Introduction

revised 3/14/2013 6:34:47 PM

Welcome to the PXL System manual. An overview of the complete system is given in Chapter 1, subsequent chapters provide greater detail on individual components.

Version 4.6 Release Notes

Vizomo:

- Support Barco PXL brightness sensor
- Added C11 brightness boost
- Further improved quality of scaled images
- Reverted improved gamma control

RasterMAPPER:

• 4.6 compatibility

See the change log for previous revision history.

Home > Safety Information

Safety Information

Read the installation instructions before connecting the system to the power source. Attention: Avant de brancher le système sur la source d'alimentation, consulter les directives d'installation. Warnung: Vor dem Anschließen des Systems an die Stromquelle die Installationsanweisungen lesen.

Safety Guidelines for Human Eyes

The panels shall be mounted 15-20 meter from the viewing place, depending on the configuration. Lamp may pose a hazard even for momentary or brief exposure. Remove power before servicing. No servicing or maintenance with power to the LEDs switched on.

A warning label shall be added to the tile and in the manual stating the risk and how to avoid the risk.

Use caution when viewing LEDs directly if driven at high current, which may greatly increase the hazard to your eyes. (IEC62471)

Electrical Safety Guidelines

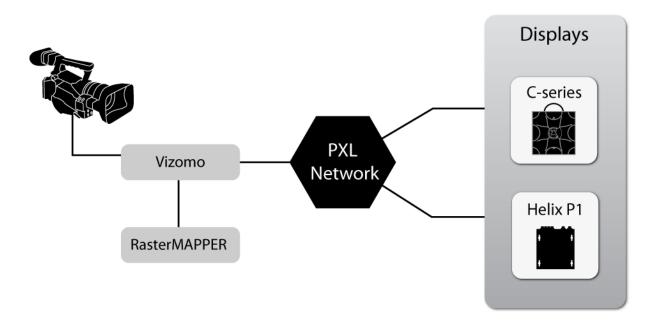

Risk of electrical shock. No user-serviceable parts inside. Observe all applicable electrical codes. The power outlet shall be installed near the equipment and shall be easily accessible.

Do not hot plug any cables. Damage to the connector pins may occur. Resulting damage is not covered under warranty. Unit shall not be exposed to dripping or splashing. To reduce the risk of electric shock, do not expose this apparatus to rain or moisture. Home > 1. PXL System Overview

1. PXL System Overview

The PXL System is a family of components that consists of LED display devices, image processing, and data distribution. The following diagram provides a basic overview of how PXL is distributed.

The Vizomo processor receives video data in a standard format such as DVI or SDI, and converts it to a special data format that may be used by the LED displays. This data is distributed over a star or hub style network to short daisy chains of the display components. By limiting the amount of data being forwarded through each daisy-chained LED display device the complexity of the devices is minimized, this results in low power consumption and passively cooled displays. To split the data stream, PXL switches are needed. Each of these topics is covered in detail in the remaining chapters of this guide.

Home > 2. C-series Tile

2. C-series Tile

The C-series tile is the primary building block of a modular system that may be used to construct large format video displays with arbitrary shapes. With resolutions in the range of 7-16mm pixel pitch, C-series tiles are suited to a wide variety of indoor and outdoor rental and architectural applications.

The remainder of this chapter covers installation guidelines for C-series tiles.

C8v Tile:

The City of Dreams Macau pylon consists of 749 C8v tiles per side, illustrating how C-series tiles can be used to create a circular video display.

Home > 2. C-series Tile > 2.1 Tile Overview

2.1 Tile Overview

C-series tiles are latched together along their edges to create large LED video displays with arbitrary shapes. Once a display shape has been decided upon, the display may be hung or attached to floor mounts for temporary rental applications, or permanently affixed to secondary steel in an architectural installation.

Horizontally curved C-series displays may be created with radii varying from 4m convex to -10m concave. Please contact your Barco project manager for further details.

C-series tiles are attached to truss or floor-mounts using header and footer blocks, as shown in the following figure. See sections <u>2.4 Assembly & Mounting</u> and <u>2.5 Rigging Hardware & Methods</u>.

Video data is provided to C-series tiles by a Vizomo LED processor, distributed through a PXL network. See chapters <u>4. Vizomo</u> and <u>5. Power and Data</u> <u>Distribution</u>. Home > 2. C-series Tile > 2.2 Installation Guidlines

2.2 Installation Guidlines

Rigging & Mounting Guidelines

- C11 and C8v C-series tiles have an IP66 rating and are suitable for use in most indoor and outdoor installations except where water immersion could occur. This conforms to the International Electrotechnical Commission (IEC) standard 60529.
- The C7 tiles have an IP50 rating and are suitable for indoor use only.
- Use caution when installing the display. C-series tiles weigh 6.4 kg (14.1 lbs)/tile.
- Ensure rigging hardware is able to handle the weight of the entire C-series system with appropriate safety factors.
- External rigging hardware must be properly installed prior to hanging C-series tiles.
- Do not hang more than 25 C-series tiles (10 m) tall with the integral rigging hardware.
- When rigging observe the maximum number of panels that can be hung or floor supported.
- Displays >10 m tall require an auxiliary frame system not supplied by Barco.
- Handle is intended for carrying a single tile only. Do not use for safety, tie-off, climbing, or lifting.

Power

Observe the following power guidelines when setting up your C-series display.

The table below indicates min/max power consumption.

Fixture	Max power consumed @ full white	Minimum power consumed in black	Maxiumum Brightness
C7	100 watts	12 watts	2000 nits
C11	85 watts	12 watts	5000 nits
C8v	55 watts	12 watts	8000 nits

When running typical video content, the duty cycle (average power consumption) is about 30% of maximum. See <u>chapter 5</u> for more details on maximum daisy chain power consumption limits for PDB-5 and break-in cables.

NOTE

For installations where a residual current device (RCD) or similar device will be used on the mains power to the display, please take into account that Cseries tiles have an earth leakage of 85 micro-amps per tile.

Data

Observe the following data limits when setting up your C-series display.

Fixture	Max panels per PDB-5 or switch output	Max Panels per Vizomo output	Max Panels per Vizomo
C7	8	80	320
C11 16		180	720
C8v 25		300	1200

Temperature

C-series installations must take into account the operating temperature of the tiles. The ambient operating temperature for a C-series tile is -20°C to 45°C.

NOTE

C-series tiles have an internal temperature sensor that shuts down the tile's output (brightness is set to 0) when internal temperature is too high. The brightness will return to normal when the internal temperature has cooled sufficiently.

Risk of electrical shock. No user-serviceable parts inside. Observe all applicable electrical codes. The power outlet shall be installed near the equipment and shall be easily accessible. Do not hot plug any cables. Damage to the connector pins may occur. Resulting damage is not covered under warranty. Home > 2. C-series Tile > 2.3 Assembly & Mounting

2.3 Assembly & Mounting

The rear of a C-series tile contains the rigging hardware necessary for temporary hanging or stacking in a staging application, as well as hardware for permanent installation in an architectural setting.

- 1 Carrying handle. Folds away when not in use.
- 2 Latch hook and lever. Locks multiple C-series tiles together.
- 3 Power & data input. Combined AC power & data input via black PXL Cable socket.
- 4 Center mount point with rotary latch. Attaches to secondary steel for fixed or architectural installations.
- 5 Latch catch receiver. Accepts the latch hook for locking multiple tiles together.
- 6 Radius adjustment dowel. Interchangeable pin available in differing angles to enable horizontally curved installations.
- 7 Breather valve. Allows air to breath through waterproof, gas-permeable membrane. One valve on each side of tile.
- 8 Power & data output. Combined AC power & data output via white PXL Cable socket.
- 9 Tile status indicator. Color indicates tile status.

Do not hang more than 25 panels (10 m) tall with the integral rigging hardware. No lifting point should support more than 100 tiles (1433 lb / 650 kg).

When using light duty headers, refer to Appendix 5, Light Duty Rigging Info to calculate the maximum number of panels.

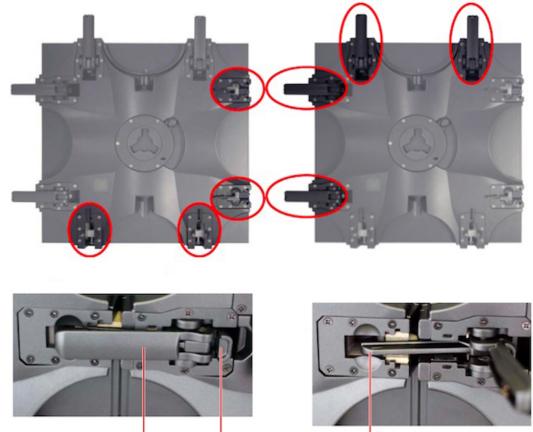

Displays >10 m tall require an auxiliary frame system not supplied by Barco.

Failure to equalize the load among all pickup points could result in serious injury.

Home > 2. C-series Tile > 2.3 Assembly & Mounting > 2.3.1 Latches

2.3.1 Latches

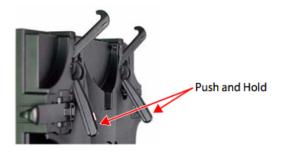

There are a total of 8 integrated locking components on each tile as shown below; 4 latches and 4 catches.

Handle Safety

Hook

The photo below illustrates the optimal position of the handle and hook to allow for easy connection to other tiles. With the hook in this position and your thumbs slightly pushing on the open handle, you can hang one tile on another, then lock the tiles together.

How to Lock C-series Tiles Together

Start with the latch fully open. Align the Cseries tiles so the latch of one aligns with the catch of the other.

catch. Ensure sure the hook is

fully seated.

Push the handle towards the

Ensure the hook is fully locked in the catch and that the safety is engaged.

<u>∧</u>

CAUTION

Use light finger pressure when latching the tile. Do not force the lock handle. If resistance is felt as you lock the tiles, open the handle, ensure the hook is fully seated, check for proper alignment, and try again.

catch.

How to Unlock C-series Tiles

Push and hold the safety catch as you begin Continue pulling the handle open. to pull the handle away from the tile.

Ensure the handle is all the way open so the hook is fully disengaged from the catch.

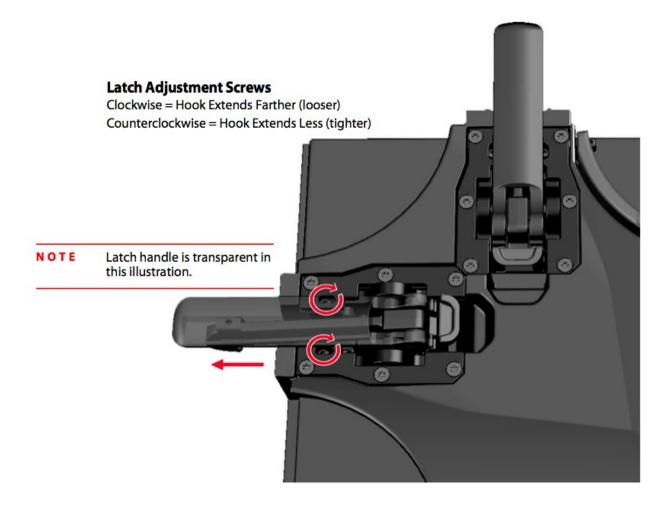

When mounting C-series units together, ensure the latches are fully engaged in the catch and lock in place before releasing the C-series tile from your grip.

Home > 2. C-series Tile > 2.3 Assembly & Mounting > 2.3.2 Latch Adjustment

2.3.2 Latch Adjustment

The latches on a C-series tile can be adjusted to provide optimal connection between tiles. This adjustment moves the hook closer to or farther from the edge of the adjacent tile.

The adjustment screws are located under the latch handle and require a 2mm hex key.

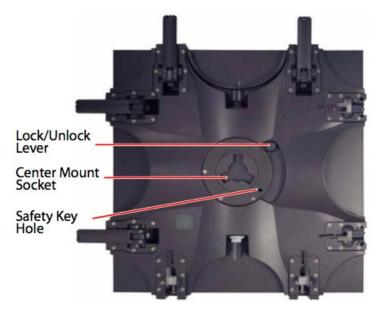

Home > 2. C-series Tile > 2.3 Assembly & Mounting > 2.3.3 Center Mount

2.3.3 Center Mount

Center Mount Detail

The center mount is used for attachment of vertical braces.

Home > 2. C-series Tile > 2.3 Assembly & Mounting > 2.3.4 L-Bracket

2.3.4 L-Bracket

In addition to the Center Mount there are two M10 threaded holes in the back of each C-series tile that may be used for permanent mounting or attaching other accessories.

The two threaded holes are located underneath the Center Mount.

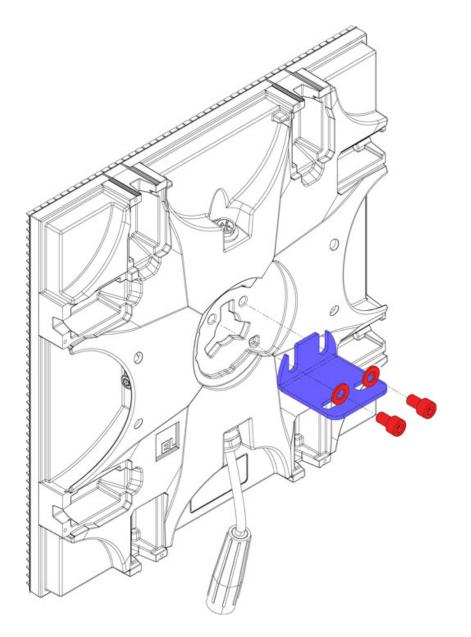

Removing the Center Mount Socket

Use of the L-bracket require the removal of the center mount socket from the rear of the tile as described in the following steps.

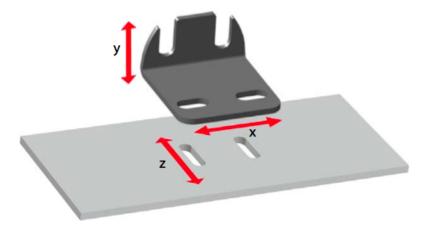

- 1 Place the tile on a flat surface, protecting the front of the tile from damage to the LEDs.
- 2 Remove the 5 screws from the retaining ring.
- 3 Remove the retaining ring and locking ring.

Installing the L-Bracket

The L-bracket mounts to the back of a C-series tile via 2x M10 threaded inserts. Use M10-16 (16mm long) bolts only. The torque specification for this M10-16 bolt is 16.9 N-m.

The L-bracket allows adjustability along the X and Y axis. To allow for Z axis adjustment the holes to which the L-bracket is attached should also be slotted as shown below:

Use M10-16 bolts for the threaded mounting holes on the back of the C-series tile. Longer lengths will cause damage to the tile. Resulting damage is not covered under warranty.

Home > 2. C-series Tile > 2.4 Rigging Hardware

2.4 Rigging Hardware

A variety of rigging hardware is available for deploying C-series displays.

Headers are used for suspending displays from overhead, while feet are used for to create floor standing or "stacked" installations. Vertical pipe or truss are used to provide structure in stacked and heavy duty hanging configurations.

