Table of Contents

List of Figures.....	XV
Introduction	1
The Xirrus Family of Products	1
Nomenclature	2
Why Choose the Xirrus Access Point?	3
Wireless Access Point Product Overview	4
XR Wireless AP Product Family	5
XR-320 Wall Mounted 2-Radio Access Points	5
XR-500 Series 2-Radio Access Points	6
XR-600 Series 2-Radio Access Points	7
XR-1000 Series 2-Radio Access Points	8
XD4-130 4-Radio High Density Access Points	9
XR-2006 Series 2- and 4-Radio High Density Access Points	10
XR-2005 Series 2- and 4-Radio Access Points	11
XR-4006 Series 4- to 8-Radio High Density Access Points	12
XR-4000 Series 4- to 8-Radio High Density Access Points (not ending in "6")	13
XR-6000 Series 8- to 16-Radio High Density Access Points	14
Enterprise Class Security	14
Deployment Flexibility	15
Power over Ethernet (POE)	16
Enterprise Class Management	16
Key Features and Benefits	18
High Capacity and High Performance	18
Extended Coverage	18
Flexible Coverage Schemes	19
Non-Overlapping Channels	20
SDMA Optimization	20
Fast Roaming	20
Ease of Deployment	20
Powerful Management	20
Secure Wireless Access	20

Applications Enablement	21
Advanced Feature Sets	21
Xirrus Advanced RF Performance Manager (RPM)	21
Xirrus Advanced RF Security Manager (RSM)	22
Xirrus Advanced RF Analysis Manager (RAM)	23
Xirrus Application Control	24
About this User's Guide	25
Organization	25
Notes and Cautions	27
Screen Images	27
Product Specifications	27
Installing the Wireless AP	29
Installation Prerequisites	29
Optional Network Components	31
Client Requirements	31
Planning Your Installation	32
General Deployment Considerations	32
Coverage and Capacity Planning	34
Placement	34
RF Patterns	35
Capacity and Cell Sizes	36
Fine Tuning Cell Sizes	37
Roaming Considerations	39
Allocating Channels	39
Other Factors Affecting Throughput	41
About IEEE 802.11ac	42
Up to Eight Simultaneous Data Streams—Spatial Multiplexing	44
MIMO (Multiple-In Multiple-Out)	44
MU-MIMO (Multi-User Multiple-In Multiple-Out)	45
Higher Precision in the Physical Layer	47
80 MHz and 160 MHz Channel Widths (Bonding)	48
802.11ac Data Rates	49
ACExpress™	50
802.11ac Deployment Considerations	50
Failover Planning	52
Switch Failover Protection	54

Wireless Access Point

Power Planning	55
Power over Ethernet	55
Security Planning	56
Wireless Encryption	56
Authentication	56
Meeting PCI DSS Standards	57
Meeting FIPS Standards	57
Port Requirements	58
Network Management Planning	62
WDS Planning	63
Common Deployment Options	66
Installation Workflow	67
Installing Your Wireless AP	69
Choosing a Location	69
Wiring Considerations	69
Mounting and Connecting the AP	72
Dismounting the AP	72
Powering Up the Wireless AP	72
AP LED Operating Sequences	73
LED Boot Sequence	73
LED Operation when AP is Running	74
Zero-Touch Provisioning and Ongoing Management	75
XMS-Cloud Next Generation (XMS-9500-CL-x)	75
XMS-Enterprise	75
If you are not using XMS	76
AP Management Interfaces	76
User Interfaces	76
Using the Serial Port	78
Using the Ethernet Ports to Access the AP	78
Starting the WMI	79
Logging In	79
Licensing	80
Performing the Express Setup Procedure	80
Securing Low Level Access to the AP	81
The Web Management Interface	85
Managing APs Locally or Using XMS	85

Introduction

This chapter introduces the Xirrus Family of Products, with an overview of its key features and benefits.

- “The Xirrus Family of Products” on page 1.
- “Why Choose the Xirrus Access Point?” on page 3.
- “Wireless Access Point Product Overview” on page 4.
- “Key Features and Benefits” on page 18.
- “Advanced Feature Sets” on page 21.
- “About this User’s Guide” on page 25.

The Xirrus Family of Products

Figure 1. Xirrus AP

The Xirrus family of products includes the following:

- **Xirrus High Density Wireless Access Points**
Xirrus APs are designed to provide distributed intelligence, integrated switching capacity, application-level intelligence, increased bandwidth, and smaller size. The radios support IEEE802.11 ac, a, b, g, and n clients, and feature the capacity and performance needed to replace switched Ethernet to the desktop. Modular radios allow you to increase the number of radios, upgrade to more powerful radios, or even upgrade later to future technologies like 802.11ac and 802.11ad as they are introduced.

- **Xirrus Management System (XMS)**

XMS is used for managing large wireless deployments from a centralized Web-based interface. Xirrus offers XMS-Cloud—a software as a service option for XMS, providing zero-touch provisioning and initial startup for new AP deployments. XMS is capable of managing large numbers of APs, including automated software and firmware upgrades for the network.

Another option is XMS, hosted on your own server. It manages all aspects of your Xirrus wireless network. For customers using the XMS-9000-CL-x Cloud-hosted version, all AP management is performed via the cloud. For detailed information, refer to the *XMS User's Guide*.

- **Xirrus-supplied Power over Ethernet (POE) Injectors and POE+ Switches**

Xirrus offers 24- and 48-port enterprise-class L2+ gigabit managed access switches with IEEE802.3at PoE+, four 1G/10G SFP+ ports, and stacking. One-, two-, and eight-port POE injectors are also available for a range of AP power requirements.

Nomenclature

Throughout this User's Guide, Xirrus Wireless Access Points are referred to as simply APs or APs. In some instances, the terms **product** and **unit** are also used. When discussing specific products from the Xirrus family, the product name is used (for example, XR-4830). The Wireless AP's operating system is referred to as the ArrayOS (AOS). The Web Management Interface for browser-based management of the AP is referred to as WMI.

APs have very flexible radio capabilities—each of the radios may be independently configured to support IEEE802.11a, 11b, 11g, or 11n clients or a combination of client types. On APs featuring 802.11ac, this option is also included. One radio may be assigned as the RF **monitor** radio, supporting intrusion detection and prevention, self-monitoring, and other services. Radios support both 2.4GHz and 5 GHz, and are named **iap1, iap2, ... iapn**.

The Xirrus Management System is referred to as XMS. The Power over Ethernet system may be referred to as POE.

Why Choose the Xirrus Access Point?

The deployment of wireless is a necessity as businesses strive for greater flexibility in the workplace and the need for employee mobility rises. The user community is placing spiraling and often unanticipated demands on the wireless network, with the rapid proliferation of devices such as iPads and wireless enabled phones. Xirrus High Density APs have the capability to support the large number of user devices present in today's environments, with superior range and coverage.

Wireless has come a long way in the past few years and now offers the performance, reliability and security that Enterprise customers have come to expect from their networks. The technology is being driven by these major IEEE standards:

- **802.11ac**
Operates in the 5 GHz range, using a number of advanced techniques to achieve a maximum speed of 1.3 Gbps. These techniques include improvements on the methods used for 802.11n, below.
- **802.11n**
Uses multiple antennas per radio to boost transmission speed as high as 450Mbps, increasing throughput, range, and maximum number of users. 802.11n is backwards compatible with 802.11a/b/g.
- **802.11a**
Operates in the 5 GHz range with a maximum speed of 54 Mbps.
- **802.11b**
Operates in the 2.4 GHz range with a maximum speed of 11 Mbps.
- **802.11g**
Supports a higher transmission speed of 54 Mbps in the 2.4 GHz range and is backwards compatible with 802.11b.

Whether you have just a few users or many users, the Xirrus AP has the scalability and flexibility to serve your needs.

[Wireless Access Point Product Overview](#)

[The Xirrus Family of Products](#)

Wireless Access Point Product Overview

The Wireless AP is a high capacity, multi-mode device designed with up to four times the coverage and eight times the bandwidth and user density compared with legacy thin access point wireless products. Its distributed intelligence eliminates the use of separate controllers and their accompanying bottlenecks. Each radio, with its directional high-gain antennas, can achieve up to 1.3 Gbps throughput.

Figure 2. Wireless AP (XR Series)

The Wireless AP (regardless of the product model) is Wi-Fi® compliant and simultaneously supports 802.11ac (on .11ac models), 802.11a, 802.11b, 802.11g, and 802.11n clients. The multi-state design allows you to assign radios to 2.4 GHz and 5 GHz bands (or both) in any desired arrangement. Integrated switching and active enterprise class features such as [VLAN](#) support and multiple [SSID](#) capability enable robust network compatibility and a high level of scalability and system control. The Xirrus Management System (XMS) allows global management of hundreds of APs from a central location.

Multiple versions of the AP with different numbers of IAPs support a variety of deployment applications.

XR Wireless AP Product Family

XR-320 Wall Mounted 2-Radio Access Points

The XR-320 is a high performance Gigabit Wi-Fi wall access point with integrated wired Gigabit switch designed for in-room connectivity. This AP, built to support the latest 802.11ac Wi-Fi standards, is designed for multi-device wired and wireless connectivity in hotel rooms, dormitories, hospital rooms, offices, and similar locations. Using existing in-wall cabling, the XR-320 can deliver Wi-Fi access, connectivity to multiple wired devices and pass through access for legacy devices like POTS.

These models have omni-directional antennas rather than directional antennas.

Feature	XR-320
No. radios: 802.11 a/b/g/n/ac/Monitor	2
Radio type	2x2
Integrated antennas	4
Integrated wireless switch ports	2
Gigabit Uplink Port	1
Wireless bandwidth	1.1 Gbps
Users supported	256

The XR-320 runs a different operating system than ArrayOS, and the WMI and CLI described in this book **do not apply to the XR-320**. This model should be managed using XMS-Cloud.

XR-500 Series 2-Radio Access Points

These Access Points have one Gigabit Ethernet port and two multi-state radios (2.4GHz or 5GHz). They support 600Mbps total, connecting up to 240 users at one time.

The Access Point provides flexibility for delivering wireless service in low-to-medium user density scenarios, in challenging deployments in areas with high RF attenuation, and in isolated or physically separated locations.

These models have an integrated controller, firewall, threat sensor, and spectrum analyzer. Indoor units have omni-directional antennas rather than directional antennas.

Feature	XR-520
No. radios: 802.11 a/b/g/n/monitor	2
Radio type	2x2
Integrated omni-directional antennas	4
Integrated wireless switch ports	2
Integrated RF spectrum analyzer, threat sensors	Yes
Gigabit Uplink Port	1
Wireless bandwidth	600 Mbps
Users supported	240

XR-600 Series 2-Radio Access Points

These Access Points provide robust wireless service in low-to-medium user density scenarios. They have two Gigabit Ethernet ports and two multi-state radios (2.4GHz or 5GHz), so that as more of your clients migrate to 802.11ac, you can increase the number of radios operating at 5 GHz. Each of the XR-630's two 3x3 802.11ac radios supports 1.3Gbps, connecting up to 240 users at one time with 2.6Gbps total Wi-Fi bandwidth.

These models have an integrated controller, firewall, threat sensor spectrum analyzer, and application-level intelligence. They have omni-directional antennas rather than directional antennas.

The XR-630 supports a unique feature that optimizes wireless performance by automatically segmenting faster 802.11ac clients from slower Wi-Fi clients. Since Wi-Fi is a shared medium, this separation ensures slower 802.11a/b/g/n clients do not slow down 802.11ac clients and prevent them from achieving high performance.

Note that the XH2-120 is an outdoor AP that is similar to the XR-620, except that it uses customer-provided external antennas rather than integrated antennas. See the Xirrus XH2-120 Quick Installation Guide for more information.

Feature	XR-620	XR-630
No. radios: 802.11 ac/a/b/g/n/monitor	2	2
Radio type	2x2	3x3
Integrated omni-directional antennas	4	6
Integrated wireless switch ports	2	2
Integrated RF spectrum analyzer, threat sensors	Yes	Yes
Gigabit Uplink Ports	2	2
Wireless bandwidth	1.7 Gbps	2.6 Gbps
Users supported	240	240

XR-1000 Series 2-Radio Access Points

These APs include models with one Gigabit Ethernet port and two multi-state radios (2.4GHz or 5GHz) that can support 300Mbps or 450Mbps, connecting up to 480 users at one time.

The Xirrus XR-1000 Series Wireless AP is a two slot chassis available in a two multi-state (2.4GHz or 5GHz) radio configuration with up to 900Mbps of bandwidth (up to 450 Mbps per radio). The XR-1000 provides flexibility for delivering wireless service in low user density scenarios, challenging deployments in areas with high RF attenuation, and in isolated or physically separated locations. The elliptical-shaped coverage pattern produced by its directional antennas is ideal for covering facilities with central hallways and adjacent rooms commonly found in office buildings, hotels, and dormitories.

Like larger APs, these models integrate multi-state radios with high gain directional antennas, an onboard multi-gigabit switch, controller, firewall, threat sensor and spectrum analyzer, built on a modular chassis for future extensibility.

Feature	XR-1220	XR-1230
No. radios: 802.11 a/b/g/n/monitor	2	2
Radio type	2x2	3x3
Integrated antennas	4	6
Integrated wireless switch ports	2	2
Integrated RF spectrum analyzer, threat sensors	Yes	Yes
Gigabit Uplink Port	1	1
Wireless bandwidth	600 Mbps	900 Mbps
Users supported	480	480

XD4-130 4-Radio High Density Access Points

These APs have two Gigabit Ethernet ports and four multi-state radios (2.4GHz or 5GHz) supporting 802.11ac and 802.11a/b/g/n. Each of the four 3x3 802.11ac radios supports 1.3Gbps, connecting up to 780 users at one time with up to 5.2 Gbps total Wi-Fi bandwidth.

