “trunk to trunk transfer” is blocked this cannot happen.
15. Hackers run random generator PC programs to detect dial tone. Then they revisit those lines to break barrier codes and/or authorization codes to make fraudulent calls or resell their services. They do this using your telephone lines to incur the cost of the call. Frequently these call/sell operations are conducted at public payphones located in subways, shopping malls, or airport locations. See [“QSIG to DCS TSC Gateway screen” on page 1085](#) to prevent this happening to your company.

## **Physical security**

---

Physical security is your responsibility. Implement the following safeguards as an added layer of security:

1. Unplug and secure attendant console handsets when the attendant position is not in use.
2. Lock wiring closets and switch rooms.
3. Keep a log book register of technicians and visitors.
4. Shred all switch information or directories you discard.
5. Always demand verification of a technician or visitor by asking for a valid I.D. badge.
6. Keep any reports that may reveal trunk access codes, screen barrier codes, authorization codes, or password information secure.
7. Keep the attendant console and supporting documentation in an office that is secured with a changeable combination lock. Provide the combination only to those individuals who need to enter the office.
8. Keep any documentation pertaining to switch operation secure.
9. Label all backup tapes or flash cards with correct dates to avoid using an outdated one when restoring data. Be sure that all backup media have the correct generic software load.

## System security checklist

---

Here's some of the steps required for indemnification. Use these to analyze your system security.

1. Remove all default factory logins of **cust**, **rcust**, **browse**, **nms**, and **bcms** and assign unique logins with 7-character alphanumeric passwords and a 90-day password aging. Use the **list logins** command to find out what logins are there.
2. If you do not use Remote Access, be sure to disable it permanently.

**Tip:**

You can use the **display remote-access** command to check the status of your remote access.

To disable Remote Access, on the Remote Access screen, in the Permanently Disable field, type **y**. See [“QSIG to DCS TSC Gateway screen” on page 1085](#) for more information on remote access.

**NOTE:**

Avaya recommends that you permanently disable Remote Access using the **change remote-access** command. If you do permanently disable Remote Access, the code is removed from the software. Avaya charges a fee to restore the Remote Access feature.

3. If you use Remote Access, but only for internal calls, change announcements or remote service observing.
  - a. Use a 7-digit barrier code.
  - b. Assign a unique COR to the 7-digit barrier code.

The unique COR must be administered where the FRL is **0**, the Calling Party Restriction field is **outward**, the Calling Permissions field is **n** on all unique Trunk Group COR.
  - c. Assign Security Violation Notification Remote to **10** attempts in **2** minutes.
  - d. Set the aging cycle to **90** days with **100** call limit per barrier code.

See [“QSIG to DCS TSC Gateway screen” on page 1085](#) for more information.

4. If you use Remote Access to process calls off-net or in any way access the public network:
  - a. Use a 7-digit barrier code.
  - b. Assign a unique COR to the barrier code.
  - c. Restrict the COR assigned to each barrier code by FRL level to only the required calling areas to conduct business.
  - d. Set the aging cycle to **90** days with **100** call limit per barrier code.
  - e. Suppress dial tone where applicable.
  - f. Administer Authorization Codes.
  - g. Use a minimum of 11 digits (combination of barrier codes and authorization codes).
  - h. Assign Security Violation Notification Remote to 10 attempts in 2 minutes.
5. If you use vectors:
  - a. Assign all Vector Directory Numbers (“**VDN**”) a unique COR. See *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers* for more information.

**NOTE:**

The “**COR**” associated with the VDN dictates the calling privileges of the VDN/vector. High susceptibility to toll fraud exists on vectors that have “collect digits” steps. When a vector collects digits, it processes those digits back to the switch and if the COR of the VDN allows it to complete the call off-net, it will do so. For example, the announcement “If you know your party’s 4-digit extension number, enter it now” results in 4 digits being collected in step 6. If you input “90##” or “900#”, the 4 digits are analyzed and if “9” points towards “**ARS**” and “0” or “00” is assigned in the ARS Analysis Tables and the VDN COR allows it, the call routes out of the switch to an outside local exchange or long distance operator. The operator then connects the call to the requested number.

- b. If vectors associated with the VDN do not require routing the call off-net or via “**AAR**”, assign a unique COR where the “**FRL**” is **0**, the Calling Party Restriction field is **outward**, the Calling Permissions field is **n** on all unique Trunk Group COR.

- c. If the vector has a “route-to” step that routes the call to a remote switch via AAR, assign a unique COR with a unique ARS/AAR Partition Group, the lowest FRL to complete an AAR call, and **n** on all unique COR assigned to your public network trunking facilities on the Calling Permissions. Assign the appropriate AAR route patterns on the AAR Partition Group using the **change aar analysis partition x 2** command.

**Tip:**

*You can use the **display aar analysis print** command to print a copy of your Automatic Alternate Routing (AAR) setup before making any changes. You can use the printout to correct any mistakes.*

- d. If the vector has a “route-to” step that routes the call to off-net, assign a unique COR with a unique ARS/AAR Partition Group, the lowest FRL to complete an ARS call, and **n** on all unique COR assigned to your public network trunking facilities on the Calling Permissions. Assign the appropriate complete dial string in the “route-to” step of the vector the unique ARS Partition Group using the **change ars analysis partition x 2** command.
6. On the [Feature Access Code](#) screen, Facility Test Calls Access Code, the Data Origination Access Code, and the Data Privacy Access Code fields, change from the default or remove them.

 **NOTE:**

These codes, when dialed, return system dial tone or direct access to outgoing trunking facilities. Transfers to these codes can take place via an unsecured vector with “collect digits” steps or an unsecured voice mail system.

7. Restrict Call Forwarding Off Net on every class of service.

See “[Class of Service](#)” on page 672 for more information on Class of Service.

 **NOTE:**

You cannot administer loop-start trunks if Call Forwarding Off Net is required.

8. If loop start trunks are administered in the switch and cannot be changed by the Local Exchange Company, block all class of service from forwarding calls off-net. In the Class of Service screen, Restriction Call Fwd-Off Net field, set to **y** for the 16 (0-15) COS numbers.

See “[Class of Service](#)” on page 672 for more information.

 **NOTE:**

If a station is call forwarded off-net and an incoming call to the extension establishes using a loop-start trunk, incorrect disconnect supervision can occur at the Local Exchange Central Office when the call terminates. This gives the caller recall or transfer dial tone to establish a fraudulent call.

9. Administer Call Detail Recording on all trunk groups to record both incoming and outgoing calls.

See “[Collecting information about calls](#)” on page 537 for more information.

10. On the “[Route Pattern](#)” on page 1096, be careful assigning route patterns with an FRL of **0**; these allow access to outgoing trunking facilities. Avaya recommends assigning routes with an FRL of 1 or higher.

 **NOTE:**

An exception might be assigning a route pattern with an FRL of 0 to be used for 911 calls so even restricted users may dial this in emergencies.

 **Tip:**

*You can use the **list route-pattern print** command to print a copy of your FRLs and check their status.*

11. On all trunk group screens, set the Dial Access field to **n**. If set to **y**, it allows users to dial Trunk Access Codes, thus bypassing all the ARS call screening functions.

See “[Trunk Group](#)” on page 1233 for more information.

12. On the “[AAR and ARS Digit Analysis Table](#)” on page 577, set all dial strings not required to conduct business to **den** (deny).

13. If you require international calling, on the “[AAR and ARS Digit Conversion Table](#)” on page 582, use only the 011+ country codes/city codes or specific dial strings.

14. Assign all trunk groups or same trunk group types a unique Class of Restriction. If the trunk group does not require networking through your switch, administer the Class of Restriction of the trunk group where the FRL is **0**, the Calling Party Restriction field is **outward**, and all unique Class of Restriction assigned to your outgoing trunk groups are **n**. See [“Class of Restriction” on page 658](#) for more information.

**Tip:**

*You can use the **list trunk-group print** command to have a printout of all your trunks groups. Then, you can use the **display trunk-group x** command (where *x* is the trunk group) to check the COR of each trunk group.*

15. For your AUDIX, on the System Appearance screen, set:
  - the Enhanced Call Transfer field to **y**.
  - the Transfer Type field to **enhanced**. If set to **basic**, set the Transfer Restriction field to **subscribers**. See [“Feature-Related System Parameters” on page 795](#) for more information.

**NOTE:**

The COR of the voice mail ports dictates the calling restrictions of the voice mail. If the above settings are not administered correctly, the possibility exists to complete a transfer to trunk access codes or ARS/AAR feature codes for fraudulent purposes. Never assign mailboxes that begin with the digits or trunk access codes of ARS/AAR feature access codes. Require your users to use a mailbox password length greater than the amount of digits in the extension number.

16. Avaya recommends you administer the following on all voice mail ports:
  - Assign all voice mail ports a unique COR. See [“Class of Restriction” on page 658](#) for more information.
  - If you are not using outcalling, fax attendant, or networking, administer the unique COR where the FRL is **0**, the Calling Party Restriction field is **outward**, and all unique trunk group COR on the Calling Permissions are **n**. See [“Class of Restriction” on page 658](#) for more information.

**NOTE:**

Avaya recommends you administer as many layers of security as possible. You can implement steps [9](#) and [16](#) as a double layer of security. In the event that the voice mail becomes unsecured for any reason, the layer of security on the switch takes over, and vice versa.

17. Administer all fax machines, modems, and answering machines analog voice ports as follows:
  - Set the Switchhook Flash field to **n**.
  - Set the Distinctive Audible Alert field to **n**. See “Station” on page 1127 for more information.
18. Install a Call Accounting System to maintain call records. In the CDR System Parameters screen, Record Outgoing Calls Only field, set to **y**. See “CDR System Parameters” on page 646 for more information.

**NOTE:**

Call Accounting Systems produce reports of call records. It detects phones that are being hacked by recording the extension number, date and time of the call, and what digits were dialed.

## Adding logins and passwords

---

This section shows you how to add a user and their password. To add a login, you must be a superuser with authority to administer permissions.

When adding logins, remember the following:

- Type the new login name as part of the **add** command. The name must be 3–6 alphanumeric characters in length, and can contain the characters 0-9, a-z, A-Z.
- The password must be from 7 to 11 alphanumeric characters in length and contain at least 1 non-alphabetic character.

### Instructions

---

We will add the login **angi3** with the password **b3stm0m**. We also will require the user to change their password every 30 days.

To add new logins and passwords:

1. Type **add login angi3** and press RETURN.  
The [Login Administration](#) screen appears.

```

 LOGIN ADMINISTRATION

Password of Login Making Change:

LOGIN BEING ADMINISTERED
 Login's Name: angi3
 Login Type:
 Service Level:
Disable Following a Security Violation?
 Access to INADS Port? _

LOGIN'S PASSWORD INFORMATION
 Login's Password:
 Reenter Login's Password:
Password Aging Cycle Length (Days): 30

LOGOFF NOTIFICATION
 Facility Test Call Notification? y Acknowledgment Required? y
 Remote Access Notification? y Acknowledgment Required? y

ACCESS SECURITY GATEWAY PARAMETERS
Access Security Gateway? n
```

The Login's Name field shows the name you typed in the **add** command.

2. In the Password of Login Making Change field, type your superuser password.
3. In the Disable Following a Security Violation field, type **y** to disable this login following a login security violation.

This field appears only if on the Security-Related System Parameters screen, SVN Login Violation Notification field is **y**.

4. In the Login's Password field, type **b3stm0m**.  
The password does not appear on the screen as you type.

5. In the Reenter Login's Password field, retype **b3stm0m**.

6. In the Password Aging Cycle Length (Days) field, type **30**.

This requires the user to change the password every 30 days.

7. Press ENTER to save your changes.

Now you need to set the permissions for this new login.

## More information

---

When you add a login, the Security Measurement reports do not update until the next hour.

Password aging is an option you can start while administering logins. The password for each login can be aged starting with the date the password was created or changed and continuing for a specified number of days (1 to 99).

The system notifies the user at the login prompt, 7 days before the password expiration date, their password is about to expire. When the password expires, the user needs to enter a new password into the system before logging in.

## Changing a login

---

This section shows you how to change a user's login. You may need to change a user's password because it has expired. To change a login's attributes, you must be a superuser with authority to administer permissions.

When changing logins, remember the following:

- Type the new login name as part of the change command. The name must be 3–6 alphanumeric characters in length, and can contain the characters 0-9, a-z, A-Z.
- The password must be from 7 to 11 alphanumeric characters in length and contain at least 1 non-alphabetic character.

## Instructions

---

We will change the login **angi3** with the password **b3stm0m**. We also will require the user to change their password every 30 days.

To change logins:

We will change the login **angi3**.

1. Type **change login angi3** and press RETURN.

The [Login Administration](#) screen appears.

```

 LOGIN ADMINISTRATION

Password of Login Making Change:

LOGIN BEING ADMINISTERED
 Login's Name:angi3
 Login Type:
 Service Level:
Disable Following a Security Violation?
 Access to INADS Port? _

LOGIN'S PASSWORD INFORMATION
 Login's Password:
 Reenter Login's Password:
Password Aging Cycle Length (Days):

LOGOFF NOTIFICATION
 Facility Test Call Notification? y Acknowledgment Required? y
 Remote Access Notification? y Acknowledgment Required? y

ACCESS SECURITY GATEWAY PARAMETERS
Access Security Gateway? n
```

2. In the Password of Login Making Change field, type your superuser password.
3. In the Login's Password field, type **b3stm0m**.  
This is the login for the password you are changing.
4. In the Reenter Login's Password field, retype **b3stm0m**.  
The password does not appear on the screen as you type.
5. In the Password Aging Cycle Length (Days) field, type **30**.  
This requires the user to change the password every 30 days.
6. Press ENTER to save your changes.

### Related topics

---

[“Logging into the system”](#).

## Displaying a login

---

This section shows you how to display a user's login and review their permissions.

### Instructions

---

To display a login such as **angi3**:

1. Type **display login angi3** and press RETURN.

The [Login Administration](#) appears and displays all information about the requested login except the password.

## Removing a login

---

This section shows you how to remove a user's login. To remove a login, you must be a superuser.

### Instructions

---

To remove a login such as **angi3**:

1. Type **remove login angi3** and press RETURN.

The [Login Administration](#) screen appears showing information for the login you want to delete.

2. Press ENTER to remove the login, or press CANCEL to leave this screen without removing the login.

### More information

---

When you remove a login, the Security Measurement reports do not update until the next hour.

### Related topics

---

[“Logging into the system”](#).

## Using access security gateway

---

This section shows you how to use Access Security Gateway (“ASG”). ASG prevents unauthorized access by requiring the use of the hand-held Access Security Gateway Key for logging into the system.

You need superuser privileges to perform any of the ASG procedures.

### Before you start

---

You need an Access Security Gateway Key.

On the “[System-Parameters Customer-Options](#)” screen, verify the Access Security Gateway (ASG) field is **y**. If not, contact your Avaya representative.

### Instructions

---

To set up access security gateway:

1. Type **change login xxxx** and press RETURN, where xxxx is the alphanumeric login ID.

The [Login Administration](#) screen appears.

```

 LOGIN ADMINISTRATION

Password of Login Making Change:

LOGIN BEING ADMINISTERED
 Login's Name:xxxxxxx
 Login Type:
 Service Level:
Disable Following a Security Violation?
 Access to INADS Port? _

LOGIN'S PASSWORD INFORMATION
 Login's Password:
 Reenter Login's Password:
Password Aging Cycle Length (Days):

LOGOFF NOTIFICATION
Facility Test Call Notification? y Acknowledgment Required? y
Remote Access Notification? y Acknowledgment Required? y

ACCESS SECURITY GATEWAY PARAMETERS
Access Security Gateway? n
```

2. In the Password of Login Making Change field, type your password.
3. In the Access Security Gateway field, type **y**.  
When set to **y**, the Access Security Gateway Login Administration screen (page 2) appears automatically.
4. Either:
  - Set the System Generated Secret Key field to:
    - **y** for a system-generated secret key, or
    - **n** for a secret key to be entered by the administrator, *or*
  - In the Secret Key field, enter your secret key.  
Be sure to remember your secret key number.
5. All other fields on page 2 are optional.
6. Press ENTER to save your changes.
7. Type **change system-parameters security** and press RETURN.  
The [Security-Related System Parameters](#) screen appears.

```

 Page 2 of 2
SECURITY-RELATED SYSTEM PARAMETERS

SECURITY VIOLATION NOTIFICATION PARAMETERS

SVN Station Security Code Violation Notification Enabled? y
 Originating Extension: _____ Referral Destination: _____
Station Security Code Threshold: 10 Time Interval: 0:03
 Announcement Extension: _____

STATION SECURITY CODE VERIFICATION PARAMETERS

 Minimum Station Security Code Length: 4
Security Code for Terminal Self Administration Required? y

ACCESS SECURITY GATEWAY PARAMETERS

SYSAM-LCL? n SYSAM-RMT? y
 MAINT? n SYS-PORT? n

```

8. In the Access Security Gateway Parameters section, you determine which of the following necessary port type fields to set to **y**.

**NOTE:**

Avaya recommends that you protect the SYSAM-RMT port since it is a dial-up port and therefore is more susceptible to compromise.

In our example, in the SYSAM-RMT field, we'll type **y**.

9. Press ENTER to save your changes.

## Disabling Access Security Gateway

To temporarily disable ASG while users are on vacation or travel:

1. Type **change login xxxx** and press RETURN, where xxxx is the alphanumeric login ID.

The [Login Administration](#) screen appears.

```

 LOGIN ADMINISTRATION

Password of Login Making Change:

LOGIN BEING ADMINISTERED
 Login's Name:xxxxxxx
 Login Type:
 Service Level:
Disable Following a Security Violation?
 Access to INADS Port? _

LOGIN'S PASSWORD INFORMATION
 Login's Password:
 Reenter Login's Password:
Password Aging Cycle Length (Days):

LOGOFF NOTIFICATION
Facility Test Call Notification? y Acknowledgment Required? y
Remote Access Notification? y Acknowledgment Required? y

ACCESS SECURITY GATEWAY PARAMETERS
Access Security Gateway? n

```

2. On the Access Security Gateway Login Administration page (page 2), set the Blocked field to **y**.

Setting the Blocked field to **y** does not remove the login from the system, but temporarily disables the login.

3. Press ENTER to save your changes.

### ⇒ NOTE:

A superuser can disable and restart access for another superuser.

## Restarting Access Security Gateway

To restart temporarily disabled access security gateway access for login:

1. Type **change login xxxx** and press RETURN, where xxxx is the alphanumeric login ID.

The [Login Administration](#) screen appears.

2. On the Access Security Gateway Login Administration page (page 2), set the Blocked field to **n**.
3. Press ENTER to save your changes.

## Loss of an ASG key

If a user loses their Access Security Gateway Key:

1. Modify any logins associated with the lost Access Security Gateway Key. See the *Access Security Gateway (ASG) Key Release 1.0 User's Guide* to change your PIN.
2. If the login is no longer valid, type **remove login xxxx** and press RETURN, to remove the invalid login from the system, where xxxx is the alphanumeric login ID.
3. To keep the same login, change the Secret Key associated with the login to a new value.
4. Using the new secret key value, re-key devices that generate responses and interact with the login.

## Monitoring the Access Security Gateway history log

The Access Security Gateway Session History Log records all ASG session establishment and session rejection events except when, on the Login Administration screen, the Access to INADS Port field is **y**. You must be a superuser to use the **list asg-history** command.

1. Type **list asg-history** and press RETURN.

The [Access Security Gateway](#) screen appears.

| ACCESS SECURITY GATEWAY SESSION HISTORY |       |           |        |                 |
|-----------------------------------------|-------|-----------|--------|-----------------|
| Date                                    | Time  | Port      | Login  | Status          |
| 01/06                                   | 12:45 | SYSAM-RMT | csand  | AUTHENTICATED   |
| 01/05                                   | 01:32 | SYSAM-LCL | jsmith | REJECT-BLOCK    |
| 01/05                                   | 12:33 | SYSAM-RMT | ajones | REJECT-EXPIRE   |
| 01/03                                   | 15:10 | SYSAM-RMT | swrigh | REJECT-PASSWORD |
| 01/02                                   | 08:32 | SYSAM-LCL | jsmith | REJECT-INVALID  |
| 01/02                                   | 07:45 | SYSAM-RMT | mehrda | REJECT-RESPONSE |

This screen contains the following fields:

- **Date** — Contains the date of the session establishment or rejection. For example, the date displays in the mm/dd format where mm = month and dd = day.
- **Time** — Contains the time of the session establishment or rejection. For example, the time displays in the hh/mm format where hh = hour and mm = minute.

- **Port** — Contains the port mnemonic associated with the port on which the session was established or rejected. The port mnemonics for G3r systems are SYSAM-LCL, SYSAM-RMT, MAINT, and SYS-PORT. For G3si systems, they are MRG1, INADS, NET, and EPN.
- **Login** — Contains the alphanumeric login string entered by the user and associated with the session establishment or rejection.
- **Status** — Contains a code that indicates whether the session was established or rejected and, if rejected, the reason for the rejection. See [Access Security Gateway](#) for a list of the possible status values.

## Changing login permissions

---

This section shows you how to change login permissions.

Once you have created a login, you can modify the permissions associated with the login. The system maintains default permissions for each level of login, but you may want to further restrict the login, or at least make sure the defaults are appropriate for the user. The default values for these fields vary based on the login type.

### Instructions

---

We will change the login permissions of **angi3**.

To change login permissions:

1. Type **change permissions angi3** and press RETURN.

## Changing passwords

---

This section shows you how to change a user's password.

### Instructions

---

We will change the password for login **angi3** to **g3or5e**.

To change passwords:

1. Type **change password angi3** and press RETURN.

The Password Administration screen appears.

```

 PASSWORD ADMINISTRATION
Password of Login Making Change: angi3
LOGIN BEING CHANGED
 Login Name:
LOGIN'S PASSWORD INFORMATION
 Login's Password:
 Reenter Login's Password:

```

2. In the Password of Login Making Change field, type your password to change any field on this screen.

We'll type **angi3**.

3. In the Login's Password field, type the initial password for this login.

We'll type **g3or5e**.

Notify the owner of the login to change their password immediately. The password does not appear on the screen as you type.

A password must be from 4 to 11 characters in length and contain at least 1 alphabetic and 1 numeric symbol.

4. In the Reenter Login's Password field, retype the login's password as above, for verification.

We'll type **g3or5e**.

The password does not appear on the screen as you type.

5. Press ENTER to save your changes.

## Using busy verify

This section shows you how to use Busy Verify (also known as Busy Verification) to help find fraud problems.

When you suspect toll fraud, you can interrupt the call on a specified trunk group or extension number and monitor the call in progress. Callers will hear a long tone to indicate the call is being monitored.

### SECURITY ALERT:

*Listening to someone else's calls may be subject to federal, state, or local laws, rules, or regulations. It may require the consent of one or both of the parties on the call. Familiarize yourself with all applicable laws, rules, and regulations and comply with them when you use this feature.*

### Before you start

On the [Trunk Group](#) screen, verify the Dial Access field is **y**. If not, contact your Avaya representative.

### Instructions

To use busy verify:

1. Type **change station xxxx** and press RETURN, where xxxx is the station to be assigned the busy verify button.

For our example, we'll enter extension **1014**.

The [Station](#) screen appears.

```

 Page 3 of X
 STATION

BUTTON ASSIGNMENTS
 1: call-appr 4: verify__
 2: call-appr 5: _____
 3: call-appr
```

2. In the Feature Button Assignments area, type **verify**.
3. Press ENTER to save your changes.
4. To activate the feature, press the VERIFY button on the phone and then enter the Trunk Access Code and member number to be monitored.

## Setting up security violations notification

---

This section shows you how to use Security Violations Notification (“SVN”) to set security-related parameters and to receive notification when established limits are exceeded. You can run reports related to invalid access attempts. You also can disable a login ID or remote access authorization that is associated with a security violation.

When a security violation has occurred, there are steps that you can take to be sure that this same attempt is not successful in the future. See the *BCS Products Security Handbook* for more information.

### Before you start

---

If you are using ASG, on the [System-Parameters Customer-Options](#) screen, verify the Access Security Gateway (ASG) field is **y**. If not, contact your Avaya representative.

### Instructions

---

To set up security violations notification:

1. Type **change system-parameters security** and press RETURN.

The [Security-Related System Parameters](#) screen appears.

```
SECURITY-RELATED SYSTEM PARAMETERS

SECURITY VIOLATION NOTIFICATION PARAMETERS

SVN Login Violation Notification Enabled? y
 Originating Extension: 3040_ Referral Destination: attd_
 Login Threshold: 3_ Time Interval: 0:03
 Announcement Extension: _____

SVN Remote Access Violation Notification Enabled? y
 Originating Extension: 2719_ Referral Destination: 2720_
 Barrier Code Threshold: 3 Time Interval: 0:03
 Announcement Extension: _____

SVN Authorization Code Violation Notification Enabled? y
 Originating Extension: 3030_ Referral Destination: 3031_
 Authorization Code Threshold: 3 Time Interval: 0:03
 Announcement Extension: _____
```

2. In the SVN Login Violation Notification Enabled field, type **y**.  
This sets Security Violations Notification login violation notification.
3. In the Originating Extension field, type **3040**.  
This becomes the phone extension for the purpose of originating and identifying SVN referral calls for login security violations.
4. In the Referral Destination field, type **attd** to send all calls to the attendant.  
This is the phone extension that receives the referral call when a security violation occurs.
5. In the Login Threshold field, type **3**.  
This is the minimum number of login attempts that are permitted before a referral call is made. More than 3 attempts causes a security violation notification.
6. In the Time Interval field, type **0:03**.  
This the time interval in which the threshold, or number of violations, must occur.
7. Press ENTER to save your changes.

**NOTE:**

If you are not using Remote Access, go to step 11.

8. (Optional) Type **change remote-access** and press RETURN.  
The **QSIG to DCS TSC Gateway screen** screen appears.

```

2: _____ 5: _____
3: _____

```

12. In the Feature Button Assignments section, type one of the following:
  - **asvn-halt** — The Authorization Code Security Violation Notification call is activated when an authorization code security violation is detected. This applies only if you are using authorization codes.
  - **lsvn-halt** — The Login Security Violation Notification call is activated a referral call when a login security violation is detected.
  - **rsvn-halt** — The Remote Access Barrier Code Security Violation Notification call is activated as a call referral. This applies only if you are using Remote Access barrier codes.
  - **ssvn-halt** — The Station Code Security Violation Notification call is activated when a station code security violation is detected. This applies only if you are using station codes.

**NOTE:**

Any of the above 4 security violations will cause the system to place a notification call to the designated phone. The call continues to ring until answered. To stop notification of any further violations, press the button associated with the type of violation.

13. Press ENTER to save your changes.

## **Setting up authorization codes**

---

Authorization codes provide the means for extending control of system users' calling privileges. They extend calling-privilege control and provide an extra level of security for remote-access callers.

**NOTE:**

To maintain system security, Avaya recommends you use authorization codes.

See *BCS Products Security Handbook* for more information.

## **Before you start**

---

On the [System-Parameters Customer-Options](#) screen, verify the Authorization Codes field is **y**. If not, contact your Avaya representative. This field turns on the feature and permits you to selectively specify levels of calling privileges that override in-place restrictions.

## Instructions

1. Type **change system-parameters features** and press RETURN.  
The [Feature-Related System Parameters](#) screen appears.

```

Page 3 of 8
FEATURE-RELATED SYSTEM PARAMETERS

Reserved Slots for Attendant Priority Queue: 5_
Time Before Off-Hook Alert: 10__
Emergency Access Redirection Extension: _____
Number of Emergency Calls Allowed in Attendant Queue: __

Authorization Code Length: 7
Authorization Code Cancellation Symbol? #
Attendant Time Out Flag? n
Display Authorization Code? _
Controlled Toll Restriction Replaces: station-station
Controlled Toll Restriction Intercept Treatment: extension 3000

```

2. In the Authorization Code Enabled field, type **y**.  
This enables the Authorization Codes feature on a system-wide basis.
3. In the Authorization Code Length field, type **7**.  
This defines the length of the Authorization Codes your users need to enter. To maximize the security of your system, Avaya recommends you make each authorization code the maximum length allowed by the system.
4. In the Authorization Code Cancellation Symbol field, leave the default of **#**.  
This is the symbol a caller must dial to cancel the 10-second wait period during which your user can enter an authorization code.
5. In the Attendant Time Out Flag field, leave the default of **n**.  
This means a call is not to be routed to the attendant if a caller does not dial an authorization code within 10 seconds or dials an invalid authorization code.
6. In the Display Authorization Code field, type **n**.  
This prevents the authorization code from displaying on phone sets thus maximizing your security.
7. Press ENTER to save your changes.

See [“Facility restriction levels and traveling class marks” on page 1684](#) and [“Route Pattern” on page 1096](#) for more information on assigning Facility Restriction Levels.

See [“Call detail recording” on page 1553](#) and [“Station” on page 1127](#) for more information on using Call Detail Recording on station phones.

See [“Class of Restriction” on page 658](#) and [“Station” on page 1127](#) for more information on using Class of Restriction on station phones.

See [“Remote Access” on page 1800](#) for more information on allowing authorized callers to access the system from remote locations.

See [“Barrier codes” on page 1504](#) or [“QSIG to DCS TSC Gateway screen” on page 1085](#) for information on barrier codes.

## Using Station Lock

---

Station Lock allows only authorized users to make external phone calls from a particular station.

### NOTE:

Avaya recommends digital phones use a Station Lock button rather than a feature access code.

## Setting Station Lock

We will set Station Lock to allow authorized users to access the system through a particular station.

## Before you start

---

- Be sure the Station Lock COR field on the Class of Restriction screen has the COR the user is using to define the calling restrictions.

## Instructions

We will set Station Lock on a digital phone (extension 7262):

1. Type **change station 7262** and press RETURN.
2. In the Security Code field, enter a security code of up to 8 digits.  
In the COR field, leave the default at 1.
3. In the Button Assignments section, type **sta-lock**.
4. Press ENTER to save your changes.

5. Type **change cor 1** and press RETURN.
6. In the Calling Party Restriction field, type **none**.  
This means that no calling party restrictions exist on extension 7262.
7. In the Station Lock COR field, type 2.
8. Press ENTER to save your changes.
9. Type **change cor 2** and press RETURN.
10. In the Calling Party Restriction field, verify it is **outward**.
11. Press ENTER to save your changes.

Now when extension 7262 activates Station Lock, calling restrictions are determined by the Station Lock COR, COR 2. Based on the administration of COR 2, extension 7262 is not allowed to call outside the private network. When Station Lock is not active on extension 7262, calling restrictions are determined by the COR administered on the Station screen, COR 1. In this example, when extension 7262 is unlocked, calls outside the private network are allowed.

Let us set Station Lock on an analog, x-mobile, or digital phone without a Station Lock button (extension 7262 and use a feature access code of 08):

1. Type **change station 7262** and press RETURN.
2. In the Security Code field, enter a security code of up to 8 digits.  
In the COR field, leave the default at 1. This means that anyone can call outside on extension 7262.
3. Press ENTER to save your changes.
4. Type **change system-parameters features** and press RETURN.  
The Feature-Related System-Parameters screen appears.
5. In the Special Dial Tone field, type **y** for an audible tone indicating the station is locked.
6. Press ENTER to save your changes.
7. Type **change feature-access-codes** and press RETURN.  
The Feature Access Codes screen appears.
8. Move the cursor to the Station Lock Activation field.
9. In the Activation field, type **\*08**.
10. In the Deactivation field, type **#08**.
11. Press ENTER to save your changes.

Now when a user activates Station Lock, no one can call outside from extension 7262.

## **Dealing with security violations**

---

When a security violation occurs, there are steps that you can take to be sure that this same attempt is not successful in the future.

### **Disabling a login ID**

---

There may be occasions when you have to disable a login for one of your users because of a security violation.

1. Log in to the switch using a login ID with the correct permissions.
2. Type **disable login ge0rg3** and press RETURN.

### **Enabling a login ID**

---

You may have to enable a login ID that has been disabled by a security violation, or disabled manually with the disable login command.

1. Log in to the switch using a login ID with the correct permissions.
2. Type **enable login ge0rg3** and press RETURN.

### **Enabling remote access**

---

You may have to enable Remote Access that has been disabled following a security violation, or disabled manually.

1. Log in to the switch using a login ID with the correct permissions.
2. Type **enable remote-access** and press RETURN.

### **Disabling remote access**

---

There may be occasions when you have to disable remote access for one of your users because of a security violation.

1. Log in to the switch using a login ID with the correct permissions.
2. Type **disable remote-access** and press RETURN.

This chapter contains basic procedures for working with analog and digital trunks. Specialized trunks such as Internet Protocol (“IP”), H.323, APLT, tandem, release-link, and DMI-BOS trunks are not covered in this manual. For more information, see *Administration for Network Connectivity for Avaya MultiVantage™ Software*. This chapter also does not contain procedures for working with ISDN trunk groups. Due to the complexity of ISDN technology and the potential consequences of errors, ask your Avaya representative to assist you in planning, installing, and administering ISDN trunks. For an introduction to Integrated Services Digital Network (ISDN) service on Avaya MultiVantage, see [“ISDN service” on page 1730](#). For descriptions of the fields on various screens used to set up H.323 trunks, see [Chapter 18, “Screen reference”](#).

### **Tips for working with trunk groups**

---

You’ll find detailed procedures for administering specific trunk groups elsewhere in this chapter. However, there’s more to working with trunks than just administering trunk groups.

### **Following a process**

---

Trunking technology is complex. Following a process can prevent mistakes and save you time. To set up new trunks and trunk groups, Avaya recommends following the process below (some steps may not apply to your situation):

1. Install the necessary circuit packs and perform any administration the circuit pack requires.
2. Connect the appropriate ports to your network service provider’s trunks.

3. Administer a trunk group to control the operation of the trunks.
4. Assign the ports you're using to the trunk group.
5. For outgoing or 2-way trunks, administer Automatic Route Selection so Avaya MultiVantage knows which outgoing calls to route over this trunk group.
6. Test your new trunk group. Using the trunk access code, place a variety of calls.

This chapter provides instructions for steps 3 and 4 in this process.

### **Working with your network service provider**

---

Depending on the type of trunk you want to add, the vendor may be your local phone company, a long distance provider, or some other service provider. Key settings on Avaya MultiVantage must be identical to the same settings on the provider's equipment for your trunks to work. Clear, frequent communication with your provider is essential — especially since some providers may use different terms and acronyms than Avaya does!

Once you decide that you want to add a new trunk, contact your vendor. The vendor should confirm the type of signal you want and provide you with a circuit identification number for the new trunk. Be sure to record any vendor-specific ID numbers or specifications in case you ever have any problems with this trunk.

### **Keeping records**

---

In addition to recording vendor-specific information such as ID numbers, you should record the following information about every trunk group you have.

| <b>The questions you need to answer</b> | <b>The kind of information you need to get</b>                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| What type of trunk group is it?         | You need to know what kind of trunks these are (central office ("CO"), foreign exchange ("FX"), etc.) and whether they use any special services (such as T1 digital service). You also need to know what kind of signaling the group uses. For example, you might have a CO trunk group with ground-start signaling running on a robbed-bit T1 service. |

| The questions you need to answer                                                    | The kind of information you need to get                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Which phone numbers are associated with each trunk group?                           | <p>For incoming or two-way trunk groups:</p> <ul style="list-style-type: none"> <li>■ What number or numbers do outside callers use to call into your switch over this group?</li> <li>■ What's the destination extension to which this trunk group delivers calls? Does it terminate at an attendant or a voice-mail system?</li> </ul> <p>For outgoing trunk groups:</p> <ul style="list-style-type: none"> <li>■ What extensions can call out over this trunk group?</li> </ul> |
| Is the service from your network service provider sending digits on incoming calls? | <p>Direct Inward Dial and Direct Inward/Outward Dial trunks send digits to your switch. Tie trunks may send digits, depending on how they're administered. You need to know:</p> <ul style="list-style-type: none"> <li>■ How many digits is your service provider sending?</li> <li>■ Are you inserting any digits? What are they?</li> <li>■ Are you absorbing any digits? How many?</li> <li>■ What range of numbers has your service provider assigned you?</li> </ul>         |

### Helpful tips for setting common fields

The procedures in this section cover the specific fields you must administer when you create each type of trunk group. Here are some tips for working with common fields that are available for most trunk groups.

- Dial Access — Typing **y** in this field allows users to route calls through an outgoing or two-way trunk group by dialing its trunk access code.

#### **SECURITY ALERT:**

*Calls dialed with a trunk access code over Wide Area Telecommunications Service (“WATS”) trunks are not validated against the ARS Digit Analysis Table, so users can dial anything they wish. For security, you may want to leave the field set to **n** unless you need dial access to test the trunk group.*

- **Outgoing Display** — Typing **y** in this field allows display phones to show the name and group number of the trunk group used for an outgoing call. This information may be useful to you when you're trying to diagnose trunking problems.
- **Queue Length** — Don't create a queue for two-way loop-start trunks, or you may have a problem with glare (the interference that happens when a two-way trunk is seized simultaneously at both ends).
- **Trunk Type** — Use ground-start signaling for two-way trunks whenever possible: ground-start signaling avoids glare and provides answer supervision from the far end. Try to use loop-start signaling only for one-way trunks.

### **Related topics**

---

See the *Avaya MultiVantage™ Solutions Hardware Guide* for information on the types of circuit packs available and their capacities.

See your switch's installation manual for installation instructions for circuit packs.

See [“Routing outgoing calls” on page 247](#) for detailed information on Automatic Route Selection.

## **Adding a CO, FX, or WATS trunk group**

---

Basic administration for Central Office (CO), Foreign Exchange (FX), and WATS trunk groups is identical, so we've combined instructions for all 3 in the following procedure. In most cases, Avaya recommends leaving the default settings in fields that aren't specifically mentioned in the following instructions. Your Avaya representative or network service provider can give you more information. Your settings in the following fields *must* match your provider's settings:

- Direction
- Comm Type
- Trunk Type

### **CAUTION:**

*Use the list above as a starting point and talk to your service provider. Depending on your particular application, you may need to coordinate additional administration with your service provider.*

## Before you start

Before you can administer any trunk group, you must have one or more circuit packs of the correct type with enough open ports to handle the number of trunks you need to add. To find out what circuit packs you need, see the *Avaya MultiVantage™ Solutions Hardware Guide*.

## Instructions

As an example, we will set up a two-way CO trunk group that carries voice and voice-grade data only. Incoming calls terminate to an attendant during business hours and to a night service destination the rest of the time

To add the new CO trunk-group:

1. Type **add trunk-group next** and press RETURN.

The [Trunk Group](#) screen appears. The system assigns the next available trunk group number to this group. In our example, we're adding trunk group 5.

```

 TRUNK GROUP

Group Number: 5 Group Type: co CDR Reports: y
Group Name: Outside calls COR: 85 TN: 1__ TAC: 105
Direction: two-way Outgoing Display? n
Dial Access? n Busy Threshold: 99 Night Service: 1234__
Queue Length: 0 Country: Incoming Destination: attd__
Comm Type: voice Auth Code? n Digit Absorption List: _
Prefix-1? y Trunk Flash? n Toll Restricted? y

TRUNK PARAMETERS
 Trunk Type: ground start
 Outgoing Dial Type: tone
 Trunk Termination: rc
 Auto Guard? n Call Still Held? n Sig Bit Inversion: none
 Trunk Gain: high

Disconnect Supervision -In? y Out? n
Answer Supervision Timeout: 10 Receive Answer Supervision? n

```

2. In the Group Type field, type **co**.

This field specifies the kind of trunk group you're creating.

3. In the Group Name field, type **Outside calls**.

This name will be displayed, along with the group number, for outgoing calls if you set the **Outgoing Display?** field to **y**. You can type any name up to 27 characters long in this field.

4. Type **85** in the COR field.

This field controls which users can make and receive calls over this trunk group. Assign a class of restriction that's appropriate for the "COR" calling permissions administered on your system.
5. In the TAC field, type **105**.

This field defines a unique code that you or your users can dial to access this trunk group. The code also identifies this trunk group in call detail reports.
6. In the Direction field, type **two-way**.

This field defines the direction of traffic flow on this trunk group.
7. Type **1234** in the Night Service field.

This field assigns an extension to which calls are routed outside of business hours.
8. In the Incoming Destination field, type **attd**.

This field assigns an extension to which incoming calls are routed during business hours. By entering attd in this field, incoming calls go to the attendant and the system treats the calls as Listed Directory Number calls.
9. In the Comm Type field, type **voice**.

This field defines whether a trunk group can carry voice, data, or both. Analog trunks only carry voice and voice-grade data.
10. In the Trunk Type field, type **ground-start**.

This field tells the system what kind of signaling to use on this trunk group. To prevent glare, Avaya recommends ground start signaling for most two-way CO, FX, and WATS trunk groups.
11. In the Outgoing Dial Type field, type **tone**.

This field tells the switch how digits are to be transmitted for outgoing calls. Entering tone actually allows the trunk group to support both dual-tone multifrequency (DTMF) and rotary signals, so Avaya recommends that you always put tone in this field.
12. In the Trunk Termination field, type **rc**.

Use **rc** in this field when the distance to the central office or the switch at the other end of the trunk is more than 3,000 feet. Check with your service provider if you're not sure of the distance to your central office.
13. Press ENTER to save your changes.

Now you are ready to add trunks to this trunk group. See ["Adding trunks to a trunk group"](#) on page 430.

## Adding a DID trunk group

---

In most cases, Avaya recommends leaving the default settings in fields that aren't specifically mentioned in the following instructions. Your Avaya representative or network service provider can give you more information. For Direct Inward Dialing (“DID”) trunk groups, settings in the following fields *must* match your provider's settings:

- Direction
- Comm Type
- Trunk Type
- Expected Digits (only if the digits your provider sends *do not* match your dial plan)

### CAUTION:

*Use the list above as a starting point and talk to your service provider. Depending on your particular application, you may need to coordinate additional administration with your service provider.*

## Before you start

---

Before you can administer any trunk group, you must have one or more circuit packs of the correct type with enough open ports to handle the number of trunks you need to add. To find out what circuit packs you need, see the *Avaya MultiVantage™ Solutions Hardware Guide*.

### Tip:

*In the DID/Tie/ISDN Intercept Treatment field on the Feature-Related System parameters screen, enter **attd**. Incoming calls to invalid extensions will be routed to the attendant.*

## Instructions

To add the new Direct Inward Dialing (DID) trunk-group:

1. Type **add trunk-group next** and press RETURN.

The **Trunk Group** screen appears. The system assigns the next available trunk group number to this group. In our example, we're adding trunk group 5.

```

 TRUNK GROUP
Group Number: 5 Group Type: did CDR Reports: y
Group Name: Incoming calls COR: 85 TN: 1 TAC: 105
 Country: 1
 Auth Code? n

TRUNK PARAMETERS
Trunk Type: wink-start Incoming Rotary Timeout(sec): 5
 Incoming Dial Type: tone
Trunk Termination: rc Disconnect Timing(msec): 500
Digit Treatment: insertion Digits: 6
Expected Digits: 4 Sig Bit Inversion: none
Analog Loss Group: ___ Digital Loss Group: ___
Extended Loop Range? n Trunk Gain: high Drop Treatment: silence

Disconnect Supervision - In? y

```

2. In the Group Type field, type **did**.

This field specifies the kind of trunk group you're creating.

3. In the Group Name field, type **Incoming calls**.

You can type any name up to 27 characters long in this field.

4. Type **85** in the COR field.

This field controls which users can receive calls over this trunk group. Assign a class of restriction that's appropriate for the COR calling permissions administered on your system.

5. In the TAC field, type **105**.

This code identifies the trunk group on "CDR" reports.

6. In the Trunk Type field, type **wink-start**.

This field tells the system what kind of signaling to use on this trunk group. In most situations, use wink start for DID trunks to minimize the chance of losing any of the incoming digit string.

7. In the Incoming Dial Type field, type **tone**.

This field tells the switch how digits are transmitted for incoming calls. Entering tone actually allows the trunk group to support both “DTMF” and rotary signals, so Avaya recommends that you always put tone in this field.

8. In the Trunk Termination field, type **rc**.

Use rc in this field when the distance to the central office or the switch at the other end of the trunk is more than 3,000 feet. Check with your service provider if you’re not sure of the distance to your central office.

9. Press ENTER to save your changes.

Now you’re ready to add trunks to this trunk group. See [“Adding trunks to a trunk group”](#) on page 430.

### **Related topics**

---

See [“Inserting and absorbing digits”](#) on page 434 for instructions on matching modifying incoming digit strings to match your dial plan.

## **Adding a DIOD trunk group**

---

Administration for Direct Inward and Outward Dialing (“DIOD”) trunk groups varies from country to country. See *Avaya MultiVantage™ Application Notes for Type Approval*, and use the DS1 screen illustrations in the chapter for your country as a model for your administration. Remember that the central office serving your switch may be emulating another country’s network protocol. If so, you’ll have to administer your circuit packs and trunk groups to match the protocol used by your central office.

### **SECURITY ALERT:**

*If you’re using Incoming Caller ID (“ICLID”) on analog trunks connected to a DIOD Central Office trunk circuit pack, DO NOT put these trunks in an outgoing AAR or ARS route pattern. Since the loop-start trunks supported on the DIOD Central Office trunk circuit pack do not provide answer supervision, the potential for toll fraud exists.*

## Adding a PCOL trunk group

---

In most cases, when administering Personal Central Office Line (“PCOL”) trunk groups, Avaya recommends leaving the default settings in fields that aren’t specifically mentioned in the following instructions. Your Avaya representative or network service provider can give you more information. Your settings in the following fields *must* match your provider’s settings:

- Trunk Type
- Trunk Direction

### CAUTION:

*Use the list above as a starting point and talk to your service provider. Depending on your particular application, you may need to coordinate additional administration with your service provider.*

### Before you start

---

Before you can administer any trunk group, you must have one or more circuit packs of the correct type with enough open ports to handle the number of trunks you need to add. To find out what circuit packs you need, see the *Avaya MultiVantage™ Solutions Hardware Guide*.

### Instructions

---

As an example, we will set up a new PCOL group and administer the group as a CO trunk for two-way voice traffic.

To add the new PCOL group:

1. Type **add personal-co-line next** and press ENTER.

The Personal CO Line Group screen appears.

```

Page 1 of X
PERSONAL CO LINE GROUP
Group Number: 1 Group Type: co CDR Reports: y
Group Name: OUTSIDE CALL TAC: _____
Security Code: _____ Coverage Path: _____ Data Restriction? _
Outgoing Display? _

TRUNK PARAMETERS
Trunk Type: ground-start Trunk Direction: two-way
Trunk Port: 01D1901_ Disconnect Timing(msec): 500
Trunk Name: _____ Trunk Termination: rc_____
Outgoing Dial Type: tone_____ Analog Loss Group: 7
Prefix-1? y Digital Loss Group: _
Answer Supervision Timeout: _____ Receive Answer Supervision? _
Trunk Gain: high Country: 1
Charge Conversion: 1_____
Decimal Point: none__
Currency Symbol: _____
Charge Type: units__

```

2. In the Group Type field, type **co**.

This field specifies the kind of trunk group you're creating. PCOL groups can be administered as CO, FX, or WATS trunks.

3. In the Group Name field, type **Outside calls**.

This name will be displayed, along with the group number, for outgoing calls if you set the Outgoing Display? field to **y**. You can type any name up to 27 characters long in this field. (You may want to put the phone number here that's assigned to this trunk.)

4. In the TAC field, type **111**.

This field defines a unique code that you or your users can dial to access this trunk group. The code also identifies this trunk group in call detail reports.

5. In the Trunk Type field, type **ground start**.

This field tells the system what kind of signaling to use on this trunk group. To prevent glare, Avaya recommends ground start signaling for most two-way CO, FX, and WATS trunk groups.

6. In the Trunk Port field, type **01D1901**.

This is the port to which the trunk is connected.

7. In the Trunk Termination field, type **rc**.

Use rc in this field when the distance to the central office or the switch at the other end of the trunk is more than 3,000 feet. Check with your service provider if you're not sure of the distance to your central office.

8. In the Outgoing Dial Type field, type **tone**.

This field tells the switch how digits are to be transmitted for outgoing calls. Entering tone actually allows the trunk group to support both DTMF and rotary signals, so Avaya recommends that you always put tone in this field.

9. Press ENTER to save your changes.

You assign phones to a PCOL group by administering a CO Line button on each phone. Once assigned, the Assigned Members page of the Personal CO Line Group screen displays member phones:

| PERSONAL CO LINE GROUP                                        |      |     |      | Page 2 of X |  |
|---------------------------------------------------------------|------|-----|------|-------------|--|
| ASSIGNED MEMBERS (Stations with a button for this PCOL Group) |      |     |      |             |  |
| Ext                                                           | Name | Ext | Name |             |  |
| 1:                                                            |      | 9:  |      |             |  |
| 2:                                                            |      | 10: |      |             |  |
| 3:                                                            |      | 11: |      |             |  |
| 4:                                                            |      | 12: |      |             |  |
| 5:                                                            |      | 13: |      |             |  |
| 6:                                                            |      | 14: |      |             |  |
| 7:                                                            |      | 15: |      |             |  |
| 8:                                                            |      | 16: |      |             |  |

## More information

---

### Call Detail Recording

Call detail recording (CDR) can be activated for calls on a personal CO line, but the CDR record does not specifically identify the call as PCOL. Calls over personal CO lines can, however, be identified by the trunk access code used on the call. The call is recorded to the extension number assigned to the phone where the call was originated or answered.

### Restrictions

- Abbreviated Dialing can be used with a personal CO line, but the accessed lists are associated with the individual phones.
- Auto Hold and Leave Word Calling do not work with calls on a personal CO line.
- Send All Calls cannot be activated for a personal CO line.
- INTUITY AUDIX cannot be in the coverage path of a PCOL group.

- Only phones in the same PCOL group can bridge onto calls on the personal CO line. If a user is active on his or her primary extension number on a PCOL call, bridged call appearances of that extension number cannot be used to bridge onto the call.
- When a user puts a call on hold on a personal CO line, the status lamp associated with the PCOL button does not track the busy/idle status of the line.

## Adding a Tie or Access trunk group

In most cases, Avaya recommends leaving the default settings in fields that aren't specifically mentioned in the following instructions. Your Avaya representative or network service provider can give you more information. Your settings in the following fields *must* match your provider's settings (or the setting on the far-end switch, if this is a private network trunk group):

- Direction
- Comm Type
- Trunk Type

### **CAUTION:**

*Use the list above as a starting point and talk to your service provider. Depending on your particular application, you may need to coordinate additional administration with your service provider.*

## Before you start

Before you can administer any trunk group, you must have one or more circuit packs of the correct type with enough open ports to handle the number of trunks you need to add. To find out what circuit packs you need, see the *Avaya MultiVantage™ Solutions Hardware Guide*.

### **Tip:**

*In the DID/Tie/ISDN Intercept Treatment field on the Feature-Related System parameters screen, enter **attd**. Incoming calls to invalid extensions will be routed to the attendant.*

## Instructions

As an example, we will add a two-way tie trunk group that supports voice and voice-grade data.

To add the new tie trunk-group:

1. Type **add trunk-group next** and press RETURN.

The **Trunk Group** screen appears. The system assigns the next available trunk group number to this group. In our example, we're adding trunk group 5.

```

Page 1 of X
TRUNK GROUP
Group Number: 5__ Group Type: tie CDR Reports: y
Group Name: Outside calls COR: 85__ TN: 1__ TAC: 105_
Direction: two-way_ Outgoing Display? n Trunk Signaling Type: ___
Dial Access? n Busy Threshold: 99_ Night Service: 1234
Queue Length: 0__ Incoming Destination: _____
Comm Type: voice Auth Code? n
Trunk Flash? n

BCC: 0
TRUNK PARAMETERS
Trunk Type (in/out): wink/wink__ Incoming Rotary Timeout(sec): 5_
Outgoing Dial Type: tone_____ Incoming Dial Type: tone_____
Digit Treatment: _____ Disconnect Timing(msec): 500_
Expected Digits: __ Digits: _____
Analog Loss Group: ___ Sig Bit Inversion: none
Incoming Dial Tone? y Digital Loss Group: ___

Disconnect Supervision - In? y Out? n
Answer Supervision Timeout: 0__ Receive Answer Supervision? y

```

2. In the Group Type field, type **tie**.

This field specifies the kind of trunk group you're creating.

3. In the Group Name field, type **Outside calls**.

This name will be displayed, along with the group number, for outgoing calls if you set the Outgoing Display? field to y. You can type any name up to 27 characters long in this field.

4. Type **85** in the COR field.

This field controls which users can make or receive calls over this trunk group. Assign a class of restriction that's appropriate for the COR calling permissions administered on your system.

5. In the TAC field, type **105**.

This field defines a unique code users can dial to access this trunk group.

6. In the Direction field, type **two-way**.

This field defines the direction of traffic flow on this trunk group.

7. Type **1234** in the Night Service field.

This field assigns an extension to which calls are routed outside of business hours.

8. In the Comm Type field, type **voice**.

This field defines whether a trunk group can carry voice, data, or both. Analog trunks only carry voice and voice-grade data. If you're administering a T1 connection in North America, type **rbavd** in this field.

9. In the Trunk Type field, type **wink/wink**.

This field tells the system what kind of signaling to use on this trunk group. Because we're receiving and sending digits over this trunk group, we're using wink/wink signaling to minimize the chance of losing part of the digit string in either direction.

10. Type **tone** in both the Outgoing Dial Type and Incoming Dial Type fields.

These fields tell the switch how digits are transmitted for incoming calls. Entering tone actually allows the trunk group to support both DTMF and rotary signals, so Avaya recommends that you always put tone in this field.

11. Press ENTER to save your changes.

Now you're ready to add trunks to this trunk group. See [“Adding trunks to a trunk group”](#) on page 430.

## Setting up digital trunks

---

Any of the common trunks, except for PCOL trunks, can be analog or digital. (PCOL trunks can only be analog.) Administering a digital trunk group is very similar to administering its analog counterpart, but digital trunks must connect to a DS1 circuit pack and this circuit pack must be administered separately. The example in this section shows you how to do this.

In most cases, Avaya recommends leaving the default settings in fields that aren't specifically mentioned in the following instructions. Your Avaya representative or network service provider can give you more information.

Your settings in the following fields *must* match your provider's settings:

- Bit Rate
- Line Coding (unless you're using a channel service unit to convert between your line coding method and your provider's)
- Framing Mode
- Signaling Mode
- Interface Companding

 **CAUTION:**

*Use the list above as a starting point and talk to your service provider. Depending on your particular application, you may need to coordinate additional administration with your service provider.*

### Before you start

---

Assign the DS1 circuit pack before you administer the members of the associated trunk groups.

 **CAUTION:**

*If enhanced DS1 administration is not enabled, you cannot make changes to the DS1 Circuit Pack screen before you remove related member translations of all trunks from the trunk group. See [“Enhanced DS1 administration”](#) on page 428.*

Before you can administer a digital trunk group, you must have one or more circuit packs that support DS1 with enough open ports to handle the number of trunks you need to add. To find out what circuit packs you need, see the *Avaya MultiVantage™ Solutions Hardware Guide*.

## Instructions

The following example shows a DS1 circuit pack configured for T1 service. The circuit pack is supporting a two-way CO trunk group that carries only voice and voice-grade data.

To configure a new DS1 circuit pack:

1. Type **add ds1 07A19** and press ENTER.

The [DS1 Circuit Pack](#) screen appears. You must enter a specific port address for the circuit pack.

```

 DS1 CIRCUIT PACK

 Location: 07A19 Name: two-way CO
 Bit Rate: 1.544 Line Coding: b8zs
Line Compensation: 1 Framing Mode: esf
 Signaling Mode: robbed-bit

Interface Companding: mulaw
 Idle Code: 11111111

Slip Detection? y

```

2. Type **two-way CO** in the Name field.

Use this name to record useful information such as the type of trunk group associated with this circuit pack or its destination.

3. In the Bit Rate field, type **1.544**.

This is the standard for T1 lines.

4. In the Line Coding field, type **b8zs**.

Avaya recommends you use b8zs whenever your service provider supports it. Since this trunk group only carries voice traffic, you could also use ami-zcs without a problem.

5. In the Framing Mode field, type **esf**.

Avaya recommends you use esf whenever your service provider supports it.

6. In the Signaling Mode field, type **robbed-bit**.

7. In the Interface Companding field, type **mulaw**.

This is the standard for T1 lines in North America.

8. Press ENTER to save your changes.

## More information

### T1 recommended settings

The table below shows recommended settings for standard T1 connections to your local exchange carrier.

| Field          | Value      | Notes                                                                                                                                                                                                         |
|----------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Line Coding    | b8zs       | Use ami-zcs if b8zs is not available.                                                                                                                                                                         |
| Signaling Mode | robbed-bit | Robbed-bit signaling gives you 56K bandwidth per channel. If you need a 64K clear channel for applications like asynchronous data transmission or remote administration access, use common channel signaling. |
| Framing        | esf        | Use d4 if esf is not available.                                                                                                                                                                               |

If you use b8zs line coding and esf framing, it will be easier to upgrade your T1 facility to ISDN should you want to. You can upgrade without reconfiguring external channel service units, and your service provider won't have to reconfigure your network connection.

### E1 recommended settings

DS1 administration for E1 service varies from country to country. See *Avaya MultiVantage™ Application Notes for Type Approval* and use the DS1 screen illustrations in the chapter for your country as a model for your administration.

 **NOTE:**

Remember that the central office serving your switch may be emulating another country's network protocol. If so, you'll have to administer your circuit packs and trunk groups to match the protocol used by your central office.

### Enhanced DS1 administration

Normally, you can't change the DS1 Circuit Pack screen unless you remove all related trunks from their trunk group. However, if the DS1 MSP field on the System-Parameters Customer-Options screen is **y** and you are assigned the associated login permissions, you can change some of the fields on the DS1 Circuit Pack screen without removing the related trunks from their trunk group.

The following enhanced DS1 administration login permissions must be assigned on the Command Permission Categories screen:

- The Maintain Enhanced DS1 field must be **y**.
- The Maintain Trunks field must be **y**.
- The Maintain Switch Circuit Packs field must be **y**.

If you busy out the DS1 circuit pack, you can change the following fields: CRC, Connect, Country Protocol, Framing Mode, Interface, Interconnect, Line Coding, and Protocol Version. After changing these fields, you may also have to change and resubmit associated screens.

### Matching field settings on different screens

For enhanced DS1 administration, some field values on the DS1 Circuit Pack screen must be consistent with those on other screens as shown in the table below. If you change field values on the DS1 screen, you must change the related fields on the other screens and resubmit them.

| <b>DS1 Circuit Pack field</b> | <b>Affected screens</b>                                                            |
|-------------------------------|------------------------------------------------------------------------------------|
| Line Coding                   | Route Pattern<br>Access Endpoint<br>PRI Endpoint<br>Signaling Group<br>Trunk Group |
| Connect                       | Signaling Group                                                                    |
| Protocol Version              | Signaling Group                                                                    |
| Interface                     | Signaling Group                                                                    |
| Interconnect                  | Trunk Group                                                                        |
| Country Protocol              | Signaling Group<br>Trunk Group                                                     |

Specific combinations of settings for some of these fields are shown below.

**ITC, Bit Rate, and Line Coding.** The ITC (Information Transfer Capability) field appears on the Route Pattern screen, Trunk Group screen, and Access Endpoint screen. The Line Coding and the Bit Rate fields appear on the DS1 Circuit Pack screen. The settings for these fields on all the screens must be coordinated as shown in the following tables.

| <b>ITC field</b> | <b>Bit Rate</b> | <b>Line Coding field</b> |
|------------------|-----------------|--------------------------|
| restricted       | 1.544 Mbps      | ami-zcs                  |
|                  | 2.048 Mbps      | ami-basic                |
| unrestricted     | 1.544 Mbps      | b8zs                     |
|                  | 2.048 Mbps      | hdb3                     |

**Interconnect and corresponding Group Type entries.** The Interconnect field appears on the DS1 Circuit Pack screen. The Group Type field appears on the Trunk Group screen. Set these fields as shown in the following table.

| <b>Interconnect field</b> | <b>Group Type field</b>                |
|---------------------------|----------------------------------------|
| co                        | co, did, diod, fx, or wats             |
| pbx                       | access, aplt, isdn-pri, tandem, or tie |

## **Adding trunks to a trunk group**

---

Use this procedure to add new trunks or to change the assignment of existing trunks. To change the assignment of existing trunks, remove them from their current trunk group and add them to the new group.

### **Before you start**

---

You must add a trunk group before you can assign and administer individual trunks. To add a new trunk group, see the instructions in this chapter for the type of group you want to add.

**Instructions**

As an example, we will assign 5 trunks to a new tie trunk group, trunk group 5. We'll use ports on several circuit packs for members of this group.

To assign trunks to trunk group 5:

1. Type **change trunk-group 5** and press RETURN.

The **Trunk Group** screen appears.

2. Move to the Group Member Assignments page.

Some of the fields on this screen won't appear for every trunk group.

| TRUNK GROUP                           |         |       |       |           |       |          |         |           |
|---------------------------------------|---------|-------|-------|-----------|-------|----------|---------|-----------|
| Administered Members(min/max): xxx/yy |         |       |       |           |       |          |         |           |
| Total Administered Members: xxx       |         |       |       |           |       |          |         |           |
| GROUP MEMBER ASSIGNMENTS              |         |       |       |           |       |          |         |           |
|                                       | Port    | Code  | Sfx   | Name      | Night | Mode     | Type    | Ans Delay |

| 15:                                   | _____   | _____ | _____ | _____     | _____ | _____    | _____   | _____     |

3. In the Port field in row 1, type **1B1501**.

This field assigns the first member of the trunk group to a port on a circuit pack.

4. In the Name field in row 1, type **5211**.

This is the extension assigned to this trunk. In general, type the circuit ID or telephone number for each trunk in this field. The information is helpful for tracking your system or troubleshooting problems. Update these fields whenever the information changes.

5. In the Mode field, type **e&m**.

**⚠ CAUTION:**

*An entry in this field is only required for some circuit packs. Dip switch settings on the circuit pack control the signalling mode used on the trunk group, so the entry in the Mode field must correspond to the actual setting on the circuit pack.*

6. In the Type field, type **t1-comp**.  
An entry in this field is only required for some circuit packs.
7. Repeat steps 3–6, as appropriate, for the remaining trunks.  
Notice that you can assign trunks in the same trunk group to ports on different circuit packs.
8. Press ENTER to save your changes.

## Removing trunks from a trunk group

Use this procedure to remove vacant trunk ports or to change the assignment of existing trunks. To change the assignment of existing trunks, remove them from their current TN trunk group and add them to the new group.

### Instructions

We will remove trunks 5214 and 5215 from trunk group 5.

To remove trunks from trunk group 5:

1. Type **change trunk-group 5** and press RETURN.  
The **Trunk Group** screen appears.

| TRUNK GROUP              |         |       |       |           |       |          |                                |       |
|--------------------------|---------|-------|-------|-----------|-------|----------|--------------------------------|-------|
|                          |         |       |       |           |       |          | Administered Members(min/max): | 3/5   |
|                          |         |       |       |           |       |          | Total Administered Members:    | 5     |
| GROUP MEMBER ASSIGNMENTS |         |       |       |           |       |          |                                |       |
| Port                     | Code    | Sfx   | Name  | Night     | Mode  | Type     | Ans                            | Delay |

| 13:                      | _____   | _____ | _____ | _____     | _____ | _____    | _____                          | _____ |
| 14:                      | _____   | _____ | _____ | _____     | _____ | _____    | _____                          | _____ |
| 15:                      | _____   | _____ | _____ | _____     | _____ | _____    | _____                          | _____ |

2. Move to the Group Member Assignments page.  
Some of the fields on this screen won't appear for every trunk group.
3. Move the cursor to the Port 4 field and clear its entry.

4. Move the cursor to the Port 5 field and clear its entry.
5. Press ENTER to save your changes.

The switch will automatically clear the other fields associated with these 2 trunks.

## Removing trunk groups

---

There's more to removing a trunk group than just executing the remove trunk-group command. If you're using Automatic Route Selection ("ARS"), you must remove an outgoing or two-way trunk group from any route patterns that use it. If you've administered Trunk-Group Night Service buttons for the trunk group on any phones, those buttons must be removed or assigned to another trunk group.

### Instructions

---

As an example, we will remove trunk group 5. This two-way group is used in ARS route pattern 2. In addition, a Trunk-Group Night Service button on extension 8410 points to this group.

To remove trunk group 5:

1. In the [Route Pattern](#) screen for route pattern 2, clear the entries for trunk group 5.

If you're replacing trunk group 5 with another trunk group, just type the information for the new trunk group over the old entries. Remember to press ENTER to save your changes.

2. In the [Station](#) screen for extension 8410, clear the entry in the Button Assignments field for the Trunk-Group Night Service button.

Remember to press ENTER to save your changes.

3. In the [Trunk Group](#) screen for trunk group 5, remove all member trunks from the group.

See "[Removing trunks from a trunk group](#)" on page 432 for instructions.

4. Type **remove trunk-group 5** and press ENTER.

The [Trunk Group](#) screen appears.

5. Press ENTER to remove the trunk group.

## Inserting and absorbing digits

Use this procedure to modify the incoming digit string on DID and tie trunks by inserting (adding) or absorbing (deleting) digits. You'll need to do this if the number of digits you receive doesn't match your dial plan.

### Instructions

As an example, let us say you have a DID trunk group. It's group number is 5. Your service provider can only send 4 digits, but your dial plan defines 5-digit extensions beginning with 6:

1. Type **change trunk-group 5** and press ENTER.

The [Trunk Group](#) screen appears.

```

 TRUNK GROUP
Group Number: 5 Group Type: did CDR Reports: y
Group Name: Incoming calls COR: 85 TN: 1 TAC: 105
 Country: 1
 Auth Code? n

TRUNK PARAMETERS
 Trunk Type: wink-start Incoming Rotary Timeout(sec): 5
 Incoming Dial Type: tone
 Trunk Termination: rc Disconnect Timing(msec): 500
 Digit Treatment: insertion Digits: 6
 Expected Digits: 4 Sig Bit Inversion: none
Extended Loop Range? n Trunk Gain: high Drop Treatment: silence
Disconnect Supervision - In? y

```

2. In the Digit Treatment field, type **insertion**.

This field tells the switch to add digits to the incoming digit string. These digits are always added at the beginning of the string.

3. In the Digits field, type **6**.

For insertion, this field defines the specific digits to insert. The switch will add a "6" to the front of the digit strings delivered with incoming calls. For example, if the central office delivers the string "4444," Avaya MultiVantage will change it to "64444," an extension that fits your dial plan.

4. In the Expected Digits field, type **4**.

This field tells the switch how many digits the central office sends.

**NOTE:**

The Expected digits field doesn't appear on the screen for tie trunk groups.

5. Press ENTER to save your changes.

If your service provider sends 7 digits but you only need 5, you need to absorb the first 2 digits in the digit string. To absorb digits:

1. Type change trunk-group 5 and press ENTER.

The **Trunk Group** screen appears.

2. In the Digit Treatment field, type **absorption**.

This field tells the switch to remove digits from the incoming digit string. These digits are always removed from the beginning of the string.

3. In the Digits field, type **2**.

For absorption, this field defines *how many* digits will be absorbed. The switch will remove the first 2 digits from the digit strings delivered with incoming calls. For example, if the central office delivers the string "556-4444," Avaya MultiVantage will change it to "64444," an extension that fits your dial plan.

4. In the Expected Digits field, type **7**.

This field tells the switch how many digits the central office sends.

**NOTE:**

The Expected digits field doesn't appear on the screen for tie trunk groups.

5. Press ENTER to save your changes.

## Related topics

---

See [“Adding a DID trunk group” on page 417](#) for instructions on administering a DID trunk group.

See [“Adding a Tie or Access trunk group” on page 423](#) for instructions on administering a tie trunk group.

## Administering answer detection

---

Use this procedure to administer an outgoing or two-way trunk group for network answer supervision or answer supervision by timeout. If your network supplies answer supervision to a trunk group, you can administer Avaya MultiVantage to recognize and respond to that signal. If your network does not supply answer supervision, you can set a timer for all calls on that group. When the timer expires, the switch assumes the call has been answered and call detail recording starts (if you are using CDR).

For information about answer detection by call classification, contact your Avaya representative or see [“Answer detection” on page 1468](#) for an introduction.

### Before you start

---

Determine whether the trunk group receives answer supervision from your service provider or private network. For example, most loop-start CO, FX, and WATS trunks do not provide answer supervision.

### Instructions

---

As an example, we will administer trunk group 5 for both types of answer detection.

To administer trunk group 5 for answer supervision from the network:

1. In the [Trunk Group](#) screen for group 5, type **y** in the Receive Answer Supervision field.
2. Press ENTER to save your change.

Now we will administer answer supervision by timeout. We'll set the timer to 15 seconds. To administer trunk group 5 for answer supervision by timeout:

1. In the [Trunk Group](#) screen for group 5, type **15** in the Answer Supervision Timeout field.
2. Press ENTER to save your change.

### Related topics

---

See [“Answer detection” on page 1468](#) for detailed information about this feature.

## Administering trunks for listed directory numbers

Listed directory numbers (“LDN”) are the phone numbers given for an organization in public telephone directories. You can administer Avaya MultiVantage so that calls to different listed directory numbers go to the same attendant group. How you administer your system for LDN calls depends on whether the calls are coming in over DID and tie trunks or over CO and FX trunks.

### Instructions

As an example, let us say that one attendant group answers calls for 3 different businesses, each with its own listed directory number:

- Company A — 855-2020
- Company B — 855-1000
- Company C — 855-1111

DID trunks and some tie trunks transmit part or all of the dialed digit string to the switch. If you want these calls to different numbers to go to one attendant group, you must identify those numbers for the switch on the Listed Directory Numbers screen.

We will take the 3 businesses listed above as an example. We will assume your switch receives 4 digits from the central office on a DID trunk group and that you’re not using Tenant Partitioning. To make these calls to different listed directory numbers terminate to your attendant group:

1. Type **change listed-directory-numbers** and press ENTER.

The [Listed Directory Numbers](#) screen appears.

```

LISTED DIRECTORY NUMBERS Page 1 of 2
Night Destination:

Ext Name TN
1: 2020 Company A 1
2: 1000 Company B 1
3: 1111 Company C 1
4: 1
5: 1
6: 1
7: 1
8: 1
9: 1
10: 1

```

2. In the Ext 1 field type **2020**.

This is the LDN for Company A.

3. Type **Company A** in the Name field.

This name will appear on the console display so the attendant knows which business the call is for and how to answer it.

4. Repeat steps 2 and 3 for the other two businesses.

You can enter up to 20 different listed directory numbers on this screen.

5. Press ENTER to save your changes.

To make LDN calls over a CO or FX trunk group terminate to an attendant group, you must type **attd** in the Incoming Destination field on the Trunk Group screen for that group.

When you use the Listed Directory Number screen to assign some extensions to the attendant group, or when you enter **attd** in the Incoming Destination field on the Trunk Group screen for CO or FX trunks, Avaya MultiVantage treats these calls as LDN calls.

### Understanding announcements

An announcement is a recorded message a caller may hear while the call is in a queue, or if a call receives intercept treatment for some reason. An announcement is often used in conjunction with music.

Announcements can be integrated or external. Integrated announcements reside on a circuit pack in the switch carrier. External announcements are stored and played back from adjunct equipment. For more information on external announcements, see *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

### Adding announcement data modules

 **NOTE:**

This task is only required if you are using the TN750-series announcement circuit pack.

Your system uses a data module to save and restore the announcements from the integrated announcement circuit pack and your system's memory. You need to set up the data module that is built into the announcement circuit pack.

### Before you start

You need to record your announcement on a special announcement circuit pack on your system, or on an external device like an answering machine. See your *Avaya MultiVantage™ Solutions Hardware Guide* for circuit pack information.

## Instructions

---

To set up the announcement data module, determine the port location of the Announcement circuit pack. You can find circuit pack information on the Integrated Announcement Board screen.

To set up the data module on the Announcement circuit pack located at 01B18:

1. Type **add data-module next** and press RETURN.

The [Data modules](#) screen appears.

The system automatically fills in the number of the next available extension. Make sure the extension conforms to your dial plan. If you want to assign a specific extension, type that extension in the command instead of “next.”

```

 DATA MODULE
Data Extension: 2002 Name: announcement data module
 Type: announcement COS: 1
Board: 01B18 COR: 1
 ITC: restricted__ TN: 1

ASSIGNED MEMBER (Station with a data extension button for this data module)

 Ext Name
1: _____
```

2. In the Name field, type **announcement data module**.
3. In the Type field, type **announcement** and press RETURN.  
The Port field automatically changes to Board.
4. In the Board field, type **01B18**.  
This is the address of the announcement circuit pack.
5. Press ENTER to save your changes.

## Adding announcement extensions

You need to assign an extension for each announcement that you want to record. After you define an announcement extension, you use it to record and access the announcement.

Announcements can be stored on a TN2501AP circuit pack, TN750 circuit pack or, for S8100 Media Server only, on the Integrated Scalable Speech Processor Application (ISSPA) circuit pack or G700 Media Gateway embedded VAL announcements (hereafter referred to as the Virtual VAL (VVAL)).

### Instructions

We will use extension 1234 for an announcement about business hours. We will use the integrated announcement circuit pack located on 01B18 (for S8100 Media Server, we use 1A13, or for VVAL, we use 12V9 if referring to gateway 12).

To add an announcement extension 1234:

1. Type **change announcements** and press RETURN.  
The [Announcements/Audio Sources](#) screen appears.

| ANNOUNCEMENTS/AUDIO SOURCES |            |     |    |                |   |      |     |      |       |
|-----------------------------|------------|-----|----|----------------|---|------|-----|------|-------|
| Ext .                       | Type       | COR | TN | Name           | Q | QLen | Pro | Rate | Port  |
| 1: 1234                     | integrated | 1_  | 1_ | business hours | n | N/A  | n   | 32   | 01B18 |
| 2: _____                    | _____      | 1_  | 1_ | _____          | n |      |     |      |       |
| 3: _____                    | _____      | 1_  | 1_ | _____          | n |      |     |      |       |
| 4: _____                    | _____      | 1_  | 1_ | _____          | n |      |     |      |       |
| 5: _____                    | _____      | 1_  | 1_ | _____          | n |      |     |      |       |

2. In the Ext field, type **1234**.
3. In the Type field, type **integrated**.
4. In the Name field, type **business hours**.

**NOTE:**

If you are using either the TN2501AP, S8100 Media Server ISSPA circuit packs or G700 VVAL, you must enter a name in the Name field. This name becomes the filename for the announcement file. See [“Announcements/Audio Sources” on page 606](#) for more information on requirements for this field.

5. In the Q field, type **y**.

This sets up an announcement queue so calls wait in a queue to hear an announcement if all the ports on the announcement circuit pack are busy.

If you leave this field n, there is no announcement queue. When all the announcement ports are busy the caller hears busy or other feedback depending upon how the announcement was accessed.

6. N/A appears in the QLen (queue length) field. You cannot change this field for integrated announcements because they have a pre-set queue length.
7. In the Pro (protected) field, type **n**.

If you enter **n**, users with console permissions can change the announcement. If you enter **y**, the announcement cannot be changed.

This field appears only if the Type field is integrated.

8. In the Port field, type:

- the location of the announcement circuit pack (TN2501AP or TN750). In this example, we use **01B18**.
- **1A13** if you are using the S8100 Media Server ISSPA circuit pack
- **ggv9** for G700 VVAL (where **gg** is the gateway number of the G700 Media Gateway)

9. Repeat steps 2 -8 with the correct information for each announcement you want to record.
10. Press ENTER to save your work.

 **NOTE:**

These steps have only created the administered name for the announcement file. You fill the file space when you record an announcement or transfer an announcement file to the circuit pack through a file transfer protocol (“FTP”) session.

To check that the announcement administration is correct:

1. At the SAT, type **list integrated-annc-boards** and press RETURN.

---

## Recording announcements

You can record an announcement for callers to hear when they dial a specific extension. You can use the same steps to change an existing announcement.

For instructions on how to record an announcement at a computer or from a phone, to a TN2501AP, see [“Recording VAL announcements”](#).

If you want to change an announcement that is recorded on a circuit pack without memory, you have to delete the original message and record a new announcement. See [“Deleting and erasing announcements” on page 448](#).

Announcement sessions always use port 0, which also is used for playing announcements, on the TN750 circuit packs. Announcement sessions always use port 1, which is dedicated for telephone access, on the TN2501AP circuit packs. With the TN2501AP circuit pack or VVAL, the port is only busy if another telephone access session is active to the same circuit pack.

To begin an announcement session, the user must dial the administered feature access code (“FAC”) followed by the announcement session. If an announcement session is already in progress, or if a save or restore command is in progress, then the user hears reorder tone (fast busy) and the system drops the call.

If the telephone session port to an integrated circuit pack is in use, then the user hears reorder tone followed by silence. This indicates that the port will be reserved for an announcement session. The user should redial the FAC and extension every 45 seconds to gain access to the port.

### NOTE:

For the MV1.1 and later release of MultiVantage™ software, multiple telephone sessions are allowed, with one session associated with each active integrated announcement circuit pack.

Once an end user accesses an announcement session, the user can dial **1** to record an announcement, **2** to play an announcement, or **3** to delete the announcement. If the circuit pack memory is more than 90% full, then the switch gives stutter dial tone when the user gains access to an announcement session. Even if the user hears stutter tone, the user should begin speaking to record the announcement.

## Before you start

---

- You need to have a phone or console with a class of service (“COS”) that provides console permissions to record announcements.

See [“Command Permission Categories” on page 676](#) for more information on COS permissions.

## Instructions

---

To record an announcement to extension 1234, or change the announcement already recorded there, we’ll use a phone with console permissions. In our example, the announcement feature access code is \*56.

To record or change the announcement:

1. Dial **\*56** from a phone or console.
  - If you hear dial tone, go to step 2.
  - If you hear a fast busy signal, hang up and redial the FAC and extension every 45 seconds until you hear dial tone.
2. Dial the announcement extension **1234**.

You hear dial tone.
3. Dial **1** to begin recording.
  - If you hear a beep or stutter tone, begin speaking. If the circuit pack memory becomes full during recording, the system drops your connection and does not retain the announcement.
  - If you hear intercept tone, hang up and record your announcement on another extension that is assigned to a different circuit pack.
4. To end the recording:
  - If you are using a digital phone, press **#**. You hear dial tone allowing you to continue your session (for example, dial 2 to hear the announcement just recorded).
  - If you are using an analog phone, hang up. If your analog phone is not connected through lineside DS1, the system records an electrical click at the end of the recording. You have to redial the announcement feature access code to continue your session.
5. To listen to the announcement you just recorded:
  - If you are using a digital phone, do not hang up. Dial 2. The recording plays back through the handset.
6. If you are not satisfied with the announcement,
  - press **1** to re-record the announcement.
  - press **3** to delete the announcement and end the recording session.
7. If you want to listen to the announcement after you have hung up, dial the extension from any phone or console. In this example, dial **1234**. The announcement plays through the handset.

**NOTE:**

You have to wait 15 seconds after you record the announcement before you can dial the extension to hear your announcement. During this 15-second window, you cannot record a new announcement and no one can play this announcement. You can re-record the announcement. Dial the feature access code, dial the extension, and press **2** before the 15-second timer expires.

## Saving announcements

---

 **NOTE:**

This task is only applies if you are using a TN750-series announcement circuit pack.

If you are using the TN2501AP (VAL) announcement circuit pack or VVAL announcements, see [“Moving announcements from the VAL circuit pack” on page 461.](#)

If you are using the ISSPA announcements capability of the S8100 Media Server, see [“Backup via the Web interface \(S8100 Media Server only\)” on page 58.](#)

You can save and back-up announcements from an announcement circuit pack to system memory. Your system memory is a tape, disk, or memory card, depending on your system. Use this procedure primarily for announcement circuit packs without built-in memory. VAL and VVAL announcements are backed up internally to non-volatile flash memory.

 **CAUTION:**

*Announcements that are recorded on announcement circuit packs without built-in memory are lost if they are not saved to system memory before power is shut down or the circuit pack is reset or removed.*

For extra security, you may also want to save announcements from announcement circuit packs that have their own built-in memory to another announcement circuit pack with built-in memory or to tape.

 **CAUTION:**

*Do not copy, save, or restore announcements from an announcement circuit pack that has built-in memory to one without built-in memory because it may corrupt the announcement data.*

## Instructions

---

To save or backup announcements when you have only one announcement circuit pack:

1. Type **save announcements** and press RETURN to save the changes.

This process can take up to 40 minutes. You cannot administer your system while it is saving announcements.

To save or backup announcements when you have more than one announcement circuit pack, specify the circuit pack address in your command.

For example to save the announcements from the circuit pack at 01B18:

1. Type **save announcements from 01B18** and press RETURN.

 **NOTE:**

If you have announcement circuit packs with and without built-in memory, save the circuit pack without built-in memory.

If you have a duplicated system with an active processor and a stand-by processor, you can save announcements from the announcement circuit pack to both processors. Simply add system memory for both processors to the save announcements command.

If the save announcements procedure fails on one of the processors, it continues on the other processor, which results in inconsistent announcement data between the two processors.

To verify that the save announcements command was successful:

1. Type **display integrated announcement boards** and press RETURN.

The Integrated Announcement Boards screen appears.

This screen shows the date, time, and location of the announcement circuit pack most recently saved. If the save announcement command failed or the save translations were not run before rebooting, “N/A” appears in these fields.

## **Copying announcements**

---

 **NOTE:**

This task only applies if you are using a TN750-series announcement circuit pack.

If you are using the TN2501AP (VAL) announcement circuit pack or VVAL announcements, see [“Moving announcements from the VAL circuit pack” on page 461](#).

If you are using the ISSPA announcements capability of the S8100 Media Server, see [“Backup via the Web interface \(S8100 Media Server only\)” on page 58](#).

You can copy recorded announcements between back-up disks and tapes when you want to store your recorded announcements in more than one place.

## Instructions

---

We will copy the announcements stored in our weekly disk back-up to the tape back-up we take off company premises for a month. To copy announcements between your back-up disk and tape:

1. Type **copy announcements** and press RETURN to save the changes.

This process can take up to 40 minutes. You cannot administer your system while it is copying announcements.

## Restoring announcements

---

### ⇒ NOTE:

This task only applies if you are using a TN750-series announcement circuit pack.

If you are using the TN2501AP (VAL) announcement circuit pack or VVAL announcements, see [“Moving announcements to a VAL circuit pack or to another LAN device”](#) on page 463.

If you are using the ISSPA announcements capability of the S8100 Media Server, see [“Backup via the Web interface \(S8100 Media Server only\)”](#) on page 58.

You can restore announcements from system memory to an announcement circuit pack. Your system memory is a tape, disk, or memory card, depending on your system.

If you have a duplicated system, your system always restores the announcements located on the active processor.

## Instructions

---

We will restore announcements from our system memory (stored on a disk) to the integrated announcement circuit pack on our system.

To restore announcements from system memory to the integrated announcement circuit pack:

1. Type **restore announcements disk** and press RETURN.

We will restore announcements from system memory to an announcement circuit pack that has built-in memory. We know that the announcement circuit pack is located at 01B18:

1. Type **restore announcements from cabinet 01. carrier B, slot 18** and press RETURN.
2. Press ENTER to restore announcements.

## Fixing problems

---

| Problem                    | Possible causes and solutions                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| You receive error code E28 | You do not have an integrated announcement circuit pack in the system.                                                                                 |
| You receive error code E31 | A call is connected to the announcement on the circuit pack and the port is busy. Wait for the call to disconnect and try restore announcements again. |

If the system crashes or there is a processor interchange during restore announcements, the restore fails and there is no valid announcement on the circuit pack. Repeat the process when the system is operating properly.

## Deleting and erasing announcements

---

You can use a system phone to delete recorded announcements from an announcement circuit pack that does not have stored memory. When you delete the announcement from the circuit pack, you do not delete the announcement from your system backup tape or disk.

You can also erase the announcements stored on an integrated announcement circuit pack that has stored memory.

### NOTE:

The system denies any attempt to delete an announcement while it is playing, being transferred, or being backed up to FLASH (amber LED is flashing), regardless of whether the attempt is from a system phone, the SAT, or through an FTP session.

## Before you start

---

- Look up the announcement extension, which is mapped to a specific TN2501AP circuit pack or VVAL gateway by location.
  1. At the SAT, type **list integrated-annc-boards** and press RETURN.
  2. Determine the extension(s) for the announcement(s) that you want to delete.
- Record the feature access code (FAC) for an announcement session.

## Instructions

---

We will use a phone with console permissions to delete the recorded announcement assigned to extension 1234. In our example, we know that the announcement feature access code is \*56.

1. Dial **\*56** from a phone or console.

You hear dial tone.
2. Dial **1234**.

You hear dial tone.
3. Dial **3** to delete the announcement from the announcement circuit pack.

You hear a confirmation tone.

If the announcement is protected or is playing at the time of the command, you hear a fast busy signal (reorder tone) and the system does not delete the announcement.
4. Hang up the phone.
5. To ensure that an announcement was deleted, dial **1234**.

You hear a busy signal if the announcement was deleted.
6. Repeat Steps 1-5 for each announcement that you want to delete.

You can delete only one announcement at a time.

You may also want to remove the announcement extension from the system. To remove the extension, use your system administration terminal to complete the following steps:

1. Type **change announcements** and press RETURN.

The [Announcements/Audio Sources](#) screen appears.
2. Delete the information in the Ext and Type fields.
3. Press ENTER to save your work.

Finally, to erase announcements on the announcement circuit pack located at 01B18:

1. Type **erase announcements 01B18**.  
A warning message appears.
2. Press ENTER to erase the announcements on the circuit pack.

## Setting up continuous-play announcements

You can set up announcements to keep on repeating while callers are connected to the announcement, so a caller listens until the system plays the entire announcement. With a “barge-in” queue, you do not need a separate port for each announcement.

For example, you can set up an Automatic Wakeup announcement to repeat and use a barge-in queue. When guests pick up the phone to hear an announcement at a particular time, they use only one port and the message repeats on that port until the last guest goes off-hook and the message ends.

### Before you start

You must use an integrated, multiple-integrated, or external announcement for barge-in announcements.

### Instructions

We will set up a continuous-play announcement for our integrated announcement on extension 1234:

1. Type **change announcements** and press RETURN.  
The Announcements/Audio Sources screen appears.

| ANNOUNCEMENTS/AUDIO SOURCES |       |       |           |    |       |                |      |     |      |          |
|-----------------------------|-------|-------|-----------|----|-------|----------------|------|-----|------|----------|
| Ext                         | .     | Type  | COR       | TN | Name  | Q              | QLen | Pro | Rate | Port     |
| 1:                          | 1234  | _____ | integ-rep | 1_ | 1_    | business hours | b    | N/A | n    | 32 01B18 |
| 2:                          | _____ | _____ | 1_        | 1_ | _____ | n              |      |     |      |          |
| 3:                          | _____ | _____ | 1_        | 1_ | _____ | n              |      |     |      |          |
| 4:                          | _____ | _____ | 1_        | 1_ | _____ | n              |      |     |      |          |
| 5:                          | _____ | _____ | 1_        | 1_ | _____ | n              |      |     |      |          |
| 6                           |       |       |           |    |       |                |      |     |      |          |

2. Type **b** in the Q field on the same line as extension 1234.
3. Leave **business hours** in the name field, or enter a new description for the announcement.
4. Press ENTER to save your work.

## Getting started with the TN2501AP or G700 Virtual VAL

---

Before you can use the capabilities of the TN2501AP or G700 VVAL announcement circuit pack, it must be properly installed and configured. These instructions are contained in other documents in the Avaya MultiVantage documentation library. For more information about these and other tasks related to using the TN2501AP, see the documents listed in the following table.

| <b>Task</b>                  | <b>Information source</b>                                                  |
|------------------------------|----------------------------------------------------------------------------|
| Installing the TN2501AP      | <i>Made Easy Tool for DEFINITY®</i>                                        |
| Administering IP Connections | <i>Media Server Configurations</i>                                         |
| Adding IP Routes             |                                                                            |
| Testing the IP Connections   | <i>Installation, Upgrades and Additions for Avaya™ CMC1 Media Gateways</i> |

| Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Information source                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Troubleshooting VAL hardware                                                             | <i>Maintenance for Avaya™ MultiVantage and DEFINITY® Server for your switch model</i>                                                                                                                                                                                                    |

## Managing VAL Announcements Using the SAT

These are the tasks that you can perform from a System Access Terminal (“SAT”):

- Administering an announcement using the SAT
- Recording announcements (with an option to use a system phone)
- Deleting announcements (with an option to use a system phone)

To administer an announcement using the SAT, see [“Adding announcement extensions”](#).

## Recording VAL announcements

---

You can record an announcement for callers to hear when they dial a specific extension or as part of call vectoring. You can use the same steps to change an existing announcement.

You can record announcements in many ways:

- Professional or computer recordings
- Recording new announcements at a computer
- Recording announcements at a system phone

### Before you start

Ensure that the announcement administration is complete before proceeding. You must have assigned a name before you can record an announcement (see [“Adding announcement extensions”](#) on page 441).

If you are replacing a TN750C announcement circuit pack with the TN2501AP,

- get a list and description of the announcements stored on the TN750C circuit pack.
- re-record the announcements on a computer or at a professional recording studio as .wav files (CCITT  $\mu$ -Law or A-Law, 8KHz, 8-bit mono), so that they are ready to transfer to the new announcement circuit pack after it is installed and administered.

Replacing old announcement circuit packs with the new TN2501AP circuit pack requires that you

- remove previous announcement administration
- record new announcements for the TN2501AP
- re-record any announcements currently resident on the TN750 circuit packs that you are replacing. You cannot transfer or restore TN750 announcements from flash card, tape, or optical disk to the TN2501AP.

### **Announcement file format requirements**

In order to be compatible with the TN2501AP circuit pack and the MultiVantage system, announcement recordings must have the following parameters:

- CCITT A-Law or CCITT  $\mu$ -Law companding format (do not use PCM)
- 8KHz sample rate
- 8-bit resolution (bits per sample)
- Mono (channels = 1)
- The  $\mu$ -Law (Mu-Law) companding is used in the United States and A-Law is used internationally. Use the companding format specified on the System Parameters Country Options screen.