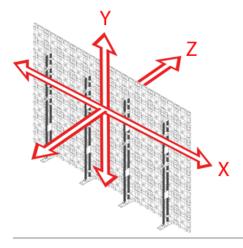

The user must accept responsibility for the correct application of products and methods based on local conditions. Never exceed the working load limits. Avoid shock loads. Inspect products regularly. If you are not sure of the proper use of a product consult with a rigging professional. Home > 2. C-series Tile > 2.4 Rigging Hardware > 2.4.1 Stacked C-series Tiles

2.4.1 Stacked C-series Tiles

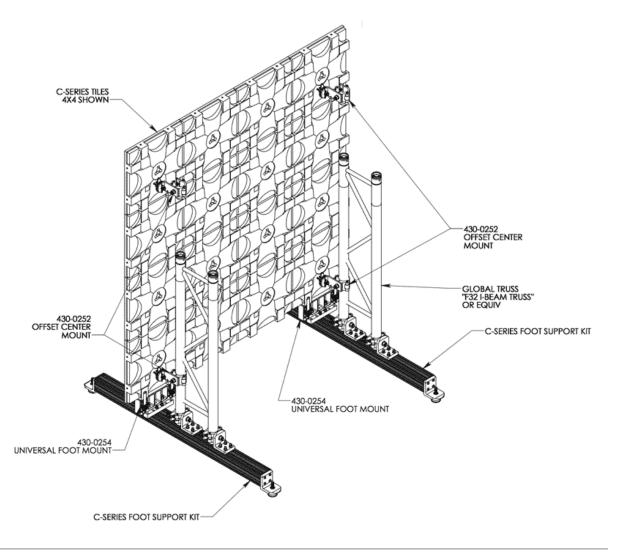

This page illustrates a example of a stacked C-series system. Before placing an order for rigging equipment consult with a Barco representative to evaluate your specific needs.

Vertical bracing for C-series tiles is for Z axis loading only. X and Y axis loads are carried by the C-series tiles themselves.

Example stacked system:

NOTES

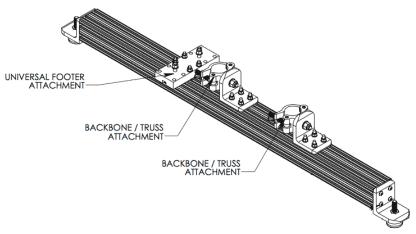

- 1 "C-series Foot Support" 430-0256 required every 3 columns (up to 8 tiles high)
- 1 "C-series Foot Support" 430-0256 required every 2 columns (for 9 or 10 tiles high)
- 1 "Universal Foot Mount" 430-0254 required for each foot support
- 1 "Offset Center Mount" 430-0252 required at each truss every 3rd tile

Assembly should not span more than 3 tiles between supports

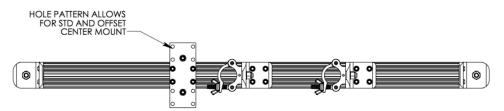

Max height is 10 tiles max wind load is 20 mph (see Appendix A: Beaufort Scale)

Should be assembled with tile in middle of support

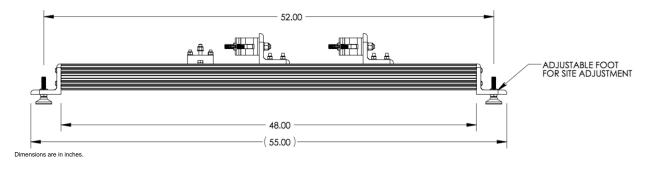

2.4.1.1 C-series Foot Support (430-0256)

Top View:

Side View:

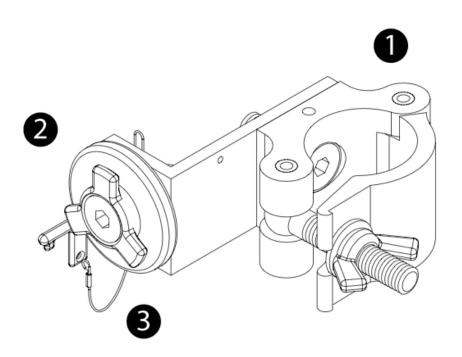

NOTES

SUPPORT OF C-SERIES LED WALL 10 TILE MAX COLUMN HEIGHT
 1 FOOT SUPPORT REQUIRED EVERY 3 COLUMNS
 20 MPH MAX WIND RATING - DO NOT EXCEED (see <u>Appendix A: Beaufort Scale</u>)

Home > 2. C-series Tile > 2.4 Rigging Hardware > 2.4.1 Stacked C-series Tiles > 2.4.1.2 C-series Pipe Clamp (430-0252)

2.4.1.2 C-series Pipe Clamp (430-0252)

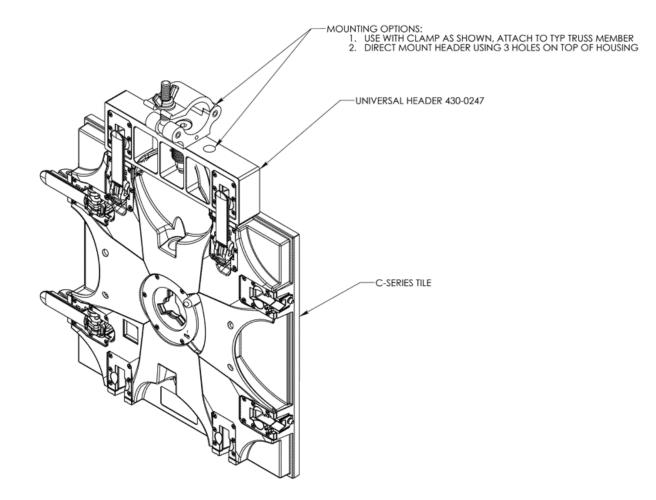

- Chesebrough clamp Truss mounting hardware
 C-series center mount
- 3 Center mount safety key

Home > 2. C-series Tile > 2.4 Rigging Hardware > 2.4.2 Hanging C-series Tiles

2.4.2 Hanging C-series Tiles

This page illustrates an example of a hanging C-series system. Before placing an order for rigging equipment consult with a Barco representative to evaluate your specific needs.

NOTES:

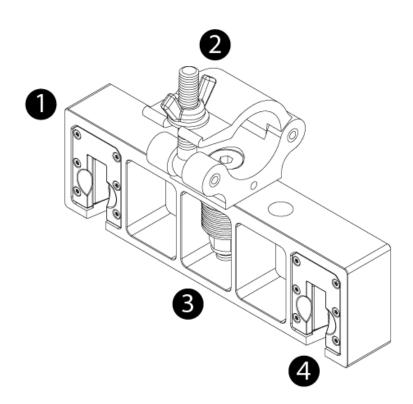

- One Universal Header supports max 25 tiles in height.
- Based on application, lateral support may be needed.
- Installation parameters should also be taken into account when determining the number of headers to use.

Examples:

- 6 high display would need header every 4th column (do not span more than 3 columns between headers)
 10 high column would need header every-other column
- 13+ high display would need header every column

Home > 2. C-series Tile > 2.4 Rigging Hardware > 2.4.2 Hanging C-series Tiles > 2.4.2.1 Universal Header (430-0247) Detail

2.4.2.1 Universal Header (430-0247) Detail

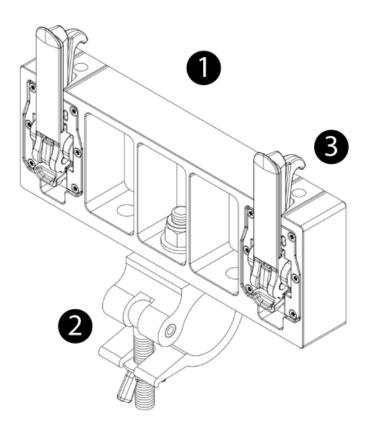

- 1 Machined 'Universal Header' chassis
- 2 Chesebrough clamp Truss mounting hardware
- 3 Disk spring assembly Load distribution mechanism
- 4 Latch Catch Socket for locking C-series panels to header.

Do not hang more than 25 panels (10 m) tall with the integral rigging hardware. No lifting point should support more than 100 tiles (1411 lb / 640 kg). Failure to equalize the load among all pickup points could result in serious injury.

Home > 2. C-series Tile > 2.4 Rigging Hardware > 2.4.2 Hanging C-series Tiles > 2.4.2.2 Universal Footer (430-0254) Detail

2.4.2.2 Universal Footer (430-0254) Detail

1 Machined 'Universal Footer' chassis

- Chesebrough clamp Truss mounting hardware
 Clamp and clamp adjust assembly

Home > 2. C-series Tile > 2.5 Power & Data Distribution

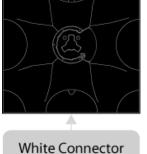

2.5 Power & Data Distribution

The C-series tiles receive power and data over a single daisy-chained PXL cable with color-coded male and female connectors. The length of the daisychain depends on the tile type - higher resolution tiles require shorter daisy-chains as discussed in chapter <u>5. Power and Data Distribution</u>.

Connectors on the back of a tile are color-coded as follows:

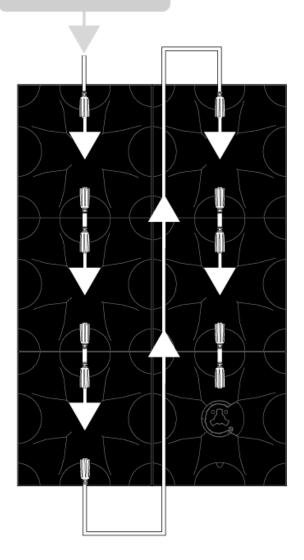

- Black PXL Connector = Power & Data In
- White PXL Connector = Power & Data Out

Black Connector

When interconnecting C-series tiles, always attach the black PXL cable plug to the black PXL tile socket and the white PXL cable plug to the white PXL tile socket.

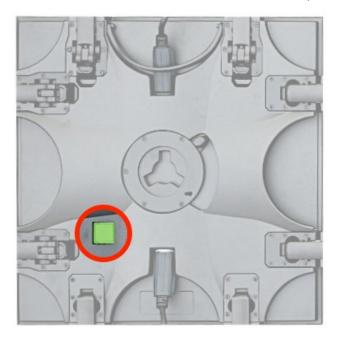

Data and Power

Home > 2. C-series Tile > 2.5 Power & Data Distribution > 2.5.1 Tile Status Indicator

2.5.1 Tile Status Indicator

The colored status indicator located on the back of the C-series tile allows you to easily monitor the state of each tile.

	Off	No Power (Note: the status indicator remains black for a few seconds when the tile is first powered on)
		Optional. Operating normally in stealth mode, when the green "normal operation" indicator may interfere with the look of the back of the wall.
	Off	In this mode, other states will still light up with the colors listed below. To enable stealth mode, the setting
		system.output.pxl.disable_status_indicator must be set to true on the Vizomo processor.
	White	Tile is powering up
	Vagenta	Tile has booted, but not yet receiving data
	Orange	Top or bottom data link is working properly
	Blue	Both data links are working properly
	Green	Video data is being received (normal operation)
	Flashing	Error
F	Red	

Home > 2. C-series Tile > Notes: Beaufort Scale

Notes: Beaufort Scale

The following table is used as a reference for wind speed calculations throughout this guide.¹

Beaufort Scale	Wind Speed (km/hr)	Wind Speed (miles/hr)	Wind Conditions
12	≥ 118	≥73	Very widespread damage to vegetation. Some windows may break; mobile homes and poorly constructed sheds and barns are damaged. Debris may be hurled about.
11	103 – 117	64 – 72	Widespread damage to vegetation. Many roofing surfaces are damaged; asphalt tiles that have curled up and/or fractured due to age may break away completely.
10	89 – 102	55 – 63	Trees are broken off or uprooted, saplings bent and deformed. Poorly attached asphalt shingles and shingles in poor condition peel off roofs.
9	75 – 88	47 – 54	Some branches break off trees, and some small trees blow over. Construction/temporary signs and barricades blow over. Damage to circus tents and canopies.
8	62 – 74	39 – 46	Some twigs broken from trees. Cars veer on road. Progress on foot is seriously impeded.
7	50 – 61	31 – 38	Whole trees in motion. Effort needed to walk against the wind. Swaying of skyscrapers may be felt, especially by people on upper floors.
6	39 – 49	25 – 30	Large branches in motion. Whistling heard in overhead wires. Umbrella use becomes difficult. Empty plastic garbage cans tip over.
5	29 – 38	18 – 24	Branches of a moderate size move. Small trees begin to sway.
4	20 – 28	13 – 17	Dust and loose paper raised. Small branches begin to move.
3	12 – 19	8 – 12	Leaves and smaller twigs in constant motion.
2	5.6 – 11	4 – 7	Wind felt on exposed skin. Leaves rustle.
1	1.1 – 5.5	1 – 3	Wind motion visible in smoke.
0	< 1	< 1	Calm. Smoke rises vertically.

1. Beaufort scale, http://en.wikipedia.org/w/index.php?title=Beaufort_scale&oldid=303100822 (last visited July 20, 2009).

The names "storm" and "hurricane" on the Beaufort scale refer only to wind strength, and do not necessarily mean that other severe weather (for instance, a thunderstorm or tropical cyclone) is present.
 To avoid confusion, strong wind warnings will often speak of e.g. "hurricane-force winds".

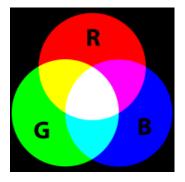

Home > 2. C-series Tile > Notes: C-series Color

Notes: C-series Color

Additive Color Mixing

Like TVs and computer screens, each pixel of a C-series display emits light. Because the LED pixels emit light, different colors are created additively; that is, the color of each pixel is created by mixing one or more primary colors together. This is in contrast with printed or painted images, which reflect light from a surface and use a subtractive color model. In the additive model, the three primary colors for human vision are defined to be red, green, and blue. By mixing together each component in different amounts, different hues and intensities can be produced. For example, mixing red and green in equal amounts produces a yellow color. Keeping the ratio of red to green equal and varying their intensity together allows different brightnesses of yellow to be made.

Additive Color:

A C-series screen takes advantage of additive color mixing by grouping three or more differently colored LEDs to form a pixel. Each LED can then be set to a corresponding brightness to provide the required color mix.

Luminance Correction

Understanding LED light output is an important factor for creating precise colours. Not all LEDs are created equally, and have many characteristics controlling both the emitted color and intensity. This is further complicated by how the human eye actually perceives the emitted light. For example, at equal intensities, green LEDs typically appear much brighter than red or blue LEDs as the human eye is more sensitive to green. This means that illuminating red and green LEDs equally does not generate yellow as expected, as the sensitivity bias of the human eye towards green would result in a yellowish shade of green.

These luminance differences are compensated for by adjusting the LED brightnesses accordingly. This allows for LEDs within a pixel to mix correctly, and neighboring pixels to appear as if they have the same brightness.

Think of it as mixing paint. Where one bucket has a much stronger color than the other. i.e. you need more from the red bucket than the green bucket to get yellow.