The Xirrus XD4-130 AP supports high-performance for medium density needs. It integrates multi-state radios with high gain directional antennas, an onboard multi-gigabit switch, controller, firewall, threat sensor and spectrum analyzer.

Feature	XD4-130
No. radios: 802.11 ac/a/b/g/n/monitor	4
Radio type	3x3
Integrated antennas	12
Integrated wireless switch ports	4
Integrated RF spectrum analyzer, threat sensors	Yes
Gigabit Uplink Ports	2
Wireless bandwidth	5.2 Gbps
Users supported	780

A unique feature optimizes wireless performance by automatically segmenting faster 802.11ac clients from slower Wi-Fi clients. Since Wi-Fi is a shared medium, this separation ensures slower 802.11a/b/g/n clients do not slow down 802.11ac clients and prevent them from achieving high performance.

XR-2006 Series 2- and 4-Radio High Density Access Points

These APs have two Gigabit Ethernet ports and two or four multi-state radios (2.4GHz or 5GHz) supporting 802.11ac and 802.11a/b/g/n. Each of the XR-2436's four 3x3 802.11ac radios supports 1.3Gbps, connecting up to 512 users at one time with up to 5.2 Gbps total Wi-Fi bandwidth.

The Xirrus XR-2006 Series has a four-slot chassis that allows you to purchase a two-radio model and add more radios later as your needs grow. These models support high-performance for medium to high density needs. Like larger XR APs, these models integrate multi-state radios with high gain directional antennas, an onboard multi-gigabit switch, controller, firewall, threat sensor and spectrum analyzer on a modular chassis designed for extensibility.

Feature	XR-2226	XR-2236	XR-2426	XR-2436
No. radios: 802.11 ac/a/b/g/n/monitor	2	2	4	4
Radio type	2x2	3x3	2x2	3x3
Integrated antennas	4	6	8	12
Integrated wireless switch ports	4	4	4	4
Integrated RF spectrum analyzer, threat sensors	Yes	Yes	Yes	Yes
Gigabit Uplink Ports	2	2	2	2
Wireless bandwidth	1.7 Gbps	2.6 Gbps	3.4 Gbps	5.2 Gbps
Users supported	256	256	512	512

A unique feature optimizes wireless performance by automatically segmenting faster 802.11ac clients from slower Wi-Fi clients. Since Wi-Fi is a shared medium, this separation ensures slower 802.11a/b/g/n clients do not slow down 802.11ac clients and prevent them from achieving high performance.

XR-2005 Series 2- and 4-Radio Access Points

These APs include models with one or two Gigabit Ethernet ports and two or four multi-state radios (2.4GHz or 5GHz) that can support 300Mbps or 450Mbps, connecting up to 960 users at one time.

The Xirrus XR-2005 Series Wireless AP has a four slot chassis available in a multi-state (2.4GHz or 5GHz) radio configuration supporting up to 1.8Gbps of bandwidth. These models support a range of low to high-performance applications, including offices, hospitals, campuses and classrooms, and hotels.

Like larger XR APs, these models integrate multi-state radios with high gain directional antennas, an onboard multi-gigabit switch, controller, firewall, threat sensor and spectrum analyzer on a modular chassis designed for extensibility.

Feature	XR-2225	XR-2235	XR-2425	XR-2435
No. radios: 802.11 a/b/g/n/monitor	2	2	4	4
Radio type	2x2	3x3	2x2	3x3
Integrated antennas	4	6	8	12
Integrated wireless switch ports	4	4	4	4
Integrated RF spectrum analyzer, threat sensors	Yes	Yes	Yes	Yes
Gigabit Uplink Ports	2	2	2	2
Wireless bandwidth	600 Mbps	900 Mbps	1.2 Gbps	1.8 Gbps
Users supported	480	480	960	960

XR-2005 Series APs have no console port, but have two Gigabit ports, one of which accepts POE+ power supplied by a Xirrus-supplied power injector or an IEEE802.3at powered switch. Note that older XR-2000 Series APs ending in “0” have one Gigabit POE port and a Console port.

XR-4006 Series 4- to 8-Radio High Density Access Points

These APs include models with two Gigabit Ethernet ports and four or eight multi-state radios (2.4GHz or 5GHz) supporting 802.11ac and 802.11a/b/g/n. Each of the XR-4836's eight 3x3 802.11ac radios supports 1.3Gbps, connecting up to 1024 users at one time with up to 10.4 Gbps total Wi-Fi bandwidth.

The Xirrus XR-4006 Series Wireless AP has an eight-slot chassis that allows you to purchase a four-radio model and add more radios later as your needs grow. These models support high-performance for high density needs, integrating multi-state radios with high gain directional antennas, an onboard multi-gigabit switch, controller, firewall, threat sensor and spectrum analyzer on a modular chassis designed for extensibility.

A unique feature optimizes wireless performance by automatically segmenting faster 802.11ac clients from slower Wi-Fi clients. Since Wi-Fi is a shared medium, this separation ensures slower 802.11a/b/g/n clients do not slow down 802.11ac clients and prevent them from achieving high performance.

Feature	XR-4426	XR-4436	XR-4826	XR-4836
No. of radios: 802.11 ac/a/b/g/n/monitor	4	4	8	8
Radio type	2x2	3x3	2x2	3x3
Integrated antennas	8	12	16	24
Integrated wireless switch ports	8	8	8	8
Integrated RF spectrum analyzer, threat sensors	Yes	Yes	Yes	Yes
1 Gigabit Uplink Ports	2	2	2	2
Wireless bandwidth	3.5 Gbps	5.2 Gbps	6.9 Gbps	10.4 Gbps
Users supported	512	512	1024	1024

Wireless Access Point

XR-4000 Series 4- to 8-Radio High Density Access Points (not ending in "6")

These APs include models with two Gigabit Ethernet ports and four or eight radios (IAPs), connecting up to 1920 users at one time and offering a maximum wireless bandwidth of 3.6 Gbps (up to 450 Mbps per radio). Smaller models may be upgraded to eight radios later when your needs change.

Feature	XR-4420	XR-4430	XR-4820	XR-4830
Number of radios: 802.11a/b/g/n/monitor	4	4	8	8
Radio type	2x2	3x3	2x2	3x3
Integrated antennas	8	12	16	24
Integrated wireless switch ports	8	8	8	8
Integrated RF spectrum analyzer, threat sensors	Yes	Yes	Yes	Yes
1 Gigabit Uplink Ports	2	2	2	2
Wireless bandwidth	1.2 Gbps	1.8 Gbps	2.4 Gbps	3.6 Gbps
Users supported	960	960	1920	1920

XR-6000 Series 8- to 16-Radio High Density Access Points

These APs include models with four Gigabit Ethernet ports and up to sixteen radios, connecting up to 3840 users at one time and offering a maximum wireless bandwidth of 7.2 Gbps (up to 450 Mbps per radio). Smaller models may be upgraded to sixteen radios later when your needs change. A 10 Gigabit modular Ethernet expansion port (DVI connector) is available to meet high traffic demands. It is used only with an optional Xirrus 10 Gig fiber optics adapter.

Feature	XR-6820	XR-6830	XR-7620	XR-7630
Number of radios: 802.11a/b/g/n/monitor	8	8	16	16
Radio type	2x2	3x3	2x2	3x3
Number of integrated antennas	16	24	32	48
Integrated wireless switch ports	16	16	16	16
Integrated RF spectrum analyzer, threat sensors	Yes	Yes	Yes	Yes
1 Gigabit Uplink Ports	4	4	4	4
External 10 Gigabit Modular Expansion Port	1	1	1	1
Wireless bandwidth (Gbps)	2.4	3.6	4.8	7.2
Users supported	1920	1920	3840	3840

Enterprise Class Security

The latest and most effective wireless encryption security standards, including Wireless Protected Access (WPA) and WPA2 with 802.11i Advanced Encryption Standard (AES) are available on the Wireless AP. In addition, the use of an embedded RADIUS server (or 802.1x with an external RADIUS server) ensures user authentication—multiple APs can authenticate to the XMS, ensuring only authorized APs become part of the wireless network. With the Xirrus [Advanced](#)

Wireless Access Point

Feature Sets, intrusion detection and prevention, site monitoring, and RF spectrum analysis are performed in the background by the AP automatically.

Deployment Flexibility

Xirrus' unique multi-radio architecture (on all APs except the XR-500 Series) generates 360 degrees of sectored high-gain 802.11a/b/g/n coverage that provides extended range and the highest possible data rates for a large volume of clients. Each sector can be adjusted automatically or manually, creating a pattern of wireless coverage perfectly tailored to individual customer needs. For example:

Figure 3. Wireless Coverage Patterns

Figure 3 depicts the following two scenarios:

- **Full pattern coverage**
All radios are activated with coverage spanning 360 degrees. If within range, clients will always receive coverage regardless of their geographic position relative to the AP. Radios may be assigned to 2.4 GHz and/or 5.0 GHz bands in any desired pattern.
- **Partial pattern coverage**
If desired, the Wireless AP can be deployed close to an exterior wall. In this case, half of all available radios have been deactivated to prevent redundant signals from “bleeding” beyond the site’s perimeter wall. This configuration may also be used in those cases where you want to restrict wireless coverage to selected areas of the building’s interior.

Power over Ethernet (POE)

Some smaller APs (XR-2000 models ending in “5” or “6”, and XR-500/600 Series) are compatible with IEEE802.3af and/or IEEE802.3at PoE+, and may be connected to appropriate powered switches. For example, the Xirrus XT-5024 and XT-5048 are 24-and 48-port 802.3at POE+ managed switches. See the Installation Guide for the AP for compatible injectors or powered switches.

POE modules provide power to APs over the same Cat 5e or Cat 6 cable used for data. Managed modules provide the ability to control power using XMS.

Figure 4. XP8 - Power over Ethernet Usage

Specific models of the AP are compatible with specific POE modules.

Enterprise Class Management

The Wireless AP can be used with its default settings, or it can be initially configured using zero touch cloud-based automated provisioning. Settings may also be customized using the AP’s embedded WMI. The WMI enables easy

Wireless Access Point

configuration and control from a graphical console, plus a full complement of troubleshooting tools and statistics.

Ethernet Settings Summary

Interface	Status	Managed	IGMP	Auto Neg	Link	Speed	MTU	STP	IP Address	Subnet Mask	Gateway
eth0	enabled	enabled	enabled	on	up	1000	1500	enabled	192.168.1.204	255.255.255.0	192.168.1.204
eth1	enabled	enabled	enabled	on	down	100	1500	disabled	192.168.1.204	255.255.255.0	192.168.1.204

Band Settings Summary

Interface	Band	Mode	Ports	Active VLANs	Monitor
eth0	band1	802.11n	eth0 eth1	all	off
eth1	band2	802.11n	eth0 eth1	all	off

AP Summary

AP	Status	AP Type	Serial	WIFI Mode	Band	Channel	Channel Mode	Autoband	Chnl. Pwr.	Tx Power	Wl. Threshold	SSID	Distance	SSID
eth0	up	3 Lagrange S...	24020	802.11n	off	1	Manual	Internal	max	20	40	0		58:65:28:23:4c:4d:42
eth1	up	3 Lagrange S...	8040	802.11n	off	137.587	External	Internal	max	20	40	0		58:65:28:23:4c:4d:42

Network Resources

Setting	Hostname	IP Address	Status
DNS server 1		192.168.1.204	Connecting OK
RADIUS primary server	Radius1		Hostname unresolved
RADIUS secondary server	Radius2		Hostname unresolved
SNMP trap host 1	Xirrus WMI		Hostname unresolved
Spring email server	mail.spring.com	22.22.128.104	No connectivity
Spring primary server		192.168.1.111	No connectivity

Figure 5. WMI: AP Status

In addition, a fully featured Command Line Interface (CLI) offers IT professionals a familiar management and control environment. Simple Network Management Protocol (SNMP) is also supported to allow management from an SNMP compliant management tool, such as the optional XMS.

For deployments of more than five APs, we recommend that you use the cloud-based or enterprise version of XMS. XMS offers a rich set of features for fine control over large deployments.

Key Features and Benefits

This section describes some of the key product features and the benefits you can expect when deploying the Wireless AP (the XR-7630 product is used as an example in this section).

High Capacity and High Performance

Figure 6. Layout of IAPs (XR-7630)

The XR-7630 version of the Wireless AP (Figure 6) enables wireless connectivity and easily handles time-sensitive traffic such as voice. This model includes four Gigabit uplink ports for connection to the wired network. Its sixteen IAPs (radios) provide a maximum wireless capacity of 7.2 Gbps, which offers ample reserves for the high demands of current and future applications. Of the sixteen IAPs, fifteen operate as radios which may be set up to serve your choice of client types—any or all of 802.11a/b/g/n (5 GHz or 2.4 GHz bands), providing backwards compatibility with 802.11b and 802.11g.

In the recommended configuration, one IAP is configured in RF monitoring and intrusion detection/prevention mode.

Extended Coverage

One XR-7630 solution enables you to replace fifteen access points (including one omni-directional IAP for monitoring the network). Fifteen IAP radios with integrated directional antennas provide increased wireless range and enhanced

Wireless Access Point

data rates in all directions. With a Wireless AP deployed, far fewer access points are needed and wired-like resiliency is delivered throughout your wireless network. Your Wireless AP deployment ensures:

- Continuous connectivity if an IAP (radio) fails.
- Continuous connectivity if an AP fails.
- Continuous connectivity if a WDS link or switch fails.
- Continuous connectivity if a Gigabit uplink or switch fails.