Announcements that are recorded in this format occupy 8K bytes per second of file space for every second of recorded speech. For example, a 10-second announcement creates an 80K bytes .wav file.

### **Professional or computer recordings**

In order to be compatible with the TN2501AP circuit pack and the MultiVantage system, announcement recordings must meet the “[Announcement file format requirements](#)” described above.

### **Recording new VAL announcements at a computer**

To record an announcement at a computer:

1. At the computer, open the application that you use to record .wav files.
2. Set the recording parameters.
3. Record the announcement by speaking into a microphone connected to the computer.
4. Play the announcement back at the computer before transferring the file to the VAL circuit pack.

### **Recording VAL announcements at a system phone**

To record an announcement at a system phone, see “[Recording announcements](#)”.

## **Converting announcement files to VAL format**

If you are sharing recordings in a multi-site environment with Avaya MultiVantage and S8100 Media Server or CONVERSANT systems, you must convert announcement files for use on either system. If you need to convert an announcement file to the required format, you can use a sound recording utility application to do so.

To convert a previously-recorded or an S8100 Media Server- or CONVERSANT-compatible announcement file to Avaya MultiVantage-compatible formats:

1. Open the sound recording application on your computer (for example, Microsoft Windows Sound Recorder).
2. Open the file you want to convert.
3. Check the file properties to see if you need to change the parameters.
4. If you need to change the recording parameters, look for a conversion tool (some have a Convert Now option, others use Save As).
5. Change the file parameters to those listed in “[Announcement file format requirements](#)”.

### **NOTE:**

In some applications, assigning the format (for example, CCITT  $\mu$ -Law) sets the remainder of the default parameters. Check each parameter carefully, perhaps changing default settings to match the parameters listed above. CCITT  $\mu$ -Law or A-Law can be referred to as ITU G.711  $\mu$ -Law or ITU G.711 A-Law, respectively.

## **Converting announcements for S8100 Media Server/CONVERSANT**

S8100 Media Server and CONVERSANT have a recording conversion utility that supports file formats similar to those required by VAL. However, the conversion utility can only read PCM-format announcement files.

If you are converting an announcement file for use on S8100 Media Server or CONVERSANT systems:

1. If the file's companding format is already PCM, go to Step 5.  
If you are not sure what the file format is, proceed with Step 2.
2. At a computer, open the sound recording application (for example, Microsoft Windows Sound Recorder).
3. Open the file that you want to convert.

4. Save (Convert Now or Save As) the announcement with these formats:

- Format: PCM
- Bits/Sample: 8
- Sample Rate: 8KHz
- Mono (channels = 1)

**NOTE:**

The recording conversion utility requires that announcement files are in PCM format. VAL files are in CCIT A-Law or  $\mu$ -Law format.

5. Open the file in recording conversion utility.
6. Convert the file to SSP format.

## Deleting VAL announcements

---

### Before you start

Look up the announcement information:

1. At the SAT, type **list directory board** and press RETURN.
2. Determine which announcement(s) that you want to delete, either by extension or filename.
3. Decide whether you are
  - [Deleting individual announcement files using the SAT.](#)
  - [Deleting all announcements on a circuit pack using the SAT.](#)
  - [“Deleting and erasing announcements”](#)

**NOTE:**

The system denies any attempt to delete an announcement while it is playing, being transferred, or backed up to FLASH (amber LED flashes), regardless of whether the attempt is from a system phone, the SAT, or through an FTP session.

## Deleting individual VAL announcement files using the SAT

To delete the announcement named Closed (announcement #3 on [Screen 13](#)):

1. At the SAT, type **remove file board *board-location* /anncl/*filename.wav*** and press RETURN.

For example, to delete announcement #3 in [Screen 13](#), type:

**remove file board 01A11 /anncl/Closed.wav**

### NOTE:

Filenames are case-sensitive and require the .wav file extension.

The */anncl* portion of the command directs the system to the announcement subdirectory on the VAL circuit pack, and */Closed.wav* indicates to delete the filename *Closed.wav*.

## Deleting all VAL announcements on a circuit pack using the SAT

To delete all of the announcement files on the VAL circuit pack:

1. At the SAT, type **busyout board *board-location*** and press RETURN.

Ensure that the command is successful.

### NOTE:

When the VAL board is busied out,

- both the RSCL and ethernet ports are busied out.
- firmware takes down the ethernet link.
- FTP is disabled because the ethernet link is down.
- announcements on that circuit pack cannot play.

2. At the SAT, type **erase announcements board *board-location*** and press RETURN.

### CAUTION:

*This command deletes the specified announcement file in both RAM and FLASH memory. The board firmware ignores the protect flag (Pro field) when erasing the announcement files.*

3. At the SAT, type **list directory board** and press RETURN.

4. Verify that there are no files listed.

**NOTE:**

The announcement directory on the TN2501AP or G700 Media Gateway is **/annc**.

5. Type **list integrated-annc-boards** and press RETURN.

Check the list to see that the announcement was deleted. The Length in Seconds field should show 0.

## Deleting VAL announcements at a system phone

See [“Deleting and erasing announcements”](#).

## Managing VAL Announcements Using FTP

---

This section includes information on setting up and terminating a file transfer protocol (FTP) session and outlines tasks that you can do in an FTP session.

There are 3 basic components to an FTP session:

- Setting up an FTP session
- Performing tasks in an FTP session
- Ending an FTP session

**SECURITY ALERT:**

*Be sure to read and observe all of the Security Alerts regarding enabling and disabling the VAL (TN2501AP or embedded G700 Gateway circuit packs) filesystem and FTP sessions into it.*

## Setting up an FTP session

---

Setting up an FTP session into the VAL circuit pack involves:

1. Preparing the VAL circuit pack for the FTP session, which
  - allows an FTP session on an individual VAL circuit pack.
  - creates an ftp-login and ftp-password for that session.
2. Starting an FTP session from a computer or network management terminal. Before you can start the FTP session, you need to know
  - the VAL circuit pack’s IP address from Step 1.
  - the VAL circuit pack’s ftp-login and ftp-password from Step 1.

## Preparing the VAL circuit pack for the FTP session

To prepare the VAL circuit pack for the FTP session, including setting the username and password:

1. At the SAT, type **enable filesystem board *board-location* login *ftp-username* [3-6 characters] *ftp-password* [7-11 characters]** and press RETURN.

For example, the command:

```
enable filesystem board 01A11 login romeo shakespeare
```

enables an FTP session into the VAL circuit pack in Cabinet 1, carrier A, slot 11. The ***ftp-username*** (3-6 characters) for this session is romeo, and the ***ftp-password*** (7-11 characters) is shakespeare.

When the FTP session on the circuit pack is enabled, the announcement and firmware files are available to anyone who knows the VAL circuit pack's IP address, the ftp-username, and the ftp-password.

### SECURITY ALERT:

*Avaya recommends using a unique ftp-login and ftp-password for each FTP session.*

## Starting an FTP session

If you are unfamiliar with FTP client application software, contact your network administrator for information about access to an FTP session.

The following points apply to FTP sessions into the VAL circuit pack:

- In FTP sessions, filenames are case-sensitive and require the ".wav" file extension.
- Only one FTP session can be active at a time. If an FTP session is already active for a particular VAL circuit pack, the system denies a second attempt to establish an FTP session from some other remote host.
- The VAL circuit pack has two user-accessible directories:
  - /ann for playable announcements
  - / (root) for temporary storage of embedded software updates. Use this directory only for software updates.
- FTP sessions time out after 10 minutes of inactivity.

## Instructions

1. At the FTP client, type **ftp val-ip-address** and press ENTER. The IP address must match the switch-administered IP address (see **change node-names ip**).
2. At the username prompt, type **romeo** and press RETURN.
3. At the password prompt, type **shakespeare** and press RETURN.

The system responds with User logged in.

### NOTE:

Once you are logged in you are in the announcements directory (/annc).

4. If you are moving files to or from the VAL circuit pack, you must set the system to binary mode. At the FTP client, type **bin** and press RETURN.

The system responds with Types set to I, binary mode.

### CAUTION:

*If you do not transfer announcement files in binary mode, they can be corrupted and the FTP session can fail.*

## Performing tasks in an FTP session

---

You are now ready to perform any of these tasks in the FTP session

- Moving announcements from the VAL circuit pack
- Deleting announcements
- Moving announcements to a VAL circuit pack or to another LAN device
- Combining tasks

## Moving announcements from the VAL circuit pack

When you move a file from the VAL circuit pack, you are either

- backing up (archiving) an announcement file.
- copying an announcement to another VAL circuit pack (restoring).

Moving a file in an FTP session means copying the file from the VAL circuit pack to the FTP client's default directory. If you want to move the file to another circuit pack or LAN device, see [“Moving announcements to a VAL circuit pack or to another LAN device”](#).

### Before you start

- Ensure that the steps in “[Setting up an FTP session](#)” are complete.
- Ensure that you have adequate storage space for backup on the remote host computer. Depending on the number of announcements and file type, 60 minutes of recording may require up to 32 megabytes of storage space for backup on the remote host computer.
- Know the IP address and location of the TN2501AP circuit pack as well as the filename (**list directory board**) for the announcement that you want to move.

**NOTE:**

The announcement directory on the TN2501AP circuit pack is **/annc**.

### Instructions

To backup or save an announcement from the VAL board to the client computer through an FTP session:

1. Ensure that the steps in “[Setting up an FTP session](#)” are complete.
2. At the FTP client, type **get filename.wav** and press RETURN.

Example: **get Closed.wav**

The announcement file is written to the directory from which you initiated the FTP session.

**NOTE:**

FTP upload or download of announcement files does not preserve the created timestamp. The file receives the current date and time when it is written to the circuit pack or on the computer.

3. List the FTP client directory contents and ensure that the announcement file is among those listed.
4. Terminate the FTP session (see “[Ending an FTP session](#)”).

### Deleting VAL announcements using FTP

You can delete an announcement from a TN2501AP circuit pack or from a LAN device.

**NOTE:**

The system denies any attempt to delete an announcement while it is playing, being transferred, or backed up to FLASH (amber LED flashes), regardless of whether the attempt is from a system phone, the SAT, or through an FTP session.

### Before you start

- Know the IP address, the announcement filename that you are deleting, and the VAL circuit pack location (**list directory board**).

### Instructions

To delete an announcement on a TN2501AP circuit pack through an FTP session:

1. Ensure that the steps in “[Setting up an FTP session](#)” are complete.
2. At the computer client, type **delete filename.wav** and press RETURN.

Example: **delete Closed.wav**

#### NOTE:

The announcement file is only removed from volatile RAM memory. Approximately 5 minutes later, the file is removed from nonvolatile ROM flash memory.

3. List the contents of the announcement directory and ensure that the file is not listed.

#### NOTE:

The .wav file extension on the announcement files are visible when you view the announcement directory from the FTP client.

4. Terminate the FTP session (see “[Ending an FTP session](#)”).
5. At the SAT, type **change announcements** and press RETURN.

The Announcements/Audio Sources screen appears.

6. Remove the announcement administration by deleting the entire line associated with the announcement.
7. Press ENTER to save your changes.

### Moving announcements to a VAL circuit pack or to another LAN device

You can copy an announcement file to the VAL circuit pack to another LAN device.

### Before you start

- Know the announcement filename and its location on the client computer.
- Know the destination IP address, the filename, and circuit pack location of the announcement and VAL circuit pack to which you are moving the announcement (**list directory board**).

- Ensure that you *have not just* administered the announcement on the Announcements/Audio Sources screen. If announcement administration precedes the file transfer, then
  - the announcement appears with a zero (0) length on the **list integrated-annc-boards** screen.
  - The Time Remaining fields on both the **list integrated-annc-boards** and **display integrated-annc-boards** screens do not refresh to reflect the presence of the new announcement file on the circuit pack.

Use this procedure to ensure that the announcement length is accurate:

1. Administer the announcement at the switch (**change announcements**), using the identical filename in the Name field *without spaces or the .wav file extension*.
2. Attempt to play the announcement that was administered first and transferred second.  
The switch returns a busy signal at the first play attempt.
3. Attempt to play the announcement that was administered first and transferred second in a telephone access session.  
The switch returns a busy signal at the first play attempt.
4. Re-record this announcement with the same filename at a phone (see [“Recording VAL announcements at a system phone”](#)).

## Instructions

To copy an announcement to a VAL circuit pack or to another LAN device:

1. Ensure that the steps in [“Setting up an FTP session”](#) are complete.
2. At the FTP client, type **put filename.wav** and press RETURN.  
Example: **put Closed.wav**
3. List the contents of the VAL announcement directory or LAN device and look for the announcement file among those listed.

### NOTE:

FTP upload or download of announcement files does not preserve its timestamp. The file receives the current date and time when it is written to the circuit pack or to a computer.

4. After you are sure that the announcement is on the VAL circuit pack, administer the announcement at the switch (**change announcements**), using the identical filename in the Name field *without spaces or the .wav file extension*.
5. Terminate the FTP session (see [“Ending an FTP session”](#)).

## Combining tasks

When you combine copying (the **get** command) and moving (the **put** command) announcement files, you can rearrange VAL announcements.

### Before you start

- Know the IP address, the filename, and location of the destination VAL circuit pack to which you are moving an announcement (**list directory board**).

### Instructions

To move an announcement to a VAL circuit pack from another VAL circuit pack in an FTP session:

1. Ensure that the steps in “[Setting up an FTP session](#)” are complete.

#### NOTE:

You must first establish an FTP session into the circuit pack *from which you are restoring an announcement*.

2. List the directory contents and ensure that the announcement file is among those listed.
3. At the FTP client, type **get filename.wav** and press RETURN.

Example: **get Closed.wav**

A copy of the file is written to the directory from which you initiated the FTP session.

4. List the FTP client directory contents to ensure that the announcement is among those listed.
5. Terminate the FTP session (see “[Ending an FTP session](#)”) to the circuit pack *from which you copied the announcement file*.
6. Set up a new FTP session into the destination VAL circuit pack (see “[Setting up an FTP session](#)”).
7. At the FTP client, type **put filename.wav** and press RETURN.

Example: **put Closed.wav**

8. List the VAL announcement directory contents to ensure that the announcement is among those listed.
9. Terminate the FTP session to the circuit pack *to which you copied the announcement file*.

## Ending an FTP session

FTP sessions to a VAL circuit pack originate at the FTP client end. You terminate an FTP session by

- logging out from the FTP client (type **bye** or **quit** and press ENTER)  
*and*
- typing **disable filesystem board board-location** at the SAT and press RETURN. (This clears the ftp-username and ftp-password.)  
*or*
- you can effectively terminate the session from the Avaya MultiVantage end by letting the system time out (10 minutes of inactivity).

### **SECURITY ALERT:**

*Both logging out of the FTP session and disabling the VAL circuit pack filesystem provide a higher degree of security.*

### **NOTE:**

If you only disable the circuit pack filesystem, you can continue your FTP session. However, new FTP session logins are not allowed.

## VAL Manager

---

VAL Manager is a standalone application that allows you to copy announcement files and MultiVantage announcement information to and from a MultiVantage system over a LAN connection.

VAL Manager offers the following basic features:

- Simplified administration to add, change, and remove MultiVantage announcement information.
- The ability to back up and restore announcement files and information to and from a MultiVantage system.
- The ability to view the status of announcement on the VAL circuit pack in any MultiVantage system.

See your Avaya representative for more information about VAL Manager.

## Troubleshooting VAL Announcements

If a working announcement file is deleted via FTP, the next attempt to play the announcement fails, and the system adds a software event to the Denial Events Log. You can view this log to see if the announcement has been deleted, and to see if other events have occurred related to announcements.

### Viewing the Denial Events Log

To view the Denial Events Log:

1. At the SAT, type **display events** and press RETURN.

The Events Report screen appears. This input screen helps you focus the report on events of a certain type or from a certain time period.

```

display events Page 1 of 1 SPE B

 EVENT REPORT

The following options control which events will be displayed.

EVENT CATEGORY

 Category: denial

REPORT PERIOD

 Interval: ___ From: __/__/__:__ To: __/__/__:__

SEARCH OPTIONS

 Vector Number: ___
 Event Type: _____

```

#### Screen 26. Event Report screen (display events)

2. In the Category field, select or type **denial**.
3. You can further limit the report by setting the Interval field to one of the following selections (select from the help list or type the first letter):
  - all
  - month
  - day
  - hour
  - minute

4. Press ENTER.

The Events Report screen appears.

| display events |                          |              |              |             |             |         | Page 1 of 1 |
|----------------|--------------------------|--------------|--------------|-------------|-------------|---------|-------------|
| EVENTS REPORT  |                          |              |              |             |             |         |             |
| Event Type     | Event Description        | Event Data 1 | Event Data 2 | First Occur | Last Occur  | Evt Cnt |             |
| 2028           | Annc file has bad format | 8C0009       | 0            | 05/14/11:55 | 05/14/12:04 | 2       |             |
| 2027           | Annc not found on board  | 8C0007       | 0            | 05/14/12:09 | 05/14/12:09 | 1       |             |

**Screen 27. Events report screen (display events)**

5. Look at the 2027 entry in the Event Type field.

- The Event Description field explains that the announcement is not on the circuit pack.
- The Event Data 1 field contains the announcement number (hexadecimal in the lower three digits).

**⇒ NOTE:**

This denial event only appears once in the Denial Events Log.

**Troubleshooting poor sound quality**

If you played an announcement files back in another environment and it sounded great, but when you play it back in the MultiVantage environment the sound quality is poor, ensure that the file formats are compatible. A good announcement file format must be:

- 8Kbps sample rate
- 8-bit resolution (bits per sample)
- A-law or Mu-law companding format
- Mono (channels = 1)

You must also have the same companding mode administered on page 1 of the System-Parameters Country-Options screen (**change system-parameters country-options**).

The system records a software denial event in the Denial Events Log each time it plays an announcement with a bad file format. Refer back to the [Events report screen \(display events\)](#) and find the 2028 entry in the Event Type field:

- The Event Description field explains that the announcement has a bad file format.
- The Event Data 1 field contains the announcement number (hexadecimal in the lower three digits).

### **Viewing announcement measurements**

You can view a report of announcement measurements, including how many times an announcement was queued to play, how many callers dropped while in queue, and how many times all announcement ports were busy during the report period.

For more information about this report, see *Reports for Avaya MultiVantage™ Software* on your documentation CD.

### **Related topics**

For more information, see [“Announcements” on page 1464](#).

## **Non-volatile storage of announcements on VAL**

---

The VAL board has a RAM based file system on which the announcements are stored. This is where a newly recorded or FTP'd announcement resides. The VAL constantly checks to determine whether changes have been made to the file system (file added or deleted or renamed). Once a change has been detected, the VAL waits for 5 minutes of stability. After such a stable period, the VAL backs up the RAM based file system to its FLASH. The FLASH version of the file system is non-volatile and is what is restored upon reset/reseat.

If you record a new announcement and immediately reset the board, the announcement will be lost. The yellow LED blinks while a backup from RAM to FLASH occurs. All of the above is true regardless which (if any) of the .wav files on the board are administered announcements. It is just the way the board (firmware) operates. Note that only files with a .wav extension in the /annc directly are backed up to FLASH.

## **MultiVantage announcement synchronicity**

---

As mentioned above, there is a separation between the actual files on the VAL board and the set of administered announcements. You can have 100 .wav files on a VAL and only be using (administered) 5 of them. The best way to visualize this is to look at the difference between a **list integrated** and the **list directory board** `<brdloc>/annc` commands.

By going into the Change Announcement screen and changing the name of an announcement, what is happening? You are changing only the administration of the announcement. This means when the extension is called, the new file name is requested. The board still has a file with the old file name but not one with the new file name. You then could run **change announcement** again and switch the name back to the old one and the announcement will play fine. The VAL board is completely unaware that you change the **change announcement** command.

## Changing the name of the announcement

To change the name of an announcement you must do two things.

1. Change the administered name (using the **change announcement** command)
2. Change the name of the file on the VAL board

## Changing the name of the file on the VAL board

There are two ways to accomplish this.

### NOTE:

For the following steps, do not use the FTP **rename** command since the FTP server on the VAL board does not support it.

1. Change the name of the existing file using the PC.
  - a. Access the file on the PC if already there or FTP the announcement file from the VAL board (in binary mode) to the PC.
  - b. Rename it locally on the PC.
  - c. FTP the file with the new name back to the VAL board.
  - d. Assign the new name to the existing extension on the announcement screen
  - e. Delete the old file on the board using the **remove file** command, if you wish, or

2. Re-record the announcement with the new file name.
  - a. FTP the new announcement to the VAL board.
  - b. Assign the new name to the existing extension on the announcement screen (replacing the old file name).
  - c. Delete the old announcement file using the **remove file** command (if desired).

Group communication features allow co-workers to communicate with each other more efficiently. This chapter shows you how to administer your system so users can place a variety of pages from their phones or use their phones as intercoms. You can also give specific users permission to monitor other users' calls or to interrupt active calls with important messages.

### Setting up voice paging over loudspeakers

---

Use this procedure to allow users to make voice pages over an external loudspeaker system connected to your Avaya MultiVantage system. If you're using an external paging system instead of an auxiliary trunk circuit pack, don't use this procedure. External systems typically connect to a trunk or station port and are not administered through the Loudspeaker Paging screen.

#### Before you start

---

Your switch must have one or more auxiliary trunk circuit packs with enough available ports to support the number of paging zones you define. Each paging zone requires 1 port. See the *Avaya MultiVantage™ Solutions Hardware Guide* for information on specific circuit packs.

## Instructions

As an example, we will set up voice paging for an office with 5 zones. We'll allow users to page all 5 zones at once, and we'll assign a class of restriction of 1 to all zones.

1. Type **change paging loudspeaker** and press RETURN.

The [Loudspeaker Paging](#) screen appears.

```

 LOUDSPEAKER PAGING

 CDR? y
 Voice Paging Timeout (sec): 30
 Code Calling Playing Cycles:

PAGING PORT ASSIGNMENTS
Zone Port Voice Paging Code Calling Location:
 TAC COR TN TAC COR TN
1: 01C0501 301 1 1 1 Reception area
2: 01C0502 302 1 1 1 Shipping & receiving
3: 01C0503 303 1 1 1 Staff offices
4: 01C0504 304 1 1 1 Management suite
5: 01C0601 305 1 1 1 Breakroom
6: 1 1
7: 1 1
8: 1 1
9: 1 1
ALL: 310 1 1 1

```

2. In the Voice Paging Timeout field, type **30**.  
This field sets the maximum number of seconds a page can last. In our example, the paging party will be disconnected after 30 seconds.
3. In the Port field for Zone 1, type **01C0501**.  
Use this field to assign a port on an auxiliary trunk circuit pack to this zone.
4. In the Voice Paging — TAC field type **301**.  
Use this field to assign the trunk access code users dial to page this zone. You cannot assign the same trunk access code to more than one zone.
5. In the Voice Paging — COR field type **1**.  
Use this field to assign a class of restriction to this zone. You can assign different classes of restriction to different zones.
6. On the Zone 1 row, type **Reception area** in the Location field.  
Give each zone a descriptive name so you can easily remember the corresponding physical location.

7. Repeat steps 4 through 6 for zones 2 to 5.
8. In the ALL row, type **310** in the Voice Paging — TAC field and **1** in the Voice Paging — COR field.  
  
By completing this row, you allow users to page all zones at once. You do not have to assign a port to this row.
9. Press ENTER to save your changes.

You can integrate loudspeaker voice paging and call parking. This is called “deluxe paging.” You enable deluxe paging by entering y in the Deluxe Paging and Call Park Timeout to Originator field on the Feature-Related System Parameters screen. To allow paged users the full benefit of deluxe paging, you should also enter a code in the Answer Back Access Code field on the Feature Access Code screen if you haven’t already: paged users will dial this code + an extension to retrieve calls parked by deluxe paging.

### Fixing problems

---

| Problem                                                | Possible causes                                                               | Solutions                                                                  |
|--------------------------------------------------------|-------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Users report that they can’t page.                     | The attendant has taken control of the trunk group.                           | Deactivate attendant control.                                              |
| Calls to an extension are heard over the loudspeakers. | The extension may have been forwarded to a trunk access code used for paging. | Deactivate call forwarding or change the extension calls are forwarded to. |

### More information

---

Users page by dialing the trunk access code assigned to a zone and speaking into their handset. For your users’ convenience, you may also want to consider the following options:

- Add the paging trunk access codes to an abbreviated dialing list and allow users to page using the list.
- Assign individual trunk access codes to Autodial buttons.
- Assign individual trunk access codes to Busy buttons. The status lamp tells the user whether or not the trunk is busy.
- For attendants, you can provide one-button paging access by assigning trunk access codes for paging zones to the Direct Trunk Group Select buttons on the attendant console.

With an appropriate class of restriction, remote callers can also make loudspeaker pages.

When deluxe paging is enabled, if a user with an active call dials the trunk access code for a paging zone the active call is automatically parked.

- Users dial the trunk access code + “#” to page and park an active call on their own extensions.
- Users with console permission can park a call on any extension by dialing the trunk access code + the extension.
- Attendants or users with console permissions may park calls to common shared extensions.
- Parked calls can be retrieved from any phone. Paged users simply dial the answer back feature access code + the extension where the call is parked.

See [“Loudspeaker paging” on page 1753](#) for detailed information on voice paging over loudspeakers.

## Setting up chime paging over loudspeakers

---

Use this procedure to allow users to make chime pages over an external loudspeaker system connected to your switch. Users page by dialing a trunk access code and the extension of the person they want to page. The system plays a unique series of chimes assigned to that extension. This feature is also known as Code Calling Access.

### Before you start

---

Your switch must have one or more auxiliary trunk circuit packs with enough available ports to support the number of paging zones you define. Each paging zone requires 1 port. See the *Avaya MultiVantage™ Solutions Hardware Guide* for information on specific circuit packs.

## Instructions

To set up chime paging, you fill out the necessary fields on the Loudspeaker Paging screen and then assign chime codes to individual extensions on the Code Calling IDs screen.

As an example, we will set up chime paging for a clothing store with 3 zones. We'll allow users to page all zones at once, and we will assign a class of restriction of 1 to all zones.

1. Type **change paging loudspeaker** and press RETURN.

The [Loudspeaker Paging](#) screen appears.

```

 LOUDSPEAKER PAGING

 CDR? y
 Voice Paging Timeout (sec):
 Code Calling Playing Cycles: 2

PAGING PORT ASSIGNMENTS
Zone Port Voice Paging Code Calling Location:
 TAC COR TN TAC COR TN
1: 01A0301 1 80 1 1 Men's Department
2: 01A0302 1 81 1 1 Women's Department
3: 01A0303 1 82 1 1 Children's
4: 1
5: 1
6: 1
7: 1
8: 1
9: 1
ALL: 1 89 1 1

```

2. In the Code Calling Playing Cycles field, type **2**.

This field sets the number of times a chime code plays when someone places a page.

3. In the Port field for Zone 1, type **01A0301**.

Use this field to assign a port on an auxiliary trunk circuit pack to this zone.

4. In the Code Calling — TAC field type **80**.

Use this field to assign the trunk access code users dial to page this zone. You cannot assign the same trunk access code to more than one zone.

5. In the Code Calling — COR field type **1**.

Use this field to assign a class of restriction to this zone. You can assign different classes of restriction to different zones.

6. On the Zone 1 row, type **Men's Department** in the Location field.  
Give each zone a descriptive name so you can easily remember the corresponding physical location.
7. Repeat steps 4 through 6 for zones 2 and 3.
8. In the ALL row, type **89** in the Code Calling — TAC field and **1** in the Code Calling — COR field.  
By completing this row, you allow users to page all zones at once. You do not have to assign a port to this row.
9. Press ENTER to save your changes.

To assign chime codes to individual extensions:

1. Type **change paging code-calling-ids** and press RETURN.  
The **Code Calling IDs** screen appears.

| ID ASSIGNMENTS |             | CODE CALLING IDs |       |      |       |      |       |      |       |
|----------------|-------------|------------------|-------|------|-------|------|-------|------|-------|
| Id             | Ext         | Id               | Ext   | Id   | Ext   | Id   | Ext   | Id   | Ext   |

| 122:           | <u>2160</u> | 152:             | _____ | 232: | _____ | 312: | _____ | 342: | _____ |
| 123:           | <u>2167</u> | 153:             | _____ | 233: | _____ | 313: | _____ | 343: | _____ |
| 124:           | _____       | 154:             | _____ | 234: | _____ | 314: | _____ | 344: | _____ |
| 125:           | _____       | 155:             | _____ | 235: | _____ | 315: | _____ | 345: | _____ |
| 131:           | _____       | 211:             | _____ | 241: | _____ | 321: | _____ | 351: | _____ |
| 132:           | _____       | 212:             | _____ | 242: | _____ | 322: | _____ | 352: | _____ |
| 133:           | _____       | 213:             | _____ | 243: | _____ | 323: | _____ | 353: | _____ |
| 134:           | _____       | 214:             | _____ | 244: | _____ | 324: | _____ | 354: | _____ |
| 135:           | _____       | 215:             | _____ | 245: | _____ | 325: | _____ | 355: | _____ |

2. Type the first extension, **2130**, in the Ext field for Id 111.  
Each code Id defines a unique series of chimes.
3. Assign chime codes to the remaining extensions by typing an extension number on the line following each code Id.  
You can assign chime codes to as many as 125 extensions.
4. Press ENTER to save your changes.

## Fixing problems

---

| Problem                            | Possible causes                                     | Solutions                     |
|------------------------------------|-----------------------------------------------------|-------------------------------|
| Users report that they can't page. | The attendant has taken control of the trunk group. | Deactivate attendant control. |

## More information

---

Users page by dialing the trunk access code assigned to a zone. For your users' convenience, you may also want to consider the following options:

- Add the paging trunk access codes to an abbreviated dialing list and allow users to page using the list.

**NOTE:**

Don't use special characters in abbreviated dialing lists used with chime paging.

- Assign individual trunk access codes to Autodial buttons.
- Assign individual trunk access codes to Busy buttons. The status lamp tells the user whether or not the trunk is busy.
- For attendants, you can provide one-button paging access by assigning trunk access codes for paging zones to the Direct Trunk Group Select buttons on the attendant console.

With an appropriate class of restriction, remote callers can also make loudspeaker pages.

## Paging over speakerphones

---

Use this procedure to allow users to make an announcement over a group of digital speakerphones. By dialing a single extension that identifies a group, users can page over all the speakerphones in that group. Speakerphone paging is one-way communication: group members hear the person placing the page but cannot respond directly.

## Before you start

You must have “DCP” set speakerphones or IP set speakerphones.

## Instructions

To set up speakerphone paging, you create a paging group and assign phones to it. In the following example, we’ll create paging group 1 and add 4 members.

1. Type **add group-page 1** and press RETURN.

The [Group Paging Using Speakerphone](#) screen appears.

```

 GROUP PAGING USING SPEAKERPHONE
Group Number: 1 Group Extension: 3210
Group Name: Sales staff COR: 5
GROUP MEMBER ASSIGNMENTS
 Ext Name Ext Name
1: 2009 B. Smith 17:
2: 2010 R. Munoz 18:
3: 2011 Y. Lu 19:
4: 2012 A. Sullivan 20:
5: 21:
6: 22:
7: 23:
8: 24:
9: 25:
10: 26:
11: 27:
12: 28:
13: 29:
14: 30:
15: 31:
16: 32:

```

2. In the Group Extension field, type **3210**.

This field assigns the extension users dial to page the members of this group.

3. In the Group Name field, type **Sales staff**.

This name appears on callers’ phone displays when they page the group.

4. In the COR field, type **5**.

Any user who wants to page this group must have permission to call COR 5.

5. In the Ext field in row 1, type **2009**.

6. Enter the remaining extensions that are members of this group.

The switch fills in the Name fields with the names from the Station screen when you save your changes.

7. Press ENTER to save your changes.

### Fixing problems

---

| Problem                                                | Possible causes                                                           | Solutions                                                             |
|--------------------------------------------------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Users get a busy signal when they try to page.         | All phones in the group are busy or off-hook.                             | Wait a few minutes and try again.                                     |
|                                                        | All phones in the group have Send All Calls or Do Not Disturb activated.  | Group members must deactivate these features in order to hear a page. |
| Some group members report that they don't hear a page. | Some phones in the group are busy or off-hook.                            | Wait a few minutes and try again.                                     |
|                                                        | Some phones in the group have Send All Calls or Do Not Disturb activated. | Group members must deactivate these features in order to hear a page. |

### More information

---

- You can create up to 32 paging groups on one Avaya MultiVantage system.
- Each group can have up to 32 extensions in it.
- One phone can be a member of several paging groups.

### Related topics

---

See [“Group paging” on page 1690](#) for detailed information on paging over speakerphones.

## Paging users who are on active calls

---

Use this procedure to allow one user to interrupt another user's call and make a private announcement. This is called whisper paging. The paging user dials a feature access code or presses a feature button, then dials the extension they want to call. All 3 users can hear the tone that signals the page, but only the person on the paged extension can hear the pager's voice: other parties on the call cannot hear it, and the person making the page cannot hear anyone on the call.

## Before you start

---

Before you administer whisper paging:

- Your switch must have a circuit pack that supports whisper paging. See the *Avaya MultiVantage™ Solutions Hardware Guide* for information on specific models.
- Users must have 6400-, 7400-, 8400-, or 9400-series DCP (digital) phones.

## Instructions

---

You give users the ability to use whisper paging by administering feature buttons or feature access codes.

You can give users feature buttons that make, answer, or block whisper pages. Using the Station screen, you can administer these buttons in any combination as appropriate:

- Whisper Page Activation — allows this user to place a whisper page
- Answerback — allows this user to answer a whisper page

Pressing the answerback button automatically puts any active call on hold and connects the paged user to the paging user.

- Whisper Page Off— allows this user to block whisper pages

If possible, assign this function to a button with a lamp so the user can tell when blocking is active. You cannot administer this button to a soft key.

To allow users to make a whisper page by dialing a feature access code, you simply need to enter a code in the Whisper Page Activation Access Code field on the Feature Access Code screen.

## Related topics

---

See [“Using phones as intercoms” on page 483](#) for another way to give individual users quick, two-way communication.

See [“Whisper paging” on page 1927](#) for detailed information on whisper paging.

## Using phones as intercoms

Use this procedure to make communications quicker and easier for users who frequently call each other. With the intercom feature, you can allow one user to call another user in a predefined group just by pressing a couple of buttons. You can even administer a button that always calls a predefined extension when pressed.

### Instructions

Administering the intercom feature is a 2-step process. First, you create an intercom group and assign extensions to it. Then, to allow group members to make intercom calls to each other, you administer feature buttons on their phones for automatic intercom, dial intercom, or both. This section also provides instructions for allowing one user to pick up another user's intercom calls.

In this example, we'll create intercom group 1 and add extensions 2010 to 2014.

1. Type **add intercom-group 1** and press RETURN.

The [Intercom Group](#) screen appears.

```

 INTERCOM GROUP
 Group Number: 1
 Length of Dial Code: 1

GROUP MEMBER ASSIGNMENTS
 Ext DC Name
1: 2010 1 B. Smith
2: 2011 2 L. Yu
3: 2012 3 R. Munoz
4: 2013 4 K. Mancetti
5: 2014 9 N. Mitchell
6:
7:
8:
9:
10:
11:
12:
13:
14:
15:
16:

```

2. Type **1** in the Length of Dial Code field.

Dial codes can be 1 or 2 digits long.

3. On row 1, type **2010** in the Ext field.

- On row 1, type **1** in the DC field.

This is the code a user will dial to make an intercom call to extension 2010. The length of this code must exactly match the entry in the Length of Dial Code field.

- Repeat steps 3 and 4 for the remaining extensions.

Dial codes don't have to be in any order. The switch fills in the Name field with the name from the Station screen when you save your changes.

- Press ENTER to save your changes.

To allow users to make intercom calls, you must administer feature buttons on the phones in the intercom group. You can administer buttons for dial intercom, automatic intercom, or both on multi-appearance phones. You can't administer either intercom feature on single-line phones, but you can assign single-line phones to intercom groups so those users can receive intercom calls.

As an example, we will set up automatic intercom between extensions 2010 (dial code = 1) and 2011 (dial code = 2) in intercom group 1.

To set up automatic intercom between extensions 2010 and 2011:

- Type **change station 2010** and press RETURN.

The **Station** screen appears.

```

 STATION
SITE DATA
 Room: _____
 Jack: _____
 Cable: _____
 Floor: _____
 Building: _____

 Headset? n
 Speaker? n
 Mounting: d
 Cord Length: 0
 Set Color: _____

ABBREVIATED DIALING
 List1: _____ List2: _____ List3: _____

BUTTON ASSIGNMENTS
 1: call-appr_ 6: _____
 2: call-appr_ 7: _____
 3: call-appr_ 8: _____
 4: auto-icom_ Grp: 1 DC: 2 9: _____
 5: dial-icom_ Grp: 1 10: _____

```

- Move to the page with the Button Assignments fields.
- In Button Assignments field 4, type **auto-icom** and press TAB.

The Grp and DC fields appear.

4. In the Grp field, type **1**.

This is the number of the intercom group. Since an extension can belong to more than one intercom group, you must assign a group number to intercom buttons.

5. In the DC field, type **2**.

This is the dial code for extension 2011, the destination extension.

6. Press ENTER to save your changes.

7. Repeat steps 1–6 for extension 2011.

Assign a dial code of **1** to 2011's automatic intercom button.

To give a member of a group the ability to make intercom calls to all the other members, administer a Dial Intercom button on the member's phone. Type the number of the intercom group in the Grp field beside the Dial Intercom button.

You can also give one user instant, one-way access to another. For example, to give user A instant, one-way access to user B, administer an Automatic Intercom button on A's phone only. You don't have to administer any intercom button on B's phone. If B has a Dial Intercom button, he can make an intercom call to A the same way as he would to any other group member.

When users are in the same call pickup group, or if Directed Call Pickup is enabled on your switch, one user can answer an intercom call to another user. To allow users to pick up intercom calls to other users, you must enter *y* in the Call Pickup on Intercom Calls field on the Feature-Related System Parameters screen.

## **Related topics**

---

See [“Abbreviated dialing” on page 1449](#) for information on another way for users to call each other without dialing complete extension numbers.

See [“Intercom” on page 1724](#) for detailed information on intercom functions.

## Setting up automatic answer intercom calls

Automatic Answer Intercom Calls (Auto Answer ICOM) allows a user to answer an intercom call within the intercom group without pressing the intercom button. Auto Answer ICOM works with digital, BRI, and hybrid phones with built-in speaker, headphones, or adjunct speakerphone.

### SECURITY ALERT:

*Press the Do Not Disturb button or the Send All Calls button on your phone when you don't want someone in your intercom group to listen in on a call. Auto Answer ICOM does not work when the Do Not Disturb button or the Send All Calls button is pressed on the phone.*

## Administration

This section contains an example, with step-by-step instructions, on how to set up Auto Answer ICOM.

In this example, you set up Auto Answer ICOM on station 12345. To do so, complete the following steps:

1. Type **change station 12345**.

The Station screen for extension 12345 appears.

```

change station 12345 Page 2 of X

```

2. Move to the Auto Answer field and enter **icom**.
3. Press ENTER to save your changes.

## Observing calls

---

Use this procedure to allow designated users, normally supervisors, to listen to other users' calls. This capability is often used to monitor service quality in call centers and other environments where employees serve customers over the phone. On Avaya MultiVantage, this is called "service observing" and the user observing calls is the "observer."

This section describes service observing in environments without Automatic Call Distribution ("ACD") or call vectoring. To use service observing in those environments, see *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

### Before you start

---

On the System Parameter Customer-Options screen, verify the:

- Service Observing (Basic) field is **y**.

If you want to enable remote service observing by allowing remote users to dial a feature access code, verify the:

- Service Observing (Remote/By FAC) field is **y**

If the appropriate field is not enabled, contact your Avaya representative.

### Instructions

---

#### **SECURITY ALERT:**

*Listening to someone else's calls may be subject to federal, state, or local laws, rules, or regulations. It may require the consent of one or both of the parties on the call. Familiarize yourself with all applicable laws, rules, and regulations and comply with them when you use this feature.*

In this example, we'll set up service observing for a manager. The manager's class of restriction is 5. We'll assign a feature button to the manager's phone and allow her to monitor calls on local extensions that have a class of restriction of 10. Everyone on an observed call will hear a repetitive warning tone.

To set up service observing:

1. Set the observer's class of restriction to permit service observing:
  - a. In the Class of Restriction screen for COR 5, type **y** in the Can Be A Service Observer? field.
  - b. Move to the page of the Class of Restriction screen that shows service observing permissions.
  - c. Type **y** in the field for class of restriction 10.
2. In the Class of Restriction screen for COR 10, type **y** in the Can Be Service Observed? field.

Anyone with class of restriction 5 now has permission to observe extensions with class of restriction 10. To further restrict who can observe calls or be observed, you may want to create special classes of restriction for both groups and use these classes only for the appropriate extensions.

3. In the Station screen, assign a Service Observing button to the observer's phone.

A service observing button permits users to switch between listen-only and listen-and-talk modes simply by pressing the button.
4. To activate the warning tone, type **y** in the Service Observing — Warning Tone field on the Feature-Related System Parameters screen.

A unique 2-second, 440-Hz warning tone plays before an observer connects to the call. While the call is observed, a shorter version of this tone repeats every 12 seconds.

In order for users to activate service observing by feature access codes, use the Feature Access Code screen to administer codes in one or both of the following fields:

- Service Observing Listen Only Access Code
- Service Observing Listen/Talk Access Code

When using feature access codes, observers must choose a mode at the start of the session. They cannot switch to the other mode without ending the session and beginning another.

 **NOTE:**

Feature access codes are required for remote observing.

---

## Related topics

See [“Service observing” on page 1817](#) for detailed information on service observing.

### Types of data connections

You can use MultiVantage to allow the following types of data elements/devices to communicate to the world:

- Data Terminals
- Personal computers
- Host Computers (for example, CentreVu CMS or Intuity AUDIX)
- Digital Phones (Digital Communications Protocol (“[DCP](#)”) and Integrated Services Digital Network-Basic Rate Interface (“[ISDN-BRI](#)”))
- Audio/Video Equipment
- Printers
- Local area networks (“[LAN](#)”)

You enable these connections using a large variety of data communications equipment, such as:

- Modems
- Data Modules
- Asynchronous Data Units (“[ADU](#)”)
- Modem Pools
- Data/modem pooling circuit packs

Once you have connected these data devices to the switch, you can use networking and routing capabilities to allow them to communicate with other devices over your private network or the public network.

This section describes the system features available to enable data communications.

## **Data Call Setup**

---

Data Call Setup provides multiple methods to set up a data call:

- Data-terminal (keyboard) dialing
- Telephone dialing
- Hayes AT command dialing
- Administered connections
- Hotline dialing

## **Administering Data Call Setup**

---

For data-terminal dialing:

1. Choose one of the following data modules and administer all fields:
  - Processor/Trunk Data Module
  - Data Line Data Module
  - 7500 Data Module
2. On the Modem Pool Group screen, administer the Circuit Pack Assignments field.  
See [“Modem Pool Group” on page 1038](#) for more information.

For telephone dialing:

1. Choose one of the following:
  - On the Feature Access Code screen, administer the Data Origination Access Code field. See [“Feature Access Code” on page 781](#) for more information.
  - On the Station screen, assign one button as data-ext (Ext:). See [“Station” on page 1127](#) for more information.
2. Choose one of the following data modules and administer all fields:
  - Processor/Trunk Data Module
  - Data Line Data Module

3. On the Modem Pool Group screen, administer the Circuit Pack Assignments field. See [“Modem Pool Group” on page 1038](#) for more information.

Depending on the hardware used, assign ports to the following:

- Data modules
- 7400D-series or CALLMASTER digital telephones
- 7500D-series telephones with asynchronous data module (ADM)
- Analog modems (port is assigned using 2500 telephone screen)

## Characters used in Data Call Setup

Basic-digit dialing is provided through an ADM or 7500B data module. The user can enter digits from 0 to 9, \*, and # from a 7500 or 8500 series telephone keypad or an EIA-terminal interface. In addition, the user can dial the following special characters.

**Table 6. Special characters**

| Character              | Use                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| SPACE, -, (, and)      | improves legibility. The switch ignores these characters during dialing.                                                                            |
| + character (wait)     | interrupts or suspends dialing until the user receives dial tone                                                                                    |
| , (pause)              | inserts a 1.5-second pause                                                                                                                          |
| % (mark)               | indicates digits for end-to-end signaling (touch-tone). This is required when the trunk is rotary. It is not required when the trunk is touch-tone. |
| UNDERLINE OR BACKSPACE | corrects previously typed characters on the same line                                                                                               |
| @                      | deletes the entire line and starts over with a new DIAL: prompt                                                                                     |

Each line of dialing information can contain up to 42 characters (the + and % characters count as two each).

Examples of dialing are:

- DIAL: 3478
- DIAL: 9+(201) 555-1212
- DIAL: 8, 555-2368
- DIAL: 9+555-2368+%9999+123 (remote access)

The following call-progress messages and their meanings are provided for DCP and ISDN-BRI modules.

**Table 7. Call-progress messages**

| Message             | Application | Meaning                                                                     |
|---------------------|-------------|-----------------------------------------------------------------------------|
| DIAL:               | DCP         | Equivalent to dial tone. Enter the desired number or FAC followed by Enter. |
| CMD                 | BRI         | Equivalent to dial tone. Enter the desired number or FAC followed by Enter. |
| RINGING             | DCP, BRI    | Equivalent to ringing tone. Called terminal is ringing.                     |
| BUSY                | DCP, BRI    | Equivalent to busy tone. Called number is busy or out of service.           |
| ANSWERED            | DCP, BRI    | Call is answered.                                                           |
| ANSWERED - NOT DATA | DCP         | Call is answered and a modem answer tone is not detected.                   |
| TRY AGAIN           | DCP, BRI    | Equivalent to reorder tone. System facilities are currently not available.  |
| DENIED              | DCP, BRI    | Equivalent to intercept tone. Call cannot be placed as dialed.              |
| ABANDONED           | DCP, BRI    | Calling user has abandoned the call.                                        |
| NO TONE             | DCP, BRI    | Tone is not detected.                                                       |
| CHECK OPTIONS       | DCP, BRI    | Data-module options are incompatible.                                       |
| XX IN QUEUE         | DCP, BRI    | Current position in queue.                                                  |
| PROCESSING          | DCP, BRI    | Out of queue. Facility is available.                                        |
| TIMEOUT             | DCP, BRI    | Time is exceeded. Call terminates.                                          |

*Continued on next page*

**Table 7. Call-progress messages (Continued)**

| Message           | Application | Meaning                                                                                                                              |
|-------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| FORWARDED         | DCP, BRI    | Equivalent to redirection-notification signal. Called terminal activates Call Forwarding and receives a call, and call is forwarded. |
| INCOMING CALL     | DCP, BRI    | Equivalent to ringing.                                                                                                               |
| INVALID ADDRESS   | DCP         | Entered name is not in alphanumeric-dialing table.                                                                                   |
| WRONG ADDRESS     | BRI         | Entered name is not in alphanumeric-dialing table.                                                                                   |
| PLEASE ANS-       | DCP, BRI    | Originating telephone user transferred call to data module using One-Button Transfer to Data.                                        |
| TRANSFER          | DCP         | Data Call Return-to-Voice is occurring.                                                                                              |
| CONFIRMED         | DCP, BRI    | Equivalent to confirmation tone. Feature request is accepted, or call has gone to a local coverage point.                            |
| OTHER END         | DCP, BRI    | Endpoint has terminated call.                                                                                                        |
| DISCONNECTED      | DCP, BRI    | Call is disconnected.                                                                                                                |
| WAIT              | DCP, BRI    | Normal processing continues.                                                                                                         |
| WAIT, XX IN QUEUE | DCP         | Call is in a local hunt-group queue.                                                                                                 |

## DCP data modules

### Data-terminal dialing

DCP data-terminal dialing allows a user to set up and disconnect data calls directly from a data terminal as follows.

1. At the DIAL: prompt, the user types the data number. The message RINGING displays.
2. If the call is queued, the message WAIT, XX IN QUEUE displays. The queue position XX updates as the call moves up in queue.

3. To originate and disconnect a call, the user presses BREAK. If the terminal does not generate a 2-second continuous break signal, the user can press originate/disconnect on the data module.
4. The user can enter digits at the DIAL: prompt.

## Telephone dialing

DCP telephone dialing allows telephone users to originate and control data calls from a telephone.

Users can set up a call using any unrestricted telephone and then transfer the call to a data endpoint.

The primary way to make data calls is with multiappearance telephone data-extension buttons. Assign any administrable feature button as a data-extension button. The data-extension button provides one-touch access to a data module. The number of assigned data-extension buttons per telephone is not limited.

The following options, either alone or combined, permit flexibility in making data calls from a telephone.

- **One-Button Transfer to Data**

A user can transfer a call to the associated data module by pressing the data-extension button after the endpoint answers.

- **Return-to-Voice**

A user can change the connection from data to voice. The user presses the data-extension button associated with the busy data module. If the user hangs up, the call disconnects. Return of a data call to the telephone implies that the same data call is continued in the voice mode, or transferred to point.

The Return-to-Voice feature is denied for analog adjuncts.

- **Data Call Preindication**

A user, before dialing a data endpoint, can reserve the associated data module by pressing the data-extension button. This ensures that a conversion resource, if needed, and the data module are reserved for the call. Avaya recommends the use of Data Call Preindication before 1-button transfer to data for data calls that use toll-network facilities. Data Call Preindication is in effect until the associated data-extension button is pressed again for a 1-button transfer; there is no time-out.

## ISDN-BRI data modules

---

### Data-terminal dialing

A user can set up and disconnect data calls directly from a data terminal without using a telephone as follows:

1. The user presses ENTER a few times. If the CMD: prompt does not appear, the user presses BREAK A + T at the same time, and then presses ENTER.
2. At the CMD: prompt, the user types and presses ENTER.
3. To disconnect, the user enters +++. At the CMD: prompt, the user types end and presses ENTER.

### Telephone dialing

To make a data call, an ISDN-BRI phone user presses the data button on the terminal, enters the number on the dial pad, and then presses the data button again.

The following data functions are not available on ISDN-BRI phones:

- One-Button Transfer to Data
- Return-to-Voice
- Data Call Preindication
- Voice-Call Transfer to Data and Data-Call Transfer to Voice

The system handles all presently defined BRI bearer data-call requests. Some capabilities that are not supported by Avaya terminals are provided by non-Avaya terminals. If the switch does not support a capability, a proper cause value returns to the terminal.

BRI terminals receive a cause or reason code that identifies why a call is being cleared. The BRI data module converts certain cause values to text messages for display.

In a passive-bus multipoint configuration, the system supports two BRI endpoints per port, thus doubling the capacity of the BRI circuit pack. When you change the configuration of a BRI from point-to-point to multipoint, the original endpoint does not need to reinitialize. Only endpoints that support service profile identifier (“SPID”) initialization can be administered in a multipoint configuration.

## **Analog modems**

---

When a telephone user places a data call with a modem, the user dials the data-origination access code assigned in the system before dialing the endpoint.

## **Considerations**

---

- A BRI phone cannot call a data terminal, and a data terminal cannot call a BRI phone.

## **Interactions**

---

- **Abbreviated Dialing**

Only 22 of the 24 (maximum) digits in an abbreviated-dialing number are available for keyboard dialing. The remaining two digits must contain the wait indicator for tone detection.
- **Call Coverage**

A hunt group made up of data endpoints cannot be assigned a coverage path.
- **Call Detail Recording**

CDR records the use of modem pools on trunk calls.
- **Call Forwarding All Calls**

Calls received by a data module can be forwarded. Activate Call Forwarding All Calls with data-terminal (keyboard) dialing. If the forwarded-to endpoint is an analog endpoint and the caller is a digital endpoint, modem pooling is activated automatically.
- **Pooled Modems with Hunt Groups**

UCD can provide a group of data modules or analog modems for answering calls to connected facilities (for example, computer ports).
- **World-Class Tone Detection**

Multiple-line data-terminal dialing is supported if the administered level of tone detection is precise. You can administer tone-detection options. The message that Data Call Setup sends to users varies according to the option. If the option is not set to precise, and a data call is set up over an analog trunk, messages describing the status of the called endpoint (for example, RINGING, BUSY, TRY AGAIN) change according to which tone-detection option is selected.

## Default Dialing

---

Default Dialing provides data-terminal users who dial a specific number the majority of the time a very simple method of dialing that number. Normal data terminal dialing and alphanumeric dialing are unaffected.

Default Dialing enhances data terminal (keyboard) dialing by allowing a data-terminal user to place a data call to a preadministered destination by either pressing a `Return` at the `DIAL:` prompt (for data terminals using DCP data modules) or typing `d` and pressing `RETURN` at the `CMD:` prompt (for data terminals using ISDN-BRI data modules). The data-terminal user with a DCP data module can place calls to other destinations by entering the complete address after the `DIAL:` prompt (normal data terminal dialing or alphanumeric dialing). The data-terminal user with an ISDN-BRI data module can place calls to other destinations by typing `d`, a space, the complete address, and press `RETURN` after the `CMD:` prompt.

### NOTE:

DU-type hunt groups connecting the system to a terminal server on a host computer have hunt-group extensions set to no keyboard dialing.

For the AT command interface supported by the 7400A/7400B/8400B data module, to dial the default destination, enter the `ATD` command (rather than press return).

## Administering Default Dialing

---

1. You can use an abbreviated dialing list for your default ID. See [“Abbreviated dialing” on page 1449](#) for more information.
2. On the Data Module screen, administer the following fields:
  - Special Dialing Option as default.
  - Abbreviated Dialing List, enter the list to use.
  - AD Dial Code.

## Alphanumeric Dialing

---

Alphanumeric Dialing enhances data-terminal dialing by allowing users to place data calls by entering an alphanumeric name rather than a long string of numbers.

For example, a user could type 9+1-800-telefon instead of 9+1-800-835-3366 to make a call. Users need to remember only the alpha-name of the far-end terminating point.

Alphanumeric Dialing allows you to change a mapped string (digit-dialing address) without having to inform all users of a changed dial address. Users dial the alpha name.

When a user enters an alphanumeric name, the system converts the name to a sequence of digits according to an alphanumeric-dialing table. If the entered name is not found in the table, the system denies the call attempt and the user receives either an `Invalid Address` message (DCP) or a `Wrong Address` message (ISDN-BRI).

Because data terminals access the switch via DCP or ISDN-BRI data modules, dialing procedures vary:

- For DCP, at the `DIAL:` prompt users type the alphanumeric name and press `RETURN`.
- For ISDN-BRI, at the `CMD:` prompt users type `d`, a space, and the alphanumeric name, and press `RETURN`.

More than one alphanumeric name can see the same digit string.

## Administering Alphanumeric Dialing

---

1. On the Alphanumeric Dialing Table screen, administer the Alpha-name and Mapped String fields. See [“Alphanumeric Dialing Table” on page 604](#) for more information.

## Considerations

---

### NOTE:

Alphanumeric dialing does not apply to endpoints with Hayes modems.

## Data Hotline

---

Data Hotline provides for automatic-nondial placement of a data call preassigned to an endpoint when the originating switch goes off-hook. Use for security purposes.

### Administering Data Hotline

---

1. You can use an abbreviated dialing list for your default ID. See [“Abbreviated dialing” on page 1449](#) for more information.
2. On the Station screen, administer the following fields. See [“Station” on page 1127](#) for more information.
  - Abbreviated Dialing List
  - Special Dialing Option
  - Hot Line Destination
3. On the Data Module screen, administer the Abbreviated Dialing List1 field.

The system automatically places Data Hotline calls to preassigned extensions or off-premises numbers. Calling terminals are connected to the system by a data module. Users should store the destination number in the abbreviated dialing list for future reference.

### Interactions

---

- Call Forwarding — All Calls  
A Data Hotline caller cannot activate both Call Forwarding and Data Hotline. Dialing the Call Forwarding feature access code (FAC) causes activation of the Data Hotline instead.

## Data Privacy

---

Data Privacy protects analog data calls from being disturbed by any of the system's overriding or ringing features.

### Administering Data Privacy

---

1. Choose either of the following:
  - On the Feature Access Code screen, administer the Data Privacy Access Code field. See [“Feature Access Code” on page 781](#) for more information.
  - On the Class of Service screen, administer the Data Privacy field. See [“Class of Service” on page 672](#) for more information.
2. On the Station screen, administer the Class of Service field. See [“Station” on page 1127](#) for more information.

To activate this feature, the user dials the activation code at the beginning of the call.

### Considerations

---

- Data Privacy applies to both voice and data calls. You can activate Data Privacy on Remote Access calls, but not on other incoming trunk calls. Data Privacy is canceled if a user transfers a call, is added to a conference call, is bridged onto a call, or disconnects from a call. You can activate Data Privacy on calls originated from attendant consoles.
- For virtual extensions, assign the Data Privacy Class of Service to the mapped-to physical extension.

### Interactions

---

- Attendant Call Waiting and Call Waiting Termination  
If Data Privacy is active, Call Waiting is denied.
- Bridged Call Appearance — Single-Line Telephone  
If you activate Data Privacy or assign Data Restriction to a station involved in a bridged call and the primary terminal or bridging user attempts to bridge onto the call, this action overrides Data Privacy and Data Restriction.
- Busy Verification  
Busy Verification cannot be active when Data Privacy is active.

- Intercom — Automatic and Dial

An extension with Data Privacy or Data Restriction active cannot originate an intercom call. The user receives an intercept tone.

- Music-on-Hold Access

If a user places a call with Data Privacy on hold, the user must withhold Music-on-Hold to prevent the transmission of tones that a connected data service might falsely interpret as a data transmission.

- Priority Calls

If a user activates Data Privacy, Priority Calls are denied on analog telephones. However, Priority Calls appear on the next available line appearance on multiappearance telephones.

## Data Restriction

---

Data Restriction protects analog-data calls from being disturbed by any of the system's overriding or ringing features or system-generated tones.

Data Restriction applies to both voice and data calls.

Once you administer Data Restriction for an analog or multiappearance telephone or trunk group, the feature is active on all calls to or from the terminal or trunk group.

 **NOTE:**

Do not assign Data Restriction to attendant consoles.

## Administering Data Restriction

---

1. On the Station screen, set the Data Restriction field to y. See [“Station” on page 1127](#) for more information.
2. Choose one of the following trunk groups and set the Data Restriction field to y. See [“ISDN trunk group” on page 936](#) and [“Trunk Group” on page 1233](#) for more information.
  - Access
  - Advanced Private-Line Termination ([“APLT”](#))
  - Circuit Pack ([“CP”](#))
  - Customer-Premises Equipment ([“CPE”](#))
  - Direct Inward Dialing ([“DID”](#))
  - Foreign Exchange ([“FX”](#))

- Integrated Services Digital Network-Primary Rate Interface (“ISDN-PRI”)
- Release-Link Trunk (“RLT”)
- Tandem
- Tie
- Wide Area Telecommunications Service (“WATS”)

### **Interactions - Data Restriction**

---

- Attendant Call Waiting and Call Waiting Termination  
If Data Restriction is active, Call Waiting is denied.
- Busy Verification  
Busy Verification cannot be active when Data Restriction is active.
- Intercom — Automatic and Dial  
An extension with Data Privacy or Data Restriction activated cannot originate an intercom call. The user receives an Intercept tone.
- Music-on-Hold Access  
If a user places a call with Data Restriction on hold, The user must withhold Music-on-Hold to prevent the transmission of tones that a connected data service might falsely interpret as a data transmission.
- Priority Calls  
Priority Calls are allowed if the analog station is idle. Call Waiting (including Priority Call Waiting) is denied if the station is busy. However, Priority Calls appear on the next available line appearance on multiappearance telephones.
- Service Observing  
A data-restricted call cannot be service observed.

### **Data-Only Off-Premises Extensions**

---

Data-Only Off-Premises Extensions allows users to make data calls involving data communications equipment (“DCE”) or digital terminal equipment (“DTE”) located remotely from the system site.

A Data-Only Off-Premises Extension uses an on-premises modular trunk data module (“MTDM”). The system communicates with remote data equipment through the private-line facility linking the on-premises MTDM and the remote data equipment.

Users can place data calls to this type of data endpoint using Telephone Dialing or Data Terminal (Keyboard) Dialing. Since there is no telephone at the remote site, originate data calls from the remote data terminal using Keyboard Dialing only.

## **Administering Data-Only Off-Premises Extensions**

---

1. On the Processor/Trunk Data Module screen, administer all fields.  
See [“Data modules” on page 707](#) for more information.

## **Considerations**

---

- The system does not support communications between two TDMs. Modem Pooling is similar to a “TDM”, it cannot be used on calls to or from a Data-Only Off-Premises Extension.

## **Interactions**

---

- Telephone Dialing

An on-premises multiappearance telephone may have a Data Extension button associated with the TDM used for a Data-Only Off-Premises Extension. The telephone user and the remote user share control of the data module. Actions of the user at the telephone may affect the remote user.

  - 1-Button Transfer to Data

The telephone user can transfer a call to the Data-Only Off-Premises Extension. The Data Extension button lamp on the telephone lights and the Call in Progress lamp on the data module lights during a data call.
  - Data Call Preindication

The multiappearance telephone user presses the idle associated Data Extension button to reserve a data module. The data module is busy to all other users. When the user reserves a data module, the lamp associated with the Data Extension button winks and lights at any other associated telephones. A remote user receives the BUSY message when attempting to originate a call.
  - Return-to-Voice

To establish a data call, the telephone user presses the associated busy Data Extension button to transfer the call to the telephone. The data module associated with the Data Extension button is disconnected from the call. The Call in Progress lamp on the data module goes dark.

## Data Modules — general

A Data Module is a connection device between a basic-rate interface (BRI) or “DCP” interface of the switch and DTE or DCE.

The following types of data modules can be used with the system:

- Announcement data module
- Data line data module
- Processor/trunk data module (P/TDM)
- Netcon data module (DEFINITY SI configurations only) See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.
- Processor interface data module (DEFINITY SI configurations only). See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.
- System port data module (DEFINITY R configurations only)
- X.25 data module (DEFINITY R configurations only). See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.
- 7500 data module
- World Class BRI data module
- Ethernet data module. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.
- Point-to-Point Protocol (“PPP”) data module. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

### NOTE:

The 51X series Business Communications Terminals (“BCT”) are not administered on the Data Module screen. The 510 BCT (equivalent to a 7405D with a display and built-in DTDM), 515 BCT (equivalent to a 7403D integrated with 7405D display module function, data terminal and built-in DTDM), and the 7505D, 7506D, and 7507D have a DCP interface but have built-in data module functionality. Both are administered through the Station screen.

## Detailed description of data modules

---

TTI allows data modules without hardware translation to merge with an appropriate data module connected to an unadministered port. The unadministered port is given TTI default translation sufficient to allow a terminal connected to the data module (connected to the port) to request a TTI merge with the extension of a data module administered without hardware translation.

**⇒ NOTE:**

TTI is not useful for Announcement and X.25 hardware.

Administration Without Hardware supports PDM, TDM, Data-Line, Announcement, and X.25 data modules.

**⇒ NOTE:**

The 513 BCT has an EIA interface rather than a DCP interface (no built in data module, attachable telephone, or telephone features). The 513 BCT is not administered; only the data module to which the 513 BCT is connected is administered.

### 7400A/7400B+/8400B+ Data Module

Use the 7400A data module instead of an MTDM when you support combined Modem Pooling. The 7400A data module supports asynchronous operation at speeds up to 19200-bps, and provides a DCP interface to the switch and an EIA 232C interface to the associated modem. The 7400A operates in stand-alone mode as a data module.

7400B+ and 8400B+ data modules support asynchronous-data communications and operate in stand-alone mode for data-only service or in linked mode, which provides simultaneous voice and data service. The 7400B+ and 8400B+ provide voice and data communications to 7400D series phones and 602A1 CALLMASTER phones that have a connection to a data terminal or personal computer. The data modules integrate data and voice into the DCP protocol required to interface with the switch via a port on a digital-line circuit pack. Use the 7400B+ or 8400B+ instead of an MPDM when you need asynchronous operation at speeds up to 19.2-kbps to provide a DCP interface to the switch for data terminals and printers. The 7400B+ and 8400B+ do not support synchronous operation and keyboard dialing. Dialing is provided using the standard Hayes command set.

### 7400D

This data module supports synchronous operation with AUDIX, CMS, and DCS. It provides synchronous data transmissions at speeds of 19.2-Kbps full duplex.

## 7400C High Speed Link

The 7400C high-speed link (HSL) is a data-service unit that allows access to DCP data services. It provides synchronous data transmission at speeds of 56- and 64-Kbps and provides a link to high-speed data networks. Used for Group 4 fax applications that include electronic mail and messaging, and electronic storage of printed documents and graphics. Use the 7400C for video teleconferencing and LAN interconnect applications.

## 7500 Data Modules

The 7500 Data Module connects DTE or DCE to the ISDN network. The 7500 Data Module supports EIA 232C and V.35 interfaces and RS-366 automatic-calling unit interface (for the EIA 232C interface only).

The 7500 has no voice functions. Configure in the following ways:

- Asynchronous DCE  
300, 1200, 2400, 4800, 9600, 19200-bps
- Synchronous DCE  
1200, 2400, 4800, 9600, 19200, 56000, 64000-bps
- Asynchronous DTE (used for modem pooling)  
up to 19200-bps

The 7500 Data Module is stand-alone or in a multiple-mount housing.

## Asynchronous Data Module

### NOTE:

The alias station command cannot be used to alias data modules.

Use the Asynchronous Data Module (ADM) with asynchronous DTEs as a data stand for the 7500 and 8500 Series of ISDN-BRI phones, thus providing connection to the ISDN network. The ADM provides integrated voice and data on the same phone and supports data rates of 300, 1200, 2400, 4800, 9600, and 19200-bps. This module also supports the Hayes command set, providing compatibility with PC communications packages.

## Related topics

---

See [“Data modules” on page 707](#) for more information.

## Administered Connection

---

An Administered Connection (“AC”) is a connection between two access or data endpoints. Avaya MultiVantage automatically establishes and maintains the connection based on the attributes you administer. ACs provides the following capabilities.

- Support of both permanent and scheduled connections
- Auto Restoration (preserving the active session) for connections routed over Software Defined Data Network (“SDDN”) trunks
- Administrable retry interval (from 1 to 60 minutes) per AC
- Administrable alarm strategy per AC
- Establishment/retry/auto restoration order based on administered priority

### Detailed description

---

Establish an AC between the following:

- Two endpoints on the same switch
- Two endpoints in the same private network, but on different switches
- One endpoint on the controlling switch and another endpoint off the private network

In all configurations, administer the AC on the switch having the originating endpoint. For an AC in a private network, if the two endpoints are on two different switches, normally the connection routes via Automatic Alternate Routing (“AAR”) through tie trunks (ISDN, DS1, or analog tie trunks) and intermediate switches. If required, route the connection via Automatic Route Selection (“ARS”) and Generalized Route Selection (“GRS”) through the public network. The call routes over associated ISDN trunks. When the far-end answers, a connection occurs between the far-end and the near-end extension in the Originator field on the AC screen.

Because the system makes an administered connection automatically, you do not use the following:

- Data Call Setup  
Do not assign a default dialing destination to a data module when it is used in an AC.
- Data Hotline  
Do not assign a hotline destination to a data module that is used in an AC.
- Terminal Dialing  
Turn off terminal dialing for data modules involved in an AC. This prevents display of call-processing messages (INCOMING CALL,...) on the terminal.

## Access endpoints

Access endpoints are non-signaling trunk ports. They neither generate signaling to the far-end of the trunk nor respond to signaling from the far-end. Designate an access endpoint as the originating endpoint or destination endpoint in an AC.

## Typical AC applications

The following are typical AC applications:

- A local data endpoint connection to a local or remote-access endpoint. Examples: an MPDM ACCUNET digital service connecting to SDDN via an ISDN trunk-group DS1 port; an MPDM ACCUNET digital service connecting to an ACCUNET Switched 56 Service via a DS1 port.
- A local-access endpoint connecting to a local or remote-access endpoint. Examples: a DSO cross-connect and a 4-wire leased-line modem to a 4-wire modem connection via an analog tie trunk.
- A local data endpoint connecting to a local or remote data endpoint such as a connection between two 3270 data modules.

### NOTE:

The following guidelines do not include AAR and ARS, or GRS administration information for routing AC calls over trunk groups. See the respective feature elsewhere in this book for that information.

## Establishing Administered Connections

The originating switch attempts to establish an AC only if one of the following conditions exist:

- AC is active.
- AC is due to be active (either a permanent AC or time-of-day requirements are satisfied if it is a scheduled AC).
- Originating endpoint is in in-service or idle state.

If the originating endpoint is not in service or is idle, no activity takes place for the AC until the endpoint transitions to the desired state. The originating switch uses the destination address to route the call to the desired endpoint. When the switch establishes two or more ACs at the same time, the switch arranges the connections in order of priority.

AC attempts can fail for the following reasons:

- Resources are unavailable to route to the destination.
- A required conversion resource is not available.
- Access is denied by class of restriction (“COR”), facilities restriction level (“FRL”), or bearer capability class (“BCC”). Or, an attempt is made to route voice-band-data over SDDN trunks in the public switch network.
- Destination address is incorrect.
- Destination endpoint is busy.
- Other network or signaling failures occur.

In the event of a failure, an error is entered into the error log, which generates an alarm, if it is warranted by your alarming strategy. You can display AC failures via the status-administered connection command.

As long as an AC is due to be active, the originating switch continues to establish an AC unless the attempt fails because of an administrative error (for example, a wrong number) or service-blocking condition (for example, outgoing calls barred).

- The frequency with which failed attempts are retried is determined by the administered retry interval (1 to 60 minutes) for each AC.
- Retries are made after the retry interval has elapsed regardless of the restorable attribute of the AC.
- ACs are retried in priority order.
- When you change the time of day on the switch, an attempt is made to establish all ACs in the waiting-for-retry state.

## Dropping Administered Connections

An AC remains active until one of the following occurs:

- The AC is changed, disabled, or removed.
- The time-of-day requirements of a scheduled AC are no longer satisfied.
- One of the endpoints drops the connection. This could be because of user action (in the case of a data endpoint), maintenance activity resulting from an endpoint failure, busying out of the endpoint, or handshake failure. If the endpoints are incompatible, the connection is successful until handshake failure occurs.

### NOTE:

An AC between access endpoints remains connected even if the attached access equipment fails to handshake.

- An interruption (for example, facility failure) occurs between the endpoints.

If an AC drops because it was disabled/removed or is no longer due to be active, no action is taken. If an AC drops because of changed AC attributes, an immediate attempt is made to establish the connection with the changed attributes if it is still due to be active. Existing entries in the error/alarm log are resolved if they no longer apply. If handshake failure resulted in the dropping of the connection, in the case of an AC involving at least one data endpoint, no action is taken for that AC until the change administered-connection command is executed.

### **Administered Connections failure: Auto Restoration and Fast Retry**

When an active AC drops prematurely, you must invoke either auto restoration or fast retry to determine whether auto restoration is attempted for an active AC.

If you option AC for auto restoration and the connection was routed over SDDN trunks, auto restoration is attempted. During restoration, connections are maintained between the switch and both endpoints. In addition to allowing the active session to be maintained, AC also provides a high level of security by prohibiting other connections from intervening in active sessions. Auto restoration generally completes before the 60-second endpoint holdover interval. If auto restoration is successful, the call might be maintained (no guarantee). The restoration is transparent to the user with the exception of a temporary disruption of service while restoration is in progress. A successful restoration is reflected by the *restored* state on the status AC screen. Although the restoration was successful, the data session may not have been preserved.

If auto restoration is not active or if the AC is not routed over SDDN trunks, the switch immediately attempts to reestablish the connection (fast retry). The switch also attempts a retry if the originating endpoint initiated the drop. With fast retry, connections are not maintained on both ends. Fast Retry is not attempted for an AC that was last established via fast retry, unless the AC is active for at least two minutes.

If auto restoration or fast retry fails to restore or reestablish the connection, the call drops and the AC goes into retry mode. Retry attempts continue, at the administered retry interval, as long as the AC is due to be active.

## **Administering Administered Connections**

---

1. Choose one of the following data modules and administer all fields:
  - Data Line Data Module (use with Data Line circuit pack)
  - Processor/Trunk Data Module (use with one of the following):
    - MPDMs, 700D, 7400B, 7400D, or 8400B
    - MTDMs, 700B, 700C, 700E, or 7400A
  - Processor Interface Data Module (see *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information)
  - X.25 Data Module (see *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information)
  - 7500 Data Module (use with ISDN Line 12-BRI-S-NT or ISDN Line 12-BRI-U-NT circuit pack)
  - World Class Core BRI Data Module (use with wcbri)
2. On the DS1 Circuit Pack screen, administer all fields. See [“DS1 Circuit Pack” on page 757](#) for more information. (Use with switch node carriers.)
3. On the Access Endpoint screen, administer all fields. See [“Access Endpoint” on page 593](#) for more information.
4. Choose one of the following trunk groups and administer all fields. See [“ISDN trunk group” on page 936](#) and [“Trunk Group” on page 1233](#) for more information.
  - ISDN-BRI
  - ISDN-PRI
  - Tie
5. On the Class of Restriction screen, administer all fields. See [“Class of Restriction” on page 658](#) for more information.
6. On the Class of Service screen, administer all fields. See [“Class of Service” on page 672](#) for more information.
7. On the Dial Plan Record screen, administer the Local Node Number field with a number from 1-63 that matches the DCS switch node number and the CDR node number. See [“DCS to QSIG TSC Gateway screen” on page 747](#) for more information.
8. On the Administered Connection screen, administer all fields. See [“Administered Connection” on page 598](#) for more information.

9. On the Station screen, assign one button as ac-alarm. See [“Station” on page 1127](#) for more information.
10. On the Attendant Console screen, assign one button as ac-alarm. See [“Attendant Console” on page 614](#) for more information.

## Interactions

---

- **Abbreviated Dialing**

Use Abbreviated Dialing entries in the `Destination` field. Entries must comply with restrictions.
- **Busy Verification of Stations and Trunks**

This feature does not apply to access endpoints because they are used only for data.
- **Call Detail Recording**

For an AC that uses a trunk when CDR is active, the origination extension is the originator of the call.
- **Class of Restriction**

Reserve a COR for AC endpoints and SDDN trunks. This restricts endpoints that are not involved in AC from connecting to SDDN trunks or endpoints involved in AC.
- **Class of Service/Call Forwarding**

Assign to an AC endpoint a COS that blocks Call Forwarding activation at the endpoint.
- **Digital Multiplexed Interface (“DMI”)**

Use DMI endpoints as the destination in an AC. DMI endpoints do not have associated extensions, so do not use them as the originator in an AC.
- **Facility Test Calls**

The feature does not apply to access endpoints because an access endpoint acts as an endpoint rather than as a trunk.
- **Modem Pooling**

If you require a modem in an AC, one is inserted automatically. If no modem is available, the connection is dropped.
- **Non-Facility Associated Signaling (“NFAS”) and D-Channel Backup**

Auto restoration for an AC that is initially routed over an NFAS facility may fail if the only backup route is over the facility on which the backup D-channel is administered. The backup D-channel may not come into service in time to handle the restoration attempt.

- Set Time Command

When you change the system time via the set time command, all scheduled ACs are examined. If the time change causes an active AC to be outside its scheduled period, the AC is dropped. If the time change causes an inactive AC to be within its scheduled period, the switch attempts to establish the AC.

If any AC (scheduled or continuous) is in retry mode and the system time changes, the switch attempts to establish the AC.

- System Measurements

Access endpoints are not measured. All other trunks in an AC are measured as usual.

## Modem Pooling

---

Modem Pooling allows switched connections between digital-data endpoints (data modules) and analog-data endpoints via pods of acoustic-coupled modems. The analog-data endpoint is either a trunk or a line circuit.

Data transmission between a digital data endpoint and an analog endpoint requires conversion via a modem, because the DCP format used by the data module is not compatible with the modulated signals of an analog modem. A modem translates DCP format into modulated signals and vice versa.

Modem Pooling feature provides pools of integrated-conversion modems and combined-conversion modems.

Integrated-conversion modem pools have functionality integrated on the Pooled Modem circuit pack, providing two modems. Each one emulates a TDM cabled to a 212 modem. Integrated are modem pools not available in countries that use A-law companding.

Combined-conversion modem pools are TDMs cabled to any TDM-compatible modem. Combined-conversion modem pools can be used with all systems.

The system can detect the needs for a modem. Data calls from an analog-data endpoint require that the user indicate the need for a modem, because the system considers such calls to be voice calls. Users indicate this need by dialing the data-origination access code field on the Feature Access Code screen before dialing the digital-data endpoint.

The system provides a Hold Time parameter to specify the maximum time any modem can be held but not used (while a data call is in queue).

## **Administering Modem Pooling**

---

For Integrated modem poolings:

1. On the Modem Pool Group screen, administer all fields. See [“Modem Pool Group” on page 1038](#) for more information.
2. On the Feature Access Code screen, administer the Data Origination Access Code field. See [“Feature Access Code” on page 781](#) for more information.
3. On the Data Module screen, administer all fields. See [“Data modules” on page 707](#) for more information.

For Combined modem poolings:

1. On the Modem Pool Group screen, administer all fields. See [“Modem Pool Group” on page 1038](#) for more information.
2. On the Feature Access Code screen, administer the Data Origination Access Code field. See [“Feature Access Code” on page 781](#) for more information.

## **Considerations**

---

- On data calls between a data module and an analog-data endpoint, Return-to-Voice releases the modem and returns it to the pool. The telephone user connects to the analog-data endpoint.
- For traffic purposes, the system accumulates data on modem-pooling calls separate from voice calls. Measurements on the pools also accumulate.
- Modem Pooling is not restricted. Queuing for modems is not provided, although calls queued on a hunt group retain reserved modems.
- Avoid mixing modems from different vendors within a combined pool because such modems may differ in transmission characteristics.
- Each data call that uses Modem Pooling uses four time slots (not just two). As a result, heavy usage of Modem Pooling could affect TDM bus-blocking characteristics.
- Tandem switches do not insert a pooled modem. The originating and terminating switches insert a pooled modem.

## Interactions

---

- Call Detail Recording  
Data call CDR records the use of modem pools on trunk calls.
- Data Call Setup  
Data calls to or from a TDM cannot use Modem Pooling.
- Data Privacy and Data Restriction  
The insertion of a modem pool does not turn off Data Privacy or Data Restriction.
- Data-Only Off-Premises Extensions  
Calls to or from a Data-Only Off-Premises Extension cannot use Modem Pooling, when this type of digital-data endpoint uses a TDM.
- DMI Trunks  
If you place a data call from a local analog-data endpoint to a DMI trunk, you must dial the data-origination access code to obtain a modem. Data calls on DMI trunks to local analog-data endpoints automatically obtain modems.
- DS1 Tie Trunk Service  
Connect modems used for Modem Pooling to AVD DS1 tie trunks via Data Terminal Dialing or by dialing the feature-access code for data origination.

## PC Interface

---

The personal computer (PC) Interface consists of the PC/PBX platforms and PC/ISDN Platform product family. These products are used with Avaya MultiVantage to provide users of IBM-compatible PCs fully-integrated voice and data workstation capabilities.

Two groups of different configurations are available for PC Interface: group 1 uses DCP and group 2 uses the ISDN-BRI (Basic Rate Interface) protocol.

The group 1 configurations consist of DCP configurations that use a DCP expansion card in the PC to link to the switch. Group 1 (shown in [Figure 12 on page 516](#)) uses the following connections:

- The PC Interface card plugs into an expansion slot on the PC. The card has 2 standard 8-pin modular jacks (line and phone).
- The digital phone plugs into the phone jack on the PC Interface card.

- The line jack on the card provides a digital port connection to Avaya DFINITY servers.
- The distance between the PC Interface card and the PBX should be no more than 1524m for 24-gauge wire or 1219m for 26-gauge wire.

**Figure Notes**

- |                                                                                                                                                                      |                                                                                                                                                                                                  |

**Figure 12. DCP PC interface configuration (Group 1)**

The group 2 configurations link to the switch using a PC/ISDN Interface card installed in the PC. This group can include a stand-alone PC terminal, or up to 4 telephones, handsets, or headsets. Group 2 (shown in [Figure 13 on page 517](#)) uses PC/ISDN Interface cards (up to four cards) which plug into expansion slots on the PC. These cards each provide 2 standard 8-pin modular-jack connections for both line connections (to the switch) and phone connections. A standard 4-pin modular jack is also available for use with a handset or headset.

**Figure 13. ISDN—BRI PC interface configuration (Group 2)**

PC Interface users have multiple appearances (depending on the software application used) for their assigned extension. Designate one or more of these appearances for use with data calls. With the ISDN-BRI version, you can use up to 4 separate PC/ISDN Interface cards on the same PC. Assign each card a separate extension, and assign each extension one or more appearances. The availability of specific features depends on the COS of the extension and the COS for the switch. Modem Pooling is provided to ensure general availability of off-net data-calling services.

## Security

---

There are two areas where unauthorized use may occur with this feature: unauthorized local use and remote access.

### **SECURITY ALERT:**

*Unauthorized local use involves unauthorized users who attempt to make calls from a PC. The PC software has a security setting so users can place the PC in Security Mode when it is unattended. You also can assign Automatic Security so that the administration program on the PC is always active and runs in Security Mode. This mode is password-protected.*

### **SECURITY ALERT:**

*Remote access involves remote access to the PC over a data extension. Remote users can delete or copy PC files with this feature. You can password-protect this feature. See the BCS Products Security Handbook for additional steps to secure your system and to find out about obtaining information regularly about security developments.*

## Administering a PC interface

---

1. On the Station screen, set the Type field to **pc**.

## Considerations

---

- Use the Function Key Module of the 7405D with PC Interface.
- BRI terminals normally are initializing terminals and require you to assign an SPID. The PC/ISDN Platform (Group 2), in a stand-alone configuration, is a non-initializing BRI terminal and does not require you to assign a SPID.
  - Set a locally-defined terminal type with General Terminal Administration
  - Define the terminal type as a non-initializing terminal that does not support Management Information Messages (MIM).
  - Assign the PC/ISDN Platform with an associated (initializing) ISDN-BRI telephone (such as an ISDN 7505) using a SPID.
  - Assign the station (using a locally-defined terminal type) to take full advantage of the capabilities of the PC Interface. This terminal type is also non-initializing with no support of MIMs.

- Do not use telephones with data modules with the PC Interface. (You can still use 3270 Data Modules if you also use 3270 emulation). If you attach a DCP data module or ISDN data module to a telephone that is connected to a PC Interface card, the data module is bypassed (not used). All the interface functions are performed by the interface card even if a data module is present.
- The 7404D telephone with messaging cartridge cannot be used with PC Interface. However, the 7404D with PC cartridge can be used, but only with Group 1 configurations.

## Wideband Switching

---

Wideband Switching provides the ability to dedicate 2 or more ISDN-PRI B-channels or DS0 endpoints for applications that require large bandwidth. It provides high-speed end-to-end communication between endpoints where dedicated facilities are not economic or appropriate. ISDN-BRI trunks do not support wideband switching.

Wideband Switching supports:

- High-speed video conferencing
- WAN disaster recovery
- Scheduled batch processing (for example, nightly file transfers)
- LAN interconnections and imaging
- Other applications involving high-speed data transmission, video transmission, or high bandwidth

## Detailed description

---

ISDN-PRI divides a T1 or E1 trunk into 24 (32 for E1) channels, where one channel is used for signaling, and all others for standard narrowband communication. Certain applications, like video conferencing, require greater bandwidth. You can combine several narrowband channels into one wideband channel to accommodate the extra bandwidth requirement. Avaya MultiVantage serves as a gateway to many types of high-bandwidth traffic. In addition, DS1 Converter circuit packs are used for wideband switching at DS1 remote EPN locations. They are compatible with both a 24-channel T1 and 32-channel E1 facility (transmission equipment). They support circuit-switched wideband connections (NxDS0) and a 192 Kbps packet channel.

The following table provides information on Wideband Switching channel types.

| Channel Type   | Number of Channels (DSOs)                                                                                                             | Data Rate     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|---------------|
| H0 (T1 or E1)  | 6 (grouped 4 (T1) or 5 (E1) quadrants of 6 B-channels each)                                                                           | 384 Kbps      |
| H11 (T1 or E1) | 24 (on T1 - all 24 B-channels, with the D-channel not used; on E1 - B-channels 1 to 15, and 17 to 25, and B-channels 26 to 31 unused) | 1536 Kbps     |
| H12 (E1 only)  | 30 (B-channels 1 to 15 and 17 to 31)                                                                                                  | 1920 Kbps     |
| NxDS0 (T1)     | 2-24                                                                                                                                  | 128–1536 Kbps |
| NxDS0 (E1)     | 2-31                                                                                                                                  | 128–1984 Kbps |

### Channel allocation

For standard narrowband communication, ISDN-PRI divides a T1 or E1 trunk as follows:

- T1 trunks are divided into 23 information channels and 1 signaling channel
- E1 trunks are divided into 30 information channels, 1 signaling channel, and 1 framing channel

Certain applications, like video conferencing, require greater bandwidth. You can combine several narrowband channels into one wideband channel to accommodate the extra bandwidth requirement. Avaya MultiVantage serves as a gateway to many types of high-bandwidth traffic. In addition, DS1 converters are used for wideband switching at remote locations.

Performed using one of the three allocation algorithms: fixed, flexible, or floating.

- Fixed allocation — Provides contiguous-channel aggregation. The starting channel is constrained to a predetermined starting point. (Used only for H0, H11, and H12 calls.)
- Flexible allocation — Allows a wideband call to occupy non-contiguous positions within a single T1 or E1 facility (NxDS0).
- Floating allocation — Enforces contiguous-channel aggregation. The starting channel is not constrained to a predetermined starting point (NxDS0).

**Typical uses**

A typical video application uses an ISDN-PRI interface to DS0 1 through 6 of the line-side facility. See [Figure 14](#).

wdbndex C.JL 061996

**Figure Notes**

- |                          |                           |

**Figure 14. Wideband Switching Video Application**

## Endpoint applications

An endpoint application is the origination or destination of a wideband call. Endpoint application can be any number of data applications based on the customer's particular needs.

### ISDN-PRI terminal adapters

For wideband switching with non-ISDN-PRI equipment, you can use an ISDN-PRI terminal adapter. ISDN-PRI terminal adapters translate standard ISDN signaling into a form that can be used by the endpoint application and vice versa. The terminal adapter also must adhere to the PRI-endpoint boundaries as administered on the Avaya MultiVantage switch when handling both incoming (to the endpoint) applications and outgoing calls.

### Line-side (T1 or E1) ISDN-PRI facility

A line-side ISDN-PRI (T1 or E1) facility is comprised of a group of DS0s (24 for a T1 facility and 32 for an E1 facility). In this context, these DS0s are also called channels. T1 facilities have 23 B-channels and a single D-channel. E1 facilities have 30 B-channels, 1 D-channel, and a framing channel. Data flows bi-directionally across the facility between the switch and the ISDN-PRI terminal adapter.

### PRI-endpoints

A PRI-endpoint (PE) is a combination of DS0 B-channels on a line-side ISDN-PRI facility that has been assigned an extension.

A PRI-endpoint can support calls of lower bandwidth. In other words, a PE having a width 6 (six DS0s) can handle a call of one channel (64 Kbps) up to an including 6 channels. For example, an endpoint application connected to a PE defined as using B-channels 1 through 6 of an ISDN-PRI facility could originate a call using B-channels 1, 3, and 5 successfully. If the PE has been administered to use flexible channel allocation, the algorithm for offering a call to the PE starts from the first DS0 administered to the PE. Since only one active call is permitted on a PE, contiguous B-channels always are selected unless one or more B-channels are not in service.

One facility can support multiple separate and distinct PRI-endpoints (several extensions) within a single facility. Non-overlapping contiguous sets of DS0s (B-channels) are associated with each PE.

### Universal digital signaling level 1 circuit pack

The UDS1 circuit pack is the interface for line-side and network facilities carrying wideband calls.

## Non-signaling configuration

Wideband also can support configurations using non-signaling (non-ISDN-PRI) line-side T1 or E1 connections. The endpoints are the same as those defined for configurations with signaling.

### Data service unit/channel service unit

This unit simply passes the call to the endpoint application. Unlike terminal adapters, the DSU/CSU does not have signaling capability.

#### ⇒ NOTE:

No DSU/CSU is needed if the endpoint application has a fractional T1 interface.

### Line-side (T1 or E1) facility

This facility, like the ISDN-PRI facility, is composed of a group of DS0s (24 for a T1 facility and 32 for an E1 facility; both T1 and E1 use 2 channels for signaling purposes). Line-side facilities are controlled solely from the switch. Through the access-endpoint command, a specific DS0 or group of DS0s is assigned an extension. This individual DS0 or group, along with the extension, is known as a Wideband Access Endpoint (“WAE”).

### Wideband access endpoint

WAEs have no signaling interface to the switch. These endpoints simply transmit and receive wideband data when the connection is active.

#### ⇒ NOTE:

The switch can determine if the connection is active, but this does not necessarily mean that data is actually coming across the connection.

A WAE is treated as a single endpoint and can support only one call. If all DS0s comprising a wideband access endpoint are in service, then the wideband access endpoint is considered in service. Otherwise, the wideband access endpoint is considered out of service. If an in-service wideband access endpoint has no active calls on its DS0s, it is considered idle. Otherwise, the wideband access endpoint is considered busy.

Multiple WAEs are separate and distinct within the facility and endpoint applications must be administered to send and receive the correct data rate over the correct DS0s. An incoming call at the incorrect data rate is blocked.

## **Guidelines and examples**

---

This section examines wideband and its components in relation to the following specific customer usage scenarios:

- Data backup connection
- Scheduled batch processing
- Primary data connectivity
- Networking

### **Data backup connection**

Using wideband for data transmission backup provides customers with alternate transmission paths for critical data in the event of primary transmission path failure.

### **Scheduled batch processing**

Scheduled batch processing applications are used for periodic database updates (for example, retail inventory) or distributions (for example, airline fare schedules). These updates are primarily done after business hours and are often referred to as nightly file transfers. Wideband meets the high bandwidth requirements at low cost for scheduled batch processing. In addition, wideband allows the dedicated-access bandwidth for busy-hour switch traffic to be used for these applications after business hours; no additional bandwidth costs are incurred.