Defining Color

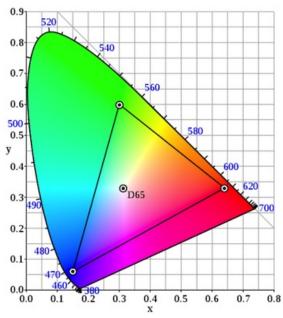

What is yellow? Is yellow the color of sunshine when seen through a low morning fog on a cold Sunday morning? Perhaps yellow is the color of Daffodils that line a nearby stream as it meanders through a calm meadow. While somewhat poetic nether of those help us define what yellow actually is.

Fortunately, the International Commission on Illumination (CIE) mathematically defined the 'CIE 1931 XYZ color space'. Using this model we can define all visible colors.

So, now we can compare thee to a summer's day... Yellow is as lovely as x=0.42, y=0.51.

Ahem.

CIE 1931 diagram with sRGB gamut:

The CIE 1931 XYZ color space lies within a horseshoe shaped locus on a two dimensional coordinate system. Points within the color space are uniquely defined with both an x and a y coordinate. These two values make up the "address" for a particular color. To find the yellow color referred to above, locate the intersection of x=0.42 and y=0.51 on the chart. This also works in reverse where the coordinate of any color can be determined by locating the color in the space, and then reading off the x and y values of that color.

Displaying True Color

These chromaticity coordinates allow us to define each color that we want to display. However, before we can begin to display a color we must define the actual colors we have from the LEDs in the C-series panels. Due to the variability in manufacturing tolerances and availability of dyes used to create LEDs, red, green, and blue LEDs are never going to perfectly match the CIE coordinates for true red, green, and blue. In order to create a color space that the C-series panel can display, each LED panel is measured by a specialized camera. This information allows the Vizomo processor to later compensate with the correct combinations of actual LED source colors that are needed to hit our true CIE target colors.

If you look closely at a C-series panel displaying the color yellow you will notice that the red, green, and blue LEDs are all on at various intensities. Why blue? The three primary colors, red, green, and blue, form a triangle on the CIE color chart. A contribution from each point of the triangle is needed to achieve a target color within the space. Colors along the edge of the triangle may be created by only mixing the two colors at the ends of that edge, and for each red, green, and blue primary, only that color contributes.

Our LED source color coordinates are fixed. We can only show a target color by adjusting (up or down) the brightness of our source colors. If we want a less red color we can either turn red down or both green and blue up.

To create true yellow, choosing a point between red and green is not enough. We must also apply some blue to pull the point down a bit in the triangle and reach the required target.

Similarly, if you create a pure red image on your computer you may see non red LEDs turn on when displayed on a color corrected LED screen. This is because red LEDs are not the same color as pure red in CIE coordinates. As such, the color correction is compensating by adjusting the output to match the color of the input.

Viewing True Color

In the discussion above, the additive color model was used to determine what quantities of the primary colors were needed to produce a specified color. To follow this model correctly, each primary color should be mixed optically. That is, the light generated by each primary color should be mixed so that they overlap, and no amount of closer examination should be able to separate one from the other. An example of this would be taking three primary colored lamps and projecting them onto a surface, where they mix.

To simplify their design, most direct view display devices such as CRTs, LCD and plasma panels, and LED displays, all place primary colored sub-pixels side by side, rather than mixing them into one dot per pixel. By shrinking the geometric size of the sub pixels (the individual color components) and placing them close enough together, at a specified viewing distance the eye can no longer resolve the individual sub pixels in space, and it blurs or fuses them together into one pixel. This is called color convergence.

C-series displays are designed to be viewed from a much larger distance than a TV or computer monitor, and as such, the minimum distance necessary for color convergence to occur is much larger. Because of the ease at which C-series displays can be closer, it may appear as though the colors don't look right when viewed from this distance. For example, as mentioned before, to display a specified "pure" red may require mixing in a small amount of blue or green, depending on the chromaticity coordinate of the red sub-pixel being used. Observing this "pure" color from less than the minimum viewing distance may seem incorrect, as the blue and green LEDs will clearly be illuminated. However, moving further away until color convergence is achieved will resolve this issue.

3.1 Installation Guidelines

- Helix P1 pixel strings have an IP66 rating and are suitable for use in most indoor and outdoor installations except where water immersion could occur. This conforms to the International Electrotechnical Commission (IEC) standard 60529.
- Helix PXL Node Boxes have an IP65 rating and are suitable for use in most indoor and outdoor installations except where water immersion could occur. This conforms to the International Electrotechnical Commission (IEC) standard 60529.

Power Guidelines

Risk of electrical shock. No user-serviceable parts inside. Observe all applicable electrical codes. The power outlet shall be installed near the equipment and shall be easily accessible. Do not hot plug any cables. Damage to the connector pins may occur. Resulting damage is not covered under warranty.

Observe the following power guidelines when setting up your Helix P1 display:

Max current draw of one PXL Node with four (4) P1 pixels strings is 0.5A @ 200-240VAC 50/60Hz. Maximum # of PXL Nodes per PDB-5 output = 20 Maximum # of PXL Nodes per PDB-5 \cdot w/ 1 x 16A input = 32 Maximum # of PXL Nodes per PDB-5 \cdot w/ 2 x 16A input = 64

* PDB-5 has 32A limit (2x 16A).

When running typical video content, the duty cycle (average power consumption) is about 30% of maximum.

Temperature

Helix installations must take into account the operating temperature of the PXL Nodes. The ambient operating temperature for a PXL Node is -20°C to 45°C.

NOTE

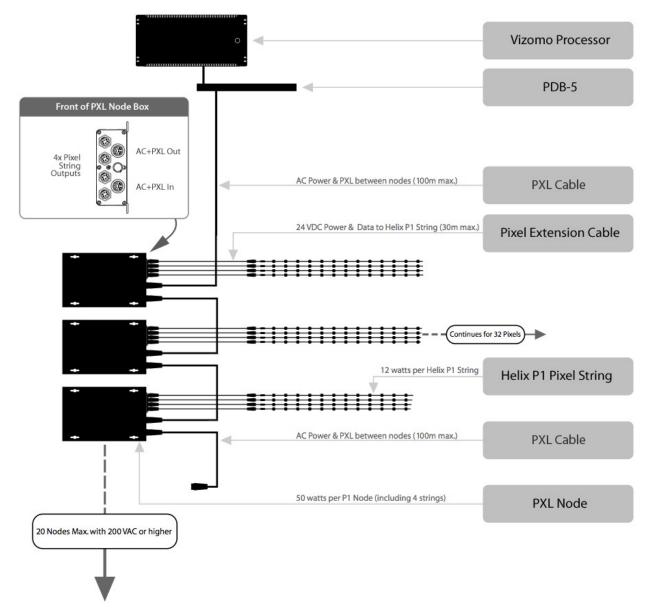

Helix PXL Nodes have an internal temperature sensor that shuts down the output (brightness is set to 0) when internal temperature is too high. The brightness will return to normal when the internal temperature has cooled sufficiently.

Home > 3. Helix P1 > 3.2 Helix System Overview

3.2 Helix System Overview

3.2.1 Basic System Info 3.2.2 Helix P1 Pixel String Overview 3.2.3 PXL Node Box Overview Home > 3. Helix P1 > 3.2 Helix System Overview > 3.2.1 Basic System Info

3.2.1 Basic System Info

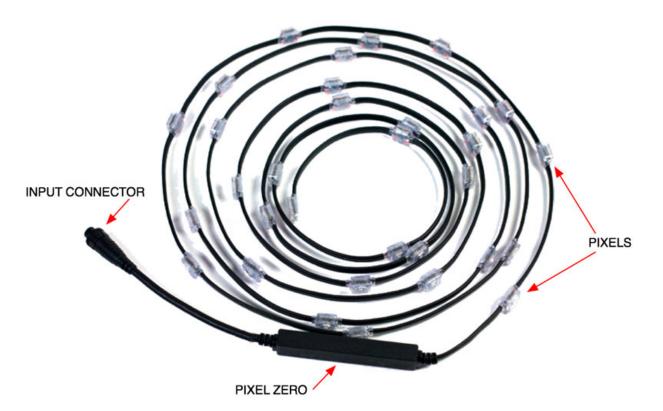

Home > 3. Helix P1 > 3.2 Helix System Overview > 3.2.2 Helix P1 Pixel String Overview

3.2.2 Helix P1 Pixel String Overview

Each Helix P1 pixel string has three parts:

- 1. Input Connector this connects to the outputs on a PXL Node Box
- 2. Pixel Zero a small power and data converter
- 3. 32 Pixels 75mm or 150mm spacing

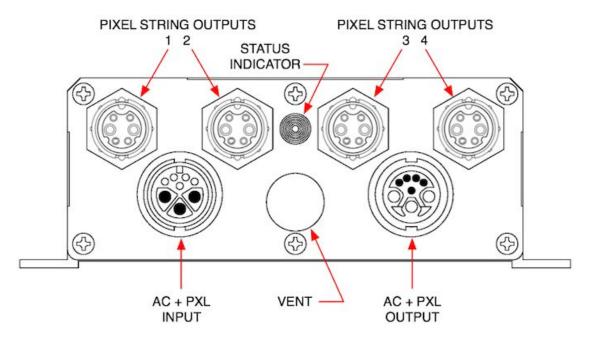

Home > 3. Helix P1 > 3.2 Helix System Overview > 3.2.3 PXL Node Box Overview

3.2.3 PXL Node Box Overview

The PXL Node Box takes AC power and PXL data in, converts this to 24VDC and data out to four strings, and passes AC power and PXL data through to the next PXL Node Box.

All connections are on one end panel of the box:

1. AC + PXL INPUT - black body - This uses the standard PXL Cable Connector.

2. AC + PXL OUTPUT - white body - This uses the standard PXL Cable Connector.

3. PIXEL STRING OUTPUTS - Four independent outputs, each can feed one P1 pixel string

4. STATUS INDICATOR - Multicolor LED indicator

5. VENT - IP65 gas-permeable microporous membrane vent

Home > 3. Helix P1 > 3.3 Power & Data Distribution

3.3 Power & Data Distribution

3.3.1 Power & Data Overivew 3.3.2 Power Input 3.3.3 PXL Node Status Indicator 3.3.4 Pixel Extension Cables Home > 3. Helix P1 > 3.3 Power & Data Distribution > 3.3.1 Power & Data Overivew

3.3.1 Power & Data Overivew

The PDB-5 handles the power and data distribution for Helix P1 systems. All power & data cabling between the PDB-5 and PXL Node Boxes is done through integrated, cabling with color-coded male or female connectors.

Alternative installations without a PDB-5 can make use of a break-in cable which accepts AC power and Ethernet data connections (P/N 350-0660).

Connectors on the front of a PXL Node Box are color-coded as follows:

- Black Connector = Power & Data In
- White Connector = Power & Data Out

The connectors on the cables are also color-coded, so it's easy to connect black to black, and white to white.

Home > 3. Helix P1 > 3.3 Power & Data Distribution > 3.3.2 Power Input

3.3.2 Power Input

Each PDB-5 has 2x 16 amp inputs and 6x 10 amp outputs with breakers for AC power distribution. The limit for each PDB-5 output is 10A, with a total output of 32A maximum per PDB-5. Refer to the PDB-5 User's Guide for more information.

Observe the following power guidelines when setting up your Helix P1 display:

Max current draw of one PXL Node with four (4) P1 pixels strings is 0.5A @ 200-240VAC 50/60Hz. Maximum # of PXL Nodes per PDB-5 output = 20 Maximum # of PXL Nodes per PDB-5^{*} w/ 1 x 16A input = 32 Maximum # of PXL Nodes per PDB-5^{*} w/ 2 x 16A input = 64

* PDB-5 has 32A limit (2x 16A).

When running typical video content, the duty cycle (average power consumption) is about 30% of maximum.

Do not hot plug any cables. Damage to the connector pins may occur. Resulting damage is not covered under warranty.

```
Home > 3. Helix P1 > 3.3 Power & Data Distribution > 3.3.3 PXL Node Status Indicator
```

3.3.3 PXL Node Status Indicator

The status indicator located on the front of the PXL Node Box allows you to easily monitor the status of the node.

No Power (Note: the status indicator remains black for a few seconds when the PXL Node Box is first powered on) PXL Node Box powering up PXL Node Box booted Top or bottom data link working properly Both data links working properly Video data is being received Home > 3. Helix P1 > 3.3 Power & Data Distribution > 3.3.4 Pixel Extension Cables

3.3.4 Pixel Extension Cables

Helix P1 pixel strings can be located remotely from the PXL Node Box by using a Pixel Extension Cable.

These are available in four lengths and can be combined together.

Do not exceed 30m in total length from the PXL Node Box to the pixel string.

	Part Number	Name
	350-0654	Helix P1 Extension Cable - 1m
	350-0490	Helix P1 Extension Cable - 3m
	350-0491	Helix P1 Extension Cable - 10m
	350-0636	Helix P1 Extension Cable - 30m

Home > 3. Helix P1 > 3.4 Helix P1 Assembly & Mounting

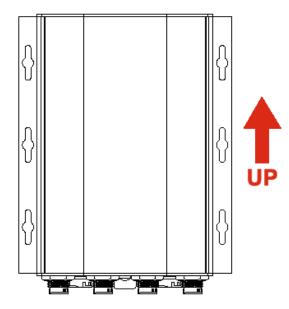

3.4 Helix P1 Assembly & Mounting

PXL Node Box Mounting

The PXL Node Box has six double-ended keyhole slots for mounting. The center hole is 8.5mm in diameter The slots are 4.5mm in diameter

When used indoors the PXL Node Box may be mounted in any orientation.

When used outdoors, or in any wet location, the PXL Node Box must be mounted with the connectors facing down, as follows:

The membrane vent located on the connector panel is rated for IP65 (all other components of the enclosure are rated for IP66 or better). The vent will withstand standing water (up to IP67) for 30 minutes, so for continuous use in an outdoor or wet environment the box must me mounted so the connectors and membrane vent are facing down. This will prohibit and liquid water from pooling on or around the vent.

P1 Pixel String Mounting

The pixel strings are rated IP66 and can be mounted in any orientation, both indoors and outdoors.

Follow the following safety guidelines when mounting the strings:

- Do not flex the cable beyond its minimum bend radius of 10mm
- Do not flex the cable near the entry to the plastic pixel housing
- Do not deform the cable with mounting hardware
- If using a cable staple, use an insulated plastic version, like this:

• Do not puncture the cable or the pixel housing

Home > 4. Vizomo > 4.1 Vizomo Quick Start Guides > 4.1.1 Installing Vizomo Controller

4.1.1 Installing Vizomo Controller

Vizomo Controller can be installed on any PC running Windows XP, Vista, or Windows 7 and is available from the Barco Creative LED support page: http://cled.barcousa.com

NOTE:

If a previous version of Vizomo Controller exists use add/remove programs in the Windows Control Panel to remove it. If you do not do this the Vizomo Controller Installer will not be able to complete the installation.

To install the Vizomo Controller:

- Double click the VizomoControllerSetup.exe
- · Follow the prompts.

• Microsoft's .Net Framework may need to be installed. If so, the machine will need to be connected to the internet to download the files. The installer will guide you through the process.