Flexible Coverage Schemes

Figure 7. Coverage Schemes (XR-7230 shown)

- **802.11a/n**
Delivers 60° wireless coverage per IAP, with 6 dBi of gain.
- **802.11b/g/n**
Delivers 180° wireless coverage, with 3 dBi of gain.

- **802.11a/b/g/n (monitor only)**

Delivers 360° wireless coverage, with 2 dBi of gain.

Non-Overlapping Channels

Complete use of non-overlapping channels limits interference and delivers maximum capacity. On the XR-7630, up to 16 non-overlapping channels are fully utilized across the 5GHz and 2.4GHz spectrums.

SDMA Optimization

SDMA (Spatial Division Multiple Access) technology provides full 360° coverage while allowing independent channel and power output customization. Also supports fast inter-zone handoffs for time-sensitive applications and roaming.

Fast Roaming

Fast roaming utilizes the Xirrus Roaming Protocol ensuring fast and seamless roaming capabilities between IAPs or APs at both Layer 2 and Layer 3.

Ease of Deployment

Xirrus XMS simplifies and speeds deployment of the wireless network by automatically setting up each AP's license, software image, and initial configuration. When the AP is installed and has Internet connectivity, it contacts Xirrus, which performs these initialization tasks.

Powerful Management

The XMS offers real time monitoring and management capabilities for the wireless network.

Secure Wireless Access

Multiple layers of authentication and encryption ensure secure data transmissions. The Wireless AP is 802.11i compliant with line-rate encryption support for 40 and 128 bit WEP, WPA and WPA2 with TKIP and AES encryption. Authentication is provided via 802.1x, including PEAP, EAP-TLS, EAP-TTLS, EAP-SIM, EAP-GTC, EAP-AKA, EAP-AKA-Prime, and Lightweight Extensible Authentication Protocol (LEAP) passthrough. Intrusion detection and prevention provide proactive monitoring of the environment for threats.

Applications Enablement

The Wireless AP's Quality of Service (QoS) functionality combined with true switch capabilities enable high density video and Voice over Wireless LAN deployments. Compliant with 802.1p and 802.1Q standards.

[Why Choose the Xirrus Access Point?](#)

Advanced Feature Sets

The Wireless AP offers a family of powerful functionality packages, including the RF Performance Manager (RPM), RF Security Manager (RSM), RF Analysis Manager (RAM), and Application Control. These four packages are separately licensed for operation on your AP. RPM, RSM, and RAM are automatically included as part of all APs. Application Control is an optional feature.

Xirrus Advanced RF Performance Manager (RPM)

The Xirrus RPM optimizes the bandwidth usage and station performance of wireless networks. Leveraging the multiple integrated access point (multi-radio) design of the Xirrus Wireless AP, RPM manages the allocation of wireless bandwidth to wireless stations across multiple RF channels. The result maximizes overall network performance with superior flexibility and capacity.

Today's wireless infrastructure is faced with ever increasing numbers and variations of wireless enabled clients, whether in the form of notebooks, tablets, smart phones, IP phones, printers, projectors, cameras, RFID tags, etc. The advent of higher speed wireless and its increased use of the 5GHz spectrum adds to the number of variables today's wireless networks must accommodate. Backwards compatibility with older clients is crucial, however their operation in a wireless network can significantly hinder the performance of faster clients. As an example, 802.11b wireless stations communicate more than 10 times slower than 802.11n stations.

With each of the AP's multiple radios operating on a different channel, RPM selects the ideal radio for each station. High-speed stations are grouped together on radios with other high speed stations, while lower speed stations are combined with other lower speed stations. This ensures optimal performance for high-speed 802.11ac stations without compromise.

The complete feature set of the RPM package includes:

- Wireless Distribution System (WDS) for point-to-point communication
- Wireless Mode per IAP
- Sharp Cell technology
- Wireless Data Rate Optimization
- Wireless Traffic Shaping
- Wireless Voice Call Admission Control
- Fast Layer 2 and 3 Roaming
- Standby Mode

Xirrus Advanced RF Security Manager (RSM)

The Xirrus RSM improves security and minimizes the risk in deploying 802.11 wireless networks. Leveraging an integrated 24/7 threat sensor and hardware-based encryption/decryption in each AP, RSM secures the wireless network from multiple types of threats. The result delivers uncompromised overall network security with superior flexibility and performance.

Wireless networks face a number of potential security threats in the form of rogue access points, ad-hoc clients, unauthorized clients, wireless-based attacks, eavesdropping, etc. As "bring your own device" (BYOD) becomes ubiquitous in enterprise networks, defending against these threats becomes more critical. With the AP's threat sensor radio scanning all channels in the 2.4GHz and 5GHz spectrums, RSM searches for security threats and automatically mitigates them.

High performance encryption/decryption in the enterprise wireless network is a must. The wireless network needs to support each client using the highest level of encryption (WPA2 Enterprise/128 bit AES) and without degrading the overall performance of the network. Xirrus incorporates hardware-based encryption/

Wireless Access Point

decryption into each AP, delivering line-rate encryption at the edge of the network instead of at a choke point within a centralized controller.

The complete feature set of the RSM package includes:

- Wireless IDS/IPS (Intrusion Detection/Prevention System)
- Wireless stateful firewall
- User group policies
- Authenticated guest access gateway
- NAC integration

Xirrus Advanced RF Analysis Manager (RAM)

The RF Advanced Analysis Manager (RAM) tests and troubleshoots wireless networks. The deployment of 802.11ac presents a set of unique challenges based on technology differences with legacy 802.11a/b/g/n networks, both on the wireless infrastructure and client side. Xirrus RAM equips each Wireless AP with a powerful set of tools and features to optimally tune and verify an 802.11ac installation, as well as give IT administrators the ability to troubleshoot issues that may occur within the wireless environment.

802.11ac deployment will continue to evolve over the next several years with additional performance and optional functions, along with an ongoing stream of IEEE 802.11 amendments. This changing wireless landscape mandates that appropriate tools are available to the user to analyze, optimize, and troubleshoot their changing environments.

The distributed architecture of the AP enables the execution of powerful wireless and networking analysis at the edge of the network where packets traverse the wireless-to-wired boundary. The AP includes an embedded wireless controller with the necessary computing and memory resources to provide these functions securely at the network's edge.

The key elements of the RAM package include:

- RF Analysis – An embedded Spectrum Analyzer leverages the dedicated threat sensor radio in each Wireless AP to provide a continual view of utilization, interference, and errors across all available wireless channels.

- 
- Packet Analysis – Integrated packet capture provides filterable views of all traffic traversing on the wired and wireless interfaces of the AP.
 - Performance Analysis – Embedded traffic generation enables the throughput of the AP’s wireless or wired interfaces to be analyzed.
 - Failure Recovery – Radio Assurance provides an automatic self-test and self healing mechanism that ensures continuous system operation.
 - Netflow Support
 - Network Tools: ping, RADIUS ping, traceroute

Xirrus Application Control

The Application Control feature is available on APs to provide real-time visibility of application usage by users across the wireless network. Network usage has changed enormously in the last few years, with the increase in smart phone and tablet usage stressing networks.

The AP uses Deep Packet Inspection (DPI) to determine what applications are being used and by whom, and how much bandwidth they are consuming. These applications are rated by their degree of risk and productiveness. The results are presented to you both graphically and in tables. [Filters](#) can be used to implement per-application policies that keep network usage focused on productive uses, eliminating risky and non-business-oriented applications such as BitTorrent. You can increase the priority of mission-critical applications like VoIP and WebEx. See [“Application Control Windows” on page 150](#) for more information.

About this User's Guide

This User's Guide provides detailed information and procedures that will enable wireless network administrators to install, configure and manage the Wireless AP so that end users can take full advantage of the product's features and functionality without technical assistance.

Organization

Topics and procedures are organized by function under the following chapter headings:

- **Introduction**
Provides a brief introduction to wireless technology, an overview of the product, including its key features and benefits, and presents the product specifications.
- **Installing the Wireless AP**
Defines prerequisites for deploying and installing the AP and provides instructions to help you plan and complete a successful installation.
- **The Web Management Interface**
Offers an overview of the product's embedded Web Management Interface, including its content and structure. It emphasizes what you need to do to ensure that any configuration changes you make are applied, and provides a list of restricted characters. It also includes instructions for logging in to the AP with your Web browser.
- **Viewing Status on the Wireless AP**
Describes the status and statistics displays available on the AP using its embedded Web Management Interface.
- **Configuring the Wireless AP**
Contains procedures for configuring the AP using its embedded Web Management Interface.
- **Using Tools on the Wireless AP**
Contains procedures for using utility tools provided in the Web Management Interface. It includes procedures for upgrading the system

firmware, uploading and downloading configurations and other files, using diagnostic tools, and resetting the AP to its factory defaults.

- **The Command Line Interface**

Includes the commands and the command structure used by the Wireless AP's Command Line Interface (CLI), and provides a procedure for establishing a Telnet connection to the AP. This chapter also includes some sample key configuration tasks using the CLI.

- **Appendix A: Quick Reference Guide**

Contains the product's factory default settings.

- **Appendix B: FAQ and Special Topics**

Offers guidance to resolve technical issues, including general hints and tips to enhance your product experience, and a procedure for isolating problems within an AP-enabled wireless network. Also includes Frequently Asked Questions (FAQs) and Xirrus contact information.

- **Appendix D: Notices (XR-1000 to XR-6000 Indoor Models)**

Contains the legal notices and compliance statements for the AP. Please read this section carefully.

- **Appendix C: Notices (XD and XR500/600 Series Only)**

Contains the legal notices and compliance statements for the XD and XR500 Series Access Points. Please read this section carefully if you are using these models.

- **Appendix E: Medical Usage Notices**

Provides compliance information for Xirrus devices with respect to the requirements of IEC 60601-1-2.

- **Appendix F: Auditing PCI DSS**

Discusses using AP features to assist in meeting security standards for PCI DSS audits.

- **Appendix G: Implementing FIPS Security**

Discusses meeting FIPS security standards with Xirrus devices.

- **Glossary of Terms**

Provides an explanation of terms directly related to Xirrus product technology, organized alphabetically.

- **Index**

The index is a valuable information search tool. Use the index to locate specific topics discussed in this User's Guide. Simply click on any page number in the index to jump to the referenced topic.

Notes and Cautions

The following symbols are used throughout this User's Guide:

This symbol is used for general notes that provide useful supplemental information.

This symbol is used for cautions. Cautions provide critical information that may adversely affect the performance of the product.

Screen Images

Some screen images of the Web Management Interface have been modified for clarity. For example, an image may have been cropped to highlight a specific area of the screen, and/or sample data may be included in some fields.

Product Specifications

Please refer to the Xirrus web site for the latest specifications for these APs—www.xirrus.com.

Installing the Wireless AP

The instructions for planning and completing a successful installation include the following topics:

- [“Installation Prerequisites” on page 29.](#)
- [“Planning Your Installation” on page 32.](#)
- [“Installation Workflow” on page 67.](#)
- [“Installing Your Wireless AP” on page 69.](#)
- [“Powering Up the Wireless AP” on page 72.](#)
- [“Zero-Touch Provisioning and Ongoing Management” on page 75.](#)
- [“Performing the Express Setup Procedure” on page 80.](#)

Installation Prerequisites

Wireless AP deployment requires the presence of hardware and services in the host wired/wireless network, including:

- **Power Source**

Xirrus APs are powered via Xirrus-supplied Power over Ethernet. POE supplies power over the same Cat 5e or Cat 6 cable used for data, thus reducing cabling and installation effort. POE power injector modules are available in 1-, 2-, and 8-port configurations and are typically placed near your Gigabit Ethernet switch. An AC outlet is required for each injector module.

Some smaller APs are compatible with IEEE802.3af and/or IEEE802.3at, and may be connected to appropriate powered switches. For example, the Xirrus XT-5024 is a 24-port 802.3at PoE+ managed switch. See the Installation Guide for the AP for compatible injectors or powered switches.
- **Ethernet ports**

You need at least one 100/1000 BaseT port to establish wired Gigabit Ethernet connectivity. XR Series APs have different numbers of ports,

depending on the model (see “XR Wireless AP Product Family” on page 5).

! *The AP’s Ethernet ports should be connected to an Ethernet switch, not an Ethernet hub—if a hub is used, we recommend that you do not bond-pair Ethernet ports.*

- **Secure Shell (SSH) utility**

To establish secure remote command line access to the AP, you need a Secure Shell (SSH) utility, such as PuTTY. The utility **must** be configured to use SSH-2, since the AP will only allow SSH-2 connections.

- **Secure Web browser**

Xirrus supports the latest version of the following Browsers: Internet Explorer, Mozilla Firefox, Chrome, or Safari. A secure Web browser is required for Web-based management of the AP. The browser must be on the same subnet as the AP, or you must set a static route for management as described in the warning above.

- **Serial connection capability**

A serial port (console) is present on most XR-2000 models and all larger XR series models. The Xircon utility can be used in place of a console port—see the Xircon *User’s Guide*. To connect directly to the console port on the AP, your computer must be equipped with a male 9-pin serial port and terminal emulation software (for example, HyperTerminal). The Xirrus AP only supports serial cable lengths up to 25’ per the RS-232 specification.