The non-ISDN backup data connection is also appropriate for scheduled batch processing applications. Administered Connections are used to schedule daily or weekly sessions originating from this application.

### **Primary data connectivity**

Permanent data connections (those always active during business hours), such as interconnections between LANs, are well suited for Avaya MultiVantage when ISDN-PRI endpoints are used. The ISDN end-to-end monitoring and the endpoint's ability to react to failures provide for critical data availability needs. With ISDN, endpoints can detect network failures and initiate backup connections through the switch; ISDN endpoints can also establish additional calls when extra bandwidth is needed.

Any failures not automatically restored by Avaya MultiVantage are signaled to the endpoint application, which can initiate backup data connections over the same PRI endpoint. Avaya MultiVantage routes the backup data connections over alternate facilities if necessary.

## Networking

All of the wideband networking is over ISDN-PRI facilities (and the emulation of them by ATM-CES) but may connect to a variety of networks, other domestic interexchange carriers' services, private line, RBOC services, and services in other countries.

### ISDN-PRI trunk groups and channel allocation

Only ISDN-PRI trunks (and the emulation of them by ATM-CES) support wideband calls to the network. Wideband's bandwidth requirements have necessitated modification of the algorithms by which trunks look for idle channels. The following section describes the search methods and their relationship to the available wideband data services.

#### Facility lists

The system always sends a wideband call over a single trunk group and a single DS1 facility (or other ISDN-PRI-capable facility). Since a trunk group may contain channels (trunk members) from several different DS1 facilities, the system maintains a facility list for each trunk group.

A facility list orders the trunk members based on signaling group. If the system is using non-facility associated signaling groups with multiple DS1 facilities, the system sorts trunk members in that signaling group according to the interface identifier assigned to the corresponding DS1 facility.

When searching for available channels for a wideband call placed over a given trunk group, the system starts with the channels in the lowest-numbered signaling group with the lowest interface identifier. If the system cannot find enough channels in a given signaling group with that interface identifier, it checks the next higher interface identifier. If no more interface identifiers are available in the current signaling group, the system moves its search to the channels in the next higher signaling group.

For example, if three facilities having signaling group/interface identifier combinations of 1/1, 1/2, and 2/1 were associated with a trunk group, then a call offered to that trunk group would search those facilities in the order as they were just listed. Also note that since trunks within a given facility can span several trunk groups, a single facility can be associated with several different trunk groups.

Given this facility list concept, the algorithms have the ability to search for trunks, by facility, in an attempt to satisfy the bandwidth requirements of a given wideband call. If one facility does not have enough available bandwidth to support a given call, or it is not used for a given call due to the constraints presented in the following section, then the algorithm searches the next facility in the trunk group for the required bandwidth (if there is more than one facility in the trunk group).

In addition to searching for channels based on facilities and required bandwidth, Port Network (PN) preferential trunk routing is also employed. This PN routing applies within each algorithm at a higher priority than the constraints put on the algorithm by the parameters listed later in this section. In short, all facilities that reside on the same PN as the originating endpoint are searched in an attempt to satisfy the bandwidth of a given call, prior to searching any facilities on another PN.

### **Direction of trunk/hunting within facilities**

You can tell the system to search for available channels in either ascending or descending order. These options help you reduce glare on the channels because the system can search for channels in the opposite direction to that used by the network. If an ISDN trunk group is not optioned for wideband, then a cyclical trunk hunt based on the administration of trunks within the trunk group is still available.

### **H11**

When a trunk group is administered to support H11, the algorithm to satisfy a call requiring 1,536 Kbps of bandwidth uses a fixed allocation scheme. That is, the algorithm searches for an available facility using the following facility-specific channel definitions:

- T1: H11 can only be carried on a facility without a D-channel being signaled in an NFAS arrangement (B-channels 1-24 are used).
- E1: Although the 1,536 Kbps bandwidth could be satisfied using a number of fixed starting points (for example, 1, 2, 3, and so forth), the only fixed starting point being supported is 1. Hence, B-channels 1-15 and 177-25 always are used to carry an H11 call on an E1 facility.

If the algorithm cannot find an available facility within the trunk that meets these constraints, then the call is blocked from using this trunk group. In this case, the call may be routed to a different trunk group preference via Generalized Route Selection (GRS), at which time, based on the wideband options administered on that trunk group, the call would be subject to another hunt algorithm (that is, either the same H11 algorithm or perhaps an N x DS0 algorithm described in a later paragraph).

Note that on a T1 facility, a D-channel is not considered a busy trunk and results in a facility with a D-channel always being partially contaminated. On an E1 facility, however, a D-channel is not considered a busy trunk because H11 and H12 calls may still be placed on that facility; an E1 facility with a D-channel and idle B-channels is considered an idle facility.

## H12

Since H12 is 1,920 Kbps which is comprised of 30 B-channels, a 1,920-kbps call can only be carried on an E1 facility. As with H11, the hunt algorithm uses a fixed allocation scheme with channel 1 being the fixed starting point. Hence, an H12 call always is carried on B-channels 1 to 15 and 17 to 31 on an E1 facility (as shown in the following table). When offered any other call (other than a 1,536-kbps call), the algorithm behaves as it does when H11 is optioned.

| Facility | ISDN Interface | DS0s Comprising Each Channel |             |
|----------|----------------|------------------------------|-------------|
|          |                | H11                          | H12         |
| T1       | 23B + D        | -                            | -           |
| T1       | 24B (NFAS)     | 1-24                         | -           |
| E1       | 30B + D        | 1-15, 17-25                  | 1-15, 17-31 |
| E1       | 31B (NFAS)     | 1-15, 17-25                  | 1-15, 17-31 |

## H0

When a trunk group is administered to support H0, the algorithm to satisfy a call requiring 384 Kbps of bandwidth also uses a fixed allocation scheme. Unlike the H11 fixed scheme which only supports a single fixed starting point, the H0 fixed scheme supports 4 (T1) or 5 (E1) starting points. The H0 algorithm searches for an available quadrant within a facility based on the direction of trunk or hunt administered. If the algorithm cannot find an available quadrant within any facility allocated to this trunk group, then the call is blocked from using this trunk group. Again, based on GRS administration, the call may route to a different trunk group preference and be subject to another algorithm based on the wideband options administered.

Note that a D-channel is considered a busy trunk and results in the top most quadrant of a T1, B-channels 19 to 24, always being partially contaminated. This is *not true* for NFAS.

If this H0 optioned trunk group is also administered to support H11, H12, or N x DS0, then the system also attempts to preserve idle facilities. In other words, when offered a narrowband, H0, or N x DS0 call, the system searches partially-contaminated facilities before it searches to idle facilities.

## N x DS0

For the N x DS0 multi-rate service, a trunk group parameter determines whether a floating or a flexible trunk allocation scheme is to be used. The algorithm to satisfy an N x DS0 call is either floating or flexible.

- Floating (Contiguous) — In the floating scheme, an N x DS0 call is placed on a contiguous group of B-channels large enough to satisfy the requested bandwidth without any constraint being put on the starting channel (that is, no fixed starting point trunk).
- Flexible — In the flexible scheme, an N x DS0 call is placed on any set of B-channels as long as the requested bandwidth is satisfied. There is absolutely no constraint such as contiguity of B-channels or fixed starting points. Of course, as with all wideband calls, all the B-channels comprising the wideband call must reside on the same ISDN facility.

Regardless of the allocation scheme employed, the N x DS0 algorithm, like the H11 and H12 algorithms, attempts to preserve idle facilities when offered B, H0, and N x DS0 calls. This is important so that N x DS0 calls, for large values of N, have a better chance of being satisfied by a given trunk group. However, if one of these calls cannot be satisfied by a partially-contaminated facility and an idle facility exists, a trunk on that idle facility is selected, thus contaminating that facility.

There are additional factors to note regarding specific values of N and the N x DS0 service:

- N = 1 — this is considered a narrowband call and is treated as any other voice or narrowband-data (B-channel) call.
- N = 6 — if a trunk group is optioned for both H0 and N x DS0 service, a 384-kbps call offered to that trunk group is treated as an H0 call and the H0 constraints apply. If the H0 constraints cannot be met, then the call is blocked.
- N = 24 — if a trunk group is optioned for both H11 and N x DS0 service, a 1,536-kbps call offered to that trunk group is treated as an H11 call and the H11 trunk allocation constraints apply.
- N = 30 — if a trunk group is optioned for both H12 and N x DS0 service, a 1,920-kbps call offered to that trunk group is treated as an H12 call and the H12 trunk allocation constraints apply.

## Glare and blocking

### Glare prevention

Glare occurs when both sides of an ISDN interface select the same B-channel for call initiation. For example, a user side of an interface selects the B-channel for an outgoing call and, before the switch receives and processes the SETUP message, the switch selects the same B-channel for call origination. Since any single wideband call uses more channels, the chances of glare are greater. With proper and careful administration, glare conditions can be reduced.

To reduce glare probability, the network needs to be administered so both sides of the interface select channels from opposite ends of facilities. This is called linear hunting, ascending or descending. For example, on a 23B+D trunk group, the user side could be administered to select B-channels starting at channel 23 while the network side would be administered to start selecting at channel 1. Using the same example, if channel 22 is active but channel 23 is idle, the user side should select channel 23 for re-use.

### Blocking prevention

Blocking occurs when insufficient B-channels required to make a call are available. Narrowband calls require only one channel so blocking is less likely than with wideband calls which require multiple B-channels. Blocking also occurs for wideband calls when bandwidth is not available in the appropriate format (that is, fixed, floating, or flexible).

To reduce blocking, the switch selects trunks for both wideband and narrowband calls to maximize availability of idle fixed channels for H0, H11, and H12 calls and idle floating channels for N x DS0 calls that require a contiguous bandwidth. The strategy for preserving idle channels to minimize blocking depends on the channel type. The chances for blocking are reduced if you use a flexible algorithm, assuming it is supported on the other end.

| Channel Type   | Blocking Minimization Strategy             |
|----------------|--------------------------------------------|
| H0             | Preserve idle quadrants                    |
| H11            | Preserve idle facilities                   |
| H12            | Preserve idle facilities                   |
| Flexible NxDS0 | Preserve idle facilities                   |
| Floating NxDS0 | Preserve idle facilities as first priority |

## Administering Wideband Switching

---

### Before you start

You need a DS1 Converter circuit pack. See the *Avaya MultiVantage™ System Release 4.0 System Description Pocket Reference* for more information on the circuit pack.

### Instructions

To administer wideband switching:

1. On the Access Endpoint screen, administer all fields.  
See “[Access Endpoint](#)” on page 593 for more information.
2. On the PRI Endpoint screen, administer all fields.  
See “[PRI Endpoint](#)” on page 1080 for more information.
3. On the ISDN Trunk Group screen, administer all fields.  
See “[ISDN trunk group](#)” on page 936 for more information.
4. On the Route Pattern screen, administer all fields.  
See “[Route Pattern](#)” on page 1096 for more information.
5. (Optional) On the Fiber Link Administration, administer all fields.  
See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

### Considerations

---

- For wideband switching with non-ISDN-PRI equipment, you can use an ISDN-PRI terminal adapter.

### Interactions

---

- **Administered Connections**  
Provides call initiation for WAEs. All Administered Connections that originate from WAEs use the entire bandwidth administered for WAE. The destination of an Administered Connection can be a PRI endpoint.

- **Automatic Circuit Assurance**

Treats wideband calls as logical single-trunk calls so that a single ACA-referral call is made if an ACA-referral call is required. The call is referred to the lowest B-channel associated with the wideband call.
- **Call Coverage**

A wideband endpoint extension cannot be administered as a coverage point in a call-coverage path.
- **Call Detail Recording**

When CDR is active for the trunk group, all wideband calls generate CDR records. The feature flag indicates a data call and CDR records contain bandwidth and BCC.
- **Call Forwarding**

You must block Call Forwarding through Class of Service.
- **Call Management System and Basic Call Management System**

Wideband calls can be carried over trunks that are measured by CMS and BCMS. Wideband endpoints are not measured by CMS and “BCMS”.
- **Call Vectoring**

PRI endpoints can use a vector-directory number (“VDN”) when dialing. For example, PRI endpoint 1001 dials VDN 500. VDN 500 points to Vector 1. Vector 1 can point to other PRI endpoints such as route-to 1002, or route-to 1003, or busy.

Call Vectoring is used by certain applications. When an incoming wideband call hunts for an available wideband endpoint, the call can route to a VDN, that sends the call to the first available PRI endpoint.
- **Class of Restriction**

COR identifies caller and called-party privileges for PRI endpoints. Administer the COR so that account codes are not required. Forced entry of account codes is turned off for wideband endpoints.
- **Facility Busy Indication**

You can administer a busy-indicator button for a wideband-endpoint extension, but the button does not accurately track endpoint status.
- **Facility Test Calls**

You can use Facility Test Calls to perform loop-back testing of the wideband call facility.

- Generalized Route Selection

GRS supports wideband BCC to identify wideband calls. GRS searches a route pattern for a preference that has wideband BCC. Route preferences that support wideband BCC also can support other BCCs to allow different call types to share the same trunk group.
- CO Trunk (TTC - Japan) Circuit Pack

This circuit pack cannot perform wideband switching. No member of the circuit pack should be a member of a wideband group.

## **CallVisor Adjunct-Switch Application Interface**

---

CallVisor Adjunct-Switch Applications Interface (“ASAI”) links Avaya MultiVantage and adjunct applications. The interface allows adjunct applications to access switch features and supply routing information to the switch. CallVisor ASAI improves Automatic Call Distribution (“ACD”) agents’ call handling efficiency by allowing an adjunct to monitor, initiate, control, and terminate calls on the switch. The CallVisor ASAI interface may be used for Inbound Call Management (“ICM”), Outbound Call Management (“OCM”), and office automation/messaging applications.

CallVisor ASAI is supported by two transport types. These are:

1. Integrated Services Digital Network (ISDN) Basic Rate Interface (BRI) transport (CallVisor ASAI-BRI)
2. LAN Gateway Transmission Control Protocol/Internet Protocol transport (Avaya LAN Gateway).

CallVisor ASAI messages and procedures are based on the ITU-T Q.932 international standard for supplementary services. The Q.932 Facility Information Element (“FIE”) carries the CallVisor ASAI requests and responses across the interface. An application program can access CallVisor ASAI services by supporting the ASAI protocol or by using a third-party vendor application programming interface (“API”).

For a simple ASAI configuration example, see [Figure 15](#).

**Figure Notes**

- |                                    |               |

| 4. Switch processing element (SPE) |               |

**Figure 15. ASAI Switch Interface Link — BRI Transport**

**ASAI Capabilities**

For information concerning the types of associations over which various event reports can be sent, see *Avaya MultiVantage™ CallVisor® ASAI Technical Reference*.

**Considerations**

- If your system has an expansion cabinet (with or without duplication), ASAI resources should reside on the system’s Processor Cabinet.

**Interactions**

See *Avaya MultiVantage™ CallVisor® ASAI Technical Reference*.

## Setting up CallVisor ASAI

CallVisor Adjunct-Switch Applications Interface (ASAI) can be used in the telemarketing and help-desk environments. It is used to allow adjunct applications to monitor and control resources in Avaya MultiVantage.

### Before you start

- On the [System-Parameters Customer-Options](#) screen, verify the:
  - ASAI Interface field is **y**. If not, contact your Avaya representative.
  - ASAI Proprietary Adjunct Links field is **y** if the adjunct is running the CentreVu Computer Telephony.

### Instructions

To set up CallVisor ASAI:

1. Type **add station nnnn** and press RETURN, where *nnnn* is the extension you want to assign to the ASAI adjunct.

The [Station](#) screen appears.

Page 1 of X

STATION

|                 |                        |        |
|-----------------|------------------------|--------|
| Extension: 1014 | Lock Messages? n       | BCC: 0 |
| Type: asai      | Security Code: _____   | TN: 1  |
| Port:           | Coverage Path 1: _____ | COR: 1 |
| Name: _____     | Coverage Path 2: _____ | COS: 1 |
|                 | Hunt-to-Station: _____ |        |

STATION OPTIONS

|                   |                                 |
|-------------------|---------------------------------|
| Data Module? n    | Personalized Ringing Pattern: 1 |
| Display Module? n | Message Lamp Ext: 1014          |
|                   | MM Complex Data Ext: _____      |

2. In the Type field, type
  - **asai** if this adjunct platform is other than CentreVu Computer Telephony, for example, IBM CallPath.
  - **adjlk** (Computer Telephony adjunct link) if this is for the CentreVu Computer Telephony using the Telephony Services Application Programming Interface (“[TSAPI](#)”).
3. In the Port field, use the port address assigned to the LAN Gateway Interface circuit pack.
4. Press ENTER to save your changes.

## Setting up DEFINITY LAN Gateway

---

### Before you start

---

This section describes pre-administrative tasks associated with the Co-Resident DLG.

### For S8100 Media Server Configurations

If you want to use a TN799 C-LAN circuit pack as the Ethernet Interface for the Co-Resident DLG, proceed as follows:

1. Type **display system-parameters customer-options** and press ENTER.
2. Go to page 2 and make sure the ASAI Link Core Capabilities and/or Computer Telephony Adjunct Links fields are **y**, and the Co-Res DEFINITY LAN Gateway field is **y**.
3. Type **display node-names ip** and press ENTER.

Make sure that there is a node name associated with the C-LAN. If there is not a node name, add one.

4. Type **display ip-interfaces** and press ENTER.

Make sure the C-LAN is administered and its Ethernet port is enabled. If the C-LAN is not listed (the Type field should display **C-LAN**, and the previously administered node name should appear in the Node Name / Local Node field), add a C-LAN.

5. Type **list data-module** and press ENTER.

Make sure that the Ethernet port on the C-LAN is administered. If the Ethernet port is not listed, add it with the **add data-module** command (the Service Type field should be **Ethernet** and the Port field should be port 17 on the TN799).

If you want to use a TN2314 circuit pack as the Ethernet Interface for the Co-Resident DLG, proceed as follows:

1. Type **display system-parameters customer-options** and press ENTER.
2. Go to page 2 and make sure the ASAI Link Core Capabilities and/or Computer Telephony Adjunct Links fields are **y**, and the Co-Res DEFINITY LAN Gateway field is **y**.
3. Go to page 4 and make sure that the Processor Ethernet field is **y**.
4. Type **display ip-interfaces** and press ENTER.

Make sure the PROCR is administered and its Ethernet port is enabled. If the PROCR is not listed (PROCR should appear in the Type field and the previously administered node name should appear in the Node Name field), add a PROCR.

### For S8300 Media Server

Although the S8300 Media Server does not use a standard DEFINITY server port board, the pre-administration is the same.

1. Type **display system-parameters customer-options** and press ENTER.
2. Go to page 2 and make sure the ASAI Link Core Capabilities and/or Computer Telephony Adjunct Links fields are **y**, and the Co-Res DEFINITY LAN Gateway field is **y**.
3. Go to page 4 and make sure that the Processor Ethernet field is **y**.
4. Type **display ip-interfaces** and press ENTER.

Make sure the PROCR is administered and its Ethernet port is enabled. If the PROCR is not listed (PROCR should appear in the Service Type field and the previously administered node name should appear in the Node Name field), add a PROCR.

### Administering CTI Links - Summary

---

Use this information to familiarize yourself with the basic administrative tasks for administering CTI links using the Co-Resident DLG.

- Use the **display system-parameters customer-options** command make sure the following fields are set to **y**.
  - ASAI Link Core Capabilities and/or Computer Telephony Adjunct Links
  - Co-Res DEFINITY LAN Gateway
- Use the **add cti-link** command to administer a CTI link.
- Use the **change ip-services** command and in the Service Type field, enter **DLG**.

When the Service Type field is **DLG**, the system adds a DLG Administration page as the last page of the screen.

- Complete the DLG Administration page to add your client information.

#### NOTE:

For additional information on DLG administration for the S8300 Media Server, see “*Avaya MultiVantage™ CallVisor® ASAI Technical Reference.*”

### Collecting information about calls

Call detail recording (CDR) collects detailed information about all incoming and outgoing calls on specified trunk groups. If you use intraswitch CDR, you can also collect information about calls between designated extensions on the switch. Avaya MultiVantage sends this information to a printer or to some other CDR output device that collects call records and that may also provide reports.

You can have a call accounting system directly connected to your switch. If you are recording call details from several switches, the switch may send the records to a collection device for storage. A system called a poller may then take these records and send them to the call accounting system. The call accounting system sorts them, and produces reports that you can use to compute call costs, allocate charges, analyze calling patterns, detect unauthorized calls, and keep track of unnecessary calls.

### Before you start

The call accounting system that you use may be sold by Avaya, or it may come from a different vendor. You need to know how your call accounting system is set up, what type of call accounting system or call detail recording unit you are using, and how it is connected to the switch. You also need to know the record format that your call accounting system requires.

## Instructions

In this example, we are going to establish call detail recording for all calls that come in on trunk group 1 (our CO trunk). We are going to set up CDR so that any call that is handled by an attendant produces a separate record for the attendant part of the call.

1. Type **change trunk-group 1** and press RETURN.

The [Trunk Group](#) screen appears.

```

 TRUNK GROUP
Group Number: 1 Group Type: co CDR Reports: y
Group Name: Outside calls COR: 85 TN: 1__ TAC: 105
Direction: two-way Outgoing Display? n
Dial Access? n Busy Threshold: 99 Night Service: 1234
Queue Length: 0 Country: 1 Incoming Destination: attd
Comm Type: voice Auth Code? n Digit Absorption List: _
Prefix-1? y Trunk Flash? n Toll Restricted? y

TRUNK PARAMETERS
 Trunk Type: ground start
Outgoing Dial Type: tone
Trunk Termination: rc Disconnect Timing(msec): 500_

 Auto Guard? n Call Still Held? n Sig Bit Inversion: none

 Trunk Gain: high

Disconnect Supervision - In? y Out? n
Answer Supervision Timeout: 10 Receive Answer Supervision? n

```

2. In the CDR Reports field, type **y**.

This tells the switch to create call records for calls made over this trunk group.

3. Press ENTER to save your changes.
4. Type **change system-parameters cdr** and press RETURN.

The [CDR System Parameters](#) screen appears.

```

 CDR SYSTEM PARAMETERS
 Page 1 of X
Node Number (Local PBX ID): 1 CDR Date Format: month/day
 Primary Output Format: _____ Primary Output Ext: _____
 Secondary Output Format: _____ Secondary Output Ext: _____
 Use ISDN Layouts? _ EIA Device Bit Rate: ____
 Use Enhanced Formats? _
 Modify Circuit ID Display? _ Remove # from Called Number? _
 Record Outgoing Calls Only? _ Intra-switch CDR? _
 Suppress CDR for Ineffective Call Attempts? _ Outg Trk Call Splitting? _
 Disconnect Information in Place of FRL? _ Outg Attd Call Record? _
 Interworking Feat-flag? _
 Force Entry of Acct Code for Calls Marked on Toll Analysis Screen? _
 Calls to Hunt Group - Record: _____
 Record Called Vector Directory Number Instead of Group or Member? _
 Record Called Agent Login ID Instead of Group or Member? _
 Inc Trk Call Splitting? _ Inc Attd Call Record? _
 Record Non-Call-Assoc TSC? _ Call Record Handling Option: _____
 Record Call-Assoc TSC? _ Digits to Record for Outgoing Calls: _____
 Privacy - Digits to Hide: _ CDR Account Code Length: ____

```

5. In the CDR Format field, type **month/day**.  
This determines how the date will appear on the header record.
6. In the Primary Output Format field, type **Unformatted**.  
This is the record format that our call accounting system requires. Check with your call accounting vendor to determine the correct record format for your system.
7. In the Primary Output Ext. field, type **2055**.  
This is the extension of the data module that we use to connect to our call accounting system.
8. In the Record Outgoing Calls Only field, type **n**.  
This tells the switch to create records for both incoming and outgoing calls over all trunk groups that use CDR.
9. In the Outg Trk Call Splitting and Inc Trk Call Splitting fields, type **y**.  
This tells the system to create a separate record for any portion of an incoming or outgoing call that is transferred or conferenced.
10. In the Outg Att Call Record and Inc Att Call Record fields, type **y**.  
This tells the system to create a separate record for the attendant portion of any incoming or outgoing call.

## More information

---

You can also administer the switch to produce separate records for calls that are conferenced or transferred. This is called Call Splitting. There are many other variations that you can administer for CDR, and these are described in the screens section of this book.

## Related topics

---

For additional information on CDR, see [“Call detail recording”](#) on page 1553.

For more information about how to connect a CDR output device, see the *Installation for Adjuncts and Peripherals for Avaya MultiVantage™ Solutions*.

The *Call Detail Acquisition and Processing Reference Manual* also contains CDR information, but has not been updated in several years and is no longer entirely accurate.

## Recording calls between users on the same switch

---

Call detail recording generally records only those calls either originating or terminating outside the switch. There may be times when you need to record calls between local users. Intra-switch CDR lets you track calls made to and from local extensions.

## Instructions

---

In this example, we administer the switch to record all calls to and from extensions 5100, 5101, and 5102.

1. Type **change system-parameters cdr** and press RETURN.  
The [CDR System Parameters](#) screen appears.
2. In the Intraswitch CDR field, type **y**.
3. Press ENTER to save your changes.
4. Type **change intra-switch-cdr** and press RETURN.

The [Intra-Switch CDR](#) screen appears.

5. In the first three available slots, type **5100**, **5101**, and **5102**.
6. Press ENTER to save your changes.
7. The switch will now produce call records for all calls to and from these extensions, including those that originated on the local switch.

## Related topics

See [“Intraswitch CDR” on page 1559](#) for more detailed information.

## Tracking calls by account code

You can have your users to enter account codes before they make calls. By doing this, you can have a record of how much time was spent on the phone doing business with or for a particular client.

## Instructions

In this example, we are going to set up the system to allow the user at extension 5004 to enter a 5-digit account code before making a call.

1. Type **change system-parameters cdr** and press RETURN.

The [CDR System Parameters](#) screen appears.

```

 CDR SYSTEM PARAMETERS
 Page 1 of X
Node Number (Local PBX ID): 1 CDR Date Format: _____
Primary Output Format: _____ Primary Output Ext: _____
Secondary Output Format: _____ Secondary Output Ext: _____
 Use ISDN Layouts? _ EIA Device Bit Rate: ____
 Use Enhanced Formats? _
Modify Circuit ID Display? _ Remove # from Called Number? _
 Record Outgoing Calls Only? _ Intra-switch CDR? _
Suppress CDR for Ineffective Call Attempts? _ Outg Trk Call Splitting? _
 Disconnect Information in Place of FRL? _ Outg Attd Call Record? _
 Interworking Feat-flag? _
Force Entry of Acct Code for Calls Marked on Toll Analysis Screen? _
 Calls to Hunt Group - Record: _____

 Record Called Agent Login ID Instead of Group or Member? _
 Inc Trk Call Splitting? _ Inc Attd Call Record? _
Record Non-Call-Assoc TSC? _ Call Record Handling Option: _____
 Record Call-Assoc TSC? _ Digits to Record for Outgoing Calls: _____
 Privacy - Digits to Hide: _ CDR Account Code Length: ____

```

2. In the CDR Account Code Length field, type **5**.
3. Press ENTER to save your changes.
4. Assign an account button on the Station screen for extension 5004. See [“Adding feature buttons” on page 129](#) for more information.
5. Provide your users with a list of account codes to use.
6. You can also assign a Feature Access Code and give this to your users.

## Forcing users to enter account codes

Forced Entry of Account Codes is another form of account code dialing. You can use it to allow certain types of calls only with an account code, to track fax machine usage by account, or just to make sure that you get account information on all relevant calls.

### Before you start

Before you can administer Forced Entry of Account Codes, it must be enabled on the System Parameters Customer-Options screens. If it is not, please contact your Avaya representative.

**Instructions**

In this example, we administer the system to force users in our North American office to enter an account code before making international calls.

1. Type **change system-parameters cdr** and press RETURN.  
The **CDR System Parameters** screen appears.
2. In the Force Entry of Acct Code for Calls Marked on Toll Analysis Form field, type **y**.
3. In the CDR Account Code Length field, type **5**.
4. Press ENTER to save your changes.
5. Type **change toll 0** and press RETURN.
6. The **Toll Analysis** screen appears.

| change toll analysis |       |     |     |           |          |                              |   |   |   |   | Page 1 of 1     |   |   |   |    |   |   |   |   |   |

| _____                | ___   | ___ | -   | -         | -        | -                            | - | - | - | - | -               | - | - | - | -  | - | - | - | - | - |
| _____                | ___   | ___ | -   | -         | -        | -                            | - | - | - | - | -               | - | - | - | -  | - | - | - | - | - |
| _____                | ___   | ___ | -   | -         | -        | -                            | - | - | - | - | -               | - | - | - | -  | - | - | - | - | - |
| _____                | ___   | ___ | -   | -         | -        | -                            | - | - | - | - | -               | - | - | - | -  | - | - | - | - | - |
| _____                | ___   | ___ | -   | -         | -        | -                            | - | - | - | - | -               | - | - | - | -  | - | - | - | - | - |

7. In the first available Dialed String field, type **011**.  
This is the international access code for this office.
8. In the Total Min and Max columns, type 10 and 18, respectively.  
This is the minimum and maximum number of digits the system will analyze when determining how to handle the call.
9. In the Toll List and CDR FEAC columns, type x.
10. Press ENTER to save your changes.

## More information

---

You can also establish a class of restriction with Forced Entry of Account Codes set to **y**, and assign this class of restriction (COR) to trunks or other facilities that you want to restrict. With this method, all users with this COR must enter account codes before making any outgoing trunk calls. See [“Class of Restriction” on page 658](#) for more information.

## Receiving call-charge information

---

Avaya MultiVantage provides two ways to receive information from the public network about the cost of calls. Note that this service is not offered by the public network in some countries, including the US.

- Advice of Charge (AOC, for ISDN trunks) collects charge information from the public network for each outgoing call. Charge advice is a number representing the cost of a call; it may be recorded as either a charging or currency unit.
- Periodic Pulse Metering (PPM, for non-ISDN trunks) accumulates pulses transmitted from the public network at periodic intervals during an outgoing trunk call. At the end of the call, the number of pulses collected is the basis for determining charges.

## Before you start

---

You need to request either AOC or PPM service from your network provider. In some areas, your choice may be limited. Your Avaya representative can help you determine the type of service you need.

### NOTE:

This service is not offered by the public network in some countries, including the U.S.

## Collecting call charge information over ISDN

In this example, we administer the system to provide Advice of Charge over an existing ISDN trunk group, at the end of a call. This information will appear on CDR reports.

1. Type **change trunk-group 2**.

The **ISDN trunk group** screen appears with existing administration for this ISDN trunk group.

Page 1 of x

TRUNK GROUP

```

Group Number: 2 Group Type: isdn CDR Reports: y
 Group Name: OUTSIDE_CALL_____ COR: 1_ TN: 1__ TAC: _____
 Direction: two-way_ Outgoing Display? n

 Queue Length: 0__
 Service Type: public-ntwrk Auth Code? n TestCall ITC: rest
 Far End Test Line No: _____

 TestCall BCC: 4
 TRUNK PARAMETERS
 Codeset to Send Display: 6 Codeset to Send TCM,Lookahead: 6
 Max Message Size to Send: 260 Charge Advice: none_____
 Supplementary Service Protocol: a Digit Handling(in/out):enbloc/enbloc

 Trunk Hunt: cyclical QSIG Value-Added Avaya? n
 Connected to Toll? n STT Loss: normal DTT to DCO Loss: normal
 Calling Number - Delete: ____ Insert: _____ Numbering Format: _____
 Bit Rate: 1200_ Synchronization: async Duplex: full
 Disconnect Supervision - In? y Out? n
 Answer Supervision Timeout: 0__

```

2. In the CDR Reports field, type **y**.

This ensures that the AOC information appears on the CDR report.

3. Verify that Service Type is **public-ntwrk**.

4. In the Supplementary Service Protocol field, type **a**.

5. The Charge Advice field, type **end-on-request**.

This ensures that the switch will place one request for charge information. This reduces the amount of information passed to the switch and consumes less processor time than other options.

6. Press ENTER to save your changes.

## Receiving call-charge information over non-ISDN trunks

In this example, we will administer an existing Direct Inward and Outward Dialing (DIOD) trunk to receive PPM from the public network.

1. Type **change trunk-group 3**.

The [Trunk Group](#) screen appears with existing administration for this trunk group.

Page 1 of x

TRUNK GROUP

```

Group Number: 3 Group Type: diod CDR Reports: y
Group Name: DIOD_PPM COR: 1_ TN: 1__ TAC: 112_

Answer Supervision Timeout: 0__ Recieve Answer Supervision: y

```

2. In the CDR Reports field, type **y**.

This ensures that the PPM information appears on the CDR report.

3. In the Direction field, type **two-way**.

4. In the PPM field, type **y**.

5. In the Frequency field, type **50/12**.

This is the signal frequency (in kHz). The frequency you will use depends on what the circuit pack you use is able to accept. See [“Trunk Group” on page 1233](#) for more information.

6. In the Administrable Timers section, set the Outgoing Glare Guard timer to **5** seconds.

7. Press ENTER to save your changes.

8. You also need to ensure that the values of the Digital Metering Pulse Minimum, Maximum and Value on the DS1 Circuit Pack screen are appropriate to the values offered by your service provider. See [“DS1 Circuit Pack” on page 757](#) for more information.

## Related topics

See [“Call charge information” on page 1527](#) for more information about AOC and PPM.

## Viewing call charge information

Avaya MultiVantage provides two ways for you to view call-charge information: on a telephone display or as part of the Call Detail Recording (CDR) report. From a display, users can see the cost of an outgoing call, both while the call is in progress and at the end of the call.

## Instructions

In this example, we administer extension 5040 to be able to view the charge of a call in progress. The charges will appear in currency units (in this case, Lira) on the user’s telephone display.

1. Type **change trunk-group 2** and press RETURN.

The [Trunk Group](#) screen appears.

```

add trunk-group next Page 2 of x
TRUNK FEATURES
 ACA Assignment? _ Measured: ____
 Maintenance Tests? _
 Data Restriction? _
Abandoned Call Search? _
Suppress # Outpulsing? _

Charge Conversion: ____
 Decimal Point: ____
 Currency Symbol: ____
 Charge Type: ____ Receive Analog Incoming Call ID: ____
 Per Call CPN Blocking Code: ____
 Per Call CPN Unblocking Code: ____
 MF Tariff Free? _
Outgoing ANI: ____

```

2. In the Charge Conversion field, type **200**.

This indicates that one charge unit sent from the service provider is equal to 200 units, in this case, Lira.

3. In the Decimal Point field, type **none**.
4. In the Charge Type field, type **Lira**.
5. Press ENTER to save your changes.

6. Type **change system-parameters features** and press RETURN.  
The [Feature-Related System Parameters](#) screen appears.
7. In the Charge Display Update Frequency (seconds) field, type **30**.  
Frequent display updates may have considerable performance impact.
8. Press ENTER to save your changes.
9. Now assign extension 5040 a disp-chrg button to give this user the ability to control the charge display. See [“Adding feature buttons”](#) on page 129 for more information.

### **More information**

---

If you want end users to control when they view this information, you can assign a display button that they can press to see the current call charges. If you want call charges to display automatically whenever a user places an outgoing call, you can set Automatic Charge Display to **y** on the user's COR screen.

---

This chapter describes how to administer an S8700 Media Server and a G700 Media Gateway and the S8300 Media Server. It is targeted for system administrators after the product is installed and tested. In a converged network where voice and data are both sent over a corporate local area network (LAN), this configuration can provide primary or standby telephony and communications-processing capabilities.

Users should have broad data networking experience with data products and technology to best understand this product. An in-depth knowledge of Avaya MultiVantage call-processing software and Avaya P330 systems is also recommended.

### Overview

---

To set up and maintain your S8300 Media Server with a G700 you need to administer:

- the G700 Media Gateway and its internal processors, typically using the P330 Device Manager web-based tool or a command-line interface (CLI)
- the S8300 Media Server using the S8300 Media Server Web Interface
- call-processing features using Avaya MultiVantage software

For details on administration access methods, tools, and alternatives, see *Welcome to the Avaya™ S8300 Media Server and Avaya™ G700 Media Gateway*.

Documents mentioned in this chapter are available on the Avaya website:

<http://www.avaya.com/support>

### G700 Media Gateway administration

---

The hardware elements of the G700 Media Gateway are summarized in this section. For details on any of these hardware components, or for different configuration setups, see the *Avaya MultiVantage Solutions Hardware Guide*.

## **G700 Media Gateway physical design**

---

(For S8300 and S8700 Media Servers) The G700 Media Gateway is a 19-inch, rack-mount design similar to other Avaya P330 hardware. The media gateway can be a member of a P330 stack of Layer 2 or 3 devices, reside in a stack of other media gateways, or operate as a standalone unit. [Figure 16](#) shows the front of the media gateway.

---

**Figure 16. The G700 Media Gateway (front view)**

(For S8300 and S8700 Media Servers) Key components of the G700 Media Gateway include:

1. LED Status Panel (top left) for the media gateway
2. S8300 Media Server slot (V1). The G700 Media Gateway does not have an S8300 Media Server in its basic configuration.
3. P330 Expansion slot (bottom left) for adding modules such as a 16-port Ethernet expansion module, fiber interfaces, ATM access or WAN access
4. Dual 10/100Base-T Ethernet Ports for connection to the corporate LAN (bottom center of chassis)
5. Up to three additional media modules in slots V2 to V4 on the right side of the chassis (slots are numbered from top to bottom)
6. 8-Pin RS-232 Serial Port (Console) for direct-connect P330 stack processor administration (typically done by Services personnel)

## S8300 Media Server faceplate

(For S8300 Media Servers) [Figure 17](#) shows the faceplate of the S8300 Media Server.

**Figure 17. S8300 Media Server faceplate**

The faceplate of the S8300 Media Server has the following components:

- The LED array on the left indicates when the S8300 is active and when it is safe to power it down.
- A Shut Down button can be used to shut down the server (the S8300 can also be shut down and restarted using software commands).
- A Services Ethernet interface provides a direct connection to a laptop computer connected with a crossover cable. Normally only Services technicians use this interface; most ongoing S8300 administration is done using the Ethernet connection to the corporate LAN on the media gateway.
- One of the two USB connections may be used to attach an external modem, primarily used to report alarms to a Services support agency.
- The label on the right provides identification information for the S8300 Media Server.

## G700 Media module description

(For S8300 Media Servers) The four slots on the G700 Media Gateway are populated with media modules according to the needs at your site. Up to four slots may be filled as follows:

- The S8300 Media Server is a special type of media module that hosts the call-processing (telephony) software. If present, the S8300 is installed in slot one (V1); only one can be installed per media gateway. The S8300 can act as a primary call controller for the system, or one or more S8300s can be configured to provide standby service for a primary call controller if needed. See [“Local Survivable Processor configuration”](#) for details.

- (For S8300 and S8700 Media Servers) The other media module slots are filled as needed to meet the call-processing needs at your site. Media modules can be mixed and matched. [Table 8](#) lists the administrative name and port capacities for the media modules that may be installed in a G700 Media Gateway.

**Table 8. Media Module names and port capacities**

| Media module type  | Administration name | Number of ports                                                                            |
|--------------------|---------------------|--------------------------------------------------------------------------------------------|
| Analog Line/Trunk  | analog              | 8                                                                                          |
| DCP Telephone      | dcp                 | 8                                                                                          |
| T1/E1              | ds1                 | 24/32 (T1=24 in robbed-bit signalling mode and E1=32 for 1 control, 1 signal and 30 voice) |
| VoIP               | voip                | N/A                                                                                        |
| S8300 Media Server | icc                 | N/A                                                                                        |
| MM270              | bri                 | 8                                                                                          |

### Local Survivable Processor configuration

(For S8300 and S8700 Media Servers) An S8300 Media Server can be configured either as the primary call-processing controller, or as a Local Survivable Processor (LSP). An LSP can take over call processing if the primary call-processing system (such as another S8300 Media Server or an S8700 Media Server) is unavailable for any reason (such as a network failure or server problem). The S8300 Media Servers can be either the primary or LSP media servers; they are set up to operate as a primary or standby LSP server during the configuration process using the S8300 Media Server Web Interface.

(For S8300 and S8700 Media Servers) If the S8300 Media Server loses contact with its G700 Media Gateway, it will take the media gateway out of service after a time-out period. However, if the G700 loses contact with the S8300 Media Server, the media gateway first tries to reestablish contact. If it fails after a time-out period, then the G700 tries to connect with another media server in its controller list. When a functional media server is located, the G700 reboots.

(For S8300 and S8700 Media Servers) If the primary call-processing server goes offline and an LSP is available as a standby unit, it will assume call processing as follows:

- IP phones and media gateways that were previously using the primary media server will try to register with the standby media server for call processing, provided that they have been administered to do so in the controller list (use the **set mgc list** command).
- The standby media server (LSP) will go into license error mode, then start to provide call processing. It cannot preserve any calls set up by the primary media server. IP phone connections can stay up until the call is completed if they are shuffled, but no features are supported on the call.

**NOTE:**

The license error mode will run for up to 10 days and if the problem is not resolved, then it goes into no license mode and call processing halts.

- When the primary media server is available again, it will begin handling call processing. However, those endpoints that are now using the standby media server will continue to do so until the standby unit is rebooted.
- If the standby S8300 Media Server is rebooted, all devices will return to using the primary media server for call-processing service. Any calls in progress on the LSP will be dropped when the reboot occurs (the change back to the primary media server is *not* call preserving).
- With LSP functionality, there is full functionality and feature support.

## **Using Device Manager to administer G700 Media Gateway components**

---

(For S8300 and S8700 Media Servers) Device Manager, also known as the P330 Embedded Web Manager, provides a browser-based graphical user interface (GUI) to assist you with ongoing media gateway administration. For complete information on using Device Manager, see the *Avaya User's Guide P330 Manager*.

(For S8300 and S8700 Media Servers) Device Manager allows you to:

- View the status of different devices on the network.
- Configure or modify devices including Virtual LAN (VLAN) groupings, port mirroring, and Simple Network Management Protocol (SNMP) traps.

## Accessing Device Manager from a web browser

(For S8300 and S8700 Media Servers) To access the P330 Device Manager from a web browser:

1. Open a compatible web browser on your computer. Microsoft Internet Explorer 5.0 (or higher) and Netscape Navigator 4.7 and 6.2 are supported. The Java Plug-in 1.3.1\_02 is required.
2. In the Address (or Location) field of your browser, type the IP address of the P330 stack.
3. Log in as prompted.
  - The default user name is: `root`
  - The default password for read-write access is: `root`

### NOTE:

You should change the default passwords after you log in, if they have not already been changed. The passwords apply to all logins for these devices, whether accessed through Device Manager or a CLI.

4. The Welcome Page is displayed. Proceed with P330 and media gateway device administration.

## Accessing Device Manager through MultiService Network Manager

(For S8300 and S8700 Media Servers) You can alternatively launch the P330 Device Manager from the Avaya MultiService (formerly P330View) Network Manager. This optional product is a complete Network Management System (NMS). Services include:

- viewing all network devices by type, subnet, or customized groupings
- logging and viewing SNMP traps and events
- launching and managing other applications including Avaya™ Site Administration

Contact your Avaya representative to obtain a copy of this program if desired.

## Command line interface administration

(For S8300 and S8700 Media Servers) Instead of using Device Manager, you could telnet into the Media Gateway Processor (MGP), or use the serial interface on the front of the chassis to establish a direct connection to the P330 stack processor.

- Command line interface (CLI) access procedures are covered in *Welcome to the Avaya S8300 Media Server and Avaya G700 Media Gateway*.
- For a list of CLI commands, see the *Maintenance for Avaya™ G700 Media Gateway controlled by an Avaya™ S8300 Media Server or an Avaya™ S8700 Media Server, 555-234-101, October 2002*.

(For S8300 and S8700 Media Servers) SNMP alarms are different from server hardware- or software-generated Operations Support System (OSS) alarms that are recorded in the server logs, and may be reported to Avaya's Initialization and Administration System (INADS) or another services support agency over the server's optional modem interface or through SNMP notifications. Either method, both, or no alarm-reporting method may be used at a given site.

## **Media Server administration**

---

(For S8300 and S8700 Media Servers) The S8300 and S8700 Media Server contains the Avaya MultiVantage call-processing software, and controls its operation over the corporate network. Some of the primary functions controlled by the S8300 and S8700 Media Server are:

- Backing up and restoring call processing, server, and security data.
- Checking server and process status.
- Administering network features for the S8300 and S8700 Media Server such as SNMP service, enabling or disabling the modem (if used), enabling FTP services, and installing license and authentication files.
- Installing new software and reconfiguring the server as needed.
- Performing routine diagnostics and troubleshooting such as viewing alarms and system logs, and running tests if needed.

## **Media Server Web Interface and online help**

---

(For S8300 and S8700 Media Servers) S8300 and S8700 Media Server tasks are performed using the Media Server Web Interface. This browser-based server administration tool is an easy-to-use graphical user interface for performing the server administration tasks listed above. It contains an extensive help system that describes all web screens and media server procedures. This section covers highlights of media server administration.

## **Accessing the Media Server Web Interface**

---

(For S8300 and S8700 Media Servers) The Web Interface can be accessed through the corporate LAN connection to the G700 Media Gateway, or through the Services Ethernet interface on the front of the S8300 and S8700 Media Server connected to a laptop PC using a crossover cable. Details on how to configure a laptop for a direct connection are in the online help and in *Welcome to the Avaya S8300 Media Server and Avaya G700 Media Gateway*.

(For S8300 and S8700 Media Servers) To access the media server, you must log in as follows:

1. Open a compatible Internet browser on your computer. Currently only Internet Explorer 5.x (Avaya recommends 5.5 with Service Pack 2) and Netscape 4.7x are supported.
2. In the Address (or Location) field of your browser, type the IP address or name of the Avaya media server and press Enter.
  - *LAN access by IP address.* If you are logging into the administrative interface over the corporate local area network, you can type the media server's unique IP address in standard dotted-decimal notation, such as `http://192.152.254.201`.
  - *LAN access by server name.* If the server has already been configured and if the corporate LAN includes a domain name service (DNS) server that has been administered with the servers' names, you can type the server's name into the address field instead of the IP address. Server names vary depending on local administration (such as `http://media-server1.mycompany.com`).
  - *Laptop access by IP address.* If you are logging in to the services Ethernet interface from a directly connected laptop, the IP address on the server is always 192 . 11 . 13 . 6. The subnet mask is always 255 . 255 . 255 . 252. New servers that have not yet been configured can only be accessed in this way. Server-name login is *not* available through the services interface because this connection is a closed (private) network with no DNS.

**NOTE:**

The S8300 Media Server's name and IP address are specified during initial media server configuration.

3. *If your browser does not have a valid security certificate, you will see a warning screen and instructions to load the security certificate.*
    - If you are certain your connection is secure, accept the server security certificate to access the Login screen.
    - If you plan to use this computer and browser to access this or other Avaya media servers again, click the main menu link to Install Avaya Root Certificate after you log in.
  4. The Login screen appears.
    - In the Username field, type your user name (login ID), such as **cust**.
    - Click the Login button or press Enter.
-  **NOTE:**  
User names and passwords are case sensitive. Enter the login ID and confirmation information in upper- or lowercase as required.
5. Enter your login confirmation information as prompted:
    - *Password prompt.* Type your password in the Password field, and click Login or press Enter again.
    - *ASG challenge.* If your login is Access Security Gateway (ASG) protected, you will see a challenge screen. Enter the correct response and click Login or press Enter.
  6. The server will match your login information against its authentication tables. If the information you entered is recognized as a valid login, the screen displays a two-frame window, with the main menu in the left panel and a usage-agreement notice in the right window.
    - If the main menu in the left panel has only about 10 links, you have accessed the server from a login ID that has restricted permissions. You can adjust the login service levels using the Login Administration screen in Avaya™ Site Administration or SAT.
    - If the server cannot recognize your user name or password, you receive an authentication failure message. Return to step 5. If you fail to enter the user name and login confirmation correctly 4 times within a few minutes, the Login screen will block further attempts to log in for a while.
  7. When you successfully log in to the server, check the top of the left panel. The Avaya media server you are logged into is identified by name and server number. The S8300 Media Server number is always 1. The S8700 Media Server shows two servers.

## Web interface main menu

---

(For S8300 and S8700 Media Servers) The tasks you can perform are shown by a list of links in the left panel of the main web interface window.

(For S8300 and S8700 Media Servers) For help with any of these tasks, click the Help button on the main menu. Alternatively, if you have already clicked on a link, click the About This Screen button on the web interface page to go directly to the help for that specific screen.

## Media server web interface tasks

---

(For S8300 and S8700 Media Servers) Key tasks that administrators typically perform on the S8300 and S8700 Media Server are summarized in this section. See the online help for complete information.

### Backup and restore data

(For S8300 and S8700 Media Servers) One of the most important tasks is to set up a schedule to routinely back up system data to a safe location. Because the S8300 Media Server does not include a media storage device for backup purposes, the data must be emailed or transferred using file transfer protocol (FTP) to another server or computer for backup. The S8700 Media Server has a local removable storage device.

(For S8300 and S8700 Media Servers) The web interface allows you to back up call-processing data (MultiVantage translations), server system data, and security files. Avaya recommends that you encrypt the backup files to keep this sensitive information secure.

### Upgrade software and configuration

(For S8300 and S8700 Media Servers) Occasionally you may need to install new software on the media server. The new software (and a new license file if required) must be copied to the media server using one of the methods listed in [“Copy files to the server”](#). The software installation process uses wizard-like screens on the web to guide you through the process.

(For S8300 and S8700 Media Servers) You may also need to update your server configuration from time to time, and reverify it after a software upgrade. IP addresses for the server and its gateway to the corporate LAN, or for the optional UPS unit, DNS servers, and modem, are specified using configuration wizard-like screens. The wizard-like screens also allow you to specify static network routes for sending information over the network, and to update or change the method by which the S8300 Media Server keeps time.

## Copy files to the server

(For S8300 and S8700 Media Servers) Files must be copied to the media server from another computer or server in the network, or uploaded from a directly connected laptop computer. Files that may be copied to the server include license and authentication files, system announcements, and files for software upgrades. Files may be copied to the server using one of the following methods:

- Upload Files to Server (via browser) link to upload one or more files from your computer to the server's FTP directory using HTTP protocol.
- Download Files to Server (from web) link to copy files to the server from another server on the network; it works like the Upload Files screen.
- Transfer files from another computer or server accessible from the corporate network using FTP or Trivial FTP (TFTP). Files must be transferred in binary mode. Either a GUI or CLI FTP program can be used, depending on what is available on your computer.

## SNMP administration

(For S8300 and S8700 Media Servers) You can set up Simple Network Management Protocol (SNMP) services on the server to provide a means for a corporate NMS to monitor the server, and send alarm notifications to a services agency, to a corporate NMS, or both.

(For S8300 and S8700 Media Servers) To activate SNMP alarm notification for the S8300 and S8700 devices, use the Configure Trap Destinations screen to set up SNMP destinations in the corporate NMS. SNMP traps for other devices on the network can be administered using Device Manager; see [“Using Device Manager to administer G700 Media Gateway components”](#).

## Downloadable programs

---

(For S8300 and S8700 Media Servers) In addition to housing the call-processing software, the S8300 and S8700 Media Server may be used to download the following application software. A downloadable version of these packages may be accessed through the S8300 and S8700 Media Server Web Interface. This software must be installed on a computer that is running a compatible Microsoft Windows system as noted.

- Avaya Site Administration is the typical way to do telephony administration. It runs on most Windows systems and is available in several languages. See [“Call-processing administration”](#) for details.
- Avaya VoIP Monitoring Manager is used to monitor network Quality of Service (QoS) for Avaya IP endpoints using a graphical user interface. Currently it runs only on Windows 2000 systems.

**NOTE:**

The VoIP Monitoring Manager may not be available on all S8300 Media Servers. (It is available on all S8700 Media Servers.) It is normally offered as part of the Avaya VisAbility Management Suite. Contact your Avaya representative if you are interested in obtaining this program.

## **Call-processing administration**

---

(For S8300 and S8700 Media Servers) The telephony features of the S8300 Media Server are administered using the same commands and procedures as an S8700 Media Server or a legacy DEFINITY Enterprise Communications System.

### **Overview**

---

(For S8300 and S8700 Media Servers) Avaya MultiVantage software resides on the S8300 and S8700 Media Server. It can be accessed through either:

- Avaya™ Site Administration features a graphical user interface (GUI) that provides access to SAT commands as well as wizard-like screens that provide simplified administration for frequently used features. You can perform most of your day-to-day administration tasks from this interface such as adding or removing users and telephony devices. You can also schedule tasks to run at a non-peak usage time.

Avaya™ Site Administration must be installed on a computer running a compatible Microsoft Windows operating system such as Windows 95, 98, NT 4.0, Millennium Edition, and Windows 2000. Once installed, it can be launched from a desktop icon, from the P330 Device Manager, or through a link in the S8300 Media Server Web Interface.

- The System Access Terminal (SAT) program uses a Command Line Interface (CLI) interface for telephony administration. SAT is available through the Avaya™ Site Administration package.

### **Security Considerations**

(For S8300 and S8700 Media Servers) Security for administration of the G700 Media Gateway is the same as for traditional MultiVantage levels. This means that administration login passwords are passed in plain text with no encryption. Exceptions to this no-encryption policy include:

- The ASG program that is installed on all Avaya media servers.
- An encrypted web interface to the S8300 Media Server (see the security certificate information in the media server online help)

- Optional encryption for data backups (see [“Backup and restore data”](#)).
- Support for RADIUS authentication for media gateways and P330 stack elements using the P330 Device Manager. See [“Using Device Manager to administer G700 Media Gateway components”](#).

## Command syntax changes for media modules

(For S8300 and S8700 Media Servers) The syntax for using the SAT commands for a G700 Media Gateway or S8300 Media Server has changed. In a traditional DEFINITY system, ports are identified by the cabinet number, carrier, slot, and port. For example: 02A0704

(For S8300 and S8700 Media Servers) Because this numbering convention does not make sense for media modules, a new convention was developed. The numbering convention for the media modules uses the same seven-character field as does a traditional system, but the fields represent the media gateway number, media module slot (V1 to V4), and port number (00 to 99 are supported; the actual number of ports that can be specified depends on the type of media module).

Example: 001V205

In this example, the 001 represents the media gateway number, the V2 represents the slot number (possibly V1 through V4), and 05 is the port number.

## Screen and command change summary

---

(For S8300 and S8700 Media Servers) The following screens have been added or changed to accommodate G700 Media Gateways, S8300 Media Servers, and other media modules. Changes relevant to an S8300 or G700 configuration are summarized in this section.

### Media Gateway changes

(For S8300 and S8700 Media Servers) New commands and screens for media gateways include:

- The `media-gateway` administration screen is used to administer G700 Media Gateways and their media modules. Information is similar to the **list media-gateway** screen (next item), but also includes MAC address, network region, location and site data. See [Chapter 18, “Screen reference”](#) for details.

- The **list media-gateway** [**'print'** or **'schedule'**] command shows the list of currently administered gateways. Information includes the media gateway number, name, serial number, IP address, and whether or not this media gateway is currently registered with the call controller. The IP address field is blank until the media gateway registers once, then remains populated.
- The **list configuration media-gateway x** command allows you to list all the assigned ports on the media modules for the G700 Media Gateway specified by its number (x).

### System-Parameters Customer-Options screen

(For S8300 and S8700 Media Servers) This screen has been updated to indicate the presence of an S8300 Media Server as a primary or standby call processor as listed below. See [Chapter 18, "Screen reference"](#) for a complete description of this screen.

- The Optional Features section contains a new Local Spare Processor (LSP) field. If it displays a **y** (yes), this S8300 Media Server is configured to provide standby call processing in case the primary media server is unavailable. See ["Local Survivable Processor configuration"](#) for details. This display-only field can be set only by the license file.
- Two additional fields in the Optional Features section indicate if the primary call-processing controller is an S8300 Media Server. If traditional port networking is disabled and Processor Ethernet is enabled, an S8300 Media Server is controlling telecommunications.
  - Port Network Support: set to **n** indicates that traditional port networking is disabled. An S8300 Media Server is the primary call controller.
  - Processor Ethernet: set to **y** indicates the presence of an S8300 Media Server.

### Quality of Service Monitoring

(For S8300 and S8700 Media Servers) Several screen changes allow you to monitor Quality of Service (QoS) on an S8300 Media Server with a G700 configuration. The media gateway can send data to a real-time control protocol (RTCP) server, which in turn monitors the network region's performance. Screens include:

- A new RTCP Monitor Server section on the IP-Options System Parameters screen allows you to enter a single default IP address, server port, and RTCP report period that can be utilized by all administered network regions. This means you do not have to re-enter the IP address each time you access the `ip-network-region` screen.

- The IP Network Region screen also must be administered for QoS monitoring (see *Administration for Network Connectivity for Avaya MultiVantage™ Software* for details). If the `RTCP Enabled` field is left at default (“y”), then be sure to set a valid IP address in the IP-Options System Parameters screen. For situations that require customization, this screen is administered on a per IP network regional basis. Items to customize include:
  - Enabling or disabling of RTCP monitoring
  - Modifications to the report flow rate
  - Changes to the server IP address and server port
- The **list ip-network-region qos** and **list ip-network-region monitor** commands list quality of service and monitor server parameters from the IP Network Region screen as follows:
  - **qos** displays VoIP media and call control (and their 802.1p priority values), BBE DiffServ PHB values, RSVP profile and refresh rate.
  - **monitor** displays RTCP monitor server IP address, port number, report flowrate, codec set, and UDP port range parameters.

## Media Gateway serviceability commands

(For S8300 and S8700 Media Servers) Additional commands related to media gateways appear in *Maintenance for S8700 Media Server for Multiconnect Configurations* and *Maintenance for S8700 Media Server for IP-connect Configurations*. These include:

- The **status media-gateways** command provides an alarm summary, busyout summary, and link summary of all configured media gateways.
- Several commands have been modified to support the media gateway port identification format described in “[Command syntax changes for media modules](#)”. These include:
  - Message Sequence Trace (`mst`)
  - `display errors`
  - `display alarms`

## SNMP Agents

The S8300 and S8700 Media Servers contain SNMP modules. A simplified SNMP manager exists to collect traps from network elements such as the Uninterruptible Power Supply (UPS), Ethernet switches, and media gateways. An SNMP alarm sub-agent exists to send SNMP traps to customer provided network managers. An SNMP alarm sub-agent exists to send alarms as traps to the Initialization and Administration System (INADS). An SNMP master agent, MIB-II sub-agent, and MultiVantage sub-agent is provided.

The co-resident MultiVantage sub-agent is used to manage the co-resident ACP software.

 **NOTE:**

The following procedures are for the S8300 and S8700 Media Servers only.

### Adding trap destinations

A trap destination is an IP addresses that needs to receive SNMP alarm traps from the media server.

#### Instructions

To add a trap destination:

1. On the main page, under SNMP, click on **Configure Trap Destinations**.  
The Configure Trap Destinations page displays.

**Configure Trap Destinations**

Current administration for sending alarms as traps:

| Status                                | IP address | Notification | SNMP Version | Community / User Name | V3 Security Model | Authentication Password | Privacy Password |
|---------------------------------------|------------|--------------|--------------|-----------------------|-------------------|-------------------------|------------------|
| No destinations have been configured. |            |              |              |                       |                   |                         |                  |

#### Screen 28. Configure Trap Destination screen

2. Click **Add**.

The Add Trap Destination page displays.

### Add Trap Destination

Fill-in IP address and provide data for one of the three SNMP versions.

Check to enable this destination.

IP address:  .  .  .

**SNMP version 1**

Community name:

**SNMP version 2c**

Notification type:  ▾

Community name:

**SNMP version 3**

Notification type:  ▾

User name:

Security Model:  ▾

Authentication Password:  Must be at least 8 characters

Privacy Password:  Must be at least 8 characters

### Screen 29. Add Trap Destination screen, upper portion

- In the Fill-in IP address and provide data for one of the three SNMP versions section, check the **Check to enable this destination** box.
- In the IP address field, enter the IP address for destination.

**NOTE:**

To use MultiVantage Fault Performance Management (MFPM), use SNMP Version 1.

- In the SNMP version 1 section, in the Community name field, type **public** if you are using MFPM. If you do not use MFPM, you can enter anything but it has to be coordinated with the receiving network management station.
- Press ADD to save your changes.
- If you go back to check what the information looks like, under SNMP, click on **Configure Trap Destinations**.

The updated Configure Trap Destinations page displays.

**Configure Trap Destinations**

Current administration for sending alarms as traps:

| Status                        | IP address   | Notification | SNMP Version | Community / User Name | V3 Security Model | Authentication Password | Privacy Password |
|-------------------------------|--------------|--------------|--------------|-----------------------|-------------------|-------------------------|------------------|
| <input type="radio"/> enabled | 129.186.51.1 | trap         | v2c          | public                | N/A               | N/A                     | N/A              |
| <input type="radio"/> enabled | 129.186.51.2 | trap         | v2c          | public                | N/A               | N/A                     | N/A              |

**Screen 30. Updated Configure Trap Destinations screen**

**Administering SNMP agents**

This link provides support for administration of the co-resident SNMP master agent and MultiVantage sub-agent.

- Enable and disable access to the MultiVantage sub-agent
- Enable and disable each protocol (V1, V2, V3) individually. Any combination may be enabled.
- Administration of the password for the ACPSNMP login
- Enable SNMP busyout/release of ACP objects

You can use this page to allow or restrict SNMP services at the application level. (You can use the Set LAN Security page to inhibit the reception of SNMP messages at the network level. Both must be enabled for SNMP to function.)

This screen is divided into three sections:

1. MultiVantage Management Sub-Agent
  - Shows if the MultiVantage Management sub-agent is enabled (the checkbox is checked).
  - Shows if the sub-agent can be used to busyout and release boards, ports, trunk groups, and trunk members (checkbox is checked).
2. SNMP Users / Communities
  - Shows the status of SNMP version 1 read-only and read-write communities. If a community has been administered, it displays.
  - Shows the status of SNMP version 2c read-only and read-write communities. If a community has been administered, it displays.

- Shows the status of SNMP version 3 read-only and read-write users. If a user has been administered, its information displays. Passwords do not display; stars display to show a password has been administered. If a privacy password is used, an authentication password also must be given.
3. IP Addresses for SNMP Access
- A list of IP addresses from which SNMP access is allowed, or
  - All IP addresses.

Each SNMP version can be enabled and disabled independently of the other versions.

### **Administering SNMP versions 1 and 2c**

---

#### **Before you start**

- If you are using MFPM, obtain the community strings entered on the completed VMS001 form. For more information, see *Avaya MultiVantage Fault and Performance Manager, Installation and Configuration, 555-233-138*.

#### **Instructions**

To set up SNMP, we will use Versions 1 and 2c for the IP addresses.

The SNMP agents will be using the MultiVantage Fault and Performance Manager (MFPM).

To set up versions 1 and 2c:

1. On the main page, under SNMP, click on **Administer SNMP Agents**. The Administer SNMP Agents page displays.

## Administer SNMP Agents

### MultiVantage Management Sub-Agent

- Check to enable MultiVantage Management Sub-Agent
- Check to enable busy-out / release

Change Agent ACP Login Password :

Verify New Agent ACP Login Password :

---

### SNMP Users / Communities

#### SNMP Version 1

- Check to enable SNMP Version 1
- Community Name (read-only) :
- Community Name (read-write) :

#### SNMP Version 2c

- Check to enable SNMP Version 2c
- Community Name (read-only) :
- Community Name (read-write) :

#### SNMP Version 3

**Screen 31. Administer SNMP Agents, upper portion**

Check to enable SNMP Version 3

**User (read-only)**

User Name :   
 Authentication Password :  (for authentication and privacy)  
 Privacy Password :  (for privacy)

**User (read-write)**

User Name :   
 Authentication Password :  (for authentication and privacy)  
 Privacy Password :  (for privacy)

**IP Addresses for SNMP Access**

Any IP address

Following IP addresses:

IP address1 :   
 IP address2 :   
 IP address3 :   
 IP address4 :   
 IP address5 :

Enter

About This Screen

**Screen 32. Administer SNMP Agents, lower portion**

2. In the MultiVantage Management Sub-Agent section, check the **Check to enable MultiVantage Management Sub-Agent** box.

If checked, an SNMP manager can interact with the ACP application using the MultiVantage sub-agent within the restrictions administered on this screen.

If not checked, SNMP access to the ACP application is denied. Disabling the MultiVantage sub-agent does not inhibit access to other SNMP agents running on the server.

If you check the **Check to enable busy-out / release** box, the MultiVantage sub-agent can be used to busyout and release boards, ports, trunk groups, and trunk members.

3. In the Change Agent ACP Login Password field, enter a new password to change the password the MultiVantage sub-agent uses to log in to the call processing software.

4. In the `Verify New Agent ACP Login Password` field, repeat the new password.

**NOTE:**

To use MFPM you must use both SNMP Version 1 and Version 2c. Community strings must be set up in the special format.

5. In the `SNMP Version 1` section, check the **Check to enable SNMP Version 1** box.

This is the SNMP version of the protocol to be used in communicating with the SNMP agents on the server.

**NOTE:**

The `Community Name` fields are the authentication mechanism for SNMP v1 and v2c. The name can contain up to 50 characters. Any character can be used except “. There must be no spaces and the text is case sensitive.

6. In the `Community Name (read-only)` field, type the name.

The user can query only for information.

Your entry must be in the format: *anything!g3mgt!aliased active server name of the switch.*

**NOTE:**

Be sure to insert the “!” character between the name sections.

For example, `spaceport!g3mgt!blanket`

**NOTE:**

If you do not use MFPM, you can enter anything but it has to be coordinated with the receiving network management station.

7. In the `Community Name (read-write)` field, type the name.

The user can query agents for information (SNMP GETSs) and send commands to an agent (SNMP SETs).

Your entry must be in the format: *anything!g3mgt!aliased active server name of the switch.*

**NOTE:**

You must insert the “!” character between the name sections.

For example, trumpet!g3mgt!soundblast. Notice the term 'g3mgt' appears in all names.

**⇒ NOTE:**

If you do not use MFPM, you can enter anything but it has to be coordinated with the receiving network management station.

**⇒ NOTE:**

If you are using MFPM, whatever is entered in the community string for 'anything' must also be administered in MFPM. For more information, see *Avaya MultiVantage Fault and Performance Manager, Installation and Configuration, 555-233-138*.

8. In the SNMP version 2c section, check the **Check to enable SNMP Version 2c** box.
9. In the Community Name (read-only) field, type the same name assigned in step 6.
10. In the Community Name (read-write) field, type the same name assigned in step 7.
11. In the IP Address for SNMP Access section, check the **Following IP address** box.
12. In the IP address 1 field, type the IP address.

The SNMP agents on this server can be programmed to accept incoming SNMP messages from a restricted list of SNMP managers. If an SNMP message is received from an IP address not listed, it is dropped.

13. Repeat step 12 until all IP addresses are listed.
14. Press ENTER to save your changes.

## Administering SNMP version 3

---

If you decide to use SNMP Version 3, there are three levels of security provided.

1. The user name with no password provides the same level of security as SNMP Version 1 and Version 2c.
2. The Authentication Password field provides an enhanced level of security.
3. The Privacy Password provides an additional level of security.

### Instructions

To set up SNMP, we will use Version 3 for the IP addresses.

To set up Version 3:

1. On the main page, under SNMP, click on **Administer SNMP Agents**.  
The Administer SNMP Agents page displays.

## Administer SNMP Agents

### MultiVantage Management Sub-Agent

- Check to enable MultiVantage Management Sub-Agent

About This Screen

**Screen 34. Administer SNMP Agents, lower portion**

2. In the MultiVantage Management Sub-Agent section, check the **Check to enable MultiVantage Management Sub-Agent** box.
3. If checked, an SNMP manager can interact with the ACP application using the MultiVantage sub-agent within the restrictions administered on this screen.
4. If not checked, SNMP access to the ACP application is denied. Disabling the MultiVantage sub-agent does not inhibit access to other SNMP agents running on the server.
5. If you check the **Check to enable busy-out / release** box, the MultiVantage sub-agent can be used to busyout and release boards, ports, trunk groups, and trunk members.
6. In the Change Agent ACP Login Password field, enter a new password to change the password the MultiVantage sub-agent uses to log in to the call processing software.
7. In the Verify New Agent ACP Login Password field, repeat the new password.

8. Scroll down to the SNMP Version 3 section and check the **Check to enable SNMP Version 3** box.

This is the SNMP version of the protocol to be used in communicating with the SNMP agents on the server.

9. In the `User Name` field, type the user name.

The user can query only for information.

Your entry must be in any alphanumeric format and up to 50 characters in length.

10. (Optional) In the `Authentication Password` field, type the security password.

Your entry must be in any alphanumeric format and up to 50 characters in length.

 **NOTE:**

If you did not do step 10, you cannot step 11.

11. (Optional) In the `Privacy Password` field, type the security password.
12. (Optional) In the `IP address 1` field, type the IP address that is allowed to access the SNMP.

The SNMP agents on this server can be programmed to accept incoming SNMP messages from a restricted list of SNMP managers. If an SNMP message is received from an IP address not listed, it is dropped.

13. Repeat step 12 until all IP addresses are listed.
14. Press ENTER to save your changes.

## **Starting/Stopping Master Agent**

---

The Master Agent receives SNMP requests and forwards them to the appropriate subagent.

### **Instructions**

Use the Start selection if you are going to use SNMP. If the Master Agent is off, the button says **Start Agent**.

Use the Stop selection if you are not going to use SNMP. (This applies to MIB access only. You can have SNMP traps enabled without MIB access activated.) If the Master Agent is on, the button says **Stop Agent**.

To stop Master Agent:

1. On the main page, under SNMP, click **Start/Stop Master Agent**.

The Start/Stop SNMP Master Agent page displays.

## Start/Stop SNMP Master Agent

Master Agent status: Up

Stop Agent

About This Screen

### Screen 35. Start/Stop SNMP Master Agent screen

2. To stop Master Agent, click **Stop Agent**.

## Administering ACP log-in permissions

Now that you have set up SNMP, you need the ability to display administration commands and get system measurements.

### Instructions

1. On the SAT, type **change permissions acpsmp** and press ENTER.

The Command Permissions Categories screen displays.

```

change permissions acpsmp Page 1
 COMMAND PERMISSION CATEGORIES
 Login Name: acpsmp

COMMON COMMANDS
 Display Admin. and Maint. Data? y
 System Measurements? y
 System Mgmt Data Transfer Only? n

ADMINISTRATION COMMANDS

| <b>svfl</b>          | service call, first party control     | toll                       |

### Dialed String

User-dialed numbers are matched to the dialed string entry that most closely matches the dialed number. For example, if a user dials 297-1234 and the AAR or ARS Digit Analysis Table has dialed string entries of 297-1 and 297-123, the match is on the 297-123 entry.

An exact match is made on a user-dialed number and dialed string entries with wildcard characters and an equal number of digits. For example, if a user dials 424, and there is a 424 entry and an X24 entry, the match is on the 424 entry.

| <b>Valid entries</b> | <b>Usage</b>                                    |
|----------------------|-------------------------------------------------|
| <b>0 to 9</b>        | Enter up to 18 digits that the switch analyzes. |
| <b>*, x, X</b>       | wildcard characters                             |

### Location (for the ARS Digit Analysis Table)

This is a display-only field on the ARS Digit Analysis Table.

| <b>Valid display</b> | <b>Usage</b>                                                                                                                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1 to 44</b>       | Defines the switch location that uses this ARS Digit Analysis Table.                                                                                                                                  |
| <b>all</b>           | Indicates that this ARS Digit Analysis Table is the default for all port network (cabinet) locations. Appears only if the Multiple Locations field is <b>n</b> on System Parameters Customer Options. |

**Max**

| <b>Valid entries</b>      | <b>Usage</b>                                                                                      |
|---------------------------|---------------------------------------------------------------------------------------------------|
| Between Min and <b>28</b> | Enter the maximum number of user-dialed digits the system collects to match to the dialed string. |

**Min**

| <b>Valid entries</b>     | <b>Usage</b>                                                                                      |
|--------------------------|---------------------------------------------------------------------------------------------------|
| Between <b>1</b> and Max | Enter the minimum number of user-dialed digits the system collects to match to the dialed string. |

**Node Number**

| <b>Valid entries</b>            | <b>Usage</b>                                                                                                                                                              |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> to <b>999</b> or blank | Enter the number of the destination node in a private network if you are using node number routing or DCS. If you complete this field, leave the Route Index field blank. |

**Percent Full**

Displays the percentage (**0 to 100**) of the system’s memory resources that have been used by AAR/ARS. If the figure is close to 100%, you can free up memory resources.

**Route Pattern**

Enter the route number you want the switch to use for this dialed string.

| <b>Valid entries</b>      | <b>Usage</b>                                                                                                                                     |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>p1</b> to <b>p2000</b> | Specifies the route index number established on the Partition Routing Table                                                                      |
| <b>1</b> to <b>640</b>    | Specifies the route pattern used to route the call.                                                                                              |
| <b>1</b> to <b>999</b>    | Specifies the route pattern used to route the call. For S8300 Media Server only.                                                                 |
| <b>r1</b> to <b>r32</b>   | Specifies the remote home numbering plan area table. Complete this field if RHNPA translations are required for the corresponding dialed string. |
| <b>node</b>               | Designates node number routing                                                                                                                   |
| <b>deny</b>               | Blocks the call                                                                                                                                  |

## AAR and ARS Digit Conversion Table

Your system uses the AAR or ARS Digit Conversion Table to change a dialed number for more efficient routing. Digits may be inserted or deleted from the dialed number. For instance, you can tell the switch to delete a 1 and an area code on calls to one of your locations, and avoid long-distance charges by routing the call over your private network.

Screen 39. ARS Digit Conversion Table

 **NOTE:**

When you access the screen with **display** or **change**, the entries are sorted in the order of the matching pattern. Digits appear before characters.

**ANI Req**

This field applies only if the Request Incoming ANI (non-AAR/ARS) field on the Multifrequency-Signaling-Related System Parameters screen is **n**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                               |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to require ANI on incoming R2-MFC or Russian MF ANI calls.                                                                                                                                                                                                  |
| <b>r</b>             | Allowed only if the Allow ANI Restriction on AAR/ARS field is <b>y</b> on the Feature-Related System Parameters screen. Use to drop a call on a Russian Shuttle trunk or Russian Rotary trunk if the ANI request fails. Other types of trunks treat <b>r</b> as <b>y</b> . |

**Conv**

| <b>Valid entries</b> | <b>Usage</b>                                         |
|----------------------|------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow additional digit conversion. |

**Del**

| <b>Valid entries</b> | <b>Usage</b>                                                                                      |
|----------------------|---------------------------------------------------------------------------------------------------|
| <b>0 to Min</b>      | Enter the number of digits you want the system to delete from the beginning of the dialed string. |

**Location (for ARS only)**

This is a display-only field. Values other than **all** appear only if the Multiple Locations field on the System Parameters Customer Options is **y**.

| <b>Valid display</b> | <b>Usage</b>                                                                                            |
|----------------------|---------------------------------------------------------------------------------------------------------|
| <b>1 to 44</b>       | Defines the switch location for this ARS Digit Conversion Table.                                        |
| <b>all</b>           | Indicates that this ARS Digit Conversion Table is the default for all port network (cabinet) locations. |

## Matching Pattern

| <b>Valid entries</b>              | <b>Usage</b>                                                                                                                                                                                       |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0 to 9</b><br>(1 to 18 digits) | Enter the number you want the switch to match to dialed numbers. If a Prefix Digit 1 is required for 10-digit direct distance dialing (DDD) numbers, be sure the matching pattern begins with a 1. |
| <b>*, x, X</b>                    | wildcard characters                                                                                                                                                                                |

## Max

| <b>Valid entries</b> | <b>Usage</b>                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------|
| Min to <b>28</b>     | Enter the maximum number of user-dialed digits the system collects to match to this Matching Pattern. |

## Min

| <b>Valid entries</b> | <b>Usage</b>                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------|
| <b>1</b> to Max      | Enter the minimum number of user-dialed digits the system collects to match to this Matching Pattern. |

## Net

Enter the switch network used to analyze the converted number.

| <b>Valid entries</b> | <b>Usage</b>                                                                                  |
|----------------------|-----------------------------------------------------------------------------------------------|
| <b>ext, aar, ars</b> | Analyze the converted digit-string as an extension number, an AAR address, or an ARS address. |

## Percent Full

Displays the percentage (**0 to 100**) of the system's memory resources that have been used by AAR/ARS. If the figure is close to 100%, you can free-up memory resources.

## Replacement String

| <b>Valid entries</b>                      | <b>Usage</b>                                                                                                                |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>0 to 9</b><br>(1 to 18<br>digits)<br>* | Enter the digits that replace the deleted portion of the dialed number. Leave this field blank to simply delete the digits. |
| <b>#</b>                                  | Use # to indicate end-of-dialing. It must be at the end of the digit-string.                                                |
| blank                                     |                                                                                                                             |

## Abbreviated Dialing List

This screen establishes system-wide or personal lists for speed dialing.

### Enhanced List

The Enhanced Abbreviated Dialing List can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

#### **NOTE:**

The Abbreviated Dialing Enhanced List field must be enabled on the System-Parameters Customer-Options screen before you can program an Enhanced List.

You can define only one Enhanced Abbreviated Dialing List in the system. Before you assign numbers to the list, you must define whether you want a 3-digit or 4-digit enhanced list on the [Feature-Related System Parameters](#) screen. If you select 3-digit enhanced list, the list can be up to 10 separate screens numbered from 0-9 that allow you to define up to 1000 numbers. If you select a 4-digit enhanced list, the list can include up to 100 separate screens numbered 0-99 that allow you to assign up to 10,000 numbers.

If you want your attendants to use abbreviated dialing, you must also administer the [Console Parameters](#) screen.

```

**Screen 40. Abbreviated Dialing Enhanced List**

See Abbreviated Dialing for a detailed description of the special characters.

**DIAL CODE**

Enter the number you want the system to dial when users enter this dial code. While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number of receivers in the system, outgoing calling capability may be impaired.

Vector Directory Number extension may also be assigned.

| <b>Valid entries</b>        | <b>Usage</b>                                                                                                                           |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|

| <b>~p</b>                   | Pause 1.5 seconds                                                                                                                      |
| <b>~w</b>                   | Wait for dial tone                                                                                                                     |
| <b>~m</b>                   | Change to output pulse DTMF digits at the end-to-end rate                                                                              |
| <b>~s</b>                   | Start suppressing display of the digits being outputted                                                                                |
| <b>~W</b>                   | Wait indefinitely for dial tone. Use this only if network response time is more than 30 seconds. Not available for S8300 Media Server. |

**Privileged**

Indicates whether users of this list can dial any number in the list, regardless of the COR of the station from which they dial.

| Valid entries | Usage                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------|
| y/n           | Set this field to <b>n</b> if you want the system to verify that this station is allowed to dial this number. |

**Size (multiple of 5)**

The number of dial code list entries you want in this list.

| Valid entries                       | Usage                        |
|-------------------------------------|------------------------------|
| 5 to <b>100</b> , in multiples of 5 | Up to 100 entries per screen |

**Group List**

This screen implements the Abbreviated Dialing Group List. The Group Lists are controlled by the System Administrator. Up to 100 numbers can be entered per group list that can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

**Screen 41. Abbreviated Dialing Group List**

**DIAL CODE**

Enter the number you want the system to dial when users enter this dial code. While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number of receivers in the system, outgoing calling capability may be impaired.

Only 1 through 5 display initially. If you enter a number greater than 5 in the Size field, the system increases the number of dial codes to the number you specified.

Vector Directory Number extension may also be assigned.

| <b>Valid entries</b>        | <b>Usage</b>                                                                                                                           |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Digits <b>0</b> to <b>9</b> | Up to 24 characters                                                                                                                    |
| <b>*</b> (star)             | Part of FAC                                                                                                                            |
| <b>#</b> (pound)            | Part of FAC                                                                                                                            |
| <b>~p</b>                   | Pause 1.5 seconds                                                                                                                      |
| <b>~w</b>                   | Wait for dial tone                                                                                                                     |
| <b>~m</b>                   | Change to output pulse DTMF digits at the end-to-end rate                                                                              |
| <b>~s</b>                   | Start suppressing display of the digits being outputted                                                                                |
| <b>~W</b>                   | Wait indefinitely for dial tone. Use this only if network response time is more than 30 seconds. Not available for S8300 Media Server. |

### Group List

This is a display-only field when the screen is accessed using an administration command such as **add** or **change**.

| <b>Valid entries</b> | <b>Usage</b>                                         |
|----------------------|------------------------------------------------------|
| Display-only field   | Enter a group number when completing a paper screen. |

### Privileged

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                             |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | If <b>y</b> is entered, the calling phone's class of restriction (COR) is never checked and any number in the group list will be dialed. |
| <b>n</b>             | If <b>n</b> is entered, the calling phone's COR is checked to determine if the number can be dialed.                                     |

### Program Ext

Enter the extension that you want to give permission to program the Group List.

### Size (multiple of 5)

Enter the number of abbreviated dialing numbers you want to assign in multiples of 5, up to 100.

**Personal List**

This screen establishes a personal dialing list for phone/data module users. The personal list must first be assigned to the phone by the System Administrator before the phone user can add entries in the list. The lists can be accessed by users to place local, long-distance, and international calls; to activate/deactivate features; or to access remote computer equipment.

| <b>~m</b>                   | Change to outpulse DTMF digits at the end-to-end rate                                            |
| <b>~s</b>                   | Start suppressing display of the digits being outpulsed                                          |
| <b>~W</b>                   | Wait indefinitely for dial tone. Use this only if network response time is more than 30 seconds. |

## Privileged

| Valid entries | Usage                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> if the originating party's class of restriction (COR) is never checked and any number in the list can be dialed. |
| n             | Enter <b>n</b> if the COR is to be checked to determine if the number can be dialed.                                            |

## Size (multiple of 5)

Enter the number of abbreviated dialing numbers you want to assign in multiples of 5, up to 100.

## 7103A Button List

This screen assigns abbreviated dialing numbers to the 7103A phone buttons. The entries can then be accessed by 7103A phone users to place local, long-distance, and international calls; activate/deactivate features; or to access remote computer equipment. This screen applies only to 7103A fixed feature phones. Only one 7103A abbreviated dialing list can be implemented in the system and it applies to all 7103A fixed feature phones in the system. This list is controlled by the System Administrator.

## Pages 1 through 4 of the screen

```
display abbreviated-dialing 7103A-buttons Page 1 of 1
 ABBREVIATED DIALING LIST
 7103A Button List

DIAL CODE (FOR THE 7103A STATION BUTTONS)
1: _____ 5. _____
2: _____ 6. _____
3: _____ 7. _____
4: _____ 8. _____
```

Screen 44. Abbreviated Dialing List — 7103A Button List

## DIAL CODE

Enter the number you want to assign to each dial code (button). Any additions or changes apply to all 7103A fixed feature phones. While the system is waiting, a call progress tone receiver is tied up, and, since there are a limited number of receivers in the system, outgoing calling capability may be impaired.

Vector Directory Number extension may also be assigned.

| Valid entries               | Usage                                                                                                                                  |

| <b>~w</b>                   | Wait for dial tone                                                                                                                     |
| <b>~m</b>                   | Mark                                                                                                                                   |
| <b>~s</b>                   | Start suppressing display of the digits being outpulsed                                                                                |
| <b>~W</b>                   | Wait indefinitely for dial tone. Use this only if network response time is more than 30 seconds. Not available for S8300 Media Server. |

## Access Endpoint

---

This screen administers Access Endpoints and Wideband Access endpoints.

### NOTE:

You can administer Wideband Access Endpoints only if, on the System-Parameters Customer-Options screen, the Wideband Switching field is **y**.

An Access Endpoint is a nonsignaling trunk that neither responds to signaling nor generates signaling. Access Endpoints eliminate the need to dedicate an entire trunk group for the access of a single trunk by providing the capability to assign an extension number to a single trunk.

An Access Endpoint can be specified as the Originator or Destination endpoint of an administered connection.

A Wideband Access Endpoint (WAE) is an endpoint application connected to line-side non-ISDN T1 or E1 facilities and, like Access Endpoints, have no signaling interface with the system. For information on endpoint applications connected to line-side ISDN-PRI facilities, see [“PRI Endpoint” on page 1080](#).

The WAE is defined by a starting port (DS0) and a width specifying the number of adjacent nonsignaling DS0s (positioned within a DS1 facility) that make up the endpoint. This width may be between 2 and 31 adjacent DS0s.

**⇒ NOTE:**

Access Endpoints and Wideband Access Endpoints consume the same resources that trunks use. Thus, the sum of Access Endpoints and trunks cannot exceed the maximum number of trunks available in your system configuration.

## Field descriptions for page 1

```

add access-endpoint next Page 1 of 1
 ACCESS ENDPOINT
 Extension: 30001 (Starting) Port: _____
 Communication Type: voice-grade-data Name: _____
 COR: 1 COS: 1
 TN: 1 ITC: restricted

```

### Screen 45. Access Endpoint screen

#### Communication Type

| Valid entries           | Usage                                                    |
|-------------------------|----------------------------------------------------------|
| <b>voice-grade-data</b> | For an analog tie trunk access endpoint.                 |
| <b>56k-data</b>         | For a DS1 access endpoint enter as appropriate           |
| <b>64k-data</b>         | ( <b>64k-data</b> is not allowed for robbed-bit trunks). |
| <b>wideband</b>         | For a Wideband access endpoint                           |

#### COR

The COR is administered so that only an administered connection (AC) endpoint can be connected to another AC endpoint.

| Valid entries  | Usage                                                    |
|----------------|----------------------------------------------------------|
| <b>0 to 95</b> | Enter the appropriate class of restriction (COR) number. |

## COS

The COS is administered (see “[Class of Service](#)” on page 672) so that the use of the Call Forwarding All Calls feature for access endpoints is prohibited.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|              |                                   |
|--------------|-----------------------------------|
| 0 through 15 | Enter the appropriate COS number. |
|--------------|-----------------------------------|

## Extension

A display-only field showing the extension number as specified in the command line, or shows the next available extension number if **next** was entered on the command line. This is the extension number assigned to the nonsignaling trunk and used to access the trunk endpoint.

## ITC (Information Transfer Capability)

This field is used to determine the type of transmission facilities to be used for ISDN calls originating from this endpoint. Displays when the Communication Type field is **56k-data**, **64k-data**, or **Wideband**.

When adding an access endpoint with the ITC administered as unrestricted, its associated port has to be a channel of a DS1 circuit pack with the Zero Code Suppression field administered as B8ZS. If the port is not a channel of a DS1 circuit pack with its Zero Code Suppression field administered as B8ZS, the end validation fails and the screen submission is rejected. The cursor is moved to ITC with the following error message:

```
An unrestricted access endpoint can only be from B8ZS DS1
circuit pack.
```

When adding an access endpoint with the ITC administered as restricted, its associated port can be a channel from a DS1 circuit pack with the Zero Code Suppression field administered as ZCS or B8ZS.

For an existing access endpoint, ITC can only be changed from restricted to unrestricted if its associated port is a channel of a DS1 circuit pack with its Zero Code Suppression field administered as B8ZS. If the port is not a channel of a DS1 circuit pack with its Zero Code Suppression field administered as B8ZS, the end validation fails and the screen submission is rejected. The cursor is moved to ITC with the following error message:

```
An unrestricted access endpoint can use only B8ZS DS1
circuit pack
```

Without this end validation, a user could administer an access endpoint as unrestricted when in fact it is restricted, that is, its associated port is a member of a DS1 circuit pack that uses ZCS data transmission.

| Valid entries       | Usage                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>unrestricted</b> | When <b>unrestricted</b> , only unrestricted transmission facilities (b8zs) will be used to complete the call. An unrestricted facility is a transmission facility that does not enforce 1's density digital transmission (that is, digital information is sent exactly as is).<br><br>For Wideband Access Endpoints, enter <b>unrestricted</b> .                       |
| <b>restricted</b>   | When <b>restricted</b> , either restricted (zcs-ami) or unrestricted transmission facilities is used to complete the call. A restricted facility is a transmission facility that enforces 1's density digital transmission (that is, a sequence of eight digital zeros is converted to a sequence of seven zeros and a digital one) via zcs coding on DS1 circuit pack. |

**Name**

Enter an name for the endpoint.

**(Starting) Port**

Enter the necessary characters.

| Valid entries                                                                                                                                                                                                   | Usage                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number. |
| <b>A</b> through <b>E</b>                                                                                                                                                                                       | Third character is the carrier.                     |
| <b>0</b> through <b>20</b>                                                                                                                                                                                      | Fourth and fifth characters are the slot number.    |
| <b>01</b> through <b>04</b><br>(Analog TIE trunks)<br><b>01</b> through <b>31</b>                                                                                                                               | Six and seventh characters are the circuit number.  |

| Valid entries                                                                                                                                                                                              | Usage   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| <b>1</b> through <b>80</b><br>(DEFINITY R, CSI) or<br><b>1</b> through <b>10</b> (DEFINITY<br>SI) or<br><b>1</b> through <b>250</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | Gateway |
| <b>V1</b> through <b>V9</b>                                                                                                                                                                                | Module  |
| <b>01</b> through <b>31</b>                                                                                                                                                                                | Circuit |

For example, 01A0612 is in cabinet 01, carrier A, slot 06, and circuit number (port) 12.

**⇒ NOTE:**

For Wideband Access Endpoints, analog tie trunks cannot be used and the DS1 Interface circuit pack, Version C or later, must be used.

The DS1 circuit number corresponds to the channel that will carry the data traffic. Channels 1 through 31 (DS1 Interface only) or channels 1 through 24 (DS1 Tie Trunk, DS1 Interface, or DS1 Interface (32) circuit packs) can be used when the DS1 Signaling Type field is **robbed-bit** or **isdn-ext**. For Common Channel or ISDN-PRI signaling, channel use is limited to channels 1 through 30 (DS1 Interface circuit pack only) or channels 1 through 23 (DS1 Interface (32) or DS1 Interface ). A channel can be administered as an access endpoint regardless of the DS1 signaling type.