Once the installer has finished, Vizomo Controller can be found in the Start menu under "Programs\ Vizomo". By default the application is installed to: c:\Program Files\Barco\VizomoController\ Home > 4. Vizomo > 4.1 Vizomo Quick Start Guides > 4.1.2 Connecting with Vizomo Controller

4.1.2 Connecting with Vizomo Controller

When Vizomo Controller launches, the "Connect to processor" window opens listing processors found on your LAN. You can either select one of the processors listed or enter the IP address of another processor.

onnect to processor window:	
Connect to processor	×
Processor address:	
Local processors:	
172.16.50.250 - SV Lab VZ080352	
	Connect

After you select a processor, you need to log in with a user name and password. By default, the Vizomo Controller has only an admin user with the following info:

- User Name = admin
- Password = vision

NOTE:

If you know that you have an active Vizomo on your LAN but you can not see it listed in the processor window, check that Windows Firewall has an exception to allow Vizomo Controller access to search for processors.

NOTE: For information on connecting to a Vizomo with RasterMAPPER see 6.6.1 Processor List

Home > 4. Vizomo > 4.1 Vizomo Quick Start Guides > 4.1.3 Upgrading Vizomo

4.1.3 Upgrading Vizomo

Vizomo upgrade files (labeled with a .vuz extension) can be downloaded from http://vizomo.com.

There are two methods for transferring .vuz files to a Vizomo.

- 1. Vizomo Controller method
- 2. RasterMAPPER method

1. Vizomo Controller:

On the **System Settings** page on the **Files** tab, press the **Upgrade System** button. A file browser will appear. Select the .vuz to be transferred to the Vizomo. After the .vuz file is transferred, the upgrade automatically executes. If necessary the Vizomo will automatically restart.

V 172.16.49.105 Vizomo BNTN	1-49071 - Vizon	no Controller	7

4.1.4 Mapping

Building and uploading maps for Vizomo is done with RasterMAPPER software available from Barco. For the quick start guide to RasterMAPPER, see the <u>6.4 RasterMAPPER QuickStart</u> section. Home > 4. Vizomo > 4.1 Vizomo Quick Start Guides > 4.1.5 Licensing

4.1.5 Licensing

Vizomos are all licensed when they are built. However, occasionally it becomes necessary to obtain a new license. The following steps describe the process of obtaining and loading a new license file.

A Vizomo license is a unique text file that is loaded onto a Vizomo. A machine ID is required to generate a license for a Vizomo. When RasterMAPPER is connected to a remote Vizomo it can be used to retrieve a Vizomo's machine ID by navigating to the 'About' page in the 'Help' Menu.

Vizomo L2i

Send the code to customer support with you new license request. Customer support can be reached at 866-374-7878. When you have a new license from customer support press the 'Upload License' button, navigate to your new license and select it for upload. When the license has been transfered to the remote Vizomo the Vizomo software will soft restart.

If the machine ID does not match the unit to which the license is being transfered to, RasterMAPPER will warn with a pop up dialog box such as the one below. Confirm that the machine ID of the Vizomo matches the one in the license.

Invalid license file: Machine ID is incorrect (does not match
expected)

4.1.6 Adding and Playing Media

If you are not yet familiar with the type of video content that best suits Vizomo, read Appendix B: Video File Encoding.

Vizomo File formats:

Motion Media

The Vizomo processor can decode H264, MPEG, and MPEG-2 encoded video stored in the following container formats:

- Quicktime Movie (.mov)
- Windows Media (.avi)

Still Media Formats

The following still image formats are supported:

- Portable Network Graphics (.png)
- Joint Picture Expert Group (.jpeg/.jpg)
- TIFF 8b & 16b (.tiff)

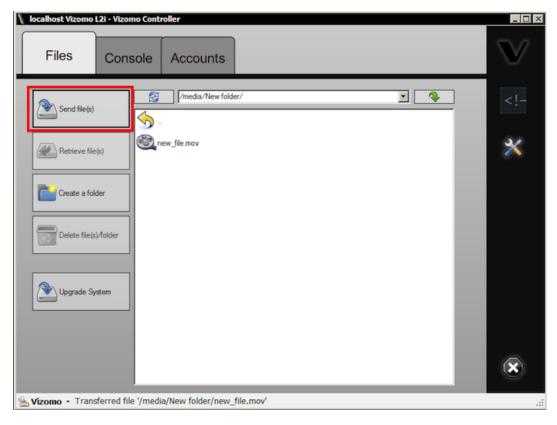

1. Media is added to Vizomo via the Vizomo Controller's file browser. Select the media folder.

localhost Vizomo L	2i - Vizomo Cont	roller		
Files	Console	Accounts		∇

 4.1.7 Capturing Video
 4.1.8 Troubleshooting Choppy Video

Home > 4. Vizomo > 4.1 Vizomo Quick Start Guides > 4.1.7 Capturing Video

4.1.7 Capturing Video

Capture formats vary by Vizomo model. See 4.2.3 Hardware Overview for a complete list of inputs and outputs by model type.

The current, in production Vizomo models and capture formats are:

L2i: HDMI

The lower HDMI port on the capture card is the input port (circled in red below). Although the connector is HDMI the Vizomo capture card is not HDCP compliant. As such it will not be able to capture the output of most devices that output in native HDMI. Best results are obtained when using a native DVI source with a DVI to HDMI cable.

R2i: SDI and HDMI

The lower HDMI port on the capture card is the input port (circled in red below). Although the connector is HDMI the Vizomo capture card is not HDCP compliant. As such it will not be able to capture the output of most devices that output in native HDMI. Best results are obtained when using a native DVI source with a DVI to HDMI cable.

The middle BNC connector is the SDI input.

HDMI Hookup

1. Ensure the DVI source is connected to the lower HDMI port on the rear of the Vizomo via a DVI to HDMI adapter cable.

2. Ensure the content is in one of the following resolutions and frequencies:

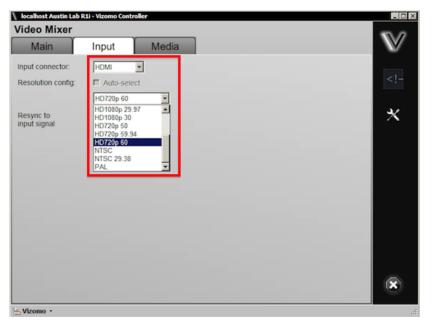

- 480/29.98 NTSC
- 480/29.97 NTSC
- 576/25 PAL
- 720p50
- 720p59.94
- 720p60

- 1080p23.98
- 1080p24
- 1080p25
- 1080p29.97
- 1080p30
- 1080i50
- 1080i59.94
- 1080i60

3. On the Vizomo blueprint *Main* tab, select *Input* as the source.

Video Mixer Main Input Media	\mathbb{V}
Input Media	-</th
Enable Windows Source Rectangle Destination Rectangle Window 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 </th <th>*</th>	*
法 Vizomo 🔹	đ

4. On the Vizomo blueprint *Input* tab, select HDMI and the appropriate resolution/frequency.

NOTE: Some 720p sources are not compliant with the Vizomo capture cards. If 720p does not seem to be working try 1080p@30.

SDI Hookup

1. Ensure the SDI source is connected to the middle BNC port on the rear of the Vizomo via a RG59 cable terminated with true 75 ohm BNC connectors.

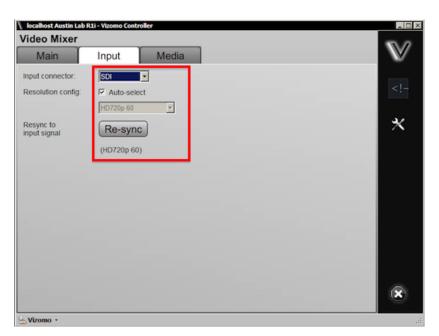

2. Ensure the content is in one of the following resolutions and frequencies:

- 480/29.98 NTSC
- 480/29.97 NTSC
- 576/25 PAL
- 720p50
- 720p59.94

Home > 4. Vizomo > 4.1 Vizomo Quick Start Guides > 4.1.8 Troubleshooting Choppy Video

4.1.8 Troubleshooting Choppy Video

A problem you may encounter during configuration of a Vizomo is the bottom part of the tile not updating as frequently as the top (seen in the image below).

Common Causes:

1. Vizomo PXL ports are not running at Gigabit

- Check Vizomo's Status page (see section <u>6.6.3 webUI</u>) to confirm that all Vizomo PXL ports are running at Gigabit rates.
- Ensure Vizomo is connected to the last port of the PXL switch. The highest numbered port is the only Gigabit port on the switch, and is the one Vizomo should be plugged into.
- Ensure the cable between the Vizomo and the switch is capable of handling Gigabit Ethernet traffic. This means it must be rated as Category 5e (Cat 5e) or better and undamaged.

2. The map is incorrect

- Ensure the correct map is loaded and active on the Vizomo.
- The map should only contain the fixtures that you are actually using.

3. Too many fixtures have been daisy-chained per switch port. The output switch ports run at 100Mbit, and can be overloaded if too many tiles are driven from a single port.

Fixture	Max tiles per PDB-5 or switch output	Max tiles per Vizomo output	Max tiles per R2i Vizomo
C7	8	80	320
C11	16	180	720
C8v	25	300	1200

Note: Evenly load the switch outputs as much as possible. Even though a system of 40 C8v tiles may fit across only two PDB-5 outputs according to the capacity limits listed above (25 tiles on one port, 15 on the other), they should be balanced across all of the switch output ports. A system of 40 tiles should be placed on 6 ports as such: 7,7,7,7,6,6. It doesn't matter which ports are chosen to have fewer tiles.

If all of the above does not resolve the issue, customer support can be reached at 866-374-7878.

4.2 General Overview

The Vizomo video processor is an advanced LED screen controller. Unsurpassed flexibility and configurability, together with the most advanced video processing technology available, conquers virtually any creative or technical challenge. Use the built-in set of tools to create intricate visual arrangements with real-time video streams. Massive computational power ensures smooth content delivery to your LED screen.

Control Vizomo remotely with Raster MAPPER 4.5.0 software. Raster MAPPER 4.5.0 presents users a clear cut interface with which to harness Vizomo's underlying complexity.

Robust hardware matches the processor's performance.

4.2.1 Key Features 4.2.2 Safety Information 4.2.3 Hardware Overview 4.2.4 Power Up Home > 4. Vizomo > 4.2 General Overview > 4.2.1 Key Features

4.2.1 Key Features

Raster MAPPER

A simple TCP/IP connection between a computer running Raster MAPPER 4.5.0 and a Vizomo processor gives full remote control of multiple processors. A streamlined workflow provides one interface for mapping, PXL addressing, and screen control.

Scaling

Size multiple simultaneous windows with pixel-for-pixel accuracy.

Color processing

The Vizomo processor automatically calibrates C-series screens with selectable white point targets. Superior color reproduction is achieved with an extended color gamut and 128-bit per pixel accuracy.

Powerful

State of the art hardware for very low latency processing of multiple input formats to multiple output ports (on specific models).

Multi-Tap Windowing

Multiple simultaneous cropping. An entire source, or a portion of a source, can be simultaneously directed to several windows via the Multi-Tap function.

Home > 4. Vizomo > 4.2 General Overview > 4.2.2 Safety Information

4.2.2 Safety Information

- Keep connections free of stress to ensure proper operation.
- Do not open the Vizomo chassis, as there is risk of electric shock.
- Do not move the chassis while in operation. Internal components are susceptible to damage caused by vibration during operation.
- Do not block front or rear vents/fans to prevent overheating and/or damage.
- Do not place liquids on or around the unit.
- Do not insert objects through vent slots.
- Do not place magnetic devices near unit.
- Always connect chassis to a grounded power source.
- If using an extension cord, make sure all connections and cords are properly rated to the load.
- Refer all servicing to qualified personnel or Barco, Inc. directly.

4.2.3 Hardware Overview

This page helps to identify the various types of Vizomo processors and their capabilities.

Currently in Production

L2i (530-0319)

Front Items:

On the locking door:

- Product model name
- IP Address label
- Model number label
- Serial number barcode

Behind the door:

- Power on switch
- Reset switch
- 2 x USB 1.2/2.0 connectors
- Power indicator LED
- SSD activity indicator LED
- Intake fan filter

Rear Connections:

Power Input: IEC-C14 100-240V 50/60Hz 620W

Data connections:

- 8 x USB 1.1/2.0
- 2 x USB 3.0
- 1 x PS2
- 1 x PXL output dual 10/100/1000Mbps ethernet port
- 1 x User dual 10/100/1000Mbps ethernet port
- 1 x DVI monitoring output

• 1 x DVI over HDMI connector input (SMPTE 125M, SMPTE 170M, ITU-R BT.656-4, SMPTE 296M-2001, SMPTE 274M-2005)

R2i (R9052942)

- 1 x PXL output dual 10/100/1000Mbps ethernet port
- 1 x User dual 10/100/1000Mbps ethernet port
- 1 x DVI monitoring output
- 1 x DVI over HDMI connector input (SMPTE 125M, SMPTE 170M, ITU-R BT.656-4, SMPTE 296M-2001, SMPTE 274M-2005)

Home > 4. Vizomo > 4.2 General Overview > 4.2.4 Power Up

4.2.4 Power Up

Follow the steps below to power up the processor:

- 1. Attach the included IEC-C13 power cord to the unit via the IEC-C14 socket.
- 2. Plug the other end of the cord into a grounded 100-240V power source.
- 3. Attach any other cables that are relevant to your setup.
- 4. Ensure the power switch of the PSU is in the ON position.
- 5. Press the Vizomo's power switch on the front of the unit behind the locking door.
- 6. Once Vizomo has finished booting, it can be administered by Vizomo Controller and RasterMAPPER.

Home > 4. Vizomo > 4.3 Configuration and Operation

4.3 Configuration and Operation

Overview

Vizomo processors are configured over a network connection via two different client applications, RasterMAPPER and Vizomo Controller. RasterMAPPER is responsible for initial setup, including creating maps and setting operating parameters. Vizomo Controller is then used for configuring windowing, media selection, and file management. Once configured, Vizomo processors are operated by both RasterMAPPER and Vizomo Controller, depending on the task.

RasterMAPPER is described in more detail in chapter 6: RasterMAPPER.

4.3.1 Vizomo Configuration 4.3.2 Video Mixer Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.1 Vizomo Configuration

4.3.1 Vizomo Configuration

The following sections will cover:

4.3.1.1 Software Installation 4.3.1.2 Vizomo Controller Overview 4.3.1.3 Blueprints 4.3.1.4 System Settings 4.3.1.5 Mapping Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.1 Vizomo Configuration > 4.3.1.1 Software Installation

4.3.1.1 Software Installation

Vizomo Controller can be installed on any PC running Windows XP, Vista, or Windows 7 and is available from the Barco Creative LED support site.

NOTE:

If a previous version of Vizomo Controller exists use add/remove programs in the Windows Control Panel to remove it. If you do not do this the Vizomo Controller Installer will not be able to complete the installation.

The installer ensures all software components that are required are installed.

Vizomo Controller's Installer:

Once Vizomo Controller has been installed, it can be found in the Start menu under

Programs\ Vizomo

By default the application is installed to:

c:\Program Files\Barco\Vizomo Controller\

NOTE:

In order to communicate via TCP/IP for laptop control the Vizomo and the laptop must be set to the same IP and subnet range (i.e. 10.0.X.Y).

Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.1 Vizomo Configuration > 4.3.1.2 Vizomo Controller Overview

4.3.1.2 Vizomo Controller Overview

When Vizomo Controller launches, the "Connect to processor" window opens listing processors found on your LAN. You can either select one of the processors listed or enter the IP address of another processor.

onnect to processor	
Processor address:	
Local processors:	
172.16.50.250 - SV Lab VZ080352	

Connect to Processor Window:

NOTE:

If you know that you have an active Vizomo on your LAN but you can not see it listed in the processor window, check that Windows Firewall has an exception to allow Vizomo Controller access to search for processors.

Windows Firewall Setting

The various parts of Vizomo Controller may be navigated using the bar to the right of the window.

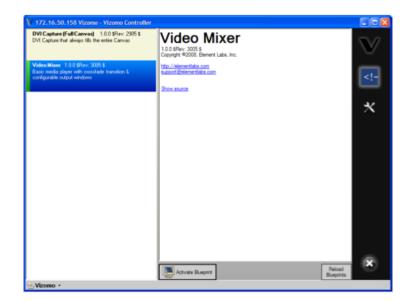

Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.1 Vizomo Configuration > 4.3.1.3 Blueprints

4.3.1.3 Blueprints

A "blueprint" is a control script for the media engine of the Vizomo processor. A stock Vizomo has only one blueprint, the Video Mixer.

The blueprint chooser can be used to re-load the current blueprint if necessary.

Blueprint Chooser:

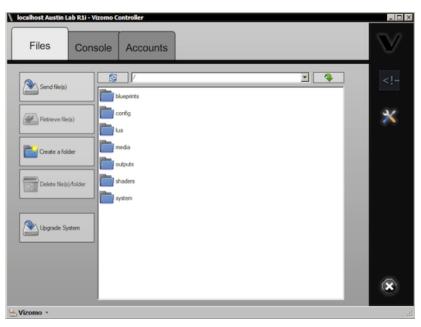

Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.1 Vizomo Configuration > 4.3.1.4 System Settings

4.3.1.4 System Settings

File Management

The file management interface consists of action buttons on the left and a file browser on the right. At the topmost level of the file browser the folders have the names of all of the different categories of files available (e.g., media).

File Management Window:

Media

Media is laid out in a one-level directory hierarchy, folders reflect categories. To copy or retrieve a file, drag and drop the file or use the function buttons on the left of the window.

Motion Media

The Vizomo processor can decode H264, MPEG, and MPEG-2 encoded video stored in the following container formats:

- Quicktime Movie (.mov)
- Windows Media (.avi)

Still Media Formats

The following still image formats are supported:

- Portable Network Graphics (.png)
- Joint Picture Expert Group (.jpeg/.jpg)
- TIFF 8b & 16b (.tiff)

Upgrades

To upgrade the Vizomo firmware, you need a ".vuz" file. Press the 'Upgrade System' button. A file browser appears. Navigate to the ".vuz" file that is to be used and click 'Open'. The upgrade file is transferred and the upgrade automatically executes. If necessary the destination machine automatically restarts.

Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.1 Vizomo Configuration > 4.3.1.5 Mapping

4.3.1.5 Mapping

The remainder of Vizomo setup, including mapping, is accomplished with the RasterMAPPER utility. Please see chapter 6: RasterMAPPER for details.

Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.2 Video Mixer

4.3.2 Video Mixer

The Video Mixer Blueprint is the mechanism by which content is controlled in Vizomo. The Video Mixer Blueprint consists of three tabs; Main, Input, and Media. These tabs contains the controls to manage image playback and captured input. The selected content can be scaled with three possible windows.

Main Tab

In the Main tab the user is able to choose between displaying a captured Input or on board media. The chosen content can be windowed into 3 copies of the original, all with independent crop, scale, and x, y location.

eo Mixer Main	Input	Media	1			
Input	Media					</th
Enable Windows	Course D	octonolo		Destination D	atanala	*
Window 1	Source R Left	Top Width	n Height	Destination Re Left Top	Width Heig	the second se
Window 2	0 -=	0 🔄 0	÷ 0 ÷	0 😤 0	720 😤 480	-
Window 3	0 🔫	0 🗄 🛛		0 😤 0	· 720 · 480	
						6
						×

For a detailed discussion see 4.3.2.1 Windowing

Input Tab

Select between multiple input types on Vizomo R1 units. When using the HDMI input the input resolution must be manually selected.

The Vizomo R1i unit has two video inputs to allow for HDMI and SDI capture. Only one active input should be connected at any given time.

Media Tab

To play a file, select from the folder/file selection window.

\ localhost Vizomo L2i - Vizomo Co	ontroller	
Video Mixer		5.4
Main Input	t Media	\mathbb{V}
Media		
Demo Test Trailers 1280x544	1280 x720 60fps Clip 1 H264.mov 720x480 60fps PanNscan H264.mov	-</th
		*
Reload Media Lis	sts	
Now Playing:		T Auto Advance
👆 Vizomo 🔹		

When new media has been loaded press the Reload Media Lists button to see the changes. (see section 4.1.6 Adding Media to learn how to load content)

Auto Advance

To play all of the media in a selected folder in succession, enable Auto Advance by selecting the checkbox at the bottom of the Media tab.

Auto Advance

- Vizomo will play each piece of video media for the duration of the clip.
- Vizomo will play still media for 5 seconds.
- When the last clip in the folder is reached Vizomo will loop back to the top of the list.

Home > 4. Vizomo > 4.3 Configuration and Operation > 4.3.2 Video Mixer > 4.3.2.1 Windowing

4.3.2.1 Windowing

In order to create a window, enable windows with the checkbox. Next, define the original size and position of content with the Source Rectangle controls...

92.168.1.111 Austin deo Mixer	Test Unit R1i #1 - Vizomo Controller	
Main	Input Media	$ \mathbb{W}$
^{urce:} Input	Media	·</th
Enable Window Window 1 Window 2 Window 3	Source Rectangle Left Top Width Height 0 = 0 = 0 = 0 = 0 = 0 = 0 = 0 = 0 = 0 =	*
fizomo •		×

...next, define the new size and position of content with the Destination Rectangle controls.

leo Mixer	est Unit R1i #1 - Vizomo Controller	
Main	Input Media	
urce:	Media	</th
Enable Windows Window 1 Window 2 Window 3	Source Rectangle Left Top Width Height 0 = 0 = 0 = 0 = 0 = 0 = 0 = 0 = 0 = 0 =	3
		×

Keep in mind the following points about source and destination windows:

- The source for a window needs to be within the boundaries of the media.
- A value of zero for the source width and height will result in an automatic selection of the entire source.
- Differences in source versus destination size results in automatic scaling.
- Windows can overlap sources and destinations. In the case of an overlap, the order of the window definition row (1-3) dictates the Z-axis position of the window. In other words, window #1 creates the lowest level window and all other windows are on top and might obscure the lower window(s).

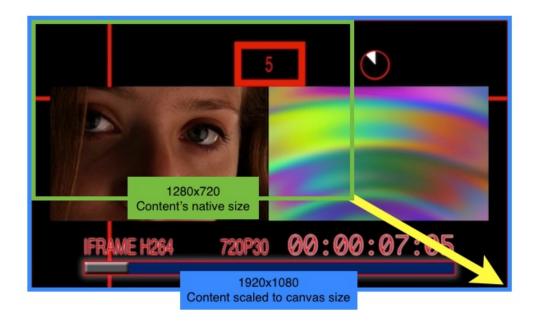

Below are illustrations of common windowing scenarios. The large black area in the images represents the background canvas of the Vizomo. The content in the examples below was created at a resolution of 1280x720.

Disabled Windows:

• Enable Windows checkbox unchecked.

With windows disabled, the Vizomo will size content to the canvas size. Beginning with version 4.5 the Vizomo canvas is automatically sized to the map dimensions of the RasterMAPPER map.

Enable Windows

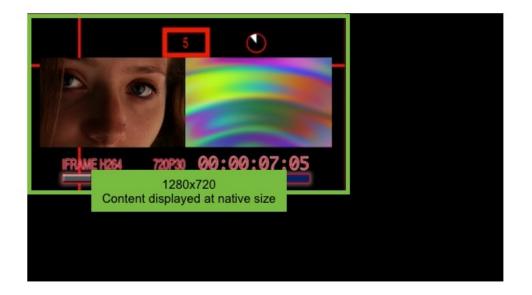

See the processor geometry section in $\underline{6.6.2 \; Setup \; Inspectors}$ for the canvas size controls.

Unity Scale:

- Set Source Rectangle to 0,0
- Set Destination Rectangle to the content's native width and height

Enable	Windows	Sou	rce Re	ectangle				Dest	ination	Recta	ngle			
		Left		Гор	Width	Heid	ght	Left	Т	ор	Wid	th	Heig	ht

Home > 4. Vizomo > Appendix B: Video File Encoding

Appendix B: Video File Encoding

Video files must be encoded and saved in a specific format and file naming structure for playback on a Vizomo processor. This section outlines the simple steps to convert your source material to a Vizomo-compatible format (H.264, MPEG-4 Part 10) and file name.

Requirements:

QuickTime Player with Pro License, v7.5.0 or later (Mac or PC) For more information go to: http://www.apple.com/quicktime/pro/.

Procedure:

Follow the steps below to ensure your source video is saved and encoded properly to play back on a Vizomo processor.

1. Launch QuickTime Player and open your media file by selecting "Open File" from the File menu.

File, Open Menu:

2. Browse to the location of your source media and select "Open". Verify that your source media plays correctly by playing it in the QuickTime window before proceeding.

3. Choose "Export" from the File menu.

QuickTime Player	File Edit View Windo	w Help
	New Player New Movie Recording New Audio Recording	ХN ~~ХN ~~СИN
	Open File Open URL Open Image Sequence Open Recent Close	NO U∺ ≎XO ₩W
	Save Save As Revert to Saved	¥S ⊕¥S
	Share Export	TC #S
	Evport for Wah	OWE

4. Enter an appropriate name in the "Save As" field. Note, for default Vizomo blueprints, you must start the filename with a three digit num- ber. For example, a valid movie name would be "001 MyMovie.mov".

Save Exported File Menu:

5. Select "Movie to QuickTime Movie" from the "Export" selections.

000	Save exported file	as	-
	Save As: 001 MyMovie.mov		
	💷 🔳 🔛 Vizomo Content	search	
> DEVICES	Name	Date Modified	
 DEVICES PLACES 	Note	Dute Modified	
	-	Date Modified	
	- Care	Oute Modified	
		Oute Modified	
	Movie to QuickTime Movie	Oute Modified	0

6. Press the "Options" button to open the Movie Settings window.

Movie Settings Window:

File, Export Menu:

	Movie Settings
Video	
(Settings)	Compression: H.264 Quality: Best
(Filter)	Frame rate: 60 Encoding mode: multi-pass
Size)	Dimensions: 16x32 (Current)

Sound	
(Settings)	Format: Integer (Little Endlan) Sample rate: 44.100 kHz Sample size: 16-bit Channels: Stereo II, RD
Prepare for Int	ternet Streaming
Constant C.	ompressed \$ Settings

7. Press the "Settings" button to open the Standard Video Compression Settings window:

Standard Video Compression Settings Window:

3010010 1000	Compression Settings
Compression Type: H.264	(A)
Motion Frame Rate: Current fps Key Frames: Automatic Curry & All Altomatic Curry Frame Reordering	Data Rate Data Rate 🕜 Automatic O Restrict to kbits/sec Optimized for: Download 💠
Compressor Quality Least Low Medium High Best Encoding: Best quality (Multi-pass) Faster encode (Single-pass)	Proview
a	(Cancel) OK

8. Confirm the following settings.

Category	Parameter	Setting	Notes
Compression Type		H.264	
Motion	Frame Rate	30 fps	This is typically 30, however it can be as high as 60 for high fps footage.
	Key Frames	All	
Compressor	Quality	Best	
	Encoding	Best quality	
Data Rate	Data Rate	Automatic	

9. Press the "OK" button to return to the Movie Settings window.

10. Press the "Size" button to open the Export Size Settings window and confirm the dimen- sions for your output size are correct.

Export	Size	Settings	Window:
--------	------	----------	---------

imensions:	Current	0	16	×	32	
	Preserve aspec	t ratio using:	Lette	rbox		•
	Deinterlace Sc	une bliden	(if rec	quired		

11. If your source footage is interlaced, be sure to check the "Deinterlace Source Video" checkbox.

12. Press the "OK" button to return to the Export window.

13. Press the "Save" button and your video will begin the encoding process. This process may take several minutes, depending on the length of

your video.

When the encoding process is finished, you will have a new file with the proper codec, bit rate, and file name for playback on Vizomo processor.

For information on transferring files to the Vizomo processor for playback, see File Management.

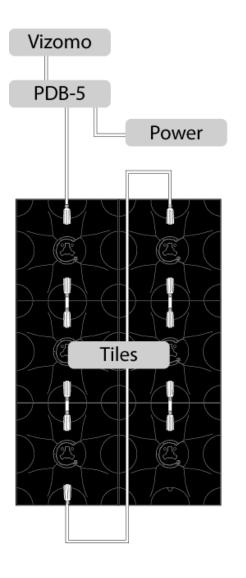

For information on playing back video files, see Newly added blueprints are not displayed until the list has been manually rebuilt by pressing the 'Reload Blueprints' button. See File Management for information on adding new Blueprints.

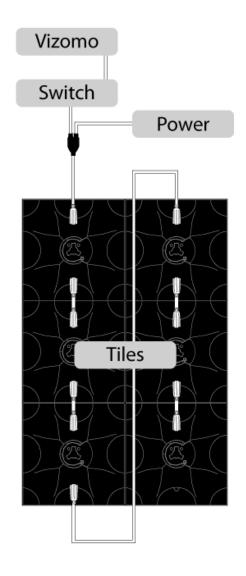

Home > 5. Power and Data Distribution

5. Power and Data Distribution

For rental and staging applications, using the integrated power and data distribution of a PDB-5 is recommended (configuration on the left). For fixed installations, it may be preferable to use a Cisco 2960G network switch and external power distribution instead of PDB-5 power injectors (configuration on the right). Both configurations are described in this section. If you need assistance determining the appropriate power and data configuration for your needs, please contact a Barco representative.

ł

Home > 5. Power and Data Distribution > 5.0 Warnings

5.0 Warnings

WARNING

- Read these instructions.
- Keep these instructions.
- Heed all warnings.
- Follow all instructions.
- Do not use this apparatus near water.
- Clean only with dry cloth.
- Do not block any ventilation openings. Install in accordance with the manufacturer's instructions.
- Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.

• Do not defeat the safety purpose of the polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding type plug has two blades and a third grounding prong. The wide blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.

• Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.

- Only use attachments/accessories specified by the manufacturer.
- Unplug this apparatus during lightning storms or when unused for long periods of time.

• Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.