Use the following settings when establishing a serial connection:

Bits per second	115,200
Data bits	8
Parity	None
Stop bits	1
Flow control	None

Optional Network Components

The following network components are optional.

- **Xirrus Management System (XMS)**
The optional XMS offers powerful management features for small or large Wireless AP deployments.

Client Requirements

The Wireless AP should only be used with Wi-Fi certified client devices.

[Planning Your Installation](#)

Planning Your Installation

This section provides guidelines and examples to help you plan your Xirrus Wireless AP deployment to achieve the best overall coverage and performance. We recommend you conduct a site survey to determine the best location and settings for each AP you install.

- [“General Deployment Considerations” on page 32](#)
- [“Coverage and Capacity Planning” on page 34](#)
- [“About IEEE 802.11ac” on page 42](#)
- [“Failover Planning” on page 52](#)
- [“Power Planning” on page 55](#)
- [“Security Planning” on page 56](#)
- [“Port Requirements” on page 58](#)
- [“Network Management Planning” on page 62](#)
- [“WDS Planning” on page 63](#)
- [“Common Deployment Options” on page 66](#)

General Deployment Considerations

For optimal placement of APs, we recommend that a site survey be performed by a qualified Xirrus partner.

The Array’s unique multi-radio architecture generates 360 degrees of sectored high-gain 802.11a/b/g/n/ac coverage that provides extended range. (Note that XR-500/600 Series radios are omni-directional rather than sectored.) The number, thickness and location of walls, ceilings or other objects that the wireless signals must pass through may affect the range. Typical ranges vary depending on the types of materials and background RF (radio frequency) noise at your location. To maximize wireless range, follow these basic guidelines:

1. Keep the number of walls and ceilings between the AP and your receiving devices to a minimum—each wall or ceiling can reduce the wireless range from between 3 and 90 feet (1 to 30 meters). Position your devices so that the number of walls or ceilings is minimized.

Wireless Access Point

2. Be aware of the direct line between each device. For example, a wall that is 1.5 feet thick (half a meter) at 90° is actually almost 3 feet thick (or 1 meter) when viewed at a 45° angle. At an acute 2° degree angle the same wall is over 42 feet (or 14 meters) thick. For best reception, try to ensure that your wireless devices are positioned so that signals will travel straight through a wall or ceiling.

Figure 8. Wall Thickness Considerations

3. Try to position wireless client devices so that the signal passes through drywall (between studs) or open doorways and not other materials that can adversely affect the wireless signal.

[Coverage and Capacity Planning](#)

[Common Deployment Options](#)

[Installation Prerequisites](#)

Coverage and Capacity Planning

This section considers coverage and capacity for your deployment(s), including placement options, RF patterns and cell sizes, area calculations, roaming considerations, and channel allocations.

XR-500/600 Series Integrated Access Points are omni-directional rather than directional (sectored), and discussions involving sectored radios are not applicable to these APs.

Placement

Use the following guidelines when considering placement options:

1. The best placement option for the AP is ceiling-mounted within an open plan environment (cubicles rather than fixed walls).
2. Keep the AP away from electrical devices or appliances that generate RF noise. Because the AP is generally mounted on ceilings, be aware of its position relative to lighting (especially fluorescent lighting)—we recommend maintaining a distance of at least 3 to 6 feet (1 to 2 meters).

Figure 9. Unit Placement

3. If using multiple APs in the same area, maintain a distance of at least 100ft/30m between APs if there is direct line-of-sight between units, or at least 50ft/15m if a wall or other barrier exists between units.

RF Patterns

The Wireless AP allows you to control—automatically or manually—the pattern of wireless coverage that best suits your deployment needs. You can choose to operate with full coverage, half coverage, or custom coverage (by enabling or disabling individual sectors).

Full (Normal) Coverage

In normal operation, the AP provides a full 360 degrees of coverage.

Figure 10. Full (Normal) Coverage

Half Coverage

Figure 11. Adjusting RF Patterns

If installing a unit close to an exterior wall, you can deactivate half of the radios to prevent redundant signals from “bleeding” beyond the wall and extending service into public areas. The same principle applies if you want to restrict service to an adjacent room within the site.

Custom Coverage

Where there are highly reflective objects in proximity to the AP, you can turn off specific radios to avoid interference and feedback.

Figure 12. Custom Coverage

Capacity and Cell Sizes

Cell sizes should be estimated based on the number of users, the applications being used (for example, data/video/voice), and the number of APs available at the location. The capacity of a cell is defined as the minimum data rate desired for each sector multiplied by the total number of sectors being used.

Figure 13. Connection Rate vs. Distance

Figure 13 shows relative connection rates for 802.11n vs. 802.11a/g and 802.11b, and the effect of distance on the connection rates. 802.11ac rates behave like 802.11n over distance—see Figure 23 for 802.11ac data rates). Wireless environments can vary greatly so the actual rates may be different depending on the specific network deployment.

Fine Tuning Cell Sizes

Adjusting the [transmit power](#) allows you to fine tune cell sizes. There are four standard sizes—Small, Medium, Large, or Max (the default is **Max**). There is also an Auto setting that automatically determines the best cell size, and a Manual setting that allows you to choose your power settings directly.

Figure 14. Transmit Power

Auto Cell Size is an automatic, self-tuning mechanism that balances cell size between APs to guarantee coverage while limiting the RF energy that could extend beyond the organizational boundary. Auto Cell uses communication between APs to dynamically set radio power so that complete coverage is provided to all areas, yet at the minimum power level required. This helps to minimize potential interference with neighboring networks. Additionally, APs running Auto Cell automatically detect and compensate for coverage gaps caused by system interruptions. To enable the Auto Cell Size feature, go to [“RF Power and Sensitivity”](#) on page 361.

There are two ways of performing Auto Cell Size—by band (Multichannel Auto Cell) or by channel (this is the default version). Auto Cell by channel adjusts the size of two or more neighboring AP radios that are on the same channel ([Figure 15 A and B](#)). Multichannel Auto Cell adjusts cell sizes of neighboring radios on the same band (2.4GHz or 5GHz) even if they are on different channels. A potential application of Autocell by Band is depicted in [Figure 15 B and C](#). In this example,

cell sizes are to be adjusted so that they are contained in each room. The goal is for stations to associate to the AP located in the same room with them.

Figure 15. Auto Cell Size Options

Multichannel Auto Cell is configured by turning off **Auto Cell by Channel** in “[Procedure for Configuring Global 802.11an IAP Settings](#)” on page 335 for the 5GHz band, and in “[Procedure for Configuring Global 802.11b/g IAP Settings](#)” on page 342 for the 2.4GHz band. Note that Multichannel Auto Cell is run separately for each band. Thus, to optimize cell size of both 2.4G and 5G, the Auto Cell function should be run once for each of these pages. APs **must** be at least 15 feet apart for Auto Cell to work properly.

If you are installing many units in proximity to each other, we recommend that you use Auto Cell Size; otherwise, reduce the transmit power using manual settings to avoid excessive interference with other APs or installed APs. See also, “[Coverage and Capacity Planning](#)” on page 34.

Sharp Cell

This patented Xirrus RF management option automatically creates more intelligently defined cells and improves performance by creating smaller, high-throughput cells. By dynamically limiting each cell to a defined boundary (cell size), the trailing edge bleed of RF energy is reduced, thus minimizing interference between neighboring Wireless APs or other Access Points. To enable the Sharp Cell feature, go to “[RF Power and Sensitivity](#)” on page 361.

Roaming Considerations

Cells should overlap approximately 10 - 15% to accommodate client roaming.

Figure 16. Overlapping Cells

Allocating Channels

Because the Wireless AP is a multi-channel device, allocating the best channels to radios is important if peak performance is to be maintained.

*Note that Auto Channel normally assigns individual channels. However, if you select **Auto bond 5GHz channels** on the **Global Settings .11n** page, and have 40MHz channels set up prior to running Auto Channel, those bonds will be preserved. 80MHz bonds will not be preserved.*

Automatic Channel Selection

In the automatic mode, channels are allocated dynamically, driven by changes in the environment. Auto Channel assignment is performed by scanning the surrounding area for RF activity on all channels, then automatically selecting and setting channels on the AP to the best channels available. This function is typically executed when initially installing APs in a new location and may optionally be configured to execute periodically to account for changes in the RF environment over time. Auto Channel selection has significant advantages, including:

- Allows the AP to come up for the first time and not interfere with existing equipment that may be already running, thereby limiting co-channel interference.
- More accurately tunes the RF characteristics of a wireless installation than manual configuration since the radios themselves are scanning the environment from their physical location.
- May be configured to run periodically.

To set up the automatic channel selection feature, go to “[Advanced RF Settings](#)” on page 358.

Manual Channel Selection

You can manually assign channels on a per radio basis, though manual selection is not recommended (and not necessary).

To avoid co-channel interference, do not select adjacent channels for radios that are physically next to each other.

Figure 17. Allocating Channels Manually

Other Factors Affecting Throughput

Throughput of the AP can be affected by many factors such as distance, number of stations, obstacles, construction materials used at the site, etc. In addition, features applied to traffic may have an effect. Performance may decrease as you add increasing numbers of SSIDs, VLANs, and features such as [Application Control](#), encryption, management via XMS-Cloud, etc. XR-500/1000 Series models are more prone to performance degradation since they have less memory than other models.

[Installation Prerequisites](#)

About IEEE 802.11ac

802.11ac is a continuation of the IEEE 802.11 standard. It multiplies the maximum data rate—eventually, up to ten times the 802.11n maximum. Along with increased data rates, it offers simultaneous transmission to multiple clients.

802.11ac will be rolled out in two phases. Wave 1 products currently available support 80MHz channels and up to 3 data streams for a maximum data rate of 1.3 Gbps. Wave 2 and future products will add 160MHz channels and up to 8 streams, for a maximum data rate of 6.93Gbps.

Xirrus currently supports up to three streams (in units with 3x3 radios) and 80 MHz channels. Xirrus models that offer 802.11ac support this technology on all IAPs, not just on one. IAPs are individually configurable to different modes or groups of modes (such as 802.11a, 11b, 11g, and 11n). Xirrus optimizes 802.11ac performance with ACEXpress™, an innovation that intelligently separates fast and slow devices on separate IAPs to maximize system performance.

The major advantages of 802.11ac are:

- Faster speeds than 802.11n over the same coverage area, operating at up to 1.3 Gbps in Wave 1 implementations. While the maximum distance that a Wi-Fi signal can reach is unchanged with 802.11ac, multiple antennas increase the data rate at every distance.
- Operates only in the less congested 5 GHz spectrum, which offers “cleaner” air and supports much greater capacity than the 2.4 GHz spectrum still used by 802.11n.
- Supports simultaneous communications to multiple clients on a single channel with multi-user MIMO in future Wave 2 products.
- Extends the techniques pioneered in 802.11n: more antennas, more spatial streams and wider channels to improve throughput.

The techniques that 802.11ac uses to realize these performance improvements and the expected results are discussed in:

- [“Up to Eight Simultaneous Data Streams—Spatial Multiplexing” on page 44](#)
- [“MIMO \(Multiple-In Multiple-Out\)” on page 44](#)

- [“MU-MIMO \(Multi-User Multiple-In Multiple-Out\)” on page 45](#)
- [“Higher Precision in the Physical Layer” on page 47](#)
- [“80 MHz and 160 MHz Channel Widths \(Bonding\)” on page 48](#)
- [“802.11ac Data Rates” on page 49](#)
- [“ACExpress™” on page 50](#)

It is important to consider [80 MHz and 160 MHz Channel Widths \(Bonding\)](#) when planning your deployment, since it contributes greatly to 802.11ac’s speed improvements and because it is configured separately for each IAP. Your selection of channel width in [IAP Settings](#)—40 MHz or 80 MHz or 20 MHz (if bonding is turned off)—has a major effect on your channel planning. A global setting is provided to enable or disable 802.11ac mode. See [“Global Settings .11ac” on page 350](#) to configure operation.

There are other factors to keep in mind when planning a roll-out of 802.11ac. Please see [“802.11ac Deployment Considerations” on page 50](#).

Up to Eight Simultaneous Data Streams—Spatial Multiplexing

Spatial Multiplexing transmits completely separate data streams on different antennas (in the same channel) that are recombined to produce new 802.11ac data rates. Previously used for 802.11n, the maximum number of streams for 802.11ac has been increased to eight. Higher data rates are achieved by splitting the original data stream into separate data streams. Each separate stream is transmitted on a different antenna (using its own RF chain). MIMO signal processing at the receiver can detect and recover each stream. Streams are then recombined, yielding higher data rates.

Figure 18. Spatial Multiplexing

The data rate increases directly with the number of transmit antennas used. Note that mobile devices in the near future will support up to three or four streams at most, with many supporting less.

MIMO (Multiple-In Multiple-Out)

MIMO (Multiple-In Multiple-Out) signal processing is one of the core technologies of 802.11n and 802.11ac. It mitigates interference and maintains broadband performance even with weak signals.

Prior to 802.11n, a data stream was transmitted via one antenna. At the receiving end, the antenna with the best signal was selected to receive data. MIMO signal processing uses multiple antennas to send and receive data. It takes advantage of multipath reflections to improve signal coherence and greatly increase receiver sensitivity (Figure 19). Multipath signals were considered to be interference by

802.11a/b/g radios, and degraded performance. In 802.11n and 802.11ac, these signals are used to enhance performance.