**TN**

| Valid entries        | Usage                              |
|----------------------|------------------------------------|
| 1 through <b>100</b> | Enter the Tenant Partition number. |

**Width**

Appears if the Communication Type field is **wideband**. This field cannot be blank.

| Valid entries         | Usage                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <b>2</b> to <b>31</b> | Enter the number of adjacent DS0 ports beginning with the specified Starting Port, that make up the WAE. |
| <b>6</b>              | A width of <b>6</b> defines a 384 Kbps WAE.                                                              |

## Administered Connection

This screen assigns an end-to-end Administered Connection (AC) between two access endpoints or data endpoints. The AC is established automatically by the system whenever the system restarts or the AC is due to be active. See [“Administered connections”](#) on page 1454 and [“Access Endpoint”](#) on page 593 for additional information.

#### Screen 46. Administered Connection screen

##### Connection Number

This is a display-only field showing an unassigned AC number when the screen is accessed using an administration command such as **change** or **display**.

##### Destination

Used to route the AC to a desired endpoint. Enter the address of the destination access or data endpoint. This endpoint is the terminating party of the AC and need not be local to the switch on which the AC is assigned. The entry must be consistent with the local switch's dial plan (that is, the first digits are assigned as

an extension, feature access code, or trunk access code, or DDD Number). If a local extension is entered, it must be assigned to either an access or data endpoint. Abbreviated Dialing entries may be used in this field.

| <b>Valid entries</b> | <b>Usage</b>                                                                     |
|----------------------|----------------------------------------------------------------------------------|
|                      | Enter the assigned access endpoint/data module extension or valid dialed string. |

**Enable**

Provides the administered connection.

| <b>Valid entries</b> | <b>Usage</b>                                                                           |
|----------------------|----------------------------------------------------------------------------------------|
| <b>y</b>             | Indicates an attempt will be made to establish the AC when the AC is due to be active. |
| <b>n</b>             | The AC will not be made or if it is up, it will drop.                                  |

**Name**

| <b>Valid entries</b>                                                                                              | <b>Usage</b>                            |
|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Up to 27 alphanumeric characters.<br>Up to 15 alphanumeric characters (S8300 Media Server, S8700 IP-Connect only) | Enter a short identification of the AC. |

**Originator**

Enter the assigned access endpoint/data module extension.

Data Line circuit pack

- Asynchronous EIA 232C compatible equipment

Digital Line circuit pack connections, including:

- MPDM (700D), MTDM (700B, 700C, 700E), 7400D data module
- 7400A, 7400B, 7400C HSL, 8400B data module
- 7401D phone with 7400B or 8400B data module
- 7403D/7405D/7407D/7410D/7434D phone with DTDM or 7400B or 8400B data module
- 7404D or 7406D phone
- 510D personal terminal

- 515 BCT, 615 BCT, or 715 BCT terminal
- PC/switch connection

ISDN-BRI Line circuit pack connections, including:

- 7500 data module
- 7505D/7506D/7507D phone with ADM

| <b>Valid entries</b>                           | <b>Usage</b>                                                                                                          |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Assigned access endpoint/data module extension | The endpoint must be local to the switch on which the AC is administered. Nonsignaling DS1 trunk or analog tie trunk. |

## **Authorized Time of Day**

---

### **Continuous**

The connection will be up all the time or re-established if the connection goes down.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                            |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Indicates that the AC is continuous (that is, not scheduled to be active at a certain time). If <b>y</b> is entered, the seven Start Days and associated Duration fields do not appear. |
| <b>n</b>             | Displays the Start Days fields.                                                                                                                                                         |

### **Duration**

Enter the period of time that the scheduled AC should remain active. This period is specified in two fields separated by a colon. The maximum duration is 167 hours and 59 minutes (that is, 1 minute less than 1 week). Only appears if the Continuous field is **n**.

| <b>Valid entries</b>          | <b>Usage</b>          |
|-------------------------------|-----------------------|
| <b>000</b> through <b>167</b> | For the hour field.   |
| <b>00</b> through <b>59</b>   | For the minute field. |

### Start Days (Sun through Sat)

These fields indicate only the days on which an attempt will be made to establish the AC and not necessarily the days it is active. A scheduled AC may be active over a number of days, and, in this situation, these fields should be used only to specify the days on which the AC starts and not other days on which the AC may be active. Only appears if the Continuous field is **n**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                 |
|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> in each of the required days of the week fields to indicate that an attempt will be made to establish the AC. |
| <b>n</b>             | Displays the day fields.                                                                                                     |

### Start Time

Only appears if the Continuous field is **n**.

| <b>Valid entries</b>              | <b>Usage</b>                                                                                                                                  |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>00:00</b> through <b>23:59</b> | Enter the time of the day when an attempt should begin to establish a scheduled AC. The time is specified in two fields separated by a colon. |

### Miscellaneous Parameters

---

#### Alarm Threshold

Only appears if an entry in the Alarm Type field is other than **none**. Enter the number of times an attempt to establish or reestablish an AC must fail consecutively before an AC alarm generates. (An alarm will be generated after the fourth retry has failed; thus, with the retry interval of 2 minutes, an alarm will be generated approximately 8 minutes after the first failure occurs.)

| <b>Valid entries</b>       | <b>Usage</b>                                                        |
|----------------------------|---------------------------------------------------------------------|
| <b>1</b> through <b>10</b> | An alarm generates on the first failure if this field is <b>1</b> . |

## Alarm Type

Enter the type of alarm to be generated if the AC cannot be initially established, or fails and cannot be reestablished, and the number of consecutive failures equals the alarm threshold. All AC alarms and the errors that caused the alarms are recorded in the system's alarm and error log. In addition, a status lamp associated with an attendant console or phone feature button (ac-alarm) may be used to indicate the AC alarm.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>major</b>         | Failures that cause critical degradation of service and require immediate attention.                                                                                                                                                                                                                             |
| <b>minor</b>         | Failures that cause some degradation of service, but do not render a crucial portion of the system inoperable. This condition requires action, but its consequences are not immediate. Problems might be impairing service to a few trunks or stations or interfering with one feature across the entire system. |
| <b>warning</b>       | Failures that cause no significant degradation of service or failures in equipment external to the system. Warning alarms are not reported to the attendant console or INADS.                                                                                                                                    |
| <b>none</b>          | The alarm notification may be disabled for this AC.                                                                                                                                                                                                                                                              |

## Auto Restoration

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                       |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to indicate an attempt is to be made to reestablish an AC that failed. Auto restoration is available only for an AC that is established over an ISDN Software Defined Data Network (SDDN) trunk group. A <b>y</b> in this field is ignored in all other situations. |

## Priority

Enter a number that is to be used to determine the order in which ACs are to be established.

| <b>Valid entries</b> | <b>Usage</b>                                |
|----------------------|---------------------------------------------|
| <b>1 through 8</b>   | 1 is the highest and 8 the lowest priority. |

## Retry Interval

| <b>Valid entries</b> | <b>Usage</b>                                                                     |
|----------------------|----------------------------------------------------------------------------------|
| 1 through 60         | Enter the number of minutes between attempts to establish or reestablish the AC. |

## Alias Station

---

This screen allows you to configure the system so that you can administer new phone types that are not supported by your system software. This screen maps new telephone models to a supported telephone model. This mapping does not guarantee compatibility, but allows nonsupported models to be administered and tracked by their own names.

Some administrators also use this screen to “name” non-telephone devices. For example, you know that you can add a modem to your system by simply administering the extension as the standard analog type 2500. But, if you listed your stations, how would you know which extensions are modems? Instead, you could use the Alias screen to create a ‘modem’ alias to type 2500 and enter modem in the Type field for every modem you add to your system. For more information, see [“Adding a fax or modem” on page 109](#).

**Tip:**

*When you upgrade a system that uses an alias set type to a new release, the system determines if the aliased type is supported in the new release (is now a native set type). When you review the Alias Station screen, you may see alias types that have become native. If the type is now native, the last character of the aliased set type becomes a “#.”*

## Field descriptions for page 1

```

```

### Screen 47. Alias Station screen

#### Alias Set Type

Enter up to a 5-character name for the non-supported phone type that you want to alias to a similar supported telephone type. Do not use blank characters.

#### Supported Set Type

Enter a supported phone type that you want to map (or alias) to the alias set type. Valid supported phone types are listed in [Table 17 on page 1162](#).

**⇒ NOTE:**

Data Communication Protocol (DCP) telephone types must be aliased to DCP telephone types, hybrid types to hybrid types, and analog to analog types.

## Alphanumeric Dialing Table

This screen associates alpha-names to dialed digit strings. This allows telephone users to place a *data call* by simply typing the alpha-name. Users need only remember far-end alpha-names instead of the actual digit strings.

The screen consists of paired Alpha-name/Mapped String fields. Entries may be made in any order on the screen. However, before the screen is displayed for changing or reviewing, the entries in the table are sorted alphanumerically by the alpha-name. All entries will be moved to the beginning of the table, leaving all blank entries at the end.

**Field descriptions for page 1**

**Screen 48. Alphanumeric Dial Table screen****Alpha-name**

All alpha-names in the table must be unique and cannot be referenced in their own “Mapped String”. The alpha-names can be used in any other “Mapped String” and multiple times in a “Mapped String”.

**Valid entries**

From 1 to 8 alphanumeric characters

**Usage**

The entry must start with an alphabetic character and may not have blank spaces between characters.

**Mapped String**

Enter from 1 to 24 characters that may contain alphanumeric, readability, delimiters, and/or special characters. The entry is used to generate the final dialing string and can include Facility Access Codes.

**⇒ NOTE:**

A Mapped String may not contain an Alpha-Name whose Mapped String also contains an Alpha-Name.

| Valid entries            | Usage                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Digits 0 through 9       | Numeric                                                                                                                                                                 |
| A through Z, a through z | Alpha (note uppercase entries are mapped to lowercase)                                                                                                                  |
| (                        | Character delimiters used for easy reading of the dial string                                                                                                           |
| )                        |                                                                                                                                                                         |
| /                        | Delimiters consisting of both readability and special characters are used to separate tokens of "alpha-names" or numeric sub-strings. For example, "(205) mt-1234+0000" |
| -                        |                                                                                                                                                                         |
| +                        |                                                                                                                                                                         |
| %                        |                                                                                                                                                                         |
| “,”                      |                                                                                                                                                                         |
| space                    |                                                                                                                                                                         |

|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| up to 27-character alpha-numeric filename (no ., /, :, *, ?, <, >, \, .wav, or blanks in this field for VAL circuit packs only) | <p>Describe the announcement message.</p> <p>For TN2501AP and Avaya MultiVantage™ S8100 Media Server with CMC1 Media Gateway ISSPA announcements, this field is required. The value in this field becomes the filename of the announcement.</p> <p>The <b>.wav</b> file extension, which is part of the filename stored on the circuit pack, does not appear. Do not enter <b>.wav</b> as part of the filename.</p> <p>Names on a single VAL circuit pack must be unique. The system checks for duplicate filenames on the same VAL circuit pack.</p> |

## Port

For External Announcements (analog, Lineside T1/E1, or Aux. Trunk). Enter the necessary characters in the **axssyy** format (where **aa** = the cabinet number, **x** = the carrier, **ss** = the slot number, and **yy** = the circuit number).

| Valid entries                                                                                                                                                                       | Usage                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect) | First and second characters are the cabinet number. |
| <b>A</b> through <b>E</b>                                                                                                                                                           | Third character is the carrier.                     |
| <b>0</b> through <b>20</b>                                                                                                                                                          | Fourth and fifth characters are the slot number.    |
| <b>00</b> through <b>32</b>                                                                                                                                                         | Six and seventh characters are the circuit number.  |

For example, 01A0612 is in cabinet 01, carrier A, slot 06, and circuit number (port) 12.

For Integrated Announcements (TN750 or TN2501AP (VAL) circuit pack). Enter the necessary characters in the **axss** format (where **aa** = the cabinet number, **x** = the carrier, and **ss** = the slot number).

| Valid entries                                                                                                                                                                       | Usage                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect) | First and second characters are the cabinet number. |
| <b>A</b> through <b>E</b>                                                                                                                                                           | Third character is the carrier.                     |
| <b>0</b> through <b>20</b>                                                                                                                                                          | Fourth and fifth characters are the slot number.    |

For example, 01A06 is in cabinet 01, carrier A, and slot 06.

For ISSPA.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                   |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>1A13</b>          | Denotes the embedded announcement in S8100 Media Server with CMC1 Media Gateway, or S8100 Media Server with G600 Media Gateway |

For G700 Media Gateway (VVAL) circuit pack). Enter the necessary characters in the **ggV9** format (where **gg** = the gateway number and **V9** = embedded announcements).

| <b>Valid entries</b>        | <b>Usage</b>          |
|-----------------------------|-----------------------|
| <b>01</b> through <b>30</b> | Media gateway number. |

For example, 10V9 is gateway 10.

## Pr

When the Type is field **analog**, **ds1**, or **aux-trunk**, N/A appears in this field.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to protect the integrated announcement from being deleted or changed by any user. For VAL, after an announcement file resides on the circuit pack (recorded or FTP transfer), you can set this field to <b>y</b> to protect the file (read-only). |
| <b>n</b>             | Enter <b>n</b> to allow only users with a console permission COS to change or delete an announcement. For VAL the default is <b>n</b> , meaning that the announcement file is read-write. Use this value when you initially administer the announcement.         |

## Q (Queue)

| Valid entries | Usage                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> to queue calls for the announcement if the Type field is <b>integrated</b> , <b>integ-rep</b> or <b>aux-trunk</b> . The caller is always connected to the beginning of the announcement. Enter <b>y</b> for ACD and vectoring delay announcements. Call centers should always use this option. |
| <b>n</b>      | No queue and no barge-in. The caller is always connected to the beginning of the announcement. The announcement does not play if a port is not available.                                                                                                                                                     |
| <b>b</b>      | Enter <b>b</b> to set up barge-in if the Type field is <b>integrated</b> , <b>integ-rep</b> or <b>aux-trunk</b> . Callers are connected to the announcement at any time while it is playing.                                                                                                                  |

### NOTE:

The same non-charge-in announcement can be played through more than one port (or all ports) of an integrated circuit pack. The initial request to play an announcement selects an available port on the board on which the announcement resides. If there are additional requests to play the announcement while it is playing on another port(s), another port is selected. If all ports are busy, new requests to play announcements go to the integrated announcement system queue (Q field must be **y**). Otherwise, the request to play is denied, and processing continues without the caller hearing the announcement. When a port becomes available, all queued calls (up to the platform “calls connected” limit) are connected at the same time to hear the announcement play from the beginning.

A barge-in announcement starts playing when first requested and continues playing through a port, repeating until there are no more requests. Call processing simultaneously connects calls to the playing barge-in announcement. Each call remains connected until the requesting feature operation removes the call (for example, wait step times out). Barge-in type announcements never select another port to play the same announcement once it is playing on a specific port.

## QLen (Queue Length)

The queue length is the number of calls that can queue for this announcement. The maximum number of queues allowed depends on your system configuration.

The QLen field applies if the Q field is **y** and the Type field is **analog**, **ds1** or **aux-trunk**. When the Type field is **integrated** or **integ-rep**, N/A appears in this field. Integrated announcements have a pre-set queue length.

| <b>Valid entries</b>                  | <b>Usage</b>                                             |
|---------------------------------------|----------------------------------------------------------|
| The maximum number your system allows | Number of calls that can be queued for this announcement |

## Rt

Enter the recording rate speed (in 1000 bits/second) for integrated announcements. A different recording speed may be used for each integrated announcement. When the Type field is **analog**, **ds1** or **aux-trunk**, N/A appears in this field.

TN750 or ISSPA.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16</b>            | 16 kbps (8 minutes and 32 seconds of announcement time per circuit pack or 1 hour and 24 minutes for 10 circuit packs for the TN750; for the ISSPA, there are 240 minutes of storage time). This rate does not provide a high-quality recording. Avaya does not recommend this for customer announcements, but it is adequate for VDN of Origin announcements. |
| <b>32</b>            | 32 kbps (4 minutes and 16 seconds of total announcement time for the TN750; for the ISSPA, there are 120 minutes of storage time).                                                                                                                                                                                                                             |
| <b>64</b>            | 64 kbps (for 2 minutes and 8 seconds of announcement time per circuit pack or 42 minutes for 10 circuit packs for the TN750; for the ISSPA, there are 60 minutes of storage time). This is the default for VAL.                                                                                                                                                |

VAL or VVAL.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                    |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>64</b>            | VAL provides 10 minutes storage as the default and 60 minutes with the VAL Maximum Capacity field.<br><br>VVAL provides 20 minutes regardless of the setting of the VAL Maximum Capacity field. |

## TN

| Valid entries | Usage                                      |
|---------------|--------------------------------------------|
| 1 to 100      | Enter the Tenant Partition number, if any. |

## Type

Enter the type of announcement you want to assign to this extension number.

If you enter **integrated** or **integ-rep**, complete the Q, Protect, Rate, and Port fields. If you enter **analog**, **ds1-fd**, **ds1-sa**, **ds1-ops**, or **aux-trunk**, complete QLen (if Q is y) and Port.

| Valid entries    | Usage                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>analog</b>    | Use to play announcements from an external device for a specific period and hang up when finished. When the device hangs up, the caller hears a click. Connects to switch through analog port. Ringing starts playback.                                                   |
| <b>analog-m</b>  | Use for continuous playing music or audio source from an external announcement device.                                                                                                                                                                                    |
| <b>analog-fd</b> | Use to play announcements from an external device for a specific period and hang up when finished. When the device hangs up, the caller hears a click. Connects to switch through analog port. Ringing starts playback. Sends forward disconnect signal to stop playback. |
| <b>aux-trunk</b> | Auxiliary trunk. Use with an external announcement device with a 4-wire "aux" interface.                                                                                                                                                                                  |
| <b>aux-trk-m</b> | Auxiliary trunk. Use with continuously playing music or audio sources that do not indicate playback is active.                                                                                                                                                            |
| <b>ds1-fd</b>    | Assigned to DS1 ports on circuit packs. Avaya recommends this for interfacing for CONVERSANT Line Side T1 ports when CONVERSANT is used. Callers do not hear a click when the device hangs up. Provides a disconnect to stop playback when the announcement is done.      |
| <b>ds1-ops</b>   | Callers do not hear a click when the device hangs up.                                                                                                                                                                                                                     |

| Valid entries     | Usage                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ds1-sa</b>     | Provides a disconnect to stop playback when the announcement is done. Callers do not hear a click when the device hangs up.                       |
| <b>integrated</b> | Stored internally on the switch on a special integrated announcement circuit pack. Use for general announcements and VDN of Origin Announcements. |
| <b>integ-rep</b>  | integrated repeating                                                                                                                              |

See Appendix A, “Recorded Announcements,” in *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*, for more information about the Type field.

## ARS Toll Table

This screen assigns ARS Toll Tables used by Subnet Trunking. Use it to specify whether calls to CO codes listed on the table are toll or non-toll calls. You specify non-toll calls based on the last 2 digits of the distant-end of the trunk group.

```

change ars toll
 ARS TOLL TABLE: __

This is a display-only field when the screen is accessed using an administration command such as **add** or **change**.

### Auto Answer

| Valid entries | Usage                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>    | Entering <b>all</b> in this field indicates an incoming call to an idle attendant will be answered automatically without any action (no button presses required) by the attendant.                 |
| <b>acd</b>    | Entering <b>acd</b> indicates only ACD split/skill calls and direct agent calls can auto answer. Non-ACD calls terminated to an attendant console with Auto Answer set to <b>acd</b> ring audibly. |
| <b>none</b>   | Entering <b>none</b> causes all calls terminated to this attendant console to receive some sort of audible ringing treatment.                                                                      |

### Console Type

Enter this console's intended use. There can only be one **night-only** or one **day/night** console in the system unless Tenant Partitioning is administered. Night Service is activated from the principal console or from the one station set per-system that has a nite-serv button.

| Valid entries     | Usage                                          |
|-------------------|------------------------------------------------|
| <b>principal</b>  | Puts the attendant console into night service. |
| <b>day-only</b>   | Will not get night service calls.              |
| <b>night-only</b> | Handles only night service calls.              |
| <b>day/night</b>  | Handles day or night service calls.            |

### COR

| Valid entries       | Usage                                                                 |
|---------------------|-----------------------------------------------------------------------|
| <b>0 through 95</b> | Enter the class of restriction that reflects the desired restriction. |

### COS

| Valid entries       | Usage                                                        |
|---------------------|--------------------------------------------------------------|
| <b>0 through 15</b> | Enter the class of service (COS) for this attendant console. |

## Data Module

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                         |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> if the console is to be connected to a data terminal via 7400B or 8400 Data Module. If <b>y</b> is entered, complete the Data Module screen (page 4). |

## Disp Client Redir

This field is administrable only if the Hospitality feature has been enabled on the System-Parameters Customer-Options screen. This field affects the station's display on calls originated from a station with Client Room Class of Service.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                   |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | <p>When the field is <b>y</b>, the redirection information for a call originating from a Client Room and terminating to this station displays.</p> <p>Note: For stations with an <b>audix</b> station type, AUDIX Voice Power ports, or ports for any other type of messaging that needs display information, this field must be <b>y</b>.</p> |
| <b>n</b>             | When the field is <b>n</b> , then for all calls originating from a Client Room (even redirected calls) that terminate to this station, this station's display will not show the redirection information. Only the client name and extension (or room, depending on what is administered on the Hospitality screen) displays.                   |

## Display Language

Enter the language in which you want console messages displayed.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| <b>English</b>       |              |
| <b>French</b>        |              |
| <b>Italian</b>       |              |
| <b>Spanish</b>       |              |
| <b>user-defined</b>  |              |

## Extension (Optional)

Enter the extension for the individual attendant console. Individual attendant extensions allow attendants to use features that an attendant group cannot use. For example, extensions can be members of a DDC or UCD group. An individual attendant extension can have its own Class of Restriction and Class of Service.

If you give your attendants an individual extension, users can call the attendant by dialing the extension or you can assign them an abbreviated-dialing button for fast access to the attendant.

| <b>Valid entries</b>             | <b>Usage</b>                                                                                                                                                                      |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| An unassigned extension or blank | If an extension is not assigned, the attendant can only be addressed as a member of the attendant group. If the attendant has a data module, the extension field cannot be blank. |

## Group

| <b>Valid entries</b> | <b>Usage</b>                     |
|----------------------|----------------------------------|
| 1 to 28              | Enter the Attendant Group number |

## H.320 Conversion

Allows H.320 compliant calls made to this phone to be converted to voice-only. Because the system can handle only a limited number of conversion calls, you may need to limit the number of phones with H.320 conversion.

| <b>Valid entries</b> | <b>Usage</b>                              |
|----------------------|-------------------------------------------|
| y/n                  | Enter <b>y</b> for H.320 compliant calls. |

## Name

Enter the name of this console.

| <b>Valid entries</b>             | <b>Usage</b>           |
|----------------------------------|------------------------|
| Up to 27 alphanumeric characters | Any entry is accepted. |

**Port**

Enter the necessary characters.

| <b>Valid entries</b>                                                                                                                                                                                        | <b>Usage</b>                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number.                                                                                                                                                                                 |
| <b>A</b> through <b>E</b>                                                                                                                                                                                   | Third character is the carrier.                                                                                                                                                                                                     |
| <b>0</b> through <b>20</b>                                                                                                                                                                                  | Fourth and fifth characters are the slot number.                                                                                                                                                                                    |

| <b>01</b> through <b>31</b>                                                                                                                                                                                 | Circuit                                                                                                                                                                                                                             |
| <b>ip</b>                                                                                                                                                                                                   | SoftConsole IP attendant. You also must have the Type field as <b>302B</b> and enter a security code. <b>ip</b> is allowed only if, on the System-Parameters Customer-Options screen, the IP Attendant Consoles field is <b>y</b> . |
| <b>x</b>                                                                                                                                                                                                    | Indicates that there is no hardware associated with the port assignment. An individual attendant extension must be assigned in the Extension field.                                                                                 |

For example, 01A0612 is in cabinet 01, carrier A, slot 06, and circuit number (port) 12.

Each attendant console requires a port on a digital line circuit pack. For reliability, the attendant consoles should not be assigned to ports on the same digital line circuit pack. For example, if three attendant consoles are to be provided, assign each console to a port on three different digital line circuit pack, if possible. However, if required, all attendant consoles can be assigned to ports on the same digital line circuit pack.

### Security Code

Does not apply to S8700 IP-Connect. Enter the security code required by the SoftConsole IP attendant. The required security code length is determined by Minimum Security Code Length on the Feature-Related System Parameters screen.

### TN

| Valid entries | Usage                              |
|---------------|------------------------------------|
| 1 to 100      | Enter the Tenant Partition number. |

### Type

| Valid entries | Usage                                                       |
|---------------|-------------------------------------------------------------|
| console       | Indicates the type of attendant console being administered. |
| 302           | Use for 302B/C/D or SoftConsole IP attendant.               |

### DIRECT TRUNK GROUP SELECT BUTTON ASSIGNMENTS (Trunk Access Codes)

Enter the trunk access codes (TACs) for local and remote switches. (There are fields for one local TAC and one remote TAC per button labeled *Local* and *Remote*.) The local TAC (1 to 4 digits) refers to a trunk group or Loudspeaker Paging zone on this switch. Remote TACs are only useful in a private network (including DCS) network. The remote TAC (1 to 3 digits) refers to a trunk group on the remote switch. If a remote TAC is given, then the local TAC must see a trunk group that connects directly to the remote switch and is also limited to 1 to 3 digits.

Avaya recommends a DCS trunk be specified as the local TAC between the local and remote switches. If the TAC specified as local between the local and remote switches is not a DCS trunk, the remote trunk cannot be monitored by the local switch.

| Valid entries    | Usage                      |
|------------------|----------------------------|
| 1-4 digit number |                            |
| * or #           | May be used as first digit |

## HUNDREDS SELECT BUTTON ASSIGNMENTS

Enter in the appropriate field (1 through 20), the hundreds group to be associated with a Hundreds Group Select button located on an optional selector console.

| Valid entries                                     | Usage                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-5 digit hundreds group (plus prefix, if needed) | Fields 1 through 8 are used when the selector console is a 24A-type console and fields 1 through 20 are used for a 26A-type console. Enter a hundreds group number that represents all but the last two digits of an extension number (for example, the Hundreds Select Button — on the selector console — for extension 3822 would be “38”). |

```

### Screen 52. Attendant Console Data Module (page 2)

#### IP FEATURE OPTIONS

##### Direct IP-IP Audio Connections

Allows direct audio connections between IP endpoints.

| Valid entries | Usage                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to save on bandwidth resources and improve sound quality of voice over IP transmissions. |

## Emergency Location Ext

The Emergency Location Ext field defaults to the phone's extension. This extension is the starting point for identifying the street address or nearby location when an emergency call is made. The entry in this field is manipulated by “[CAMA Numbering Format](#)” before being sent over CAMA trunks; or similarly by “[ISDN Numbering — Public/ Unknown](#)” before being sent over ISDN trunks.

| Valid entries | Usage                                                                    |
|---------------|--------------------------------------------------------------------------|
| 1-8 digits    | Enter the Emergency Location Extension for the SoftConsole IP Attendant. |

## IP Audio Hairpinning

Allows IP endpoints to be connected through the IP circuit pack on the switch.

| Valid entries | Usage                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow IP endpoints to be connected through the IP circuit pack on the switch in IP format, without going through the MultiVantage TDM bus. |

## IP Emergency calls

This field tells the switch how to handle emergency calls from the SoftConsole IP Attendant. This field appears when the Port field is set to **ip** on the Attendant Console screen.

### CAUTION:

*An Avaya IP endpoint can dial emergency calls (for example, 911 calls in the U.S.). It only reaches the local emergency service in the Public Safety Answering Point area where the telephone system has local trunks. Please be advised that an Avaya IP endpoint cannot dial to and connect with local emergency service when dialing from remote locations that do not have local trunks. You should not use an Avaya IP endpoint to dial emergency numbers for emergency services when dialing from remote locations. Avaya Inc. is not responsible or liable for any damages resulting from misplaced emergency calls made from an Avaya endpoint. Your use of this product indicates that you have read this advisory and agree to use an alternative telephone to dial all emergency calls from remote locations.*

| Valid entries    | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>extension</b> | Enter <b>extension</b> to send the attendant extension entered in the Emergency Location Extension field to the Public Safety Answering Point (PSAP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>block</b>     | <p>Enter <b>block</b> to prevent the completion of emergency calls. Use this entry for attendants who move around but always have a circuit-switched phone nearby, and for users who are farther away from the switch than an adjacent area code served by the same 911 Tandem office.</p> <p>When users attempt to dial an emergency call from a SoftConsole IP Attendant and the call is blocked, they can dial 911 from a nearby circuit-switched phone instead.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>cesid</b>     | <p>Enter <b>cesid</b> to allow the switch to send the CESID information supplied by the SoftConsole IP Attendant to the PSAP. The end user enters the emergency information into the SoftConsole IP Attendant.</p> <p>Use this entry for SoftConsole IP Attendant that are near enough to the switch that an emergency call routed over the switch's trunk reaches the PSAP that covers the switch.</p> <p>If the switch uses ISDN trunks for emergency calls, the digit string is the telephone number (provided that the number is a local direct-dial number with the local area code) at the physical location of the SoftConsole IP Attendant. If the switch uses CAMA trunks for emergency calls, the end user enters a specific digit string for each SoftConsole IP Attendant location, based on advice from the local emergency response personnel.</p> |
| <b>option</b>    | <p>Enter <b>option</b> to allow the attendant to select the option (<b>extension</b>, <b>block</b>, or <b>cesid</b>) that the attendant selected during registration and the SoftConsole IP Attendant reported. Use this entry for extensions that are swapped back and forth between SoftConsole IP Attendants and a phone with a fixed location.</p> <p>The user chooses between <b>block</b> and <b>cesid</b> on the softphone. A DCP or IP phone in the office automatically selects <b>extension</b>.</p>                                                                                                                                                                                                                                                                                                                                                   |

### Screen 53. Attendant Console Data Module (page 2)

This page displays if the Data Module field on Page 1 is **y**. If this is a non-IP attendant console this is page 2 of the Attendant screen.

## DATA MODULE

### BCC

A display-only field that appears when the ISDN-PRI or ISDN-BRI Trunks field is enabled on the System-Parameters Customer-Options screen.

#### NOTE:

The BCC value is used to determine compatibility when non-ISDN facilities are connected to ISDN facilities (ISDN Interworking feature).

### COR

Enter the desired class of restriction (COR) number.

#### Valid entries    Usage

0–95

### COS

Enter the desired (COS) number to designate allowed features. See [“Class of Service” on page 672](#) for additional information on the allowed features.

#### Valid entries    Usage

0–15

**Data Extension**

Enter the extension number assigned to the data module.

| <b>Valid entries</b> | <b>Usage</b>                           |
|----------------------|----------------------------------------|
| 1- to 5-digit number | Must agree with the system's dial plan |

**ITC**

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| <b>restricted</b>    |              |
| <b>unrestricted</b>  |              |

**Name**

Enter the name of the user associated with the data module. The name is optional; it can be left blank.

**TN**

Enter the Tenant Partitioning number.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| 1-100                |              |

| <b>hot-line</b> |  |
|-----------------|--|

|                |  |
|----------------|--|
| <b>default</b> |  |
|----------------|--|

## HOT LINE DESTINATION — Abbreviated Dialing Dial Code

Only displays when the Special Dialing Option field is **hot-line** or **default** (S8700 IP-Connect only). The associated AD number is dialed when the user goes off-hook on a Data Hot Line call.

Hot Line Service allows single-line telephone users, by simply lifting the handset, to automatically place a call to a preassigned destination (extension, telephone number, or feature access code).

The Hot Line Service destination number is stored in an Abbreviated Dialing List.

A Direct Department Calling (DDC), a Uniform Call Distribution (UCD), a Terminating Extension Group (TEG) extension, or any individual extension within a group can be a Hot Line Service destination. Also, any extension within a DDC group, UDC group, or TEG can have Hot Line Service assigned.

Use Hot Line Service when very fast service is required and when you use a telephone only for accessing a certain facility. Loudspeaker Paging Access can be used with Hot Line Service to provide automatic access to paging equipment.

|             |                                                       |
|-------------|-------------------------------------------------------|
| A dial code | Within the range of the abbreviated dialing list type |
|-------------|-------------------------------------------------------|

## DEFAULT DIALING Abbreviated Dialing Dial Code

The associated AD number is dialed when the user goes off-hook and enters a carriage return following the "DIAL" prompt. The data call originator also can perform data terminal dialing by specifying a dial string that may or may not contain alphanumeric names. Only displays when the Special Dialing Option field is **default**.

|             |                                                       |
|-------------|-------------------------------------------------------|
| A dial code | Within the range of the abbreviated dialing list type |
|-------------|-------------------------------------------------------|

**Ext**

This is the extension number of a previously administered user who has an associated Data Extension button and who will share the use of the module.

**Name**

Contains the name assigned to the above extension number.

**Screen 54. Attendant Console**

If this is a non-IP attendant console this is page 3 of the Attendant screen.

**FEATURE BUTTON ASSIGNMENTS**

Enter the feature buttons from [“Attendant console feature buttons”](#) on page 170 that you want to assign to the attendant console. The fixed buttons that cannot be changed (that is, split and forced release) are shown on the screen. The hold, night-serv, and pos-busy buttons are shown in the system default locations. These buttons can be administered elsewhere on the screen. The following provides descriptions of feature buttons that are unique to the attendant console. See the [“Attendant console feature buttons”](#) and to the [“Telephone feature buttons”](#) sections for more information about the buttons.

**Valid entries      Usage**

Audible Tones On/Off

**cw-ringoff**      Call waiting ringer off; turns on/off the audible tone for call waiting on attendant console (1 per console).

**in-ringoff**      Incoming call ringer off; turns on/off the audible tone for incoming call ringer (1 per console).

| <b>Valid entries</b>                    | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>re-ringoff</b>                       | Timed reminder ringer off; turns on/off the audible tone for timer reminder ringer (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>alt-fri</b>                          | Alternate FRL. Alternate facility restriction level; allows the attendant to activate or deactivate the AFRL feature. When activated, this allows the originating device (lines or trunks) to use an alternate set of the facility restriction levels to originate a call (1 per console).                                                                                                                                                                                                                                                                                                                                                       |
| Attendant Control of Trunk Group Access |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>act-tr-grp</b>                       | Activate trunk group access; allows the attendant to control a trunk group. All calls going to the trunks are routed to the attendant (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>deact-tr-g</b>                       | Deactivate trunk group access; allows the attendant to release control of a trunk group (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>class-rstr</b>                       | Display Class of Restriction. Used to display the COR associated with a call (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>em-acc-att</b>                       | Emergency Access to the Attendant. The associated status lamp is flashed when there are one or more calls on the emergency attendant queue (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>hold</b>                             | Hold. When the HOLD button is pressed while the attendant is active on a loop, the party on the loop is put on hold and the “call type” button associated with the loop is lit (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>pos-busy</b>                         | Position Busy. When this button is pushed, the attendant is put into position busy mode, the “Pos Avail” light is turned off, and the light associated with the pos-busy button is lit. Pushing the POS-BUSY button a second time takes the console out of “position busy” mode, turns on the “Pos Avail” light and turns off the light associated with the pos-busy button.<br><br>If the pos-busy button is administered on a 2-LED button, the top LED flashes when the last attendant goes into “Position Busy” mode. Otherwise, if the button has only one LED, the single LED associated with the pos-busy button flashes (1 per console). |
| <b>serial-cal</b>                       | Serial Call. This button allows the attendant-extended calls to return to the same attendant if the trunk remains off-hook (1 per console).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Valid entries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Screen 55. Attendant Console**

- DISPLAY MODULE BUTTON ASSIGNMENTS** — Display-type buttons obtain display functions on the associated alphanumeric display. These buttons are noted as [display button] in the Feature or Function column on the table. Also, several feature buttons can be administered so that their associated status lamps can be used to provide visual indications of the associated feature or function. In some cases, the button itself is not operational. These buttons are noted as [status lamp]. If a Call Cover Msg Rt (cov-msg-rt) button is assigned, a Leave Word Calling Delete Msg (delete-msg) button and a Next (next) button must also be assigned.

**Audix Names**

Identifies the name of the AUDIX node.

| Valid entries        | Usage                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------|
| 1-7 character string | Used as a label for the associated IP address. The node names must be unique on each switch. |

## IP Address

The IP address associated with the node name. This field can be blank for X.25 connections.

## MSA Names

Identifies the name of the MSA node.

| Valid entries        | Usage                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------|
| 1-7 character string | Used as a label for the associated IP address. The MSA names must be unique on each switch. |

## Authorization Code — COR Mapping

You use this screen to assign authorization codes and the class of restriction (COR) that is associated with a given authorization code. See *“Authorization codes” on page 1479* and *“CLAN and processor CLAN QoS and CIDR support” on page 1637* for more information on how Authorization Codes work with COR.

To maximize the security of your system:

- Administer authorization codes to the maximum length allowed by the system
- Create random (nonconsecutive) authorization codes
- Change authorization codes at least quarterly
- Deactivate authorization codes immediately if a user leaves the company or changes assignments
- Assign each authorization code the minimum level of calling permissions required

**Screen 57. Authorization Code - COR Mapping screen**

**AC**

| <b>Valid entries</b>                       | <b>Usage</b>                                                                                                                                                                                                                 |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Any combination of between 4 and 13 digits | The number of digits must agree with the number assigned to the Authorization Code Length field on the Feature-Related System Parameters screen. To enhance system security, choose Authorization Codes of 13 random digits. |

**COR**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                         |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>0-95</b>          | When a user dials the associated authorization code, this is the COR that the telephone or other facility will assume for that call. |

**Number of Codes Administered**

Displays the number of Authorization Codes already administered using the Authorization Codes screen. There is a maximum number of authorization codes that you can use. To find out what this number is for your system, type **display capacity**, and page down to find the authorization code information.

## Best Service Routing

This screen administers the routing numbers for each location associated with a particular application. This allows the DEFINITY ECS to compare specified skills, identify the skill that will provide the best service to a call, and deliver the call to that resource.

For information on setting up Best Service Routing (BSR), see *Avaya MultiVantage Call Center Software Guide to ACD Call Centers*.

### Field descriptions for page 1

change best-service-routing 1 Page 1 of 15

BEST SERVICE ROUTING

| Number: 1 | Name: ARS     | Maximum Suppression Time: 30 | Lock? n         |               |            |
|-----------|---------------|------------------------------|-----------------|---------------|------------|

| 4         | st10          | auto                         | 95022014        | 3035551110    | n          |

### Screen 58. Best Service Routing

## Interflow VDN

When a given remote switch is the best available, the origin switch interflows the call to this vector on the remote switch. Each remote switch in a given application has to have a dedicated interflow switch.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                    |  |
|--------------------|--|
| 0 through 9, *, #, |  |

|-----------------------|--|

## Location Name

Indicates the location.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                                                            |  |
|------------------------------------------------------------|--|
| Up to 15 alphanumeric characters.<br>(DEFINITY R, SI, CSI) |  |
|------------------------------------------------------------|--|

## Lock

Indicates whether this application is locked.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                              |                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------|
| y/n<br>(DEFINITY R, SI, CSI) | Set to <b>y</b> to prevent this application from being sent to Call Management System (CMS). |
|------------------------------|----------------------------------------------------------------------------------------------|

## Maximum Suppression Time

Prevents callers from connecting to a VDN within a certain time period after receiving a busy signal.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                               |                        |
|-------------------------------|------------------------|
| 0-60<br>(DEFINITY R, SI, CSI) | Enter time in seconds. |
|-------------------------------|------------------------|

**Name**

Contains the name assigned to the BSR number.

| <b>Valid entries</b>                                       | <b>Usage</b>                                         |
|------------------------------------------------------------|------------------------------------------------------|
| Up to 15 alphanumeric characters.<br>(DEFINITY R, SI, CSI) | Assign a descriptive name for the physical location. |

**Net Redir**

| <b>Valid entries</b>                | <b>Usage</b>                                                                                                                                                     |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b><br>(DEFINITY R, SI, CSI) | Set to y for each to location to which calls are to be redirected using Network Call Redirection. For more information, see “ <i>Network Call Redirection.</i> ” |

**Num**

This field corresponds to the “consider location x” step from the Call Vector screen.

| <b>Valid entries</b>                  | <b>Usage</b>      |
|---------------------------------------|-------------------|
| <b>1-255</b><br>(DEFINITY R, SI, CSI) | Enter the number. |

**Number**

This display-only field corresponds to the BSR Application field on the Vector Directory Number screen.

**Status Poll VDN**

This field specifies the AAR or ARS pattern that routes over an IP trunk. The status poll vector on the remote switch compares resources on that switch and replies to the origin switch with information on the best of these. Each remote switch in a given application has to have a dedicated status poll vector.

| <b>Valid entries</b>                                                                                                                                                               | <b>Usage</b> |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| <b>0</b> through <b>9</b> , <b>*</b> , <b>#</b> ,<br><b>~p</b> (pause)<br><b>~w/~W</b> (wait)<br><b>~m</b> (mark)<br><b>~s</b> (suppress)<br>or blank<br><br>(DEFINITY R, SI, CSI) |              |

## Switch Node

Enter a number unique to the switch in a network of switches.

| Valid entries                                | Usage                                                                              |
|----------------------------------------------|------------------------------------------------------------------------------------|
| 1 to 32767 or blank<br>(DEFINITY R, SI, CSI) | This number is an important part of the UCID tag and must be unique to the switch. |

## Bulletin Board

Use the bulletin board to post and receive information. There are three pages of message space within the bulletin board. The first page has 19 lines, but you can only enter text on lines 11-19. The first 10 lines on page 1 are for high-priority messages from Avaya personnel and are noted with an asterisk (\*). The second and third pages each have 20 lines, and you can enter text on any line. The system automatically enters the date the message was posted or last changed to the right of each message line.

You can enter up to 40 characters of text per line. You can also enter one blank line. If you enter more than one blank line, the system consolidates them and displays only one. The system also deletes any blank line if it is line one of any page. You cannot indent text on the bulletin board. The TAB key moves the cursor to the next line.

## Field descriptions for page 1

| change bulletin-board                     | Page 1 of 3 |
|-------------------------------------------|-------------|
| Message (* indicates high-priority)       | Date        |
| *Avaya is in the process of               | 03/02/93    |
| *investigating your trunk lockup problem. | 03/02/93    |
| *The Bulletin Board will be updated as    | 03/02/93    |
| *we find information.                     | 03/02/93    |
| * We have identified the problem.         | 03/04/93    |
| *The trunk you added does not provide     | 03/04/93    |
| *disconnect supervision. However, the     | 03/04/93    |
| *trunk group was administered as such.    | 03/04/93    |
| *Please call Pat J. for details.          | 03/04/93    |
| We recently added a new trunk group (14)  | 03/02/93    |
| and have had many of the members getting  | 03/02/93    |
| locked up.                                | 03/02/93    |
| We see the error - thanks for checking.   | 03/05/93    |

## Screen 59. Sample Bulletin Board

**Date**

This display-only field contains the date the information was entered or last changed.

**Lines 1 through 10**

These lines are reserved for high priority messages and are noted with an asterisk (\*) in the first column on the left. If you have an init or inads login you can enter high-priority information to trigger the high-priority message at login time.

| <b>Valid entries</b>                                                                                                    | <b>Usage</b>           |
|-------------------------------------------------------------------------------------------------------------------------|------------------------|
| <b>A through Z</b>                                                                                                      | Enter any information. |
| <b>a through z</b>                                                                                                      |                        |
| Blank                                                                                                                   |                        |
| <b>0 through 9</b>                                                                                                      |                        |

**Screen 62. Call Vector**

**01 through XX**

Enter vector commands as required (up to the maximum allowed in your configuration). For more information, see *Avaya MultiVantage™ Call Center Software Call Vectoring and Expert Agent Selection (EAS) Guide*.

| <b>Valid entries</b> | <b>Usage</b>                                                                                            |
|----------------------|---------------------------------------------------------------------------------------------------------|
| <b>adjunct</b>       | Causes a message to be sent to an adjunct requesting routing instructions based on the CTI link number. |
| <b>announcement</b>  | Provides the caller with a recorded announcement.                                                       |
| <b>busy</b>          | Gives the caller a busy signal and causes termination of vector processing.                             |
| <b>check</b>         | Checks the status of a split (skill) for possible termination of the call to that split (skill).        |

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                     |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>collect</b>       | Allows the user to enter up to 16 digits from a touch-tone phone, or allows the vector to retrieve Caller Information Forwarding (CINFO) digits from the network.                                                                |
| <b>consider</b>      | Defines the resource (split, skill, or location) that is checked as part of a Best Service Routing (BSR) consider series and obtains the data BSR uses to compare resources.                                                     |
| <b>converse-on</b>   | Delivers a call to a converse split (skill) and activates a voice response script that is housed within a Voice Response Unit (VRU).                                                                                             |
| <b>disconnect</b>    | Ends treatment of a call and removes the call from the switch. Also allows the optional assignment of an announcement that will play immediately before the disconnect.                                                          |
| <b>goto</b>          | Allows conditional or unconditional movement (branching) to a preceding or subsequent step in the vector.                                                                                                                        |
| <b>messaging</b>     | Allows the caller to leave a message for the specified extension or the active or latest VDN extension.                                                                                                                          |
| <b>queue-to</b>      | Unconditionally queues a call to a split or skill and assigns a queueing priority level to the call in case all agents are busy.                                                                                                 |
| <b>reply-best</b>    | Used only in status poll vectors in multi-site Best Service Routing applications, where it “returns” best data for its location to the primary vector on the origin switch.                                                      |
| <b>route-to</b>      | Routes calls either to a destination that is specified by digits collected from the caller or an adjunct (route-to digits), or routes calls to the destination specified by the administered digit string (route-to number).     |
| <b>stop</b>          | Halts the processing of any subsequent vector steps.                                                                                                                                                                             |
| <b>wait-time</b>     | Delays the processing of the next vector step if a specified delay time is included in the command’s syntax. Also provides feedback (in the form of silence, ringback, or music) to the caller while the call advances in queue. |

### **ANI/II-Digits**

A display-only field indicating whether you can use ANI and II-Digits Vector Routing Commands. ANI/II-Digits Routing requires that the G3V4 Enhanced field be **y**.

## ASAI Routing

A display-only field indicating whether, on the System-Parameters Customer-Options screen, the CallVisor Adjunct/Switch Applications Interface (ASAI Link Core Capabilities) field is **y**.

## Attendant Vectoring

This field appears only if, on the System-Parameters Customer-Options screen, the Attendant Vectoring field is **y**. Attendant Vectoring and Meet-me Conference cannot be enabled at the same time. This field does not appear for S8700 IP-Connect.

| Valid entries | Usage                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> so the vector is an attendant vector. Default when, on the System-Parameters Customer-Options screen, the Vectoring (Basic) and Vectoring (Prompting) fields are <b>y</b> . |
| <b>n</b>      | Default when, on the System-Parameters Customer-Options screen, the Vectoring (Basic) and Vectoring (Prompting) fields are <b>n</b> . No changes allowed to this field.                    |

## Basic

A display-only field indicating whether, on the System-Parameters Customer-Options screen, the Vectoring (Basic) field is **y**.

## BSR

A display-only field indicating that on the System-Parameters Customer-Options screen, the Vectoring (Best Service Routing) field is **y**. Thus, you can use BSR commands and command elements in your vectors. An **n** indicates that the BSR option is not enabled.

## CINFO

A display-only field indicating whether, on the System-Parameters Customer-Options screen, the Vectoring (CINFO) field is **y**.

## EAS

A display-only field indicating whether, on the System-Parameters Customer-Options screen, the Expert Agent Selection (EAS) field is **y**.

 **NOTE:**

When Expert Agent Selection (EAS) field is **y**, the help messages and error messages associated with this screen will reflect a terminology change from “Split” to “Skill”. In addition, the vector commands entered also will be affected by this terminology change (for example, *check backup split* becomes *check backup skill* when EAS is enabled).

## G3V4 Adv Route

A display-only field indicating whether you can use the G3V4 Advanced Vector Routing commands.

## G3V4 Enhanced

A display-only field indicating whether you can use G3V4 Enhanced Vector Routing commands and features.

## Holidays

A display-only field that appears when, on the System-Parameters Customer-Options screen, the Vectoring (Holidays) field is **y**.

## LAI

A display-only field indicating whether Look-Ahead Interflow is enabled.

## Lock

This field controls access to the vector from Avaya CentreVu<sup>®</sup> products.

 **NOTE:**

Always lock vectors that contain secure information (for example, access codes).

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                        |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | You do not want this vector to be accessible to these client programs. Locked vectors can only appear and be administered through the SAT or a terminal emulator.<br><br>If Meet-me Conference is <b>y</b> , the Lock field also must be <b>y</b> . |
| <b>n</b>             | Gives CentreVu <sup>®</sup> CMS and CentreVu <sup>®</sup> Control Center users the ability to administer this vector from these client programs.                                                                                                    |

### Meet-me Conf

This field appears only if, on the System-Parameters Customer-Options screen, the Enhanced Conferencing field is **y**. This field designates the VDN as a Meet-me Conference VDN.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to enable Meet-me Conference for this vector. If Meet-me Conference is <b>y</b> , the Lock field also must be <b>y</b> . When the Lock field is <b>y</b> , the vector cannot be changed by adjunct vectoring programs such as Visual Vectors.<br><br>Attendant Vectoring and Meet-me Conference cannot be enabled at the same time. |

### Multimedia

Indicates whether the vector should receive early answer treatment for multimedia calls. This only applies if the Multimedia Call Handling field is **y**. This field does not appear for S8700 IP-Connect.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | If you expect this vector to receive multimedia calls, set this field to <b>y</b> . If this value is <b>y</b> , the call is considered to be answered at the start of vector processing, and billing for the call starts at that time. See <a href="#">“Managing multimedia calling” on page 275</a> for more information. |

### Name

Represents the vector name.

| Valid entries                                                                                                         | Usage                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Up to 27 alphanumeric characters.<br>Up to 15 alphanumeric characters (for S8300 Media Server, S8700 IP-Connect only) | This is an optional field.<br><br>If ~r can be used to activate Network Call Redirection if, on the System-Parameters Customer-Options screen, the ISDN Network Call Redirection field is <b>y</b> . |

### Number

A display-only field when the screen is accessed using a **change** or **display** administration command.

### Prompting

A display-only field indicating whether, on the System-Parameters Customer-Options screen, the Vectoring (Prompting) field is **y**.

## CAMA Numbering Format

This screen administers the Centralized Automatic Message Accounting (CAMA) trunks and provides Caller's Emergency Service Identification (CESID) information to the local community's Enhanced 911 system through the local tandem office.

This screen provides the CESID format by extension number or number blocks. This allows for multiple CESID formats to be sent over multiple CAMA trunk groups allowing for mixed station numbering plans and some limited conversion from non-DID to DID numbers typically required by the Private Switch/Automatic Location Interface (PS/ALI) database.

The default CESID defines the CESID for all extensions that are not defined in the Ext Code field.

There are 446 CESID entries over 15 pages. The first page contains the Default CESID and 26 extensions to CESID entries. The second through fifteenth pages each contain 30 extensions to CESID entries.

### Field descriptions for page 1

Screen 63. CAMA Numbering Format

**CESID**

| <b>Valid entries</b>                                           | <b>Usage</b>                                                                                                                                                                   |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 11 digits or blank                                        | Enter the number that will be used to identify the calling terminal within an emergency service system. This field may represent a prefix to an extension or the entire CESID. |
| 1 to 16 digits or blank (S8300 Media Server, S8700 IP-Connect) |                                                                                                                                                                                |

**Ext Code**

| <b>Valid entries</b>                                           | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Up to 5 digits or blank                                        | Enter the leading digits or all of the digits in the extension for the specified CESID. If the extension length is greater than the number of digits in the extension code, the extension code will be interpreted as a block of digits. For example, if the extension length is 4 and the extension code is 11, the CESID will serve extensions 1100 through 1199. The Ext Code 11 is for a DID block. An Ext Code of 126 might point a non-DID block to a nearby DID extension 5241666. |
| Up to 7 digits or blank (S8300 Media Server, S8700 IP-Connect) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Ext Len**

| <b>Valid entries</b> | <b>Usage</b>                                 |
|----------------------|----------------------------------------------|
| 1 to 7 or blank      | Enter the number of digits in the extension. |

**System CESID Default**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                      |
|----------------------|-------------------------------------------------------------------------------------------------------------------|
| 1 to 16 digits       | Enter a default CESID. This number will be sent over the CAMA trunk if the Ext Code field does not have an entry. |

**Total Length**

| <b>Valid entries</b> | <b>Usage</b>                              |
|----------------------|-------------------------------------------|
| 1–16 or blank        | Enter the total number of digits to send. |

## CDR System Parameters

Use the Call Detail Recording (CDR) System Parameters screen to set parameters for the types of calls you want to record and how to format the information. You can use CDR records to determine call costs, diagnose problems, detect abuse, and optimize your network.

### Field descriptions for page 1

```

change system-parameters cdr Page 1 of 1
 CDR SYSTEM PARAMETERS

Node Number (Local PBX ID): CDR Date Format: month/day
 Primary Output Format: printer Primary Output Endpoint: CDR1
 Secondary Output Format:
 Use ISDN Layouts? n EIA Device Bit Rate: 9600
 Use Enhanced Formats? n Condition Code 'T' for Redirected Calls? n
Modified Circuit ID Display? n Remove # From Called Number? n
 Record Outgoing Calls Only? y Intra-switch CDR? n
 Suppress CDR for Ineffective Call Attempts? y CDR Call Splitting? y
 Disconnect Information in Place of FRL? n Attendant Call Recording? y
 Interworking Feat-flag? n
 Force Entry of Acct Code for Calls Marked on Toll Analysis Form? n
 Calls to Hunt Group - Record: member-ext
Record Called Vector Directory Number Instead of Group or Member? n
Record Agent ID on Incoming? n Record Agent ID on Outgoing? n
 Inc Trk Call Splitting? n
Record Non-Call-Assoc TSC? n
 Record Call-Assoc TSC? n Digits to Record for Outgoing Calls: dialed
 Privacy - Digits to Hide: 0 CDR Account Code Length: 4

```

### Screen 64. CDR System Parameters screen

## Call Record Handling Option

Displays on DEFINITY R only. Used to control call routing when new calls come in, the CDR link is down, and the buffer is filled.

### ☰ NOTE:

Changing this field from the default **warning** may cause ACD & vector calls that are measured by CDR to be redirected.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                       |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reorder</b>       | Enter <b>reorder</b> to block calls with reorder tone when the buffer is full. This applies to all calls. If you choose this option, no one will be able to make or receive calls if CDR is unable to record them. |
| <b>warning</b>       | Enter <b>warning</b> to stop call recording when the buffer is full. This generates a minor alarm.                                                                                                                 |
| <b>attendant</b>     | Enter <b>attendant</b> to route all calls to the attendant as non-CDR calls.                                                                                                                                       |

## Calls to Hunt Group — Record

| <b>Valid entries</b> | <b>Usage</b>                                                                                             |
|----------------------|----------------------------------------------------------------------------------------------------------|
| <b>member-ext</b>    | Enter <b>member-ext</b> to record the extension of the phone or data terminal where the call terminated. |
| <b>group-ext</b>     | Enter <b>group-ext</b> to record the extension that was dialed.                                          |

## CDR Account Code Length

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                     |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1–15</b>          | Enter the number of digits to record when a user enters an account code. For some record formats, a long account code overwrites spaces on the record that are usually assigned to other fields. |

## CDR Date Format

Use this field to select the format for the date stamp that begins each new day of call records.

| <b>Valid entries</b> | <b>Usage</b>                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------|
| <b>month/day</b>     | Choose the format that is most appropriate for your situation.                                        |
| <b>day/month</b>     | If your company has many different sites, you may need to use the same format as the other locations. |

### Condition Code 'T' for Redirected Calls

You can elect to identify CDR records of calls that have been redirected automatically off the switch.

| Valid entries | Usage                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------|
| y             | The Condition Code of both CDR records for the call will be 'T.'                                 |
| n             | The Condition Codes normally associated with the Record Outgoing Calls Only field are generated. |

### Digits to Record for Outgoing Calls

| Valid entries | Usage                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dialed        | Use <b>dialed</b> to record the digits a user actually dials.                                                                                                     |
| outpulsed     | Use <b>outpulsed</b> to record the digits that the switch actually sends out over the trunk, including any additions or deletions that take place during routing. |

### Disconnect Information in Place of FRL

See [“Call detail record field descriptions”](#) on page 1587 for more information.

| Valid entries | Usage                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to replace the Facility Restriction Level (FRL) field with information about why a call disconnects. You can use this information to isolate problems between the DEFINITY R and the telephone network. |
| n             | Enter <b>n</b> to record the call's FRL.                                                                                                                                                                               |

### EIA Device Bit Rate

Applies to DEFINITY SI only. Displays if either Primary or Secondary Output Format field is **eia**.

| Valid entries |                                                                  |
|---------------|------------------------------------------------------------------|
| 300           | Enter the baud rate of the CDR device connected to the EIA port. |
| 1200          |                                                                  |
| 2400          |                                                                  |
| 4800          |                                                                  |
| 9600          |                                                                  |

## Force Entry of Acct Code for Calls Marked on Toll Analysis Form

Specifies whether an account code will be required when making a toll call. This will not necessarily be all chargeable calls and it may even include some non-chargeable calls. See [“Forcing users to enter account codes” on page 542](#) for more information.

| Valid entries | Usage                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> to deny all toll calls unless the user dials an account code. Forced Entry of Account Codes must be <b>y</b> on the System-Parameters Customer-Options screen. |
| <b>n</b>      | Enter <b>y</b> to allow calls without an account code. This does not override other calling restrictions.                                                                     |

## Inc Attd Call Record

Appears when Inc Trk Call Splitting is **y**.

| Valid entries | Usage                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to enable separate recording of attendant portions of outgoing calls that are transferred or conferenced. |

## Inc Trk Call Splitting

Appears when the Record Outgoing Calls Only field on the System Parameters CDR screen is **n**.

| Valid entries | Usage                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to create separate records for each portion of incoming calls that are transferred or conferenced. |

## Interworking Feat-flag

See [“Call detail record field descriptions” on page 1587](#) for more information.

| Valid entries | Usage                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> if you want the feature flag to indicate interworked outgoing ISDN calls. An interworked call is one that passed through more than one ISDN node. |
| <b>n</b>      | Enter <b>n</b> if you want the feature flag to indicate no answer supervision for interworked calls.                                                             |

## Intra-Switch CDR

| Valid entries | Usage                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to record calls within the switch. If you choose this option, you must complete the Intraswitch CDR screen to indicate which extensions to monitor. |

## Modified Circuit ID Display

This affects the “printer,” “teleseer,” and “59-character” output formats.

| Valid entries | Usage                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to display the circuit ID in its actual format (100’s, 10’s, units). For example, circuit ID 123 displays as 123. You might need to verify that your output device can accept this format. |
| n             | Enter <b>n</b> to display the circuit ID in its default format (10’s, units, 100’s). For example, circuit ID 123 appears as 231.                                                                          |

## Node Number (Local PBX ID)

A display-only field indicating the DCS switch node number in a network of switches.

## Outg Attd Call Record

Only appears if Outg Trk Call Splitting is **y**.

| Valid entries | Usage                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to enable separate recording of attendant portions of outgoing calls that are transferred or conferenced. |

## Outg Trk Call Splitting

See [“Call Splitting” on page 1555](#) for more information.

| Valid entries | Usage                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to create separate records for each portion of outgoing calls that are transferred or conferenced. |

### Primary Output Endpoint

This field determines where the switch sends the CDR records, and is required if you specify a Primary Output Format.

| Valid entries     | Usage                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>eia</b>        | If you use the EIA port to connect the CDR device, enter <b>eia</b> . This is not a valid option on DEFINITY R systems.                      |
| Extension number  | This is the extension of the data module (if used) that links the primary output device to the switch.                                       |
| <b>CDR1, CDR2</b> | Use this value if the CDR device is connected over a TCP/IP link, and this link is defined as either CDR1 or CDR2 on the IP Services screen. |

### Primary Output Format

Controls the format of the call records sent to the primary output device.

| Valid entries                                                                                                                                                     | Usage                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>customized</b>                                                                                                                                                 | Use this option if you have special call accounting needs that standard record formats do not accommodate. If you use a customized record format, you need to have call accounting software that is also customized to receive these records. Consult with your call accounting vendor before using this option. |
| <b>printer</b>                                                                                                                                                    | Use <b>printer</b> if you are sending the call detail records to a printer rather than to a record collection or call accounting system.                                                                                                                                                                         |
| <b>59-char expanded</b><br><b>lsu</b><br><b>lsu-expand</b><br><b>int-direct</b><br><b>int-isdn</b><br><b>int-process</b><br><b>teleseer</b><br><b>unformatted</b> | The remaining formats are standard record formats. The one you use must be compatible with your call accounting software. Verify this through your vendor or the accounting system documentation.                                                                                                                |

## Privacy — Digits to Hide

If you enable CDR Privacy on the Station screen for a given phone, use this field to indicate how much of the dialed number to hide on the CDR record.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                   |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0–7</b>           | Enter the number of digits to hide, counting from the end (right to left). For example, if you enter <b>4</b> in this field and the user dials 555-1234, only “555” would appear in the Dialed Number field of the CDR record. |

## Record Agent ID Instead on Incoming

Only displays if the Expert Agent Selection (EAS) field is **y** on the System-Parameters Customer-Options screen. You cannot use both the Called VDN and the Agent Login ID Instead of Group or Member. Only one of these fields can be **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                    |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to include the EAS agent’s LoginID instead of the physical extension in the Dialed Number Field of a CDR record. |

## Record Agent ID Instead on Outgoing

Only displays if the Expert Agent Selection (EAS) field is **y** on the System-Parameters Customer-Options screen.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                    |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to include the EAS agent’s LoginID instead of the physical extension in the Dialed Number Field of a CDR record. |

## Record Call-Assoc TSC

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                 |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to create records for call-associated temporary signaling connections. If you have a lot of data connections this could increase the number of records. You may want to consider the capacity of your call collection device. |

## Record Called Vector Directory Number Instead of Group or Member

If this option is enabled, the called VDN overrides the group or member information that normally appears in the Dialed Number Field of the CDR record. If a call is directed through more than one VDN, the first VDN used for the call is stored. This applies only to calls routed to a hunt group by a vector, not to calls routed directly to an extension by a vector.

You cannot use both the Called VDN and the Agent Login ID Instead of Group or Member. Only one of these fields can be **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to include the Vector Directory Number (VDN) in the Dialed Number Field of a CDR record. |
|------------|---------------------------------------------------------------------------------------------------------|

## Record Non-Call-Assoc TSC

A temporary signaling channel (TSC) is a virtual connection established within an ISDN D-channel. For more information, see the *DEFINITY® Communications System Generic 2.2 and Generic 3 V2 DSI/CEPT1/ISDN PRI Reference*.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to create records for non-call-associated temporary signaling connections. If you have a lot of data connections this could increase the number of records. You may want to consider the capacity of your record collection device. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Record Outgoing Calls Only

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|          |                                                                                                                              |
|----------|------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b> | Enter <b>y</b> to record only outgoing calls. This can save space if you are only concerned with charges for outbound calls. |
| <b>n</b> | Enter <b>n</b> to record both outgoing and incoming calls.                                                                   |

## Remove # From Called Number

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|          |                                                                                                                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b> | Enter <b>y</b> to have the “#” (or “E”) symbol removed from the Dialed Number field of the call detail record. You might need to verify that your output device can accept this format. |
| <b>n</b> | Enter <b>n</b> to have the trailing “#” (or “E”) symbol appear in the Dialed Number field whenever inter-digit time out occurs or users dial # to indicate the end of dialing.          |

## Secondary Output Endpoint

Appears when the Secondary Output Format field is administered.

| Valid entries     | Usage                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>eia</b>        | Use this if the secondary output device is connected to the eia port. This is not a valid option on DEFINITY R systems.                      |
| Extension number  | This is the extension of the data module (if used) that links the secondary output device to the switch.                                     |
| <b>CDR1, CDR2</b> | Use this value if the CDR device is connected over a TCP/IP link, and this link is defined as either CDR1 or CDR2 on the IP Services screen. |

## Secondary Output Format

Controls the format of the call records sent to the secondary output device.

 **CAUTION:**

*Only qualified (Avaya) service personnel should administer a secondary output device. This option may cause loss of data when the buffer contains large amounts of data.*

| Valid entries                                                                                    | Usage                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>customized</b><br><b>int-direct</b><br><b>int-process</b><br><b>lsu</b><br><b>unformatted</b> | These are the only formats you can use for a secondary output device. The format must be compatible with your call accounting software. Verify this through your vendor or the accounting system documentation. |

## Suppress CDR for Ineffective Call Attempts

Ineffective call attempts are calls that are blocked because the user did not have sufficient calling privileges or because all outgoing trunks were busy. This includes the unavailable incoming or outgoing trunks due to trunk usage allocation for ISDN Call-by-Call Service Selection trunks, incoming calls rejected by the switch due to NSF mismatch, and ISDN calls that did not complete at the far end, if a cause value was provided. These calls appear on the CDR record with a condition code "E."

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                             |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to ignore ineffective call attempts. Use this if you have limited storage space for CDR records and records often overrun the buffer.                                                                                                                                                                                                     |
| <b>n</b>             | Enter <b>n</b> to report ineffective call attempts. This can tell you if your users are often unable to place outgoing calls, or if a large number of incoming calls are not completed. You can also use this if you need to have records of attempts to contact a client, and are using ISDN trunks. Using this option requires more space for records. |

## Use Enhanced Formats

Enhanced formats provide additional information about time in queue and ISDN call charges, where available. This affects the "expanded", "teleseer", "lsu", "printer", and "unformatted" output formats.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                        |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to enable the use of the Enhanced version of the specified primary output format. You cannot use Enhanced formats and ISDN formats at the same time. |

## Use ISDN Layouts

ISDN Layouts provide more accurate information about the inter-exchange carrier and ISDN network services used for a call. This affects "lsu" and "printer" output formats, as well as any format with ISDN layouts, such as "teleseer."

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                    |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to enable the use of the ISDN version of the specified primary output format. You cannot use ISDN formats and Enhanced formats at the same time. |

**Screen 65. CDR System Parameters**

This page appears only if the Primary Record Format field is **customized**.

**Data Item**

Enter the data items in the order they should appear on the customized record. Only use this screen if you have arranged with your vendor to customize your call accounting system to receive these records.

You must include at least one field in order to have a record. See the table below for valid entries. The last two data items in a the record must be **line-feed** and **return**, in that order.

For more information, see [“Call detail record field descriptions” on page 1587](#).

**Table 9. Valid Data Item entries**

| Data Item    | Length | Data Item | Length |
|--------------|--------|-----------|--------|
| acct-code    | 15     | ins       | 3      |
| attd-console | 2      | isdn-cc   | 11     |
| auth-code    | 7      | ixc-code  | 4      |

*Continued on next page*

**Table 9. Valid Data Item entries (Continued)**

| <b>Data Item</b> | <b>Length</b> | <b>Data Item</b> | <b>Length</b> |

| feat-flag        | 1             | tsc_flag         | 1             |
| fri              | 1             | vdn              | 5             |
| in-crt-id        | 3             |                  |               |
| in-trk-code      | 4             |                  |               |
| line-feed        | 1             |                  |               |

**Length**

Enter the length of each data item, if different from the default.

**Valid entries**

The maximum record length depends on the call accounting system you use. Check with your vendor.

**Usage**

The date field should be six-digits to ensure proper output. Certain fields default to the required length.

**Record Length**

Display-only field indicating the accumulated total length of the customized record, updated each time the length of a data item changes.

## Class of Restriction

Use this screen to establish classes of restriction (COR). Classes of restriction control call origination and termination. Your system may use only one COR or as many as necessary to control calling privileges. You can assign up to 96 different CORs (0 – 95).

Consider the following to enhance your system security:

1. Assign a separate COR to incoming and outgoing trunk groups, then restrict calling between the two groups.
2. Limit the calling permissions as much as possible by setting appropriate Calling Party Restrictions and Facility Restriction Levels (FRLs).

### Field descriptions for page 1

```

Screen 66. Class of Restriction

### Access to MCT?

This field refers to Malicious Call Trace.

| Valid entries | Usage                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> to allow permissions to activate a request to trace a malicious call.                                                                                                                                        |
| <b>n</b>      | Entering <b>n</b> prohibits this user from requesting a malicious call trace, but does not prevent this extension from appearing in the MCT History report, should this extension be the subject of a malicious call trace. |

### Add/Remove Agent Skills

| Valid entries | Usage                                                                 |
|---------------|-----------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to allow users with this COR to add and remove skills. |

### APLT

| Valid entries | Usage                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>n</b> to allow access to APLT trunk group Enhanced Private Switched Communications System (EPSCS) or Common Control Switched Arrangement (CCSA) off-net facilities.<br><br>If fully restricted service is enabled, set this field to <b>n</b> . |

### Automatic Charge Display

Shows the cost of an active outgoing call using Periodic Pulse Metering (PPM) or ISDN Advice of Charge (AOC) on Digital Communications Protocol (DCP) or Avaya BRI stations. Not available in the U.S.

| Valid entries | Usage                                                                               |
|---------------|-------------------------------------------------------------------------------------|
| <b>y</b>      | Displays call charges during and at the end of the call.                            |
| <b>n</b>      | Call charges can be seen if users press the DISP-CHRG button before the call drops. |

## Called Party Restriction

| Valid entries      | Usage                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Inward</b>      | Blocks the calling party from receiving incoming exchange network calls, attendant originated calls, and attendant completed calls.                                                                                                                                    |
| <b>Manual</b>      | Blocks the called party from receiving all calls except for those originated or extended by the attendant.                                                                                                                                                             |
| <b>Public</b>      | Blocks the called party from receiving public network calls. Attendant calls are allowed to go through to the called party as well as attendant-assisted calls if the Restriction Override field in the public restricted station's COR is <b>attd</b> or <b>all</b> . |
| <b>Termination</b> | Blocks the called party from receiving any calls at any time.                                                                                                                                                                                                          |
| <b>None</b>        | No called party restrictions.                                                                                                                                                                                                                                          |

## Calling Party Restriction

This field determines the level of calling restriction associated with this COR.

**NOTE:**

To enhance system security, limit calling permissions as much as possible.

| Valid entries      | Usage                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Origination</b> | Blocks the calling party from originating a call from the facility at any time. The party can only receive calls. A phone with this COR may initiate Remote Access calls, if the COR of the barrier code allows it.                   |
| <b>Outward</b>     | Blocks the calling party from calling outside the private network. Users can dial other users on the same switch or within a private network. To enhance security, Avaya recommends that you use outward restrictions when practical. |

| Valid entries   | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>All-toll</b> | Blocks the calling party from making ARS and trunk access calls from a facility assigned the COR to certain toll areas as defined in the Dialed String field on the Toll Analysis screen. The Dialed String field must be marked as being associated with the system's Toll List. The call completes if the facility's COR also is associated with an Unrestricted Call List and whose Dialed String field also matches the dialed number.                                                                        |
| <b>Tac-toll</b> | Blocks the calling party from making trunk access calls from the facility assigned the COR to certain toll areas as defined in the Dialed String field on the Toll Analysis screen. The Dialed String field must be marked as being associated with the system's Toll List. The call completes if the facility's COR also is associated with an Unrestricted Call List and whose Dialed String field also matches the dialed number. See <a href="#">“Toll Analysis” on page 1230</a> for additional information. |
| <b>None</b>     | No calling party restrictions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Can Be a Service Observer

If you want an observer to observe users, set the users' CORs to **y** on the observer's COR Service Observing Permission table.

 **SECURITY ALERT:**

*The use of Service Observing features may be subject to federal, state, or local laws, rules, or regulations; or require the consent of one or both of the parties to the conversation. Customers should familiarize themselves with and comply with all applicable laws, rules, and regulations before using these features.*

 **NOTE:**

You cannot enter **y** in the previous two fields unless Service Observing (Basic) is enabled on the System-Parameters Customer-Options screen.

| Valid entries | Usage                                                                  |
|---------------|------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> if users with this COR can service observe other users. |

## Can Be Picked Up By Directed Call Pickup

| Valid entries | Usage                                                                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow this Station's or EAS agent's calls to be picked up by using the Directed Call Pickup Up feature. Before you can set this field to <b>y</b> , you must set Directed Call Pickup on the Feature-Related System Parameters screen to <b>y</b> . |

## Can Be Service Observed

Note that this field allows or denies service observing for not only physical extensions, but also for logical agent IDs and VDNs. If you want an observer to observe users, set the users' CORs to **y** on the observer's COR Service Observing Permission table.

| Valid entries | Usage                                                          |
|---------------|----------------------------------------------------------------|
| y/n           | Enter <b>y</b> if users with this COR can be service observed. |

## Can Change Coverage

| Valid entries | Usage                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow station users with this COR to select one of two previously administered coverage paths or to activate, change, or deactivate call forward all calls or call forward busy/don't answer from any on-site or off-site location. |

## Can Use Directed Call Pickup

| Valid entries | Usage                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow the station, attendant, or EAS agent to pick up calls using the Directed Call Pickup feature. Set Directed Call Pickup on the Feature-Related System Parameters screen to <b>y</b> to set this field to <b>y</b> . |

## Category For MFC ANI

The Category for MFC ANI field always controls categories for Russian signaling trunks. It also may control categories for R2-MFC signaling trunks, depending on what value is in the Use COR for Calling Party Category field on the system-parameters multi-frequency screen.

The Calling Party Category digit administered in this field is included as part of the ANI information sent to the Central Office on request using R2-MFC signaling.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|       |                         |
|-------|-------------------------|
| 1 –10 | Used in other than U.S. |
|-------|-------------------------|

## COR Description

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                     |                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Up to 35 characters | Enter a description of the COR that indicates how you use it. If you make this as clear as possible (for example, Customer Service, Legal Department), it will be easier to remember which COR to assign when you add users. |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## COR Number

This is a display-only field when the screen is accessed via an administration command such as **change** or **display**.

## Direct Agent Calling

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|     |                                                                                                                                                                                                                                                                                            |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n | If this is <b>y</b> , users may dial an ACD agent's extension directly, rather than anyone in the agent pool. If the system is in Night Service, the call routes to the Night Service extension. If the extension with this COR belongs to an agent, the agent may receive calls directly. |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Facility Access Trunk Test

An associated feature button (“trk-ac-alm”) status lamp lights when a successful test attempt occurs. Pressing one of the alarm buttons (ten maximum) when its associated status lamp is lit turns off all lamps on all buttons whether the access is still in progress or has completed.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|     |                                                                                     |
|-----|-------------------------------------------------------------------------------------|
| y/n | Enter <b>y</b> to allow users with this COR to perform Facility Access Trunk Tests. |
|-----|-------------------------------------------------------------------------------------|

## Forced Entry of Account Codes

FEAC must be enabled on the System Parameters Customer-Options screen and on the CDR System Parameters screen.

See [“Forced Entry of Account Codes” on page 1554](#) and [“Forcing users to enter account codes” on page 542](#) for more information.

### NOTE:

If a COR requiring entry of account codes is assigned a VDN, the route to commands executed by the associated vector will not be successful.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | <p>Enter <b>y</b> to indicate that an account code must be dialed when making outgoing trunk calls.</p> <p>If this is <b>y</b>, any telephone assigned the associated COR must dial an account code before making an outgoing call. If you set this to <b>y</b> for a COR assigned to a trunk group, users must dial account codes before calling out over that trunk group. This may be useful for trunks used in international calls, and those that are more expensive. If a call is being routed by ARS, account code checking is not done on the COR.</p> |

## FRL

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 to 7        | <p>Enter an originating FRL number. AAR and/or ARS features use this entry to determine call access to an outgoing trunk group. Outgoing call routing is determined by a comparison of the FRLs in the AAR/ARS Routing Pattern and the FRL associated with the COR of the call originator (typically, a telephone user). An originating FRL of 0 has the least calling privileges.</p> <p>To enhance system security, assign the lowest possible FRL.</p> |

## Fully Restricted Service

**⇒ NOTE:**

If this field is enabled, the APLT field must be **n**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                        |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | When <b>y</b> entered for a given COR, stations assigned that COR will not have access to the public network for either incoming or outgoing calls. |

## Group II Category For MFC

This field always controls categories for Russian signaling trunks. It can control categories for R2-MFC signaling trunks, depending on the value of the Use COR for Calling Party Category field on the Multifrequency-Signaling-Related System Parameters screen.

The Calling Party Category digit administered in this field is included as part of the ANI information sent to the Central Office on request using R2-MFC signaling.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                    |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>1 –10</b>         | Enter the value you want the switch to send as the Calling and/or Called Party Category for phones or trunks that use this COR. |

## Group Controlled Restriction

A display-only field that determines if the current COR is under controlled restriction. This field can help troubleshoot problems by first checking its value.

| <b>Valid entries</b> | <b>Usage</b>                                   |
|----------------------|------------------------------------------------|
| <b>active</b>        | indicates the COR is controlled restricted     |
| <b>inactive</b>      | indicates the COR is not controlled restricted |

## Hear System Music on Hold

| <b>Valid entries</b> | <b>Usage</b>                                                                      |
|----------------------|-----------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow the Music on Hold feature to be activated by a telephone. |

## Hear VDN of Origin Announcement

| Valid entries | Usage                                                                     |
|---------------|---------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> if users with this COR can receive VDN of Origin messages. |

## MF ANI Prefix

Defines the prefix to apply to an extension number when ANI is sent to the CO. This overrides any ANI prefix administered on the Multifrequency Signaling screen. This does not apply when ANI is tandemed through the switch on tandem calls. This field also applies to the ANI for the switch when the originating side is a trunk and there was no ANI.

| Valid entries       | Usage                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| 1–7 digits or blank | If you want the entire number to display on the receiving end, enter all digits except the extension number. |

## Partitioned Group Number

This field appears only if AAR/ARS Partitioning is **y** and Time of Day Routing is **n** on the System Parameters Customer-Options screen.

| Valid entries | Usage                                                                |
|---------------|----------------------------------------------------------------------|
| 1–8           | Enter the AAR/ARS partitioned group number associated with this COR. |

## PASTE (Display PBX Data on telephone)

| Valid entries | Usage                                                                               |
|---------------|-------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to download all lists. Enter <b>n</b> to disallow the PASTE feature. |

## Priority Queuing

| Valid entries | Usage                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to allow the telephone user's calls to be placed ahead of non-priority calls in a hunt group queue                                  |
| n             | If you do not use Automatic Call Distribution (ACD is not enabled on the System-Parameters Customer-Options screen), this field must be <b>n</b> . |

## Restricted Call List

This list can be used whether the COR is toll restricted. The Restricted Call List (RCL) has priority over the Toll Analysis Unrestricted Call List (UCL). A call attempt from a facility assigned a COR (with RCL field set to **y**), whose dialed digit string is on the Toll Analysis screen and is marked as being associated with the RCL, will be denied.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                      |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to specify that this COR will have access to the system's Restricted Call List (see <a href="#">"Toll Analysis"</a> on page 1230). |

## Restriction Override

Allows the specified users to bypass restriction on conference, transfer or call forwarding operations.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>attendant</b>     | A telephone with a COR that is inward restricted cannot receive public network, attendant-originated, or attendant-extended calls. Enter <b>attendant</b> to give your attendants the ability to override this restriction. |
| <b>all</b>           | Enter <b>all</b> if you want all of the users with this COR to override inward restrictions.                                                                                                                                |
| <b>none</b>          | Enter <b>none</b> if you do not want any users of this COR to bypass the restrictions.                                                                                                                                      |

## Send ANI for MFE

Only applicable for Spain. Valid for 2/6 signaling, but not 2/5 signaling. The following field appears only if Expert Agent Selection (EAS) is enabled on the Feature-Related System-Parameters screen.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                           |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to enable Automatic Number Identification (ANI). When the value is <b>y</b> , the switch sends the calling party's number to the public or IBERCOM network so that charges will be broken down by line. |
| <b>n</b>             | If this value is <b>n</b> , charges are not itemized by line, and your company will receive a single bill for the total number of calls made (block charging).                                                         |

## Time of Day Chart

Appears only if Time of Day field is enabled on the System Parameters Customer-Options screen. See *“Setting up time of day routing” on page 268* for more information.

| Valid entries | Usage                                                                |
|---------------|----------------------------------------------------------------------|
| 1–8           | Enter the AAR/ARS time-of-day-chart number associated with this COR. |

## Unrestricted Call List

Any entry on the Toll Analysis screen with an “X” in the Toll List column is restricted, meaning that the system blocks any attempt to complete a call containing the Dialed String. However, this field overrides that restriction.

For example, if the Toll Analysis screen shows a Dialed String entry of 538 and there is an “X” in the Toll List column, the 538 number is restricted. To override this restriction, in the Toll Analysis screen, enter **X** in the “5” column under the Unrestricted Call List heading. In the Class of Restriction screen, in this field, enter **5** to complete the restriction override.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1–10 or blank | Appears when Calling Party Restriction is <b>all-toll</b> or <b>tac-toll</b> . This field allows a user to complete a toll call with “restricted” dialed digits. This field is associated with the Dialed String field on the Toll Analysis screen. An Unrestricted Call List number is denoted on that screen. |

## Use COR for all Group II Responses

This field appears only if, on the Multifrequency-Signaling-Related System Parameters screen, the Outgoing Call Type field is **group-ii-mfc**.

| Valid entries | Usage                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------|
| y/n           | <b>Y</b> allows the COR administered category to be used for both the calling party and called party categories. |

Station Lock COR: 10

## Screen 67. Class of Restriction screen

### Block Enhanced Conference/Transfer Display

Use this field to add display messages regarding conference and transfer features on digital phones.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |                                                                                                           |
|-----|-----------------------------------------------------------------------------------------------------------|
| y/n | Enter <b>y</b> to block all the enhanced conference/transfer display messages except "Transfer Completed" |
|-----|-----------------------------------------------------------------------------------------------------------|

### Block Transfer Display

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |                                                                                                                                                           |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n | Enter <b>y</b> to prevent users of DCP, Hybrid, ISDN-BRI, or wireless display telephones from receiving a confirmation message when they transfer a call. |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

### Brazil Collect Call Blocking

For Brazil only

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |                                                                                                                                                                                                                                                                                                                                                                |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n | Enter <b>y</b> to permit all Brazilian trunks calls that terminate to a station to send back a double answer to the CO. This double answer tells the CO that this particular station cannot accept collect calls. The CO then tears down the call if it is a collect call. Set Country on the trunk group screen to <b>23</b> and set this field to <b>y</b> . |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### MF Incoming Call Trace

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow assignment of a Call Trace COR to a station. Avaya MultiVantage then generates an MFC backward signal (administered on the System-Parameters Multifrequency-Signaling screen) during call setup instead of the “free” signal. This triggers the central office to collect trace information before releasing the calling party, if the terminating station’s COR has this feature set to <b>y</b> . |

### Remote Logout of Agent

Use a feature access code to logout an idle ACD or EAS agent without being at the agent’s phone.

| Valid entries | Usage                                                              |
|---------------|--------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow remote logout of an idle ACD or EAS agent. |

### Station Lock COR

This field defaults to the current screen COR. Extensions that are assigned this COR can use Station Lock with the access code administered on the FAC screen.

| Valid entries | Usage                               |
|---------------|-------------------------------------|
| 0 through 95  | This field defaults to current COR. |

**SERVICE OBSERVING PERMISSION**

**Valid entries    Usage**

---

**y/n**                    A **y** grants permission to observe specific CORs. Enter **n** for each COR number (0 through 95) that cannot be observed by the COR being implemented.

## Class of Service

This screen administers access permissions for call processing features that require dial code or feature button access.

**NOTE:**

Class of Service (COS) does not apply to trunk groups except for the Remote Access feature.

A COS assignment defines whether or not a telephone user may access or use the following features and functions. Up to 16 different COS numbers may be administered (0–15).

| change cos                      |  | CLASS OF SERVICE |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    | Page 1 of 1 |

### Screen 70. Class of Service screen

The screen lists the default values for each COS/feature combination. For a particular combination, **y** allows access to the feature and **n** denies access. Assign entries on the screen for each COS to be implemented. Default values are shown on the screen.

**CAUTION:**

*Because many hunt groups are set up with COS 1, be careful when you assign restrictions to COS 1.*

### Automatic Callback

Allows this user to request Automatic Callback. See [“Automatic callback” on page 1486](#) for more information.

## Automatic Exclusion

Allows a user to activate automatically Exclusion when they go off hook on a station that has an assigned EXCLUSION button. If set to **n**, allows a user manual exclusion when they press the EXCLUSION button before dialing or during a call. Appears when, on the Feature-Related System Parameters screen, the Automatic Exclusion by COS field is **y**.

## Call Forwarding All Calls

Allows this user to forward all calls to any extension. See [“Call forwarding” on page 1612](#) for more information.

## Call Forwarding Busy/DA

Allows this user to forward calls to any extension when the dialed extension is busy or does not answer. See [“Call forwarding” on page 1612](#) for more information.

## Client Room

Allows users to access Check-In, Check-Out, Room Change/Swap, and Maid status functions. In addition, Client Room is required at consoles or telephones that are to receive message-waiting notification. You can administer class of service for Client Room only when you have Hospitality Services and a Property Management System interface. See *GuestWorks® and DEFINITY® Systems Technician Handbook for Hospitality Installations* for more information.

## Console Permissions

Console Permissions allow multiappearance telephone users to control the same features that the attendant controls. You might assign this permission to front-desk personnel in a hotel or motel, or to a call center supervisor. With console permission, a user can:

- Activate Automatic Wakeup for another extension
- Activate and deactivate controlled restrictions for another extension or group of extensions
- Activate and deactivate Do Not Disturb for another extension or group of extensions
- Activate Call Forwarding for another extension
- Add and remove agent skills
- Record integrated announcements

## Data Privacy

Allows this user to enter a feature access code to protect a data call from interruption by any of the system's override or ringing features. See [“Data Privacy” on page 500](#) for more information.

## Extended Forwarding All

Allows a user to administer call forwarding (for all calls) from a remote location. You cannot change a COS to **y** if Extended Cvg/Fwd Admin on the System Parameters Customer-Options screen is **n**. See [“Extended User Administration of Redirected Calls” on page 1545](#) for more information.

## Extended Forwarding B/DA

Allows this user to administer call forwarding (when the dialed extension is busy or does not answer) from a remote location. You cannot change this COS to **y** if Extended Cvg/Fwd Admin on the System Parameters Customer-Options screen is **n**. See [“Extended User Administration of Redirected Calls” on page 1545](#) for more information.

## Off-Hook Alert

See [“Emergency Access to the Attendant” on page 1668](#) for more information. To enable this option, either the Hospitality (Basic) or Emergency Access to Attendant field must be enabled on the System-Parameters Customer-Options screen.

## Personal Station Access (PSA)

Allows users to associate a telephone to their extension with their programmed services, using a feature access code. This field must be set to **n** for virtual phones. You cannot change this field to **y** if Personal Station Access (PSA) on the System Parameters Customer-Options screen is **n**. See [“Personal Station Access” on page 1794](#) for more information.

## Priority Calling

Allows user to dial a feature access code to originate a priority call. Such calls ring differently and override send all calls, if active. See [“Priority Calling” on page 1798](#) for more information.

## QSIG Call Offer Originations

Allows this user to invoke QSIG Call Offer services. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## Restrict Call Fwd-Off Net

This restricts users from forwarding calls to the public network. For security reasons, this should be enabled for all classes of service except the ones you use for very special circumstances. See [“Call Forwarding Off Net” on page 1613](#) for more information.

## Trk-to-Trk Restriction Override

Users with this COS override any system and/or COR-to-COR calling party restrictions that would otherwise prohibit the trunk-to-trunk transfer operation for users with this COS. See [“Transfer — Trunk-to-Trunk” on page 1899](#) for more information.

### SECURITY ALERT:

*Use this COS capability with caution. The ability to perform trunk-to-trunk transfers greatly increases the risk of toll fraud.*

## Code Calling IDs

On systems with chime paging, use this screen to assign a unique series of chimes (a *chime code*) to extensions. The chime code assigned to an extension plays over the speakers whenever that extension is paged. You may assign chime codes to up to 125 extensions.

change paging code-calling-ids Page 1 of 2

CODE CALLING IDs

### Screen 71. Code Calling IDs

**Ext**

This field assigns extensions to chime codes. Only one extension can be assigned to each chime code.

| Valid entries       | Usage                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------|
| An extension number | Enter a physical extension, not a VDN, to assign that extension to a code. Otherwise, leave this field blank. |

**Related topics**

See [“Setting up chime paging over loudspeakers” on page 476](#) for instructions.

See [“Loudspeaker paging” on page 1753](#) for a description of the feature.

**Command Permission Categories**

Use this screen to administer a user’s permissions associated with their login. When set to y, the permissions on this screen apply for the object that is not restricted. Use the second and third pages of the Command Permission Categories screen to restrict a user from any access to specified objects. To see pages 2 and 3, type **y** in the Additional Restrictions field.

**Screen 72. Command Permission Categories**

### Additional Restrictions

Use page 2 and 3 to add objects (up to 40) that this user cannot manipulate. If an object appears on the Additional Restrictions page, users cannot display, add, change, or do anything else with that object.

| Valid entries | Usage                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to create additional restrictions, and to have the second and third pages of this screen appear. |

### Administer Features

Use caution when assigning this permission to a user.

| Valid entries | Usage                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to administer feature-related parameters, such as coverage paths, class of service, class of restriction, system parameters, authorization codes, and security. |

### Administer Permissions

This permission only applies to super-user logins.

| Valid entries | Usage                                                                        |
|---------------|------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to administer logins and command permissions. |

### Administer Stations

| Valid entries | Usage                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to add, change, duplicate, or remove stations, data modules and associated features, such as abbreviated dialing, vectors, and routing tables. |

### Administer Trunks

Give this permission only to users who are very familiar with these features.

| Valid entries | Usage                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to administer AAR/ARS, trunk groups, remote access, and route patterns. |

## Display Admin. and Maint. Data

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                              |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow a user to use the display, list, monitor, status, and schedule commands and also change their own passwords and schedule reports. |

## Login Name

This display-only field shows the login to which these permissions apply.

## Maintain Enhanced DS1

You can only enter a value in this field if the DS1 MSP field is set to **y** on the [System-Parameters Customer-Options](#) screen.

| <b>Valid entries</b> | <b>Usage</b>                                                        |
|----------------------|---------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow a user to perform enhanced DS1 maintenance. |

## Maintain Process Circuit Packs

You can only enter a value in this field if the Processor and System MSP field is set to **y** on the [System-Parameters Customer-Options](#) screen.

| <b>Valid entries</b> | <b>Usage</b>                                                     |
|----------------------|------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow a user to perform processor maintenance. |

## Maintain Stations

You can only enter a value in this field if the Station and Trunk MSP field is set to **y** on the [System-Parameters Customer-Options](#) screen.

| <b>Valid entries</b> | <b>Usage</b>                                                   |
|----------------------|----------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow a user to perform station maintenance. |

## Maintain Switch Circuit Packs

You can only enter a value in this field if the Station and Trunk MSP field is set to **y** on the [System-Parameters Customer-Options](#) screen.

| <b>Valid entries</b> | <b>Usage</b>                                                        |
|----------------------|---------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow a user to perform circuit pack maintenance. |

### Maintain Systems

You can only enter a value in this field if the Processor and System MSP field is set to **y** on the [System-Parameters Customer-Options](#) screen.

| Valid entries | Usage                                                         |
|---------------|---------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to perform system maintenance. |

### Maintain Trunks

You can only enter a value in this field if the Station and Trunk MSP field is set to **y** on the [System-Parameters Customer-Options](#) screen.

| Valid entries | Usage                                                        |
|---------------|--------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to perform trunk maintenance. |

### System Measurements

This field only appears for DEFINITY SI systems.

| Valid entries | Usage                                                                 |
|---------------|-----------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow a user to use the list measurements commands. |

### System Mgmt Data Transfer Only

| Valid entries | Usage                                                                          |
|---------------|--------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to indicate the switch is accessible by Network Administration. |

## Field descriptions for page 2

```
change permissions angi3 Page 2 of 3

 COMMAND PERMISSION CATEGORIES
 RESTRICTED OBJECT LIST

```

### Screen 73. Command Permission Categories—Restricted Object List screen

Pages 2 and 3 of this screen are identical, and allow you to specify up to 40 objects that this user cannot access. These pages do not appear unless you set both the Administer Station and Additional Restrictions fields to **y** on page 1 of this screen. If you want to limit a user's permissions beyond those on page 1, enter the objects in this list. For example, if you want a user to be able to add and change stations, but not Vector Directory Numbers (VDN), in the Administer Stations and Additional Restrictions fields, type **y**. Then on page 2, type **vdn** as a restricted object.

## Configuration Set

This screen defines a number of call treatment options for EC500 cell phone calls. The EC500 allows the use of up to 10 Configuration Sets, which are already defined in the system using default values.

### Field descriptions for page 1

```
change xmobile configuration-set 1 Page 1 of 1

 CONFIGURATION SET: 1

 Configuration Set Description:
 Calling Number Style:
 CDR for Calls to EC500 Destination?
 Fast Connect on Origination?
 Post Connect Dialing Options?
```

### Screen 74. Configuration Set

## Calling Number Style

Determines the format of the caller ID for calls from a local switch extension to an EC500 cell phone.

| Valid entries  | Usage                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>network</b> | Provides a display of only 10-digit numbers. For internal calls, the ISDN numbering tables are used to create the calling number and DCS calls use the ISDN calling number if provided. The externally provided calling number is used when available for externally originated calls. |
| <b>pbx</b>     | Provides a display of less than 10-digits. Extensions sent as the calling number for all internally- and DCS network-originated calls.                                                                                                                                                 |

## CDR for Calls to EC500 Destination

Determines whether a call detail record is generated for any call to the cell phone.

### NOTE:

CDR reporting for EC500 calls relies on the CDR Reports field on the Trunk Group screen. If, on the Trunk Group screen, the CDR Reports field is **n**, no CDR is generated even if this field is **y**.

| Valid entries | Usage                                                                              |
|---------------|------------------------------------------------------------------------------------|
| <b>y</b>      | Treats calls to the XMOBILE station as trunk calls and generates a CDR.            |
| <b>n</b>      | Treats calls to the XMOBILE station as internal calls and does not generate a CDR. |

## Configuration Set Description

Describes the purpose of the configuration set.

| Valid entries                             | Usage                        |
|-------------------------------------------|------------------------------|
| Up to 20 alphanumeric characters or blank | For example, EC500 handsets. |

## Fast Connect on Origination

Determines whether some additional processing occurs on the switch prior to connecting a call.

| Valid entries | Usage                                    |
|---------------|------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to send CONNECT messages. |

## Post Connect Dialing Options

Determines whether additional capabilities, beyond standard ISDN dialing, are available for those incoming ISDN trunk calls that are mapped into XMOBILE stations. These options come into effect after the call has entered the active state (the switch has sent a CONNECT message back to the network).

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dtmf</b>          | Expect digits from either in-band or out-of-band, but not simultaneously. The switch allocates a DTMF receiver whenever it needs to collect digits. This option normally would be used for EC500 XMOBILE station calls.                                                                                                                                                                                                                                                                                                                              |
| <b>out-of-band</b>   | Expect all digits to be delivered by out-of-band signaling only. The switch collects digits that it needs from the out-of-band channel (no touch-tone receiver). In addition, any digits received when the switch is not collecting digits are converted to DTMF and broadcast to all parties on the call. This option is in force for DECT XMOBILE station calls.                                                                                                                                                                                   |
| <b>both</b>          | Expect all subsequent digits to be delivered by simultaneous in-band and out-of-band signaling. Out-of-band signaling consists of digits embedded in ISDN INFO messages while the in-band signaling consists of DTMF in the voice path. The switch collects all digits that it needs from the out-of-band channel. No touch tone receive is allocated in order to prevent collecting double digits. End-to-end signaling occurs transparently to the switch via in-band transmission of DTMF. This option is in force for PHS XMOBILE station calls. |

## Console Parameters

This screen administers attendant console group parameters. This includes basic parameters for Centralized Attendant Service (CAS) and Inter-PBX Attendant Service (IAS). A list of the administered attendant consoles also displays on this screen.

### Field descriptions for page 1

```

### Screen 75. Console Parameters — Default Attendant Group

#### AAR/ARS Access Code

Appears if the CAS field is **QSIG-branch**. An optional field that contains an AAR/ARS access code to route to the main PBX, if needed.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                      |                       |
|----------------------|-----------------------|
| 0 through 9,<br>*, # | Enter up to 4 digits. |
| blank                |                       |

#### Alternate FRL Station

This is a display-only field indicating the extension of the alternate facility restriction level (FRL) activation station.