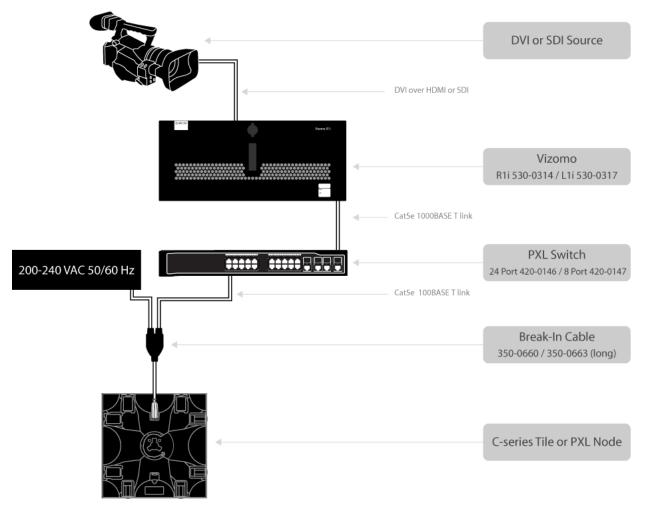

Home > 5. Power and Data Distribution > 5.1 Hookup with a PXL Switch

5.1 Hookup with a PXL Switch

The image below illustrates the data flow of a C-series system from image capture to tile using a PXL switch for data and power routing.

Connections Checklist

- DVI over HDMI or SDI (to a R1i only) signal connected to Vizomo capture card
- Network cable from a Vizomo PXL output to a switch PXL input
- Break-in cable from switch PXL output to tiles. Observe maximum tiles per line limit
- 100-240V 50/60Hz VAC power source to Vizomo and PXL Switch(es)
- 200-240V 50/60Hz VAC power source to PXL tiles

Observe the following data limits when setting up your C-series display.

Fixture	Max panels per PDB-5 output
C7	8
C11	16
C8v	25

Never attach more than one PXL switch to a Vizomo output.

• Never attach more than one Vizomo PXL output to a switch.

Home > 5. Power and Data Distribution > 5.2 PXL Switch Overview

5.2 PXL Switch Overview

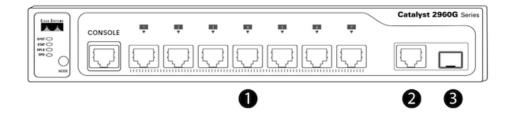

For fixed installations, it may be preferable to use a Cisco 2960G network switch and external power distribution instead of PDB-5 power injectors. Preconfigured 8 and 24 port switches are available from Barco (P/N 420-0147 and 420-0146). Note that Cisco equipment provided by third party suppliers are not configured to route PXL correctly, and are unsupported by Barco for use in PXL systems.

This switch supports PXL input via both copper UTP Cat 5e terminating at an RJ-45 socket, as well as fiber optic cable using the SFP transceiver. The SFP interface should be used if a distance of greater than 100m must be covered between the Vizomo and the PXL display. Please contact your Barco representative for more information on this configuration.

There are two PXL switches available, depending on the capacity required. These Cisco Catalyst 2960G switches are pre-configured by Barco to act as PXL distribution devices. Note that Cisco equipment provided by third party suppliers are not configured to route PXL correctly, and are unsupported by Barco for use in PXL systems.

8 port

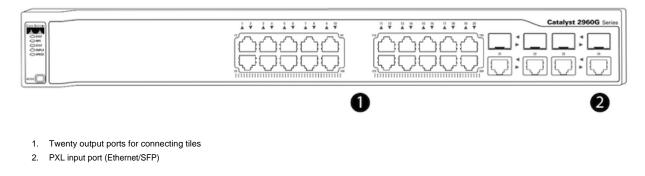

The 8 port PXL Switch has 7 PXL output ports and 1 PXL Input port.

- 1. Seven ports for connecting tiles
- 2. PXL input port (Ethernet)
- 3. PXL input port (SFP)

24 Port

The 24 Port PXL Switch has 20 PXL output ports and 1 PXL input port. Ports 21,22, and 23 are unused.

NOTE

A Vizomo's PXL port must always be connected to the highest number port on a switch. On a 8 port switch this is port 8. On a 24 port switch this is port 24. Using any other port as an input is unsupported. Only one PXL output of a Vizomo may be connected to a switch at any time.

System Status Indicator

The System LED on the front left of the PXL Switch indicates system status as follows:

1.10				
- 41	Color	Stata	Description	
- 68	0000	Sidle	Description	

Off	Steady	System is not powered on
Green	Blinking	System is booting up
Green	Steady	System is operating correctly
Amber	Steady	System is receiving power, but not operating correctly

Port Status Indicators

The LEDs above each port on a switch indicate each port's status as follows:

1	Color	State	Description
1	Off	Steady	No link
1	Green	Steady	Link present
	Green	Blinking	Activity - port is sending or receiving data
	Amber/Green	Alternating	Link fault
	Amber	Steady	Port is blocked and not forwarding data
3	Amber	Blinking	Port is blocked and is not sending or receiving packets

Cabling Limits

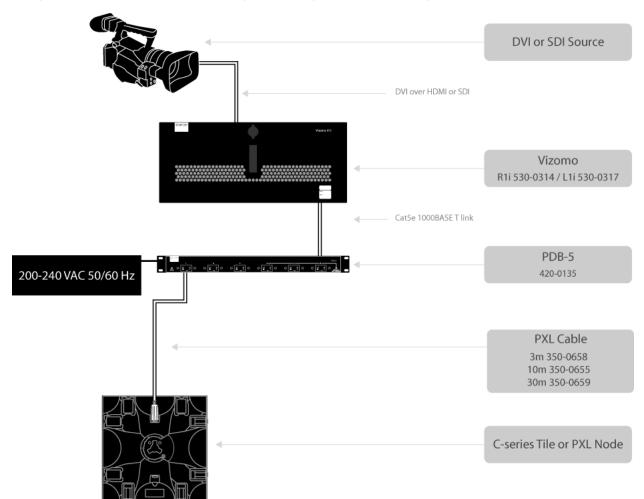

The length of the daisy chain of tiles per switch PXL output is determined by tile pixel density and thus the amount of data required per tile. The following table describes the number of each tile type that may be chained per PXL output.

Tile type	Maximum tiles per switch PXL output
C7	8
C11	16
C8v	25

Home > 5. Power and Data Distribution > 5.3 Hookup with a PDB-5

5.3 Hookup with a PDB-5

The image below illustrates the data flow of a C-series system from image capture to tile using a PDB5 for data and power routing.

Observe the following data limits when setting up your C-series display.

Fixture	Max panels per PDB-5 output 8 16	
C7	8	
C11	16	
C8v	25	

Home > 5. Power and Data Distribution > 5.4 PDB-5 Overview

5.4 PDB-5 Overview

The PDB-5 has been designed primarily for rental and staging applications. The PDB-5 handles the power and data distribution for C-series tiles and P1 nodes.

- 1. System Status Indicator. Indicates power and boot status.
- 2. Circuit Breakers. 2-pole, 10A magnetic hydraulic circuit breakers for each of the 6 PXL cable outputs.
- 3. Power Input B Indicator. Indicates presence of power input through connector B on the back panel. Input B powers outputs 4-6.
- 4. Port Status Indicators. Indicates link integrity, disabled, activity, speed, full-duplex.
- 5. AC Power Input A 200-240 VAC, 50/60 Hz, 16 A max. via PowerCon (blue) connector.
- 6. AC Power Input B 200-240 VAC, 50/60 Hz, 16 A max. via PowerCon (blue) connector.
- 7. PXL Data Input via RJ45 EtherCon (shown) or optional Fiber Optic (not shown) connector.
- 8. PXL Data Thru (pass through) via RJ45 EtherCon connector.
- 9. PXL Cable Outputs 1-3. Integrated power and data outputs 1-3 via custom PXL Cable connectors. Powered by AC Power Input A.
- 10. PXL Cable Outputs 4-6. Integrated power and data outputs via custom PXL Cable connectors. Powered by AC Power Input A, or B if present.

NOTE

When first powered on, the PDB-5 will take several minutes to be fully booted and configured.

System Status Indicator

The LED on the front of the PDB-5 or PXL Switch indicates system status as follows:

Color	State	Description
Off	Steady	System is not powered on
Green	Blinking	System is booting up
Green	Steady	System is operating correctly
Amber	Steady	System is receiving power, but not operating correctly

Port Status Indicators

The LEDs on the rear of the PDB-5 or next to each port on a switch indicate each port's status as follows:

Color	State	Description
Off	Steady	No link
Green	Steady	Link present
Green	Blinking	Activity - port is sending or receiving data
Amber/Green	Alternating	Link fault
Amber	Steady	Port is blocked and not forwarding data
Amber	Blinking	Port is blocked and is not sending or receiving packets

Home > 5. Power and Data Distribution > 5.5 PDB-5 Input & Output

5.5 PDB-5 Input & Output

Connections Checklist

- DVI over HDMI or SDI (to a R1i only) signal connected to Vizomo capture card
- 100-240 50/60 VAC power to Vizomo
- PXL data cable from a Vizomo to the PXL Data Input jack on the back of the PDB-5.
- Power and data cable(s) from the fixture(s) to the appropriate PXL Cable output(s) on the back of the PDB-5.
- PowerCon end of the PDB5 power cable to the AC Power Input A jack on the back of the PDB-5.
- IEC end of the PDB5 power cable to a 200-240 VAC power source.

Power Inputs A & B

The PDB-5 has two power 16A inputs on the rear panel labeled A and B.

Input A must always be used as it powers the electronics inside the PDB-5.

If only input A is used then all outputs (1 through 6) will be powered by input A.

When input B is used in addition to A, then outputs 4, 5, and 6 automatically switch over and become powered by input B. This doubles the PDB-5's total capacity.

capacity.

A green indicator on the front panel shows when input B is being used.

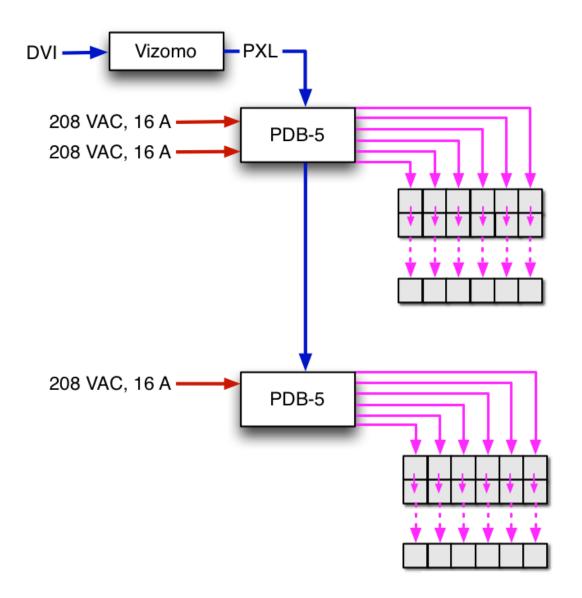

PXL Cable Outputs

The PDB-5 has 6x 10 amp outputs with breakers for AC power distribution.

- The limit for each PDB-5 output is 10 A, with a total output of 32 A maximum per PDB-5, if both inputs A and B are used.
- The maximum number of C8v tiles per PDB-5 port is 25 (this is limited by data, not power).

The maximum number of C11 tiles per PDB-5 port is 16 (this is limited by data, not power).

For additional information on the PXL Cable, see "Cables & Connectors" in the C-series Tile Manual.

Observe the following power guidelines when setting up your C-series display. The tables below indicate maximum power consumption.

C7 Max Power = 100 watts (@2,000 nits, full white)

Voltage	Max Panels per PDB- 5 ² w/ 1 x 16A input	Max Panels per PDB- 5 ² w/ 2 x 16A input
240VAC	23	46
220VAC	21	42
208VAC	20	78
200VAC	19	75

1. PDB-5 has 32A limit (2x 16A).

2. Maximum C7 panels per PDB-5 Port is 8.

C11 Max Power = 85

Max Power = 85 watts (@5,000 nits, full white)

Voltage	Max Panels per PDB-5 ² w/ 1 x 16A input	Max Panels per PDB-5 ² w/ 2 x 16A input
240VAC	45	90
220VAC	41	83
208VAC	39	78
200VAC	38	75

1. PDB-5 has 32A limit (2x 16A). 2. Maximum C11 panels per PDB-5 Port is 16.

C8v

Max Power = 55 watts (@8,000 nits, full white)

Voltage	Max Panels per PDB-5 ² w/ 1 x 16A input	Max Panels per PDB-5 ² w/ 2 x 16A input
240VAC	70	140
220VAC	64	128
208VAC	61	122
200VAC	58	116

PDB-5 has 32A limit (2x 16A).
 Maximum C8v panels per PDB-5 Port is 25.

When running typical video content, the duty cycle (average power consumption) is about 30% of maximum.

Home > 5. Power and Data Distribution > 5.2 Cables & Connectors

5.2 Cables & Connectors

PXL Cable

PXL cables are designed to carry both power and data, and are available in a variety of lengths to span the distance from a PDB-5 or switch to the display, as well as between each tile within the display. The gender of a PXL cable connector is determined by the power pins (the 3 large pins), each cable has a male and a female connector.

Male PXL Connector - The male plug end of a PXL cable connects to an upstream **source** such as a PDB-5 or upstream tile. The male end of a PXL cable has a white shell, and mates with a white female socket.

Female PXL Connector - The female plug end of a PXL cable connects to a downstream **sink** such as a tile. The female end of a PXL cable has a black shell, and mates with a black male socket.

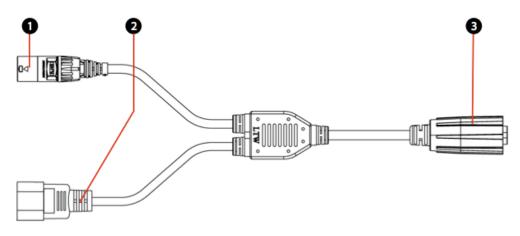

PXL Cable Coupler (P/N 656-0500)

The male-female coupler can be used to extend the length of a PXL cable.

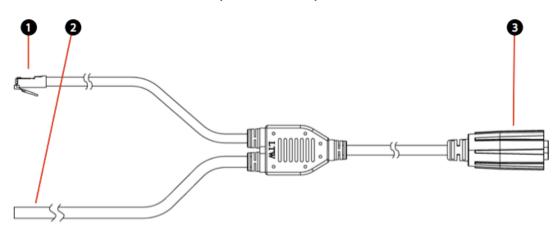

Break-In Cable - Standard (P/N 350-0660)

- 1. Data Input PXL data input via Neutrik EtherCon (RJ45) connector.
- 2. Power Input AC power input via IEC C14 (male) connector.
- 3. Power and Data Output Combined power and data via black female PXL cable connector.

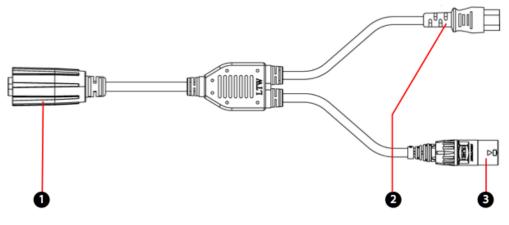

Break-In Cable - Fixed Install (P/N 350-0663)

- 1. Data Input PXL data input via Ethernet (RJ45) connector.
- 2. Power Input Unterminated AC power harness to be hardwired in fixed installations. (see table below for wire colors)
- 3. Power and Data Output (female) Combined power and data via PXL cable connector.