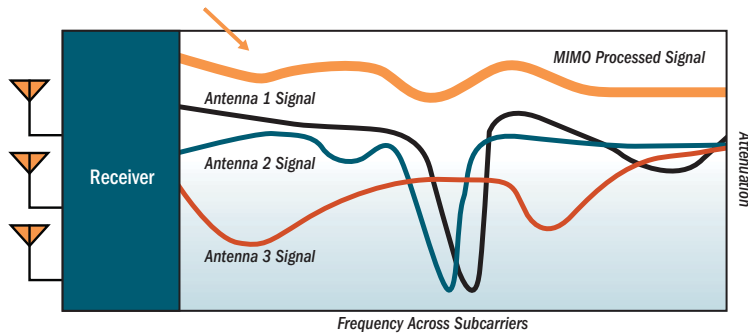

Figure 19. MIMO Signal Processing

802.11ac increases the number of antennas and spatial streams from a maximum of four in 802.11n to a maximum of eight, contributing to much higher maximum data rates (up to 6.93Gbit/s). The spatial streams can be concurrently allocated to more than one receiving device when the AP operates in multi-user MIMO mode (MU-MIMO, see the next section).

MU-MIMO (Multi-User Multiple-In Multiple-Out)

MU-MIMO (multi-user multiple-in/multiple-out) signal processing uses multiple antennas on the transmitter and receiver operating on the same channel. With spatial multiplexing in 802.11ac, up to 8 data streams may be concurrently transmitted. MU-MIMO’s innovation allows the streams to be split between multiple devices at once.

With 802.11n, whenever the IAP transmitted data, all of the traffic at any instant of time was directed to a single client. As a consequence, if a set of devices included a mix of fast and slow client clients, the fast traffic was often substantially delayed by the transmission to slower clients. 802.11ac MU-MIMO works by directing some of the spatial streams to one client and other spatial streams to other clients, up to four at a time

For example, in the figure below, the transmitter has four antennas. Three are transmitting to an 802.11ac laptop that has three antennas, while the remaining

one is directed to a mobile phone. When a transmission is complete, the antennas are reallocated.

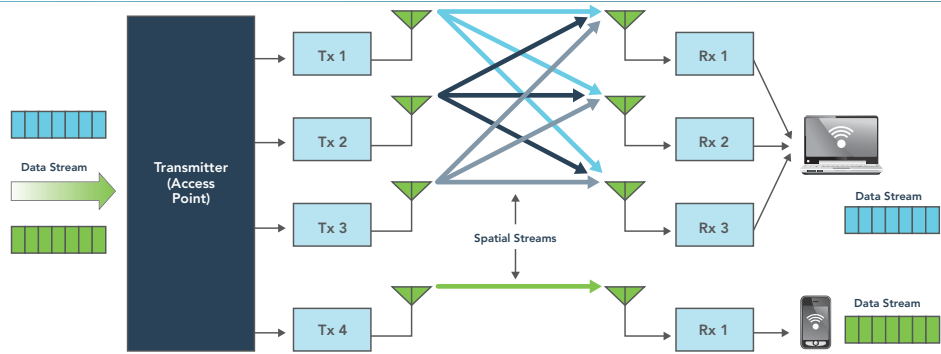

Figure 20. MU-MIMO with Four Antennas

The table below illustrates how data streams might be allocated to multiple users on an 802.11ac transmitter with multiple antennas.

# of AP Antennas	Possible Combinations of Receiver Antennas
2	1 station w/ 2 antennas -or- 2 stations w/ 1 antenna
3	1 station w/ 3 antennas -or- 1 station w/ 2 antennas + 1 station w/ 1 antenna -or- 3 stations w/ 1 antenna
4	1 station w/4 antennas -or- 2 stations w/2 antennas -or- 1 station w/2 antennas + 2 stations w/1 antenna -or- 4 stations w/ 1 antenna
8	1 station w/ 8 antennas -or- 2 stations w/ 4 antennas -or- 1 station w/ 4 antennas + 2 stations w/ 2 antennas -or- 2 stations w/ 2 antennas + 4 stations w/1 antenna -or- ... many other combinations ...

Higher Precision in the Physical Layer

Wi-Fi utilizes several digital modulation techniques and automatically switches between them to optimize for throughput or range. The basic unit of data transmitted is called a symbol. The number of points in the modulation constellation determines the number of bits of data conveyed with each symbol.

Figure 21. Physical Layer Data Encoding

802.11n uses 16 Quadrature Amplitude Modulation (QAM), which conveys $\log_2(16) = 4$ bits per symbol and 64 QAM, which conveys 6 bits per symbol. 802.11ac adds 256 QAM which conveys 8 bits per symbol for a 33% increase in throughput vs. the highest 802.11n data rate.

You may select the highest Modulation and Coding Scheme (MCS) level allowed with **1, 2, or 3 Spatial Streams** (see the **Max MCS** setting in [“Procedure for Configuring Global 802.11ac IAP Settings”](#) on page 351). You may limit the highest level of modulation to 64-QAM, or allow 256-QAM. It also determines the coding scheme used for error correction. Higher MCS levels allocate fewer bits to error correction, and thus more bits are used for data. The default value is **MCS9**, the highest level.

The higher the MCS value, the higher the data rate, as shown in the table below. Xirrus APs support MCS7 -MCS9. Higher MCS levels require higher signal-to-noise ratios (i.e., a less noisy environment) and shorter transmission distances.

MCS index value	Modulation	Code rate (R)
0	BPSK	1/2
1	QPSK	1/2
2	QPSK	3/4
3	16-QAM	1/2
4	16-QAM	3/4
5	64-QAM	2/3
6	64-QAM	3/4
7	64-QAM	5/6
8	256-QAM	3/4
9	256-QAM	5/6

80 MHz and 160 MHz Channel Widths (Bonding)

Channel bonding increases data rates by combining two, four, or eight adjacent 20 MHz channels into one channel. This increases the data rate proportional to the width of the bond.

Bonding is specified on the [IAP Settings](#) page for each IAP in terms of the primary channel and the width of the bond. Be aware that Channel Bonding impacts channel planning, since you are using multiple channels per IAP.

802.11ac allows creation of 20, 40, 80, or 160 MHz wide channels. The 160MHz channel can also be a combination of two non-contiguous 80MHz channels (80+80). Although channel bonding increases bandwidth, wider channels are more susceptible to signal interference which may lead to reduced range and poorer signal quality. [Figure 22](#) is an example showing how Channels 36-64 may

Wireless Access Point

be used: as eight 20 MHz channels; four 40 MHz channels; two 80 MHz channels; or one 160 MHz channel. Xirrus currently supports channels up to 80 MHz wide.

Figure 22. Channel Bonding (Channels 36-64 shown)

802.11ac Data Rates

Maximum Data Rate	# Transmit Antennas	Bandwidth (MHz)	# Streams	Modulation	
293Mbps	1	40	1	64QAM	Phase 1
433Mbps	1	80	1	256QAM	
867Mbps	2	80	2	256QAM	
1.299Gbps	3	80	3	256QAM	
1.730Gbps	4	80	4	256QAM	Phase 2+
3.470Gbps	8	80	8	256QAM	
867Mbps	1	160	1	256QAM	
1.730Gbps	2	160	2	256QAM	
3.470Gbps	8	160	4	256QAM	
6.930Gbps	8	160	8	256QAM	

Figure 23. Maximum 802.11ac Data Rates

IEEE 802.11ac data rates are dependent on the number of spatial streams obtained through the use of MU-MIMO, 80 vs. 160MHz channel widths, the number of transmit antennas, and the type of modulation. [Figure 23](#) shows the maximum data rate achievable at each level, with many additional lower rates occurring at each level dependent on signal level, signal to noise ratio in the environment, etc.

Phase 1 802.11ac, first available in consumer products in 2012 and enterprise products in 2013, supports up to 80MHz channels and up to 3 spatial streams for a maximum data rate of 1.3Gbps.

Phase 2 and beyond products, expected starting in 2014, will add 160MHz channels and up to 8 spatial streams for a maximum data rate of 6.9Gbps.

ACExpress™

Xirrus 802.11ac IAPs use ACExpress™ to optimize wireless performance by automatically separating faster 802.11ac clients from slower Wi-Fi clients. Since Wi-Fi is a shared medium, this separation ensures that slower 802.11a/b/g/n clients do not starve the performance of 802.11ac clients. For example, the data rate of an 802.11n client is less than 25% of the rate of an 802.11ac client, and thus will take four times as much air time for a given amount of data. This takes available bandwidth away from faster clients, reducing their performance significantly. ACExpress intelligently separates clients by type onto different radios, grouping fast clients separately from slow clients, thereby maximizing performance for all. ACExpress is supported on all Xirrus 802.11ac products, and may be enabled or disabled as part of the Load Balancing feature. See [Step 26 on page 331](#).

802.11ac Deployment Considerations

The theoretical data rates shown are just that, theoretical. For 802.11ac deployments, numerous factors affect real-world performance. These are some important considerations in the deployment of networks that include 802.11ac:

- **Wireless networks are not wired networks.** Wired network users who share a Gigabit network can expect to see bursts of up to 900Mbps, depending on their hardware. Maximum Wi-Fi data rates are reduced by signaling overhead and media contention. Most 802.11ac users will see

data rates less than 100Mbps as the effective bandwidth is shared among all devices connecting to a given radio.

- **Migration to 802.11ac will take time.** Older Wi-Fi technologies will continue to be with us for years. In order for 802.11ac to provide maximum data rates, it is important to keep interference from earlier Wi-Fi standards at a minimum. For example, 802.11n devices operating in the 5GHz band can slow down 802.11ac devices to 300Mbps or 450Mbps depending on the 2x2 or 3x3 MIMO technology used.
- **Infrastructures must be upgraded as well.** The bandwidth required out of 802.11ac APs will certainly exceed 1Gbps and may reach 10Gbps. The links from the APs to the core network must keep pace with this need. Centralized firewalls, LAN controllers, and authentication servers may also reach their limits. Migration to a decentralized architecture, with intelligence at the edge of the network may be a more scalable solution, avoiding single points of failure.
- **More power.** Multi-antenna APs handling 802.11ac speeds will likely require more power. Power planning for your access switches should be carefully considered.
- **A new site survey may be needed.** Wireless networks established as recently as a few years ago were probably designed for coverage and not capacity. APs were placed so that there were no dead zones, without considering future capacity needs. With the increasing use of mobile devices, new site surveys that ensure enough bandwidth for anticipated usage should precede deployment of 802.11ac APs.
- **Manage application usage.** With 802.11ac, a range of applications are now practical on mobile devices that were previously only used over wired networks or on laptops. Uncontrolled use of Wi-Fi bandwidth can cause wireless networks to quickly degrade. Network control elements must control use of applications and prioritize critical applications.
- **Upgrading with 802.11ac radio modules.** Xirrus offers modular APs that enable you to evolve the capacity of your Arrays as your needs grow.

XI Series 802.11ac Wireless Access Points (APs) are offered in two models: 867 Mbps (2X2 MIMO) or 1300 Mbps (3X3 MIMO).

When you add IAPs to an AP or replace 802.11n IAPs with 802.11ac modules, the Access Point determines its model number based on the count and types of radios. For example, if you add four 1300 Mbps (3X3 MIMO) IAPs to an XR-4420, the AP will display its model number as XR-4836 because it now has eight 3x3 IAPs including 802.11ac radios.

Xirrus highly recommends that the upgraded Array have a radio count that matches one of our standard Arrays (e.g., XR-4000 with 4 or 8 radios, XR-2000 with 2 or 4). The Array may have more of one type of radio than another. For example, an upgraded XR-4830 may have six 802.11n radios and two 802.11ac radios, or vice versa.

Failover Planning

This section discusses failover protection at the unit and port levels. To ensure that service is continued in the event of a port failure, you can utilize two Gigabit Ethernet ports simultaneously as a bonded pair (on APs with two or more Gigabit ports).

Figure 24. Port Failover Protection

Wireless Access Point

In addition, the AP has full failover protection between the bonded-pair Gigabit ports (see following table).

Interface	Bridges Data?	Bridges Management Traffic?	Fails Over To:	IP address
Gigabit port	Yes	Yes	Bonded port	DHCP or static
Bonded Gigabit port	Yes	Yes	Bonded port	Same

The Wireless AP Gigabit Ethernet ports actually support a number of modes:

- 802.3ad Link Aggregation
- Load Balancing
- Broadcast
- Link Backup
- Mirrored

For more details on Gigabit port modes and their configuration, please see [“Bonds and Bridging”](#) on page 173.

Switch Failover Protection

To ensure that service is continued in the event of a switch failure, you can connect APs having multiple Gigabit ports to more than one Ethernet switch (not a hub).

Figure 25. Switch Failover Protection

Gigabit Ethernet connections must be on the same subnet.

Power Planning

All AP models support Power over Ethernet (POE) with an integrated splitter.

Power over Ethernet

To deliver power to the AP, you must use Xirrus-supplied Power over Ethernet (POE) modules or powered switches that are compatible with your AP. They provide power over Cat 5e or Cat 6 cables to the AP without running power cables—see [Figure 4 on page 16](#).

Specific models of the AP are compatible with specific PoGE modules. For details, please see the *Power over Gigabit Ethernet Installation and User Guide*.

When using Cat 5e or Cat 6 cable, power can be provided up to a distance of 100m.

Certain models (XR-500/600 Series and some XR-2000 models) also accept IEEE802.3af and/or IEEE802.3at powered switch ports.

Security Planning

This section offers some useful guidelines for defining your preferred encryption and authentication method. For additional information, see [“Understanding Security” on page 226](#) and the [Security](#) section of [“Frequently Asked Questions” on page 522](#).