#### Attendant Group Name

Enter a name for the attendant group.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                                    |  |
|------------------------------------|--|
| 1-27<br>alphanumeric<br>characters |  |
|------------------------------------|--|

## Attendant Lockout

Attendant Lockout prevents an attendant from re-entering a multiple-party connection held on the console unless recalled by a telephone user.

Attendant Lockout provides privacy for parties on a multiple-party call held on the console. The held parties can hold a private conversation without interruption by the attendant.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to activate Privacy — Attendant Lockout. If <b>y</b> is entered, the attendant is prohibited from reentering a conference call that has been placed on hold unless recalled by a phone user on the call. |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Attendant Vectoring VDN

This field appears only if, on the System-Parameters Customer-Options screen, the Attendant Vectoring field is **y** and the Tenant Partitioning field is **n**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                 |                                                     |
|---------------------------------|-----------------------------------------------------|
| Assigned VDN extension or blank | Enter an assigned Attendant VDN extension or blank. |
|---------------------------------|-----------------------------------------------------|

## Backup Alerting

Indicates whether or not system users can pick up alerting calls if the attendant queue has reached its warning state.

## Calls In Queue Warning

Enter the number of incoming calls that can be in the attendant queue before the console's second Call Waiting lamp lights. The console's first Call Waiting lamp lights when any incoming calls are waiting to be answered. The second lamp lights when the number of calls waiting equals the value you entered in the Calls in Queue Warning field.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|              |  |
|--------------|--|
| <b>1-300</b> |  |
|--------------|--|

## CAS

The CAS Main or Branch features must be enabled on the System- Parameters Customer-Options screen for either of these features to be functional here.

| Valid entries      | Usage                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>main</b>        |                                                                                                                                                                                     |
| <b>branch</b>      |                                                                                                                                                                                     |
| <b>none</b>        |                                                                                                                                                                                     |
| <b>QSIG-main</b>   | Can be used if, on the System-Parameters Customer-Options screen, the Centralized Attendant field is <b>y</b> . Indicates all attendants are located on the main PBX.               |
| <b>QSIG-branch</b> | Can be used if, on the System-Parameters Customer-Options screen, the Centralized Attendant field is <b>y</b> . Indicates there are no local attendants and routes to the main PBX. |

## CAS Back-Up Ext.

This field handles attendant-seeking calls if the RLT trunk group to the CAS Main switch is out of service or if CAS Back-Up is activated. This field must be explicitly defined as an extension in the dial plan. Neither a prefixed extension nor a VDN extension is allowed. Appears only when **branch** is entered in the CAS field.

| Valid entries                     | Usage |
|-----------------------------------|-------|
| An extension number for a station |       |
| individual attendant console      |       |
| hunt group                        |       |
| TEG                               |       |

## COR

Enter the class of restriction (COR) number that reflects the desired features for the attendant. You can override this COR, by assigning a different COR on the individual Attendant screen.

| Valid entries | Usage |
|---------------|-------|
| <b>0-95</b>   |       |

## COS

Enter a class of service (COS) number that reflects the desired features for all your attendant consoles. You can override this COS, by assigning a different COS on the individual Attendant screen.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|      |  |
|------|--|
| 1-15 |  |
|------|--|

## DID-LDN Only to LDN Night Ext.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                                                                                         |
|----------|-------------------------------------------------------------------------------------------------------------------------|
| <b>y</b> | Enter <b>y</b> to allow only listed directory number (LDN) calls to go to the listed directory night service extension. |
|----------|-------------------------------------------------------------------------------------------------------------------------|

|          |                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------|
| <b>n</b> | Enter <b>n</b> if you want all attendant seeking calls to route to the LDN night service extension. |
|----------|-----------------------------------------------------------------------------------------------------|

## Ext Alert Port (TAAS)

Enter the seven-digit port number assigned to the external alerting device. This supports the Night Service — Trunk Answer From Any Station feature.

 **NOTE:**

Type an “X” in this field to indicate that there is no hardware associated with this port assignment. If an **X** is used here, you must also fill in the Ext Alert (TAAS) Extension field.

## Ext Alert (TAAS) Extension

Appears only when an **X** is entered in the Ext Alert Port (TAAS) field. This extension is used by the Terminal Translation Feature (TTI) to assign a port to the Ext Alert Port from a station on the Ext Alert port during system installation or provisioning. Once a port is assigned (either via TTI or by changing the Ext Alert Port field from the G3-MA or other manager terminal) the extension is automatically removed and treated as unassigned.

## IAS Att. Access Code

Enter the extension number of the attendant group at the main switch. This entry is required when IAS Branch is **y**. Does not appear if, on the System-Parameters Customer-Options screen, the Centralized Attendant field is **y**.

### IAS (Branch)

Enables or disables Inter-PBX Attendant Service (IAS) Branch feature. Does not appear if, on the System-Parameters Customer-Options screen, the Centralized Attendant field is **y**.

**NOTE:**

CAS and IAS cannot both be active at the same time.

### IAS Tie Trunk Group No.

**NOTE:**

Enter the number of the tie trunk group to the main for the IAS (Branch). This entry is required when IAS Branch is **y**. Does not appear if, on the System-Parameters Customer-Options screen, the Centralized Attendant field is **y**.

| Valid entries | Usage                                                          |
|---------------|----------------------------------------------------------------|
| 1-666         | For DEFINITY R, CSI, SI.                                       |
| 1-2000        | For S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect. |

### Night Service Act. Ext.

This is a display-only field containing the extension of the current night service activation station, if any. Such a station is administered by assigning it a “night-serv” button.

### QSIG CAS Number

Appears if the CAS field is **QSIG-branch**. Contains the complete number of the attendant group at the main switch, or a vector directory number (VDN) local to the branch switch. This field cannot be left blank.

| Valid entries | Usage                  |
|---------------|------------------------|
| 0 through 9   | Enter up to 20 digits. |

### RLT Trunk Group No.

Appears only when **branch** is entered in the CAS field. Enter the trunk group number corresponding to the Release Link Trunk (RLT) trunk group to the main location when supporting CAS Branch service.

```

### Screen 76. Console Parameters — Default Attendant Group

#### TIMING

##### Return Call Timeout (sec)

Enter the time in seconds before a split away call (call extended and ringing a station or otherwise split away from the console) returns to the console. Be sure to allow five seconds for each ring at all points in a coverage path to ensure the entire path is completed before the call returns to the console.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                     |  |
|---------------------|--|
| 10-1024 or<br>blank |  |
|---------------------|--|

##### Time In Queue Warning (sec)

Enter the number of seconds a call can remain in the attendant queue before activating an alert.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                   |  |
|-------------------|--|
| 9-999 or<br>blank |  |
|-------------------|--|

**Time Reminder on Hold (sec)**

Enter the time in seconds that a call remains on hold at the console before the attendant is alerted. In a CAS arrangement, the main and the branch consoles (when administered) should be administered the same.

**Valid entries      Usage**

---

10-1024

**INCOMING CALL REMINDERS**

---

**Alerting (sec)**

Enter the number of seconds after which a held or unanswered call is disconnected from an attendant loop and routed to another attendant or night service

**No Answer Timeout (sec)**

Enter the number of seconds a call to the attendant can remain unanswered without invoking a more insistent sounding tone. Be sure to allow five seconds for each ring at all points in a coverage path to ensure the entire path is completed before the call returns to the console.

**Valid entries      Usage**

---

10-1024 or  
blank

**Secondary Alert on Held Reminder Calls?**

**Valid entries      Usage**

---

**y**                      Enter **y** to begin attendant alerting for Held Reminder Calls with secondary alerting.

**n**                      Enter **n** to have held reminder calls alert the attendant the same as normal calls. Normal calls start with primary alerting and switch to secondary alerting when the No Answer Timeout expires.

## **ABBREVIATED DIALING**

---

### **List1, List2, List3**

You can assign up to 3 abbreviated dialing lists to each attendant. However, you cannot assign a personal list to an attendant.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| <b>enhanced</b>      | Allows the attendant to access the enhanced system abbreviated dialing list.                                     |
| <b>group</b>         | Allows the attendant to access the specified group abbreviated dialing list. You also must enter a group number. |
| <b>system</b>        | Allows the attendant to access the system abbreviated dialing list.                                              |

### **SAC Notification**

Enables or disables Enhanced Attendant Notification for Send All Calls.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

y/n

## **COMMON SHARED EXTENSIONS**

---

### **Count**

Enter a number to indicate the number of consecutive extensions, beginning with the Start Extension to be used as common, shared extensions. For example, if you enter a starting extension of 4300 and a count of 3, the system provides three consecutive extension numbers (4300, 4301, and 4302) for parking calls.

The extensions should be assigned to the optional Attendant Selector Console in the 00 through 09 block (bottom row) in any hundreds group for easy identification by the attendant. The lamp associated with the number will identify “call parked” or “no call parked”, instead of busy or idle status.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

1-80 or blank

### **Starting Extension**

These extension numbers can be used by the attendant to park calls.

 Miscellaneous Call:2_

Call-Type Ordering Within Priority Levels? n

```

**Screen 77. Console Parameters — Default Attendant Group**

**QUEUE PRIORITIES**

Attendant Priority Queue allows attendants to answer calls by call category (for example, by trunk type). The Attendant Priority Queue handles incoming calls to an attendant when the call cannot be immediately terminated to an attendant. The calling party hears ringback until an attendant answers the call.

You may assign the same priority level to more than one call. Priority 1 is the highest priority and is the default for Emergency Access. Assign a priority level from **1** through **13** to each of the call types.

The attendant call categories are:

- Emergency Access — A call from a telephone user who dials the emergency access code (default is highest-priority level)
- Assistance Call— A call from a telephone user who dials the attendant-group access code, or from a telephone that has the Manual Originating Line Service feature activated
- CO Call — An incoming trunk call (CO/FX/WATS trunk) to an attendant group. This does not include trunk calls that return to the attendant group after a timeout or deferred attendant recall.
- DID to Attendant — An incoming DID trunk call to an attendant group. This does not include trunk calls that return to the attendant group after a timeout or deferred attendant recall.

- Tie Call — An incoming TIE trunk call (dial-repeating or direct types) to an attendant group. This does not include trunk calls that return to the attendant group after a timeout or deferred attendant recall.
- Redirected DID Call — A DID or ACD call that times out due to ring/no-answer, busy condition (if applicable), or Number Unobtainable and reroutes to the attendant group.
- Redirected Call — A call assigned to one attendant, but redirected to the attendant group because the attendant is now busy
- Return Call — A call returned to the attendant after it times out. If the attendant is now busy, the call redirects to the attendant group.
- Serial Call — A call from the Attendant Serial Call feature when an outside trunk call (designated as a serial call by an attendant) is extended to and completed at a telephone, and then the telephone user goes on-hook. If the attendant who extended the call is busy, the call redirects to the attendant group.
- Individual Attendant Access — A call from a telephone user, incoming trunk call, or a system feature to the Individual Attendant Access (IAA) extension of a specific attendant. If the attendant is busy, the call queues until the attendant is available.
- Interposition — A call from one attendant to the Individual Attendant Access (IAA) extension of another attendant
- VIP Wakeup Reminder Call — A VIP Wakeup reminder call.
- Miscellaneous Call — All other calls.

### Call-Type Ordering Within Priority Levels?

If you use call-type ordering, calls to the attendant are first grouped by the queue priority level, then by call type, and, finally, in the order received.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                    |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> if you want to present calls by call type. You can assign a type-disp button on the <a href="#">Attendant Console</a> screen so that the attendant can review the call type for the active call. |
| <b>n</b>             | Enter <b>n</b> if you wish the calls to be queued in chronological order by queue priority level.                                                                                                               |

The call types, in descending order of priority, are:

- Type 1 call: outgoing public-network calls receive answer supervision when the Answer Supervision Timer of the trunk group expires, even if the trunk is actually still ringing. Also, incoming calls when answered by the attendant.

- Type 2 call: incoming external public-network calls before they receive answer supervision or before the Answer Supervision Timer of the trunk group expires
- Type 3 call: all other calls (internal calls, conference calls, and tie-trunk calls of any type)

Note that external public-network calls have priority over all other calls including conference calls. And, answered public-network calls have priority over those calls not yet answered.

**Screen 78. Console Parameters — Default Attendant Group**

**ASSIGNED MEMBERS (Installed attendant consoles)**

**Grp**

Display-only field that lists the Attendant Group number.

**TN**

Display-only field that lists the Tenant Partition number.

**Type**

Display-only field that shows all attendants in the group. You administer the individual attendant consoles on the [Attendant Console](#) screen.

## Coverage Answer Group

This screen establishes Call Coverage Answer Groups.

An answer group contains up to eight members who act as a coverage point for another user. For example, if several secretaries are responsible for answering a department's redirected calls, all the secretaries could be assigned to an answer group. The answer group is assigned a group number, and that group number appears in the department's coverage path. All phones in an answer group ring (alert) simultaneously. Any member of the group can answer the call.

Each coverage answer group is identified by a number from 1 through the maximum number allowed by your system configuration (see *Avaya MultiVantage™ Solutions Hardware Guide*). The members of the group are identified by their extension number. Any phone, including those administered without hardware (X-ported (but not attendants) can be assigned to a coverage answer group. Note that members whose extensions are X-ported will not be alerted.

### Screen 79. Coverage Answer Group

#### Ext

Enter the extension number (may not be a Vector Directory Number extension) for each member of this coverage answer group.

#### Valid entries

#### Usage

An assigned extension for a station.

## Group Name

Enter the group name you want to use to identify this group.

**Tip:**

*Enter the extension numbers that are group members. This allows a list coverage answer group command to be used to list the phones that will be alerted. The list command can be used in conjunction with the list station, list coverage path, and list hunt group commands to determine stations involved in call coverage. This makes it possible to follow call coverage for any extension, allowing the administrator to easily track call coverage paths.*

| <b>Valid entries</b> | <b>Usage</b>                                        |
|----------------------|-----------------------------------------------------|
| Up to 27 characters  | For example, typing pool, room 12, secy, and so on. |

## Group Number

A display-only field when the screen is accessed using an administration command such as **add** or **change**.

## Name

This display-only field indicates the name assigned when the member's phone is administered.

## Coverage Path

This screen implements Call Coverage Paths. The screen provides the means to specify the call coverage criteria, the points in the coverage path used to redirect calls, and the number of times a principal's phone rings before the call redirects to coverage.

### Screen 80. Coverage Path screen

#### Coverage Path Number

A display-only field indicating the coverage path being administered.

#### Hunt After Coverage

| Valid entries | Usage                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | Coverage treatment continues by searching for an available station in a hunt chain that begins with the hunt-to-station assigned on the station screen of the last coverage point. |
| n             | Coverage treatment is terminated; the call is left at the last available location (principal or coverage point).                                                                   |

**Linkage**

Display-only fields that show the (up to) two additional coverage paths in the coverage path chain. (See above.)

**Next Path Number**

Enter the next coverage path in a coverage path chain. See “[Call coverage](#)” on [page 1532](#) for more information. If the coverage criteria of the current coverage path is not satisfied, the system steps down this chain until it finds a coverage path with redirection criteria that matches the call status. If the chain is exhausted before the system finds a match, the call does not redirect to coverage. No path number here indicates that this path is the only path for the principal.

| <b>Valid entries</b> | <b>Usage</b> |

| 1 to 9999 or blank |  |
|--------------------|--|

**COVERAGE CRITERIA**

---

COVERAGE CRITERIA are the conditions that, when met, cause the call to redirect to coverage. Assign one of the following:

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Active</b>                  | Calls redirect if at least one call appearance is busy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Busy</b>                    | Calls redirect if all call appearances that accept incoming calls are busy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Don't Answer</b>            | Calls redirect when the specified number of rings has been exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>All</b>                     | Calls redirect immediately to coverage and overrides any other criteria with a <b>y</b> in this column.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DND/SAC/<br/>Goto Cover</b> | Must be assigned before a user can activate Do Not Disturb (Hospitality Services), Send All Calls (SAC), or Go to Cover features. Allows a calling user, when calling to another internal extension, to redirect a call immediately to coverage by pressing a GO TO COVER button. Allows a principal temporarily to direct all incoming calls to coverage, regardless of the other assigned coverage criteria by pressing the SEND ALL CALLS (OR DO NOT DISTURB) button. Send All Calls also allows covering users to temporarily remove their phones from the coverage path. |

## Number of Rings

Enter the number of rings.

| Valid entries | Usage                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1 through 99  | This is the number of rings a user's phone rings before the system redirects the call to the first point in the coverage path. |

## COVERAGE POINTS

### Point1, Point2, Point3, Point4, Point5, Point6

The alternate destinations that comprise a coverage path. Coverage points must be assigned sequentially beginning with Point 1 (do not leave gaps). Each path can have up to six coverage points.

| Valid entries                                                                                           | Usage                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension                                                                                               | Redirects the call to an internal extension or announcement                                                                                                                                                                                              |
| attd                                                                                                    | Redirects the call to the attendant or attendant group. If the system has Centralized Attendant Service (CAS), the call goes to the CAS attendant.                                                                                                       |
| h1 to h999                                                                                              | Redirects the call to the corresponding hunt-group. For example, enter " <b>h32</b> " if you want a coverage point routed to hunt group 32. (See " <a href="#">Hunt Group</a> " on page 875 for more information.)                                       |
| <b>c1 to c750</b><br><b>c1 to c1000</b> (For S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect) | Redirects the call to the corresponding coverage answer group. For example, enter " <b>c20</b> " if you want a coverage point routed to call coverage answer group 20. (See " <a href="#">Coverage Answer Group</a> " on page 694 for more information.) |

| Valid entries                                                                                           | Usage                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>r1 to r999</b><br><b>r1 to r1000</b> (For S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect) | Redirects the call to the corresponding remote coverage point number. For example, enter “ <b>r27</b> ” if you want a coverage point routed to remote coverage point 27. (See <a href="#">“Remote Call Coverage Table” on page 1092</a> for more information.)                                      |
| <b>v + extension</b>                                                                                    | Redirects the call to the corresponding VDN extension. For example, enter “ <b>v12345</b> ” if you want the last administered coverage point to be the VDN associated with extension 12345. Note that a Vector Directory Number may be used only as the last administered point in a coverage path. |

If calls redirect to an AUDIX in a DCS network, administer a unique Hunt Group screen. Assign the AUDIX extension in the Group Extension field. If the AUDIX is connected to the local node, set the Message Center field to **audix**; if the AUDIX is connected to another node, set the Message Center field to **rem-audix**.

If calls redirect to Message Center (a special Uniform Call Distribution hunt group), AUDIX, or to the attendant, do not list any subsequent coverage points. These calls will normally queue and never redirect to another coverage point. Calls to any hunt group will queue if possible. Calls redirect from a hunt group only if all hunt group members are busy and either the queue is full or there is no queue.

If the Coverage of Calls Redirected Off-Net feature is not enabled, a remote coverage point will function as the last point in the coverage path, because the system will no longer have control of the call once it has redirected off-net. However, if the Coverage of Calls Redirected Off-Net feature is enabled, a call redirected off-net can be monitored by the system and brought back for further call coverage processing.

### Terminate to Coverage Pts. with Bridged Appearances

| Valid entries | Usage                                                                          |
|---------------|--------------------------------------------------------------------------------|
| <b>y</b>      | Allows a call to alert as both a bridged call and a redirected call.           |
| <b>n</b>      | The call skips the coverage point if it has already alerted as a bridged call. |

## Crisis Alert System Parameters

This screen allows you to define the system parameters associated with sending crisis alert messages.

### Screen 81. Crisis Alert System Parameters screen

#### ALERT STATION

##### Every User Responds

Controls who needs to respond to a crisis alert.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | If set to <b>y</b> , all users who have a crisis alert button are notified and must clear the alert for every emergency alert. Assign crisis alert buttons only to attendant consoles and stations that must be notified of an emergency call.                                                                       |
| <b>n</b>      | If set to <b>n</b> , all users are notified, but only one user needs to acknowledge an alert. This user may be the attendant or any other digital telephone with a crisis alert button. When the alert is acknowledged by one user, the alert is cleared at all stations except the one that acknowledged the alert. |

## ALERT PAGER

---

### Alert Pager

| Valid entries | Usage                                                  |
|---------------|--------------------------------------------------------|
| y/n           | Enter <b>y</b> to use Crisis Alert to a Digital Pager. |

### Crisis Alert Code

Displays when the Alert Pager field is **y**. This field requires an entry before submitting the screen.

| Valid entries      | Usage                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 through 3 digits | The numbers in this field are the first 3 digits in the crisis alert pager message. Avaya recommends you enter the numbers used to call the local emergency service or any digits used for an emergency situation (for example, 911). |

### DTMF Duration - Tone (msec)

The length of time the Dual-Tone Multi-Frequency (DTMF) tone is heard for each digit. Displays when the Alert Pager field is **y**.

| Valid entries   | Usage                               |
|-----------------|-------------------------------------|
| 20 through 2550 | Enter a number in increments of 10. |

### Main Number

The main phone number to the location or a location code. This field is optional and does not require an entry. Displays when the Alert Pager field is **y**.

| Valid entries          | Usage                                                                                                                                                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| digits 0-9<br>- (dash) | Enter a number up to 15 digits to identify the location where the crisis alert call originated. It can be the main number to the location or a numerical identification. Any dashes are for display purposes only and not included in the message sent to the pager. This entry is the last group of digits displayed in the pager message. |

## Originating Extension

Used as the extension originating the call to send a crisis alert message to a pager. Displays when the Alert Pager field is **y**. This field requires an entry before submitting the screen.

| Valid entries      | Usage                                                             |
|--------------------|-------------------------------------------------------------------|
| 1 through 7 digits | Requires a valid unassigned extension according to the dial plan. |

## Pager Number

Displays when the Alert Pager field is **y**. One of these fields must have a number or the screen cannot be submitted.

| Valid entries              | Usage                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 15 digits<br>- (dash) | Any dashes are for display purposes only and not included in the message sent to the pager. One of the pager number fields must have a number or the screen cannot be submitted. |

## Pause (msec)

The length of time between DTMF tones for each digit. Displays when the Alert Pager field is **y**.

| Valid entries                 | Usage                               |
|-------------------------------|-------------------------------------|
| <b>20</b> through <b>2550</b> | Enter a number in increments of 10. |

## Pin Number

This field can be used for any combination of the pager pin number and pauses or left blank. Displays when the Alert Pager field is **y**.

| Valid entries                                                                | Usage                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| digits <b>0-9</b><br><b>p</b> (pause)<br><b>#</b> (pound)<br><b>*</b> (star) | Enter a number up to 15 digits. A pause (about 2 seconds) is for timing of the message. For instance, after the pin number you may want to have a pause to allow time for the pager service to set up the correct pager message box. If the pager service requires you to submit a PIN number, enter it here. |

**Retries**

Displays when the Alert Pager field is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                      |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0 through 10</b>  | The number of times the system tries to send out the alert message in case of an unsuccessful attempt. This increases the chances that the pager receives a crisis alert message. |

**Retry Interval (sec)**

Displays when the Alert Pager field is **y**. This field is not used unless the Retries field is **1-10**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>30 through 60</b> | The administrable time period (in seconds) between retries. If an attempt to call the pager fails, the retry call attempts after the retry interval period. |

**CTI Link**

---

The cti-link commands are available only if, on the System-Parameters Customer-Options screen, either the ASAI Link Core Capabilities and/or Computer Telephony Adjunct Links field is **y**.

### Screen 83. CTI Link screen when Type field is ASAI-IP or ADJ-IP

#### CTI Link

A display-only field indicating the CTI link number.

| Valid entries | Usage                                                                                  |
|---------------|----------------------------------------------------------------------------------------|
| 1-8           | S8100 Media Server with a CMC1<br>Avaya MultiVantage on a DEFINITY CSI<br>DEFINITY G3i |
| 1-16          | S8300 Media Server<br>Avaya MultiVantage on a DEFINITY R<br>S8700 Multi-Connect        |

#### Extension

This field displays the extension for this link.

#### Type

For each link that you want to add to your system, you must specify the CTI link type.

| Valid entries | Usage                                               |
|---------------|-----------------------------------------------------|
| ADJLK         | For ASAI links not used by co-resident DLG.         |
| ADJ-IP        | For ASAI adjunct links used by co-Resident DLG.     |
| ASAI          | For ASAI adjunct links not used by co-resident DLG. |
| ASAI-IP       | For ASAI links used by co-Resident DLG.             |

**Port**

Appears when the Type field is **ASAI** or **ADJLK**. Enter 7 characters to specify a port, or an x.

| <b>Valid entries</b>                         | <b>Usage</b>                                                                           |
|----------------------------------------------|----------------------------------------------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R)  | First and second numbers are the cabinet number                                        |
| <b>01</b> through <b>03</b><br>(DEFINITY SI) |                                                                                        |
| <b>A</b> through <b>E</b>                    | Third character is the carrier                                                         |
| <b>01</b> through <b>20</b>                  | Fourth and fifth characters are the slot number                                        |
| <b>01</b> through <b>32</b>                  | Sixth and seventh characters are the circuit number                                    |
| <b>x</b>                                     | Indicates that there is no hardware associated with the port assignment. Use for AWOH. |

**Name**

Enter a name associated with this CTI link.

**COR**

Enter a Class of Restriction (COR) number to select the desired restriction.

**BRI Options**

---

**XID**

Appears when the Type field is **ASAI** or **ADJLK**. Used to identify Layer 2 XID testing capability.

**MIM Support**

Management Information Message Support. A display-only field that appears when the Type field is **ASAI** or **ADJLK**.

**Fixed TEI**

Appears when the Type field is **ASAI** or **ADJLK**. It indicates that the endpoint has a fixed Terminal Endpoint Identifier (TEI).

The TEI identifies a unique access point within a service. You must administer TEIs for fixed TEI terminals. However, for terminals with the automatic TEI capability, the system dynamically assigns the TEI.

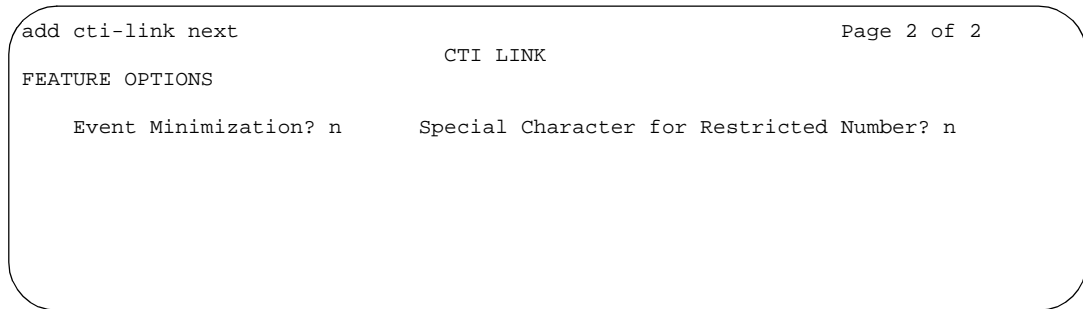

| <b>Valid entries</b> | <b>Usage</b>                                                            |
|----------------------|-------------------------------------------------------------------------|
| <b>y/n</b>           | Entering <b>y</b> displays the TEI field.<br>For ASAI, enter <b>y</b> . |

### CRV Length

Appears when the Type field is **ASAI** or **ADJLK**. Enter **1** or **2** to indicate the length of CRV for each interface.

### Field descriptions for page 2

---

### Screen 84. Link screen when Type field is ASAI-IP or ADJ-IP

#### Event Minimization

May be used when event reports normally would be sent on multiple associations, but the adjunct does not need to see more than one. Typically, these event reports are identical except for the association they are sent over (for example, call control, domain control, or active notification). Some applications discard duplicate events, so in this case, there is no point in sending them across the ASAI CTI link. When enabled, this option allows only a single such event to be sent. The selection of the association on which the event will be sent is based on association precedence as follows: active notification (if enabled), call control (if enabled), or domain control (if enabled). Use the Station screen to change this option. The new option settings take effect the next time the ASAI link is activated.

| <b>Valid entries</b> | <b>Usage</b>                                                     |
|----------------------|------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to control the behavior for that particular link. |

## Special Character for Restricted Number

Enables an ASAI CTI link to indicate the calling number restricted presentation within an event report. For further information, see *DEFINITY® Enterprise Communications Server CallVisor® ASAI Technical Reference*.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|            |                                                                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | When set to <b>y</b> and a calling number received in a SETUP message has the presentation indicator set (octet 3a in the calling number), then an "*" is appended to the calling party number in the ASAI message. |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Data modules

The following section provides descriptions of standard fields on Data Module screens. Some of the fields are used for specific data module types; others are used for all data modules. Unique fields and fields requiring special consideration are listed with the appropriate data module descriptions in this book.

### Field descriptions for page 1

```

change data-module 30 Page 1 of 2
 DATA MODULE

```

### Screen 85. Data Module

## Baud Rate

Used with X.25 Data Modules. The maximum raw data transmission speed.

| Valid entries   | Usage                                                                          |
|-----------------|--------------------------------------------------------------------------------|
| <b>300</b>      |                                                                                |
| <b>1200</b>     |                                                                                |
| <b>2400</b>     |                                                                                |
| <b>4800</b>     |                                                                                |
| <b>9600</b>     |                                                                                |
| <b>19200</b>    |                                                                                |
| <b>switched</b> | You can enter this if the Cable Type field is <b>none</b> on the PGATE screen. |

## BCC

(Bearer Capability Class) A display-only field used with Data Line, Netcon, Processor Interface, Point-to-Point Protocol, Processor/Trunk (**pdm** selection), and System Port Data Modules. Appears when the ISDN-PRI or ISDN-BRI Trunks field is **y** on the System-Parameters Customer-Options screen. The value in this field corresponds to the speed setting of the data module. This field may be compared with the BCC value in an associated routing pattern when attempted calls utilizing the data module fail to complete. The BCC values must be the same.

See [“Generalized route selection” on page 1687](#) for a detailed description of Bearer Capability Classes (BCC) and their ability to provide specialized routing for various types of voice and data calls. The BCC value is used to determine compatibility when non-ISDN-PRI facilities are connected to ISDN facilities (ISDN-PRI Interworking).

| Valid entries  | Usage              |
|----------------|--------------------|
| <b>1</b>       | Relates to 56-kbps |
| <b>2, 3, 4</b> | Relates to 64 kbps |

## Board

Used with Announcement Data Modules. Enter the five character announcement circuit pack number that identifies the physical circuit pack to which the announcement module is connected. You can enter **X** in this field to indicate that there is no hardware associated with this port assignment.

The five character announcement board number is comprised of:

| Characters | Meaning          | Value                                                                   |
|------------|------------------|-------------------------------------------------------------------------|
| 1-2        | Cabinet Number   | 01 through 44<br>(DEFINITY R configurations)<br>1-64 (S8700 IP-Connect) |
|            |                  | 01 through 03<br>(DEFINITY SI configurations)                           |
| 3          | Carrier          | A through E                                                             |
| 4-5        | Slot Number or X | 0 through 20                                                            |

### Broadcast Address

Used with Ethernet data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information. Does not appear for S8700 IP-Connect.

### Connected Data Module

Used with X.25 and Processor Interface (used with DEFINITY CSI and SI only) data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

### Connected to

Used with Data Line and Processor/Trunk (**pdm** selection) Data Module. This field shows to what the Asynchronous Data Unit (ADU) is connected.

| <b>0</b> through <b>15</b> | Select the allowed features. |
|----------------------------|------------------------------|

## COR

Does not appear for **ethernet**. Enter the desired class of restriction.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                            |                                 |
|----------------------------|---------------------------------|
| <b>0</b> through <b>95</b> | Select the allowed restriction. |
|----------------------------|---------------------------------|

## Data Extension

A display-only field indicating the extension assigned to the data module.

## Destination Number

Used with X.25 and Processor Interface data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## DTE/DCE

Used with X.25 Data Modules. Specifies how the above endpoint type acts.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                         |
|------------|-------------------------|
| <b>dte</b> | Data Terminal Equipment |
|------------|-------------------------|

|            |                               |
|------------|-------------------------------|
| <b>dce</b> | Data Communications Equipment |
|------------|-------------------------------|

## Enable Link

Used with X.25, Point-to-Point, and Processor Interface data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information. This field is in different locations on the screen for different data module types.

## Endpoint Type

Used with X.25 Data Modules. An endpoint type is a type of packet switched data endpoint that uses X.25 call control procedures. The X.25 Endpoint connects to external ports on the PGATE board and to the TDM bus via a DS1 trunk. Ports connected to the adjunct endpoint can be either DTEs or DCEs. The type of endpoint (DTE or DCE) is administrable on the “data-mod” screen.

## Error Logging

Used with X.25 Data Modules.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|            |                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to record X.25 protocol errors in the hardware error log. See the <i>Maintenance for Avaya™ MultiVantage and DEFINITY® Server</i> for more information about error logs. |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Establish Connection

Used with X.25, Point-to-Point, and Processor Interface (used with DEFINITY CSI and SI only) data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## Highest PVC Logical Channel

A display-only field used with X.25 Data Modules. Appears when the Permanent Virtual Circuit field is **y**. Specifies how the above endpoint type acts.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                     |                                                                   |
|---------------------|-------------------------------------------------------------------|
| <b>1 through 64</b> | Indicates that 1 to 64 Logical Channels are allowed on this port. |
|---------------------|-------------------------------------------------------------------|

## IP Address Negotiation

Used with Point-to-Point data modules. Does not appear for S8700 IP-Connect. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

**ITC**

(Information Transfer Capability) Used with 7500, Announcement, data-line, Netcon, Processor/Trunk (**pdm** selection), Processor Interface, and System Port Data Modules. Appears only when, on the Trunk Group screen, the Comm Type field is **56k-data** or **64k-data**. Indicates type of transmission facilities to be used for ISDN calls originated from this endpoint. Does not display for voice-only or BRI stations.

---

**Valid entries      Usage**

---

|                     |                                                                                                                                                                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>restricted</b>   | Either restricted or unrestricted transmission facilities are used to complete the call. A restricted facility is a transmission facility that enforces 1's density digital transmission (that is, a sequence of 8 digital zeros are converted to a sequence of 7 zeros and a digital 1). |
| <b>unrestricted</b> | Only unrestricted transmission facilities are used to complete the call. An unrestricted facility is a transmission facility that does not enforce 1's density digital transmission (that is, digital information is sent exactly as is).                                                 |

**Link**

Used with X.25, Ethernet, Point-to-Point, and Processor Interface (used with DEFINITYCSI and SI only) data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information. This field is in different locations on the screen for different data module types.

**Maintenance Extension**

Used with Netcon and Processor Interface Data Modules.

---

| <b>Valid entries</b>                                                                                                                | <b>Usage</b>                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Enter the extension number required to perform maintenance functions on the standby netcon physical channel in a duplicated system. | The standby remote loop around tests fails if this field is not administered. |

## MM Complex Voice Ext

Used with 7500 and World Class BRI Data Modules. Does not appear on S8700 IP-Connect. This field contains the number of the associated phone in the multimedia complex. This field appears only after you set the Multimedia field to **y**. This field is left blank until you enter the data module extension in MM Complex Data Ext on the Station screen.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                        |                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Valid values conform to your dial plan | Once you complete the field on the station screen, these two extensions are associated as two parts of a one-number complex, which is the extension of the telephone. |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Multimedia

Used with the 7500 and World Class BRI Data Modules. Appears only if, on the System-Parameters Customer-Options screen, the MM field is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|            |                                                                       |
|------------|-----------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to make this data module part of a multimedia complex. |
|------------|-----------------------------------------------------------------------|

## Name

Enter the name of the user associated with the data module. The name is optional and can be blank.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                  |  |
|----------------------------------|--|
| Up to 27 alphanumeric characters |  |
|----------------------------------|--|

## Network uses 1's for Broadcast Addresses

Used with Ethernet data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## Node Name

Used with Ethernet (not on S8700 IP-Connect) and Point-to-Point data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## PDATA Port

Used with System Port Data Modules. Enter a seven-digit alphanumeric port location to which the data module is connected. Used to relate the physical PDATA port to which the mode 3 portion of the system port is connected. This entry must be assigned to a port on a PDATA Line Board.

| <b>Valid entries</b> | <b>Usage</b>                                                          |
|----------------------|-----------------------------------------------------------------------|
| <b>01 through 22</b> | First and second characters are the cabinet number                    |
| <b>01 through 64</b> | First and second characters are the cabinet number (S8700 IP-Connect) |
| <b>A through E</b>   | Third character is the carrier                                        |
| <b>01 through 20</b> | Fourth and fifth characters are the slot number in the carrier        |
| <b>01 through 12</b> | Sixth and seventh characters are the circuit number                   |

## Permanent Virtual Circuit

A display-only field used with X.25 Data Modules.

| <b>Valid entries</b> | <b>Usage</b>                                                                      |
|----------------------|-----------------------------------------------------------------------------------|
| <b>y/n</b>           | A <b>y</b> indicates that the logical channels for PVC are allowed for this port. |

## Physical Channel

Used with Netcon and Processor Interface Data Modules. The Physical Channel number is referred to on associated system forms as the Interface Link number.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>01 through 08</b> | For Processor Interface Data Modules, enter the 2-digit circuit number of the Processor Interface port. A multi-carrier cabinet system supports the use of two Processor Interface circuit packs, the first circuit pack (mounted in Control Carrier A) supports physical channels or links 01 through 04; the second (mounted in Control Carrier A) supports physical channels or links 05 through 08. A single-carrier cabinet system supports one Processor Interface circuit pack and physical channels or links 01 through 04 only. |
| <b>01 through 04</b> | For DEFINITY CSI configurations. For Netcon Data Modules, enter a netcon data channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>01 through 08</b> | For DEFINITY SI configurations. For Netcon Data Modules, enter a netcon data channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Port

Used with 7500, Data Line, Ethernet, Processor/Trunk, PPP, System Port, X.25, and World Class BRI Data Modules. Specifies a port location to which the data module is connected.

| Characters | Meaning        | Value                                                                                                                                                                                                                                                |
|------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-2        | Cabinet Number | 01 through 44 (DEFINITY R configurations)<br>01 through 03 (DEFINITY SI configurations)<br>01 through 64 (S8700 IP-Connect)                                                                                                                          |
| 3          | Carrier        | A through E                                                                                                                                                                                                                                          |
| 4-5        | Slot Number    | 0 through 20                                                                                                                                                                                                                                         |
| 6-7        | Circuit Number | 01 through 04 (x.25 circuit pack)<br>01 through 31 (DEFINITY SI, S8700 IP-Connect (tdm, pdm) configurations)<br>01 through 16 (ppp for S8700 IP-Connect)<br>01 through 08 (system-port for S8700 IP-Connect)<br>17/33 (ethernet on S8700 IP-Connect) |

### NOTE:

You can enter X in the Port field to indicate that there is no hardware associated with the port assignment (also known as administration without hardware). These stations are referred to as “phantom stations.” If this data module is designated as a secondary data module (Secondary data module set to **y**) X cannot be entered into this field. The port of a primary data module cannot be changed to X if a secondary data module is administered.

## Remote Loop-Around Test

Used with Processor/Trunk and X.25 Data Modules. Appears when the Type field is **pdm**, **tdm**, or **x.25**.

| Valid entries | Usage                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | For Processor/Trunk Data Modules, enter <b>y</b> if the data module supports a loop-back test at the EIA interface. In general, Avaya equipment supports this test but it is not required by Level 2 Digital Communications Protocol. Enter <b>n</b> to abort a request for this test. |
| <b>y/n</b>    | For X.25 Data Modules, enter <b>y</b> to allow remote loop-around tests on this port. See the <i>Maintenance for Avaya™ MultiVantage and DEFINITY® Server</i> manual for more information about remote loop-around tests. Enter <b>n</b> to abort a request for this test.             |

## Secondary data module

Used with Processor/Trunk Data Modules. Appears only when the Type field is **pdm**. The primary data module must be administered before the secondary data module may be added. If the Port field is **X**, the Secondary data module field cannot be **y**.

| Valid entries | Usage                                                                             |
|---------------|-----------------------------------------------------------------------------------|
| <b>y</b>      | This PDM is the secondary data module used for Dual I-channel AUDIX networking.   |
| <b>n</b>      | This is the primary PDM, or if this data module is not used for AUDIX networking. |

## Subnet Mask

Used with Point-to-Point data modules (for S8700 IP-Connect). See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## Switched Virtual Circuit

A display-only field used with X.25 Data Modules.

| Valid entries | Usage                                                                                |
|---------------|--------------------------------------------------------------------------------------|
| <b>y/n</b>    | A <b>y</b> indicates that the Switched Virtual Circuit is not allowed for this port. |

**TN**

| <b>Valid entries</b> | <b>Usage</b>                       |
|----------------------|------------------------------------|
| 1 through 100        | Enter the Tenant Partition number. |

**Type**

Enter the type of data module.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>7500</b>          | Assigns a 7500 Data Module. The 7500 data module supports automatic TEI, B-channel, maintenance and management messaging, and SPID initialization capabilities. BRI endpoints, both voice and/or data, are assigned to either the ISDN-BRI - 4-wire S/T-NT Interface circuit pack or the ISDN-BRI - 2-wire U circuit pack. Each can support up to 12 ports. Since BRI provides multipoint capability, more than one ISDN endpoint (voice or data) can be administered on one port. For BRI, multipoint administration allows for telephones having SPID initialization capabilities, and can only be allowed if no endpoint administered on the same port is a fixed tie endpoint and no station on the same port has B-channel data capability. Currently, multipoint is restricted to 2 endpoints per port. |
| <b>announcement</b>  | Assigns an announcement data module. The announcement data module is built-in to the integrated announcement circuit pack and is administered using the Announcement Data Module screen. This data module (in conjunction with an administered Netcon Data Module in DEFINITY SI configurations) allows the system to save and restore the recorded announcements file between the announcement circuit pack and the system memory.                                                                                                                                                                                                                                                                                                                                                                           |

| Valid entries    | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>data-line</b> | <p data-bbox="467 247 1116 484">Assigns a Data Line Data Module. The Data Line Data Module (DLDM) screen assigns ports on the Data Line circuit pack (DLC) that allows EIA 232C devices to connect to the system. The DLC, with a companion Asynchronous Data Unit (ADU), provides a less expensive data interface to the system than other asynchronous DCP data modules.</p> <p data-bbox="467 527 1149 691">The DLC supports asynchronous transmissions at speeds of Low and 300, 1200, 2400, 4800, 9600, and 19200 bps over 2-pair (full-duplex) lines. These lines can have different lengths, depending on the transmission speed and wire gauge.</p> <p data-bbox="467 734 1145 935">The DLC has 8 ports. The connection from the port to the EIA device is <i>direct</i>, meaning that no multiplexing is involved. A single port of the DLC is equivalent in functionality to a data module and a digital line port. The DLC appears as a data module to the Digital Terminal Equipment (DTE) and as a digital line port to the switch.</p> <p data-bbox="467 977 1142 1039">The DLC connects the following EIA 232C equipment to the system:</p> <ul data-bbox="515 1060 1136 1358" style="list-style-type: none"><li>■ Printers</li><li>■ Non-Intelligent Data Terminals</li><li>■ Intelligent Terminals, Personal Computers (PCs)</li><li>■ Host Computers</li><li>■ Information Systems Network (ISN), RS-232C Local Area Networks (LANs), or other data switches.</li></ul> |
| <b>ethernet</b>  | <p data-bbox="467 1381 1126 1613">Assigns an Ethernet data module. The Ethernet Data Module screen assigns the 10BaseT port on the Control-LAN (C-Lan) circuit pack. This port provides a TCP/IP connection to network hub or LAN. See <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> for more information on Ethernet data modules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>netcon</b> | Assigns a Netcon Data Module. Netcon data modules are the Processor Data Modules (PDMs) that are integrated into the system's network control ports that provide asynchronous circuit switched interfaces to the maintenance and administration terminals, Hospitality journal printers, and CDR digital output. They are characterized by their special locations, that is, special port identifications. |

**NOTE:**

The Netcon data module is only applicable to DEFINITY SI configurations. For DEFINITY R and later configurations, use the **system-port** command.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pdm</b>    | <p>Assigns a DCE interface for Processor/Trunk Data Modules. These screens assign Modular Processor Data Modules (MPDMs) and Modular Trunk Data Modules (MTDMs). One screen is required for assigning MPDMs (700D), 7400B, 7400D or 8400B Data Module, and another screen for MTDMs (700B, 700C, 700E, 7400A). One screen must be completed for each MPDM, 7400B, 7400D, 8400B or MTDM.</p> <p>The MPDM, 7400B, or 8400B Data Module provides a Data Communications Equipment (DCE) interface for connection to equipment such as data terminals, CDR output devices, on-premises administration terminal, Message Server, Property Management System (PMS), AUDIX, and host computers. It also provides a Digital Communications Protocol (DCP) interface to the digital switch. (DCE is the equipment on the network side of a communications link that provides all the functions required to make the binary serial data from the source or transmitter compatible with the communications channel.)</p> <p>The MTDM provides an Electronic Industries Association (EIA) Data Terminal Equipment (DTE) interface for connection to off-premises private line trunk facilities or a switched telecommunications network and a DCP interface for connection to the digital switch. (DTE is the equipment comprising the endpoints in a connection over a data circuit. For example, in a connection between a data terminal and a host computer, the terminal, the host, and their associated modems or data modules make up the DTE.) The MTDM or 7400A Data Module also can serve as part of a conversion resource for Combined Modem Pooling.</p> |
| <b>ppp</b>    | <p>Assigns a Point-to-Point Protocol data module. The PPP Data Module screen assigns a synchronous TCP/IP port on the C-Lan. These ports are tailored to provide TCP/IP connections for use over telephone lines. See <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> for more information on Point-to-Point data modules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>procr-intf</b>  | <p>Assigns a Processor Interface Data Module. The Processor Interface data modules are the Processor Data Modules (PDMs) that are integrated into the system's synchronous/asynchronous Processor Interface circuit pack ports.</p> <p style="text-align: center;"> <b>NOTE:</b><br/>The Processor Interface data module is applicable only to DEFINITY SI configurations.</p> <p>They are used to provide the following interfaces:</p> <ul style="list-style-type: none"> <li>■ 3B/Call Management System (maximum of 1)</li> <li>■ 3B/Message Server (maximum of 1)</li> <li>■ Distributed Communications System (maximum of 8)</li> <li>■ AUDIX (maximum of 1)</li> </ul> <p style="text-align: center;"> <b>NOTE:</b><br/>Not all maximums can be achieved at the same time</p> <p>Connections for these interfaces are achieved via a digital line port and MPDM combination, and/or in the case of DCS or ISDN-PRI, via a DS1 interface. One direct EIA connection is available (labeled as Processor Interface on the back of the Control Cabinet) for simplex operation. When used, the physical channel assignment (see below) must be "01". Use of the EIA connection eliminates the need for one digital line port/MPDM combination. See <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> for more information on Processor Interface data modules.</p> |
| <b>system-port</b> | Assigns a System Port Data Module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>tdm</b>         | Assigns a DTE interface for Processor/Trunk Data Modules. See the pdm entry above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>wcbri</b>       | Assigns a World Class BRI Data Module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|---------------------------------------|--------------|
| Extension of the destination or blank |              |

### **Node Name**

Appears when the Type field is **ppp**. Used with Point-to-Point data modules. See *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## **ABBREVIATED DIALING**

---

### **List1**

Used with 7500, Data Line, Netcon, Processor/Trunk, Processor Interface, and World Class BRI Data Modules. Supports Data Hot Line. This field can be left blank.

| <b>Valid entries</b> | <b>Usage</b>                                          |
|----------------------|-------------------------------------------------------|
| <b>e</b>             | Enhanced                                              |
| <b>g</b>             | Group. You also must enter a group list number.       |
| <b>p</b>             | Personal. You also must enter a personal list number. |
| <b>s</b>             | System.                                               |

## **SPECIAL DIALING OPTION**

---

Used with 7500, Data Line, Netcon, Processor/Trunk, Processor Interface, and World Class BRI Data Modules. Identifies the type of dialing for calls when this data module originates calls.

| <b>Valid entries</b> | <b>Usage</b>                           |
|----------------------|----------------------------------------|
| <b>hot-line</b>      |                                        |
| <b>default</b>       |                                        |
| blank                | For regular (normal) keyboard dialing. |

## **HOT LINE DESTINATION**

---

### **Abbreviated Dialing Dial Code**

Used with 7500, Data Line, Netcon, Processor/Trunk, Processor Interface, and World Class BRI Data Modules. Appears only when the Special Dialing Option field is **hot-line**. Entry in this field supports Data Hot Line.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                     |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>0-999</b>         | This number is associated with the AD List. When the user goes off-hook on a Data Hot Line call, the system dials the AD number. |

## DEFAULT DIALING

---

### Abbreviated Dialing Dial Code

Used with 7500, Data Line, Netcon, Processor/Trunk, Processor Interface, and World Class BRI Data Modules. Only appears when the Special Dialing Option field is **default**. When the user goes off-hook and enters a carriage return following the DIAL prompt, the system dials the AD number. The data call originator can also perform data-terminal dialing by specifying a dial string that may or may not contain alphanumeric names.

| <b>Valid entries</b> | <b>Usage</b>                                                      |
|----------------------|-------------------------------------------------------------------|
| <b>0-999</b>         | Enter a list number associated with the abbreviated dialing list. |

## CIRCUIT SWITCHED DATA ATTRIBUTES

---

Used with 7500 and World Class BRI Data Modules.

### NOTE:

These fields represent defaults needed for modem pooling conversion resource insertion when the endpoint does not support data query capability and administered connections. These fields have no significance for data modules providing data query [all Avaya -supported ISDN-BRI data modules (7500 and ADM)]. For Avaya ISDN-BRI or World Class ISDN-BRI data modules, use the default settings.

### Default Duplex

Used with 7500 and World Class BRI Data Modules. Used to identify the duplex mode.

| <b>Valid entries</b> | <b>Usage</b>                                      |
|----------------------|---------------------------------------------------|
| <b>full</b>          | Allows simultaneous two-way transmission.         |
| <b>half</b>          | Allows only one transmission direction at a time. |

### Default Mode

Used with 7500 and World Class BRI Data Modules. Used to identify the data mode.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| <b>sync</b>          | Synchronous  |
| <b>async</b>         | Asynchronous |

## Default Speed

Used with 7500 and World Class BRI Data Modules. Used to identify the data rate.

| <b>Valid entries</b> | <b>Usage</b>                                                |
|----------------------|-------------------------------------------------------------|
| <b>1200</b>          |                                                             |
| <b>2400</b>          |                                                             |
| <b>4800</b>          |                                                             |
| <b>19200</b>         |                                                             |
| <b>56000</b>         | Can be entered when the Default Mode field is <b>sync</b> . |
| <b>64000</b>         |                                                             |

## ASSIGNED MEMBER

---

### Ext and Name

Used with Data Line, Announcement, Netcon, Processor/Trunk, Processor Interface, and System Port Data Modules. Displays the extension number and name of the user (previously administered) with associated Data Extension buttons who shares the module.

## DATA MODULE CAPABILITIES

---

### Default Data Applications

Used with 7500 and World Class BRI Data Modules. Used to identify mode to be Used with originating data calls when the mode is not specified with the calling parameters. This mode is also used for terminating trunk calls that do not have bearer capability specified or administered connections. See [“Generalized route selection” on page 1687](#) for additional information.

| <b>Valid entries</b> | <b>Usage</b>                                                                      |
|----------------------|-----------------------------------------------------------------------------------|
| <b>M0</b>            | Mode 0. Use this setting for a WCBRI endpoint used as an administered connection. |
| <b>M1</b>            | Mode 1                                                                            |
| <b>M2_A</b>          | Mode 2 asynchronous                                                               |
| <b>M2_S</b>          | Mode 2 synchronous                                                                |
| <b>M3/2</b>          | Mode 3/2 adaptable                                                                |

**Default ITC**

Used with 7500 and World Class BRI Data Modules.

**Valid entries      Usage**

**restricted**      For a WCBRI endpoint used as an administered connection.  
**unrestricted**

**MM Complex Voice Ext:**

Used with 7500 and World Class BRI Data Modules. This display-only field contains the number of the associated phone in the multimedia complex. It only appears when the Multimedia field is **y**. This field is left blank until you enter the data module extension in MM Complex Data Ext field on the Station screen. Once you complete the field on the Station screen, these two extensions are associated as two parts of a one-number complex, which is the extension of the phone. Valid values conform to your dial plan.

**Field descriptions for page 2**

### Screen 87. Data Line Data Module — if KYBD Dialing is n

See “[DLC Option Settings](#)” on page 732 for additional information when assigning entries for the remaining fields on the screen.

## CAPABILITIES

---

### Busy Out

This option should be enabled for DTEs that are members of a hunt group and to allow “busy out” when DTE turns power off so that calls do not terminate on that DTE.

#### Valid entries

#### Usage

---

**y/n** Enter **y** to place the DLC port in a busied-out state once the DTE control lead to the DLC is dropped.

### Configuration

Appears when the KYBD Dialing field is **y**. This option normally is enabled for “originate/receive” DTE such as non-intelligent terminals and disabled for intelligent devices such as computers. The KYBD Dialing field must be **y** with this option.

#### Valid entries

#### Usage

---

**y/n** Enter **y** to allow the viewing and changing of options from the DTE.

### KYBD Dialing

This option must be enabled to allow data endpoints to originate calls via the EIA 232C interface and obtain ASCII feedback text. When enabled, the user gets the dial prompt. This option normally is enabled for “originate/receive” DTE that has

a need to set up data calls. If this option is disabled, originations cannot be done at the DTE and text feedback does not occur at the DTE during call setup/take down. Data call answering is still allowed but without text feedback.

**⇒ NOTE:**

ADU-type hunt groups connecting the system to terminal servers on a host computer should have these hunt group extensions assigned as “no” keyboard dialing.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                         |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow keyboard dialing. This enables the data endpoint to receive and transmit text during call origination or termination. Low must be <b>n</b> . |

**SPEEDS**

Enter **y** to select operating speeds as follows:

| <b>Valid entries</b>                         | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Low</b>                                   | Enter <b>y</b> to instruct the DLC to operate at a low speed from 0 to 1800 bits per second (bps). Enter <b>n</b> if the KYBD Dialing field is <b>y</b> .                                                                                                                                                                                                                                                                                                                                                            |
| <b>300, 1200, 2400, 4800, 9600, or 19200</b> | <p>Enter <b>y</b> beside the desired operating speed. Enter <b>n</b> if the speed is not desired. The DLC can be any one of these speeds. The speed is matched for the duration of the call, from call setup to call takedown.</p> <p>When multiple speeds are selected (select three or more, do not select just two speeds) and autoadjust is disabled, the DTE’s speed must be the highest selected speed. This is required because all feedback text is delivered to the DTE at the highest selected speed.</p>  |
| <b>Autoadjust</b>                            | Appears when the KYBD Dialing field is <b>y</b> . Enter <b>y</b> which tells the DLC port to automatically adjust to the operating speed and parity of the DTE it is connected to. Enter <b>n</b> if this option is not desired. Autoadjust can be selected with any of the speeds selected in the previous step. Autoadjust allows the DLC port to determine the speed and parity of the DTE and then match itself to this speed. Autoadjust only applies to calls originated by the user through Keyboard Dialing. |

## Answer Text

Appears when the KYBD Dialing field is **y**. This option enables text feedback that is normally delivered to the DTE when a call is answered or disconnected. The Answer Text option applies to DLC-generated text as well as text received from the system. If this option is disabled, the system still generates the text, but the DLC prevents it from being sent to the device.

This applies to the following messages:

- INCOMING CALL
- ANSWERED
- DISCONNECTED
- DISCONNECTED OTHER END

This option usually is disabled when the answering DTE is a computer or an intelligent device.

## OPTIONS

---

### Answer Text

Appears when the KYBD Dialing field is **y**. This option enables text feedback that is normally delivered to the DTE when a call is answered or disconnected. The Answer Text option applies to DLC-generated text as well as text received from the system. If this option is disabled, the system still generates the text, but the DLC prevents it from being sent to the device.

This applies to the following messages:

- INCOMING CALL
- ANSWERED
- DISCONNECTED
- DISCONNECTED OTHER END

This option usually is disabled when the answering DTE is a computer or an intelligent device.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to allow text messages to be delivered to the DTE when a call is being answered. |
|------------|-------------------------------------------------------------------------------------------------|

### Connected Indication

Appears when the KYBD Dialing field is **y**. This option generates a “CONNECTED” message to the DTE when the connection has been established. If the KYBD Dialing field is **n**, the connected indication is provided by the DLC activating its EIA 232C control lead.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                       |
|------------|---------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to select this option. |
|------------|---------------------------------------|

### Dial Echoing

Appears when the KYBD Dialing field is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to echo characters back to the DTE. Dial echoing should be disabled when keyboard dialing is done by an intelligent device. |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|

## Disconnect Sequence

Appears when the KYBD Dialing field is **y**. Selects the sequence for a disconnect.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                   |                                         |
|-------------------|-----------------------------------------|
| <b>long-break</b> | A long-break is greater than 2 seconds. |
| <b>two-breaks</b> | Two-breaks is within 1 second.          |

## Parity

Appears when the KYBD Dialing field is **y**. Select the desired type of parity. The DLC generates the parities when call setup text is sent to the DTE. The DLC does not check the parity when receiving dialing characters. Parity has nothing to do with the far end; it is used by the DLC to terminal communications during call setup. Set to match the connected DTE.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|              |  |
|--------------|--|
| <b>even</b>  |  |
| <b>odd</b>   |  |
| <b>mark</b>  |  |
| <b>space</b> |  |

## Permit Mismatch

This option allows the EIA interface to operate at a rate different than that agreed to in the data module handshake. (The data module handshake is always the highest compatible rate as determined by the reported speed option of each data module.) Permit Mismatch eliminates the need to change the DTE/DLC speed every time a call is placed to/from an endpoint operating at a different speed. When this option is enabled, the DLC reports the highest optioned speed and all the lower speeds (or the previously selected autoadjust speed) during the handshake process.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|            |                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to instruct the DLC to operate at the highest selected speed, which is a higher rate than the far-end data module. |
|------------|-----------------------------------------------------------------------------------------------------------------------------------|

 **CAUTION:**

*Caution must be used when using this option to send information from a DTE/DCE that is transmitting data at higher rates than that of the far end. Sustained usage of this type transmission results in loss of data. Whenever this option is enabled, the DTE must match the highest speed selected for the associated DLC port.*

This option is intended to be used by a DTE device operating locally at a higher baud rate than that of its far-end connection but transmitting relatively low amounts of data (for example, a user typing at a terminal). Also, this option may be selected whether Keyboard Dialing is selected.

 **NOTE:**

The Low speed setting is not reported as an available speed when the Permit Mismatch field is **y**.

## DLC Option Settings

The following provides additional information on the option settings for DLCs when used with the following types of devices:

- Printers
- Non-intelligent terminals
- Data terminals and personal computers
- Host computers
- Information Systems Network (ISN)

### Printers

A DLC port with a companion ADU, when attached to a printer, usually terminates a data call. Therefore, in this connection, the printer is the endpoint device. The originating device may be attached to a DCP mode 2 data module (such as the MPDM) or the DLC. A Z3A ADU extends the range of the EIA 232C connection.

When a receive-only printer (or any printer that does not generate the Transmit Data and DTR leads) is used, the ADU must be powered from a small plug-mounted transformer (2012D, or equivalent) connected to pins 7 and 8 of the modular jack. (See *ADU User Manual* for details.)

An ADU cannot be used if the printer has hardware flow control using the Clear To Send (CTS) lead. An ADU can be used, however, if the printer is using software flow control.

A printer connected to a DLC is usually assigned as a line. [Table 10](#) lists the option settings for printer connections.

**Table 10. DLDM screen settings for printer connection**

| Field on screen      | Option                                      | Comments                                             |
|----------------------|---------------------------------------------|------------------------------------------------------|
| Speed                | Highest speed at which the Printer operates | Subject to distance limitations; Autoadjust not used |
| KYBD Dialing         | no                                          |                                                      |
| Busy Out             | yes                                         | If printer is member of Hunt Group                   |
| Permit Mismatch      | yes                                         | No, if printer is low speed                          |
| Parity               | -                                           | Don't care                                           |
| Dial Echoing         | -                                           | Don't care                                           |
| Disconnect Sequence  | -                                           | Don't care                                           |
| Answer Text          | -                                           | Don't care                                           |
| Connected Indication | -                                           | Don't care                                           |
| Configuration        | no                                          |                                                      |

### Non-intelligent terminals

A non-intelligent terminal connected to the DLC usually is assigned as a line. [Table 11](#) lists the option settings for non-intelligent terminals.

**Table 11. DLDM screen settings for connection to non-intelligent terminals**

| Field On screen | Option                                                   | Comments                                                                                                                            |
|-----------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Speed           | All speeds at which the terminal can operate; autoadjust | Subject to distance limitations; Autoadjust when the KYBD Dialing field is <b>y</b> and the Terminal can generate an ASCII "return" |
| KYBD Dialing    | yes                                                      |                                                                                                                                     |
| Busy Out        | no                                                       | Yes, if terminal is member of a hunt group                                                                                          |
| Permit Mismatch | yes                                                      | -                                                                                                                                   |

*Continued on next page*

**Table 11. DLDM screen settings for connection to non-intelligent terminals (Continued)**

| Field On screen      | Option      | Comments                                   |
|----------------------|-------------|--------------------------------------------|
| Parity               | Same as DTE |                                            |
| Dial Echoing         | yes         | Only if the KYBD Dialing field is <b>y</b> |
| Disconnect Sequence  | 2           | Depends on terminal                        |
| Answer Text          | yes         |                                            |
| Connected Indication | -           | Don't care                                 |
| Configuration        | yes         |                                            |

### Data terminals and personal computers

An intelligent data terminal or a personal computer (PC) attached to a DLC can either originate or terminate a data call. A single ADU at the site of the originating device extends the distance signals can travel to the switch (the model ADU depends on the terminal connector). An analog telephone can be attached to this arrangement whenever an ADU uses the standard building wiring. [Table 12](#) lists the option settings used for data terminal and personal computer connections.

**Table 12. DLDM screen settings for connection to data terminal or personal computer**

| Field on screen | Option                                                  | Comments                                             |
|-----------------|---------------------------------------------------------|------------------------------------------------------|
| Speed           | All speeds at which the Data Terminal or PC can operate | Subject to distance limitations; Autoadjust not used |
| KYBD Dialing    | yes                                                     |                                                      |
| Busy Out        | no                                                      | Yes, if device is accessed through a hunt group      |
| Permit Mismatch | yes                                                     | No, if device does not support XON/XOFF flow control |

*Continued on next page*

**Table 12. DLDM screen settings for connection to data terminal or personal computer (Continued)**

| Field on screen      | Option       | Comments                                                              |
|----------------------|--------------|-----------------------------------------------------------------------|
| Parity               | Same as DTE  |                                                                       |
| Dial Echoing         | no           | These devices can dial in the ASCII stream without human intervention |
| Disconnect Sequence  | Long <BREAK> | -                                                                     |
| Answer Text          | no           | These devices may not want to see any text                            |
| Connected Indication | -            | Don't care                                                            |
| Configuration        | yes          |                                                                       |

### Host computers

A host computer may originate and terminate a data call. For this application, the number of DLCs required depends on the number of ports needed. An MADU can be used (instead of 8 ADUs) to complete the connection. [Table 13 on page 736](#) lists option settings for a port that has a terminating connection to a host computer or an originating connection from a host computer.

#### NOTE:

If the KYBD Dialing field is **n**, the rest of the option settings are irrelevant.

**Table 13. DLDM screen settings for terminating connection to host computer**

| Field on screen      | Option                                       | Comments                                             |
|----------------------|----------------------------------------------|------------------------------------------------------|
| Speed                | All speeds at which the computer can operate | Subject to distance limitations; Autoadjust not used |
| KYBD Dialing         | no                                           |                                                      |
| Busy Out             | -                                            | Don't care                                           |
| Permit Mismatch      | -                                            | Don't care                                           |
| Parity               | -                                            | Don't care                                           |
| Dial Echoing         | -                                            | Don't care                                           |
| Disconnect Sequence  | -                                            | Don't care                                           |
| Answer Text          | -                                            | Don't care                                           |
| Connected Indication | -                                            | Don't care                                           |
| Configuration        | -                                            | Don't care                                           |

This version of page 2 does not appear for S8700 IP-Connect.

 Restart (T20) Timer (seconds): 8
 Reset (T22) Timer (seconds): 10

```

**Screen 88. X.25 Adjunct Data Module**

## **LAYER 2 PARAMETERS**

---

### **Frame Size (N1)**

Specifies the number of bytes in a frame.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>135</b> | If the value is <b>135</b> , there can be up to 1080 bits within a frame. This value is suitable for all adjuncts and for DCS. |
| <b>263</b> |                                                                                                                                |

### **Idle (T4) Timer (1/10 seconds)**

The T4 timer is a system parameter that represents the time a DTE allows without frames being exchanged on the data link.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

**0** through **250**

### **Number of Outstanding Frames (w)**

Specifies layer 2 window size.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                           |                                                                          |
|---------------------------|--------------------------------------------------------------------------|
| <b>1</b> through <b>7</b> | If you enter <b>2</b> , up to 2 frames can be sent without confirmation. |
|---------------------------|--------------------------------------------------------------------------|

### **Retransmission (T1) Timer (1/10 seconds)**

The T1 timer is started at the beginning or the end of the transmission of a frame. At the end of this timer, retransmission of a frame is initiated according to the procedures for link set-up and disconnection or information transfer.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

**0** through **250**

### **Retry Attempt Counter (N2)**

Specifies the number of times to send one frame when this frame is not confirmed for a period of time.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

**0** through **7**

## LAYER 3 PARAMETERS

---

### Number of Outstanding Packets

Specifies the number of packets that can be sent without confirmation.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|             |  |
|-------------|--|
| 2 through 7 |  |
|-------------|--|

### Reset (T22) Timer (seconds)

The T22 timer is a DTE time-limit started when DTE issues a reset indication and terminated when the reset request is received or confirmed.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|               |  |
|---------------|--|
| 0 through 500 |  |
|---------------|--|

### Restart (T20) Timer (seconds)

The T20 timer is a DTE time-limit started when DTE issues a restart indication and terminated when the restart request is received or confirmed.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|               |  |
|---------------|--|
| 0 through 500 |  |
|---------------|--|

 MIM Support? y Endpt Init? y SPID: 300____ MIM Mtce/Mgt? y

```

### Screen 89. 7500 and World Class BRI Data Module

## **BRI LINK/MAINTENANCE PARAMETERS**

### **Country Protocol**

Used with World Class BRI Data Modules. Enter the protocol that corresponds to your supported initialization and codesets. The Country Protocol must match any previously-administered endpoint on the same port. The following table lists the valid protocol entries.

| <b>Country/Area</b>                    | <b>Protocol</b> |
|----------------------------------------|-----------------|
| Australia                              | 2               |
| ETSI (Europe)                          | etsi            |
| Japan                                  | 3               |
| Singapore                              | 6               |
| United States (Bellcore National ISDN) | 1               |

### **Endpt ID**

Used with World Class BRI Data Modules. Appears only if the Endpt Init field is **y**. This field provides for multipoint configuration conformance to the Bellcore Terminal Initialization procedures. In these procedures, a multipoint configuration requires that the last 2 digits of the Service Profile Identifier (SPID) be between **00** and **63** and be binary unique for each endpoint. This field, combined with the SPID, gives the effective SPID administered into the terminal. Bellcore ISDN-1 requires that the SPID programmed into the endpoint contain at least 9 digits. (For example, if the SPID field is **1234**, and the Endpt ID field is set to **01**, then the SPID administered on the terminal is 000123401. The three leading zeros are necessary to create a 9-digit SPID.)

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                             |                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------|
| <b>00</b> through <b>62</b> | Enter a 2-digit number. Each Endpt ID field must have a unique value for each endpoint on the same port. |
|-----------------------------|----------------------------------------------------------------------------------------------------------|

### **Endpt Init**

Used with 7500 and World Class BRI Data Modules. Endpoint initialization is a procedure, required for multipoint operation, by which User Service Order Profile (USOP) is associated with an endpoint on the ISDN-BRI. This association is made via the Service Profile Identifier (SPID), administered into the system and entered into the ISDN-BRI terminal. For a ISDN-BRI terminal to become operational in a multipoint configuration, both the administered SPID and the

SPID programmed into the ISDN-BRI terminal must be the same. This means that the SPID of the new or re-used terminals must be programmed to match the administered SPID value.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                              |
|------------|--------------------------------------------------------------|
| <b>y/n</b> | Indicates the terminal's endpoint initialization capability. |
|------------|--------------------------------------------------------------|

### **Fixed TEI**

Used with 7500 and World Class BRI Data Modules. Used to indicate whether the endpoint has Fixed Terminal Equipment Identifier (TEI) capability. TEI identifies a unique access point within a service. For Fixed TEI stations, the TEI must be administered. Terminals with automatic TEI capability, the associated TEI is assigned by the system.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to indicate the endpoint has Fixed Terminal Equipment Identifier (TEI) capability. |
|------------|---------------------------------------------------------------------------------------------------|

### **MIM Mtce/Mgt**

Used with 7500 Data Modules.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Entering <b>y</b> indicates the terminal supports MIM Maintenance and Management capabilities, other than endpoint initialization. |
|------------|------------------------------------------------------------------------------------------------------------------------------------|

### **MIM Support**

Used with 7500 Data Modules. Management Information Message Support. Used to support two types of capabilities: MIM endpoint initialization capability (SPID support), and other Maintenance/Management capability.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |  |
|------------|--|
| <b>y/n</b> |  |
|------------|--|

## SPID

Used with 7500 and World Class BRI Data Modules. Appears only if the Endpt Init field is **y**. The Service Profile Identifier (SPID) is a variable parameter of up to 10 digits. The SPID must be different for all terminals on the ISDN-BRI and from the Service SPID. The SPID should always be assigned. If the SPID is not assigned for the first ISDN-BRI on a port, any other ISDN-BRI assignment to that port is blocked.

| <b>y/n</b> | Avaya recommends setting to <b>n</b> . |
|------------|----------------------------------------|

## Date and Time

---

Use this screen to set the system date and time, to select the daylight savings plan number, if any, and to show whether the current time is standard time or daylight savings. Settings on this screen affect your switch's internal clock and timestamp. You should update the date and time for a leap year or a system restart after a power failure. The correct date and time assure that CDR records are correct. CDR does not work until the date and time have been entered.

For additional information, see the *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*.

and MEASUREMENTS

### Screen 90. Date and Time

#### Day of the Month

| Valid entries | Usage                                                                               |
|---------------|-------------------------------------------------------------------------------------|
| 1 to 31       | Enter the current day of the month. The system clock uses this as the current date. |

#### Day of the Week

| Valid entries           | Usage                                                                             |
|-------------------------|-----------------------------------------------------------------------------------|
| Sunday through Saturday | Enter the current day of the week. The system clock uses this as the current day. |

#### Daylight Savings Rule

This field displays which daylight savings rule is in use for your system.

| Valid entries | Usage                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 to 15       | Enter the appropriate rule number. The system clock uses this as the current daylight savings rule. These rules are defined on the Daylight Savings Rules screen. |

#### Hour

The system uses a 24-hour clock. For example, 14:00 is the same as 2:00 p.m.

| Valid entries | Usage                                                  |
|---------------|--------------------------------------------------------|
| 0 to 23       | Enter the current hour to be used by the system clock. |

## Minute

| <b>Valid entries</b> | <b>Usage</b>                                                                |
|----------------------|-----------------------------------------------------------------------------|
| <b>0 to 59</b>       | Enter the current minute. The system clock uses this as the current minute. |

## Month

| <b>Valid entries</b>            | <b>Usage</b>                                                              |
|---------------------------------|---------------------------------------------------------------------------|
| <b>January through December</b> | Enter the current month. The system clock uses this as the current month. |

## Second

This display-only field shows the seconds and cannot be modified. It resets to zero when you save the information on this screen.

## Type

| <b>Valid entries</b>    | <b>Usage</b>                                                                  |
|-------------------------|-------------------------------------------------------------------------------|
| <b>daylight-savings</b> | Enter <b>daylight-savings</b> to indicate daylight savings time is in effect. |
| <b>standard</b>         | Enter <b>standard</b> to indicate standard time is in effect.                 |

## Year

| <b>Valid entries</b> | <b>Usage</b>                                                            |
|----------------------|-------------------------------------------------------------------------|
| <b>1990 to 2099</b>  | Enter the current year. The system clock uses this as the current year. |

## Related topics

---

To update the date and time for the change to or from daylight savings time, use the Daylight Saving Rule screen. See [“Establishing daylight savings rules” on page 41](#) for instructions on how to set up daylight savings rules.

## Daylight Savings Rules

Use this screen to enter up to 15 customized daylight savings rules. You can specify the day, month, date, time, and increment each daylight savings rule goes into effect and the day, month, date, and time it stops. Rule 0 makes no adjustment to the system clock for daylight savings and cannot be modified. Telephone displays are affected by these settings.

|---------------------------------|-----------------------------------------------------------------------------|
| <b>January through December</b> | Enter the month you want the clock to move ahead to begin daylight savings. |

**Month (Stop)**

| <b>Valid entries</b>            | <b>Usage</b>                                                                |
|---------------------------------|-----------------------------------------------------------------------------|
| <b>January through December</b> | Enter the month you want the clock to move back to return to standard time. |

**Rule**

This display-only field indicates the daylight savings rule number.

**Time (Start)**

The system uses a 24-hour clock. For example, 14:00 is the same as 2:00 p.m.

| <b>Valid entries</b> | <b>Usage</b>                                                                 |
|----------------------|------------------------------------------------------------------------------|
| <b>0 to 23</b>       | Enter the hour you want the clock to move ahead to begin daylight savings.   |
| <b>0 to 59</b>       | Enter the minute you want the clock to move ahead to begin daylight savings. |

**Time (Stop)**

The system uses a 24-hour clock. For example, 14:00 is the same as 2:00 p.m.

| <b>Valid entries</b> | <b>Usage</b>                                                                 |
|----------------------|------------------------------------------------------------------------------|
| <b>0 to 23</b>       | Enter the hour you want the clock to move back to return to standard time.   |
| <b>0 to 59</b>       | Enter the minute you want the clock to move back to return to standard time. |

**DCS to QSIG TSC Gateway screen**

---

Use the DCS to QSIG TSC Gateway screen to determine when and how to convert messages from an administered AUDIX NCA-TSC to a QSIG NCA-TSC. This screen maps the AUDIX NCA-TSC to the appropriate machine ID index to find the QSIG subscriber entry in the QSIG MWI-Prefix screen. It also assigns the voice mail number to be used when a DCS served-user node interrogates a QSIG message center.

This screen only appears if the Interworking with DCS field is enabled on the System-Parameters Customer-Options screen.

**Screen 92. DCS to QSIG TSC Gateway screen**

**AAR/ARS Access Code**

This field can be left blank.

| <b>Valid entries</b>            | <b>Usage</b>                     |
|---------------------------------|----------------------------------|
| <b>0</b> through <b>9, *, #</b> | Enter up to 4-digit access code. |

**Mach ID**

You can enter up to 20 machine IDs.

| <b>Valid entries</b>       | <b>Usage</b>                                                                                                                        |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> through <b>20</b> | Enter a unique machine ID. The system does not allow you to specify an ID that you already entered on the Processor Channel screen. |

**Sig Grp**

You must complete the Signaling Group field for each machine ID.

| <b>Valid entries</b>        | <b>Usage</b>                                                                                                               |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> through <b>110</b> | Enter the assigned signaling group number between 1 and 110 for DEFINITY SI and CSI.                                       |
| <b>1</b> through <b>416</b> | Enter the assigned signaling group number between 1 and 416 for DEFINITY R                                                 |
| <b>1</b> through <b>650</b> | Enter the assigned signaling group number between 1 and 650 for S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect. |

## TSC Index

You must complete the TSC Index field for each machine ID.

| Valid entries | Usage                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------|
| 1 through 64  | Enter the assigned signaling group number for <b>qsig-mwi</b> application type on the Signaling Group screen. |

## Voice Mail Number

This field can be left blank.

| Valid entries | Usage                                                         |
|---------------|---------------------------------------------------------------|
| 0 through 9   | Enter the complete Voice Mail Dial Up number up to 15 digits. |

## Dial Plan Analysis Table

The Dial Plan Analysis Table is the system's guide to translating the digits dialed by users. This screen enables you to determine the beginning digits and total length for each type of call that your switch needs to interpret. The Dial Plan Analysis Table and the Dial Plan Parameters screen work together to define your system's dial plan.

| Dial Plan Analysis Table |              |           | Dial Plan Analysis Table |              |           | Page            | 1 of | 3 |

### Screen 93. Dial Plan Analysis Table

## Call Type

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>attd</b>          | Attendant — Defines how users call an attendant. Attendant access numbers can start with any number from 0 – 9 and contain 1 or 2 digits. If a telephone’s COR restricts the user from originating calls, this user cannot access the attendant using this code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>dac</b>           | <p>Dial access code — Allows you to use trunk access codes (TAC) and feature access codes (FAC) in the same range. Dial access codes can start with any number from 0–9, * or # and can contain up to 4 digits.</p> <p>If an extension entry and a DAC entry have the same Dialed String, the extension entry can be as long as or longer than the DAC entry only if all of the trunk groups covered by that DAC entry have Dial Access on the Trunk Group screen set to “no.”</p> <p>You can use the DAC to activate or deactivate a switch feature or to seize a trunk from a trunk group, or both. In the first case, the DAC functions as a FAC, in the second as a TAC. For example, you can define the group 300–399 for dial access codes, and allow both FAC and TAC in that range.</p> <p>You can use 4-digit DACs for ordinary trunk access, but they do not work for attendant control of trunk groups, trunk-ID buttons, or DCS, and only the last 3 digits of the codes can be recorded in CDR records.</p> |
| <b>ext</b>           | Primary extension — Defines extension ranges that can be used on your system. Extension can have a first digit of 0 through 9 and can be 1 – 7 digits in length. Extension cannot have the same first digit as the ARS or AAR feature access code (FAC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>fac</b>    | <p data-bbox="422 251 1181 347">Feature access code only — A FAC can be any number from 1–9 and contain up to 4 digits. You can use * or #, but only as a first digit.</p> <p data-bbox="422 372 1181 537">Avaya recommends that a FAC have the longest total length for a given dialed string when using mixed numbering. Otherwise, problems may occur when, for example, 3-digit FACs and 4-digit extensions begin with the same first digit and the FAC is an abbreviated dialing list access code.</p> <p data-bbox="422 562 1181 656">However, if the entry in the dial plan that defines the FAC is used to define the AAR or ARS access code, then it <i>must</i> have the longest total length in the dial plan.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>pext</b>   | <p data-bbox="422 681 1181 846">Prefixed extension — Is made up of a prefix (first digit) that can be a <b>0–9</b> (* and # not allowed) and an extension number of up to 5 digits in length. The maximum length of a prefix and extension combination is 6 digits. You cannot administer a dial access code with the same first digit as a prefixed extension.</p> <p data-bbox="422 871 1181 1132">The purpose of the prefix is to identify the call type as an extension. After digit collection, the prefix digit is removed from the string of dialed digits. The remaining digits (extension number) are then processed. A prefixed extension allows the use of extensions numbers with any dialed string (the extension length must be specified on the table). The “prefixed extension” cannot have the same dialed string as the ARS or AAR facility access code (FAC).</p> <p data-bbox="422 1159 1181 1427">When a dial plan has mixed station numbering, extensions of various lengths (all with the same first digit) are mapped on the Dial Plan Analysis table. The system then employs an inter-digit time-out to ensure that all dialed digits are collected. The inter-digit time-out may add several seconds to the dial time. An alternative to the delay required in the time-out mechanism at the expense of dialing an extra digit is to use prefixed extensions in the dial plan.</p> |

### Dialed String

The dialed string contains the digits that the switch will analyze to determine how to process the call.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                     |                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------|
| <b>0–9, * and #</b> | Enter up to 2 characters for each call type. * and # can only be the first digit in a string. |
|---------------------|-----------------------------------------------------------------------------------------------|

**NOTE:**

For call type attd, if the total length is 2, the Dialed String must be 2 digits long.

### Percent Full

Displays the percentage (0 to 100) of the system's memory resources that have been allocated for the dial plan that are currently being used.

### Total Length

| <b>2–6 for pext</b> |                                                                                                                                                                         |

## Dial Plan Parameters

---

The Dial Plan Parameters screen works with the Dial Plan Analysis Table to define your system's dial plan.

It also controls the appearance of 6- and 7-digit extensions on station displays and administration forms. 6- and 7-digit extensions may be hard to read as a block. MultiVantage allows you to select a single system-wide format for all 6-digit extensions and a format for all 7-digit extensions.

You are allowed, but not required, to use punctuation marks when entering an extension number on any form in the system. The punctuation marks need not match the format given in the system parameter. When the form redispays, the format prescribed in the system parameter is used.

You can enter the period (.) or hyphen (-) punctuation in an extension on a command line, but you cannot use a space within an extension number in a command line, even if that is part of your specified display format.

**Screen 94. Dial Plan Parameters screen**

**6-Digit Extension Display Format (Phase 3)**

Determines how the system punctuates 6-digit extensions.

| Valid entries   | Usage                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>xx.xx.xx</b> | This field can contain all 'x' characters (no punctuation) or you can use a combination of 6 'x' characters and 0-2 hyphens (-), spaces, or periods (.) to depict how 6-digit extensions will display. There must be 6 'x' characters and no more than 2 punctuation marks. You must specify a format or accept the default. You cannot leave this field blank. |

**7-Digit Extension Display Format (Phase 3)**

Determines how the system punctuates 7-digit extensions.

| Valid entries   | Usage                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>xxx-xxxx</b> | This field can contain all 'x' characters (no punctuation) or you can use a combination of 7 'x' characters and 0-1 hyphen (-), space, or period (.) to depict how 7-digit extensions will display. There must be 7 'x' characters and no more than 2 punctuation marks. You must specify a format or accept the default. You cannot leave this field blank. |

**AAR/ARS Internal Call Prefix**

Appears if, on the System-Parameters Customer-Options screen, the ARS/AAR Dialing Without FAC field is **y**.

**Valid entries      Usage**

---

|             |                                                                                  |
|-------------|----------------------------------------------------------------------------------|
| <b>1–63</b> | Enter the number of a specific node in a network.                                |
| blank       | The field may be left blank if automatic restoration, DCS, and CDR are not used. |

**AAR/ARS Internal Call Total Length**

Appears if, on the System-Parameters Customer-Options screen, the ARS/AAR Dialing Without FAC field is **y**.

**Valid entries      Usage**

---

|             |                                                                                  |
|-------------|----------------------------------------------------------------------------------|
| <b>1–63</b> | Enter the number of a specific node in a network.                                |
| blank       | The field may be left blank if automatic restoration, DCS, and CDR are not used. |

**ETA Node Number**

Enter the number of the destination switch for Extended Trunk Access (ETA) calls. ETA calls are unrecognized numbers you can send to another switch for analysis and routing. Such numbers can be Facility Access Codes, Trunk Access Codes, or extensions that are not in the UDP table.

**Valid entries      Usage**

---

|                            |                                           |
|----------------------------|-------------------------------------------|
| <b>1 – 999</b> or<br>blank | Enter the number of a destination switch. |
|----------------------------|-------------------------------------------|

**ETA Routing Pattern**

Enter the number of the routing pattern to reach the destination switch.