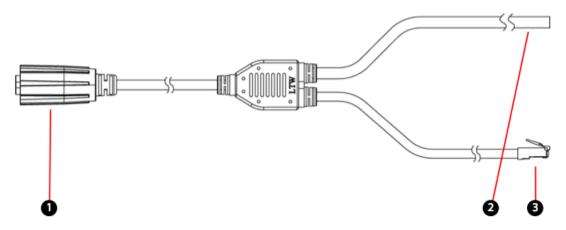

PXL Break-In Cable AC Pinout		
PXL CONNECTOR PIN	INTERNAL WIRE COLOR	FUNCTION
6	Brown	AC Power - Line
7	Green / Yellow	AC Power - Earth Ground
8	Blue	AC Power - Neutral

Break-Out Cable - Standard (P/N 350-0675)

- 1. Power and Data Input (Male) Combined power and data via PXL cable connector.
- 2. Power Output AC power output via IEC C13 (female) connector.
- 3. Data Output PXL data output via Neutrik EtherCon (RJ45) connector.

Break-Out Cable - Fixed Install (P/N 350-0678)

- 1. Power and Data Input (Male) Combined power and data via PXL cable connector.
- 2. Power Output Unterminated AC power harness to be hardwired in fixed installations. (see table below for wire colors)
- 3. Data Output PXL data output via Neutrik EtherCon (RJ45) connector.

PXL Break-Out Cable AC Pinout		
PIN	INTERNAL WIRE COLOR	FUNCTION
6	Brown	AC Power - Line
7	Green / Yellow	AC Power - Earth Ground
8	Blue	AC Power - Neutral

Home > 6. RasterMAPPER

6. RasterMAPPER

RasterMAPPER is a Windows and Apple OS X application used for mapping C-series tiles to the Vizomo processor and for making settings to remote Vizomo processors. The latest version of RasterMAPPER can be downloaded from http://vizomo.com

6.1 Software Installation 6.2 Basic Workflow 6.3 RasterMAPPER QuickStart Guides 6.4 UI Overview 6.5 Mapping 6.6 Processor Control 6.7 Software Update Appendix A: Notes Home > 6. RasterMAPPER > 6.1 Software Installation

6.1 Software Installation

System Requirements

RasterMAPPER software requires the following:

- Microsoft Windows® XP or
- Mac OS X v10.5+, Intel Processor (PowerPC not supported) with
- 1024 x 768 display (or larger), 10 MB of disk space minimum an ethernet port (to connect to a Vizomo processor)

Download/Install Info

Follow the steps below to install and run RasterMAPPER:

Windows

- 1. Download RasterMAPPER software for Windows from the Barco support site.
- 2. Extract/un-zip the files to the same folder.
- 3. Double-click the file named RasterMAPPER.exe.
- 4. Note: If RasterMAPPER fails to launch, you need to download and install Microsoft Visual C++ 2005 SP1 Redistributable Package (x86) available free from the following link: http://www.microsoft.com/downloads/ details.aspx?familyid=200B2FD9-AE1A-4A14-984D-389C36F85647&displaylang=en

Macintosh

- 1. Download RasterMAPPER software for Mac OS X from the Barco support site.
- 2. Extract/un-zip the files to the same folder.
- 3. Double-click the file named RasterMAPPER.

NOTE:

The downloaded files must all be extracted to the same folder to run properly.

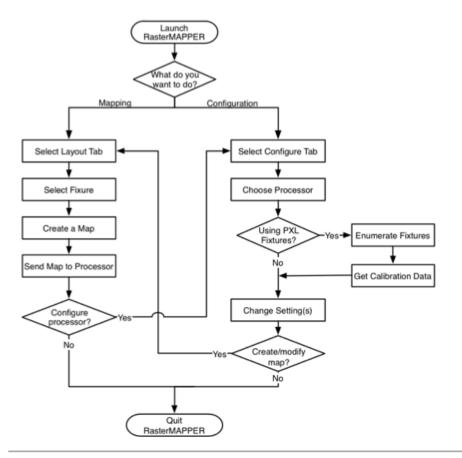

Home > 6. RasterMAPPER > 6.2 Basic Workflow

6.2 Basic Workflow

RasterMAPPER has two main functions:

- Create a map which defines the relationship between pixels from the video source and the actual pixels on the modular LED fixtures. After creating the map in RasterMAPPER it is uploaded and stored on the processor.
- Control and adjust the processor as needed. With C-Series fixtures, it is necessary to enumerate the fixtures to tell the Vizomo where they are, as well as to retrieve calibration data from the fixtures for Vizomo to use in its color correction algorithms.

The chart below illustrates the basic RasterMAPPER workflow.

NOTE:

When using PXL protocol fixtures such as C-series, each time a map is changed enumerate and retrieve the calibration data.

Home > 6. RasterMAPPER > 6.3 RasterMAPPER QuickStart Guides

6.3 RasterMAPPER QuickStart Guides

The following basic information will get you up and running quickly with RasterMAPPER version 4.0 and greater. The steps detailed below are only those necessary to create a map, send it to the processor, and ensure the fixtures are configured properly on the processor. These steps are based on the <u>RasterMAPPER Basic Workflow</u> using the Vizomo video processor and C11 fixtures.

6.3.1 Mapping 6.3.2 Enumeration 6.3.3 Calibration Home > 6. RasterMAPPER > 6.3 RasterMAPPER QuickStart Guides > 6.3.1 Mapping

6.3.1 Mapping

The mapping step is necessary to tell the Vizomo the relationship between pixels in the input signal, and where those pixels are located on the modular LED fixtures. This is accomplished by building a **map** of fixtures in a space representing the input pixels.

Create and Send Map

- 1. Download and Install RasterMAPPER.
- 2. Launch RasterMAPPER. A new window opens with a blank map and a 'New C-series Display' tool.

000			Untitled.rmmap (1009	9			0
BARGO				(NONE)	:	Setup	Mapping
Map Totals Total Pixels: 0 Total Pixeures: 0			New C-series Displa	v	3% 	Port Name	Pixels 0
Current Selection None Selected Fixtures: 0 Selected Pixels: 0		My display i	s cabled from top to b			Image: Second state Image: Second state Ima	0 0 0
Pert/Seq X, Y A: Pert A School School	Type					Center x	degrees
)414	Send Ma	

3. Define screen specifics then press Create.

New C-series Display
My C11 🗘 display is 10 columns wide and 5 rows tall.
Looking at the front, it is cabled from top to bottom, left to right 📫
Always show this wizard at launch.

4. A grid will be generated in the top left position.

5. Select a processor.

00	R1i #1	
BARCO	R11#1	Mapping

6. Select Save To ... from the File menu .

ile	Edit	Format	View	Window	Help
Ne	w				ЖN
Ne	w C-se	ries Displ	ay	1	ĉ₩N
Op	en				жΟ
Op	en Cur	rent Map	From 'R	1i # 1'	0%7
Op	en Rec	ent			•
Sav	/e				₩S
Sav	e As			1	ĵ۳%S
Sav	/e To 'F	R1i # 1'		1	⊂₩S
Sav	e As T	o 'R1i # 1	'	Σ1	۵жS
Pag	ge Setu	ip			ĉжΡ
Pri	nt				ЖP
Clo	se				₩W

7. Name the map and click **Send Map** to send the map to the Vizomo.

	Processor :	elect
- (LA 10 2	36
	Send map to: R1i #1 Map name Untitled Cancel Send Map	

NOTE:

Each time a map on the Vizomo is changed perform the steps of $\underline{6.1.2 \text{ Enumeration}}$ and $\underline{6.1.3 \text{ Calibration}}$.

```
Home > 6. RasterMAPPER > 6.3 RasterMAPPER QuickStart Guides > 6.3.2 Enumeration
```

6.3.2 Enumeration

The **enumeration** step associates fixtures in their physical cabled order with their logical position within the map. This is necessary to ensure that each fixture gets the correct video data that it needs to display an image when combined with all of it's neighbors. Failing to do this step may result in a display that has an image that is broken into randomly arranged squares.

Enumerate PXL Fixtures

1. Click on the button for Setup inspectors.

2. In the PXL Setup section, click Enumerate.

0.0	Vizomo L2i

6. When the status area reads xxx nodes found, enumeration is complete click the Close button to close the window.

	The enumeration operation traverses attached fixtures, assigning
1	sequence numbers to them. This should be done any time fixtures are attached, removed, or re-ordered.
	Show on-screen display of fixture address during enumeration
Console sta	-
1 node fou	br

NOTE:

Each time a map on the Vizomo is changed perform the steps of 6.1.2 Enumeration and 6.1.3 Calibration.

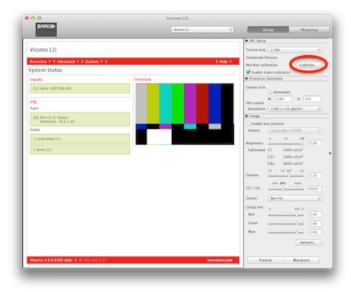

Home > 6. RasterMAPPER > 6.3 RasterMAPPER QuickStart Guides > 6.3.3 Calibration

6.3.3 Calibration

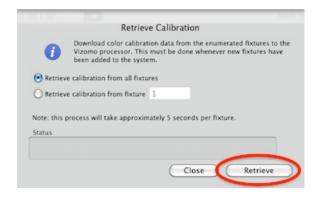

The **calibration** step is necessary to copy LED calibration data from each fixture back to the Vizomo processor, where the calibration algorithms are run. Failing to do this step may result in a speckled looking image, or fixtures that have a different color cast than their neighbors.

Retrieve Calibration Data from PXL Fixtures

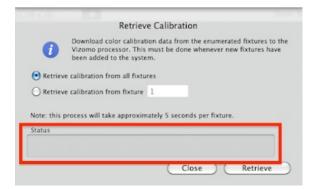

1. Click the Calibrate... button.

2. Click the Retreive button to begin the process.

3. Check the status area for any errors.

4. When the status area reads *Complete*, click the **Close** button to close the window.

	Retrieve Calibration
0	Download color calibration data from the enumerated fixtures to the Vizomo processor. This must be done whenever new fixtures have been added to the system.
📀 Retrieve	e calibration from all fixtures
Retrieve	e calibration from fixture 1
Note: this p Status	rocess will take approximately 5 seconds per fixture.
	l total)

Home > 6. RasterMAPPER > 6.5 Mapping

6.5 Mapping

Mapping involves choosing existing fixtures or creating new ones and placing them on the work grid in the same order as they are cabled in the system.

The processing equipment may contain multiple output ports for fixtures. Always be aware of which port fixtures are being assigned to. Additional functionality allows the changing of the wiring order of the fixtures in the map by re-sequencing.

With RasterMAPPER Version 4.0 and above multiple maps can be open at the same time. Each can be saved or opened independently of each other and fixtures can be copied between maps.

```
Home > 6. RasterMAPPER > 6.5 Mapping > 6.5.1 Canvas
```

6.5.1 Canvas

The work grid or canvas in RasterMAPPER is where you place fixtures. When you first launch RasterMAPPER, a blank canvas is displayed. Once you begin placing fixtures, they appear in a unique color. Fixtures on an inactive port are slightly transparent.

Below are descriptions of the tools specific to the canvas.

Select Tool

The select tool highlights any fixture or group of fixtures on an active port.

Fixtures can be selected by:

- Starting in an empty section of the grid, click and drag across the canvas.
- Click on the first fixture, then press and hold Shift (Win or Mac) or Command (Mac) or Control (Win) and click on the next fixture. Only those two fixtures will be selected.

Hand Tool

The hand tool moves the canvas.

Note: Scroll bars can also be used to move the canvas.

Zoom

Adjust the zoom slider to increase or decrease the viewable canvas in preset values from 8-800%.

Zoom can also be adjusted by:

- Zoom In/Zoom Out from the view menu
- Command +/- (Mac)
- Control +/- (Win)

Add fixture tool

To place the default C11 fixture, click the the add tool button so that it is highlighted. A yellow add cursor will be displayed when mousing over the map area.

Fixture select Menu

To select another type of fixture click and hold the triangle next to the fixture name to display the 'Fixture Select Menu'. Mouse over the desired fixture and

release to select a fixture.

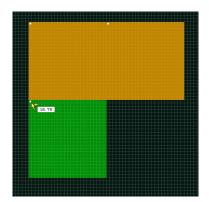

▼ C11 (36 x 36)		
C-series		C11 (36 x 36)	
Helix	•	C8v (48 x 48)	
Custom		C7 (52 x 52)	

Building the Map

Click the map grid area to add the fixture to the map. Fixtures will be added to the selected port.

Add fixtures to the canvas in the order they are wired (sequence). The sequence can be changed later, if desired (see Sequencing, p. 21 for more information).

When placing fixtures, the x and y location is displayed adjacent to the cursor. The white square at the top left of each fixture aids in determining the fixture's Z rotation.

Home > 6. RasterMAPPER > 6.5 Mapping > 6.5.2 Mapping Inspectors

6.5.2 Mapping Inspectors

The Mapping pane's inspectors are a collection of tools to help with map editing.

pixels
pixels
pixels
pixels

Alignment Pane

Use the buttons as the top of the alignment pane to align objects either Vertically or Horizontally. Select the fixtures or groups to be aligned and then press the button for the type of alignment desired.

¥	Alignn	nent		 		
	1	eje.	<u>th</u>	-		
	Grid Si	nap X:	1	•	Snap	
	Grid Si	nap Y:	1	•	Overlap	

The alignment pane also contains tools to set x and y snap values and enable/disable grid snap and overlay. Snapping limits the placement of fixtures to within only a certain number of pixels, commonly the width/height of the fixture. Overlap allows fixtures to be placed on top of or behind another fixture.

Duplicate Array

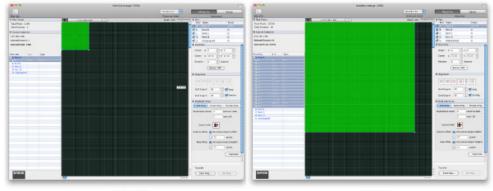

The Duplicate Array inspector of the Layout tab displays the options for three Array Duplication modes.

Grid Array

Grid Array	Linear Array	Circular Array
Duplication co	unt 4	columns wide
	4	rows tall
	der 🌐	
olumn offset	36 pixels	(object width)
Column offset	 36 pixels 0 	(object width) pixels
	00	_

- 1. Enter the number of rows and columns the resulting array will be.
- 2. Choose the new scan order for the resulting array.
- 3. Enter the desired column and row offset between each duplicated array.

RasterMAPPER automatically sets the offsets based on the width and height of the selected fixtures (objects), but you can enter your own, if desired.