Wireless Encryption

Encryption ensures that no user can decipher another user’s data transmitted over the airwaves. There are three encryption options available to you, including:

- **WEP-40bit or WEP-128bit**
Because WEP is vulnerable to cracks, we recommend that you only use this for legacy devices that cannot support a stronger encryption type.
- **Wi-Fi Protected Access (WPA)**
This is much more secure than WEP and uses TKIP for encryption.
- **Wi-Fi Protected Access (WPA2) with AES**
This is government-grade encryption—available on most new client adapters—and uses the AES-CCM encryption mode (Advanced Encryption Standard-Counter Mode).

Authentication

Authentication ensures users are who they say they are. Users are authenticated when they attempt to connect to the wireless network and periodically thereafter. The following authentication methods are available with the Wireless AP:

- **RADIUS 802.1x**
802.1x uses a remote RADIUS server to authenticate large numbers of clients, and can handle different authentication methods (EAP-TLS, EAP-TTLS, EAP-PEAP, and EAP-LEAP Passthrough). Administrators may also be authenticated via RADIUS when preferred, or to meet particular security standards.
- **Xirrus Internal RADIUS server**
Recommended for smaller numbers of users (about 100 or less). Supports EAP-PEAP only

- **Pre-Shared Key**
Uses a pass-phrase or key that is manually distributed to all authorized users. The same passphrase is given to client devices and entered into each AP.
- **MAC Access Control Lists (ACLs)**
MAC access control lists provide a list of client adapter MAC addresses that are allowed or denied access to the wireless network, and can be used in addition to any of the above authentication methods. ACLs are good for embedded devices, like printers and bar-code scanners (though MAC addresses can be spoofed). The AP supports 1,000 global ACL entries. You may also define per-SSID access control lists, with up to 1000 entries each.

Meeting PCI DSS Standards

The Payment Card Industry (PCI) Data Security Standard (DSS) was developed by major credit card companies. It lays out a set of requirements that must be met in order to provide adequate security for sensitive data. The AP may be configured to assist in satisfying PCI DSS standards. For details, please see [“Auditing PCI DSS” on page 585](#). Note that the license installed on the AP must include the Advanced RF Security Manager (RSM) to support the PCI audit command.

Meeting FIPS Standards

The Federal Information Processing Standard (FIPS) Publication 140-2 establishes a computer security standard used to accredit cryptographic modules. The standard is a joint effort by the U.S. and Canadian governments. To implement Level 2 security requirements of FIPS Level 2 on the Wi-Fi AP, see [“Implementing FIPS Security” on page 591](#).

Port Requirements

A number of ports are used by various AP features and by the Xirrus Management System (XMS). The [Port Requirements table on page 59](#) lists ports and the features that require them (XMS port requirements are included in the table for your convenience). If you are using a feature, please make sure that the ports that it requires are not blocked by firewalls or other policies, and that they do not conflict with any other port assignments.

As an example, XMS port requirements are illustrated in [Figure 26](#). XMS requires ports 161, 162, and 443 to be passed between APs and the XMS server. Similarly, port 9443 is required for communication between the XMS server and XMS clients, and port 25 is typically used by the XMS server to access an SMTP server to send email notifications.

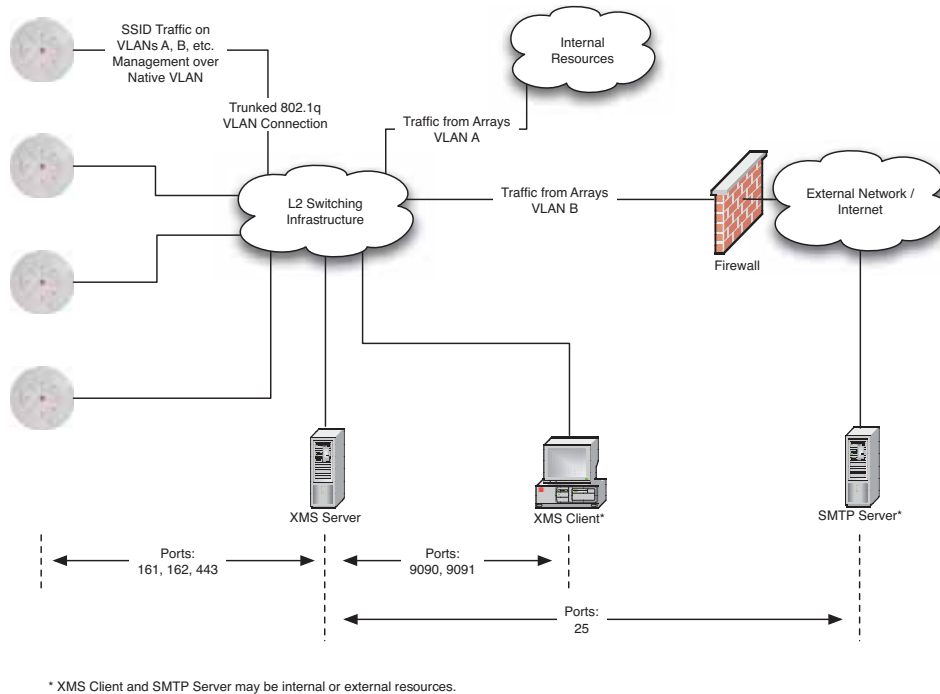

Figure 26. Port Requirements for XMS

Wireless Access Point

The following table lists port requirements for the AP and for XMS, how the ports are used, and whether they may be changed.

Port	Application	Peer	Configurable
AP			
icmp	Ping	XMS Server	No
20 tcp 21 tcp	FTP	Client	Yes
22 tcp	SSH	Client	Yes
23 tcp	Telnet	Client	Yes
25 tcp	SMTP	Mail Server	No
69 udp	TFTP	TFTP Server	No
123 udp	NTP	NTP Server	No
161 udp	SNMP	XMS Server	No
162 udp	SNMP Traphost Note - Up to four Traphosts may be configured.	XMS Server	Yes - but required by XMS
443 tcp	HTTPS (WMI,WPR)	Client	Yes
514 udp	Syslog	Syslog Server	No
1812, 1645 udp	RADIUS (some servers use 1645)	RADIUS Server	Yes
1813, 1646 udp	RADIUS Accounting (some servers still use 1646)	RADIUS Accounting Server	Yes
2055 udp	Netflow	Client	Yes
5000 tcp	Virtual Tunnel	VTUN Server	Yes
22610 udp	Xirrus Roaming	APs	Yes
22612 udp	Xircon (Console Utility)	Admin Workstation	Yes

Port	Application	Peer	Configurable
XMS			
icmp	Ping	APs	No
22 tcp	SSH	APs	Yes
25 tcp	SMTP	Mail Server	Yes
123 udp	NTP	NTP Server	No
161 udp	SNMP	APs	No
162 udp	SNMP Traphost 1	APs	Via XMS config file
443 tcp	HTTPS	APs	No
514 udp	Resident Syslog server	Internal*	Via XMS config file
1099 tcp	RMI Registry	Internal*	No
2000 tcp	XMS Back-end Server	Internal*	No
3306 tcp	MySQL Database	Internal*	No
8001 tcp	Status Viewer	Internal*	No
8007 tcp	Tomcat Shutdown	Internal*	During installation
8009 tcp	Web Container	Internal*	During installation
9090 tcp	XMS Webserver	XMS client	During installation
9091 tcp	XMS Client Server	XMS client	Via XMS config file
9092 tcp	XMS Client Server	XMS client	Via XMS config file
9443 tcp	XMS WMI SSL	XMS web client	Yes
* Internal to XMS Server, no ports need to be unblocked on other network devices

VLAN Management

Network Management Planning

Network management can be performed using any of the following methods:

- Centralized Web-based management, using the optional Xirrus Management System (XMS). XMS-Cloud provides zero-touch provisioning and ongoing management. XMS is hosted on a dedicated Xirrus appliance or your own server. XMS manages large Wireless AP deployments from a centralized Web-based interface and offers the following features:
 - ◆ Globally manage large numbers of APs
 - ◆ Seamless view of the entire wireless network
 - ◆ Easily configure large numbers of APs
 - ◆ Rogue AP monitoring
 - ◆ Easily manage system-wide firmware updates
 - ◆ Monitor performance and trends
 - ◆ Aggregation of alerts and alarms
- The AP's Command Line Interface, using an SSH (Secure Shell) utility, like PuTTY. The utility **must** be set up to use SSH-2, since the AP will only allow SSH-2 connections.
- Web-based management, using the AP's embedded Web Management Interface (WMI). This method provides configuration and basic monitoring tools, and is good for small deployments (one or two units).

WDS Planning

WDS (Wireless Distribution System) creates wireless backhaul connections between APs, allowing your wireless network to be expanded using multiple APs without the need for a wired backbone to link them (see [Figure 27](#)). WDS features include:

- One to three IAPs may be used to form a single WDS link, yielding up to 1350 Mbps bandwidth per link. Up to three different WDS links may be created on a single AP.
- Automatic IAP load balancing
- If desired, you may allow clients to associate to a BSS on the same radio interface used for a WDS Host Link. This will take bandwidth from the WDS link.

Figure 27. WDS Link

- Multiple links per AP allow you to configure multi-hop connections.

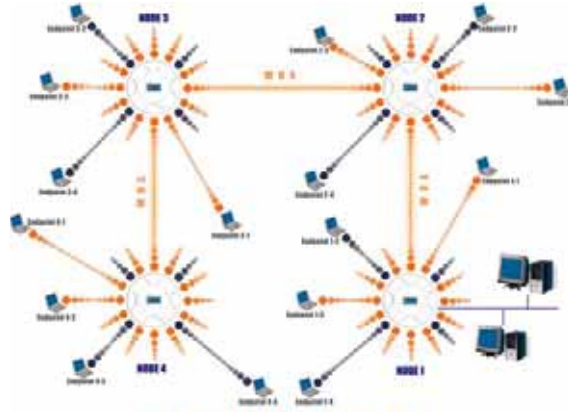

Figure 28. A Multiple Hop WDS Connection

- Multiple WDS links can provide link redundancy (failover capability - see [Figure 29](#)). A network protocol (Spanning Tree Protocol—STP) prevents APs from forming network loops.

Figure 29. WDS Failover Protection

Wireless Access Point

WDS links have a Host/Client relationship similar to the usual IAP/station pattern for APs:

- A *WDS Client Link* associates/authenticates to a host (target) AP in the same way that stations associate to IAPs. The client side of the link must be configured with the root MAC address of the target (host) AP.
- A *WDS Host Link* acts like an IAP by allowing one WDS Client Link to associate to it. An AP may have both client and host links.

WDS configuration is performed only on the client-side AP. See “WDS” on [page 385](#). Note that both APs must be configured with the same SSID name.

Common Deployment Options

The following table lists some typical and recommended deployment options for a number of the features that have been discussed in this chapter.

Function	Number of Wireless APs	
	One or Two	Three or More
Power	Power over Ethernet	Power over Ethernet UPS backup (recommended)
Failover	Recommended	Highly recommended
VLANs	Optional	Optional use, Can be used to put all APs on one VLAN or map to existing VLAN scheme
Encryption	WPA2 with AES (recommended) PSK or 802.1x	WPA2 with AES (recommended) 802.1x keying
Authentication	Internal RADIUS server EAP-PEAP Pre-Shared Key	External RADIUS server
Management	Cloud XMS or Internal WMI Internal CLI (via SSHv2)	Cloud XMS or XMS (Enterprise-hosted)

Wireless Access Point Product Overview
Security Planning

Installing Your Wireless AP

This section provides information about the physical installation of your Xirrus Wireless AP. For complete instructions, please see the Installation Guide for your model of AP or Access Point.

Choosing a Location

Based on coverage, capacity and deployment examples previously discussed, choose a location for the AP that will provide the best results for your needs. The Wireless AP was designed to be mounted on a ceiling where the unit is unobtrusive and wireless transmissions can travel unimpeded throughout open plan areas.

Choose a location that is central to your users (see the following diagram for correct placement).

Figure 31. AP Placement

Wiring Considerations

Before using the Xirrus-supplied POE to distribute power, see [“Power over Ethernet \(POE\)”](#) on page 16.

Once you have determined the best location for your Wireless AP, you must run cables to the location for the following services:

Power

No separate power cable is required to the AP—Xirrus wireless APs use POE (Power over Ethernet). See the Installation Guide for your AP model for compatible power injectors or switches.

The total of all Cat 5e or Cat 6 cable segments from the Gigabit Ethernet switch to the power injector and then to an AP POE port must be less than 100m long. The AP must be connected to POE networks without routing cabling to the outside plant, to ensure that cabling is not exposed to lightning strikes or possible high voltage crossover.

Network

APs have at least one POE port to supply power and data over the same cable. Many models have additional Gigabit ports, or even additional POE ports. Please see the Installation Guide for your AP model for detailed information about running cables to the AP and connecting it.

Some models also have a serial (console) port. The Serial cable may be up to 25 feet long per the RS-232 specification.

When the unit's IP address is unknown or a network connection has not been established, the serial cable is used for connecting directly with the Command Line Interface (CLI) via HyperTerminal. When a network connection is established, the AP can be managed from any of the available network connections, either Gigabit 1 or Gigabit 2.

For models with no console port, such as the XR-500, XR-1000, and some XR-2000 models, the Xircon utility may be used locally to set up an IP address if necessary.