**Valid entries      Usage**

---

|                            |                                                            |
|----------------------------|------------------------------------------------------------|
| <b>1 – 640</b> or<br>blank | DEFINITY R, CSI, SI.                                       |
| <b>1–999</b> or<br>blank   | S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect. |

## Local Node Number

Enter a number to identify a specific node in a switch network. This entry must match the DCS switch node number and the CDR node number if they are specified.

| Valid entries | Usage                                                                            |
|---------------|----------------------------------------------------------------------------------|
| 1–63          | Enter the number of a specific node in a network.                                |
| blank         | The field may be left blank if automatic restoration, DCS, and CDR are not used. |

## UDP Extension Search Order

Appears if, on the System-Parameters Customer-Options screen, the Uniform Dialing Plan field is **y**. Specifies the first table to search to match a dialed extension. If the dialed extension is not found in the specified place, it then is searched for in the “other” place.

| Valid entries                 | Usage                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>local-extensions-first</b> | Searches the local Dial Plan first to match a dialed extension; if not found, then uses the UDP tables to route the call.    |
| <b>udp-table-first</b>        | Searches the UDP tables for an off-switch conversion; if not found, then searches the local server for the dialed extension. |

## Digit Absorption

This screen implements up to 5 digit absorption lists. The screen may be required for each CO and FX trunk group connected to a step-by-step CO. Each outgoing digit string from the switch to the step-by-step CO is treated according to entries in the “Absorption Treatment Assignment” section of the screen.

### NOTE:

If the Digits field on the Trunk Group screen is blank, you cannot administer Digit Absorption.

**Field descriptions for page 1**

change digit absorption Page 1 of 1

DIGIT ABSORPTION

List Number:     

ABSORPTION TREATMENT INFORMATION (All selections must be from same group)

|           | Choice | Meaning                                                                                 |
|-----------|--------|-----------------------------------------------------------------------------------------|
| Group I.  | A      | Digit not absorbed.                                                                     |
|           | B      | Digit absorbed repeatedly.                                                              |
|           | C      | Digit absorbed once with no further absorption.                                         |
| Group II. | A      | Digit not absorbed.                                                                     |
|           | D      | Digit absorbed only if it is the first digit.                                           |
|           | E      | Digit absorbed only if it is the second digit and the first digit was already absorbed. |
|           | F      | Digit asorbed only if it is the first or second digit.                                  |

ABSORPTION TREATMENT ASSIGNMENT (select treatment (A-F) for each digit below)

|      |      |      |      |      |
|------|------|------|------|------|
| 0: A | 2: A | 4: A | 6: A | 8: A |
| 1: A | 3: A | 5: A | 7: A | 9: A |

**Screen 95. Digit Absorption**

**Absorption Treatment Assignment**

Enter a desired treatment letter. All choices for the digits 0 through 9 must be taken from the same group (Group I or Group II).

**Valid entries      Usage**

**A through F**

**Absorption Treatment Information**

This is a display-only section. It shows how Digit Absorption treats each digit, 0 through 9, depending on the assignment of A through C for Group I, and A, D, E, and F for Group II. Enter the assignment on the next section on the screen.

**List Number**

A display-only field indicating the Digit Absorption List number (**0** through **4**). The list number is referenced from a field entry on the associated trunk group.

## DLG Administration

This screen appears if, on the Station screen, the Service Type field is **DLG**. This screen includes all clients that are allowed to connect to the virtual DEFINITY LAN Gateway (DLG).

### Field descriptions for page 1

The following screen appears if the Service Type field is **DLG** and is administered. This screen includes all clients that are allowed to connect to the co-resident DEFINITY LAN Gateway (DLG). This page is always the last page on the IP Services screen.

| DLG Administration |         |             |             | Page X of Y   |
|--------------------|---------|-------------|-------------|---------------|
| CTI_-Link          | Enabled | Client Name | Client Link | Client Status |
| 1                  | y       | client1     | 1           | in use        |
| 3                  | y       | client2     | 1           | idle          |
| 4                  | y       | client1     | 2           | idle          |

### Screen 96. DLG Administration

#### Client Link

The client name on the CTI switch side identifies the logical connection on the client side (IP address and host name) for multiple links and for the corresponding client (CTI link number/client name) that are connected to you.

| Valid entries | Usage                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------|
| 1-X or blank  | Enter the number between 1 and the number of CTI links allowed on the system (for instance, 8 or 16). |

#### Client Name

Enter the node name of the client adjunct requesting service for the specified CTI link.

#### Client Status

A display-only field indicating **idle** (currently there is no active connection) or **in use** (currently there is an active connection for this client link).

#### CTI Link

A display-only field indicating the link number.

**Enabled**

Controls whether the co-resident DLG will allow connections for the corresponding client.

| Valid entries | Usage                                                          |
|---------------|----------------------------------------------------------------|
| y             | Enter y to access DLG.                                         |
| n             | Will refuse connections for that Client Name/Client Link pair. |

**DS1 Circuit Pack**

Use this screen to administer all DS1 circuit packs.

**Screen 100. DS1 Circuit Pack screen for Channel Associated Signaling**

**Bit Rate**

Use this field to select the maximum transmission rate for DS1 circuit packs that support either T-1 or E-1 service. For circuit packs that only support one of these services, the field is a display-only field.

**⇒ NOTE:**

Once an **add ds1** operation is complete (that is, the DS1 screen has been submitted) you can't change the Bit Rate field with a **change ds1** command. Instead, execute a **remove ds1** command. Then use the **add ds1** command to administer the circuit pack again. You'll have to re-enter all the information for the circuit pack.

TN464C (and later release) circuit packs have an option switch that must be set to match the entry in the Bit Rate field.

| <b>Valid entries</b> | <b>Usage</b>         |
|----------------------|----------------------|
| <b>1.544</b>         | Use for T-1 service. |
| <b>2.048</b>         | Use for E-1 service. |

## Channel Numbering

The ETSI and ISO QSIG specifications require that B-channels on an E1 be encoded as 1-30 in the Channel ID IE. Prior to this field, Avaya MultiVantage only used this scheme for Country Protocols 2a (Australia) and 13a (Germany ITR6). This field appears when the Signaling Mode field is **isdn-pri**, the Bit Rate field is **2.048**, the Connect field is **pbx**, and the Interface field is **peer-master** or **peer-slave**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                 |  |
|-----------------|--|
| <b>timeslot</b> |  |
|-----------------|--|

|                   |                                                                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sequential</b> | If the Avaya MultiVantage is connected via QSIG trunks to a switch supporting the ETSI QSIG or ISO QSIG specifications, this field must be <b>sequential</b> . |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

When the Signaling Mode field is **isdn-pri** and the Bit Rate field is **2.048**, but the Channel Numbering field does not display because of the setting of other fields, it is set internally to **sequential** for 2a (Australia) and 13a (Germany).

## Connect

In order to control communications at layers 2 and 3 of the ISDN-PRI protocol, use this field to specify what is on the far end of this DS1 link. This field only appears when the Signaling Mode field is **isdn-pri**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|            |                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pbx</b> | Enter <b>pbx</b> if this DS1 link is connected to another switch in a private network. If <b>pbx</b> is entered, the Interface field appears. |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------|

|                  |                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>line-side</b> | Enter <b>line-side</b> when the switch is acting as the network side of an ISDN-PRI interface. Use <b>line-side</b> to connect to Roll About Video equipment. |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------|
| <b>network</b> | Enter <b>network</b> when the DS1 link connects this switch to a central office or any other public network switch. |
|----------------|---------------------------------------------------------------------------------------------------------------------|

|             |                                                                         |
|-------------|-------------------------------------------------------------------------|
| <b>host</b> | Enter <b>host</b> when the DS1 link connects this switch to a computer. |
|-------------|-------------------------------------------------------------------------|

## Country Protocol

The entry in this field must match the country protocol used by the far-end switch. For connections to a public network, your network service provider can tell you which country protocol they are using.

This field appears if the Signaling Mode field is **CAS** or **isdn-pri**. For the Japanese 2Mbit trunk circuit pack, this is a display-only field if the Signaling Mode field is **CAS**.

| Valid entries | Usage                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 25       | Enter the country protocol used by the central office at which this link terminates.                                                                                                                        |
| <b>etsi</b>   | Enter <b>etsi</b> if your network service provider uses the protocol of the European Telecommunications Standards Institute (ETSI). Enter <b>etsi</b> only if the Signaling Mode field is <b>isdn-pri</b> . |

## CRC

This field indicates whether a cyclic redundancy check (CRC) will be performed on transmissions that the DS1 circuit pack receives. This field does not display for all circuit packs.

| Valid entries | Usage                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> when the Signaling Mode field is <b>CAS</b> and the DS1 link is providing E-1 service. |
| <b>n</b>      | Enter <b>n</b> for all other applications.                                                            |

## D-Channel

The Japanese 2Mbit trunk circuit pack, when administered to support ISDN-PRI signaling, allows you to assign the D-channel to any channel from 1 to 31 in an E-1 facility. You cannot submit the screen if this field is blank. Using the **change ds1** command, you can change this field if the D-channel is not used in a signaling group. This field appears only when the Location field indicates the circuit pack is a Japanese 2Mbit trunk circuit pack and the Signaling Mode field is **isdn-pri**.

| Valid entries | Usage                                                               |
|---------------|---------------------------------------------------------------------|
| 1 to 31       | Enter the number of the channel that will be used as the D-channel. |

## DCP/ANALOG Bearer Capability

This field appears when the Signaling Mode field is **isdn-pri**. It is used to determine bearer capability encoding.

| Valid entries                  | Usage |
|--------------------------------|-------|
| <b>3.1kHz</b><br><b>speech</b> |       |

## DMI-BOS

The DMI/BOS protocol is used for high-speed digital communications between a host computer and an Avaya MultiVantage. With this 24-channel protocol, channels 1–23 of the DS1 link carry data and channel 24 carries control signaling. DMI/BOS has greater capacity than a robbed-bit 24-channel facility. This field appears only when the Signaling Mode field is **common-chan**.

| Valid entries | Usage                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> to activate the Digital Multiplexed Interface-Bit Oriented Signaling (DMI-BOS) format. |
| <b>n</b>      | Enter <b>n</b> to use an Avaya proprietary format.                                                    |

## Framing Mode

Use this field to select either superframe (sf or d4) or extended superframe (esf) for T1 service on the DS1 link. The framing mode you use must match the mode used on the other end of the link, so work with your network services provider to determine the appropriate entry for this field.

This field only appears if the Bit Rate field is **1.544** (that is, if you're using T-1 service). If you're using E-1 service, Avaya MultiVantage automatically selects CEPT1 framing.

### Tip:

*Avaya recommends using ESF when your service provider supports it, especially if you may someday upgrade the facility to ISDN. The ESF format provides enhanced performance measurements and uses a sophisticated error-checking method to ensure data integrity.*

| Valid entries | Usage                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>d4</b>     | Enter <b>d4</b> to use the basic DS1 superframe (sf). Avaya recommends this mode only for voice traffic.                                                                                                                                                                                           |
| <b>esf</b>    | Enter <b>esf</b> to use the Extended Superframe format. Avaya recommends this mode for digital data traffic. If you enter <b>esf</b> for a TN464F, TN767E, or a later suffix DS1 circuit pack, a second page of the DS1 Circuit Pack screen becomes available to administer ESF Data Link options. |

## Idle Code

### CAUTION:

*Customers: The entry in the Country Protocol field sets the default idle code. Do not change the default without assistance from Avaya or your network services provider.*

For some circuit packs, this is a display-only field.

| Valid entries                     | Usage                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| any 8-digit string of 0's and 1's | This entry sets the signal sent out over idle DS0 channels. The string must be compatible with the protocol used by the far-end switch. |

## Interconnect

For E-1 service using channel-associated signaling, the entry in this field tells Avaya MultiVantage whether the DS1 circuit pack is using a public or private network protocol. The entry in this field must agree with the entry in the Group Type field on the Trunk Group screen. This field appears only when the Signaling Mode field is **CAS**.

| Valid entries | Usage                                                                      |
|---------------|----------------------------------------------------------------------------|
| <b>pbx</b>    | If <b>pbx</b> is selected, the board operates as a tie trunk circuit pack. |
| <b>CO</b>     | If <b>CO</b> is selected, the board operates as a CO or DID circuit pack.  |

## Interface

This field only appears when the Connect field is **pbx**; that is, when this DS1 link is providing an ISDN-PRI connection in a private network. The Interface field controls how your switch negotiates glare with the far-end switch. The switches at either end of the DS1 link must have complementary settings in this field: if not, the D-channel won't even come up. For example, if the switch at one end of the link is administered as **network**, the other must be administered as **user**.

| Valid entries  | Usage                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>network</b> | Use the following 2 values for private network applications in the U.S.<br>Enter <b>network</b> if your switch overrides the other end when glare occurs. If you are connecting your switch to a host computer, set this field to <b>network</b> . |
| <b>user</b>    | Enter <b>user</b> if your switch releases the contested circuit and looks for another when glare occurs. If you are connecting your switch to a public network, set this field to <b>user</b> .                                                    |

**Valid entries      Usage**

---

Use the following values for private networks (including QSIG networks) outside the U.S. Entering either of these values causes the Peer Protocol and Side fields to appear.

|                    |                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <b>peer-master</b> | Enter <b>peer-master</b> if your switch overrides the other end when glare occurs.                             |
| <b>peer-slave</b>  | Enter <b>peer-slave</b> if your switch releases the contested circuit and looks for another when glare occurs. |

**Interface Companding**

The entry in this field must match the companding method used by the far-end switch. This field does not appear for all DS1 circuit packs.

**Valid entries      Usage**

---

|              |                                     |
|--------------|-------------------------------------|
| <b>alaw</b>  | Enter <b>alaw</b> for E-1 service.  |
| <b>mulaw</b> | Enter <b>mulaw</b> for T-1 service. |

**Interworking Message**

This field determines what message the switch sends when an incoming ISDN trunk call interworks (is routed over a non-ISDN trunk group).

**Valid entries      Usage**

---

|                 |                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PROGress</b> | Normally select this value. PROGress asks the public network to cut through the B-channel and let the caller hear tones such as ringback or busy tone provided over the non-ISDN trunk.                                                                                                                              |
| <b>ALERTing</b> | ALERTing causes the public network in many countries to play ringback tone to the caller. Select this value only if the DS1 is connected to the public network, and it is determined that callers hear silence (rather than ringback or busy tone) when a call incoming over the DS1 interworks to a non-ISDN trunk. |

**ITN-C7 Long Timers**

This field controls the T302 and T303 timers. It only appears if the Signaling Mode field is **isdn-pri**.

**Valid entries      Usage**

---

|          |                                                            |
|----------|------------------------------------------------------------|
| <b>y</b> | Use if you want to increase the length of the long timers. |
| <b>n</b> | Leave n if you want to use the default long timers.        |

## Line Coding

This field selects the type of line coding used on this facility. The setting in this field must match the setting on the far-end of the link, or you must have an intervening CSU to convert the line coding protocols. Voice calls will work even if line coding does not match, but a single data call will bring down the DS1 facility. For the TTC 2Mb CMI Trunk circuit pack, this is a display-only field showing **cmi** (coded mark inversion).

The following information is for reference. Talk with your network service provider or your Avaya representative to find the appropriate protocol for your application.

### CAUTION:

*If you change this field, you must busy out the DS1 circuit pack. You must also change the following screens: Route-Pattern, Access Endpoint, PRI Endpoint, Signaling-Group, and Trunk-Group.*

### NOTE:

When the DS1 circuit pack is used for ISDN service, the ISDN D-channel data is inverted when **ami-basic** or **ami-zcs** is entered and not inverted when **b8zs** or **hdb3** is entered.

| Valid entries                                                     | Usage                                                                                                                                                                                                                           |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>b8zs</b> (bipolar eight zero substitution)                     | Enter <b>b8zs</b> for T-1 facilities that support voice and/or data traffic. Enter <b>b8zs</b> if you need a 64K clear channel.                                                                                                 |
| <b>ami-zcs</b> (alternate mark inversion - zero code suppression) | Enter <b>ami-zcs</b> only for T-1 facilities that carry voice traffic: Avaya does not recommend this for digital-data applications. If you anticipate upgrading this facility to ISDN, use <b>b8zs</b> line coding if possible. |
| <b>ami-basic</b> (alternate mark inversion-basic)                 | Enter <b>ami-basic</b> for unrestricted E-1 facilities.                                                                                                                                                                         |
| <b>hdb3</b> (high density bipolar 3)                              | Enter <b>hdb3</b> for restricted E-1 facilities.                                                                                                                                                                                |
| <b>cmi</b> (coded mark inversion)                                 | Used in Japan, <b>cmi</b> is the only type of line coding you can use with the Japanese 2Mbit trunk circuit pack. This field becomes a display-only field when you are administering the Japanese 2Mbit trunk circuit pack.     |

## Line Compensation

The appropriate entry in this field varies with the type of cable used, so work with your network service provider to determine the correct setting in your situation. The following table shows the appropriate entries for different lengths of 22-gauge ABAM cable terminated on a DSX-1 cross-connect.

| Valid entries | Usage                               |
|---------------|-------------------------------------|
| 1             | Length: 000–133 (ft), 000–40.5 (m)  |
| 2             | Length: 133–266 (ft), 40.5–81.0 (m) |
| 3             | Length: 266–399 (ft), 81.0–122 (m)  |
| 4             | Length: 399–533 (ft), 122–163 (m)   |
| 5             | Length: 533–655 (ft), 163–200 (m)   |

The following table shows the appropriate entries for different lengths of 22-gauge ABAM cable directly connecting to DS1 interfaces.

| Valid entries | Usage                             |
|---------------|-----------------------------------|
| 1             | Length: 0000–0266(ft), 000–081(m) |
| 2             | Length: 0266–0532(ft), 081–162(m) |
| 3             | Length: 0532–0798(ft), 162–243(m) |
| 4             | Length: 0798–1066(ft), 243–325(m) |
| 5             | Length: 1066–1310(ft), 325–400(m) |

## Location

This display-only field shows the port address specified in the **add** command when the circuit pack was first administered.

## MMI Cabling Board

This field appears only if the MMCH field is **y** on the System-Parameters Customer-Options screen.

| Valid entries                               | Usage                                                                                                                                               |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| slot address<br>(cabinet,<br>carrier, slot) | Enter the slot location (cabinet, carrier, slot) of the multimedia interface circuit pack that is connected to the Expansion Services Module (ESM). |

## MMI Interface

This display-only field appears if the MMCH field is **y** on the System-Parameters Customer-Options screen and there is a value in the MMI Cabling Board field.

### Name

Use this field to assign a significant, descriptive name to the DS1 link. Avaya recommends putting the vendor's circuit ID for the link in this field, because that information helps you troubleshoot problems with the link, but you could also use this field to indicate the function or the destination of this DS1 facility. In that case, put the DS1 link circuit ID in the Name field of the trunk group associated with this link.

| Valid entries   | Usage                          |
|-----------------|--------------------------------|
| 1–15 characters | Enter a name for the DS1 link. |

## Peer Protocol

This allows you to administer the peer level protocol that will operate in a private network. This field appears if the Interface field is **peer-master** or **peer-slave**. To enter **Q-SIG**, the Basic Call Setup field on the System-Parameters Customer-Options screen must be **y**.

| Valid entries | Usage                                                                                    |
|---------------|------------------------------------------------------------------------------------------|
| <b>Q-SIG</b>  | This implements QSIG Network Basic Call.                                                 |
| <b>TTC</b>    | For private networking. Requires a Digital Trunk (Japan 2 MB TTC) (TN2242) circuit pack. |

## Protocol Version

In countries whose public networks allow multiple layer-3 signaling protocols for ISDN-PRI service, this field selects the protocol that matches your network service provider's protocol. See [“Public network signaling administration for ISDN-PRI Layer 3” on page 768](#) to see which countries support which protocols.

This field appears only when:

- The Signaling Mode field is **isdn-pri** and the Connect field is **network**.
- The Signaling Mode field is **isdn-pri**, the Connect field is **pbx**, and the Interface field is **user** or **network**.

| Valid entries     | Usage                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a, b, c, d</b> | The entry in this field must match the protocol used by your network service provider, so work with your vendor to determine the appropriate entry. |

**⚠ WARNING:**

*The AT&T Switched Network Protocol does not support restricted displays of connected numbers. Therefore, if you administer the 1a country-protocol/protocol-version combination on the DS1 screen, you cannot set the Send Connected Number field to r (restricted) on the ISDN-PRI Trunk Group screen, as this causes display problems.*

**Public network signaling administration for ISDN-PRI Layer 3**

The table below shows Avaya MultiVantage public network access connections for ISDN-PRI Layer 3.

| <b>Admin value</b> | <b>Country</b>        | <b>Protocol supported</b>                                                          | <b>B-channel mtce msg</b> |
|--------------------|-----------------------|------------------------------------------------------------------------------------|---------------------------|
| 1-a                | United States, Canada | AT&T TR 41449/ 41459 (tested with AT&T network, Canadian network, and MCI network) | Service                   |
| 1-b                | United States         | Bellcore TR 1268; NIUF.302; ANSI T1.607                                            | Restart                   |
| 1-c                | United States         | NORTEL DMS-250 BCS36/IEC01                                                         | Service                   |
| 1-d                | United States         | Telecordia SR-4287                                                                 | Service                   |
| 2-a                | Australia             | AUSTEL TS014.1; Telecom Australia TPH 1856 National ISDN protocol                  | Restart                   |
| 2-b                | Australia             | ETSI ISDN protocol                                                                 | Restart                   |
| 3                  | Japan                 | NTT INS-NET                                                                        | Restart                   |
| 4                  | Italy                 | ETS 300 102                                                                        | Restart                   |
| 5                  | Netherlands           | ETS 300 102                                                                        | Restart                   |
| 6                  | Singapore             | ETS 300 102                                                                        | Restart                   |
| 7                  | Mexico                | ETS 300 102                                                                        | Restart                   |
| 8                  | Belgium               | ETS 300 102                                                                        | Restart                   |
| 9                  | Saudi Arabia          | ETS 300 102                                                                        | Restart                   |
| 10-a               | United Kingdom        | ETS 300 102 (for connection to DASS II/DPNSS through external converter)           | Restart                   |

### Received Digital Metering Pulse Maximum (ms)

This field appears only when the Signal Mode field is **cas** (Channel Associated Signaling), the Interconnect field is **co** or **pbx**, and the Country Protocol field is administered for a protocol that uses periodic pulse metering (PPM) as defined in [Table 14](#). The default value depends on the Country Protocol field's entry.

| <b>Valid entries</b> | <b>Usage</b> |

*Continued on next page*

**Table 14. Incoming digital PPM signaling default (per Country Protocol code) (Continued)**

| Code | Country      | PPM Min (ms) | PPM Max (ms) | PPM Value |
|------|--------------|--------------|--------------|-----------|
| 23   | Brazil       | NA           | NA           | NA        |
| 24   | Nordic       | NA           | NA           | NA        |
| 25   | South Africa | 160          | 240          | 0, 1      |

**Side**

This field controls how your switch resolves glare at layer 3 over an ISDN-PRI link in QSIG private networks. It appears if the Interface field is **peer-master** or **peer-slave**.

The default value of the field changes depending upon which value the Interface field contains.

**⚠ CAUTION:**

*It is critical that administration on this switch correctly pairs with the administration of the far-end switch. If the far-end is administered as the b side, this field should be set to a regardless of whether the layer 2 designation is peer-master or peer-slave, and vice versa.*

| Valid entries | Usage                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b>      | Enter <b>a</b> if the Interface field is <b>peer-master</b> (this switch overrides the far-end when glare occurs).                               |
| <b>b</b>      | Enter <b>b</b> if the Interface field is <b>peer-slave</b> (this switch releases the contested circuit and looks for another when glare occurs). |

## Signaling Mode

This field selects the signaling method used for the DS1 link. This mode must match the method used on the other end of the link, so work with your network services provider to determine the appropriate entry for this field.

| <b>Valid entries</b>                               | <b>Usage</b>                                                                                                                                                                                             |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CAS</b><br>(Channel<br>Associated<br>Signaling) | Enter <b>CAS</b> for out-of band signaling with E-1 service. This setting yields 30 64-kbps B-channels for voice or data transmission. Channel 0 is used for framing while channel 16 carries signaling. |
| <b>robbed-bit</b>                                  | Enter <b>robbed-bit</b> for in-band signaling with T-1 service. This setting yields 24 56-kbps B-channels for voice transmission.                                                                        |
| <b>isdn-pri</b>                                    | Enter <b>isdn-pri</b> for either T-1 or E-1 ISDN service. This setting supports both Facility Associated Signaling and Non-Facility Associated Signaling.                                                |
| <b>isdn-ext</b>                                    | Enter <b>isdn-ext</b> for either T-1 or E-1 ISDN service. This setting supports only Non-Facility Associated Signaling.                                                                                  |
| <b>common-ch<br/>an</b>                            | Enter <b>common-chan</b> , for out-of-band signaling with T-1 service. This setting yields 23 64-kbps B-channels for voice or data transmission. Channel 24 is used for signaling.                       |

## MAINTENANCE PARAMETERS

---

### Alarm When PRI Endpoint Detached

Use this field for DS1 circuit packs connected to Roll-About Video equipment. This field appears only when the Connect field is **line-side**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                  |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> if you want the switch to generate an alarm when the DS1 board detects a loss of signal (for example, if the video equipment is disconnected). |

## EC Configuration

Appears when Echo Cancellation is **y** on the DS1 Circuit Pack screen.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-15                 | Four default echo cancellation configurations are available:<br><br>Enter 1, 5-15: provides the most rapid adaptation in detecting and correcting echo at the beginning of a call.<br><br>Enter 2: slightly slower adaptation to echo, use if speech is clipped when both parties talk at the same time.<br><br>Enter 3: slightly slower adaptation to echo, may result in a 2 or 3 second fade on strong echo<br><br>Enter 4: in cases of extreme echo, excessive clipping or breakup of speech. May result in slight echo or background noise. |

## EC Direction

Direction of echo cancellation. Appears when Echo Cancellation is **y** on the DS1 Circuit Pack screen.

| <b>Valid entries</b> | <b>Usage</b>                                                |
|----------------------|-------------------------------------------------------------|
| inward/outward       | Indicate the direction of the echo that is being cancelled. |

## Echo Cancellation

Appears when DS1 Echo Cancellation is **y** on the System-Parameters Customer-Options screen and circuit packs support echo cancellation.

| <b>Valid entries</b> | <b>Usage</b>                               |
|----------------------|--------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow echo cancellation. |

## Near-end CSU Type

This field appears only when the DS1 circuit pack is a TN767D or TN464E or later suffix model, the Bit Rate field is **1.544** and the Country Protocol field is **1** (U.S.). This field does not display for all circuit packs.

| Valid entries     | Usage                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>other</b>      | Enter <b>other</b> if no channel service unit is attached to the DS1 facility or if the CSU is an external unit. No options are available on page 2 for administering an external CSU.                                                                                                                                                                                                                |
| <b>integrated</b> | Enter <b>integrated</b> if a 120A CSU module is attached to the DS1 board. This integrated channel service unit (ICSU) can accept software-administrable option downlinks (that is, it can respond to test codes from technician's equipment and report its status). When you enter <b>integrated</b> , fields for administering options on the ICSU appear on page 2 of the DS1 Circuit Pack screen. |

## Slip Detection

Slips — synchronization errors — slow digital transmissions and can result in data loss. The switch maintains a slip-count record for each DS1 interface to detect errors and evaluate their severity (the type of alarm). If as many as 50 percent of those spans administered for slip detection are experiencing slips (with respect to the primary), then a decision is made to switch to the secondary.

### CAUTION:

*Always enter **y** for DS1 circuit packs that serve as primary or secondary synchronization references.*

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | Enter <b>y</b> to allow maintenance software to measure the slip-rate of this circuit pack and determine whether it's excessive. Typically, enter <b>y</b> for DS1 spans used for data applications and for spans used as synchronization references. This excludes all T1-spans connecting channel banks, unless the channel bank is externally timed. This entry enables switching between the primary and secondary synchronization references and an internal high-accuracy clock. |
| <b>n</b>      | Enter <b>n</b> for DMI-BOS links or when testing is not required. Normally, enter <b>n</b> for DS1 spans that are used exclusively for voice and that do not serve as the primary or secondary synchronization source.                                                                                                                                                                                                                                                                 |

### Screen 101. DS1 Circuit Pack

#### CAUTION:

*Customers: Do not change fields on this page without assistance from Avaya or your network service provider.*

Page 2 does not appear for all DS1 circuit packs. For those circuit packs that support it, this page appears only when the Framing Mode field is **esf** or the Near-end CSU Type field is **integrated**.

## ESF DATA LINK OPTIONS

### Far-end CSU Address

This field, which, appears only if the Framing Mode field is **esf**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                                                                                                                                                 |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> | Enter <b>b</b> . This field administers the transmit direction address used for the <b>ESF data link</b> command with both integrated and external channel service units (CSU). |
| <b>b</b> |                                                                                                                                                                                 |

### Network Management Protocol

This field appears only if the Framing Mode field is **esf**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|             |                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tabs</b> | The entry in this field, used only with circuit packs that have an integrated channel service unit (CSU), allows the data link to be remotely monitored. |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

## Send ANSI-T1.403 One-Second Performance Reports

This field selects whether your DS1 circuit pack will send error reports to the far-end switch. These reports are useful for network management, and are sent at 1-second intervals when enabled. This field appears only if the Framing Mode field is **esf**. It is used only with circuit packs that have an integrated channel service unit (CSU).

| <b>Valid entries</b> | <b>Usage</b>                                                                                       |
|----------------------|----------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>n</b> . Consult your Avaya representative if you think you may want to use these reports. |

## INTEGRATED CSU OPTIONS

### Receive ALBO (Receive Automatic Line Build-Out)

This field increases the strength of incoming signals by a fixed amount to compensate for line losses.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                      |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>26db</b>          | To set this field correctly, you should measure the signal loss on this specific facility. However, you may enter <b>26db</b> for most applications. <b>36db</b> is occasionally appropriate, mainly on campus networks that don't conform to public telephone network standards. |
| <b>36db</b>          |                                                                                                                                                                                                                                                                                   |

### Transmit LBO (Transmit Line Build-Out)

This field reduces the outgoing signal strength by a fixed amount. The appropriate level of loss depends on the distance between your switch (measured by cable length from the smart jack) and the nearest repeater. Where another switch is at the end of the circuit, as in campus environments, use the cable length between the 2 switches to select the appropriate setting from the table below. This field appears if the Near-end CSU Type field is **integrated**.

| <b>Valid entries</b> | <b>Usage</b>                      |
|----------------------|-----------------------------------|
| <b>0db</b>           | For distances of 2,001–3,000 feet |
| <b>-7.5db</b>        | For distances of 1,001–2,000      |
| <b>-15db</b>         | For distances of 0–1,000 feet     |
| <b>-22.5db</b>       | For mid-span repeaters            |

## Upon DTE LOS

DTE stands for “Data Terminal Equipment.” This field tells the switch what to do if the outgoing signal from the DS1 circuit pack (the data terminal equipment) to the network is lost.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                       |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loopback</b>      | Enter <b>loopback</b> to return the network signal to the network. This prevents any alarms at the far-end switch.                                                                                                                 |
| <b>ais</b>           | Enter <b>ais</b> (Alarm Indicator Signal) to send an unframed all-ones signal (the AIS or Blue Alarm) to the far-end switch. This option alerts your network service provider to the problem immediately and aids troubleshooting. |

## CPE LOOPBACK JACK OPTIONS

---

### Supply CPE Loopback Jack Power

If a CPE (Customer Premise Equipment) Loopback Jack is installed, the DS1 board should supply power to the equipment during loopback testing.

| <b>Valid entries</b> | <b>Usage</b>                                                                          |
|----------------------|---------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> if a CPE Loopback Jack is installed. If not, you must enter <b>n</b> . |

Used to retrieve parked calls.

### **Auto Alternate Routing (AAR) Access Code**

Used to access AAR.

### **Auto Route Selection (ARS) Access Code1**

Used to access ARS. You can have one ARS access code for local and one for long distance, and route accordingly.

### **(ARS) Access Code 2**

Also used to access ARS.

### **Automatic Callback Activation/Deactivation**

Used to activate/cancel Automatic Callback.

### **Call Forwarding Activation Busy/DA**

Used to forward calls to an administered number if the user is busy or does not answer.

### **(Call Forwarding Activation) All**

Used to forward calls to an administered number for all calls.

### **(Call Forwarding) Deactivation**

Used to deactivate call forwarding.

### **Call Park Access Code**

Used to park an active call, which can then be retrieved from a different station using the answer back access code. Do not administer to have the same first digit as another feature access code that is longer in length.

### **Call Pickup Access Code**

Used to answer a call directed to a pickup group.

### **CAS Remote Hold/Answer Hold-Unhold Access Code**

Used by a Centralized Attendant Service (CAS) attendant to place calls on hold and answer calls held at a remote switch.

### **CDR Account Code Access Code**

Used prior to entering an account code for CDR purposes.

### **Change COR Access Code**

Used to allow users to change their class of restriction (COR) from a phone. This field can only be used if the Change COR by FAC field is enabled on the System-Parameters Customer-Options screen.

### **Change Coverage Access Code**

Used to change a coverage path from a telephone or remote station.

### **Data Origination Access Code**

Used to originate a data call from a voice station.

### **Data Privacy Access Code**

Used to isolate a data call from call waiting or other interruptions.

### **Directed Call Pickup Access Code**

Used to establish directed call pickup.

### Screen 105. Feature Access Code (FAC) screen

#### Emergency Access To Attendant Access Code

Used to gain access to the attendant in an emergency situation. Such calls alert as emergency calls. This field cannot be used if the Emergency Access to Attendant field is not enabled on the System-Parameters Customer-Options screen.

#### Enhanced EC500 Activation

Used to activate extension to cellular where calls to an office number are extended to a cell phone.

#### Extended Call Fwd Activate Busy D/A

Used to activate call forwarding from a telephone or remote location.

#### Extended Call Fwd Activate All

Used to activate call forwarding from a telephone or remote location.

### **Extended Call Fwd Deactivation**

Used to deactivate call forwarding from a telephone or remote location.

 **NOTE:**

An extension must have Station Security Codes administered to use the following FACs:

- Extended Call Forward All Activate
- Extended Call Forward Busy/Don't Answer Activate
- Extended Call Forward Deactivate
- Change Coverage

### **Extended Group Call Pickup Access Code**

The feature access code (FAC) users enter when a call directed to another pickup group is to be answered. Users must enter a valid "Pickup Number" following the Extended Group Call Pickup Access Code to complete the operation.

### **Facility Test Calls Access Code**

Used to place activate a facility test call.

 **SECURITY ALERT:**

*To ensure the security of your system, leave Facility Test Calls Access Code blank except when actually testing trunks.*

### **Flash Access Code**

Used to generate trunk flash. This code ensures that the flash signal is interpreted by the central office switch, rather than the Avaya MultiVantage.

### **Group Control Restrict Activation / Deactivation**

Used to change the restriction level for all users with a given class of restriction. Requires console permissions.

### **Hunt Group Busy Activation/Deactivation**

Hunt Group members can dial these codes to place themselves in a busy state, and to become available again.

### **ISDN Access Code**

Used to place an ISDN call without using ARS, AAR, or UDP.

### **Last Number Dialed Access Code**

Used to redial the last number dialed from this station.

### **Leave Word Calling Message Retrieval Lock**

Used to lock the display module on telephones. The lock function activates at a telephone by dialing this system-wide lock access code. This prevents unauthorized users from displaying, canceling, or deleting messages associated with the telephone. The Lock Messages field on the Station screen also must be enabled.

### **Leave Word Calling Message Retrieval Unlock**

Used to unlock a telephone's display module. The lock function is canceled at the telephone by dialing this unlock FAC followed by the SCC.

### **Leave Word Calling Send A Message**

Used to send a leave word calling message.

### **Leave Word Calling Cancel A Message**

Used to cancel a leave word calling message.

### **Malicious Call Trace Activation**

Used to activate a trace request on a malicious call.

### **Meet-me Conference Access Code Change**

Allows the controlling user of a Meet-me Conference VDN to change the access code.

### **PASTE (Display PBX data on Phone) Access Code**

Allows users to view call center data on display phones. PASTE is used in conjunction with Avaya IP Agent.

### **Personal Station Access (PSA) Associate Code**

Used to associate a telephone with the phone features assigned to a user's extension.

### Personal Station Access (PSA) Dissociate Code

Used to remove the association between a physical phone and an extension number. You cannot provide the code until Personal Station Access (PSA) on the System Parameters Customer-Options screen is **y**.

### Per Call CPN Blocking Code Access Code

If CPN blocking is off for a trunk group, users can turn it on for a call by using this code. When they dial this code, the calling party number is not sent to the public network.

### Per Call CPN Unblocking Code Access Code

If CPN blocking is on for a trunk group, users can turn it off for a call by using this code. When they dial this code, the calling party number is sent to the public network.