Before

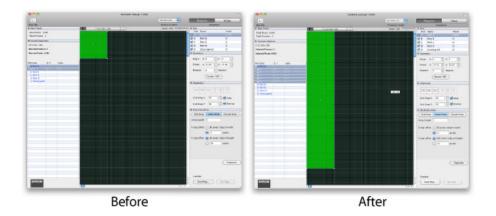

After

Linear Array

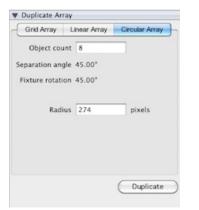

Grid Array	Linear Array	Circular Array
rray length	5	
step offset	O 36 pixels (o	bject width)
	0	pixels
step offset	180 pixels	(object height)
	36	pixels

- Enter the total number of fixtures for the resulting array.
- Enter the X (horizontal) and/or Y (vertical) offsets for the resulting array. Each new fixture will be this number of pixels away from each other. RasterMAPPER automatically sets the offsets based on the width and height of the selected fixtures (objects), but you can enter your own, if

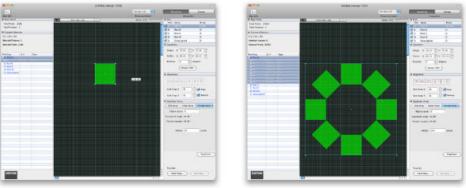

desired.

- Enter the total number of fixtures for the new array.
- Based on the count, the Separation angle and Fixture rotation will be automatically computed.
- Enter the desired Radius (in pixels) for the new array.

NOTE:

Don't forget that in RasterMAPPER v4.0 and later you can have multiple maps open at the same time. This enables enhanced functionality like copying and pasting fixtures from one map to another.

Home > 6. RasterMAPPER > 6.5 Mapping > 6.5.5 Advanced Fixture Options

6.5.5 Advanced Fixture Options

Creating Custom Fixtures

RasterMAPPER provides a default list of PXL fixtures to use. You can also create new fixtures that can be saved with the current map or as a template fixture to be used with any map. If a custom fixture is created in a map and opened on another computer without that custom fixture, it will be automatically added to the current map.

Select Edit this Menu... from the fixture menu to add or remove custom fixtures from the menu.

A C	▼ C11 (36 x 36)	*
	C-Series Helix	•	
	Custom	•	Edit this Menu

Then press the + button at the bottom.

Note: Editing existing fixtures is not yet supported.

Fixture Setup Window

Provide the name, pixel dimensions, scan order and desired fixture color. Then, select save to template or map.

	Fixture Setup
Name	
Width	1 Dixels
Height	1 Dixels
Scan Order	#
Fixture Color	
	Save as template
	Cancel Save to map

Scan Order

Click the Scan Order icon to select a scan order for the new fixture.

₩			
#	₩	±	ŧ
₩	ŧĦ	₽	ŧ
Ð	Ð	lţſ	fl <u>t</u>
Ħ	tt	ţţ	ţĴÌ

Save to Map

Saves the custom fixture to the current map. This fixture will not be loaded the next time RasterMAPPER is launched. However, if a map with a custom fixture is loaded, it will be placed in the Custom section of the fixture menu.

Save to Template

Template fixtures load whenever RasterMAPPER is launched and are saved to the following locations:

- Win: "Documents and Settings\user\Application Data\RasterMAPPER\Templates\" (ensure "Show hidden files and folders" is enabled)
- Mac: "~/Library/Application Support/RasterMAPPER/templates/"

Moving Fixtures

X/Y Coordinate movement

- Mouse: click on a fixture and drag it to a new location. If Overlap is turned off, you will not be able to place one fixture over another (see <u>Alignment</u> <u>Pane</u>)
- Keyboard: press the desired arrow key to move the selected fixture(s) in any direction on the canvas.
- Geometry Pane: enter explicit x-axis and y-axis values for the fixture(s). (See Geometry Pane)

Z Rotation

- Mouse: position the cursor over one of the corners of the box surrounding the selection and click and drag to rotate the selected fixture(s). The cursor changes to indicate the possible direction of rotation.
- Geometry Pane: enter an explicit rotation value for the fixture(s). (See Geometry Pane)

Duplicating Fixtures

Fixtures can be duplicated both Horizontally and Vertically.

- Choose Duplicate Horizontally from the Edit menu, or press Command + D(Mac), Control + D (Win) to place a copy of the fixture(s) on the canvas to the right of the selected fixture(s). If there is no space in the default location the duplicated fixture(s) will be placed in the next available area.
- Choose Duplicate Vertically from the Edit menu, or press Shift + Command + D (Mac), Shift + Control + D (Win) to place a copy of the fixture(s) on the canvas to the bottom of the selected fixture(s). If there is no space in the default location the duplicated fixture(s) will be placed in the next available area.

Note: Press and hold the Option key to duplicate drag a copy of the fixture(s) to a new location.

Home > 6. RasterMAPPER > 6.6 Processor Control

6.6 Processor Control

RasterMAPPER provides control over many functions on the Vizomo processor via the Configure Inspectors. Some parameters are sent instantly to the processor resulting in an immediate change. Other parameters are not sent until you expressly push a button or otherwise commit the changes.

For more information on the Vizomo processor, please refer to the Vizomo User Guide.

Home > 6. RasterMAPPER > 6.6 Processor Control > 6.6.1 Processor List

6.6.1 Processor List

RasterMAPPER provides the functionality to control different processors from the same interface. A processor select drop-down menu is presented at the top of the main program window and also displayed, when saving a map.

Home > 6. RasterMAPPER > 6.6 Processor Control > 6.6.2 Setup Inspectors

6.6.2 Setup Inspectors

Overview

The inspectors in the Setup pane provide access to Vizomo processor functions. Most sections of the pane contain a triangle to the left of the section name allowing you to close or open that section. This gives you the flexibility to hide seldom used sections while ensuring frequently used ones remain visible. Additionally, if the screen size does not accommodate all the inspectors, scrollbars will appear. The top and bottom sections are always visible and will not scroll out of view.

Freeze and Blackout

Ercozo	Blackout
Freeze	BIACKOUL

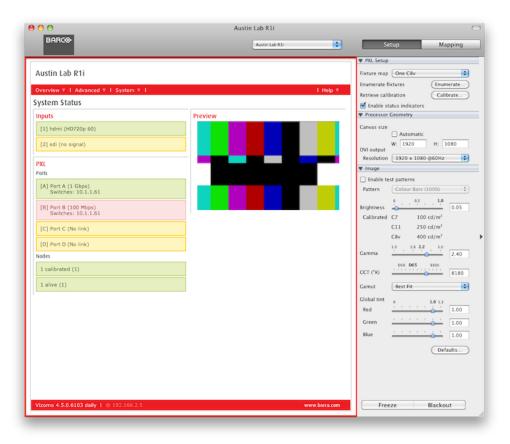

Freeze the current image on-screen while allowing playback and other functions to continue in the background.

Blackout displays video black on the PXL output, all playback and other functions continue as normal in the background.

Home > 6. RasterMAPPER > 6.6 Processor Control > 6.6.3 webUI

6.6.3 webUI

The Vizomo webUI is a web based User Interface that contains information about the system and other advanced features such as Vizomo's command line interface.

The pages of the webUI are accessible via the red navigation bar across the top:

Overview V | Advanced V | System V |

I Help ▼

Overview >> System Status and Content Preview

The System Status section displays current information about the video Input devices, PXL ports of the Vizomo, Switches connected to PXL ports and nodes. In addition to system heartbeat information, a Preview of the content is also provided.

In the image below we see all 3 indicator colors present (red, green and yellow)

• A green color rectangle indicates that the system component is functioning as expected. In the example below, there is 1 C-series tiles in the map. The Vizomo sees that the tile is alive and all calibration data has been received. So, the nodes indicator bars are green.

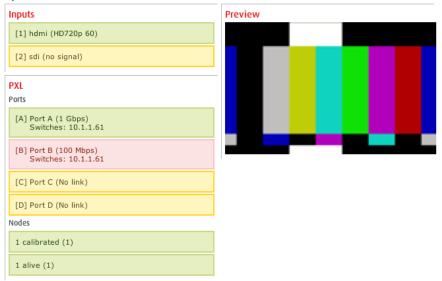

• A yellow color rectangle indicates an abnormal condition. In the example below, the SDI input does not detect a signal and both port 'C' and port "D' have been unplugged.

• A red color rectangle indicates a failure. In the example below, Port B has been connected to a 100 Mbps port of a switch rather than the Gigabit port.

Preview

To the right of the status section is a low frame rate preview of the Vizomo content.

System Status

Overview >> PXL Nodes

The PXL nodes page displays current information about the status of nodes (tiles). At the bottom of the page a download button allows for this information to be saved as a csv file.

PXL Nodes

Id	Serial #	Туре	Firmware	Last Calibrated	Temp °C
1	180912000046	C8v	04.04.00.1638		30.0

Advanced >>Console

The console page is a tool for advanced users. Here, text commands are used to control a Vizomo. In the example below the brightness property is queried with the command '? system.output.pxl.fps'. The Vizomo responded with the current frame rate.

Console

Austin Lab R1i> ?system.output.pxl.fps 60.044104859672 Austin Lab R1i> |

Advanced >> Calibration

The calibration page is an experimental tool for manually adjusting the appearance of tiles. It is easy to make screens look much worse. As such, it is strongly recommended that only trained operators make use of this feature.

Calibration

<u>Disclaimer</u>								

System >> Support

The Support page contains a detailed summary of the system. It automatically updates every 10 seconds. The 'Download Support File' button at the bottom can be used to download the whole report as a file that can be emailed to customer support.

System >> Log

The log page displays the full system log.

System >> Configuration

Some of the Vizomo parameters can be adjusted on the configuration page of the webUI. For the full set of controls use the RasterMAPPER interface.

Configuration

General		
Description:	Austin Lab R1i	What you loudly refer to this Vizomo as
Canvas		
Size to PXL Map:	Enabled	Automatically size the canvas to encompass all fixtures in the PXL fixture map
Dimensions:	W: 1920 H: 1080	Manually specify the canvas dimensions (largest drawable region)
DVI Output		
Resolution:	1920 x 1080 @60Hz Apply	(Requires an automatic restart)
PXL Output		
Color Gamut:	Best Fit	How colors are reproduced (i.e., what red actually is)
Fixture Map:	One C8v	Mapping of fixture positions
Status Indicators:	✓ Enabled	Rear tile indicator control

System >> Upgrade

Transfer .vuz files to a remote Vizomo in order to perform an upgrade.

Upgrade

System >> Shutdown

Reboot or shutdown the Vizomo with the buttons on this page.

Shut down

Help

The Help menu contains a link to the PXL system documentation and the Vizomo About Menu

Footer

The Footer of the webUI contains four elements.

Vizomo 4.5.0.6103 daily | @ 192.168.2.5

1. The current software version

2. The IP address(s) of the Vizomo

3. The Barco.com URL

Home > 6. RasterMAPPER > 6.7 Software Update

6.7 Software Update

RasterMAPPER automatically checks for software updates when it is started. Update checks may also be manually triggered with the *Check for Updates...* function:

Appendix A: Notes

Typographic Information

This User's Guide uses the following typographic conventions:

- menu items are displayed in Bold Italics
- clickable buttons are displayed in Bold Title Case.
- on-screen text is displayed in *italics*
- filenames & application names are displayed between "quote marks"
- keyboard keystrokes are displayed in Courier Font

Home > 7. Change Log

7. Change Log

PXL System 4.6

C-series / Helix Firmware:

• No changes

Vizomo:

- Support Barco PXL brightness sensor
- Added C11 brightness boost
- Further improved quality of scaled images
- Reverted improved gamma control

RasterMAPPER:

• Vizomo 4.6 compatibility

PXL System 4.5

C-series / Helix Firmware:

- Improved bulk transfer speed (calibration, firmware)
- Fixed issue with downgrading below 4.4
- Fixed tile runtime bug

Vizomo:

- Redesigned webUI
- Capture device status
- Live preview
- PXL nodes (tiles) status report page
- Experimental color calibration page
- Vizomo configuration page
- Upgrade and license Vizomo software from the webUI
- Updated Video Mixer blueprint
- Window source rectangle now optional
- Content can now be auto advanced
- Canvas now automatically sizes to map
- Automatically deinterlace interlaced content
- Improved quality of scaled images
- Best fit PXL gamut dynamically determines the "best"/"widest" available color space for the attached screen

RasterMAPPER:

• Enumeration and calibration bug fixes

PXL System 4.4.1

C-series / Helix Firmware v4.4.0:

Enumeration speed gain

Vizomo v4.4.0:

- C7 support
- Auto-complete for web console
- Improved gamma control
- Added detection of unrecognized tiles
- Make use of new nVidia EDID mechanism to force DVI-D resolutions

RasterMAPPER v4.4.1:

- Maps can now be retrieved from Vizomos
- C7 support
- Improved network connection to Vizomo
- Improved Vizomo UI

PXL System 4.3

Vizomo v4.3.0:

- Enumerate on all four PXL ports
- Make use of tile PWM brightness control
- Improved network awareness
- RasterMAPPER v4.3:
- Added webUI
- C-series setup tool

PXL System 4.2.2

C-series / Helix Firmware:

No changes

Vizomo:

• PXL timing improvements for 'choppy' tiles

RasterMAPPER:

- New C-series Display tool pops up when RM is opened
- Disable status indicators on the back of C-series tiles
- 14 new test patterns
- Separate brightness values for C11 and C8v
- Pixel quantities for C8v now reported correctly

PXL System 4.2.1

C-series / Helix Firmware:

No changes

Vizomo:

• Increased pixel capacity

RasterMAPPER:

- Fixed IE script error
- Mapping for P1 fixed
- Show correct release notes in auto update mechanism

PXL System 4.2.0

C-series / Helix Firmware:

- C-series 'On Screen Enumeration', sequence numbers are now displayed during enumeration
- Improved PXL error handling

Vizomo:

- New Video Mixer blueprint.
- Implemented new capture devices to support HD-SDI and DVI over HDMI
- DVI monitor now warns if the system is in 'Blackout'
- Improved the way Vizomo interacts with the PXL network
- Improved logs and reports for trouble shooting
- Support for placing C11 and C8v in the same map

RasterMAPPER:

- Adjusted interface elements to aid workflow
- Numerous 'behind the scenes' components to support future features

Barco, Inc. assumes no responsibility or liability for any errors or inaccuracies that may appear in this manual.

Safety Information

The symbols below are used throughout this manual to identify important safety information. Heed all warnings and safety information.

Meaning Warning, Danger, or Caution

Risk of injury to yourself or the product.

Risk of Electrical Shock Risk of severe electrical shock.

Risk of electrical Shock. No user-serviceable parts inside. Observe all applicable electrical codes. The power outlet shall be installed near the equipment and shall be easily accessible.

Warranty Information

Barco, Inc. warrants C-series, Helix, and Vizomo hardware products against defects in materials and workmanship under normal use for a period of one (1) year from the date of retail purchase by the original end-user purchaser.

Barco, Inc. does not warrant that the operation of any product will be uninterrupted or error free. Barco Inc. is not responsible for damage arising from failure to follow instructions relating to the product's use.

Federal Communications Commission (FCC Statement)

C-series and Helix have been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules.

These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Changes

Barco provides this manual 'as is' without warranty of any kind, either expressed or implied, including but not limited to the implied warranties or merchantability and fitness for a particular purpose. Barco may make improvements and/or changes to the product(s) and/or the program(s) described in this publication at any time without notice.

This publication could contain technical inaccuracies or typographical errors. Changes are periodically made to the information in this publication; these changes are incorporated in new editions of this publication.