Important Note About Network Connections

! *The AP's Ethernet ports should be plugged into an Ethernet switch, not an Ethernet hub—if a hub is used, we recommend that you connect only one Ethernet port.*

[Mounting and Connecting the AP](#)

[Power over Ethernet \(POE\)](#)

Mounting and Connecting the AP

A detailed Installation Guide is available at support.xirrus.com that describes mounting your AP. Please follow the provided instructions carefully. Data and power connections to the AP are also detailed in the Installation Guide. Please follow the cabling and connection instructions carefully.

Dismounting the AP

For all AP models, push up on the AP (i.e., push it against the mounting plate). Then turn the AP to the left to remove it. This is similar to dismounting a smoke detector.

Powering Up the Wireless AP

When powering up, the AP follows a specific sequence of LED patterns showing the boot progress, and following a successful boot will provide extensive status information.

Ethernet Activity,
Status, and
Radio LEDs

Figure 32. LED Locations

AP LED settings may be altered or disabled entirely for diagnostic purposes or for personal preference. Changes are made via the AP's Command Line Interface or the Web Management Interface—refer to “LED Settings” on page 380.

AP LED Operating Sequences

Use the following tables to review the operating sequences of the AP's LEDs.

- [“LED Boot Sequence” on page 73](#)
- [“LED Operation when AP is Running” on page 74](#)

LED Boot Sequence

The normal boot LED sequence is as follows:

AP Activity	Status LED	IAP LEDs
Power ON	Blinking GREEN	All OFF
Boot loader power ON self-test	Blinking GREEN	All ON
Image load from compact FLASH	Blinking GREEN	Spinning pattern (rotate all to ON, then all to OFF)
Image load failure	Blinking ORANGE	All OFF
Hand off to ArrayOS	Solid GREEN	All OFF
System software initialization	Solid GREEN	Walking pattern—(LED rotating one position per second)
Up and running	Solid GREEN	ON for IAPs that are up: OFF for IAPs that are down. Green or orange per table on the next page. Behavior may be changed using “LED Settings” on page 380 .

LED Operation when AP is Running

The normal LED operation when the AP is running is shown in the table below. Note that behavior may be modified using “LED Settings” on page 380 or via the CLI.

LED Status	Reason
IAP LED is OFF	IAP is down
IAP LED is solid ON	IAP is up, but no associations and no traffic
IAP LED heartbeat	IAP is up, with stations associated but no traffic
IAP LED flashing Flashing at 10 Hz Flashing at 5 Hz Flashing at 2.5 Hz	IAP is up, passing traffic Traffic > 1500 packets/sec Traffic > 150 packets/sec Traffic > 1 packet/sec
IAP LED is GREEN	IAP is operating in the 2.4 GHz band
IAP LED is ORANGE	IAP is operating in the 5 GHz band
IAP LED flashing ORANGE to GREEN at 1 Hz	The radio is in monitor mode (standard intrude detect)
STATUS LED is GREEN ***	AP is operational
GIG (Ethernet) LEDs are dual color Ethernet LED is ORANGE Ethernet LED is GREEN	Transferring data at 1 Gbps Transferring data at 10/100 Mbps
*** NOTE: On an XR-2000 Series AP model ending in 5 or 6, there is a combined GIG2/STS LED . If the GIG2 port is not connected, the LED behaves as a Status LED. If the GIG2 port is connected, the LED behaves as a GIG2 LED.

[LED Settings](#)

Zero-Touch Provisioning and Ongoing Management

Most customers employ the Xirrus Management System (XMS) for the initial setup and continuing management of Xirrus devices. XMS users can readily set up their new devices for zero touch provisioning and ongoing maintenance via the following platforms.

XMS-Cloud Next Generation (XMS-9500-CL-x)

XMS in the cloud performs zero touch provisioning as shown in this quick video guide: www.xirrus.com/TV/Training/XMS-Cloud-Next-Generation. New APs appear in XMS even before you receive your equipment. When the email arrives with your login information, use XMS Cloud to specify the initial settings for your APs. A Guided Tour will walk you through the basic steps of creating a profile containing configuration settings, including creating SSIDs and firewall/application control rules. Once a new, unlicensed AP is connected to a network with DHCP and Internet connectivity, it will automatically contact Xirrus for cloud-based zero touch provisioning per your settings. It will first install the latest applicable license, and upgrade the AP to the latest software version as appropriate.

XMS-Enterprise

(Also available as a cloud-deployed solution: XMS-9000-CL-x) This enterprise-hosted platform automatically detects and provisions new Xirrus devices deployed in your network via a zero touch provisioning approach similar to that described above. Create and configure a default profile for newly added APs—these new devices will automatically receive the configuration defined in your default profile.

If you are an XMS customer, we recommend that you manage your APs completely by XMS. Wait five minutes after powering up the AP or Access Point, then use XMS to view/manage this unit. If you change settings directly on the AP, XMS may not sync up with these changes for up to 24 hours.

Note that the AP must already be running ArrayOS release 6.5 or above to support zero-touch provisioning.

If you are not using XMS

If you are not using XMS, please proceed to the rest of this chapter to configure your AP manually via the Express Setup menu option.

AP Management Interfaces

User Interfaces

With zero-touch setup provided by XMS, your Xirrus network is ready for use a few minutes after deployment. We recommend that you use the XMS for ongoing monitoring and fine-tuning of the network. (For XMS-E, you must set up a default profile and discovery first, to find new APs).

To check the configuration of individual APs locally, AP settings may be viewed or configured through the Command Line Interface (CLI) using SSH, or on a browser with the Web Management Interface (WMI). You may use the CLI via the serial management port (console—on all APs except the XR-500/600/1000 Series and some XR-2000 models) or any of the Gigabit Ethernet ports. You can use the WMI via any of the AP's Ethernet ports.

Figure 33. Network Interface Ports—XR-520 (left); XR-1000 Series (right)

Figure 34. Network Interface Ports—XR-600 Series

Figure 35. Network Interfaces—XR-2000 Series (left); XR-2005/2006 (right)

Figure 36. Network Interface Ports—XR-4000 Series

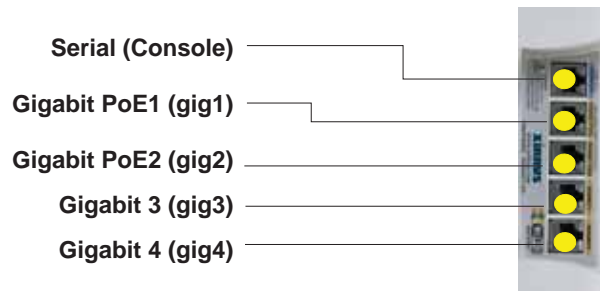

Figure 37. Network Interface Ports—XR-6000 Series

The Xircon utility may also be used to communicate with APs locally as an alternative to using a serial connection to the console. This is especially useful for the XR-500/600/1000 Series and some XR-2000 models, which do not have a console port. See “Securing Low Level Access to the AP” on page 81.

Using the Serial Port

If using the serial port to make your connection, use serial settings of 8 bits, no parity, no flow control, 1 stop bit (8N1) and a speed setting of 115200 baud. Use the communication package of your choice. You may use the serial port to change settings on the AP, even if the AP’s Gigabit interfaces are in XMS managed mode (i.e., read-only mode, see “Managing APs Locally or Using XMS” on page 85).

Using the Ethernet Ports to Access the AP

By default, the AP’s Ethernet interfaces use DHCP to obtain an IP address. If the AP is booted and does not receive DHCP addresses on Gigabit Ethernet ports, then both Gigabit1 and its bonded pair port (if any) will default to 10.0.2.1 with a mask of 255.255.255.0.

If the AP is connected to a network that provides DHCP addresses, the IP address can be determined by the following methods:

1. The simplest way to address the AP is using its default hostname which is the AP’s serial number, found on the AP label and shipping container (for example, XR40123091CACD). If your network provides DHCP and DNS, then you can use this hostname.
2. Otherwise, examine the DHCP tables on the server and find the addresses assigned to the AP (Xirrus MAC addresses begin with 00:0F:7D or 50:60:28 and are found on the AP label and shipping container).
3. Alternatively, you may query the AP using the CLI via the console port (on all models except the XR-500/600/1000, and some XR-2000 models). Log in using the default user name **admin** and password **admin**. Use the **show ethernet** command to view the IP addresses assigned to each port.

Wireless Access Point

4. If the AP cannot obtain an IP address via DHCP, the factory default uses a static IP address of 10.0.2.1 with a mask of 255.255.255.0 on its Gigabit POE port.

Take care to ensure that your network is not using the 10.0.2.1 IP address prior to connecting the AP to the network.

To connect to the AP, you must set your laptop to be in the same subnet as the AP: set your laptop's IP address to be in the 10.0.2.xx subnet, and set its subnet mask to 255.255.255.0. If this subnet is already in use on your network, you may connect your laptop directly to the AP by connecting the laptop to the power injector's IN port temporarily (this port may be called the SWITCH port or the DATA port on your injector).

Starting the WMI

Use this procedure to log in to the WMI on a Web browser.

1. Establish a network connection and open your Web browser.
2. Connect to the Wireless AP using its host name or IP address as described in the previous section.

http://<hostname or IPaddress>

Logging In

Enter the default user name and password—the default user name is **admin**, and the default password is **admin**.

[Powering Up the Wireless AP](#)

Licensing

When a newly deployed AP boots up, it automatically contacts Xirrus with its serial number and MAC address and obtains its license key, software image, and initial configuration from XMS. Any unlicensed AP running ArrayOS release 6.5 or above will update in this way after it boots up, if it has Internet connectivity and if you are running XMS (you must have a default profile set up in XMS).

The AP's license determines some of the features that are available on the AP. For example, the Application Control feature on APs requires a license. When a new AP first boots, it self-generates a license for its current software version. No upgrades or licensed features will operate until the AP receives a license obtained from Xirrus. The AP's license is not installed at the factory.

If you need to enter the license manually, use the following procedure. It describes entering the license key using the WMI. If you are using the XMS, you may use it to manage and upgrade large numbers of licenses for the wireless network.

1. This procedure assumes that you have pointed a browser to the AP to start WMI, and that you have logged in with the default username and password above.
2. In the left hand frame, in the **Configuration** section, click **Express Setup**.
3. **License Key:** Enter the key License Activation Code (LAC) that was provided for the AP. The key was provided to you in an email as an attachment in the form of an Excel file (.xls). Enter the key exactly as it appears in the file. Click the **Apply** button to apply the key.
4. Now you may verify the features provided by the key. In the **Status** section of the left hand frame, click AP and then click **Information**. Check the items listed in the **License Features** row.

Performing the Express Setup Procedure

The Express Setup procedure establishes global configuration settings that enable basic AP functionality. Changes made in this window will affect all radios. If you are not using XMS to perform your initial configuration, please see [“Express](#)

Setup” on page 163. Also see “Zero-Touch Provisioning and Ongoing Management” on page 75.

Securing Low Level Access to the AP

Most local management of the Xirrus AP is done via the WMI or CLI—see “[The Command Line Interface](#)” on page 435. The AP also has a lower level interface: XBL (Xirrus Boot Loader), which allows access to more primitive commands. You won’t normally use XBL unless instructed to do so by Xirrus Customer Support. For proper security, you should replace the default XBL login username and password with your own, as instructed below. XBL has its own username and password, separate from the ArrayOS Admin User and Password (used for logging in to the WMI and CLI) that you may change on the [Express Setup](#) page (see [Step 5](#) on page 167).

Xirrus also provides the Xircon utility for connecting to Xirrus APs that are not reachable via the normal access methods such as Secure Shell (SSH) or WMI and that do not have a physical console port, or whose console port is not accessible. Xircon discovers APs on your network subnet by sending IP/UDP broadcast packets. Once an AP is discovered, Xircon can establish an encrypted console session to the AP via the network even if the AP IP configuration is incorrect. Xircon allows you to manage the AP using CLI, just as you would if connected to the console port. Xircon also has an option for easily accessing XBL.

In normal circumstances Xirrus APs should be configured and managed through SSH or via the WMI. A connection is established using either the AP hostname or DHCP-assigned IP address, or via the other options described in “[Using the Ethernet Ports to Access the AP](#)” on page 78. Xircon may be needed in special circumstances as directed by Xirrus Customer Support for troubleshooting AP

problems or IP connectivity. (In this case, see the Xircon *User Guide* for detailed information.)

Xircon access to the AP:

- You may enable or disable all Xircon access to the AP as instructed in the procedure below. There are also options to allow access only to CLI (i.e., ArrayOS access) or only to XBL.
 - Since some models do not have a console port, these models have Xircon access to both XBL and CLI enabled by default. For APs that do not have a console port, to avoid potentially being locked out of the AP, Xircon should always be enabled at the XBL level at least.
- ! *If you disable Xircon access to both XBL and CLI on models with no console port, you must ensure that you do not lose track of the username and password to log in to CLI/WMI! In this situation, there is no way to recover from a lost password, other than returning the AP to Xirrus. If you have Xircon access to XBL enabled, you can reset the password, but this recovery will require setting the unit to factory defaults with loss of all configuration data.*
- On all other AP models (those with a console port), Xircon access to both XBL and CLI is disabled by default. If Xircon is not going to be used to access an AP, we recommend leaving Xircon access disabled.

Procedure for Securing Low Level AP Access

Use the following steps to replace the default XBL username and password, and optionally to change the type of Xircon management access that is allowed. These steps use CLI commands.

1. To access CLI via the WMI, click **CLI** under the **Tools** section on the left (for detailed instructions see [“CLI” on page 426](#)). Skip to [Step 4 on page 83](#).

To access CLI via SSH, see [“Establishing a Secure Shell \(SSH\) Connection” on page 435](#). Then proceed to the next step.