 User Control Restrict Activation: Deactivation:
 Voice Coverage Message Retrieval Access Code:
 Voice Principal Message Retrieval Access Code: *80

```

### Screen 106. Feature Access Code (FAC) screen

#### Program Access Code

Used to program abbreviated dial buttons on an individual phone.

### **Refresh Terminal Parameters Access Code**

Used to update terminal parameters on an individual phone when system settings have changed.

### **Remote Send All Calls Activation/Deactivation**

Used to activate or deactivate the Send All Calls feature. Requires console permissions.

### **Self Station Display Activation**

The self station field is not active. If set to a valid FAC, a digital station displays its primary extension number when the FAC is entered.

### **Send All Calls Activation/Deactivation**

Used to activate or deactivate sending all calls to coverage with minimal or no alerting at the station.

### **Station Firmware Download Access Code**

This field specifies the feature access code used for 2420 DCP station firmware downloads.

### **Station Lock Activation/Deactivation**

Used to activate or deactivate Station Lock.

### **Station Security Code Change Access Code**

Enter the code the user must dial to change their Station Security Code. The SCC must be administered before the user can change it using this FAC. That is, a user cannot change a blank SCC.

### **Station User Admin of FBI Assign**

Use to activate or deactivate Facility Busy Indicators.

### **Station User Button Ring Control Access Code**

Used to control the ring behavior for each line appearance and bridged appearance from the station. Allows users to have their phones ring either silently or audibly.

### **Terminal Dial-Up Test Access Code**

Used to perform tests on digital telephones to make sure that the telephone and the buttons are communicating properly with the switch. See your Maintenance documentation for information about Digital Terminal Remote Looparound Test.

### **Terminal Translation Initialization Merge Code**

Enter the digits that must be dialed to install (merge) a station without losing any of its previous feature settings. The Terminal Translation Initialization Separation Code must have been used, or an X administered in the Port field of the Station screen, when the telephone was removed from its former location in order for the Terminal Translation Initialization Merge Code to be effective. (If you try to use this and it doesn't work, check the station screen for this extension. If there is still a port assigned, type X in the port field, then try the TTI merge again.)

### **Terminal Translation Initialization Separation Code**

Enter the digits that must be dialed to remove (separate) a station from a location without losing any of its feature settings.

### **Transfer to Voice Mail Access Code**

Enter the digits that must be dialed to allow coverage to transfer the caller to the original call recipient's AUDIX mail where the caller can leave a message. Do not administer this code to have the same first digit as another feature access code that is longer in length.

### **Trunk Answer Any Station Access Code**

Enter the access code that station users must dial to answer calls alerting on night bells.

### **User Control Restrict Activation/Deactivation**

Used to change the restriction level for a specific extension. Requires console permissions.

### **Voice Coverage Message Retrieval Access Code**

Allows users to retrieve voice messages for another user (for whom they are a coverage point) via a digital display module.

## Voice Principal Message Retrieval Access Code

Allows users to retrieve their own voice messages for another user via a digital display module.

## Screen 108. Feature Access Code (FAC) screen

### **Add Agent Skill Access Code**

Enter the digits an agent must dial to be able to add a skill to their current skill set.

### **After Call Work Access Code**

Enter the code the agent must dial when the agent will be performing work-related ACD activities.

### **Assist Access Code**

Enter the digit the agent must dial to request assistance from the split supervisor.

### **Auto-In Access Code**

Enter the code the agent must dial to become automatically available to receive another ACD call each time a call is released.

### **Aux Work Access Code**

Enter the code the agent must dial when the agent will be performing non-ACD activities.

### **Converse Data Return Code**

Enter the access code the CONVERSANT must output prior to outputting the digits being returned to the system. This FAC must match the code administered on CONVERSANT.

### **Login Access Code**

Enter the code the agent must dial to gain access to the ACD functions. This is a system-wide code for all ACD agents.

### **Logout Access Code**

Enter the logout code the agent must enter to exit ACD. This is a system-wide logout code for all ACD agents.

### **Manual-In Access Code**

Enter the code the agent must dial to receive a single, new ACD call upon the completion of an ACD call.

#### **⇒ NOTE:**

The following two fields appear only if Service Observing (Remote/By FAC) on the System Parameters Customer-Options screen is **y**.

### **Remove Agent Skill Access Code**

Enter the digits an agent must dial to be able to remove a skill from their current skill set.

**⇒ NOTE:**

The next field is available only if Vectoring (Basic) and Vectoring (Prompting) have been enabled on the System-Parameters Customer-Options screen.

### **Remote Logout of Agent Access Code**

Enter the digits you need to dial to remotely logout an idle ACD or EAS agent.

### **Service Observing Listen Only Access Code**

Enter the code that must be dialed to allow a station with Service Observing permission (COR) to listen to other agent ACD calls without being heard on the ACD call.

### **Service Observing Listen/Talk Access Code**

Enter the code that must be dialed to allow a station with Service Observing permission (COR) to both listen and be heard on an ACD call.

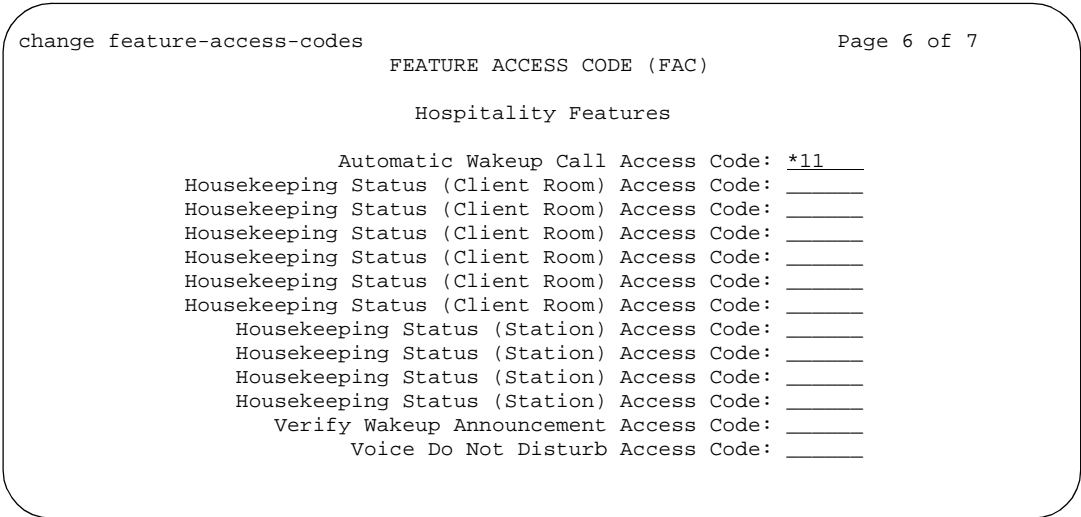

**⇒ NOTE:**

The following two fields appear only if Expert Agent Selection (EAS) Enabled is optioned on the Feature-Related System-Parameters screen.

**Field descriptions for page 6**

The feature access codes on this page pertain only to Hospitality features.

**Screen 109. Feature Access Code (FAC) screen**

**Automatic Wakeup Call Access Code**

Enter the access code the user must dial to schedule or cancel a wakeup call.

**Housekeeping Status (Client Room) Access Code**

Enter the access code the housekeeper dials from the client’s room to provide room status. These codes are transmitted to the Property Management System (PMS) for processing. You can assign a definition to the six codes on the [Hospitality](#) screen.

**Housekeeping Status (Station) Access Code**

Enter the access code the housekeeper must dial to provide room status. This access code must be dialed from designated telephones. There are four codes.

**Verify Wakeup Announcement Access Code**

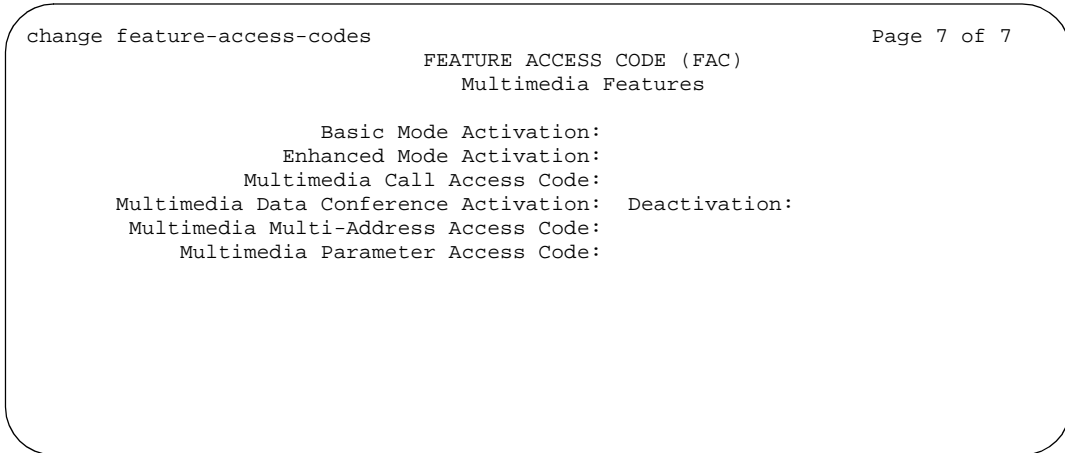

Enter the access code the user can dial to verify a wakeup announcement.

**Voice Do Not Disturb Access Code**

Enter the access code the user must dial to enter or cancel a do not disturb request without using a display — through the use of voice prompting.

## Field descriptions for page 7

The feature access codes on this page pertain only to Multimedia Call Handling (MMCH).

**Screen 110. Feature Access Code (FAC) screen**

### Basic Mode Activation

If you enter this FAC when your system is an Enhanced multimedia complex, it will revert to a Basic multimedia complex. If you enter this FAC when your system is a Basic mode station it will do nothing.

### Enhanced Mode Activation

If you enter this FAC when your system is a Basic multimedia complex, it will become an Enhanced multimedia complex. If you enter this FAC when your system is an Enhanced mode station it will do nothing.

### Multimedia Call Access Code

If you enter this FAC from any voice station, it indicates to the Avaya MultiVantage that you are making an Enhanced mode multimedia call. If you originate a multimedia call with the multimedia call access code, it will originate a call according to the Default Multimedia Parameters selected on the Feature Related System Parameters screen.

### Multimedia Data Conference Activation

If you enter this FAC from any voice station that is participating in a multimedia call, it will alert the Avaya MultiVantage that you want to enable data collaboration with the other parties on the call. If you enter this FAC a second

time, it will give denial treatment (since a collaboration session is already active). This FAC only applies to voice stations on an Avaya MultiVantage switch equipped with an ESM adjunct.

### **Multimedia Data Conference Deactivation**

If you enter this FAC from the phone that enabled data collaboration on a multimedia mode call, it will deactivate the data session and revert to a voice and video call. If a user enters this FAC while participating in a data-collaboration multimedia call that the user did not initiate, the system responds with denial treatment.

### **Multimedia Multi-Address Access Code**

The multimedia multi-address access code is similar to the multimedia call access code. It allows origination of a multimedia call from a voice station. It is used when the destination being dialed requires a different address for each of the 2 B-channels. For example, ISDN-BRI provided by a Central Office is provisioned with separate listed directory numbers for each B-channel. In order to make a 2B multimedia call to such a device, two sets of addresses must be entered.

Originating a multimedia call with the multimedia multi-address access code will originate a call according to the Default Multimedia Parameters selected on the System Parameters Features screen.

### **Multimedia Parameter Access Code**

This FAC can be entered by any voice station to indicate to the Avaya MultiVantage that you want to initiate a multimedia mode call with a specific bearer capability. This FAC would be followed by a 1 or 2 to indicate the following parameter selections respectively: 2x64 (unrestricted initial system default), 2x56 (restricted).

## **Feature-Related System Parameters**

This screen implements system parameters associated with various System features.

### **⇒ NOTE:**

This screen used to contain Call Coverage and Call Forwarding parameters. These fields have been moved to a new screen, which you can access with the command **change system-parameters coverage-forwarding**.

**Screen 111. Feature-Related System Parameters screen**

**AAR/ARS Dial Tone Required**

A second dial tone provides feedback to the user that additional dialing can occur.

| Valid entries | Usage                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to indicate a second dial tone is to be given to the calling party on a incoming tie or DID trunk call that is to be routed via AAR/ARS. |

**Abbreviated Dial Programming by Assigned Lists**

| Valid entries | Usage                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to allow programming by station's assigned list.                                  |
| n             | Enter <b>n</b> if using Program Access code to indicate which personal list is to be programmed. |

### ACA Referral Calls

Indicates where ACA referral calls generate. This field only appears when the Automatic Circuit Assurance (ACA) Enabled field is **y**.)

| Valid entries  | Usage                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>local</b>   | Local referral calls generate on and for the local switch.                                                                                                                                                                                                                                  |
| <b>primary</b> | Primary referral calls generate on the local switch for remote switches as well as the local switch.                                                                                                                                                                                        |
| <b>remote</b>  | Remote referral calls generate at another switch in a DCS network. In this case, the remote node number must also be entered. The remote node number is the same node number as defined on the Dial Plan screen. Also, ACA button status transmits to other switches when in a DCS network. |

### ACA Referral Destination

The specified extension should be equipped with a display module. This field only appears if ACA Referral Calls is **local** or **primary**.

| Valid entries | Usage                                                                             |
|---------------|-----------------------------------------------------------------------------------|
| An extension  | Enter the extension on the local switch that is to receive the ACA referral call. |
| <b>attd</b>   | Enter <b>attd</b> for attendant.                                                  |

### ACA Remote PBX Identification

This field only appears if ACA Referral Calls is **remote**.

| Valid entries | Usage                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1–63</b>   | Enter a number to identify the switch in a DCS network that makes the referral call. Do not define the remote switch identified in this field as <b>local</b> on the system's Dial Plan screen. |

### ACA Short Holding Time Originating Extension and ACA Long Holding Time Originating Extension

| Valid entries           | Usage                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| An unassigned extension | Do not use the same extension number for both fields. The specified extensions are assigned automatically by the system when the screen is submitted. These fields only display if ACA Referral Calls is <b>local</b> or <b>primary</b> . |

**Auto Abbreviated/Delayed Transition Interval (rings)**

| <b>Valid entries</b> | <b>Usage</b>                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------|
| 1–16                 | Enter the number of rings before an automatic abbreviated/delayed transition is triggered for a call |

**Automatic Callback — No Answer Timeout Interval (rings)**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                   |
|----------------------|----------------------------------------------------------------------------------------------------------------|
| 2–9                  | Enter the number of times the callback call rings at the calling station before the callback call is canceled. |

**Automatic Circuit Assurance (ACA) Enabled**

If Automatic Circuit Assurance (ACA) Enabled is **n**, associated ACA fields will not display.

Must have an “aca-halt” button administered on the user’s station. If you enable this feature, complete the following ACA-related fields.

| <b>Valid entries</b> | <b>Usage</b>                                      |
|----------------------|---------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> if ACA measurements will be taken. |
| <b>n</b>             | Otherwise, enter <b>n</b> .                       |

**Call Park Timeout Interval (minutes)**

| <b>Valid entries</b> | <b>Usage</b>                                                         |
|----------------------|----------------------------------------------------------------------|
| 1–90                 | Enter the number of minutes a call remains parked before it cancels. |

### DID/Tie/ISDN Intercept Treatment

| Valid entries                     | Usage                                                                                                                                                                                                    |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A recorded announcement extension | Toll charges do not apply to DID and private network calls routed to an announcement.                                                                                                                    |
| <b>attd</b>                       | For system security, Avaya recommends entering <b>attd</b> in this field. This routes intercept calls to the attendant and, if the attendant receives several of these, they will know a problem exists. |

### Display Calling Number for Room to Room Caller ID Calls

| Valid entries | Usage                                                                            |
|---------------|----------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to display the calling number for room to room hospitality calls. |

### Internal Auto-Answer of Attd-Extended/Transferred Calls

This only applies to digital telephones (except BRI) with a headset or speakerphone capability.

| Valid entries        | Usage                                                                                 |
|----------------------|---------------------------------------------------------------------------------------|
| <b>attd-extended</b> | Enter <b>attd-extended</b> to enable IAA for only attendant extended calls.           |
| <b>both</b>          | Enter <b>both</b> to enable IAA for station transferred and attendant extended calls. |
| <b>none</b>          | Enter <b>none</b> to disable IAA for all calls.                                       |
| <b>transferred</b>   | Enter <b>transferred</b> to enable IAA for only station transferred calls.            |

## Music (or Silence) On Transferred Trunk Calls

| Valid entries    | Usage                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>       | Enter <b>all</b> to allow all transferred trunk calls to receive music until the call is answered if the Music-on-Hold feature is available.                                                                            |
| <b>no</b>        | Enter <b>no</b> if trunk callers are to hear music (or silence if Music-on-Hold is not administered) while waiting to be transferred, and then ringback as soon as the transfer is completed till the call is answered. |
| <b>call-wait</b> | Enter <b>call-wait</b> if trunk calls transferred to stations that require the call to wait hear music (if administered); all other transferred trunk calls receive ringback tone.                                      |

## Music/Tone on Hold

If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from, or pay fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI). You can purchase a Magic OnHold<sup>®</sup> system, which does not require such a license, from Avaya. This field does not appear if Tenant Partitioning is **y** on the System-Parameters Customer-Options screen. In that case, use the [Tenant](#) screen to establish Music on Hold.

| Valid entries                  | Usage                                        |
|--------------------------------|----------------------------------------------|
| <b>music<br/>tone<br/>none</b> | Indicates what a caller hears while on hold. |

## Off-Premises Tone Detect Timeout Interval (seconds)

| Valid entries | Usage                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>5–25</b>   | The number of seconds a call progress tone receiver (CPTR) tries to detect dial tone from a trunk during dialing. Once the time-out interval occurs, the call either outpulses on the trunk or gets intercept treatment depending on the setting of the Outpulse Without Tone field on page 6 of this screen. |

**Port**

Indicates the port number that provides Music-on-Hold access. This requires a port on a TN763 Auxiliary Trunk circuit pack or any supported Analog Line circuit pack. Appears when Music/Tone on Hold is **music**. Enter the necessary characters.

| <b>Valid entries</b>                                                                                                                                                                   | <b>Usage</b>                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>01 through 44</b><br>(DEFINITY R) or<br><b>01 through 03</b><br>(DEFINITY CSI, SI) or<br><b>1 through 64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number |
| <b>A through E</b>                                                                                                                                                                     | Third character is the carrier                     |
| <b>0 through 20</b>                                                                                                                                                                    | Fourth and fifth character are the slot number     |
| <b>01 through 04</b><br>(Analog TIE trunks)<br><b>01 through 31</b>                                                                                                                    | Six and seventh characters are the circuit number  |
| <b>1 through 80</b><br>(DEFINITY R, CSI) or<br><b>1 through 10</b> (DEFINITY<br>SI) or<br><b>1 through 250</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server)  | Gateway                                            |
| <b>V1 through V9</b>                                                                                                                                                                   | Module                                             |
| <b>01 through 31</b>                                                                                                                                                                   | Circuit                                            |

## Protocol for Caller ID Analog Terminals

Determines the protocol/tones sent to a Caller ID phone.

| Valid entries   | Usage                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Bellcore</b> | Enter <b>Bellcore</b> for Bellcore protocol with 212 modem protocol tones. Used in the U.S. and similar countries. |
| <b>V23-Bell</b> | Enter <b>V23-Bell</b> for Bellcore protocol with V.23 modem tones. Used in Bahrain and similar countries.          |

## Self Station Display Enabled

Use this field to control the use of the INSPECT button for digital display phones.

Self Station Display allows a user to display the primary extension associated with a digital display phone. There are two methods: (1) enter a feature access code (FAC), and (2) use the INSPECT button. In either case, the display shows the primary extension associated with the phone where the FAC or NORMAL or EXIT button is entered. In the case of the FAC, the display continues until a display-altering event occurs (for instance, going on-hook or receiving an incoming call). In the case of the INSPECT button, the display continues until the user presses the NORMAL or EXIT button or until a display-altering event occurs.

| Valid entries | Usage                                                                  |
|---------------|------------------------------------------------------------------------|
| <b>y</b>      | The primary extension does display when the INSPECT button is pressed. |
| <b>n</b>      | The extension does not display when the INSPECT button is pressed.     |

## Trunk-to-Trunk Transfer

Regulations in some countries control the settings for this field. See your Avaya representative for assistance.

| Valid entries     | Usage                                                                                                                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>        | Enter <b>all</b> to enable all trunk-to-trunk transfers. This allows telephone users to set up trunk-to-trunk transfer, go on-hook without disconnecting the call, and forward the call to a remote location. |
| <b>restricted</b> | Enter <b>restricted</b> (restricted public) to restrict all public trunks (CO, WATS, FX, CPE, DID, and DIOD).                                                                                                 |
| <b>none</b>       | Enter <b>none</b> to restrict all trunks (except CAS and DCS) from being transferred.                                                                                                                         |

**Screen 112. Feature-Related System Parameters screen**

**LEAVE WORD CALLING PARAMETERS**

**Maximum Number of Messages Per Station  
(when MSA not in service)**

Appears for DEFINITY CSI and S8100 Media Server with CMC1 only.

| <b>Valid entries</b> | <b>Usage</b>                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------|
| <b>0-125</b>         | The maximum number of LWC Messages that can be stored by the system for a telephone at a given time. |

**Maximum Number of External Calls Logged Per Station**

When an external call is not answered, the switch keeps a record of up to 15 calls (provided information on the caller identification is available) and the phone’s message lamp lights. The phone set displays the names and numbers of unsuccessful callers.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                     |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0 through 15</b>  | The maximum number of calls that can be logged for each user. The assigned number cannot be larger than the entry in the Maximum Number of Messages Per Station (when MSA not in service) field. |

## Message Waiting Indication for External Calls

Provides a message waiting indication when external calls are logged.

| <b>Valid entries</b> | <b>Usage</b>                                                                                       |
|----------------------|----------------------------------------------------------------------------------------------------|
| <b>y</b>             | The message waiting indication for a particular station is on whenever an external call is logged. |
| <b>n</b>             | The log of external calls has no impact on the message waiting indication.                         |

## COR for PSA Dissociated Sets

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                        |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1-95</b> or blank | Enter the class of restriction to apply to calls made from dissociated telephones. See <a href="#">“Personal Station Access”</a> on <a href="#">page 1794</a> for more information. |

## CPN, ANI for PSA Dissociated Sets

Appears when the COR for PSA Dissociated Sets field is non-blank. Specifies the ISDN calling party number (CPN), R2-MFC ANI, and CAMA CESID applied to calls made from PSA dissociated sets, if no system-wide calling party information has been administered for those protocols on their respective administration screens.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                  |
|----------------------|---------------------------------------------------------------------------------------------------------------|
| 1-20 digits          | Enter the calling party number or automatic number identification for calls made from dissociated telephones. |

## Customer Telephone Activation (CTA) Enabled

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                            |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | If <b>y</b> , you can use #* to automatically activate telephones after administration. See <a href="#">Installing new phones</a> for more information. |

### Default Multimedia Outgoing Trunk Parameter Selection

Does not appear on S8700 IP-Connect.

| <b>Valid entries</b> | <b>Usage</b>                                                         |
|----------------------|----------------------------------------------------------------------|
| <b>2x56</b>          | Sets default parameter for bandwidth and bearer for all video calls. |
| <b>2x64</b>          |                                                                      |

### Enhanced Abbreviated Dial Length (3 or 4)

The administrator may not be able to use all entry slots because of system capacity constraints.

| <b>Valid entries</b> | <b>Usage</b>                                                                        |
|----------------------|-------------------------------------------------------------------------------------|
| <b>3</b>             | A value of <b>3</b> makes 1000 Enhanced List entries available to the administrator |
| <b>4</b>             | A value of <b>4</b> makes 10,000 entries available.                                 |

### Prohibit Bridging Onto Calls with Data Privacy

| <b>Valid entries</b> | <b>Usage</b>                                                                                                               |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to protect calls from bridge-on by any party, including Service Observing, Intrusion, Verify, and Bridging. |

### Record All Submission Failures in History Log

Allows submission failures to be recorded on the history log.

| <b>Valid entries</b> | <b>Usage</b>                                                     |
|----------------------|------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to record submission failures on the history log. |

### Record CTA/PSA/TTI Transactions in History Log

Use this field to record when extensions and physical phones move between ports without additional administration from the switch administrator.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                  |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to start records for ACTR, TTI, and PSA transactions (extension and phone moves between ports) in the history log. You access these transactions via the List History command. |

### Record IP Registrations in History Log

Allows the logging of IP registrations in the history log.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                               |
|------------|---------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to record IP registrations on the history log. |
|------------|---------------------------------------------------------------|

### Record PMS/AD Transactions in History Log

Allows PMS and abbreviated dialing button transactions to be recorded on the history log.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                             |
|------------|---------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to record PMS or abbreviated dialing button transactions on the history log. |
|------------|---------------------------------------------------------------------------------------------|

### Stations With System-wide Retrieval Permission (enter extension)

An extension must be removed from this list before the station is removed from the system. The switch refers to the extensions on this list as “super-retrievers.”

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                        |                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| An assigned extension. | Enter up to 10 telephone extension numbers that can retrieve LWC Messages or External Call Log records for all other telephones. A VDN extension is not allowed. |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |                                                                       |
|-------------|-----------------------------------------------------------------------|
| <b>attd</b> | An entry of <b>attd</b> gives retrieval permission to all attendants. |
|-------------|-----------------------------------------------------------------------|

### Terminal Translation Initialization (TTI) Enabled

Terminal Translation Initialization (TTI) must be enabled on the System Parameters Customer Options screen before the TTI and Automatic Customer Telephone Rearrangement (ACTR) fields can be administered.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|          |                                                                                                    |
|----------|----------------------------------------------------------------------------------------------------|
| <b>y</b> | Enter <b>y</b> to start ACTR, TTI, and PSA transactions (extension and phone moves between ports). |
|----------|----------------------------------------------------------------------------------------------------|

|          |                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------|
| <b>n</b> | Enter <b>n</b> to remove existing TTI port translations and make sure no new TTI port translations are generated. |
|----------|-------------------------------------------------------------------------------------------------------------------|

### TTI Security Code

(This is also known as the TTI authorization code but is not the same as system authorization codes.) This field appears when Terminal Translation Initialization (TTI) Enabled is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                        |
|----------------------|-------------------------------------------------------------------------------------|
| 1- to 7-digit code   | This is the code that TTI users must enter when accessing TTI from their telephones |

### TTI State

The value of this field determines what type of TTI default port translation is generated for unadministered digital ports. This field appears when Terminal Translation Initialization (TTI) Enabled is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                |
|----------------------|-------------------------------------------------------------------------------------------------------------|
| <b>data</b>          | Used for moving processor data modules, should be turned off after move.                                    |
| <b>resume</b>        | Allows the TTI state to return to what it was before TTI was manually suspended.                            |
| <b>suspend</b>       | Allows any current generation or removal of TTI port translations to be halted and access to TTI is denied. |
| <b>voice</b>         | Enter voice to allow Personal Station Access and Automatic Customer Telephone Rearrangement.                |

**Screen 113. Feature-Related System Parameters screen**

**Call Pickup Alerting**

This provides pickup group members with a visual indication on the Call Pickup status lamp of calls eligible to be answered via Call Pickup.

**Valid entries**

**Usage**

**y/n** Enter **y** to enable Call Pickup Alerting on a system-wide basis.

**Call Pickup on Intercom Calls**

**Valid entries**

**Usage**

**y** Enter **y** to allow a user's or Agent LoginID's call, ringing as an intercom call, to be picked up using the Call Pickup or Directed Call Pickup features. This field controls the use of this feature throughout the system.

**n** Enter **n** to prevent the use of these features to pickup an intercom call.

### Controlled Outward Restriction Intercept Treatment

Enter the type of intercept treatment the caller receives when the call is outward restricted.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                  |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>announcement</b>  | Provides a recorded announcement to calls that cannot be completed as dialed. You select and record the message.<br><br>The calling party receives indication that the call is receiving Intercept Treatment.<br><br>Enter the extension number for the announcement in the associated field. |
| <b>attendant</b>     | Allows attendants to provide information and assistance to outgoing calls that cannot be completed as dialed or that are transferred to incomplete or restricted stations.                                                                                                                    |
| <b>extension</b>     | Enter the extension number for the extension in an associated field. May not be a VDN extension.                                                                                                                                                                                              |
| <b>tone</b>          | Provides a siren-type tone to internal calls that cannot be completed as dialed                                                                                                                                                                                                               |

### Controlled Station-to-Station Restriction

Enter the type of intercept treatment the caller receives when the call is placed to a restricted telephone.

| <b>Valid entries</b>                          | <b>Usage</b>                                                                                                                             |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>announcement</b>                           | If announcement is entered, an associated extension number field displays. Enter the extension of the restricted telephone in the field. |
| <b>attendant</b>                              | Intercepted calls are redirected to the attendant.                                                                                       |
| <b>extension</b> (may not be a VDN extension) | If extension is entered, an associated extension number field displays. Enter the extension of the restricted telephone in the field.    |
| <b>tone</b>                                   | Intercepted calls receive intercept (siren) tone.                                                                                        |

## Controlled Termination Restriction (Do Not Disturb)

Enter the type of intercept treatment the caller receives when the call is placed to a termination restricted telephone.

| <b>Valid entries</b> | <b>Usage</b>                                                                                               |
|----------------------|------------------------------------------------------------------------------------------------------------|
| <b>announcement</b>  | If <b>announcement</b> is entered, complete an associated extension number field.                          |
| <b>attendant</b>     | Redirects intercepted calls to the attendant.                                                              |
| <b>coverage</b>      | Redirects intercepted calls to coverage.                                                                   |
| <b>extension</b>     | If <b>extension</b> is entered, complete an associated extension number field. May not be a VDN extension, |
| <b>tone</b>          | Provides a siren-type tone to calls that cannot be completed as dialed.                                    |

## Deluxe Paging and Call Park Timeout to Originator

Paged calls that are to be parked require separate activation of the Call Park feature. All parked calls that time out return to the attendant.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                          |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to enable the Loudspeaker Paging - Deluxe feature that essentially integrates the Loudspeaker Paging and Call Park features. All parked calls that time out (not answered by paged party) return to the parking party. |
| <b>n</b>             | Enter <b>n</b> to enable the Loudspeaker Paging feature.                                                                                                                                                                              |

## Directed Call Pickup

Feature use by individual stations, attendants, or EAS agents can be controlled by COR.

| <b>Valid entries</b> | <b>Usage</b>                                                                       |
|----------------------|------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to allow use of the Directed Call Pickup feature across the system. |
| <b>n</b>             | Enter <b>n</b> to prevent feature use.                                             |

## Emergency Access Redirection Extension

| <b>Valid entries</b>  | <b>Usage</b>                                                                                     |
|-----------------------|--------------------------------------------------------------------------------------------------|
| An assigned extension | Enter the assigned extension number (can be a VDN) where emergency queue overflow will redirect. |

## Extended Group Call Pickup

Enables call pickup groups to answer calls directed to another call pickup group.

| <b>Valid entries</b> | <b>Usage</b>                                                                                      |
|----------------------|---------------------------------------------------------------------------------------------------|
| <b>flexible</b>      | Flexible feature version supporting a one-to-n (pickup group-to-extended pickup group) mapping.   |
| <b>simple</b>        | Simple feature version with a one-to-one pickup group-to-extended pickup group mapping supported. |
| none                 | Extended group call pickup not supported.                                                         |

## Number of Emergency Calls Allowed in Attendant Queue

| <b>Valid entries</b> | <b>Usage</b>                                                                                                         |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>0-75</b>          | Enter the number of calls allowed in the attendant queue before additional calls are routed to the backup extension. |

### Reserved Slots for Attendant Priority Queue

| Valid entries | Usage                                                           |
|---------------|-----------------------------------------------------------------|
| 2-75          | Enter the number of calls that can go in to the emergency queue |

### Temporary Bridged Appearance on Call Pickup

| Valid entries | Usage                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to allow a temporary bridged appearance for calls answered with the Call Pickup or Directed Call Pickup features. This field controls this capability on a system-wide basis. |
| n             | Enter <b>n</b> to prevent the temporary bridged appearance of calls answered with these features.                                                                                            |

### Time Before Off-Hook Alert

| Valid entries     | Usage                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 3000 seconds | Enter the time in seconds that a telephone with an Off-Hook Alert Class of Service can remain off-hook (after intercept tone has started) before an emergency call is sent to the attendant. |

## **AUTHORIZATION CODE PARAMETERS**

---

### **Attendant Time Out Flag**

If this field is not enabled, the caller receives Intercept tone. This flag affects only remote users or incoming calls over trunks requiring an authorization code. This field only appears if Authorization Codes Enabled is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> if a call is to be routed to the attendant if the caller does not dial an authorization code within 10 seconds or dials an invalid authorization code. |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### **Authorization Code Cancellation Symbol**

Enter the symbol a caller must dial to cancel the 10-second wait period during which the user can enter an authorization code. This field only appears when Authorization Code is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|          |                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------|
| <b>#</b> | Enter the cancellation code <b>#</b> if the main and tandem switches are both the same type of switch.             |
| <b>1</b> | Enter the cancellation code <b>1</b> if an Avaya System 85 or DIMENSION PBX switch is part of the complex/network. |

### **Authorization Code Length**

This field only appears and must be completed if Authorization Codes Enabled is **y**. This is the number of digits that must be assigned to the Authorization Code (AC) field on the Authorization Code screen.

 **SECURITY ALERT:**

*You enhance your system's security by using the maximum length for your authorization code.*

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|             |                                                                                            |
|-------------|--------------------------------------------------------------------------------------------|
| 4–13 digits | Enter a number that defines the number of digits (length) in the Authorization Code field. |
|-------------|--------------------------------------------------------------------------------------------|

## Authorization Codes Enabled

This field cannot be administered if Authorization Codes is not enabled on the System-Parameters Customer-Options screen.

### SECURITY ALERT:

*To maintain system security, Avaya recommends that Authorization Codes be used.*

| Valid entries | Usage                                                               |
|---------------|---------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to enable Authorization Codes on a systemwide basis. |

## Controlled Toll Restriction Intercept Treatment

Appears when the Controlled Toll Restriction Replaces field is **outward** or **station-to-station**. This field applies an intercept treatment to a toll call during the call processing.

| Valid entries       | Usage                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>announcement</b> | A sub-field appears to the right if <b>announcement</b> is used. If the entry is <b>announcement</b> , enter the assigned announcement extension.                 |
| <b>attendant</b>    | Intercepted calls are redirected to the attendant.                                                                                                                |
| <b>extension</b>    | A sub-field appears to the right if <b>extension</b> is used. If the entry is <b>extension</b> , enter the extension assigned to station or individual attendant. |
| <b>tone</b>         | Intercepted calls receive intercept (siren) tone.                                                                                                                 |

## Controlled Toll Restriction Replaces

This field activates the Controlled Toll Restriction feature.

| Valid entries                                           | Usage                                                                                                                                                                                                                          |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>outward</b><br><b>station-station</b><br><b>none</b> | The value that you choose for this field will be replaced by controlled toll restriction. In other words, if you choose station-station, you will not be able to use station-station restrictions unless you reset this field. |

## Display Authorization Code

This field applies only to DCP, not to BRI or hybrid sets.

### SECURITY ALERT:

*To enhance your system's security, set Display Authorization Code to **n**.*

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                                                             |
|----------|---------------------------------------------------------------------------------------------|
| <b>y</b> | Enter <b>y</b> to allow authorization code digits to display on the set during the dialing. |
| <b>n</b> | Enter <b>n</b> if these digits should not display.                                          |

## SYSTEM PRINTER PARAMETERS

---

The system printer is the printer dedicated to support scheduled reports.

### EIA Device Bit Rate

This field does not appear for DEFINITY R, S8700 IP-Connect, S8700 Multi-Connect.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|      |                                           |
|------|-------------------------------------------|
| 1200 | Enter the required printer speed setting. |
| 2400 |                                           |
| 4800 |                                           |
| 9600 |                                           |

### Lines Per Page

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                             |
|----------|-------------------------------------------------------------|
| 24 – 132 | Enter the number of lines per page required for the report. |
|----------|-------------------------------------------------------------|

### System Printer Endpoint

 NOTE:

The **eia** option is not available for DEFINITY R.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                       |                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Data module extension | Does not appear for S8700 IP-Connect. Associated with the System printer.                                                            |
| <b>eia</b>            | Does not appear for S8700 IP-Connect. If the DCE jack is used to interface the printer.                                              |
| <b>SYS_PRNT</b>       | Use this value if the system printer is connected over a TCP/IP link, and the link is defined as SYS_PRNT on the IP Services screen. |
| blank                 |                                                                                                                                      |

## SYSTEM-WIDE PARAMETERS

---

### Emergency Numbers - Internal

Enter the phone number you want to use for emergency calls. If your system is in a No-License mode, these will be the only numbers that users can dial. The number may contain the feature access code for Emergency Access to the Attendant, trunk access codes, or any number or blank.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                                                         |   |
|-------------------------------------------------------------------------|---|
| Enter extension assigned to station<br>or individual attendant or blank | . |
|-------------------------------------------------------------------------|---|

### Emergency Numbers - External

Enter the external phone number you want to use for emergency calls.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                                                            |                        |
|----------------------------------------------------------------------------|------------------------|
| <b>0</b> through <b>9</b> ,<br><b>*</b> , <b>#</b> ,<br>~ <b>p</b> (pause) | Enter up to 21 digits. |
|----------------------------------------------------------------------------|------------------------|

### No-License Incoming Call Number

Enter the administered extension that can receive incoming calls when the switch is in No-License mode.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                                                         |   |
|-------------------------------------------------------------------------|---|
| Enter extension assigned to station<br>or individual attendant or blank | . |
|-------------------------------------------------------------------------|---|

### Switch Name

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                              |                                                    |
|------------------------------|----------------------------------------------------|
| Any<br>keyboard<br>character | Enter alpha-numeric characters for identification. |
|------------------------------|----------------------------------------------------|

## **MALICIOUS CALL TRACE PARAMETERS**

---

### **Apply MCT Warning Tone**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                      |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to provide an audible tone to the controlling station when an MCT recorder is actively recording a malicious call. |

### **Delay Sending RELease (seconds)**

This field specifies the amount of time DEFINITY waits before sending an ISDN release message in response to receiving an ISDN disconnect message. This field appears only if, on the System-Parameters Customer-Options screen, the Malicious Call Trace field is **y**.

| <b>Valid entries</b> | <b>Usage</b>                          |
|----------------------|---------------------------------------|
| <b>0-30</b>          | Enter the number in increments of 10. |

### **MCT Voice Recorder Trunk Group**

Assign the trunk group for MCT voice recorders.

| <b>Valid entries</b>         | <b>Usage</b>                         |
|------------------------------|--------------------------------------|
| <b>1 to 666</b> or<br>blank  | group number for DEFINITY R, CSI, SI |
| <b>1 to 2000</b> or<br>blank | group number for S8700 IP-Connect    |

## **SEND ALL CALLS OPTIONS**

---

### **Auto Inspect on Send All Calls**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                            |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | If set to <b>y</b> , allows you to be presented automatically with Calling Party information for calls which are silently alerting their station because of the Send-All-Calls feature. |
| <b>n</b>             | If set to <b>n</b> , you are not guaranteed a Calling Party display for calls sent directly to Coverage by the Send-All-Calls feature.                                                  |

## Send All Calls Applies to

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>station</b>       | If set to <b>station</b> , any call to that station, regardless of the number dialed, causes calls to that station's own extension to be sent immediately to Coverage, or causes calls to different extensions assigned to the station as bridged appearances to become Ring-Ping notification if Redirect Notification field is <b>y</b> . |
| <b>extension</b>     | When set to <b>extension</b> , only the calls sent to that extension are placed to coverage.                                                                                                                                                                                                                                                |

## UNIVERSAL CALL ID

### Create Universal Call ID (UCID)

| <b>Valid entries</b> | <b>Usage</b>                                                                   |
|----------------------|--------------------------------------------------------------------------------|
| <b>y</b>             | If set to <b>y</b> , DEFINITY will generate UCID for each call when necessary. |
| <b>n</b>             | If set to <b>n</b> , the DEFINITY will not generate a UCID for any call.       |

### UCID Network Node ID

Enter a number unique to the switch in a network of switches.

| <b>Valid entries</b>       | <b>Usage</b>                                                                       |
|----------------------------|------------------------------------------------------------------------------------|
| <b>1 to 32767</b> or blank | This number is an important part of the UCID tag and must be unique to the switch. |

**7405ND Numeric Terminal Display**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                          |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n                  | If enabled, this allows you to use 7405ND in the Type field of the station screen. This is not an actual phone type, but you can use this to define ports for certain types of Octel Messaging Division voice messaging systems. This numeric display setting sends only numbers, and not names, to the Octel system. |

**7434ND**

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                             |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n                  | If enabled, this allows you to use 7434ND in the Type field of the station screen. This is not an actual phone type, but you can use this to define ports for certain types of Octel Messaging Division systems. Use this value if your voice messaging system operates in Bridged Mode. |

## Allow AAR/ARS Access from DID/DIOD

| <b>Valid entries</b> | <b>Usage</b>                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to allow calls for DID and DIOD type trunk groups to complete calls using ARS or AAR. |

## Allow ANI Restriction on AAR/ARS

(For Russia only) If a call is placed over a Russian shuttle trunk or a Russian rotary trunk via an AAR or ARS entry with the ANI Req field set to **r**, then ANI is requested just like a **y** entry. However, if the ANI request fails, the call immediately drops. All other trunk types treat the **r** entry as a **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                               |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | The ANI Req field on the “ <a href="#">AAR and ARS Digit Analysis Table</a> ” on page 577 and the “ <a href="#">AAR and ARS Digit Conversion Table</a> ” on page 582 permits the additional value of <b>r</b> (estricted). |
| <b>n</b>             | The ANI Req field on the two screens takes only the current values of <b>n</b> and <b>y</b> .                                                                                                                              |

## Attendant Tone

| <b>Valid entries</b> | <b>Usage</b>                                                     |
|----------------------|------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to provide call progress tones to the attendants. |

## Auto Hold

| <b>Valid entries</b> | <b>Usage</b>                                                                |
|----------------------|-----------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to enable the Automatic Hold feature on a system-wide basis. |

## Auto Start

If this field is enabled, the START buttons on all attendant consoles are disabled.

| <b>Valid entries</b> | <b>Usage</b>                                          |
|----------------------|-------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to enable the Automatic Start feature. |

## Bridging Tone

| Valid entries | Usage                                                                                 |
|---------------|---------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to apply a bridging tone when calls are bridged on primary extensions. |

## Conference Parties with Public Network Trunks

Specifies the maximum number of parties allowed in a conference call involving a public network subscriber. If the value of the Public Network Trunks on Conference Call field is **0**, this field will not appear on the screen.

| Valid entries | Usage |
|---------------|-------|
| 3 to 6        |       |

## Conference Parties without Public Network Trunks

Enter a number to specify the maximum number of parties allowed in a conference call involving no public network trunks.

| Valid entries | Usage |
|---------------|-------|
| 3 to 6        |       |

## Conference Tone

### NOTE:

Bridging and Conference Tones are not supported by all countries. If these tones are enabled for countries other than Italy, Belgium, United Kingdom, or Australia, the tones will be equivalent to no tone (silence) unless the tone is independently administered or customized on the System-Parameters Country Options screen.

| Valid entries | Usage                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to provide conference tone as long as three or more calls are in a conference call. |

## DID Busy Treatment

| Valid entries     | Usage                                                                         |
|-------------------|-------------------------------------------------------------------------------|
| attendant<br>tone | Specifies how to handle a direct inward dialing (DID) call to a busy station. |

### Intrusion Tone

| Valid entries | Usage                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to apply an intrusion tone (executive override) when an attendant intrudes on the call. |

### Invalid Number Dialed Intercept Treatment

Enter the type of intercept treatment the end-user hears after dialing an invalid number.

| Valid entries | Usage                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| announcement  | Provides a recorded announcement when the end-user dials an invalid number. You select and record the message.<br><br>Enter the extension number for the announcement in the associated field. |
| tone          | Provides intercept tone when the end-user dials an invalid number.                                                                                                                             |

### Line Intercept Tone Timer (seconds)

Enter a number to specify how long an analog station user can wait after hearing warning tone without going on hook, before the station is placed in the lockout state.

| Valid entries | Usage |
|---------------|-------|
| 0–60          |       |

### Long Hold Recall Timer (seconds)

You can administer the system to remind a user that a call has been on hold for too long.

| Valid entries | Usage                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 through 999 | Enter a number between <b>0</b> and <b>999</b> ; <b>0</b> deactivates the timer. This value is the number of seconds a call can be on hold before the system re-alerts the user to remind them of the call. |

## Mode Code Interface

### ⇒ NOTE:

If you make a change to this field, you must log off and log back on to effect the permission changes to get to the [“Mode Code Related System Parameters”](#) on page 1034.

Allows you to use the Mode Code Voice Mail System Interface to connect the switch over a DTMF interface to INTUITY AUDIX or other vendors' voice mail systems.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |  |
|-----|--|
| y/n |  |
|-----|--|

## Night Service Disconnect Timer (seconds)

Enter a number or blank to indicate how long a trunk call can be unanswered during night service before being disconnected. The trunk must not have Disconnect Supervision for this timer to apply.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                     |  |
|---------------------|--|
| 10 to 1024 or blank |  |
|---------------------|--|

## Public Network Trunks on Conference Call

Indicates the number of public network trunks allowed on a conference call.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|             |                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| 0 through 5 | If this field is <b>0</b> , the Conference Parties with Public Network Trunks field will not appear on the screen. |
|-------------|--------------------------------------------------------------------------------------------------------------------|

## Reset Shift Timer (seconds)

Used only for station-to-station calls or private network calls using ISDN trunks.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|               |                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 through 255 | Specifies the number of seconds that reset shift dial tone is audible before busy tone is heard. Reset shift dial tone allows the user to dial a new extension by dialing one new digit that replaces the last digit of the extension previously dialed. The new digit replaces the last digit of the extension previously dialed.<br>Enter <b>0</b> to disable this feature. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Short Interdigit Timer (seconds)

Enter a number to limit the time that digit analysis will wait for the next digit when it has predicted that all the digits have already been collected.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

3 through 9

### Special Dial Tone

Special dial tone notifies an analog-phone user if certain features are still active when the user goes off-hook. These features include:

- Call Forwarding
- Send All Calls
- Do Not Disturb

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                   |
|------------|-----------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to use the Special Dial Tone. You must have a TN2182 circuit pack. |
|------------|-----------------------------------------------------------------------------------|

### Station Call Transfer Recall Timer (seconds)

Allows a user-transferred call (station-to-station, a trunk call, or a DCS call) to re-terminate with priority ringing back to the station user who initiates the transfer operation if the transfer-to party does not answer the call within the administered Station Call Transfer Recall timer.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                      |                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0 through 999</b> | Enter the time in seconds before a call redirects back to the station user who initiated the transfer operation. Enter <b>0</b> to disable this feature. |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

## Unanswered DID Call Timer (seconds)

Enter number or blank to limit how long a DID call can remain unanswered before routing to the DID/TIE/ISDN Intercept Treatment feature. This timer interacts with the nonadministrable 50 second Wait for Answer Supervision Timer (WAST). The WAST timer overrides this field. Thus if this field is set to a value equal to or greater than 50 seconds, the caller receives intercept tone instead of the normal attendant or announcement treatment that is given when the Unanswered DID Call Timer expires before the WAST. If the Unanswered DID Call Timer expires while the DID call is being processed by call vectoring, the timer is ignored. See [Wait Answer Supervision Timer](#) in this section.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

A number between **10** and **1024**

blank

## DISTINCTIVE AUDIBLE ALERTING

### Attendant Originated Calls

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

**internal**  
**external**  
**priority**

Indicates which type of ringing (defined above) applies to attendant-originated calls.

### Distinctive Audible Alerting (Internal, External, Priority)

This is also known as Distinctive Ringing.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

**1** through **3**.

Enter the number of rings for internal, external and priority calls. For virtual stations, this applies to the mapped-to physical phone.

### DTMF Tone Feedback Signal to VRU - Connection, Disconnection

This field appears only if DTMF Feedback Signals for VRU on the Customer-Options System Parameters screen is **y**.

| Valid entries                                                                                     | Usage                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b> through <b>9</b> ,<br><b>*</b> , <b>#</b> , <b>A</b> , <b>B</b> , <b>C</b> ,<br><b>D</b> | Enter the code to connect or disconnect the VRU. This can be a single digit, or a combination such as *99 to connect, #99 to disconnect. The tones must be programmed at the VRU as well. |
| blank                                                                                             | Blank means that no tone is to be sent to the VRU.                                                                                                                                        |

### CONFERENCE/TRANSFER

#### Abort Conference Upon Hang-Up

Allows DCP, hybrid, IP, wireless, or ISDN-BRI phone users to abort the conference operation when they hang up.

| Valid entries | Usage                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to change a call placed on soft-hold in the conference-pending status to hard-held status if the user hangs up. |

## Abort Transfer

Stops the transfer operation whenever a user presses a non-idle call appearance button in the middle of the transfer operation, or when they hang up. If both the Abort Transfer and Transfer Upon Hang-Up fields are **y** and you press the TRANSFER button and then dial the complete transfer-to number, hanging up the phone transfers the call. You must select another non-idle call appearance to abort the transfer. If the Transfer Upon Hang-Up field is **y**, hanging up completes the transfer. Requires DCP, Hybrid, IP, ISDN-BRI or wireless phones.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to abort the transfer a call by pressing the TRANSFER button, dialing the desired extension, and then hanging up or selecting another non-idle call appearance. The user must press the TRANSFER button again to complete the process unless Transfer Upon Hang-up is also set to <b>y</b> . |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## No Dial Tone Conferencing

When another line is on hold or alerting, No Dial Tone Conferencing, eliminates dial tone while setting up a conference. See GuideBuilder for more information.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                      |
|------------|------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to activate No Dial Tone Conferencing |
|------------|------------------------------------------------------|

## No Hold Conference Timeout

Controls the timeout of No Hold Conference call setup. The system Answer Supervision timer should be set to a value less than this.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|               |                              |
|---------------|------------------------------|
| <b>20-120</b> | Enter the number of seconds. |
|---------------|------------------------------|

## Select Line Appearance Conferencing

Select Line Appearance Conference changes the capabilities of the conference buttons and line appearance buttons on digital phones. See GuideBuilder for more information.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                |
|------------|----------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to activate Select Line Appearance Conferencing |
|------------|----------------------------------------------------------------|

### Transfer Upon Hang-Up

Allows DCP, hybrid, IP, wireless, or ISDN-BRI phone users to complete a transfer operation by hanging up.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> so users may transfer a call by pressing the TRANSFER button, dialing the desired extension, and then hanging up. The user may also wait to hang up, speak with the other party, then press TRANSFER again to complete the process. |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Unhold

Allows the user to press the hold button on a phone to release a hold (if no other line appearance is on hold or alerting). This does not apply to BRI phones or attendant consoles.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                  |
|------------|--------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to activate the unhold capability |
|------------|--------------------------------------------------|

### ANALOG BUSY AUTO CALLBACK

#### Announcement

Appears only if the Without Flash field is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|  |                                                                        |
|--|------------------------------------------------------------------------|
|  | Enter a valid announcement extension. This field cannot be left blank. |
|--|------------------------------------------------------------------------|

#### Voice Mail Hunt Group Ext

Appears only if the Without Flash field is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                               |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A valid extension    | Administration of this field is required for proper termination of some Feature Plus signaling. For example, Message Waiting Indication (MWI) requires this extension in order to send the indication to the appropriate switch. Appears only if the ISDN Feature Plus field is <b>y</b> on the System Parameters Customer Options screen. |

## International CPN Prefix

Allows you to apply prefixes to international calling numbers for display at receiving phones. This is useful for those phones that use or implement call back features based on incoming call numbers. When an ISDN-PRI call arrives, the incoming call setup is analyzed for: (1) whether the Type of Address (TOA) is national or international, and (2) whether the Numbering Plan Identifier (NPI) is Unknown or ISDN/Telephony. This administered prefix is applied to international calls. Prefixing applies to any subsequent display on the same switch when the call is transferred, covered, or forwarded. The same prefixing applies to outgoing ISDN-PRI calls when the connected number information is returned and meets the same TOA and NPI criteria. The prefix plus the calling/connected number digit string is limited to 15 digits, with truncation occurring at the least significant digits.

| <b>Valid entries</b>                                                 | <b>Usage</b>                                                                                   |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| 1 to 5 digits,<br><b>0</b> through <b>9</b> , *<br>and # or<br>blank | Enter a number that allows you to apply prefixes to international calling numbers for display. |

## Maximum Length

Appears only if the Unknown Numbers Considered Internal for AUDIX field is **y**. Indicates the maximum length of an unknown private number. Any unknown number longer than the administered value is considered external. This field cannot be blank when it appears.

| <b>Valid entries</b>       | <b>Usage</b>                                                        |
|----------------------------|---------------------------------------------------------------------|
| <b>1</b> through <b>20</b> | Enter a number for the maximum length of an unknown private number. |

## MWI - Number of Digits Per Voice Mail Subscriber

Appears only if the Basic Supplementary Services field or the ISDN Feature Plus field on the System-Parameters Customer-Options screen is **y**. This field provides an indication of the number of digits per AUDIX subscriber.

**⇒ NOTE:**

For QSIG-MWI only. These routing digits and inserted digits must screen a digit string that, when analyzed and processed, routes to a Signaling Group supporting QSIG-TSCs. Once a QSIG TSC is established (from a message center switch to a served user switch) then every lamp update message places the Inserted Digits field (from the Message Waiting Indication Subscriber Number Prefixes screen) in front of the AUDIX subscriber number to screen a complete QSIG network number for the served user.

**⇒ NOTE:**

For Feature Plus MWI only. The routing digits and inserted digits must screen a digit string that routes over an SSF trunk to the Feature Plus extension on the remote (Served User) switch. The Inserted Digits field must include the Feature Plus extension.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|               |                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>3 to 7</b> | Enter a value that corresponds to the digit string length of subscribers translated in the Message Center entity. For instance, if the Message Center entity is AUDIX, the value in this field must match the value of the Extension Length field on the Switch Interface Administration screen of AUDIX. |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### National CPN Prefix

Allows you to apply prefixes to national calling numbers for display at receiving phones. This is useful for those phones that use or implement call back features based on incoming call numbers. When an ISDN-PRI call arrives, the incoming call setup is analyzed for: (1) whether the Type of Address (TOA) is national or international, and (2) whether the Numbering Plan Identifier (NPI) is Unknown or ISDN/Telephony. This administered prefix is applied to national calls. Prefixing applies to any subsequent display on the same switch when the call is transferred, covered, or forwarded. The same prefixing applies to outgoing ISDN-PRI calls when the connected number information is returned and meets the same TOA and NPI criteria. The prefix plus the calling/connected number digit string is limited to 15 digits, with truncation occurring at the least significant digits.

| Valid entries                                         | Usage                                                                                     |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------|
| 1 to 5 digits,<br>0 through 9, *<br>and # or<br>blank | Enter a number that allows you to apply prefixes to national calling numbers for display. |

### Pass Prefixed CPN to ASAI

Passes Calling Party Number information (CPN) to ASAI. The prefixed number is not passed on to other adjuncts, Call Detail Recording, or switches.

| Valid entries | Usage                                           |
|---------------|-------------------------------------------------|
| y/n           | Enter <b>y</b> to pass CPN information to ASAI. |

### Path Replacement While in Queue/Vectoring

| Valid entries | Usage                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow Path Replacement after queue/vector processing has started. Depending on the version of CMS you are using, some calls can go unrecorded if you enable this capability. Please see your Avaya representative for more information. |

### Path Replacement with Measurements

| Valid entries | Usage                                                                               |
|---------------|-------------------------------------------------------------------------------------|
| y/n           | Allows QSIG path replacement or DCS with Reroute to be attempted on measured calls. |

### QSIG Path Replacement Extension

Enter the extension for the system to use as part of the complete number sent in the Path Replacement Propose message.

| <b>Valid entries</b> | <b>Usage</b>                                               |
|----------------------|------------------------------------------------------------|
| Extension            | Enter an unused extension that conforms to your dial plan. |

### QSIG TSC Extension

| <b>Valid entries</b>                   | <b>Usage</b>                                                                                                                                                                                  |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enter any valid, unassigned extension. | This is the phantom endpoint extension for QSIG Call Independent Signaling Connections (CISCs), which are similar to NCA Temporary Signaling Connections (TSCs) (both incoming and outgoing). |

### Send ISDN Trunk Group Name on Tandem Calls

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                            |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| y/n                  | Enter <b>y</b> to provide consistent display information regardless of trunk type. If set to <b>y</b> , provides only trunk group name. |

### Send Non-ISDN Trunk Group Name as Connected Name

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                       |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n                  | Enter <b>y</b> to send a name of the non-ISDN trunk group as the connected name when a call routes from ISDN to non-ISDN and the call is answered. |

## Unknown Numbers Considered Internal for AUDIX

Appears when, on the System-Parameters Customer-Options screen, either the ISDN-PRI or ISDN-BRI Trunks field is **y**. This field controls the treatment of an ISDN number whose numbering plan identification is “unknown” in a QSIG centralized AUDIX arrangement. This field works in conjunction with the Calling Party Number to Intuity AUDIX field on the Hunt Group screen. The Calling Party Number to Intuity AUDIX field on the Hunt Group screen must be **y** for this field to have an effect.

### Valid

| Valid entries | Usage                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>      | The unknown number is considered “internal” and AUDIX tries to find a calling party name match for the digit string. If a name match is found, AUDIX provides the calling party’s name. If no name is found, AUDIX provides the calling party’s phone number. |
| <b>n</b>      | The unknown number is considered “external” and AUDIX provides the calling party’s phone number.                                                                                                                                                              |

## USNI Calling Name for Outgoing Calls?

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to send a name on outgoing calls over NI PRI trunks.<br><br><b>Important:</b> Be sure you have validated that your service provider’s central office is capable of accepting calling name information from DEFINITY in this way. For example, if the central office switch is a 5ESS, it must be a generic 5EXX or later. Failure to validate the central office capability may cause the central office to drop outgoing calls from your switch. In this case, change the value in this field to <b>n</b> .<br><br>Enter <b>n</b> to prevent sending calling name information with outgoing calls over NI PRI trunks. <b>n</b> in this field overrides a <b>y</b> in the Send Name field of the outgoing trunk group screen. |

**Screen 119. Feature-Related System Parameters screen**

**Allow Conference via Flash**

| Valid entries | Usage                                                                                |
|---------------|--------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to allow an analog station to use flash to conference calls together. |
| n             | Enter <b>n</b> to prevent this.                                                      |

**Charge Display Update Frequency (seconds)**

This applies only if you use Advice of Charge or Periodic Pulse Metering with display functions.

| Valid entries  | Usage                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10-60 or blank | The amount of time (in seconds) between charge-display updates. Frequent display updates may have considerable performance impact. If the duration of a call is less than the Charge Display Update Frequency, the display will not automatically show charge information. To see charge information for a call, the user must have a disp-chrg button and must press the button before the call drops. |

## Date Format on 607/2420/4600/6400 Terminals

The format of the date as displayed on the telephones.

| Valid entries | Usage          |
|---------------|----------------|
| mm/dd/yy      | month/day/year |
| dd/mm/yy      | day/month/year |
| yy/mm/dd      | year/month/day |

## Hear Zip Tone Following VOA?

This tone alerts a telephone user that the announcement has completed and a caller is now connected. CallMaster set and attendant console users hear double zip tone following the announcement. All other telephone users hear single zip tone.

### NOTE:

This field does not effect auto-answer zip tone heard prior to the VOA.

| Valid entries | Usage                                                                         |
|---------------|-------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to play zip tone following a VDN of Origin Announcement (VOA). |
| n             | Enter <b>n</b> if you do not want zip tone following a VOA.                   |

## Intercept Treatment on Failed Trunk Transfers

| Valid entries | Usage                                                                           |
|---------------|---------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to provide intercept treatment to calls failing trunk transfers. |
| n             | Enter <b>n</b> to drop these calls.                                             |

## Level of Tone Detection

For the most part, this option is no longer required in today's switching environment. It may be useful if your users are having difficulty placing outgoing calls due to inaccurate detection of network dial tone.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                           |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>broadband</b>     | This is the least exact of the levels of tone detection. If the switch detects any tone at all, it interprets this as dial tone.                                                       |
| <b>medium</b>        | The switch interprets any tone which has a continuous "on" period of longer than 1 second as dial tone. Otherwise, the switch accepts whatever the tone detector circuit pack reports. |
| <b>precise</b>       | The switch accepts whatever the tone detector circuit pack reports.                                                                                                                    |

## Misoperation Alerting

Misoperation Alerting should not be enabled if Call Prompting is optioned.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                           |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> for misoperation recall alerting on multi-appearance stations, analog stations, and attendant consoles. |
| <b>n</b>             | Enter <b>n</b> for standard misoperation handling without recall alerting.                                             |

## Network Feedback During Tone Detection

| <b>Valid entries</b> | <b>Usage</b>                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to provide audible feedback to the user while the system attempts to detect dial tone. |

## On-hook Dialing on 607/2420/4600/6400/8400 Terminals

For 6400/8400, 607, 2420, and 4600 telephone users with speakerphones.

| Valid entries | Usage                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> allows users to dial without lifting the handset. If you enable this, users hear dial tone when they press the Speaker button, even if the handset is on-hook. |

The next four fields control station-to-switch recall signal timing. If a flashhook interval (recall window) is required, the upper and lower bounds of the interval can be administered. An on-hook that lasts for a period of time greater than or equal to the lower bound and less than or equal to the upper bound will be treated as a recall flash. If an interval is not required, the Disconnect Timing value must be administered. An on-hook that lasts for a period of time less than this value will be ignored; greater than or equal to this value will be regarded as a disconnect. Regardless, an on-hook lasting 50 to 150 ms coming from a 2500-type set will always be treated as a digit pulse unless Ignore Rotary Digits is **y** for that station.

## Outputse Without Tone

| Valid entries | Usage                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to indicate the switch will outputse digits even when a dial tone has not been received. |
| n             | Enter " <b>n</b> " if the calling party should receive intercept tone if no dial tone is detected.      |

## Pull Transfer

| Valid entries | Usage                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to enable the Pull Transfer feature on a system-wide basis. This allows either the transferring or transferred-to party to press the Transfer button to complete the transfer operation |

## Repetitive Call Waiting Interval (sec)

This field appears when the Repetitive Call Waiting Tone field is **y**.

| Valid entries | Usage                                                                       |
|---------------|-----------------------------------------------------------------------------|
| 1 to 99       | Enter a number to specify the number of seconds between call waiting tones. |

### Repetitive Call Waiting Tone

| Valid entries | Usage                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to indicate that a repetitive call waiting tone be provided to the called party for all types of call waiting access. |

### Station Tone Forward Disconnect

Tone Forward Disconnect applies to any station other than one administered as a data endpoint, an attendant console, a BRI phone, an auto answer, or as an Outgoing Call Management (OCM) agent.

| Valid entries                | Usage                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| busy<br>intercept<br>silence | When a station is the last party remaining off-hook on a call, that station receives the indicated tone or silence until that station is placed on-hook, or until the tone has played for 45 seconds and is followed by silence. |

### System Updates Time On Station Displays

This does not apply to phones (such as BRI phones) where the user sets the time.

| Valid entries | Usage                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to have the system automatically update the time on display phones when background maintenance is run (for example, when the set is plugged in). |

### Update Transferred Ring Pattern

| Valid entries | Usage                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to change the ringing pattern from internal to external when an internal station transfers an external call. If most of your calls go through an attendant, you might want to set this to <b>y</b> , so your users will be able to distinguish an external call. |

### Vector Disconnect Timer (min)

Enter the number of minutes, or blank that a trunk should remain connected to a vector.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                 |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 240             | The number of minutes that you enter determines when the trunk will be disconnected if the Disconnect Supervision-In or Disconnect Supervision-Out fields on the Trunk screen are <b>n</b> . |
| blank                | Enter blank if you do not want Avaya MultiVantage to initiate a disconnect.                                                                                                                  |

### Wait Answer Supervision Timer

See [Unanswered DID Call Timer \(seconds\)](#) for more information.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                    |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to enable this feature on a systemwide basis. When <b>y</b> is entered in this field, calls to stations unanswered after 50 seconds are dropped. |
| <b>n</b>             | When <b>n</b> is entered in this field, unanswered calls drop only when the calling party goes on-hook.                                                         |

## RECALL TIMING

### Disconnect Timing (msec)

Appears when the Flashhook Interval field is **n**.

| <b>Valid entries</b>                     | <b>Usage</b> |
|------------------------------------------|--------------|
| <b>80 to 1250</b> (in increments of 10). |              |

### Flashhook Interval

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                   |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to indicate that a flashhook interval (recall window) is required. If a <b>y</b> is entered, Upper Bound and Lower Bound appear |
| <b>n</b>             | If <b>n</b> is entered, Disconnect Timing appears.                                                                                             |

**Forward Disconnect Timer (msec)**

Specify the duration of a momentary disconnect sent by the switch to an analog station user when that user is the last party still off-hook on a call.

**Valid entries****Usage**

---

**25 to 1500** (in increments of 25).

**Lower Bound (msec)**

The lower bound of the station-to-switch recall signal timing interval in milliseconds. Specifies the lower bound of the flashhook interval. Appears when the Flashhook Interval field is **y**.

**Valid entries****Usage**

---

**80 to 1250** (in increments of 10).

**Upper Bound (msec)**

Specifies the upper bound of the flashhook interval. Specifies the upper bound of the station-to-switch recall signal timing interval in milliseconds. Appears when the Flashhook Interval field is **y**.

**Valid entries****Usage**

---

**80 to 1250** (in increments of 10).

A flash of 50 msec to 130 msec is always acceptable from a 2500-type set regardless of the setting of the Upper and Lower bounds and will be treated as the digit one.

**ITALIAN DCS PROTOCOL**

---

The next three fields control the Italian DCS Protocol feature.

**Apply Intercept Locally**

This field appears if the Italian Protocol Enabled field is **y**.

**Valid entries****Usage**

---

**y/n**

Enter **y** to indicate that DID/CO intercept treatment will be applied locally instead of on the originating switch.

## Enforce PNT-to-PNT Restrictions

This field appears if the Italian Protocol Enabled field is **y**.

| Valid entries | Usage                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to indicate that restrictions and denial of PNT-to-PNT connections will be enforced when the EDCS message is unavailable. A <b>y</b> in this field means restrictions will be enforced. |

## Italian Protocol Enabled

| Valid entries | Usage                                                                   |
|---------------|-------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to enable the Italian DCS feature on a systemwide basis. |

## **CALL CENTER SYSTEM PARAMETERS**

---

### **EAS**

---

#### **Direct Agent Announcement Delay**

Only appears if Expert Agent Selection (EAS) or ASAI Link Core Capabilities on the System-Parameters Customer-Options screen is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                      |                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>0–99</b> or blank | Enter the number of seconds the caller will hear ringback before the Direct Agent Announcement is heard by the calling party. |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------|

#### **Direct Agent Announcement Extension**

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                 |                                                       |
|-----------------|-------------------------------------------------------|
| Valid extension | Enter the extension of the direct agent announcement. |
|-----------------|-------------------------------------------------------|

#### **Expert Agent Selection (EAS) Enabled**

To enable this field, either no ACD or vectoring hunt groups may exist or, existing ACD or vectoring hunt groups must be “skilled.” Only appears if Expert Agent Selection (EAS) on the System-Parameters Customer-Options screen is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                  |
|------------|--------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to enable Expert Agent Selection. |
|------------|--------------------------------------------------|

#### **Message Waiting Lamp Indicates Status For**

Only appears if Expert Agent Selection (EAS) on the System-Parameters Customer-Options screen is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>station</b> | Since you only have one message waiting lamp on a phone, you need to indicate if the message is for at the phone extension or the loginID. |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                  |
|----------------|------------------------------------------------------------------|
| <b>loginID</b> | Expert Agent Selection (EAS) must be enabled to use this option. |
|----------------|------------------------------------------------------------------|

### Minimum Agent-LoginID Password Length

Enter the minimum number of digits that must be administered as an EAS Agent's LoginID password. Only appears if Expert Agent Selection (EAS) on the System-Parameters Customer-Options screen is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                 |
|------------|-----------------------------------------------------------------|
| <b>0-9</b> | Entering a <b>0</b> or blank indicates no password is required. |
|------------|-----------------------------------------------------------------|

### VECTORIZING

---

#### Available Agent Adjustments for BSR

Controls the use of BSR available agent adjustments. The Vectoring (Best Service Routing) field must be **y** on the System-Parameters Customer-Options screen.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                          |
|------------|----------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to allow adjustments to available agents. |
|------------|----------------------------------------------------------|

#### Converse First Data Delay/Second Data Delay

The First Data Delay prevents data from being outpulsed (as a result of a converse vector step) from the system to CONVERSANT before CONVERSANT is ready. The delay commences when the CONVERSANT port answers the call. The Second Data Delay is used when two groups of digits are being outpulsed (as a result of a converse vector step) from the system to CONVERSANT. The Second Data Delay prevents the second set from being outpulsed before CONVERSANT is ready. The delay commences when the first group of digits has been outpulsed. Only appears if Vectoring (Basic) on the System-Parameters Customer-Options screen is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|               |                                  |
|---------------|----------------------------------|
| <b>0 to 9</b> | Number of seconds for the delay. |
|---------------|----------------------------------|

### Converse Signaling Tone/Pause

Only appears if Vectoring (Basic) and DTMF on the System-Parameters Customer-Options screen are **y**. In the Signaling Tone field, enter the length in milliseconds of the digit tone for digits being passed to the CONVERSANT. In the Pause field, enter the length in milliseconds of the delay between digits being passed. The optimum timers for the CONVERSANT are a 100 msec tone and 70 msec pause.

| Valid entries                     | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 40 to 2550 (in increments of 10). | Values entered in the Tone/Pause fields are rounded up or down depending upon the type of circuit pack used to outpulse the digits.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 100                               | <ul style="list-style-type: none"> <li data-bbox="450 633 1136 807">■ <b>TN742B or later suffix analog board</b> — Tone and pause round up or down to the nearest 25 msec. For example a 130 msec tone rounds down to 125 msec, a 70 msec pause rounds up to 75 msec for a total of 200 msec per tone.</li> <li data-bbox="450 817 1136 989">■ <b>TN464F, TN767E or later suffix DS1 boards</b> — Tone and pause round up to the nearest 20 msec. For example a 130 msec tone rounds up to 140 msec, a 70 msec pause rounds up to 80 msec for a total of 220 msec per tone.</li> </ul> |

If a circuit pack has been used for end-to-end signalling to the CONVERSANT, and has then been used to send digits to a different destination, the CONVERSANT timers may stay in effect. To reset your timers to the system default, pull and reseal the circuit pack.

### Interflow-qpos EWT Threshold

Displays only if, on the System-Parameters Customer-Options screen, the Lookahead Interflow (LAI) field is **y**. Part of enhanced Look-Ahead Interflow. Any calls predicted to be answered before this threshold will not be interflowed (therefore saving CPU resources).

| Valid entries | Usage                                |
|---------------|--------------------------------------|
| 0–9 or blank  | Number of seconds for this threshold |

### Prompting Timeout (secs)

Enter the number of seconds before the Collect Digits command times out for callers using rotary dialing. Only appears if Vectoring (Prompting) on the System-Parameters Customer-Options screen is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|         |  |
|---------|--|
| 4 to 10 |  |
|---------|--|

### Reverse Star/Pound Digit for Collect Step

The “\*” is interpreted as a “caller end-of-dialing indicator and the “#” is an indicator to clear all digits previously entered by the caller for the current “collect” vector step.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to reverse the star and pound digits by the “collect” vector step. If set to <b>y</b> , it does not affect any other DEFINITY vector step or other non-ACD DEFINITY feature (such as ARS) in that the “*” and “#” digit-processing is unchanged. |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### SERVICE OBSERVING

---

#### or Conference Tone

Service Observing (Basic) on the System-Parameters Customer-Options screen must be **y** before this field may be administered.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to assign a conference tone to be given to telephone users and calling parties whenever their calls are being monitored using the Service Observing feature. |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Service Observing: Warning Tone

Service Observing (Basic) on the System-Parameters Customer-Options screen must be **y** before this field may be administered.

 **CAUTION:**

*The use of Service Observing features may be subject to federal, state, or local laws, rules or regulations or require the consent of one or both of the parties to the conversation. Customers should familiarize themselves and comply with all applicable laws, rules, and regulations before using these features.*

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to assign a warning tone to be given to telephone users and calling parties whenever their calls are being monitored using the Service Observing feature. |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ASAI

### Call Classification After Answer Supervision?

For use with ASAI Outbound Call Management (OCM).

| Valid entries | Usage                                                                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to force the switch to rely on the network to provide answer/busy/drop classification to the switch. After the call has been answered, a call classifier can be added to perform answering machine, modem and voice answering detection. |

### Send UCID to ASAI

| Valid entries | Usage                                                                                  |
|---------------|----------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to enable transmission of Universal Call ID (UCID) information to ASAI. |

## AGENT AND CALL SELECTION

---

### ACW Agents Considered Idle

| Valid entries | Usage                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to have agents who are in After Call Work included in the Most-Idle Agent queue. This means that ACW is counted as idle time. Enter <b>n</b> to exclude ACW agents from the queue. |

### Auto Reserve Agents

| Valid entries  | Usage |
|----------------|-------|
| all            |       |
| none           |       |
| secondary-only |       |

### Call Selection Measurement

This field determines how Avaya MultiVantage selects a call for an agent when the agent becomes available and there are calls in queue.

For information on CentreVu<sup>®</sup> Advocate, please contact your Avaya Account Executive or see the *Avaya Business Advocate Release 3 Version 11 User Guide*.

| Valid entries        | Usage                                                                            |
|----------------------|----------------------------------------------------------------------------------|
| current-wait-time    | Current Wait Time selects the oldest call waiting for any of the agent's skills. |
| predicted-wait-time. | Predicted Wait Time is a feature of CentreVu <sup>®</sup> Advocate.              |

### Copy ASAI UUI During Conference/Transfer

Displays when, on the System-Parameters Customer-Options screen, either the ASAI Interface or ASAI Proprietary Adjunct Links field is **y**.

| Valid entries | Usage                                                                |
|---------------|----------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to copy ASAI UUI during conference or transfer calls. |

## MIA Across Splits or Skills

| Valid entries | Usage                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to remove an agent from the MIA queue for all the splits/skills/hunt groups that he or she is available in when the agent answers a call from any of his or her splits/skills/hunt groups. |

## Service Level Supervisor Call Selection Override

This field determines whether Avaya MultiVantage changes agents' call handling preferences when a skill using Service Level Supervisor exceeds its Level 1 threshold.

For information on CentreVu<sup>®</sup> Advocate, please contact your Avaya Account Executive or see the *Avaya Business Advocate Release 3 Version 11 User Guide*.

| Valid entries | Usage                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> if you want to override the normal call handling preferences of a skill's assigned agents in this situation.                                                                                                       |
| n             | Enter <b>n</b> if you do not want to override agents' normal call handling preferences when the skill exceeds its Level 1 threshold. Service Level Supervisor requires Expert Agent Selection and CentreVu <sup>®</sup> Advocate. |

## REASON CODES

---

### Aux Work Reason Code Type

| Valid entries | Usage                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| none          | Enter <b>none</b> if you do not want an agent to enter a Reason Code when entering AUX work.                                                                                                                                                                 |
| requested     | Enter <b>requested</b> if you want an agent to enter a Reason Code when entering AUX mode but do not want to force the agent to do so. To enter <b>requested</b> the Reason Codes and EAS on the System-Parameters Customer-Option screen must be <b>y</b> . |
| forced        | Enter <b>forced</b> to force an agent to enter a Reason Code when entering AUX mode. To enter <b>forced</b> , the Reason Codes and EAS on the System-Parameters Customer-Option screen must be <b>y</b> .                                                    |

## Logout Reason Code Type

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                             |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>none</b>          | Enter <b>none</b> if you do not want an agent to enter a Reason Code when logging out.                                                                                                                                                                                                   |
| <b>requested</b>     | Enter <b>requested</b> if you want an agent to enter a Reason Code when logging out but do not want to force the agent to do so. To enter <b>requested</b> the Reason Codes and EAS on the System-Parameters Customer-Option screen must be <b>y</b> .                                   |
| <b>forced</b>        | Enter <b>forced</b> to force an agent to enter a Reason Code when logging out. Enter <b>forced</b> to force an agent to enter a Reason Code when entering AUX mode. To enter <b>forced</b> , the Reason Codes and EAS on the System-Parameters Customer-Option screen must be <b>y</b> . |

## CALL MANAGEMENT SYSTEM

### ACD Login Identification Length

Enter the number of digits for an ACD Agent Login ID if Expert Agent Selection (EAS) on the System-Parameters Customer-Options screen is **n**. If BCMS/VuStats Login IDs is **y**, the ACD Login ID length must be greater than 0. This field identifies an ACD agent to CMS. The number you enter in this field must equal the number of characters in the agent's login ID.

| <b>Valid entries</b> | <b>Usage</b>                     |
|----------------------|----------------------------------|
| <b>0–9</b>           | For CMS, this field cannot be 0. |

### Adjunct CMS Release

Specifies the release of the CMS adjunct used with the system.

| <b>Valid entries</b>                                                     | <b>Usage</b>                         |
|--------------------------------------------------------------------------|--------------------------------------|
| <b>R3V5</b><br><b>R3V6</b><br><b>R3V8</b><br><b>R3V9</b><br><b>R3V11</b> | For CMS, this field cannot be blank. |

### BCMS/VuStats Measurement Interval

You can enter **half-hour** or **hour** for polling and reporting measurement data if the BCMS (Basic) and/or the VuStats on the System-Parameters Customer-Options screen is **y**.

| Valid entries    | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>half-hour</b> | There are a maximum of 25 time slots available for measurement intervals. If <b>hour</b> is specified, an entire day of traffic information will be available for history reports; otherwise, only half a day will be available. This does not affect daily summaries as they always reflect traffic information for the entire day. The interval may be changed at any time, but will not go into effect until the current interval completes. |
| <b>hour</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### BCMS/VuStats LoginIDs

This feature can be used when EAS is not optioned, or in addition to EAS login IDs. When this field is **y**, both BCMS and CMS use the same login ID for an agent.

| Valid entries | Usage                                                                                 |
|---------------|---------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to administer valid agent login IDs to monitor call activity by agent. |

### BCMS/VuStats Abandon Call Timer (seconds)

Specifies the number of seconds before calls are considered abandoned. Calls with talk time that is less than this number (and that are not held) are tracked by BCMS and displayed by VuStats as ABAND calls.

| Valid entries        | Usage |
|----------------------|-------|
| <b>1–10</b> or blank |       |

### Clear VuStats Shift Data

| Valid entries      | Usage                                                                          |
|--------------------|--------------------------------------------------------------------------------|
| <b>on-login</b>    | Enter <b>on-login</b> to clear shift data for an agent when the agent logs in. |
| <b>at-midnight</b> | Enter <b>at-midnight</b> to clear shift data for all agents at midnight.       |

## Remove Inactive BCMS/VuStats Agents

| Valid entries | Usage                                                                                    |
|---------------|------------------------------------------------------------------------------------------|
| y             | Agents are removed from reports when they have no staff time during the previous 7 days. |
| n             | Agents remain on the report even if they have no staff time for any period of time.      |

## Validate BCMS/VuStats Login IDs

| Valid entries | Usage                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------|
| y             | Enter <b>y</b> to allow entry only of login-IDs that have been entered on the BCMS Login-ID screen. |
| n             | Enter <b>n</b> to allow entry of any ACD login of the proper length.                                |

## Field descriptions for page 12

|                                                                          |         |

## Screen 122. Feature-Related System Parameters screen

## **AUTOMATIC EXCLUSION PARAMETERS**

### **Automatic Exclusion by COS**

Activates automatic exclusion automatically by class of service when a user goes off-hook on a station with an assigned EXCLUSION button. This works only for stations on the local switch.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enables automatic exclusion by a class of service.                                                                          |
| <b>n</b>             | Exclusion operates normally. See Exclusion on <a href="#">“Telephone feature buttons”</a> on page 131 for more information. |

### **Automatic Exclusion Coverage/Hold**

Appears when Automatic Exclusion by COS field is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                        |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | The principal can bridge onto the call by pressing the appropriate bridged appearance button. And, if the coverage point places the exclusion call on hold, the principal can retrieve the call.                                    |
| <b>n</b>             | If a coverage point has answered a call and there is active exclusion on the call, the principal cannot bridge onto the call. And, if the coverage point places the exclusion call on hold, the principal cannot retrieve the call. |

### **Automatic Exclusion with Whisper Page**

Appears when Automatic Exclusion by COS field is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | The whisper page goes through to an excluded call.                                                           |
| <b>n</b>             | The whisper page is denied when a station attempts to whisper page to a station that is on an excluded call. |

### **Duration of Call Timer Display**

Administer a call timer button on the Station screen.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                 |
|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>3–30</b>          | Enter the length of time (in 3 second increments) that the call information remains on display after the call is terminated. |

## Password to Change COR by FAC

Appears if, on the System-Parameters Customer-Options screen, the Change COR by FAC field is **y**. Avaya recommends using this password option.

| <b>Valid entries</b> | <b>Usage</b>                  |
|----------------------|-------------------------------|
| 4 to 8 digits        | Requires the password option. |
| blank                | Disables the password option. |

## Recall Rotary Digit

This establishes the digit to use for rotary phones to receive recall dial tone. Dialing this digit simulates switch hook flash so that users of rotary phones can use features such as conference and transfer. The phone must also be administered to use the recall rotary digit.

| <b>Valid entries</b>      | <b>Usage</b>                                                                                                                      |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b> through <b>9</b> | Enter the digit users can dial to generate recall dial tone. Use a number that is not the first digit in normal dialing patterns. |

## WIRELESS PARAMETERS

---

### Radio Controllers with Download Server Permission

Enter the necessary characters for the port location of the circuit pack containing the radio controllers with download server permission.

| <b>Valid entries</b>                                                                                                                                                                                        | <b>Usage</b>                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number |
| <b>A</b> through <b>E</b>                                                                                                                                                                                   | Third character is the carrier                     |
| <b>0</b> through <b>20</b>                                                                                                                                                                                  | Fourth and fifth characters are the slot number    |

## IP PARAMETERS

---

### Direct IP-IP Audio Connections

Allows direct audio connections between IP endpoints

| Valid entries | Usage                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------|
| y/n           | Enter to <b>y</b> to save on bandwidth resources and improve sound quality of voice over IP transmissions. |

### IP Audio Hairpinning

Allows IP endpoints to be connected through the IP circuit pack on the switch.

| Valid entries | Usage                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to allow IP endpoints to be connected through the IP circuit pack on the switch in IP format, without going through the DEFINITY TDM bus. |

## RUSSIAN MULTI-FREQUENCY PACKET SIGNALING

---

### Re-try

The Re-try field applies to outgoing Russian MFP trunks. It allows the switch to resend Russian MFP calling party number and dialed number information to the CO. The switch resends the information only once over another outgoing trunk port of the same trunk group if the switch receives a message that the information was received incorrectly by the CO. The switch also sends Russian MFP information over another trunk port if the switch does not receive a timely response for the information.

| Valid entries | Usage                                                                        |
|---------------|------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to resend address information on outgoing Russian MFP trunks. |

## T2 (Backward Signal) Activation Timer (secs)

The T2 (Backward Signal) Activation Timer (secs) field applies to outgoing Russian MFP trunks. This field sets the number of seconds the switch waits for confirmation after sending calling party number and dialed number information on outgoing Russian MFP trunks

### Valid entries Usage

**5 through 20** Enter the number of seconds the system waits to receive confirmation after sending the address information on outgoing Russian MFP trunks.

## Group Paging Using Speakerphone

Use this screen to assign digital speakerphones to a paging group. Users can page all the phones in the group simultaneously by dialing the group's extension.

## COR

### Valid entries Usage

**0 to 95** Enter a class of restriction. In order to page the group, users' class of restriction must give them calling permission for the group's class of restriction.

### Ext

| <b>Valid entries</b> | <b>Usage</b>                                                                |
|----------------------|-----------------------------------------------------------------------------|
| An extension number  | Assign a phone to the group by entering its extension number in this field. |

### Group Extension

| <b>Valid entries</b> | <b>Usage</b>                                                            |
|----------------------|-------------------------------------------------------------------------|
| An extension number  | Assign the extension users will dial to page the members of this group. |

### Group Name

| <b>Valid entries</b> | <b>Usage</b>                                                                                                      |
|----------------------|-------------------------------------------------------------------------------------------------------------------|
| 1 to 27 characters   | Enter a name that's informative to users, because it appears on callers' phone displays when they page the group. |

### Group Number

This field displays the identifying number the switch assigns to the group when it is created.

### Name

When you save your changes, the switch fills in this display field with the name assigned to each extension on the Station screen.

#### Client Room Coverage Path Configuration

This indicates whether the server and the PMS exchange coverage path information for guest stations.

| Valid entries    | Usage                                                                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>act-nopms</b> | The message is acknowledged (MESSAGE ACK), but no action is taken.                                                                                                                                                                                                                                                     |
| <b>act-pms</b>   | If active ( <b>act-pms</b> ), the server and PMS exchange and accept coverage path information. This field does not apply to normal mode. When upgrading from a release that does not support this feature, the field is set to <b>act-pms</b> if the PMS protocol mode is administered for transparent or ASCII mode. |

## Controlled Restrictions Configuration

This indicates whether controlled restriction information is being exchanged between the server and the PMS.

| Valid entries    | Usage                                                                          |
|------------------|--------------------------------------------------------------------------------|
| <b>act-nopms</b> | The message is acknowledged (MESSAGE ACK), but no action is taken.             |
| <b>act-pms</b>   | The server and the PMS exchange and accept controlled restriction information. |

## Default Coverage Path for Client Rooms

This applies only to stations with a “client room” class of service in the “occupied” mode. This field is used for transparent or ASCII mode. The value in this field is also used during a translation save as the coverage path for each station with “client room” class of service.

| Valid entries             | Usage                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>1 to 9999</b> or blank | Enter the coverage path assigned when the server receives a check-out message for a valid extension or a new check-in. |

## Forward PMS Message to INTUITY Lodging

This field is used only in ASCII mode.

| Valid entries | Usage                                                                          |
|---------------|--------------------------------------------------------------------------------|
| <b>y</b>      | PMS-to-INTUITY messages are sent through the server.                           |
| <b>n</b>      | PMS-to-INTUITY messages are sent directly to the Avaya INTUITY Lodging system. |

## Housekeeper Information Configuration

This indicates whether housekeeper information is being exchanged between the server and the PMS.

| Valid entries    | Usage                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------|
| <b>act-nopms</b> | The message is acknowledged (MESSAGE ACK), but no action is taken.                            |
| <b>act-pms</b>   | If active ( <b>act-pms</b> ), the server and PMS exchange and accept housekeeper information. |

## Journal/Schedule Endpoint

This is a valid data extension number that is assigned to the data module connected to the Journal/Schedule printer.

| <b>Valid entries</b>        | <b>Usage</b>                                                                                                                                                                                                                                         |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Valid data extension number | Cannot be a VDN extension. This extension can be the same as the PMS/Log printer and both sets of reports can be printed on the same printer. This extension is dialed by the server to send journal information or schedule reports to the printer. |
| <b>PMS_LOG</b>              | Use this value if the printer is connected over a TCP/IP link, and this link is defined as PMS_LOG on the IP Services screen.                                                                                                                        |
| <b>PMS_JOURNAL</b>          | Use this value if the printer is connected over a TCP/IP link, and this link is defined as PMS_JOURNAL on the IP Services screen.                                                                                                                    |

blank

## Message Waiting Configuration

This indicates whether message waiting notification requests and changes are being exchanged between the server and the PMS.

| <b>Valid entries</b> | <b>Usage</b>                                                                                             |
|----------------------|----------------------------------------------------------------------------------------------------------|
| <b>act-nopms</b>     | The message is acknowledged (MESSAGE ACK), but no action is taken.                                       |
| <b>act-pms</b>       | Message waiting is active on the server and information between the PMS and server is being transmitted. |

## Number of Housekeeper ID Digits

| <b>Valid entries</b> | <b>Usage</b>                                                                  |
|----------------------|-------------------------------------------------------------------------------|
| <b>0 to 6</b>        | Enter the number of digits that the housekeeper must dial for identification. |

## PMS Log Endpoint

This is a valid data extension number that is assigned to the data module connected to the PMS/Log printer.

| Valid entries        | Usage                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Valid data extension | Cannot be a VDN extension. This extension is dialed by the server to send housekeeping and PMS events to the printer.             |
| <b>PMS_LOG</b>       | Use this value if the printer is connected over a TCP/IP link, and this link is defined as PMS_LOG on the IP Services screen.     |
| <b>PMS_JOURNAL</b>   | Use this value if the printer is connected over a TCP/IP link, and this link is defined as PMS_JOURNAL on the IP Services screen. |

blank

## PMS LINK PARAMETERS

### ASCII mode

The PMS Protocol Mode field must be **transparent**.

| Valid entries | Usage                                                                          |
|---------------|--------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> when the ASCII-only mode is being used for the PMS message set. |

### Milliseconds Before PMS Link Acknowledgment Timeout

This regulates how quickly the system responds to a message from the PMS (also known as “pace timing.”) This value is also used as the “inquiry message” (ENQ) time-out value. In most cases, keep this as short as possible.

| Valid entries      | Usage                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>100 to 1500</b> | Enter the time in milliseconds the system waits for an acknowledgment from the PMS indicating it correctly received a message. |

### PMS Link Maximum Retransmission Requests

| Valid entries | Usage                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------|
| <b>1 to 5</b> | Enter the number of times that the server will allow the PMS to request acknowledgment for a message that it sent. |

## PMS Link Maximum Retransmissions

| Valid entries | Usage                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 5        | Enter the number of times that the server retransmits a message to the PMS in response to a negative acknowledgment, or sends an inquiry for acknowledgment from the PMS before giving up on the message. |

## PMS Log Endpoint

| Valid entries   | Usage                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| Valid extension | Enter the data extension number the server dials to access PMS. Cannot be a VDN extension.                            |
| PMS             | Use this value if the PMS is connected over a TCP/IP link, and this link is defined as PMS on the IP Services screen. |
| blank           |                                                                                                                       |

## PMS Protocol Mode

This indicates the message protocol mode used between the server and PMS. Coordinate this option with your PMS vendor.

| Valid entries | Usage |
|---------------|-------|
| normal        |       |
| transparent   |       |

## Seconds Before PMS Link Idle Timeout

| Valid entries | Usage                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 to 20       | Enter the idle time in seconds that the server waits for an acknowledgment from the PMS before the server enters link failure mode from the PMS transmission link. |

## Take Down Link for Lost Messages

| Valid entries | Usage                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to cause the PMS link to come down if messages are being lost. Monitor your PMS error log if you use n. |

### Announcement Type

This indicates the type of automatic wakeup announcement the hotel guest will receive. Allowable entries are as follows:

| Valid entries          | Usage                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>external</b>        | Applicable when using an announcement adjunct.<br><br>If <b>external</b> is used, complete the <b>Auxiliary Board for Announcement</b> field.                                                                                                                                                                                                                                                           |
| <b>integrated</b>      | Applicable when using the TN750B or TN750C announcement circuit pack.<br><br>If <b>integrated</b> is used, complete the <b>Integrated Announcement Extension</b> field. The extension you enter must be a valid integrated announcement extension (administered on the Recorded Announcements screen) or a VDN. If you enter an invalid extension, the server displays an error message.                |
| <b>mult-integ</b>      | Multi-integrated; applicable when using the TN750B or TN750C announcement circuit pack.<br><br>If <b>mult-integ</b> is used, complete the <b>Default Announcement Extension</b> field. The extension you enter must be a valid integrated announcement extension (administered on the Recorded Announcements screen) or a VDN. If you enter an invalid extension, the server displays an error message. |
| <b>voice-synthesis</b> | If <b>voice-synthesis</b> is used, complete the <b>Announcement Ports</b> field.                                                                                                                                                                                                                                                                                                                        |
| <b>music-on-hold</b>   | If <b>music-on-hold</b> is used, no other field appears.                                                                                                                                                                                                                                                                                                                                                |
| <b>silence</b>         | If <b>silence</b> is used, no other field appears.                                                                                                                                                                                                                                                                                                                                                      |

### Automatic Selection of DID Numbers

This field assigns a 2- to 5-digit number to a guest's phone number that is not associated with the room number.

| <b>Valid entries</b> | <b>Usage</b>                                                                          |
|----------------------|---------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to use the Automatic Selection of DID Numbers for Guest Rooms feature. |

### Auxiliary Board for Announcement

This field appears only when the Announcement Type field is **external**. This indicates the equipment location of an auxiliary trunk circuit that connects to the external announcement equipment. Enter the necessary characters.

| <b>Valid entries</b>                                                                                                                                                                   | <b>Usage</b>                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>01 through 44</b><br>(DEFINITY R) or<br><b>01 through 03</b><br>(DEFINITY CSI, SI) or<br><b>1 through 64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number |
| <b>A through E</b>                                                                                                                                                                     | Third character is the carrier                     |
| <b>0 through 20</b>                                                                                                                                                                    | Fourth and fifth character are the slot number     |
| <b>01 through 04</b><br>(Analog TIE trunks)<br><b>01 through 31</b>                                                                                                                    | Six and seventh characters are the circuit number  |
| <b>1 through 80</b><br>(DEFINITY R, CSI) or<br><b>1 through 10</b> (DEFINITY SI) or<br><b>1 through 250</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server)     | Gateway                                            |
| <b>V1 through V9</b>                                                                                                                                                                   | Module                                             |
| <b>01 through 31</b>                                                                                                                                                                   | Circuit                                            |

## Custom Selection of VIP DID Numbers

This field allows you to select the DID number assigned to a room when a guest checks in. This field can be accessed only if the Automatic Selection of DID Numbers field is **y**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |                                                                                                 |
|-----|-------------------------------------------------------------------------------------------------|
| y/n | Enter <b>y</b> to allow you to select the DID number assigned to a room when a guest checks in. |
|-----|-------------------------------------------------------------------------------------------------|

## Daily Wakeup

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |                                                                  |
|-----|------------------------------------------------------------------|
| y/n | Enter <b>y</b> if each extension can request daily wakeup calls. |
|-----|------------------------------------------------------------------|

## Default Announcement Extension

This field appears only when the Announcement Type field is **mult-integ**. This indicates the default wakeup announcement extension when using the integrated announcement circuit pack.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                        |                                                                                   |
|------------------------|-----------------------------------------------------------------------------------|
| valid extension or VDN | Enter the extension of the announcement you want to use for default wakeup calls. |
|------------------------|-----------------------------------------------------------------------------------|

## Digit to Insert/Delete

Enter the leading digit that may be deleted and inserted back as described in the following text. The current PMS message set uses the extension number as the room identifier. In many customer configurations, the leading digit of the extension number is dropped to screen the room number. In order to accommodate PMS devices that are based on room number and not extension, this leading digit may be deleted on messages from the switch to the PMS, and then inserted back on messages from the PMS.

 **NOTE:**

The PMS interface supports 3-, 4-, or 5-digit extensions, but prefixed extensions do not send the entire number across the interface. Only the assigned extension number is sent. Therefore, you should not use prefixed extensions for numbers that are also going to use the Digit to Insert/Delete function.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|        |  |
|--------|--|
| 0 to 9 |  |
|--------|--|

### Display Room Information in Call Display

This indicates the type of guest room information displayed on phone displays.

| Valid entries | Usage                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | If this field is set to <b>y</b> , the phones will display the name and room number. The extension number and room number are not always the same number. |
| n             | If this field is set to <b>n</b> , the phones will display the name and extension number.                                                                 |

### Dual Wakeup

| Valid entries | Usage                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> if each extension can request two wakeup calls within one 24-hour time period. |

### Extension to Receive Failed Wakeup LWC Messages

This indicates where unsuccessful wakeup LWC messages will be stored. This is usually administered to an unassigned extension (cannot be a VDN extension) or to the attendant (attd). In addition, a LWC lamp for that extension is usually assigned to the attendant console as an indication of failed wakeup calls.

| Valid entries        | Usage |
|----------------------|-------|
| Unassigned extension |       |

### Integrated Announcement Extension

This field appears only when the Announcement Type field is **integrated**. This indicates the wakeup announcement extension when using the integrated announcement circuit pack.

| Valid entries          | Usage                                                                     |
|------------------------|---------------------------------------------------------------------------|
| valid extension or VDN | Enter the extension of the announcement you want to use for wakeup calls. |

## Length of Time to Remain Connected to Announcement

Enter the length of time in seconds that a hotel guest will be connected to an announcement. This applies only after the guest has heard the announcement completely one time, but continues to listen.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |  |
|----------|--|
| 0 to 300 |  |
|----------|--|

## Number of Digits from PMS

This indicates the number of digits being sent from the PMS to the server to identify room numbers.

 NOTE:

If the **Number of Digits from PMS** field is blank and the **PMS Sends Prefix** field is set to **n**, the server will not support an extension that starts with 0.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|        |                                                       |
|--------|-------------------------------------------------------|
| 1 to 4 | When using normal mode, digits 1 through 4 are valid. |
|--------|-------------------------------------------------------|

|        |                                                                     |
|--------|---------------------------------------------------------------------|
| 1 to 5 | When using transparent or ASCII mode, digits 1 through 5 are valid. |
|--------|---------------------------------------------------------------------|

|       |                                                                 |
|-------|-----------------------------------------------------------------|
| blank | If using mixed numbering in the server, leave this field blank. |
|-------|-----------------------------------------------------------------|

## Number of Digits in PMS Coverage Path

This indicates whether the coverage paths are 3 or 4 digits long. There can be up to 9999 coverage paths.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|        |  |
|--------|--|
| 3 to 4 |  |
|--------|--|

## PMS Sends Prefix

This indicates if the PMS sends a prefix digit to the server as part of the room numbering plan.

 NOTE:

If the **PMS Sends Prefix** field is set to **n** and the **Number of Digits from PMS** field is blank, the server will not support an extension that starts with 0.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |  |
|-----|--|
| y/n |  |
|-----|--|

### Room Activated Wakeup with Tones

| Valid entries | Usage                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n           | Enter <b>y</b> if wakeup calls can be activated via tones that prompt users for the time they wish to waken. This allows room activated wakeup calls without the use of a speech synthesizer or a display telephone. |

### Routing Extension on Unavailable Voice Synthesis

This indicates where a wakeup call will go to if both wakeup announcements on the Speech Synthesizer circuit pack are not available. This is usually administered to an unassigned extension (cannot be a VDN extension) or to the attendant (attd).

| Valid entries                 | Usage |
|-------------------------------|-------|
| Assigned extension or<br>attd |       |

### CAUTION:

*Set the following reports for a time other than when the system does its scheduled maintenance tests. To make sure the times do not overlap, enter the command display system-parameters maintenance and check when the system is set to run tests.*

### Time of Scheduled Emergency Access Summary Report

This indicates the time of day that the Emergency Access Summary Report will be printed on the Journal/ Schedule printer.

| Valid entries | Usage                                                       |
|---------------|-------------------------------------------------------------|
| hh:mm:am/pm   | Enter the time where hh=hour, mm=minute, am/pm=A.M. or P.M. |

### Time of Scheduled Wakeup Activity Report

This indicates the time of day that the Wakeup Activity Report will be printed on the Journal/Schedule Printer. This report summarizes the wakeup activity for each extension that had wakeup activity for the past 24 hours.

| Valid entries | Usage                                                       |
|---------------|-------------------------------------------------------------|
| hh:mm:am/pm   | Enter the time where hh=hour, mm=minute, am/pm=A.M. or P.M. |

## Time of Scheduled Wakeup Summary Report

This indicates the time of day that the Wakeup Summary Report will be printed on the Journal/Schedule printer. This report gives an hour-by-hour summary of the number of scheduled wakeup calls and a list of extensions to which wakeup calls were attempted but did not complete during the hour.

| Valid entries | Usage                                                       |
|---------------|-------------------------------------------------------------|
| hh:mm:am/pm   | Enter the time where hh=hour, mm=minute, am/pm=A.M. or P.M. |

## VIP Wakeup

| Valid entries | Usage                                                          |
|---------------|----------------------------------------------------------------|
| y/n           | Enter <b>y</b> if each extension can request VIP wakeup calls. |

## VIP Wakeups Per 5 Minutes

This field appears if the VIP Wakeup field is **y**.

| Valid entries | Usage                                                                |
|---------------|----------------------------------------------------------------------|
| 1 through 50  | Enter the number of VIP Wakeup calls allowed in a 5-minute interval. |

|----------------------|--------------|

---

|            |                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to use the Suite Check-in feature. See " <a href="#">Suite Check-in</a> " for more information. |
|------------|----------------------------------------------------------------------------------------------------------------|

## Hunt Group

---

Allows calls to be answered by users (agents) at a predefined group of telephones or devices.

This screen creates a hunt group that is identified by a hunt group number. Users assigned to a hunt group are identified by their extension number.

This screen can be used to implement a hunt group and its associated features such as Automatic Call Distribution (ACD) and Hunt Group Queuing. Look at the various hunt group screens and choose the screens that can be used to implement your hunt group requirements.

The total number of pages vary depending on your System configuration. See the *Avaya MultiVantage™ Solutions Hardware Guide* for the maximum number of hunt groups supported by each configuration.

The System checks for the busy or idle status of extension numbers in the hunt group when answering calls. A Uniform Call Distribution (UCD) type hunt group selects the “most idle” extension in the group when answering a new call. A Direct Department Calling (DDC) type hunt group selects the first available extension (in the administered sequence) when answering a new call. Expert Agent Distribution (EAD), used only with Expert Agent Selection (EAS), selects the “most idle” agent or the “least occupied” agent with the highest skill level for the call’s skill.

**⇒ NOTE:**

Vector controlled splits/skills can be called directly via the split/skill extension (instead of calling a VDN mapped to a vector that will terminate the call to a vector controlled split/skill); however, the calls will not receive any announcements, be forwarded, redirect to coverage, or intraflow/interflow to another hunt group.

**Screen 131. Hunt Group screen when Queue is y and Vector is n**

**ACD**

Indicates whether Automatic Call distribution is used. This field cannot be set to **y** if, on the System-Parameters Customer-Options screen, the ACD field is **n**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | The hunt group will function as an ACD split/skill. AUDIX hunt groups can function as ACD splits/skills.                                                                                                                                                                                                                                                                                        |
| <b>n</b>             | This feature is not desired, even if, on the System-Parameters Customer-Options screen, the ACD field is <b>y</b> . When the hunt group is assigned as an ACD split/skill, the hunt group members serve as ACD agents. The agents in this split/skill must log in to receive ACD split/skill calls. If this hunt group is on a remote switch using the AUDIX in a DCS feature, enter <b>n</b> . |

**Calls Warning Threshold**

Appears if the Queue field is **y**. Enter the number of calls that can be queued before the System flashes the queue status (feature buttons assigned on agents phones) and the optional Auxiliary Queue Call Warning Threshold lamp assigned to the split/skill. These lamps are lighted steadily when at least one call is in queue and the threshold has not yet been reached.

| <b>Valid entries</b>                                              | <b>Usage</b>                                                                       |
|-------------------------------------------------------------------|------------------------------------------------------------------------------------|
| 1-999 and must be less than or equal to the queue length or blank | This field must not be left blank if Calls Warning Port is assigned a port number. |

**(Calls Warning) Extension**

Appears if the Queue field is **y** and when the Calling Warning Port and the Time Warning Port fields are **X**. An extension is needed when an **X** is placed in Calls Warning Port. This extension can be used by the Terminal Translation Initialization (TTI) feature to assign a port to this extension from the port itself. Once Calls Warning Port is assigned a valid port (either via TTI or the **change hunt-group** command), then the extension is removed and considered unassigned.

| <b>Valid entries</b> | <b>Usage</b>                                                |
|----------------------|-------------------------------------------------------------|
|                      | Enter an unassigned extension. This field may not be blank. |

**(Calls Warning) Port**

Appears if the Queue field is **y**. Enter the seven-character port number assigned to connect the optional external Auxiliary Queue Call Warning Threshold lamp that will flash when the number of calls in queue has exceeded the queue warning threshold (assigned in Calls Warning Threshold).

This port is assigned to an Analog Line circuit pack or given an “X” designation if an extension is used. Enter the necessary characters.

| <b>Valid entries</b>                                                                                                                                                                   | <b>Usage</b>                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>01 through 44</b><br>(DEFINITY R) or<br><b>01 through 03</b><br>(DEFINITY CSI, SI) or<br><b>1 through 64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number |
| <b>A through E</b>                                                                                                                                                                     | Third character is the carrier                     |
| <b>0 through 20</b>                                                                                                                                                                    | Fourth and fifth character are the slot number     |
| <b>01 through 04</b><br>(Analog TIE trunks)<br><b>01 through 31</b>                                                                                                                    | Six and seventh characters are the circuit number  |

**⇒ NOTE:**

For example, 01A0612 is in cabinet 01, carrier A, slot 06, and circuit number (port) 12.

**COR**

Enter the class of restriction (COR) number that reflects the desired restriction for the hunt group. If this is a hunt group supporting the AUDIX in a DCS feature, the CORs on the Hunt Group screen on each switch must be the same.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| <b>0 to 95</b>       |              |

## Coverage Path

Enter a coverage path number. This assigns a coverage path for the hunt group. The coverage path is assigned using the Coverage Path screen. Does not appear if the Vector field is **y**

| Valid entries | Usage             |
|---------------|-------------------|
| 1 to 999      |                   |
| t1 to t999    | Time of day table |
| blank         |                   |

## Group Extension

Enter an unused extension number to be assigned to the hunt group. The field may not be blank.

| Valid entries | Usage                |
|---------------|----------------------|
| 1 to 7 digits | Unassigned extension |

## Group Name

Enter a character string that uniquely identifies the group (for example, “parts dept,” “purchasing,” or “sales dept”).

| Valid entries       | Usage |
|---------------------|-------|
| 27-character string |       |

## Group Number

This is a display-only field when the screen is accessed using an administration command such as **add** or **change**.

## Group Type

The group types available depend on what is administered on your System Parameters Customer Options screen for Automatic Call Distribution (ACD), Expert Agent Selection (EAS) and CentreVu Advocate. The table below shows what group types are available depending on your configuration.

Each option uses a different method to select an extension or agent for a call when two or more extensions or agents are available. The second table shows how calls are handled for each group type.

**Table 15. Group Types**

|                          | circ | ddc | ucd-<br>mia | ead-<br>mia | ucd-<br>loa | ead-<br>loa | pad |
|--------------------------|------|-----|-------------|-------------|-------------|-------------|-----|
| ACD=n                    | x    | x   |             |             |             |             |     |
| ACD, Split, Vector = n/y |      | x   | x           |             |             |             |     |
| ACD, Skill, Vector = n/y |      |     | x           | x           |             |             |     |
| ACD, Skill, Vector = y   |      |     | x           | x           | x           | x           |     |
| Advocate or Elite        |      |     |             |             |             |             |     |
| ACD, Skill, Vector = y   |      |     | x           | x           | x           | x           | x   |
| Dynamic Advocate         |      |     |             |             |             |             |     |

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ddc                  | Enter ddc when the call should be routed to the first extension or ACD agent assigned in the ACD split. Group type ddc is also known as “hot seat” distribution. “ddc” distribution is not available when the group is administered as a skill.                                                                                                                                                                              |
| ucd-mia<br>ucd-loa   | When ucd-mia or ucd-loa is entered, a call routes to the most-idle agent based on when the agent finished the most recent call (“ucd-mia”), or the least occupied agent based on agent occupancy (“ucd-loa”). Enter ucd-mia or ucd-loa if the hunt group has an AUDIX message. One of these entries is required when supporting the Outbound Call Management feature and when the Controlling Adjunct field is <b>asai</b> . |

| Valid entries      | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ead-mia<br>ead-loa | When ead-mia or ead-loa is entered, a call routes to the available agent with the highest skill level for the call. If two or more agents with equal skill levels are available, Avaya MultiVantage routes the call to the most-idle agent based on when the agent finished the most recent call (“ead-mia”), or the least occupied agent based on agent occupancy (“ead-loa”). This allows a call to be distributed to the agent best able to handle the call if multiple agents are available.              |
| circ               | Enter circ (circular) when the call should be routed in a “round-robin” order. The order in which you administer the extensions determines the order that calls are directed. The switch keeps track of the last extension in the hunt group to which a call was connected. The next call to the hunt group is offered to the next extension in the circular list independent of how long that extension has been idle. You cannot use circular hunting with automatic call distribution, queues, or vectors. |
| pad                | Enter pad (percent allocation distribution) to select an agent from a group of available agents based on a comparison of the agent’s work time in the skill and the agent’s target allocation for the skill.                                                                                                                                                                                                                                                                                                  |

### ISDN Caller Disp

This field is required if, on the System-Parameters Customer-Options screen, the ISDN-PRI or ISDN-BRI Trunks field is **y**.

| Valid entries                      | Usage                                                                                                                                               |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>grp-name</b><br><b>mbr-name</b> | Enter <b>grp-name</b> or <b>mbr-name</b> to specify whether the hunt group name or member name, respectively, will be sent to the originating user. |
| blank                              | If the ISDN-PRI or the ISDN-BRI Trunks field is <b>n</b> , this field must be blank.                                                                |

### MM Early Answer

This field applies for systems using Multimedia Call Handling only.

| Valid entries | Usage                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | The system begins to answer an H.320 call and establish an audio channel before offering the conversion call to the hunt group. This starts billing for the call when the call is first put into queue. |

### Night Service Destination

Enter the destination where calls to this split will redirect when the split is in the night service mode. Not all features will work correctly if this is not a local extension. Does not appear if the Vector field is **y**.

| Valid entries                                         | Usage                    |
|-------------------------------------------------------|--------------------------|
| An assigned extension number (can be a VDN extension) |                          |
| <b>attd</b>                                           | An attendant group code. |
| blank                                                 |                          |

### Queue

Specifies a queue for the hunt group.

| Valid entries | Usage                                                       |
|---------------|-------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> so the hunt group will be served by a queue. |

### Queue Length

Appears if the Queue field is **y**. Enter the maximum number of calls that can be in the queue at the same time. This field must have an entry when the Queue field is **y**.

| Valid entries | Usage                                                         |
|---------------|---------------------------------------------------------------|
| <b>1-200</b>  | For DEFINITY R, CSI, SI configurations                        |
| <b>1-999</b>  | For S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect |

### Security Code

Enter a 4-digit security code (password) used for the Demand Print feature.

| Valid entries         | Usage |
|-----------------------|-------|
| 4-digit security code |       |

## Time Warning Threshold

Appears if the Queue field is **y** and when the Calling Warning Port and the Time Warning Port fields are **X**. Enter the time in seconds that a call can remain in the queue before the System flashes the Queue status lamps (feature buttons assigned members phones) and the Auxiliary Queue Time Warning lamp assigned to this split/skill.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                                 |                                                                    |
|---------------------------------|--------------------------------------------------------------------|
| <b>0</b> to <b>999</b> or blank | An entry of <b>0</b> provides a warning whenever a call is queued. |
|---------------------------------|--------------------------------------------------------------------|

## (Time Warning) Extension

Appears if the Queue field is **y**. An extension is needed when an **X** is placed in Time Warning Port. This extension can be used by the Terminal Translation Initialization (TTI) feature to assign a port to this extension from the port itself. Once Time Warning Port is assigned a valid port (either via TTI or the **change hunt-group** command), then the extension is removed and considered unassigned.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|  |                                                             |
|--|-------------------------------------------------------------|
|  | Enter an unassigned extension. This field may not be blank. |
|--|-------------------------------------------------------------|

## (Time Warning) Port

Appears if the Queue field is **y**. Enter the seven-character port number assigned to the Auxiliary Queue Time Warning lamp that flashes when the time entered in Time Warning Threshold has been reached by a call in queue.

**⇒** NOTE:

This port is assigned to an Analog Line circuit pack or given an “X” designation if an extension is used. Enter the necessary characters.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                                                |                                                    |
|------------------------------------------------|----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or | First and second characters are the cabinet number |
|------------------------------------------------|----------------------------------------------------|

|                                                      |  |
|------------------------------------------------------|--|
| <b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or |  |
|------------------------------------------------------|--|

|                                                                                                   |  |
|---------------------------------------------------------------------------------------------------|--|
| <b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) |  |
|---------------------------------------------------------------------------------------------------|--|

|                           |                                |
|---------------------------|--------------------------------|
| <b>A</b> through <b>E</b> | Third character is the carrier |
|---------------------------|--------------------------------|

| <b>Valid entries</b>                               | <b>Usage</b>                                      |
|----------------------------------------------------|---------------------------------------------------|
| <b>0</b> through <b>20</b>                         | Fourth and fifth character are the slot number    |
| <b>01</b> through <b>04</b><br>(Analog TIE trunks) | Six and seventh characters are the circuit number |
| <b>01</b> through <b>31</b>                        |                                                   |

For example, 01A0612 is in cabinet 01, carrier A, slot 06, and circuit number (port) 12.

## TN

Enter the Tenant Partition number.

| <b>Valid entries</b>        | <b>Usage</b> |
|-----------------------------|--------------|
| <b>1</b> through <b>100</b> |              |

## Vector

See example screens for fields that display when this field is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to indicate that this hunt group will be vector controlled. On the System-Parameters Customer-Option screen, the Vectoring-Basic field must be <b>y</b> before <b>y</b> can be entered here. |

**Field description for page 2**

Page 2 of the Hunt group screen appears only when the ACD field on page 1 is **y**. If the ACD field is **n**, page 3 becomes page 2 and all subsequent page numbers are decreased by one.

The Timed ACW Interval field appears only if, on the System-Parameters Customer-Option screen, the Timed ACW field on page 3 is **y**.

**Screen 133. Hunt Group screen when Queue and Vector are y**

## AAS

Appears when the ACD field is **y**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|     |                                                                           |
|-----|---------------------------------------------------------------------------|
| y/n | Enter <b>y</b> if this hunt group is to serve as an Auto-Available Split. |
|-----|---------------------------------------------------------------------------|

## Acceptable Service Level (sec)

Appears if the ACD field is **y** and the Measured field is **internal** or **both**. Enter the number of seconds within which calls to this hunt group should be answered. This allows BCMS and/or VuStats to report a percentage of calls that were answered within the specified time. This entry is also used by the CentreVu® Advocate Service Objective feature.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                        |  |
|------------------------|--|
| 0 through 9999 seconds |  |
|------------------------|--|

## Adjunct CTI Link

Appears when the ACD field is **y** and the Controlling Adjunct field is **asai** or **adjlk**. Enter the appropriate ASAI CTI Link. This field cannot be blank.

## Controlling Adjunct

Appears only if the ACD field is **y**. If the controlling adjunct is a CONVERSANT voice system (requires an ASAI link), then enter **asai** in this field. (On the System-Parameters Customer-Option screen, the ASAI Link Core Capabilities and Computer Telephony Adjunct Links fields must be **y** for CallVisor ASAI capability and for an entry other than **none**.)

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|             |                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------|
| <b>none</b> | Indicates that members of the split/skill or hunt group are not controlled by an adjunct processor. |
|-------------|-----------------------------------------------------------------------------------------------------|

|             |                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>asai</b> | All agent logins are controlled by an associated adjunct and logged-in agents can only use their data terminal keyboards to perform phone functions (for example, change work state). |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Valid entries  | Usage                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>adjlk</b>   | Computer Telephony Adjunct Links                                                                                                                                                                                                                    |
| <b>asai-ip</b> | Indicates ASAI links administered without hardware and used by the Co-Resident DLG application. You cannot use this selection unless, on the System-Parameters Customer-Options screen, the Co-Res DEFINITY LAN Gateway field is <b>y</b> .         |
| <b>adj-ip</b>  | Indicates ASAI adjunct links administered without hardware and used by the Co-Resident DLG application. You cannot use this selection unless, on the System-Parameters Customer-Options screen, the Co-Res DEFINITY LAN Gateway field is <b>y</b> . |

### Dynamic Percentage Adjustment

Appears when ACD and Group Type fields on the Hunt Group screen are **pad** and the Business Advocate field is **y** on the System-Parameters Customer-Options screen.

| Valid entries | Usage |
|---------------|-------|
| <b>y/n</b>    |       |

### Dynamic Queue Position

Appears when the ACD and Skill fields are **y** on the Hunt Group screen and the Business Advocate field is **y** on the Feature-Related System Parameters screen.

| Valid entries | Usage                                                                                 |
|---------------|---------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to apply the dynamic queue operation to the calls queued to the skill. |

### Dynamic Threshold Adjustment

Appears when the ACD and Service Level Supervisor fields on the Hunt Group screen are **y** and the Business Advocate field is **y** on the System-Parameters Customer-Options screen.

| Valid entries | Usage |
|---------------|-------|
| <b>y/n</b>    |       |

### Expected Call Handling Time (sec)

Appears if, on the System-Parameters Customer-Options screen, either the Vectoring (Advanced Routing) or Business Advocate field is **y**, and, on the Hunt Group screen, the ACD field is **y**.

| Valid entries                       | Usage                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to <b>9999</b> in increments of 1 | Establishes the number of seconds for expected call handling. This value is used to initialize Expected Wait Time and is also used by the CentreVu® Advocate Percent Allocation feature. |

### Forced Entry of Stroke Counts or Call Work Codes

Appears when the ACD field is **y** and Controlling Adjunct field is **none**.

| Valid entries | Usage                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> so either a Stroke Count or Call Work Code must be entered for each call answered by an agent when in the Manual-In mode. |

### Inflow Threshold (sec)

Appears only when the ACD and Queue fields are **y** and Vector field is **n**. Enter the number of seconds that a call can remain in the queue before no more calls will be accepted by the queue. If 0 is entered, a call is redirected to this split/skill only if there is an available agent.

| Valid entries | Usage |
|---------------|-------|
| <b>0-999</b>  |       |

### Level 1 Threshold (sec)

Enter the number of seconds corresponding to the Expected Wait Time (EWT) you want to set for this threshold. For example, if you enter 45 calls whose EWT exceeds 45 seconds will be classified as over threshold 1. This field is used with Service Level Supervisor and only appears if the Service Level Supervisor field is **y**.

### Level 2 Threshold (sec)

Appears if the ACD field is **y**. Enter the number of seconds corresponding to the Expected Wait Time (EWT) you want to set for this threshold. For example, if you enter 60 calls whose EWT exceeds 60 seconds will be classified as over threshold 2. This field is used with Service Level Supervisor and only appears if the Service Level Supervisor field is **y**.

## Measured

Provides measurement data for the ACD split/skill collected (internal to the switch) for VuStats or BCMS. This measurement data is collected for VuStats and BCMS only if, on the System-Parameters Customer-Options screen, they are **y** and, on the Hunt Group screen, the ACD field is **y**.

| Valid entries   | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>internal</b> | <p>If you enter <b>internal</b> in this field and on the System-Parameters Customer-Options screen neither the VuStats or BCMS field is <b>y</b>, the system displays the following message:</p> <pre style="text-align: center;">&lt;value&gt; cannot be used; assign either BCMS or VuStats first</pre> <p>Contact your Avaya representative to assist with any changes you want to make on the System-Parameters Customer-Options screen.</p> |
| <b>external</b> | Provides measurements made by the Call Management System (external to switch).                                                                                                                                                                                                                                                                                                                                                                   |
| <b>both</b>     | Provides measurements collected both internally and externally.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>none</b>     | Measurement reports for this hunt group are not required.                                                                                                                                                                                                                                                                                                                                                                                        |

## Multiple Call Handling

Appears only if, on the System-Parameters Customer-Options screen, the Multiple Call Handling field is **y** and the ACD field on this screen is **y**. This field defines whether the hunt group can have multiple call handling capabilities, and if so, what type.

| Valid entries      | Usage                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>none</b>        | Agents who are members of that split/skill can only receive an ACD call from that split/skill when the phone is idle.                                                                                     |
| <b>on-request</b>  | Agents in the Multiple Call Handling split/skill can place a non-ACD or an ACD call on hold and select an available work mode. A queued ACD split/skill or direct agent call then is routed to the agent. |
| <b>many-forced</b> | An ACD call is delivered automatically to an idle line appearance if the agent is in the Auto-In/Manual-In (MI/AI) work mode and an unrestricted line appearance is available.                            |

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>one-forced</b>    | An ACD call is delivered automatically to an idle line appearance if the agent has no other ACD call on the station, is in the Auto-In/Manual-In (MI/AI) work mode, and an unrestricted line appearance is available.                                                                                        |
| <b>one-per-skill</b> | An ACD call is delivered automatically to an idle line appearance if the agent has no other ACD call for that skill on the station, is in the Auto-In/Manual-In (MI/AI) work mode, and an unrestricted line appearance is available. Valid in an EAS environment and only when the Skill field is <b>y</b> . |

### Priority On Intraflow

Appears if the ACD field is **y** and the Vector field is **n**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> for calls intraflowing from this split to a covering split to be given priority over other calls waiting in the covering split queue. |

### Redirect on No Answer (rings)

Appears if the ACD field is **y**. Enter the maximum number of rings before a call will redirect back to the split/skill, or to the administered VDN.

| <b>Valid entries</b> | <b>Usage</b>                       |
|----------------------|------------------------------------|
| <b>1 to 20</b>       |                                    |
| blank                | Deactivates Redirect on No Answer. |

### Redirect to VDN

Appears if the ACD field is **y**. To redirect a RONA call to a VDN instead of to the split/skill, enter the extension number of the VDN. The administered VDN must be on-premises and must be administered on the system. The VDN can specify a vector that will in turn route to an off-premises VDN. You cannot enter an extension in this field if the Redirection on No Answer (rings) field is blank. Direct Agent calls go to the agent's coverage path if it is administered. If not, the calls go to a VDN.

| <b>Valid entries</b>     | <b>Usage</b> |
|--------------------------|--------------|
| Assigned<br>VDN or blank |              |

## Service Level Supervisor

Appears if, on the System Parameters Customer-Options screen, the Business Advocate field is **y** and, on the Hunt Group screen, the ACD and Skill fields are **y**. For information on CentreVu® Advocate, please contact your Avaya Account Executive or see the *CentreVu® Advocate User Guide*.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                                |
|------------|----------------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> to use Service Level Supervisor for this skill. |
|------------|----------------------------------------------------------------|

## Service Level Target

Appears when the ACD field and the Dynamic Percentage Adjustment or Dynamic Threshold Adjustment field on the Hunt Group screen is **y** and the Business Advocate field is **y** on the System-Parameters Customer-Options screen.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|                                 |                                                                       |
|---------------------------------|-----------------------------------------------------------------------|
| <b>1-99</b> (percentage)        | Enter the percentage and time components of the service level target. |
| <b>1-9999</b> (time in seconds) |                                                                       |

## Service Objective

Appears when the Skill and Business Advocate fields on the Feature Related System Parameters screen are **y** and, on the Hunt Group screen, the ACD field is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|               |                                        |
|---------------|----------------------------------------|
| <b>1-9999</b> | Enter the per-skill service objective. |
|---------------|----------------------------------------|

## Skill

Appears if, on the System-Parameters Customer-Options screen, the Expert Agent Selection field is **y** and, on the Hunt Group screen, the ACD field is **y**.

If this field is **y**, then the Group Type field must be **ucd** or **ead**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|            |                                                          |
|------------|----------------------------------------------------------|
| <b>y/n</b> | Enter <b>y</b> if this hunt group is to be an EAS skill. |
|------------|----------------------------------------------------------|

## Supervisor Extension

Appears if the ACD field is **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

|  |                                                                                                                                            |
|--|--------------------------------------------------------------------------------------------------------------------------------------------|
|  | Enter the extension number (cannot be a VDN number) of the ACD split/skill supervisor that agents will reach when using the Assist feature |
|--|--------------------------------------------------------------------------------------------------------------------------------------------|

### Timed ACW Interval (sec)

When a value is entered in this field, an agent in auto-in work mode who receives an ACD call from this hunt group is placed automatically into After Call Work (ACW) when the call drops. Enter the number of seconds the agent should remain in ACW following the call. When the administered time is over, the agent automatically becomes available. Timed ACW cannot be administered if the hunt group is adjunct controlled, is an AUDIX Message Center, or is an auto-available split. The Timed ACW Interval field appears if, on the System Parameters Customer-Option screen, the Timed ACW field is **y** and, on the Hunt Group screen, the ACD field is **y**.

| Valid entries   | Usage                                                                    |
|-----------------|--------------------------------------------------------------------------|
| 1-9999 or blank | The number of seconds the agent should remain in ACW following the call. |

### VuStats Objective

Enter a numerical user-defined objective. An objective is a split or skill goal for the call. This could be an agent objective such as a specific number of calls handled or an average talk time. The objective could also be a percent within the service level. The objective appears on the VuStats display and allows agents and supervisors to compare the current performance against the value of the objective for the split or skill.

You can use this value in a customized VuStats display format if, on the VuStats display format screen, the Object Type field is either **agent**, **agent-extension**, or **split**.

Appears if, on the System-Parameters Customer-Options screen, the VuStats field is **y** and the Measured field is either **internal** or **both** and, on the Hunt Group screen, the ACD field is **y**.

| Valid entries | Usage                             |
|---------------|-----------------------------------|
| 0-99999       | Enter a split or skill objective. |

## Field description for page 3

```

change hunt-group 4 Page 3 of x
 HUNT GROUP
 Message Center: rem-vm
 Voice Mail Extension: _____
Calling Party Number to INTUITY AUDIX? n
 LWC Reception: none

```

### Screen 134. Hunt Group screen

#### AUDIX Name

Enter the name of the AUDIX machine as it appears on the Node Names screen. Only appears on DEFINITY R. Add the AUDIX name to the Node Names screen before entering it in this field. For more information on the Node Names screen, see *Administration for Network Connectivity for Avaya MultiVantage™ Software*.

#### Calling Party Number to INTUITY AUDIX

Appears when the Message Center field is **audix** or **rem-vm**.

| Valid entries | Usage                                                             |
|---------------|-------------------------------------------------------------------|
| y/n           | Enter <b>y</b> to send the calling party number to INTUITY AUDIX. |

#### First Announcement Delay (sec)

Enter the number of seconds that a call remains in queue before the associated first announcement is given the calling party. The call retains its place in the queue while the caller is listening to the recorded announcement. If the call hasn't been answered after the announcement, the caller hears music (for first announcement only) if Music-on-Hold is provided or ringing for as long as the call remains in queue. Appears only if the Queue field is **y** and the Vector field is **n**.

| Valid entries | Usage                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 through 99  | When <b>0</b> is entered, the first announcement is provided immediately to the caller. This value is set automatically to <b>0</b> if there is no queue. |
| blank         | This field must be blank if there is no first announcement.                                                                                               |

### First Announcement Extension

Appears when the ACD and Queue fields are **y** and the Vector field is **n**.

| Valid entries                                   | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enter a recorded announcement extension number. | This is the announcement the caller receives after being in the queue for the time interval specified in First Announcement Delay. If the call hasn't been answered after the announcement, the caller hears music (only after the first announcement) if Music-on-Hold is provided, or ringing for as long as it remains in the queue. If this is the forced first announcement, the caller always hears ringback after the announcement; otherwise, the caller hears music (if provided). |
| blank                                           | Leaving this field blank indicates there will be no announcement.                                                                                                                                                                                                                                                                                                                                                                                                                           |

### LWC Reception

Defines the destination for Leave Word Calling (LWC) messages left for the hunt group.

| Valid entries | Usage                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>audix</b>  | If LWC is attempted, the messages are stored in AUDIX. The Audix Name field must be filled in too.                                          |
| <b>msa</b>    | If LWC is attempted, the messages are stored in the system processing element (spe). The Messaging Server Name field must be filled in too. |
| <b>spe</b>    |                                                                                                                                             |
| <b>none</b>   |                                                                                                                                             |

### Message Center

Enter the type of messaging adjunct for the hunt group. Only one hunt group in the System can be administered as **audix**, one as **qsig-mwi**, one as **fp-mwi**, and one as **rem-vm**.

| Valid entries | Usage                                                           |
|---------------|-----------------------------------------------------------------|
| <b>msa</b>    | Messaging Server Adjunct                                        |
| <b>rem-vm</b> | DCS feature allowing voice mail to be located on another switch |
| <b>audix</b>  | For AUDIX located on this switch                                |

| Valid entries   | Usage                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>qsig-mwi</b> | QSIG network allowing voice mail to be located on another switch                                                                                                                  |
| <b>fp-mwi</b>   | Public network allowing AUDIX to be located on another switch; administrable only when the ISDN Feature Plus field on the System-Parameters Customer-Options screen is <b>y</b> . |
| <b>none</b>     | Indicates the hunt group does not serve as a message hunt group.                                                                                                                  |

### Message Center AUDIX Name

Enter the name of the Message Center AUDIX. Appears on DEFINITY R, S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect if the Message Center field is **audix** or **rem-vm**.

### Message Center MSA Name

#### NOTE:

Administer the IP Node Names screen first.

Enter the name of the Message Center MSA. When it appears, it replaces the Message Center AUDIX Name field. Appears on DEFINITY R, S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect if the Message Center field is **msa**.

### Messaging Server Name

Enter the name of the messaging server machine as it appears on the Node Names screen. Appears on DEFINITY R, S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect. Use the **change node-names** command to add the AUDIX name to the Node Names screen before entering it in this field. For more information on the Node Names screen, see *Administration for Network Connectivity for Avaya MultiVantage™ Software*.

### Primary

Appears on DEFINITY R, S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect if the Message Center field is **audix**, **rem-audix**, or **msa**.

| Valid entries | Usage                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> to indicate that the specified AUDIX or Messaging Server is the primary adjunct. |

### Second Announcement Extension

Appears only when the ACD and Queue fields both are **y** and the Vector field is **n**.

| Valid entries                                                   | Usage                                                              |
|-----------------------------------------------------------------|--------------------------------------------------------------------|
| Enter the extension number assigned to a recorded announcement. |                                                                    |
| blank                                                           | Leaving the field blank indicates there is no second announcement. |

### Second Announcement Delay (sec)

Appears only when the ACD and Queue fields both are **y** and the Vector field is **n**. Enter the time in seconds before the call in the queue receives a second recorded announcement or that the second announcement is repeated.

| Valid entries | Usage                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 through 99  | Avaya recommends that, if this split/skill or hunt group is a coverage point for another split/skill, this delay should not be more than 15 seconds. |
| blank         | Leave blank if there is no second announcement.                                                                                                      |

### Second Announcement Recurring

Appears only when the ACD and Queue fields both are **y** and the Vector field is **n**.

| Valid entries | Usage                                           |
|---------------|-------------------------------------------------|
| <b>y</b>      | The second announcement can be repeated.        |
| blank         | Leave blank if there is no second announcement. |

### Voice Mail Extension

Appears if the Message Center field is **rem-vm**.

| Valid entries | Usage                                                                    |
|---------------|--------------------------------------------------------------------------|
| extension     | Enter the UDP extension of the voice mail hunt group on the host switch. |

**Screen 135. Hunt Group for MWI screen**

**Calling Party Number to INTUITY AUDIX**

Only appears when the Message Center field is **audix** or **rem-audix**.

| <b>Valid entries</b> | <b>Usage</b>                                                      |
|----------------------|-------------------------------------------------------------------|
| y/n                  | Enter <b>y</b> to send the calling party number to INTUITY AUDIX. |

**First Announcement Extension**

Appears when the ACD and Queue fields are **y** and the Vector field is **n**.

| <b>Valid entries</b>                            | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enter a recorded announcement extension number. | This is the announcement the caller receives after being in the queue for the time interval specified in First Announcement Delay. If the call hasn't been answered after the announcement, the caller hears music (only after the first announcement) if Music-on-Hold is provided, or ringing for as long as it remains in the queue. If this is the forced first announcement, the caller always hears ringback after the announcement; otherwise, the caller hears music (if provided). |
| blank                                           | Leaving this field blank indicates there will be no announcement.                                                                                                                                                                                                                                                                                                                                                                                                                           |

### First Announcement Delay (sec)

Enter the number of seconds that a call remains in queue before the associated first announcement is given the calling party. The call retains its place in the queue while the caller is listening to the recorded announcement. If the call hasn't been answered after the announcement, the caller hears music (for first announcement only) if Music-on-Hold is provided or ringing for as long as the call remains in queue. Appears only if the Queue field is **y** and the Vector field is **n**.

| Valid entries              | Usage                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b> through <b>99</b> | When <b>0</b> is entered, the first announcement is provided immediately to the caller. This value is set automatically to <b>0</b> if there is no queue. |
| blank                      | This field must be blank if there is no first announcement.                                                                                               |

### LWC Reception

Defines the destination for Leave Word Calling (LWC) messages left for the hunt group.

| Valid entries | Usage                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>audix</b>  | If LWC is attempted, the messages are stored in AUDIX. The Audix Name field must be filled in too.                                          |
| <b>msa</b>    | If LWC is attempted, the messages are stored in the system processing element (spe). The Messaging Server Name field must be filled in too. |
| <b>spe</b>    |                                                                                                                                             |
| <b>none</b>   |                                                                                                                                             |

### Message Center

Enter the type of messaging adjunct for the hunt group. Only one hunt group in the System can be administered as **audix**, one as **qsig-mwi**, one as **fp-mwi**, one as **rem-audix**, and up to 6 as **qsig-mwi**.

| Valid entries    | Usage                                                      |
|------------------|------------------------------------------------------------|
| <b>rem-audix</b> | DCS feature allowing AUDIX to be located on another switch |
| <b>audix</b>     | For AUDIX located on this switch                           |

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                    |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>qsig-mwi</b>      | QSIG network allowing AUDIX to be located on another switch                                                                                                                     |
| <b>fp-mwi</b>        | Public network allowing AUDIX to be located on another switch; administrable only when the ISDN Feature Plus field on the System-Parameters Customer-Options screen is <b>y</b> |
| <b>none</b>          | Indicates the hunt group does not serve as a message hunt group.                                                                                                                |

### Routing Digits (e.g. AAR/ARS Access Code)

Appears only if the Message Center field is **qsig-mwi** or **fp-mwi**. Shows the AAR (most likely for a Message Center type of **qsig-mwi**) or ARS (most likely for a Message Center type of **fp-mwi**) access code which when prepended to the AUDIX Complete Number field defines a route to the Message Center switch hunt group containing the line ports to the AUDIX.

| <b>Valid entries</b> | <b>Usage</b>      |
|----------------------|-------------------|
| <b>0-9, *, or #</b>  | Enter 1-4 digits. |

### Second Announcement Delay (sec)

Appears only when the ACD and Queue fields both are **y** and the Vector field is **n**. Enter the time in seconds before the call in the queue receives a second recorded announcement or that the second announcement is repeated.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1 through 99</b>  | Avaya recommends that, if this split/skill or hunt group is a coverage point for another split/skill, this delay should not be more than 15 seconds. |
| blank                | Leave blank if there is no second announcement.                                                                                                      |

### Second Announcement Extension

Appears only when the ACD and Queue fields both are **y** and the Vector field is **n**.

| <b>Valid entries</b>                                            | <b>Usage</b>                                                       |
|-----------------------------------------------------------------|--------------------------------------------------------------------|
| Enter the extension number assigned to a recorded announcement. |                                                                    |
| blank                                                           | Leaving the field blank indicates there is no second announcement. |

## Second Announcement Recurring

Appears only when the ACD and Queue fields both are **y** and the Vector field is **n**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                 |
|----------|-------------------------------------------------|
| <b>y</b> | The second announcement can be repeated.        |
| blank    | Leave blank if there is no second announcement. |

## Voicemail Number

Appears only if, on the System-Parameters Customer-Options screen, the Basic Call Setup and Basic Supplementary Services fields are **y** and the Message Center field on this screen is **qsig-mwi** or **fp-mwi**. The **qsig-mwi** selection shows the complete number of the AUDIX hunt group on the Message Center switch for QSIG MWI. The **fp-mwi** selection shows the public network number of the AUDIX hunt group on the Message Center switch.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                 |                                          |
|-----------------|------------------------------------------|
| Up to 17 digits | Enter the complete AUDIX dial-up number. |
|-----------------|------------------------------------------|

### Screen 136. Hunt Group Members screen

 **NOTE:**

Only Pages 1, 2, and 3 appear if the hunt group is skilled.

### **Administered Members (min/max)**

Appears on all member pages. Indicates the minimum and maximum member number administered for this hunt group.

### **At End of Member List**

This display-only field shows the current page is also the last page.

### **Group Extension**

This display-only field shows the extension of the hunt group.

### **Group Number**

This display-only field shows the number of a hunt group.

### **Group Type**

This display-only field shows the type of the hunt group.

### **Member Range Allowed**

The range of allowed members displays on all member pages. These values vary depending on the particular system and/or configuration.

### **More Members Exist**

This display-only field shows there are more members than currently displayed (the current page is not the last page).

### **Total Administered Members**

Appears on all member pages. Indicates the total number of members administered for this hunt group.

## **GROUP MEMBER ASSIGNMENTS**

---

### **Ext**

A display-only field if the Controlling Adjunct field is **asai**. Controlled Agent extensions must be entered on the Adjunct Controlled Agent Table screen. The extension cannot be a VDN. The data module cannot be a member of an ACD split/skill.

| <b>Valid entries</b>                                             | <b>Usage</b>                                    |
|------------------------------------------------------------------|-------------------------------------------------|
| Enter the assigned extension for a station or attendant console. | If the Controlling Adjunct field is <b>none</b> |

**Name**

This display-only field shows the name assigned to the above extension number when it is administered in the System.

**Intercom Group**

This screen assigns extensions to intercom groups.

```

**Screen 137. Intercom Group**

**DC**

This field assigns a dial code to an extension. The dial code is the code users must dial to make intercom calls to the corresponding extension.

**Valid entries**

**Usage**

1- or 2-digit code

The number of digits entered must exactly match the number assigned in the Length of Dial Code field. For example, if the Length of Dial Code field is set to 2, you must type 1 as 01 in the DC field. This field cannot be blank.

## Ext

This field assigns an extension to the group.

| <b>Valid entries</b> | <b>Usage</b>                                                              |
|----------------------|---------------------------------------------------------------------------|
| an extension number  | Enter a physical extension number. You may not enter a VDN in this field. |

## Group Number

This display-only field shows the group's ID number.

## Length of Dial Code

This field sets the number of digits that users must dial to access an extension in the group. (On Page 2, this is a display-only field.)

| <b>Valid entries</b> | <b>Usage</b>                                    |
|----------------------|-------------------------------------------------|
| 1                    | Enter <b>1</b> if there are 9 or fewer members. |
| 2                    | Enter <b>2</b> if there are 10 or more members. |

## Name

Display-only field. The switch fills in this field with the name from the Station screen.

## IXC Code Format

| <b>Valid entries</b>     | <b>Usage</b> |
|--------------------------|--------------|
| 1 to 4 digit code format |              |
| *                        |              |
| x                        |              |
| X                        |              |
| xxxx                     | For line 1   |
| xxx                      | For line 2   |

## IXC Prefix

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| 1 to 3 digit prefix  |              |
| *                    |              |
| 101                  | For line 1   |
| 10                   | For line 2   |

## Intra-Switch CDR

---

This screen administers extensions for which Intra-Switch CDR is to be enabled.

### NOTE:

Attendants are not allowed to be optioned for the Intra-Switch CDR feature.

If your system can record more than 100 stations, the system only displays two pages of extensions (112 per page) at one time. When you enter the add command to add extensions, the system automatically begins after the last administered extensions. If you enter the change command, the system display begins with the first extension. If you enter the change command with an extension number, the system begins the display with that extension.

When you enter the command list intra-switch-cdr <extension> count x, the system lists “x” switch extensions administered for Intra-Switch CDR beginning with the extension specified by <extension>. For example, if you enter “list intra-switch-cdr 81000 count 500,” the system displays extension 81000 (if it is administered for Intra-Switch CDR) and the next 500 extensions that are administered for Intra-Switch CDR. The display command functions similarly to the change command.

## Capacities

The Intra-Switch CDR extension capacities vary from switch to switch. See the *Avaya MultiVantage™ Solutions Hardware Guide*.

```

### Screen 141. IP Address Mapping

#### From IP Address

Defines the starting IP address.

**Valid entries**

32-bit address  
(4 decimal numbers,  
each in the range  
0-255)

**Usage**

See the *Administration for Network Connectivity for Avaya MultiVantage™ Software* for more information.

## To IP Address

---

Defines the termination of the IP address.

If this field and the Subnet Mask fields are blank when submitted, the address in the From IP Address field is copied into this field.

The Subnet Mask field data is applied to the From field, created the converted To IP Address field information.

| <b>Valid entries</b>                                                 | <b>Usage</b>                                                                                                  |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| 32-bit address<br>(4 decimal numbers,<br>each in the range<br>0-255) | See the <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> for more information. |

## Subnet or Mask

---

Specifies the mask to be used to obtain the subnetwork identifier from the IP address.

If this field is non-blank on submit, then:

- The mask is applied to the From IP Address field, placing zeros in the non-masked rightmost bits. This becomes the stored “From” address.
- The mask is applied to the To IP Address field, placing 1’s in the non-masked rightmost bits. This becomes the stored “To” address.

If this field and the To IP Address fields are blank when submitted, the address in the From IP Address field is copied into the To IP Address field.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| 0-32 or blank        |              |

## Region

---

Identifies the network region for the IP address range.

| <b>Valid entries</b>                            | <b>Usage</b>                                                                                                       |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>1-250</b>                                    | Enter the network region number for this interface.                                                                |
| <b>1-80</b> for DEFINITY<br>SI (off the switch) | This field must contain a non-blank value if the From IP Address field on the same row contains a non-blank value. |

## VLAN

---

Sends VLAN instructions to IP endpoints such as IP telephones and softphones. This field does not send VLAN instructions to the PROCR (S8300 Media Server, S8700 IP-Connect, and S8700 Multi-Connect), CLAN, and Media Processor boards.

| Valid entries | Usage                            |
|---------------|----------------------------------|
| 0-4094        | Specifies the virtual LAN value. |
| n             | Disabled                         |

## IP Codec Set

---

The IP Codec Set screen allows you to specify the type of codec used for voice encoding and companding (compression/decompression). The main difference between codecs is in the compression algorithm used; some codecs compress the voice data more than others. A greater degree of compression results in lower bandwidth requirements on the network, but may also introduce transmission delays and lower voice quality.

The default codec is set for G711. The G711 provides the highest voice quality because it does the least amount of compression, but it uses the most bandwidth. The G711 default setting can be changed to one of four other codecs if the G711 does not meet your desired voice-quality/bandwidth trade-off specification. Also, if the far-end switch is not an Avaya MultiVantage, you may need to change the codec to match one that is supported by that switch.

The order in which the codecs are listed on this screen is the order of preference of usage. A trunk call between two DEFINITY switches will be set up to use the first common codec listed.

### NOTE:

The codec ordering *must be the same* on DEFINITY switches at both ends of an H.323 trunk connection. The *set* of codecs listed need not be the same, but the *order* of the listed codecs must be the same.

This screen allows you to define the allowed codecs and packet sizes used by each IP network region. You can also enable silence suppression on a per-codec basis. This screen will dynamically display the packet size in milliseconds for each codec in the set, based on the number of frames you administer per packet.

```

change ip-codec-set 1
Page 1 of 1

IP Codec Set

Codec Set: 1

Audio Silence Frames Packet
Codec Suppression Per Pkt Size (ms)
1: G.711MU y 3 30
2: _____ - - -
3: _____ - - -
4: _____ - - -
5: _____ - - -

```

**Screen 142. IP Codec Set screen**

## Audio Codec

Specifies the audio codec used for this codec set.

| Valid entries           | Usage                                    |
|-------------------------|------------------------------------------|
| <b>G.711A</b> (a-law)   | Enter the codec used for this codec set. |
| <b>G.711MU</b> (mu-law) |                                          |
| <b>G.723-5.3</b>        |                                          |
| <b>G.723-6.3</b>        |                                          |
| <b>G.729</b>            |                                          |
| <b>G.729A</b>           |                                          |
| <b>G.729B</b>           |                                          |
| <b>G.729AB</b>          |                                          |

## Codec Set

A display-only field that identifies the IP codec set.

## Frames Per Pkt

Specify the number of frames per packet up to 60 milliseconds.

| Valid entries       | Usage                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1-6</b> or blank | Specify the number of frames per packet up to 60 ms. Note: the frame size for G.711 and G.729 codecs is 1 (10ms), and for G.723.1 is 3 (30ms). |

## Packet Size (ms)

A display-only field showing the packet size in milliseconds.

## Silence Suppression

Enables RTP-level silence suppression on the audio stream.

**Valid entries**

**Usage**

**y/n** Enter **y** to enable RTP-level silence suppression on the audio stream.

## IP Interfaces

Use this screen to assign a network region to each IP interface device. Use one line for each C-LAN, VAL, and IP interface circuit pack.

```

change ip-interfaces

Screen 143. IP Interfaces screen

### Code/Sfx

Display-only fields that identify the interface.

**Valid display**

**Usage**

**TN799, TN802, TN2302, 2501AP**

Displays the circuit pack code number.

## Gateway Address

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                        |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0-255</b>         | Enter the address of a network node that serves as the default gateway for the IP interface. Entering a value in this field poses a potential security risk. For more information on using a default gateway, see <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> . |

## Net Rgn

Identify the network region for the interface on this row.

| <b>Valid entries</b> | <b>Usage</b>                                        |
|----------------------|-----------------------------------------------------|
| <b>1-250</b>         | Enter the network region number for this interface. |

## Node Name

The unique node name for the IP interface. The node name here already must be administered on the Node Names screen.

| <b>Valid entries</b> | <b>Usage</b>                |
|----------------------|-----------------------------|
| Character string     | Enter the name of the node. |

## ON

Allows use of the ethernet port.

| <b>Valid entries</b> | <b>Usage</b>                                                                                    |
|----------------------|-------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Enter <b>y</b> to use the ethernet port. Enter <b>n</b> before you make changes on this screen. |

## Slot

Describes the physical port location of the interface on your system. Enter the necessary characters.

| Valid entries                                                                                                                                                                                               | Usage                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number |
| <b>A</b> through <b>E</b>                                                                                                                                                                                   | Third character is the carrier                     |
| <b>0</b> through <b>20</b>                                                                                                                                                                                  | Fourth and fifth character are the slot number     |
| <b>01</b> through <b>04</b><br>(Analog TIE trunks)<br><b>01</b> through <b>31</b>                                                                                                                           | Six and seventh characters are the circuit number  |

## Subnet Mask

The subnet mask is a 32-bit binary number that divides the network ID and the host ID in an IP address.

| Valid entries                                    | Usage                                                                            |
|--------------------------------------------------|----------------------------------------------------------------------------------|
| <b>255, 254, 252, 248, 240, 224, 192, 128, 0</b> | Identifies the subnet mask associated with the IP address for this IP interface. |

## Type

Identify the type of IP interface.

| Valid entries                | Usage                           |
|------------------------------|---------------------------------|
| <b>c-lan, VAL, or medpro</b> | Enter the type of IP interface. |
| <b>procr</b>                 | For S8700 IP-Connect only.      |

## VLAN

This field sends VLAN instructions to the PROCR (S8300 Media Server, S8700 IP-Connect, and S8700 Multi-Connect), CLAN, and Media Processor boards. It does not send VLAN instructions to IP endpoints such as IP telephones and softphones. This field cannot be administered for VAL boards.

| Valid entries | Usage                            |
|---------------|----------------------------------|
| 0-4095        | Specifies the virtual LAN value. |
| n             | Disabled                         |

## IP Network Region

Use this screen to pool devices with LAN-like connectivity. The first page is used to modify the audio and QoS settings. The Codec Set field on this page reflects the CODEC set that must be used for connections between phones within this region or between phones and MedPro/Prowler boards within this region.

**Screen 144. IP Network Region screen**

## Name

Description of the region.

| <b>Valid entries</b> | <b>Usage</b>          |
|----------------------|-----------------------|
| Up to 20 characters  | Describes the region. |

## Region

A display-only field indicating the number of the region being administered.

## Audio Parameters

### Codec Set

Specifies the codec assigned to the region.

| <b>Valid entries</b> | <b>Usage</b>                                       |
|----------------------|----------------------------------------------------|
| 1-7                  | Enter the number for the codec set for the region. |

### Direct IP-IP Audio Connections

Allows direct audio connections between IP endpoints.

| <b>Valid entries</b> | <b>Usage</b>                                                                                               |
|----------------------|------------------------------------------------------------------------------------------------------------|
| y/n                  | Enter to <b>y</b> to save on bandwidth resources and improve sound quality of voice over IP transmissions. |

### IP Audio Hairpinning

Allows IP endpoints to be connected through the IP circuit pack on the switch.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                             |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| y/n                  | Enter <b>y</b> to allow IP endpoints to be connected through the IP circuit pack on the switch in IP format, without going through the DEFINITY TDM bus. |

## Location

Specifies the location by IP network region allowing correct date and time information and trunk routing based on IP network region.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1-44</b>          | (For DEFINITY R, CSI, SI only.) Enter the number for the location for the IP network region. The IP endpoint uses this as its location number. This applies to IP telephones and softphones.                                                                                                                                                                                                                                                             |
| <b>1-64</b>          | (For Avaya S8300 Media Server, Avaya S8700 Multi-Connect, and Avaya S8700 IP-Connect only.) Enter the number for the location for the IP network region. The IP endpoint uses this as its location number. This applies to IP telephones and softphones.                                                                                                                                                                                                 |
| blank                | The location is obtained from the cabinet containing the CLAN that the endpoint registered through or the media gateway containing the Internal Call Controller or Local Spare Processor on an Avaya S8300 Media Server that the endpoint registered through. This applies to IP telephones and softphones. Traditional cabinets, Remote Offices, and the Avaya S8300 Media Server all have their locations administered on their corresponding screens. |

## RTCP Enabled

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                         |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>y/n</b>           | Specifies whether you want to enable RTCP. If this field is set to <b>y</b> , then the RTCP Monitor Server Parameters fields appear. |

## UDP Port Range

---

### UPD Port Range Max

Specifies the maximum range of the UDP port number used for audio transport.

| <b>Valid entries</b> | <b>Usage</b>                                                      |
|----------------------|-------------------------------------------------------------------|
| <b>3-65535</b>       | Enter the highest UDP port number to be used for audio transport. |

### UPD Port Range Min

Specifies the minimum range of the UDP port number used for audio transport.

| <b>Valid entries</b> | <b>Usage</b>                                                     |
|----------------------|------------------------------------------------------------------|
| <b>2-65534</b>       | Enter the lowest UDP port number to be used for audio transport. |

### RTCP Monitor Server Parameters

#### RTCP Report Period (secs)

This field only appears when the Use Default Server Parameters field is set to **n** and the and the RTCP Enabled field is set to **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                    |
|----------------------|-----------------------------------------------------------------|
| <b>5-30</b>          | Enter the report period for the RTCP Monitor server in seconds. |

#### Server IP Address

This field only appears when the Use Default Server Parameters field is set to **n** and the and the RTCP Enabled field is set to **y**

| <b>Valid entries</b>                         | <b>Usage</b>                                      |
|----------------------------------------------|---------------------------------------------------|
| <b>0-255</b> in<br>nnn.nnn.nnn.nnn<br>format | Enter the IP address for the RTCP Monitor server. |

#### Server Port

This field only appears when the Use Default Server Parameters field is set to **n** and the and the RTCP Enabled field is set to **y**

| <b>Valid entries</b> | <b>Usage</b>                                |
|----------------------|---------------------------------------------|
| <b>1-65535</b>       | Enter the port for the RTCP Monitor server. |

## Use Default Server Parameters

This field only appears when the RTCP Enabled field is set to **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                   |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b>             | Enter <b>y</b> to use the default RTCP Monitor server parameters as defined on the IP Options System Parameters screen. If set to <b>y</b> , you must complete the Default Server IP Address field on the IP Options System Parameters screen. |
| <b>n</b>             | If you enter <b>n</b> , you need to complete the Server IP Address, Server Port, and RTCP Report Period fields that appear.                                                                                                                    |

## DiffServ/TOS Parameters

### BBE PHB Value

This field contains the Better than Best Effort (BBE) PHB value.

| <b>Valid entries</b> | <b>Usage</b>                                                |
|----------------------|-------------------------------------------------------------|
| <b>0-63</b>          | Enter the decimal equivalent of the DiffServ BBE PHB value. |

### Call Control 802.1p Priority

Provides Layer 2 priority for Layer 2 switches.

| <b>Valid entries</b> | <b>Usage</b>                         |
|----------------------|--------------------------------------|
| <b>0-7</b>           | Specifies the 802.1p priority value. |

### Call Control Value

Provides scalable service discrimination in the Internet without per-flow state and signaling at every hop. Use the IP TOS field to support the DiffServ codepoint.

| <b>Valid entries</b> | <b>Usage</b>                                                |
|----------------------|-------------------------------------------------------------|
| <b>0-63</b>          | Enter the decimal equivalent of the Call Control PHB value. |

### VoIP Media 802.1p Priority

Provides Layer 2 priority for Layer 2 switches.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

0-7

Specifies the Audio 802.1p priority value.

### VoIP Media PHB Value

Provides scalable service discrimination in the Internet without per-flow state and signaling at every hop. Use the IP TOS field to support the Audio PHB codepoint.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

0-63

Enter the decimal equivalent of the DiffServ Audio PHB value.

### Resource Reservation Parameters

#### Retry upon RSVP Failure Enabled

This field only appears if the RSVP Enabled field is set to **y**.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

y/n

Specifies whether you to enable retries when RSVP fails.

#### RSVP Enabled

Controls the appearance of the other fields in this section.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

y/n

Specifies whether or not you want to enable RSVP.

#### RSVP Profile

This field only appears if the RSVP Enabled field is set to **y**. You set this field to what you have configured on your network.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

---

**guaranteed-service**

**controlled-load**

**RSVP Refresh Rate (secs)**

This field only appears if the RSVP Enabled field is set to **y**.

| Valid entries | Usage                                   |
|---------------|-----------------------------------------|
| 1-99          | Enter the RSVP refresh rate in seconds. |

**Page 2**

This page displays a matrix where each cell in the matrix represents a network region. If network region **x** is connected to network region 4, then when **change ip-network-region x** is run, 4's cell contains the CODEC set for the connection between the two regions. A cell value can be changed to reflect a different CODEC set or to add or remove connections between network regions. Any changes made to **x**'s connection to network region **y** are reflected automatically in **y**'s IP Network Region screen.

To illustrate how the matrix is used, notice that the second row of the matrix is for network regions 33 through 64 which indicates that the first column in that row represents network region 33, the second column is for 34, and so on, until the last column is for 64. So a value of "4" in that row's second column indicates that the network region specified in the command (**x = 3**) has a connection to network region 34 and the codec set for that connection is 4.

```

change ip-network-region 3 Page 2 of 2

 Inter Network Region Connection Management

Region (Group of 32)

**Screen 147. IP-Options System Parameters screen**

**IP MEDIA PACKET PERFORMANCE THRESHOLDS**

**Number of Pings Per Measurement Interval**

Specifies the number of test pings that comprise a measurement from which the performance values (delay and loss) are calculated.

| <b>Valid entries</b> | <b>Usage</b>                     |
|----------------------|----------------------------------|
| <b>10-100</b>        | Enter the number. Default is 10. |

**Packet Loss (%)**

Specifies thresholds to be applied to packet loss rates (as measured by ping) for determining activation/deactivation of signaling group bypass.

**High**

| <b>Valid entries</b>        | <b>Usage</b>                                                     |
|-----------------------------|------------------------------------------------------------------|
| <b>0</b> through <b>100</b> | This value cannot be less than the minimum value. Default is 40. |

**Low**

| <b>Valid entries</b>        | <b>Usage</b>                                                     |
|-----------------------------|------------------------------------------------------------------|
| <b>0</b> through <b>100</b> | This value cannot be more than the maximum value. Default is 15. |

**Ping Test Interval (sec)**

Specifies the time between performance test pings for each testable signaling group.

| <b>Valid entries</b>         | <b>Usage</b>                   |
|------------------------------|--------------------------------|
| <b>10</b> through <b>999</b> | Enter the time. Default is 20. |

**Roundtrip Propagation Delay (ms)**

Specifies thresholds to be applied to roundtrip packet propagation delays (as measured by ping) for use in activating or clearing signaling group bypass.

**High**

| <b>Valid entries</b>          | <b>Usage</b>                                                      |
|-------------------------------|-------------------------------------------------------------------|
| <b>10</b> through <b>9999</b> | This value cannot be less than the minimum value. Default is 800. |

**Low**

| <b>Valid entries</b>          | <b>Usage</b>                                                      |
|-------------------------------|-------------------------------------------------------------------|
| <b>10</b> through <b>9999</b> | This value cannot be more than the maximum value. Default is 400. |

## **RTCP MONITOR SERVER**

---

### **Default RTCP Report Period(secs)**

In conjunction with the IP address and server port, this value tells the IP phones, IP softphones and VoIP media modules how often to send the information (RTCP packets) to the server.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|              |  |
|--------------|--|
| 5 through 99 |  |
|--------------|--|

### **Default Server IP Address**

The default server IP address that can be utilized by the IP Network Region screen for each administered region.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|                                    |                                                                                              |
|------------------------------------|----------------------------------------------------------------------------------------------|
| 0-255 in<br>nnn.nnn.nnn.nnn format | A unique IP address is assigned to each port on any IP device that is used for a connection. |
|------------------------------------|----------------------------------------------------------------------------------------------|

### **Default Server Port**

The RTCP monitor is a separate computer that receives RTCP packets from many devices. The MultiVantage software pushes these values to IP phones, IP softphones and VoIP media modules such that they know where to send the data. The IP address is that of the RTCP server. The server port is the TCP/IP port of that RTCP server where the information should be sent.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|         |                                               |
|---------|-----------------------------------------------|
| 1-65535 | Enter the port being used as an RTCP monitor. |
|---------|-----------------------------------------------|

## **MEDIA GATEWAY ANNOUNCEMENT SERVER PARAMETERS (available in December)**

---

### **Announcement Server IP Address**

Identifies the IP address of the Announcement Server.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
|----------------------|--------------|

|       |                                                                                              |
|-------|----------------------------------------------------------------------------------------------|
| 0-255 | A unique IP address is assigned to each port on any IP device that is used for a connection. |
|-------|----------------------------------------------------------------------------------------------|

## Announcement Storage Path Name

Indicates the path name on the Announcement Server where the announcements are stored.

| Valid entries                | Usage                                                         |
|------------------------------|---------------------------------------------------------------|
| Up to 40 characters or blank | Enter the directory path name where announcements are stored. |

## Login

Indicates the login to be used by the Media Gateway to access the Announcement Server.

| Valid entries            | Usage                              |
|--------------------------|------------------------------------|
| 1-10 characters or blank | Enter a login up to 10 characters. |

## Password

Indicates the password to be used by the Media Gateway to access the Announcement Server.

| Valid entries            | Usage                                 |
|--------------------------|---------------------------------------|
| 1-10 characters or blank | Enter a password up to 10 characters. |

## IP Routing

```

change ip-route 1
 Page 1 of 1

 IP ROUTING

Route Number:
Destination Node:
Network Bits: Subnet Mask:
Gateway:
Board:
Metric:

```

**Screen 148. IP Routing screen**

## Board

Enter the necessary characters.

| <b>Valid entries</b>                                                                                                                                                                                        | <b>Usage</b>                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>01</b> through <b>44</b><br>(DEFINITY R) or<br><b>01</b> through <b>03</b><br>(DEFINITY CSI, SI) or<br><b>1</b> through <b>64</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server) | First and second characters are the cabinet number |
| <b>A</b> through <b>E</b>                                                                                                                                                                                   | Third character is the carrier                     |
| <b>0</b> through <b>20</b>                                                                                                                                                                                  | Fourth and fifth character are the slot number     |
| <b>01</b> through <b>04</b><br>(Analog TIE trunks)<br><b>01</b> through <b>31</b>                                                                                                                           | Six and seventh characters are the circuit number  |
| <b>1</b> through <b>80</b><br>(DEFINITY R, CSI) or<br><b>1</b> through <b>10</b> (DEFINITY SI) or<br><b>1</b> through <b>250</b><br>(S8700 IP-Connect /<br>S8700 Multi-Connect /<br>S8300 Media Server)     | Gateway                                            |
| <b>V1</b> through <b>V9</b>                                                                                                                                                                                 | Module                                             |

## Destination Node

The node name of the final destination for this connection.

| <b>Valid entries</b>                                  | <b>Usage</b>                                                                      |
|-------------------------------------------------------|-----------------------------------------------------------------------------------|
| The name previously entered on the Node Names screen. | Enter the name of the final destination node of the IP route for this connection. |

## Gateway

The node name of the first intermediate node.

| Valid entries                                                                                                                                                | Usage                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A name previously entered on the Node Names screen and is either a port on the CLAN circuit pack or is identified as a Destination Node on another IP route. | <p>If there are one or more intermediate nodes, the first intermediate node is the Gateway.</p> <p>If there are no intermediate nodes between the local and remote CLAN ports for this connection, the Gateway is the local CLAN port.</p> |

## Metric

| Valid entries | Usage                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 or 1        | <p>Enter <b>1</b> on a switch that has more than one CLAN circuit pack installed.</p> <p>See <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> for more information.</p> |

## Network Bits

This field is a 32-bit binary number that divides the network ID and the host ID in an IP address.

| Valid entries | Usage                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0-32          | Enter the number of Network Bits that corresponds to the Subnet Mask for the IP Route. If you skip this field and enter a Subnet Mask, the system automatically sets the corresponding Network Bits value. For example, if you set this field to <b>24</b> , then the system sets the Subnet Mask field to <b>255.255.255.0</b> . |

## Route Number

Identifies the IP route.

| Valid entries | Usage                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------|
| 1-400         | Enter the number of the IP route you want to add or change, or enter <b>n</b> for the next available number. |

## Subnet Mask

| Valid entries                                    | Usage                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>255, 254, 252, 248, 240, 224, 192, 128, 0</b> | Enter the subnet mask associated with this IP route. If you enter a value in the Network Bits field, the system automatically completes this field with the corresponding Subnet Mask. For example, if you set this field to <b>255.255.255.0</b> , then the system sets the Network Bits field to <b>24</b> . |

There is one-to-one mapping between the `Network Bits` and the `Subnet Mask` fields; entering a value in one field uniquely determines the other field. A list of Subnet Mask addresses and their corresponding Network Bits are shown in [Table 16](#)).

**Table 16. Network Bits and Subnet Mask fields**

| Network Bits | Subnet Mask | Number of Hosts | Network Type |
|--------------|-------------|-----------------|--------------|
| 0            | 0.0.0.0     | 4,294,967,294   | / 0          |
| 1            | 128.0.0.0   | 2,147,483,646   | / 1          |
| 2            | 192.0.0.0   | 1,073,741,822   | / 2          |
| 3            | 224.0.0.0   | 536,870,910     | / 3          |
| 4            | 240.0.0.0   | 268,435,454     | / 4          |
| 5            | 248.0.0.0   | 134,217,726     | / 5          |
| 6            | 252.0.0.0   | 67,108,862      | / 6          |
| 7            | 254.0.0.0   | 33,554,430      | / 7          |
| 8            | 255.0.0.0   | 16,777,214      | / 8          |
| 9            | 255.128.0.0 | 8,388,606       | / 9          |
| 10           | 255.192.0.0 | 4,194,302       | / 10         |
| 11           | 255.224.0.0 | 2,097,150       | / 11         |
| 12           | 255.240.0.0 | 1,048,574       | / 12         |
| 13           | 255.248.0.0 | 524,286         | / 13         |
| 14           | 255.252.0.0 | 262,142         | / 14         |
| 15           | 255.254.0.0 | 131,070         | / 15         |

*Continued on next page*

**Table 16. Network Bits and Subnet Mask fields (Continued)**

| <b>Network Bits</b> | <b>Subnet Mask</b> | <b>Number of Hosts</b> | <b>Network Type</b> |
|---------------------|--------------------|------------------------|---------------------|
| 16                  | 255.255.0.0        | 65,534                 | / 16                |
| 17                  | 255.255.128.0      | 32,766                 | / 17                |
| 18                  | 255.255.192.0      | 16,382                 | / 18                |
| 19                  | 255.255.224.0      | 8,190                  | / 19                |
| 20                  | 255.255.240.0      | 4,094                  | / 20                |
| 21                  | 255.255.248.0      | 2,046                  | / 21                |
| 22                  | 255.255.252.0      | 1,022                  | / 22                |
| 23                  | 255.255.254.0      | 510                    | / 23                |
| 24                  | 255.255.255.0      | 254                    | / 24                |
| 25                  | 255.255.255.128    | 126                    | / 25                |
| 26                  | 255.255.255.192    | 62                     | / 26                |
| 27                  | 255.255.255.224    | 30                     | / 27                |
| 28                  | 255.255.255.240    | 14                     | / 28                |
| 29                  | 255.255.255.248    | 6                      | / 29                |
| 30                  | 255.255.255.252    | 2                      | / 30                |
| 31                  | 255.255.255.254    | 1                      | / 31                |
|                     | 255.255.255.255    | 0                      | / 32                |

**⇒ NOTE:**

For the Network Bits and Subnet Mask fields, if you put a value into either field and then press ENTER or TAB to move the cursor to another field, the other field gets populated automatically with a value corresponding to the one you just entered.

## IP Services

change ip-services Page 1 of X

| IP SERVICES  |         |            |            |             |             |
|--------------|---------|------------|------------|-------------|-------------|
| Service Type | Enabled | Local Node | Local Port | Remote Node | Remote Port |

Screen 149. IP Services screen

### Enabled

When the Service Type field is **DLG**, this field controls whether the co-resident DLG application listens to the interface to which it is bound.

| Valid entries | Usage                                     |
|---------------|-------------------------------------------|
| <b>y</b>      | Enter <b>y</b> to enable this IP service. |
| <b>n</b>      | Does not listen over the interface.       |

## Local Node

Specify the node name for the port. When the Service Type field is **DLG**, there can be only one entry on this screen with a Service Type field of **DLG** and the same Local Node.

| <b>Valid entries</b>                            | <b>Usage</b>                                                                                                                                                                                                                                                  |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node names as defined on the Node Names screen. | If the link is administered for services over the C-LAN circuit pack, enter a node name defined on the Node Name screen. See <i>Administration for Network Connectivity for Avaya MultiVantage™ Software</i> for information on how to administer node names. |
| <b>processor</b>                                | Processor is only available for S8100 Media Server and S8300 Media Server.                                                                                                                                                                                    |

## Local Port

Specify the originating port number. When the Service Type field is **DLG**, this field becomes **5678** and is read-only.

| <b>Valid entries</b> | <b>Usage</b>                                    |
|----------------------|-------------------------------------------------|
| <b>5000 to 9999</b>  | 5111-5117 for SAT applications<br>5678 for ASAI |
| <b>0</b>             | For client applications, this defaults to zero. |

## Remote Node

Specify the switch at the far end of the link for SAT. The remote node should not be defined as a link on the IP Interface or Data Module screens. When the Service Type field is **DLG**, this field is cleared and read-only.

| <b>Valid entries</b>                          | <b>Usage</b>                                        |
|-----------------------------------------------|-----------------------------------------------------|
| Node name as defined on the Node Names screen | For SAT, use a node name to provide added security. |
| any                                           | Use any available node.                             |

## Remote Port

Specify the port number of the destination. When the Service Type field is **DLG**, this field is cleared and read-only.

| Valid entries        | Usage                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>5000 to 64500</b> | Use if this service is a client application, such as CDR or PMS. This must match the port administered on the adjunct, PC or terminal server that is at the remote end of this connection. |
| <b>0</b>             | Default for System Management applications.                                                                                                                                                |

## Service Type

Defines the service provided.

| Valid entries         | Usage                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ALARM1, ALARM2</b> | Available only on DEFINITY R. Use this to connect send alarms over a TCP/IP link.                                                                                                                                                                                                                                                                          |
| <b>cbc</b>            | Enter cbc to reserve the trunk for outgoing use only to enhance Network Call Redirection.                                                                                                                                                                                                                                                                  |
| <b>CDR1, CDR2</b>     | Use this to connect either the primary or secondary CDR device over a TCP/IP link.                                                                                                                                                                                                                                                                         |
| <b>DAPI</b>           | Available only on DEFINITY R, CSI, SI, S8300 Media Server, S8700 IP-Connect, S8700 Multi-Connect.                                                                                                                                                                                                                                                          |
| <b>DLG</b>            | For S8300 Media Server and S8100 Media Server only.<br><br>Can be entered only if, on the System-Parameters Customer-Options screen, the Co-Res DEFINITY LAN Gateway field is <b>y</b> .<br><br>Use this service type for co-resident DEFINITY LAN Gateway. For more information, see the <i>Avaya MultiVantage™ CallVisor® ASAI Technical Reference</i> . |
|                       |  <b>NOTE:</b><br>If DLG is selected, another screen displays. See “ <a href="#">DLG Administration</a> ” on page 756.                                                                                                                                                   |
| <b>PMS</b>            |                                                                                                                                                                                                                                                                                                                                                            |
| <b>PMS_JOURNAL</b>    | Use this to connect the PMS journal printer over a TCP/IP link.                                                                                                                                                                                                                                                                                            |

| Valid entries    | Usage                                                                            |
|------------------|----------------------------------------------------------------------------------|
| <b>PMS_LOG</b>   | Use this to connect the PMS log printer over a TCP/IP link.                      |
| <b>SAT</b>       | System administration terminal. Not available on S8100 Media Server with a CMC1. |
| <b>SYS_PRINT</b> | Use this to connect the system printer over a TCP/IP link.                       |

### **IP Services screen (Session Layer Timers page)**

Use this screen to enable reliable protocol for TCP/IP links, and to establish other session-layer parameters. This screen only appears if you enter CDR1, CDR2, PMS\_JOURNAL, or PMS\_LOG in the Service Type field on page 1 or 2.

```

change ip-services Page 3 of 3

```

| SESSION LAYER TIMERS |                   |                   |                              |           |                    |  |
|----------------------|-------------------|-------------------|------------------------------|-----------|--------------------|--|
| Service Type         | Reliable Protocol | Packet Resp Timer | Session Connect Message Cntr | SPDU Cntr | Connectivity Timer |  |
| CDR1                 | y                 | 3                 | 1                            | 1         | 1                  |  |

### **Screen 150. IP Services screen (Session Layer Timer page)**

#### **Connectivity Timer**

| Valid entries | Usage                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1-255</b>  | Indicates the amount of time (in seconds) that the link can be idle before the switch sends a connectivity message to ensure the link is still up. |

#### **Packet Resp Timer**

| Valid entries | Usage                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1-255</b>  | Determines the number of seconds to wait from the time a packet is sent until a response (acknowledgement) is received from the far-end, before trying to resend the packet. |

## Reliable Protocol

Indicates whether you want to use reliable protocol over this link.

| <b>Valid entries</b> | <b>Usage</b>                                                                 |
|----------------------|------------------------------------------------------------------------------|
| y/n                  | Use reliable protocol if the adjunct on the far end of the link supports it. |

## Service Type

A display-only field that identifies the service type for which you are establishing parameters.

| <b>Valid entries</b> | <b>Usage</b>                                                                   |
|----------------------|--------------------------------------------------------------------------------|
| CDR1, CDR2           | Used to connect either the primary or secondary CDR device over a TCP/IP link. |
| PMS_JOURNAL          | Used to connect the PMS journal printer over a TCP/IP link.                    |
| PMS_LOG              | Used to connect the PMS log printer over a TCP/IP link.                        |

## Session Connect Message Cntr

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                           |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| 1–5                  | The Session Connect Message counter indicates the number of times the switch tries to establish a connection with the far-end adjunct. |

## SPDU Cntr

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                  |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 1–5                  | The Session Protocol Data Unit counter indicates the number of times the switch transmits a unit of protocol data before generating an error. |

## ISDN trunk group

---

This screen assigns an Integrated Services Digital Network (ISDN) trunk group that supports the ISDN and Call-by-Call Service Selection service selection features. The trunk group provides end-to-end digital connectivity and supports a wide range of services including voice and non-voice services, to which users have access by a limited set of CCITT-defined, standard multipurpose interfaces.

The ISDN trunk group may contain ISDN-PRI or ISDN-BRI interfaces. However, it is not possible to use the two types of interfaces in the same trunk groups. The type of interface is chosen when the trunk members are assigned to the trunk group.

When ISDN-PRI interfaces are used on ISDN trunk groups, they may also be used to support the Wideband Switching feature. This is intended to work with the H0 (384 Kbps), H11 (1536 Kbps), H12 (1920 Kbps), and NXDS0 (128 to 1984 Kbps) data services, and to support high-speed video conferencing and data applications.

## Administration commands

---

When an ISDN trunk connects two switches, set the trunk options identically at both ends of the connection, with the exception of the Trunk Hunt fields. When ISDN-PRI interfaces are used, it is acceptable for both ends to have the Trunk Hunt fields administered as **cyclical**, but if one end is administered as **ascend**, the other end must be administered as **descend**. This helps avoid the possibility of glare conditions. When ISDN-BRI is used, the Trunk Hunt field has to be **cyclical**.

## Hardware requirements

---

ISDN-BRI interfaces are supported by the TN2185 Trunk-side BRI circuit pack (for implementing the user side of the BRI interface) and by the TN556B or TN556C ISDN-BRI Line circuit pack or the TN2198 ISDN BRI (U-LT) Line circuit pack (for the network side of the BRI interface). The TN2464 circuit supports T1 and E1 digital facilities.

ISDN-PRI interfaces are supported by the TN767 circuit pack (for assignment of a T1 signaling link and up to 24 ISDN-PRI trunk group members), or the TN464C or later circuit pack (for assignment of a T1 or E1 signaling link and up to 24 or 31 ISDN-PRI trunk group members, respectively). The TN2464 and TN2207 circuit pack can also be used with ISDN-PRI.

- The D-channel for ISDN-PRI interfaces switches through either the TN765 Processor Interface (PI) circuit pack or the TN778 Packet Control (PACCON) circuit pack. The D-channel for ISDN-BRI interfaces only switches through the TN778 Packet Control (PACCON) circuit pack.

**NOTE:**

You cannot use the TN765 circuit pack with ISDN-BRI interfaces.

- For DEFINITY R configurations, the D-channel switches through the TN1655 Packet Interface (PKTINT) circuit pack.
- A TN780 or TN2182 Tone Clock circuit pack provides synchronization for the DS1 circuit pack.

**NOTE:**

The TN767 cannot be used to carry the D-channel if either the TN778 (PACCON) or TN1655 (PKTINT) circuit packs are used to switch the D-channel. However, in these circumstances, the TN767 can be used for NFAS interfaces carrying only B-channels.

**How to administer ISDN trunk groups**

---

The table below shows the screens used to administer the TN765 Processor Interface (PI) for DEFINITY SI configurations.

| <b>Screen</b>                     | <b>Field</b>                                     |
|-----------------------------------|--------------------------------------------------|
| System-Parameters                 | Version                                          |

| Terminating Extension Group                    | ISDN Caller Display |

### Notes for Above Tables

- System-Parameters Customer-Options — Set the ISDN-BRI Trunks or ISDN-PRI fields to **y**. For a TN778 and if using ISDN-PRI interfaces, set the PRI Over PACCON field to **y**. The QSIG Optional Features fields may be enabled to allow appropriate administration for the Supplementary Service Protocol.
- Feature-Related System-Parameters — Set the Send Non-ISDN Trunk Group Name as Connected Name and Display Connected Name/Number for ISDN DCS Calls fields.
- ISDN-BRI Trunk Circuit Pack — This screen is required if using ISDN-BRI trunk interfaces. Assign all fields as required.
- DS1 Circuit Pack — This screen is required if using ISDN-PRI interfaces.
  - DS1 (T1) Circuit Pack
 

Assign all fields as required. For Facility Associated Signaling, up to 23 ports are available for administration as trunk members in an associated ISDN-PRI trunk group. The 24th port is used as a signaling channel. For Non-Facility Associated Signaling, all 24 ports may be used on certain DS1 circuit packs. The D-channel signaling function for these packs must be provided by a designated DS1 pack on its 24th channel.
  - E1 Circuit Pack
 

Assign all fields as required. For Facility Associated Signaling, up to 30 ports are available for administration as trunk members in an associated ISDN-PRI trunk group. Port number 16 is used as a signaling channel.
- Maintenance-Related System-Parameters — Use this screen only for a TN778. Set the Packet Bus Maint field to **y**.

- **ISDN Trunk Group** — Enter information in all the fields except the trunk group members. When using ISDN-PRI interfaces, enter the members after you establish the signaling links.
- **Signaling Group** — This screen is required if ISDN-PRI interfaces are used. Complete all fields. This screen identifies groups of ISDN-PRI DS1 interface B-channels for which a given D-channel (or D-channel pair) will carry the associated signaling information (supports the Facility and Non-Facility Associated Signaling feature). Each DS1 board that is required to have a D-channel must be in a different signaling group by itself (unless D-channel backup is needed, in which case a second DS1 is administered as a backup D-channel). You are not required to select a channel for a trunk group, but if you do, you must have already defined the trunk group as type ISDN.

**NOTE:**

The following three screens, Processor Interface Data Module, Communication Interface Links, and Communication Processor Channel Assignment are used only to support the ISDN-PRI interfaces using PI TN765.

- **Processor Interface Data Module** — Use this screen only for a TN765. Assign up to 8 interface links using 8 Processor Interface Data Module screens for multi-carrier cabinet systems, and up to 4 links for single-carrier cabinet systems. One Processor Interface Data Module screen must be completed for each interface link to be assigned.
- **Communication Interface Links** — Use this screen only for a TN765. Assign link numbers 01 to 08 for a multi-carrier cabinet system or links 01 to 04 for a single-carrier cabinet system as required. When first administering this screen in Avaya MultiVantage for ISDN, do not administer the Enable field.
- **Communication Processor Channel Assignment** — Use this screen only for a TN765. Enter assigned link numbers and assign associated channel numbers to each link. Complete all fields of the screen as required. When first administering this screen in Avaya MultiVantage for ISDN, you need to:
  - First, administer the Interface Links screen, except the Enable field.
  - Second, administer the ISDN fields on the Processor Channel screen.
  - Last, go back to the Interface Links screen and administer the Enable field.

- ISDN Numbering - Public/Unknown — Complete all fields. This screen supports the ISDN Call Identification Display.
- ISDN Numbering - Private — Complete all fields. This screen supports the ISDN Call Identification Display.
- Routing Pattern — Complete all fields including the Supplemental ISDN Routing Information fields as required.
- Hunt Group — Complete the ISDN Caller Display field by entering either **grp-name** or **mbr-name** to specify whether the hunt group name or member name, respectively, is sent to the originating user (supports the ISDN Call Identification Display feature).
- Terminating Extension Group — Complete the ISDN Caller Display field by entering either **grp-name** or **mbr-name** to specify whether the group name or member name, respectively, is sent to the originating user (supports the ISDN Call Identification Display feature).
- Synchronization Plan — Assigns primary and secondary external synchronization sources for the ISDN-BRI Trunk or DS1 circuit pack. Complete all screen fields as required.

## Design Considerations

ISDN-BRI and ISDN-PRI interfaces cannot be mixed in the same trunk group. Therefore, consider the following:

- The earliest trunk member (the lowest numbered one) administered is considered correct.
- If an offending member is subsequently found (meaning the first member was BRI and a later member was PRI, or vice versa), the cursor positions on the offending member, and the following error message appears:  

```
Cannot mix BRI and PRI ports in the same trunk group.
```

**Field descriptions for page 1**

Many of the fields on the following screens are described in [“Trunk Group” on page 1233](#). If a field on this screen is unique, it is listed and defined.

```

add trunk-group next Page 1 of x

**Screen 151. ISDN Trunk Group screen**

The Calling Number – Delete, Insert, and Numbering Format fields are the administrable fields for the Calling Line Identification Prefix feature. They appear when the Direction field is **incoming** or **two-way**.

**Calling Number – Delete**

| Valid entries | Usage                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| 1 to 15       | Enter the number of digits, if any, to delete from the calling party number for all incoming calls on this trunk group. |
| all           |                                                                                                                         |
| blank         |                                                                                                                         |

**Calling Number – Insert**

| Valid entries                    | Usage                                                                                                                                                    |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enter up to 15 characters (0- 9) | Enter the specific digits, if any, to add to the beginning of the digit string of incoming calls when the calling party is a member of this trunk group. |
| blank                            |                                                                                                                                                          |

## Calling Number – Numbering Format

This field indicates the TON/NPI encoding applied to CPN information modified by the CLI Prefix feature. This encoding does not apply to calls originating locally. The Numbering Format field on page 2 of this screen applies to calls originated from this switch.

If this field is blank, Avaya MultiVantage passes on the encoding received in the incoming setup message. If the incoming setup message did not contain CPN information and digits are added, the outgoing message will contain these digits. If the Numbering Format field is blank in this case, the value defaults to pub-unk.

If the Numbering Format field on page 2 of this screen is also administered as **unknown**, the trunk group is modified to “unk-unk” encoding of the TON/NPI. Therefore, this field also must contain a value other than **unknown**.

### ⇒ NOTE:

The values for this field map to the Type of Numbering (TON) and Numbering Plan Identifier (NPI) values shown below.

| Valid entries | Type of numbering (TON) | Numbering plan identifier (NPI) |
|---------------|-------------------------|---------------------------------|
| blank         | incoming TON unmodified | incoming NPI unmodified         |
| natl-pub      | national(2)             | E.164(1)                        |
| intl-pub      | international(1)        | E.164(1)                        |
| locl-pub      | local/subscriber(4)     | E.164(1)                        |
| pub-unk       | unknown(0)              | E.164(1)                        |
| lev0-pvt      | local(4)                | Private Numbering Plan - PNP(9) |
| lev1-pvt      | Regional Level 1(2)     | Private Numbering Plan - PNP(9) |
| lev2-pvt      | Regional Level 2(1)     | Private Numbering Plan - PNP(9) |
| unk-unk       | unknown(0)              | unknown(0)                      |

## Carrier Medium

This field lets you to specify the type of transport medium interface used for the ISDN trunk group. Appears only when the Group Type field is **isdn** and, on the System-Parameters Customer-Options screen, either the Async. Transfer Mode (ATM) Trunking or H.323 field is **y**.

| <b>Valid entries</b> | <b>Usage</b>                                                                                            |
|----------------------|---------------------------------------------------------------------------------------------------------|
| <b>ATM</b>           | The trunk is implemented via the ATM Interface circuit pack.                                            |
| <b>IP</b>            | The trunk is implemented via the LAN/WAN (C-LAN)/MedPro Interface circuit pack as an H.323 trunk group. |
| <b>PRI/BRI</b>       | The trunk is implemented as a standard DS1 or BRI interface.                                            |

## Charge Advice

Use this field to accumulate and access charge information about a call. You already must have set the CDR Reports field to **y** or **r** (ring-intvl) before changing this field from its default of none. Remember that receiving Advice of Charge during the call (administered as “automatic” or “during-on-request”) affects system performance because of the increased ISDN message activity on the signaling channel, which may reduce the maximum call capacity.

| <b>Valid entries</b>     | <b>Usage</b>                                                                                                                                                          |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>none</b>              | Enter <b>none</b> if you do not want the system to collect Advice of Charge information for this trunk group.                                                         |
| <b>automatic</b>         | Enter <b>automatic</b> only if your public network sends Advice of Charge information automatically.                                                                  |
| <b>end-on-request</b>    | Enter <b>end-on-request</b> if Avaya MultiVantage must request charge information with each call, and you want to receive only the final call charge.                 |
| <b>during-on-request</b> | Enter <b>during-on-request</b> if Avaya MultiVantage must request charge information with each call, and you want charges to display during and at the end of a call. |

## Codeset to Send Display

This field defines the codeset for sending the information element for Display. The value depends on the type of switch to which the user is connected.

| <b>Valid entries</b> | <b>Usage</b>                                 |
|----------------------|----------------------------------------------|
| <b>0</b>             | CCITT                                        |
| <b>6</b>             | Any other than CCITT or System 85 R2V4, 4E11 |
| <b>7</b>             | System 85 R2V4, 4E11                         |

## Codeset to Send National IEs

This field defines the codeset for sending the information element (IE) for national IEs. National IEs include all IEs previously sent only in code set 6 (such as DCS IE). Now these national IEs, including Traveling Class Marks (TCMs) and Lookahead Interflow (LAI), can be sent in code set 6 or 7. The value depends on the type of switch the user is connected to.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|   |                                             |
|---|---------------------------------------------|
| 6 | Other types.                                |
| 7 | System 85 R2V4, 4E11, or newer switch types |

### ⇒ NOTE:

A Traveling Class Mark (that is, the user's FRL or the user's trunk group FRL) is passed between tandem nodes in an ETN in the setup message only when the Service Type field is **tandem**. It then is used by the distant tandem switch to permit access to facilities consistent with the originating user's privileges.

## Digit Handling (in/out)

This field defines whether overlap receiving and overlap sending features are enabled. Set the field to **overlap** when you want overlap receiving or overlap sending. Set to **enbloc** when you do not want these features enabled. The first field value indicates digit receiving and the second value indicates digit sending.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|                        |  |
|------------------------|--|
| <b>enbloc/enbloc</b>   |  |
| <b>enbloc/overlap</b>  |  |
| <b>overlap/enbloc</b>  |  |
| <b>overlap/overlap</b> |  |

Without overlap receiving or sending enabled, the digits on incoming and outgoing calls are sent enbloc. If the Digit Handling field is **overlap/enbloc** or **overlap/overlap**, the following results:

- Incoming Call Handling Treatment table does not appear
- The Digit Treatment and Digits fields appear
- Warning message indicates that all Incoming Call Handling entries are removed when screen is submitted
- When screen is submitted with these values, all Incoming Call Handling entries are removed

## Far End Test Line No.

Specifies the number sent to the far-end's ISDN test line extension. When the test trunk long command is issued, this exact number is sent to the far-end to establish a call that tests the integrity of the trunk member under test. The number does not pass through routing or undergo digit manipulation. The digits entered must be what the far-end expects. For example, for an ISDN tandem trunk, the far-end test number should be a 7-digit ETN (Electronic Tandem Network) number.

| Valid entries   | Usage                                  |
|-----------------|----------------------------------------|
| Up to 15 digits | Enter a code to test signaling channel |
| blank           |                                        |

## Max Message Size to Send

Defines the maximum size of ISDN messages sent by the switch. Currently, the system can receive 260 byte messages. Valid entries are **128**, **244**, **256**, and **260**.

The following table indicates the expected ISDN-PRI message size from several Avaya products.

| Products         | Message Length (octets) Received |
|------------------|----------------------------------|
| 4ESS (4E11)      | 256                              |
| 4ESS (4E13)      | 256                              |
| 4ESS (4E14)      | 256                              |
| 5ESS (5E4)       | 244                              |
| 5ESS (5E5)       | 244                              |
| 5ESS (5E6)       | 244                              |
| System 75 (all)  | 260                              |
| System 85 (R2V4) | 128                              |
| System 85 (R2V5) | 260                              |
| System 85 (R2V6) | 260                              |

## QSIG Value-Added

Provides QSIG-VALU services. This field appears only if the Value-Added (VALU) field on the System-Parameters Customer-Options screen is **y**. This field can be set to **y** only if the Supplementary Service Protocol field on the System-Parameters Customer-Options screen is **b**. Valid entries are **y** and **n**. Blank is not a valid entry.

## Service Type

Indicates the service for which this trunk group is dedicated. The following table provides a listing of predefined entries. In addition to the Services/Features listed in this table, any user-defined Facility Type of 0 (feature) or 1 (service) on the Network Facilities screen is allowed.

Up to 10 (DEFINITY SI, CSI) or 200 (DEFINITY R) ISDN trunk groups can have this field administered as **cbc**.

| Valid entries     | Usage                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access</b>     | A tie trunk giving access to an Electronic Tandem Network.                                                                                                                                                                                                   |
| <b>accunet</b>    | ACCUNET Switched Digital Service — part of ACI (AT&T Communications ISDN) phase 2.                                                                                                                                                                           |
| <b>cbc</b>        | Call-by-Call service — provides different dial plans for different services on an ISDN trunk group. Indicates this trunk group is used by the Call-By-Call Service Selection feature.                                                                        |
| <b>dmi-mos</b>    | Digital multiplexed interface — message oriented signaling.                                                                                                                                                                                                  |
| <b>i800</b>       | International 800 Service — allows a subscriber to receive international calls without a charge to the call originating party.                                                                                                                               |
| <b>inwats</b>     | INWATS — provides OUTWATS-like pricing and service for incoming calls.                                                                                                                                                                                       |
| <b>lds</b>        | Long-Distance Service — part of ACI (AT&T Communications ISDN) phase 2.                                                                                                                                                                                      |
| <b>megacom</b>    | MEGACOM Service — an AT&T communications service that provides unbanded long-distance services using special access (switch to 4ESS switch) from an AT&T communications node.                                                                                |
| <b>mega800</b>    | MEGACOM 800 Service — an AT&T communications service that provides unbanded 800 service using special access (4ESS switch to switch) from an AT&T communications node.                                                                                       |
| <b>multiquest</b> | AT&T MULTIQUEST Telecommunications Service — dial 700 service. A terminating-user's service that supports interactive voice service between callers at switched-access locations and service provides directly connected to the AT&T Switched Network (ASN). |
| <b>operator</b>   | Network Operator — provides access to the network operator.                                                                                                                                                                                                  |

*Continued on next page*

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                                                                                                                  |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>outwats-bnd</b>   | OUTWATS Band — WATS is a voice-grade service providing both voice and low speed data transmission capabilities from the user location to defined service areas referred to as bands; the widest band is 5.                                                    |
| <b>public-ntwrk</b>  | Public network calls — It is the equivalent of CO (outgoing), DID, or DIOD trunk groups. If Service Type is public-ntwrk, Dial Access can be set to <b>y</b> .                                                                                                |
| <b>sddn</b>          | Software Defined Data Network — provides a virtual private line connectivity via the AT&T switched network (4ESS switch). Services include voice, data, and video applications. These services complement the SDN service. Do not use for DCS with Rerouting. |
| <b>sdn</b>           | Software Defined Network (SDN) — an AT&T communications offering that provides a virtual private network using the public switched network. SDN can carry voice and data between customer locations as well as off-net locations.                             |
| <b>sub-operator</b>  | Presubscribed Common Carrier Operator — provides access to the presubscribed common carrier operator.                                                                                                                                                         |
| <b>tandem</b>        | Tandem tie trunks integral to an ETN                                                                                                                                                                                                                          |
| <b>tie</b>           | Tie trunks — general purpose                                                                                                                                                                                                                                  |
| <b>wats-max-bnd</b>  | Maximum Banded Wats — a WATS-like offering for which a user's calls are billed at the highest WATS band subscribed to by users.                                                                                                                               |

## Supplementary Service Protocol

Indicates which supplementary service protocol to use for services over this trunk group. Supplementary Service protocols are mutually exclusive.

| Valid entries | Usage                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b>      | National                                                                                                                                                                                                                         |
| <b>b</b>      | ISO/ETSI QSIG Private Network                                                                                                                                                                                                    |
| <b>c</b>      | ETSI public network                                                                                                                                                                                                              |
| <b>d</b>      | European Computer Manufacturer's Association (ECMA) QSIG private network (supports only Name Identification and Additional Network Feature Transit Counter (ANF-TC))                                                             |
| <b>e</b>      | DCS with Rerouting <ul style="list-style-type: none"> <li>— Do not use the Service Type field entry of <b>dmi-mos</b> or <b>sddn</b> with this option.</li> <li>— Set the Used for DCS field (on page 2) to <b>y</b>.</li> </ul> |
| <b>f</b>      | ISDN Feature Plus<br>Public network feature plus signaling.                                                                                                                                                                      |
| <b>g</b>      | ANSI. Available only if, on the System-Parameters Customer-Options screen, the ISDN-PRI or ISDN-BRI field is <b>y</b> or the Used for DCS field is <b>y</b> .                                                                    |

## Test Call BCC

Indicates the Bearer Capability Code (BCC) used for the ISDN test call.

| Valid entries | Usage               |
|---------------|---------------------|
| <b>0</b>      | Voice               |
| <b>1</b>      | Mode 1              |
| <b>2</b>      | Mode 2 Asynchronous |
| <b>3</b>      | Mode 3 Circuit      |
| <b>4</b>      | Mode 0              |

## Testcall ITC

Controls the encoding of the Information Transfer Capability (ITC) codepoint of the bearer capability Information Element (IE) in the SETUP message when generating an ISDN test call. Allowed values are **rest** (restricted) and **unre** (unrestricted).

**NOTE:**

ISDN Testcall feature has no routing, so a testcall is never blocked due to an incompatible ITC.

## Testcall Service

Specifies the call-by-call selection for an ISDN test call. Only appears if the Service Type field is **cbc**. Valid entries are all of the services listed in “[Service Type](#)” on page 948, excluding **sddn** or any new Facility Type of 0 (feature), 1 (service), or 3 (outgoing) that is defined by users on the Network Specific Facility Encoding screen.

## Trunk Hunt

The switch performs a trunk hunt when searching for available channels within a facility in an ISDN trunk group. With both **ascend** and **descend**, all trunks within an ISDN trunk group are selected based on this field and without regard to the order in which trunks are administered within the trunk group. When using ISDN-BRI interfaces, only **cyclical** is allowed.

| <b>Valid entries</b> | <b>Usage</b>                                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| <b>ascend</b>        | Enter to enable a linear trunk hunt search from the lowest to highest numbered channels.                         |
| <b>cyclical</b>      | Enter to enable a circular trunk hunt based on the sequence the trunks were administered within the trunk group. |
| <b>descend</b>       | Enter for a linear trunk hunt search from the highest to lowest numbered channels.                               |

**NOTE:**

The cyclical option cannot be set if the trunk group using ISDN-PRI interfaces is to be used for Wideband operations (the Wideband Support field set to **y**).

The search can be administered per ISDN-PRI trunk group, but it infers the direction of search within all ISDN-PRI facilities (or portions of those facilities) administered within the trunk group.

**Usage Alloc**

Appears when the Service Type field is **cbc**.

| <b>Valid entries</b> | <b>Usage</b> |

**Screen 153. ISDN Trunk Group screen**

These fields are unique to the ISDN trunk group screen.

**BSR Reply-best DISC Cause Value**

Switches that are polled as resources in a Best Service Routing application return data to the polling switch in the ISDN DISC message. Since some cause values do not work over some networks, this field sets the cause value that your switch will return in response to a BSR status poll. If this field is set incorrectly, incoming status poll calls over this trunk group will be dropped before any data is returned to the polling switch. This field only appears if the UII IE Treatment field is set to **shared**.

| Valid entries                    | Usage                                                                                  |
|----------------------------------|----------------------------------------------------------------------------------------|
| <b>31</b> (normal-unspecified)   | Enter <b>31</b> unless otherwise instructed by Avaya or your network service provider. |
| <b>17</b> (user-busy)            |                                                                                        |
| <b>16</b> (normal-call-clearing) |                                                                                        |

**⚠ CAUTION:**

*In most cases, this field will be set to the appropriate value during installation. If you need to change it, your network service provider should be able to help you choose an appropriate value. Don't change this field without the assistance of Avaya or your network service provider.*

## DCS Signaling

Specifies the means used to send the DCS message. This field only appears if the Used for DCS field entry is **y** and the Service Type field is anything except **dmi-mos** or **sddn**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|              |                                        |
|--------------|----------------------------------------|
| <b>bx.25</b> | Enter for the traditional DCS feature. |
|--------------|----------------------------------------|

|               |                                                    |
|---------------|----------------------------------------------------|
| <b>d-chan</b> | Enter for the DCS over ISDN-PRI D-channel feature. |
|---------------|----------------------------------------------------|

DCS over D-channel is not supported on trunk groups containing ISDN-BRI interfaces.

- Hop Dgt — The Tandem Hop Limitation and QSIG Additional Network Feature Transit Counter (ANF-TC) features provide a counter that reflects the number of switches (that is, the number of hops) that a call has gone through. The counter increments as a call leaves Avaya MultiVantage using tandem facilities. Valid values are **y** and **n**. One or both of the features can be applied to the trunk group depending on the following:
  - If you enter **y** and the Group Type field is **tandem** or the Group Type field is **isdn** and the Service Type field is **tandem**, the Tandem Hop Limitation feature is applied to the trunk group.
  - If you enter **y** and you set the Group Type field to **isdn**, set the Service Type field to **access**, **dmi-mos**, **public-ntwrk**, **tandem**, **tie**, or any of the craft-defined services allowed in the field. Set the Supplementary Service Protocol field to **b** or **d**, then the ANF-TC feature is applied to calls on the trunk group.

**⇒ NOTE:**

The above conditions overlap. If the Group Type field is **isdn**, the Service Type field is **tandem**, and the Supplementary Service Protocol field is **b** or **d**, then both the Tandem Hop Limitation and ANF-TC features are applied to calls on the trunk group.

- If both features are applied to calls on the trunk group, ANF-TC takes precedence. In situations where Avaya MultiVantage is an Incoming or Outgoing Gateway, either feature uses the hop count and transit information provided by the other.

## Maximum Size of UII IE Contents

This field appears when the UII IE Treatment field is **shared**. Enter the maximum number of bytes of user information that the network supports.

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| <b>32-128</b>        |              |

## NCA-TSC Trunk Member

Identifies the trunk member whose D-channel will be used to route tandem NCA-TSCs or QSIG CISCs. Value range for this field is from 1 to the maximum number of members per trunk group supported on the switch or blank.

## Network (Japan) Needs Connect Before Disconnect

Sends an ISDN Connect message just prior to the Disconnect message.

## Numbering Format

This field appears if the Send Calling Number field is **y** or **r** or the Send Connected Number field is **y** or **r**. This specifies the encoding of Numbering Plan Indicator for identification purposes in the Calling Number and/or Connected Number IEs, and in the QSIG Party Number. Valid entries are **public**, **unknown**, **private**, and **unk-pvt**. **Public** indicates that the number plan according to CCITT Recommendation E.164 is used and that the Type of Number is national. **Unknown** indicates the Numbering Plan Indicator is unknown and that the Type of Number is unknown. **Private** indicates the Numbering Plan Indicator is PNP and the Type of Number is determined from the ISDN Private-Numbering screen. An entry of **unk-pvt** also determines the Type of Number from the ISDN Private-Numbering screen, but the Numbering Plan Indicator is unknown.

## Outgoing Channel ID Encoding

Appears only if the Group Type field is **isdn** and the Service Type field is anything except **dmi-mos** or **sddn**. Determines whether to encode the Channel ID IE as preferred or exclusive. Blank is not a valid entry. Defaults are determined as follows:

If the Group Type field is **isdn** and the Used for DCS field is **y**, default is **exclusive**.

If the Group Type field is **isdn** and the Used for DCS field is **n**, default is **preferred**.

If the Group Type field is not **isdn** or it is **isdn**, but the Used for DCS field does not appear, default is **preferred**.

### Path Replacement Method

Appears when either the ISDN-PRI trunk or the ISDN-BRI trunk fields and the Basic Call Setup and Supplementary Services with Rerouting fields are set to **y** on the System-Parameters Customer-Options screen and when the Supplementary Service Protocol is either **b** or **e** and the Group Type field is **isdn** on the ISDN trunk group screen.

| Valid entries       | Usage                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>better-route</b> | Uses the most economical route, for example, the reconfigured call does not use the same trunk group as the original call. |
| <b>always</b>       | Always reconfigures the call regardless of the trunk group used.                                                           |

### Replace Restricted Numbers

Appears when the Group Type field is **isdn**. Indicates whether to replace restricted numbers with administrable strings for incoming and outgoing calls assigned to the specified trunk group. This field applies to BRI and PRI trunks.

| Valid entries | Usage                                                                                      |
|---------------|--------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> for the display to be replaced regardless of the service type of the trunk. |

### Replace Unavailable Numbers

Appears when the Group Type field is **isdn**. Indicates whether to replace unavailable numbers with administrable strings for incoming and outgoing calls assigned to the specified trunk group. This field applies to BRI and PRI trunks.

| Valid entries | Usage                                                                                      |
|---------------|--------------------------------------------------------------------------------------------|
| <b>y/n</b>    | Enter <b>y</b> for the display to be replaced regardless of the service type of the trunk. |

### Send Called/Busy/Connected Number

This field appears only if the QSIG Value-Added field on the Trunk Group screen is **y** and the Group Type field is **isdn**. Specifies if the connected party's number is sent on incoming or tandemed ISDN calls. Valid entries are **y**, **n**, or **r** (restricted).

If set to **y**, the ISDN Numbering - Public/Unknown Format screen is accessed to construct the actual number sent, or the ISDN Numbering-Private screen (based on Numbering Format) is used. If set to **r**, the connected number is sent “presentation restricted.”

### Send Calling Number

Specifies whether the calling party’s number is sent on outgoing or tandemed ISDN calls. Valid entries are **y**, **n**, or **r** (restricted). If **y** is entered, the ISDN Numbering - Public/Unknown Format screen is accessed to construct the actual number to be sent, or the ISDN Numbering-Private screen (based on the Numbering Format field) is used. If the value is **r**, the calling number is sent “presentation restricted.”

#### ⇒ NOTE:

The ISDN Numbering - Public/Unknown Format screen can override the Send Calling Number field entry for any administrable block of extensions.

### Send Codeset 6/7 LAI IE?

Specifies whether the ISDN trunk should transmit information in Codeset 6/7. If the UII IE Treatment field is **shared**, then this field should be **n**. Otherwise, the same information will be sent twice and may exceed the message size. Default is **y** for pre-DEFINITY 6.3 compatibility.

### Send Connected Number

Appears if the QSIG Value-Added field on the Trunk Group screen is **n**. Specifies if the connected party’s number is sent on incoming or tandemed ISDN calls. Valid entries are **y**, **n**, or **r** (restricted). If **y** is entered, the ISDN Numbering - Public/Unknown Format screen is accessed to construct the actual number sent, or the ISDN Numbering-Private screen (based on the Numbering Format field) is used. If the value is **r**, the connected number is sent “presentation restricted.”

#### ⇒ NOTE:

The AT&T Switched Network Protocol does not support restricted displays of connected numbers. Therefore, if you administer the 1a country-protocol/protocol-version combination on the DS1 screen, you should not administer the Send Connected Number field to **r** (restricted) on the ISDN Trunk Group screen, as this causes display problems.

#### ⇒ NOTE:

The ISDN Numbering - Public/Unknown Format screen overrides the Send Connected Number field entry for any administrable block of extensions.

## Network Call Redirection

Administrable if, on the System-Parameters Customer-Options screen, the ISDN-PRI or ISDN-BRI Trunks field is **y**, the ISDN Network Call Redirection field is **y**, and on the ISDN Trunk Group screen, the Supplementary Service Protocol field is **c** or **g**. Whenever the Supplementary Service Protocol field is changed, this field resets to **none** to prevent an inadvertent incorrect value,

| <b>Valid entries</b>   | <b>Usage</b>                                                                                                           |
|------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>ANSI-transfer</b>   | Indicates standard ANSI encoding functionality. Allowed only if the Supplementary Service Protocol field is <b>g</b> . |
| <b>Nortel-transfer</b> | Indicates non-standard ENCT functionality. Allowed only if the Supplementary Service Protocol field is <b>g</b> .      |
| <b>deflect</b>         | Indicates network call redirection. Allowed only if the Supplementary Service Protocol field is <b>c</b> .             |
| <b>none</b>            | No redirection (default).                                                                                              |

## Send Name

Specifies whether the calling/connected/called/busy party's administered name is sent to the network on outgoing/incoming calls. Valid entries are **y**, **n**, or **r** (restricted). The value **r** indicates that the calling/connected name will be sent by the switch but will be marked "presentation restricted." This value is valid only if the Supplementary Service Protocol field is **a** (national supplementary service), **b** (for called/busy only) or **d** for the QSIG Global Networking Supplementary Service Protocol. When the Supplementary Service Protocol field is **e** (DCS with Rerouting), only values of **y** and **n** are permitted.

### NOTE:

If name information is not administered for the calling station or the connected/called/busy station, the system sends the extension number in place of the name.

## Send UCID

Specifies whether or not the trunk should transmit Universal Call IDs. The valid entries are **y** and **n**.

## Send UUI IE

Specifies whether to block sending UUI information on a per trunk group basis. The valid entries are **y** and **n**.

## US NI Delayed Calling Name Update

Administrable if, on the System-Parameters Customer-Options screen, the ISDN-PRI field is **y**, and on the Trunk Group screen, the Carrier Medium field is either **PRI/BRI** or **ATM**, and the Supplementary Service Protocol field is **a**. This field provides display updates to the terminating phone for delayed calling party name provided by the network,

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>y</b> | If calling name information is received after the incoming call has been delivered to the terminating phone, there is a display update. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------|

**NOTE:**

BRI trunks do not support this value.

|          |                                                                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>n</b> | If calling name information is received after the incoming call has been delivered to the called phone, there is no display update to the terminating phone. |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

## UUI IE Treatment

Specifies whether the user Information Element (IE) is shared.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|               |                                                                |
|---------------|----------------------------------------------------------------|
| <b>shared</b> | If the trunk is connected to a DEFINITY 6.3 (or later) switch. |
|---------------|----------------------------------------------------------------|

|                         |                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------|
| <b>service-provider</b> | If the trunk is connected to a pre-DEFINITY 6.3 switch or service provider functionality is desired. |
|-------------------------|------------------------------------------------------------------------------------------------------|

## Wideband Support

Specifies whether Wideband Switching is supported by this trunk group. Valid entries are **y** or **n**. For ISDN trunk groups containing ISDN-BRI interfaces, the only valid entry is **n**. Otherwise you can administer this field only if the Wideband Switching field is **y** on the System-Parameters Customer-Options screen. If set to **y**, the Wideband Support Options page appears. All trunk members must be from TN464C (or later) circuit packs.

**NOTE:**

Wideband trunk calls are treated as a single trunk call when Automatic Circuit Assurance (ACA) measurements are taken. This way, if an ACA referral call is generated (for short or long holding time), the wideband call only triggers a single referral call using the lowest B-channel trunk member associated with the wideband channel.

## Field descriptions for the Shared UI Feature Priorities page

The fields in this page show the priorities for each type of information to be forwarded in the Shared UI. This page appears only on the ISDN trunk group screen when all of the following conditions are met:

- The UI IE Treatment field is **shared**.
- The Supplementary Service Protocol field is set to anything except **b**.

```

add trunk-group next Page y of x
 SHARED UI FEATURE PRIORITIES

 ASAI: 1

 Universal Call ID: 2

MULTI SITE ROUTING (MSR)

 In-VDN Time: 3
 VDN Name: 4
 Collected Digits: 5
 Other LAI Information: 6

```

### Screen 154. Shared UI Feature Priorities

Changing the priorities in this screen may affect whether certain information will be sent. For more information about setting priorities, see “Information Forwarding” in *Avaya MultiVantage™ Call Center Software Guide to ACD Call Centers*. These fields are unique to the ISDN trunk group screen.

#### ASAI

User information from ASAI. Valid entries are **1** to **6** (**1** is high) and blank. If blank, that field’s information is not forwarded.

#### Collected Digits

Digits collected from caller (not including dial-ahead digits). Valid entries are **1** to **6** (**1** is high) and blank. If blank, that field’s information is not forwarded.

#### In-VDN Time

Number of seconds the call has spent in vector processing. Valid entries are **1** to **6** (**1** is high) and blank. If blank, that field’s information is not forwarded.

### Other LAI Information

Includes the time stamp of when the call entered the current queue, the call's priority level in its current queue, and the type of interflow. Valid entries are 1 to 6 (1 is high) and blank. If blank, that field's information is not forwarded.

### Universal Call ID

Unique tag to identify each call. Valid entries are 1 to 6 (1 is high) and blank. If blank, that field's information is not forwarded.

### VDN Name

Name of the active VDN (also called LAI DNIS). Valid entries are 1 to 6 (1 is high) and blank. If blank, that field's information is not forwarded.

### Field descriptions for the Incoming Call Handling Treatment page

---

add trunk-group next Page y of x

| Service/<br>Feature | Called<br>Len | INCOMING CALL HANDLING TREATMENT |            | Per Call<br>CPN/BN | Night<br>Serv |

**Screen 155. Incoming Call Handling Treatment**

 **NOTE:**  
This page does not appear if the Digit Handling (in/out) field is **overlap** on the “in” side or if the Direction field is **outgoing**.

The Incoming Call Handling Treatment page can (optionally) provide unique call treatment for different incoming calls on any ISDN trunk group. The number of unique treatments that can be specified in this table and the number of pages vary depending on whether the Usage Allocation Enhancements feature is enabled and on the amount of available system memory.

Unique digit manipulation capabilities, CPN/BN requests, and night service destinations are possible for different types of incoming calls. The unique digit manipulation capabilities can be particularly useful to accommodate different dial plans for different services on an ISDN trunk type with a Service Type (field entry) of **cbc** (Call-by-Call). The table can also be used for ISDN trunk groups that are not Call-by-Call. For example, an ISDN group with Service Type set to **mega800** could use the Incoming Call Handling Treatment table to distinguish treatment of calls to different 800 numbers based on the Dialed Number Identification Service (DNIS) number that is incoming to the switch.

Each row in the table consists of seven columns. The first three columns (Service/Feature, Called Len, and Called Number) constitute a key that together select which row or unique treatment should apply for an incoming call on the group. The remaining four columns (Del, Insert, and so on) specify the treatment to be provided for a call that matches the key.

If an incoming call is for a service listed in a row on the table, then that row may specify the treatment for the call, depending on the other two columns of the key. The Called Len field is used to continue the row determination. If the number of digits received with the incoming call matches the number of digits in the Called Len field for calls to the matched service, then this row may apply. If no other row also contains a matching service and called length, then this row does apply. If another row does exist with the same service and number length, then the Called Number field will be used to continue the row determination.

If the leading digits received with the incoming call match the digits specified in the Called Number field, then this row applies to the call. Therefore, with this table, a unique treatment can be given to any incoming call, even if these calls are to the same service or have the same length of digits. The remaining four fields specify the unique treatment for the call once the row has been determined. Together, the Del and Insert fields can be used to manipulate the incoming number that will be used to route the call. The Per Call CPN/BN field can be used to request CPN/BN from AT&T networks for specific calls incoming on the group. The Night Serv field is used to have calls of different types routed to different night destinations when night service is in effect.

The Incoming Call Handling Treatment Table always automatically rearranges to show the precedence order the system uses to pick an entry. Thus, you can easily predict the behavior of the Incoming Call Handling Treatment Table by noting the order in which the entries display. (The entries rearrange after submitting the trunk group screen. A subsequent change trunk-group or display trunk-group command then shows the rearranged order.)

Avaya MultiVantage traverses the table from top to bottom and picks the first entry that matches all the following criteria:

- The Service /Feature, if applicable, matches
- The Called/Length matches
- The Called Number matches

If the administered Called Length or Called Number is blank, that criterion is considered successful.

Incoming Call Handling Treatment Table entries with a predefined service/feature always appear before entries with a user-defined service/feature. To control the order in which certain entries appear, you must use user-defined services/features for those entries. For example, you can redefine the predefined mega800 service/feature as an identical user-defined entry with the name m800.

User-defined entries are always listed in the reverse order compared to the way they appear on the ISDN Network-Facilities screen. See [“Packet Gateway Board” on page 1072](#). Thus, given two user-defined services/features ABC and XYZ, you can force XYZ to appear before ABC in an Incoming Call Handling Treatment Table by putting XYZ after ABC on the Network-Facilities screen.

**⇒ NOTE:**

DCS features that use the remote-tgs button (on the remote switch) do not work when the local trunk group deletes or inserts digits on the incoming call. These buttons try to dial a local TAC. Adding or deleting digits defeats this operation and renders the remote feature inoperable. If digit manipulation is needed, use it on the outgoing side, based on the routing pattern. One reason for digit manipulation is insertion of the AAR feature access code (FAC).

These fields are located on the Incoming Call Handling Treatment Table screen.

## Called Len

Specifies the number of digits received for an incoming call. A blank entry is used as a “wild card” entry and, when used, means that any length of digits associated with the specified Service/Feature can match in this field. Valid entries are **0** to **21**, or leave blank.

## Called Number

Specifies the leading digits received for an incoming call. A blank entry is used as a “wild card” entry and, when used, means that any number associated with the specified Service/Feature can match in this field. Valid entries are up to 16 digits, or leave blank.

## Del

Specifies the number of leading digits to be deleted from the incoming Called Party Number. Calls of a particular type may be administered to be routed to a single destination by deleting all incoming digits and then administering the Insert field with the desired extension. Valid entries are **1** to **21**, **all**, or leave blank.

## Insert

Specifies the digits to be prepended to the front of the remaining digits after any (optional) digit deletion has been performed. The resultant number formed from digit deletion/insertion is used to route the call, provided night service is not in effect. Valid entries are up to 16 characters consisting of a combination from the following: **0** to **9**, **\***, **#**, or leave blank.

## Per Call CPN/BN

Specifies when and how to request Calling Party Number (CPN) or Billing Number (BN) for calls of this type. Leave blank when connected to another switch, or when connected to a public network outside North America. Within North America, leave blank when connected to a public network that does not permit customer equipment to request CPN or BN for individual incoming calls. The AT&T Switched Network offers this service under the titles “CPN/BN to Terminating End on a Per-Call Basis” and “ANI (BN) on Request.” An entry of **none** indicates the switch will not request either CPN or BN for any incoming calls of this type. Valid entries are **cpn-only**, **bn-only**, **bn-pref** (prefer BN, but accepts CPN), **cpn-pref** (prefer CPN, but accepts BN), **none**, or leave blank. Leave blank when connected to another switch or to a network other than the AT&T Switched Network.

### NOTE:

A 4-second delay occurs in terminating the call to the far-end station if the connecting switch does not respond to the request.

### Night Serv

Specifies a night service extension (can be a VDN extension) per Service/Feature. An entry other than blank overrides Night Service entry on page 1 of the screen. This entry can be overridden by the Trunk/Member Night Service entry when provided. Valid entries are an assigned extension, the attendant group access code (**attd**), or leave blank.

### Service/Feature

Specifies the ISDN Services/Features for an incoming call type. See the Service Type field description for a list of predefined Services/Features that can be received. Or, use Type 0, Type 1, and Type 2 user defined services. The identifier other can be used for any Services/Features not explicitly specified.

### Field Descriptions for the CBC Trunk Group Usage Allocation page

Appears when the Service Type field is **cbc** and the Usage Alloc field is **y**.

| Usage Allocation Plan 1 |      | Usage Allocation Plan 2 |                 |      |      | Usage Allocation Plan 3 |      |      |  |

### Screen 156. CBC Trunk Group Usage Allocation

The CBC Trunk Group Usage Allocation screen sets a minimum and maximum number of members for up to ten different Services/Features for up to three different Usage Allocation Plans (1–3). See [“Call-by-call service selection” on page 1629](#) for a detailed description of Usage Allocation Plans.

**Max# Chan**

Indicates the maximum number of members of a ISDN trunk group with a Service Type field of **cbc** that a particular Service/Feature can use at any given time. This field must be completed if a Service/Feature has been entered in the Incoming Call Handling Treatment Table screen. Valid values are **0** to **99** or blank.

**Min# Chan**

Indicates the minimum number of members of an ISDN trunk group with a Service Type field of **cbc** that a particular Service/Feature can use at any given time. The sum of the minimum number of members for all Service/Features must not exceed the total number of members of the trunk group. Valid values are **0-99** or blank.

**Service/Feature**

Specifies the ISDN Services/Features that can be requested at call setup time when using this trunk group. See Service Type description for a list of predefined Services/Features that can be received on a call by call basis. In addition, the user defined service types can also be used. The identifier **other** is used for all Services/Features not explicitly specified.

**Field descriptions for the CBC Service Trunk Group Allocation Plan Assignment Schedule page**

Appears when the Service Type field is **cbc** and the Usage Alloc field is **y**.

**Screen 157. CBC Service Trunk Group Allocation Plan Assignment Schedule**

The CBC Service Trunk Group Allocation Plan Assignment Schedule screen provides for administering a fixed schedule or administering a schedule that can change up to 6 times a day for each day of the week. This screen determines which CBC Service Trunk Group Allocation Plan will be in use at any given time.

### **Act Time**

Indicates the time the usage allocation plan administered in the next field (Plan #) will become effective. Enter the time in military time. There must be at least one entry per day. Valid entries are **00:00** through **23:59**.

### **Allocation Plan Number**

Specifies the CBC Trunk Allocation Plan (1 through 3) that is in effect if a fixed usage method has been selected. This field must be assigned if the Fixed field is **y**. Valid entries are **1–3** or blank.

### **Fixed**

Indicates whether the allocation plan will be fixed. If **y** is entered, the plan number entered in the Allocation Plan Number field will be enabled.

### **Plan #**

Specifies the number of the usage allocation plan that will be in effect from the activation time until the activation time of the next scheduled plan change. Valid entries are **1** to **3** or blank.

### **Scheduled**

Indicates whether or not the allocation plans will be in effect according to the schedule found on this page. If **y** is entered in this field then there must be at least one entry in the schedule.

## Field descriptions for the Wideband Support Options page

|                      |                          |               |
|----------------------|--------------------------|---------------|
| add trunk-group next | Wideband Support Options | Page y of x   |
|                      | H0? n                    |               |
|                      | H11? n                   |               |
|                      | H12? n                   |               |
|                      | NxDS0? y                 | Contiguous? n |

### Screen 158. Wideband Support Options

The Wideband Support Options screen appears immediately before the trunk group member pages. The actual page number will vary.

#### NOTE:

All B-channels that comprise the wideband call must reside on the same ISDN-PRI facility. Also, all trunk members in an ISDN trunk group with the Wideband Support field set to **y** must be from a TN464C (or later) circuit pack.

#### H0

Enter **y** to specify the ISDN information transfer rate for 384-kbps of data, which is comprised of six B-channels. When a trunk group is administered to support H0, the trunk/hunt algorithm to satisfy a call requiring 384-kbps of bandwidth uses a fixed allocation scheme.

#### H11

Enter **y** to specify the ISDN information transfer rate for 1536-kbps of data, which is comprised of 24 B-channels. When a trunk group is administered to support H11, the trunk/hunt algorithm to satisfy a call requiring 1536-kbps bandwidth uses a fixed allocation scheme.

#### H12

Enter **y** to specify the ISDN information transfer rate for 1920-kbps of data, which is comprised of 30 B-channels. When a trunk group is administered to support H12, the trunk/hunt algorithm to satisfy a call requiring 1920-kbps bandwidth uses a fixed allocation scheme.

## Contiguous

Specifies whether or not to hunt contiguous NXDS0 channels. This field only appears if the NxDS0 field is **y**.

The trunk/hunt algorithm to satisfy an NXDS0 call is as follows:

- Enter **y** to specify the “floating” scheme. NXDS0 calls are placed on a contiguous group of B-channels large enough to satisfy the requested bandwidth without constraint on the starting channel (no fixed starting point trunk).

**NOTE:**

H0 and NXDS0 “floating” scheme cannot both be **y**.

- Enter **n** to specify the “flexible” scheme. NXDS0 calls are placed on any set of B-channels on the same facility as long as the requested bandwidth is satisfied. There are no constraints such as contiguity of B-channels or fixed starting points.

## NxDS0

Enter **y** to specify the “N by DS-zero” multi-rate service.

## Field Descriptions for the Group Member Assignments page

1: _____
2: _____
3: _____
4: _____
5: _____
6: _____
7: _____
8: _____
9: _____
10: _____
11: _____
12: _____
13: _____
14: _____
15: _____

```

**Screen 159. ISDN Group Member Assignments**

The total number of pages, and the first page of Group Member Assignments, will vary depending on whether the CBC and Wideband Support pages display.

**⇒ NOTE:**

When supporting DCS, Member Number Assignments must be the same between nodes (Member #1 must be Member #1 at the far-end trunk group).

**Port**

When using ISDN-BRI interfaces, B-channel 1 is the port number while B channel 2 is the port number plus 16. For example, if B channel 1's port number is 01A1002, then B channel 2's port number is 01A1018.

When using ISDN-PRI interfaces, the port number will be the one allied with the B-channel. For example, if the DS1 is located in 01A10, then B channel 1 will be 01A1001, B channel 2 will be 01A1002 and so forth.

**Sig Grp**

When using ISDN-BRI interfaces, this field becomes unadministrable. Otherwise, enter the appropriate signaling group number. If a DS1 interface appears in one signaling group, then the number of that signaling group appears as a default in the Sig Grp column for any trunk on that interface after the screen is submitted. This value cannot be altered without adding a DS1 interface to another signaling group. If a DS1 circuit pack appears in more than one signaling group, then the Sig Grp field cannot be left blank. One of the signaling group members must be entered. Enter assigned signaling group number between **1** through **416** or blank.

See [“DS1 trunk service” on page 1659](#) for detailed information on DS1.

**ISDN Numbering — Private**

---

This screen supports Private Numbering Plans (PNP). It allows you to specify the digits to be put in the Calling Number information element (IE), the Connected Number IE, and the QSIG Party Number for extensions in the Private Numbering Plan.

Avaya MultiVantage supports private-network numbers up to 15 digits long. If the total number — including the level 1 and 2 prefixes, the PBX identifier, and the extension — is more than 15 digits long, neither QSIG PartyNumbers nor the information elements are created or sent.

PBX Identifier: ____
Deleted Digits: _

```

## Screen 160. ISDN Number — Private Format

### Deleted Digits

In some networks, the leading digits of the number you dial internally to reach any extension are not part of its longer private network number. For example, extension 35581 might have a private network number of 221-5581. To send this network number correctly, you must set the Deleted Digits field to **1** (that is, tell the switch to delete 1 digit before inserting the PBX Identifier of 221).

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b> | Enter the number of digits to be deleted from the most significant digits of a local extension prior to sending it in the Calling or Connected Number IEs or in the QSIG |
| <b>1</b> | PartyNumber. This allows UDP network numbers to be converted to PNP Complete Numbers.                                                                                    |
| <b>2</b> |                                                                                                                                                                          |

### Level 1 Code

Enter the switch's first level regional code in the network. Administer this field carefully. The system will not check to ensure you have entered a code that supports your entry in the Network Level field. You cannot enter anything in this field unless the Network Level field is set to **1** or **2**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|               |                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------|
| <b>0 to 9</b> | Enter up to 5 digits.                                                                                  |
| blank         | Because blank regional codes are valid, an entry is not required if the Network Level field is 1 or 2. |

In QSIG standards, this level 1 code is called the Level 0 Regional Code.

## Level 2 Code

Enter the switch's second level regional code in the network. Administer this field carefully. The system will not check to ensure you have entered a code that supports your entry in the Network Level field. You cannot enter anything in this field unless the Network Level field is set to **2**.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|               |                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------|
| <b>0 to 9</b> | Enter up to 5 digits.                                                                             |
| blank         | Because blank regional codes are valid, an entry is not required if the Network Level field is 2. |

In QSIG standards, this level 2 code is called the Level 1 Regional Code.

## Network Level

Enter the value of the highest regional level employed by the PNP network. Use the following table to find the relationship between the network level and the Numbering Plan Identification/Type of Number (NPI/TON) encoding used in the QSIG PartyNumber or the Calling Number and Connected Number IEs.

| Valid entries | Usage |
|---------------|-------|
|---------------|-------|

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| blank    | <p>If this field is blank and the Send Calling Number and/or Send Connected Number field is <b>y</b> or <b>r</b> with <b>private</b> specified for the Numbering Format field on the ISDN Trunk Group screen, the Calling Number and/or Connected Number IEs will not be sent.</p> <p>If the field is left blank but <b>private</b> has been specified in the Numbering Format field on the ISDN Trunk Group screen, the Identification Number (PartyNumber data type) is sent for QSIG PartyNumbers encoded in ASN.1-defined APDUs. In this case, the ASN.1 data type containing the PartyNumber (PresentedAddressScreened, PresentedAddressUnscreened, PresentedNumberScreened, or PresentedNumberUnscreened) is sent marked as "PresentationRestricted" with "NULL" for the associated digits.</p> |

## PBX Identifier

| Valid entries   | Usage                                                                                                                                                                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 to 9 or blank | Enter up to 5 digits. Digits entered in this field are added to the beginning of local extensions. The PBX identifier is added first, before Level 1 or Level 2 codes. For example, in private networks with a 7-digit numbering plan, the first 3 digits of the private-network number are often considered the PBX identifier. |

### ⇒ NOTE:

The PBX identifier does not depend on the network level. Therefore, in a level 0 private network you can use this field to create a level 0 number longer than 5 digits.

## ISDN Numbering — Public/ Unknown

This screen supports the ISDN Call Identification Display feature. The feature provides a name/number display for display-equipped stations within an ISDN network. The system uses the caller's name and number and displays it on the called party's display. Likewise, the called party's name and number can be displayed on the caller's display.

The screen allows you to specify the desired digits for the Calling Number IE and the Connected Number IE (in addition to the QSIG Party Number) for any extension in the Public and/or Unknown Number Plans.

Administer these screens if either the Send Calling Number, Send Connected Number field is specified, or the Supplementary Service Protocol field is **b** on the trunk group screen.

### ⇒ NOTE:

If the table is not properly administered and the Send Calling Number or Send Connected Number field is **y** or **r** and the Numbering Format field on the ISDN Trunk Group screen is **public** or **unknown**, the Calling Number and Connected Number IE are not sent. If the table is not administered, but the Send Calling Number or Send Connected Number field is **public** or **unknown**, the Identification Number (PartyNumber data type) is not sent for QSIG PartyNumbers. In this case, the ASN.1 data type containing the PartyNumber (PresentedAddressScreened, PresentedAddressUnscreened, PresentedNumberScreened, or PresentedNumberUnscreened) will be sent marked as "PresentationRestricted" with "NULL" for the associated digits.

**Screen 161. ISDN Numbering Public/Unknown**

**CPN Prefix**

Use this field to specify the number that is added to the beginning of the extension to form a Calling or Connected Number.

**Valid entries    Usage**

1 to 15 digits    Only digits are allowed in the CPN Prefix column. Leading spaces, or spaces in between the digits, are not allowed.

- If the length of the CPN Prefix matches the Total CPN Length, the extension number is not used to formulate the CPN number.
- If the number of digits in the CPN Prefix plus the extension length exceeds the administered Total CPN Length, excess leading digits of the extension are deleted when formulating the CPN number.
- If the number of CPN Prefix digits plus the extension length is less than the Total CPN Length, the entry is not allowed.
- If the Total CPN Length is 0, no calling party number information is provided to the called party and no connected party number information is provided to the calling party.

blank    If this field is blank, the extension is sent unchanged. This is useful in countries where the public network is able to insert the appropriate CPN Prefix to form an external DID number.

## Ext Code

Allows for groups of extensions to be administered.

### ☰ NOTE:

When **0** alone is entered, the Ext Len field must be 1 and the DDD number must be 10-digits.

| Valid entries                 | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b> to <b>9</b> or blank | The Ext Code can be up to 7-digits long depending on the Ext Len field entry. The entry cannot be greater than the Ext Len field entry. For example, in the case of a 4-digit Ext Len field entry, an Ext Code of 12 is the equivalent of all extensions of the screen 12xx, excluding any explicitly listed longer codes. If a code of 123 is also listed, the 12 code is equivalent of all extensions of the screen 12xx except extensions of the screen 123x. The coding precludes having to list all the applicable 12xx extensions. |
| <b>attd</b>                   | For attendant                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Ext Len

Specifies the number of digits the extension can have.

| Valid entries                 | Usage                                                          |
|-------------------------------|----------------------------------------------------------------|
| <b>0</b> to <b>7</b> or blank | Corresponds to the extension lengths allowed by the dial plan. |

## Total CPN Len

| Valid entries                  | Usage                                     |
|--------------------------------|-------------------------------------------|
| <b>0</b> to <b>15</b> or blank | Enter the total number of digits to send. |

## Trk Grp(s)

The switch generates the station's identification number if there is an entry in the Ext Code field, and this field is administered with the trunk group number carrying the call.

| Valid entries | Usage                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 7 digits | Enter the valid administered ISDN trunk-group number or a range of group numbers. For example, if trunk groups 10 through 24 use the same CPN Prefix, enter <b>10-24</b> . |
| blank         | The identification numbers are not dependent on which trunk group the call is carried.                                                                                     |

## ISDN-BRI Trunk Circuit Pack

This screen administers an ISDN-BRI circuit pack. See *Avaya MultiVantage™ Solutions Hardware Guide* for information on the maximum number of ISDN-BRI circuit packs that you can administer.

Screen 162. BRI Trunk (using a TN2185 circuit pack)

### Cntry/Peer Protocol

Tells call processing software which ISDN protocol standard is applied.

| Valid entries   | Usage                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 25<br>etsi | When this field is <b>10</b> , <b>12</b> , <b>13</b> , or <b>etsi</b> , the Protocol Version field is equivalent to <b>b</b> on the DS1 circuit pack screen. When the Cntry/Peer Protocol field is set <b>10</b> , <b>12</b> , <b>13</b> , or <b>etsi</b> , set the Provol Version field to <b>b</b> . For all other administered values, the Protocol Version sets to <b>a</b> . |
| QSIG            | When the Interface field is <b>peer-slave</b> or <b>peer-master</b> , this field must be <b>QSIG</b> . The choice <b>QSIG</b> is valid only when the Interface field is <b>peer-slave</b> .                                                                                                                                                                                       |
| blank           | You cannot leave this field blank if the Interface field is set to a valid, non-blank value                                                                                                                                                                                                                                                                                       |

## DCP/Analog Bearer Capability

| <b>Valid entries</b>     | <b>Usage</b>                                                                                                  |
|--------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>3.1kHz<br/>speech</b> | Indicates how to encode the Bearer Capability IE for an outgoing call originated by a DCP or analog endpoint. |

## Detect Slips

| <b>Valid entries</b> | <b>Usage</b>                                                                        |
|----------------------|-------------------------------------------------------------------------------------|
| <b>y/n</b>           | Tells maintenance software whether slips reported by the BRI port should be logged. |

## Interface

| <b>Valid entries</b>                                   | <b>Usage</b>                                                                                                                                                                                                                              |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>network<br/>user<br/>peer-master<br/>peer-slave</b> | Tells call processing software whether a particular port is connected to a user/network or a peer interface. These entries are valid for the TN2185. You can enter <b>peer-slave</b> only if the QSIG Basic Call Setup feature is enabled |

## Interface Companding

| <b>Valid entries</b>    | <b>Usage</b>                                                              |
|-------------------------|---------------------------------------------------------------------------|
| <b>a-law<br/>mu-law</b> | Indicates the companding algorithm expected by the system at the far end. |

## Invert Bits

| <b>Valid entries</b> | <b>Usage</b> |
|----------------------|--------------|
| <b>y/n</b>           |              |

## Layer 1 Stable

| <b>Valid entries</b> | <b>Usage</b>                                                                                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>y<br/>n</b>       | Tells call processing and maintenance software whether to expect the network to drop Layer 1 when the BRI port is idle. Only the TN2185 may be set to <b>n</b> . |

**Location**

This is a display-only field. It shows the TN2185 circuit pack location (PPCSS)

**Name**

| Valid entries                    | Usage                                           |
|----------------------------------|-------------------------------------------------|
| 1–15<br>alpha-numeric characters | This name is used to identify the circuit pack. |

**Port**

This is a display-only field. It shows the port number to which parameters administered on the row apply.

**Side**

| Valid entries | Usage                                                                                   |
|---------------|-----------------------------------------------------------------------------------------|
| a<br>b        | Determines how glare conditions are handled when Interface field is <b>peer-slave</b> . |

**Synch Source**

| Valid entries | Usage |
|---------------|-------|
| y<br>n        |       |

**T3 Timer Length (sec)**

| Valid entries | Usage                                                                                     |
|---------------|-------------------------------------------------------------------------------------------|
| 1 to 127      | Tells the TE side how long to wait, in seconds, for an inactive Layer 1 to become active. |

**TEI**

| Valid entries | Usage |
|---------------|-------|
| auto<br>0     |       |

**Time Fill**

The bit pattern sent on the D-channel between valid LAPD packets.

**Valid entries      Usage**

**flags**

**ones**

**Screen 163. BRI Trunk (with a TN556B or TN2198 circuit pack)**

The following field descriptions are unique to the ISDN-BRI Circuit Pack screen with a TN556B or TN2198 circuit pack. The following fields do not display with a TN556B or TN2198 circuit pack:

- T3 Timer Length (sec)
- Synch Source
- Layer 1 Stable
- Detect Slips

## Cntry/Peer Protocol

Tells call processing software which ISDN protocol standard is applied.

| Valid entries | Usage                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 25       | When this field is <b>10</b> , <b>12</b> , or <b>13</b> , the Protocol Version field is equivalent to <b>b</b> on the DS1 circuit pack screen. |
| <b>etsi</b>   | When this field is <b>etsi</b> , the Protocol Version field is equivalent to <b>b</b> on the DS1 circuit pack screen.                          |
| <b>QSIG</b>   | When the Interface field is <b>peer-master</b> , this field must be <b>QSIG</b> .                                                              |
| blank         | You cannot leave this field blank if the Interface field is set to a valid, non-blank value.                                                   |

## Interface

| Valid entries      | Usage                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>network</b>     | Tells call processing software whether a particular port is connected to a user/network or a peer interface. These entries are valid for the TN556B. You can enter <b>peer-master</b> only if the QSIG Basic Call Setup feature is enabled |
| <b>peer-master</b> |                                                                                                                                                                                                                                            |

## Side

| Valid entries | Usage                                                                                                                                                        |