2. At the **login as** prompt, log in to CLI using the username and password that you set in [Step 5 on page 167](#), or the default value of **admin/admin** if you have not changed them.

```
login as: jsmith
jsmith@xr4012802207c's password:

Xirrus Wi-Fi AP
ArrayOS Version 6.1.2-3299
Copyright (c) 2005-2012 Xirrus, Inc.
http://www.xirrus.com

AP42#
```

3. Type **configure** to enter the CLI config mode.

```
AP42#configure
```

4. If Xircon access at the XBL level is to be allowed, use the following three commands to change the XBL username and password from the default values of **admin/admin**. In the example below, replace **newusername** and **newpassword** with your desired entries. Note that these entries are case-sensitive.

```
AP42#(config)#boot-env
AP42#(config-boot)#set username newusername
AP42#(config-boot)#set password newpassword
AP42#(config-boot)#save
Saving boot environment.... OK
AP42(config-boot)# exit
```

5. Enter the following commands if you wish to change Xircon access permission:

```
AP42#(config)# management
AP42#(config-mgmt)# xircon <management-status>
AP42#(config-mgmt)# save
AP42#(config-mgmt)# exit
AP42#(config)#
```

<management-status> may be one of:

- **on**—enables both CLI and XBL access
- **off**—disables both CLI and XBL access
- **aos-only**—enables only CLI (i.e. ArrayOS) access

- **boot-only**—enables only XBL access

Note that there is a WMI setting for changing Xircon access, timeout period, and the UDP port used. This may be used instead of CLI if you wish. See [“Management Control” on page 238](#). Note that you cannot change the XBL username and password via the WMI.

The Web Management Interface

This topic provides an overview of the Xirrus Wireless AP's embedded Web Management Interface (WMI), used for establishing your network's configuration settings and wireless operating parameters. It also includes login instructions. The following topics are discussed:

- [Managing APs Locally or Using XMS](#)
- [An Overview](#)
- [Structure of the WMI](#)
- [User Interface](#)
- [Logging In](#)
- [Applying Configuration Changes](#)

Managing APs Locally or Using XMS

For Xirrus deployments of any size, we recommend that you use XMS to manage the network rather than directly managing each AP individually. You may change settings directly on the AP—but be aware that XMS may not sync up with these changes for up to 24 hours. All XMS versions automatically “rediscover” the wireless network once a day by default, and XMS will fetch updated settings into its database at that time. If you are an XMS-Cloud customer (XMS-9500-CL-x), you may wish to use WMI or CLI directly on the wireless device to change settings that may not be available in XMS-Cloud.

To immediately sync up XMS with changes that you have made to a particular AP, you may go to the XMS **Monitor > APs** or **Configure > APs** page. Select the AP, and click the **Refresh** button to update XMS with your changes on an AP. This causes XMS to read the current configuration of the AP and update the XMS database with these values.

An Overview

The WMI is an easy-to-use graphical interface to your Wireless AP. It allows you to configure the product to suit your individual requirements and ensure that the unit functions efficiently and effectively.

User Interface

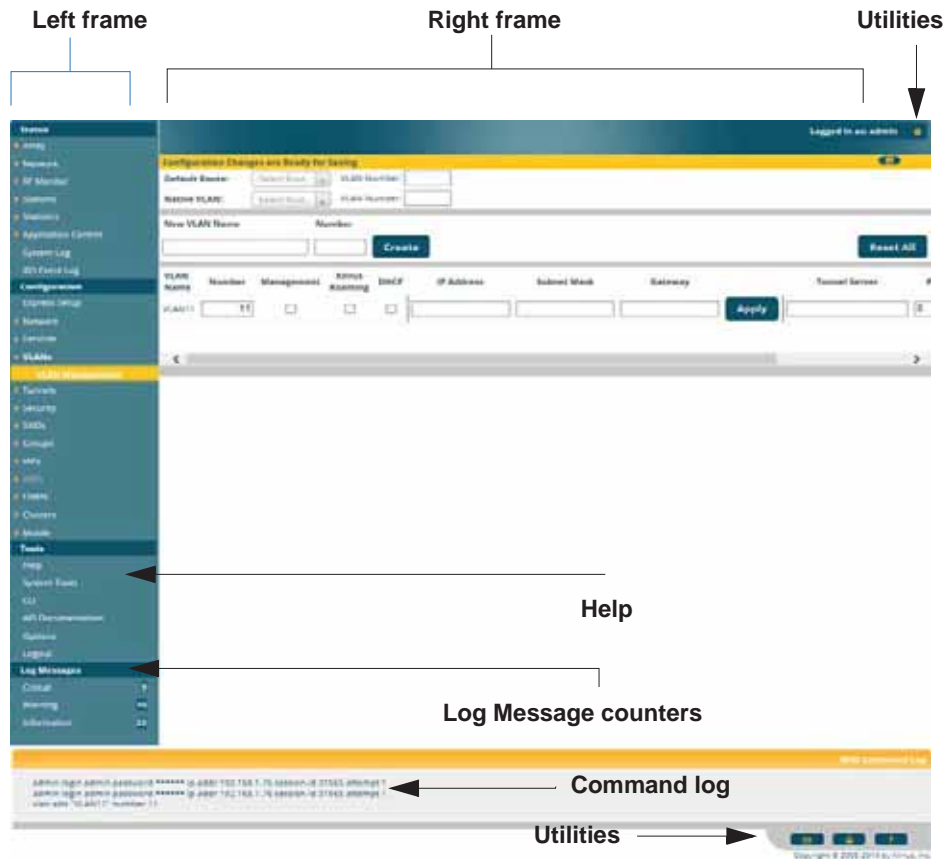

Figure 39. WMI: Frames

The WMI has been designed with simplicity in mind, making navigation quick and easy. In the following example, you'll see that windows are divided into left and right frames. (Figure 39)

The left frame contains two main elements:

- The menu is organized into three major sections (**Status**, **Configuration**, **Tools**). Each has headings for major functions, such as Network, SSIDs, Security, etc. Click a heading, such as **Network**, to display a page

showing a summary of its current configuration, as well as to show links for all of its associated WMI pages.

- Three **Log Messages** counters are located at the bottom of the menu. They provide a running total of messages generated by the ArrayOS Syslog subsystem during your session—organized into **Critical**, **Warning**, and **General** messages. Click on a counter to display the associated Syslog messages. Messages at the selected level or higher will be shown. For more information, please see “[System Log Window](#)” on page 157.

The right frame has four main elements:

- The header shows the AP type in the upper right corner, along with the hostname (this defaults to the unit’s serial number) and IP address. The Uptime shows the time since the AP was last rebooted.

If you have added modular IAPs to your AP, note that its model number will be automatically adjusted to reflect the count and types of IAPs currently installed. See [Upgrading with 802.11ac radio modules](#).

Below this is the page title, and the user name you used to log in. On the right, click the Utilities button  for a drop-down menu that allows you to **Refresh Page**, **Save** your changes, open the **Help** system, or **Logout**. If you have any unsaved changes, the **Save** button  is displayed on the right, in the top bar.

Figure 40. WMI Header

- The main window displays the status information or configuration page that you requested. This is where you review the AP’s current status and activity or enter changes if you wish.

- The Command Log shows the resulting commands for requests made through the WMI.

Figure 41. WMI Command Log

- Utility buttons are located at the bottom right of each window—a **Feedback** button, a **Print** button and a **Help** button.

Figure 42. WMI: Utility Buttons

- Click the **Feedback** button to generate a Web page that allows you to submit your comments to Xirrus, Inc.
- Click the **Print** button to open a print dialog to send a copy of the active window to your local printer.
- Click the **Help** button to access the AP's online help system.

Submitting Your Comments

When submitting comments via the Feedback button ensure that you provide as much detail as possible, including your contact information, the product model number that the comment relates to, and the ArrayOS software version (if known). When finished, click on the **Submit** button to submit your comment.

Some pages or individual settings are only available if the AP's license includes appropriate Xirrus Advanced Feature Sets. If a setting is unavailable (grayed out), then your license does not support the feature. See "About Licensing and Upgrades" on page 412.

Note that WMI provides an option that allows you to change its behavior. You may change:

- **Refresh Interval**—the refresh interval, if automatic refresh is selected.

See "Options" on page 433 for more information.

Logging In

Use this procedure to log in to the WMI via your Web browser.

1. Establish a network connection and open your Web browser.
2. If your network supports DHCP and DNS, enter the AP's default host name in the browser's URL. The default host name is simply the AP's serial number (for example, XR0823091CACD).

Otherwise, enter the AP's IP address. This may be determined as described in "Using the Ethernet Ports to Access the AP" on page 78.

3. The default login to the AP's Web Management Interface is **admin** for both the user name and password.

Figure 43. Logging In to the Wireless AP

Applying Configuration Changes

In most of the WMI configuration windows, your changes to settings are applied to the AP as you make them. In most cases, there is no separate Apply button to click to make the changes take effect. There are a few exceptions to this rule. In these cases, a particular section of a page may have its own **Apply Settings** button right below the settings.

In both cases described above, the changes that you have made are not saved to the latest configuration file in the AP's flash memory, so they will not be restored after a reboot. Click the **Save** button  (located on the upper right of each page) in order to make sure that these changes will be applied after rebooting. This will save the entire current configuration, not only the changes on current WMI page.

Character Restrictions

When inputting strings in the WMI (for example, assigning SSIDs, host name, password, etc.), use common alphanumeric characters. Some of the fields in the WMI will not accept special characters, so use of the following characters should typically be avoided:

& < > ' " / \

Viewing Status on the Wireless AP

These windows provide status information and statistics for your AP using the product's embedded Web Management Interface (WMI). You cannot make [configuration changes](#) to your AP from these windows. The following topics have been organized into functional areas that reflect the [flow and content](#) of the Status section of the navigation tree in the left frame of the WMI.

- [“Access Point Status Windows” on page 96](#)
- [“Network Status Windows” on page 104](#)
- [“RF Monitor Windows” on page 115](#)
- [“Station Status Windows” on page 126](#)
- [“Statistics Windows” on page 139](#)
- [“Application Control Windows” on page 150](#)
- [“System Log Window” on page 157](#)
- [“IDS Event Log Window” on page 158](#)

Configuration and Tools windows are not discussed here. For information on these windows, please see:

- [“Configuring the Wireless AP” on page 161](#)
- [“Using Tools on the Wireless AP” on page 411](#)

If you have added modular IAPs to your AP, note that its model number will be automatically adjusted to reflect the count and types of IAPs currently installed. See [Upgrading with 802.11ac radio modules](#).

Access Point Status Windows

The following AP Status windows are available:

- **Access Point Summary**—displays information on the configuration of all AP interfaces, including IAPs.
- **Access Point Information**—provides version/serial number information for all AP components.
- **Access Point Configuration**—shows all configuration information for the AP in text format.
- **Admin History**—shows all current and past logins since the last reboot.

Access Point Summary

This is a status only window that provides a snapshot of the global configuration settings for all Wireless AP network interfaces and IAPs. You must go to the appropriate configuration window to make changes to any of the settings displayed here—[configuration changes](#) cannot be made from this window. Clicking on an interface or IAP will take you to the proper window for making configuration changes.

Ethernet Settings Summary												
Interface	State	Management	LED	Auto Neg	Link	Duplex	Speed (Mbps)	MTU Size	DHCP	IP Address	Subnet Mask	Gateway
gig1	enabled	enabled	enabled	on	up	full	1000	1500	enabled	10.100.44.37	255.255.255.	10.100.44.1

Operating Status

Figure 44. AP Summary

Content of the Access Point Summary Window

The Access Point Summary window is sub-divided into the **Ethernet Interfaces** section and the Integrated Access Point (radio) section, providing you with the following information:

- **Ethernet Settings Summary**

This section provides information about network interface devices. To make configuration changes to these devices, go to [“Interfaces” on page 170](#).

- **Interface:** Lists the network interfaces that are available on the AP.
- **State:** Shows the current state of each interface, either enabled or disabled.
- **Mgmt:** Shows whether AP management traffic is allowed on this interface.
- **Auto Neg:** Shows whether auto-negotiation is in use on this interface, to determine settings for speed, parity bits, etc.
- **LED:** Shows whether LED display of interface status is enabled.
- **Link:** Shows whether the link on this interface is up or down.
- **Duplex:** Shows whether full duplex mode is in use.
- **Speed:** Shows the speed of this interface in Mbps.
- **MTU Size:** Shows the Maximum Transmission Unit size that has been configured. This is the largest packet size (in bytes) that the interface can pass along.
- **DHCP:** Shows whether DHCP on this port is enabled or disabled.
- **IP Address:** Shows the current IP address assigned to each network interface device.
- **Subnet Mask:** Shows the subnet mask, which defines the number of IP addresses that are available on the routed subnet where the AP is located.
- **Gateway:** Shows the IP address of the router that the AP uses to transmit data to other networks.

- **Bond Settings Summary**

This section provides information about the relationship that has been selected for the Gigabit ports. For detailed explanations and to make configuration changes, see [“Bonds and Bridging” on page 173](#).

- **Bond:** Lists all network bonds that have been configured.
- **Mode:** Shows the type of relationship that has been selected for the Gigabit ports.
- **Ports:** Shows the Gigabit ports that are part of this bond.
- **Port Mode:** Shows the relationship that has been selected for the Ethernet ports. See [“Bonds and Bridging” on page 173](#) for details
- **Active VLANs:** Shows the VLANs that are active in this bond.
- **Mirror:** Shows whether mirroring is enabled on this bond.

- **IAP Section**

This section provides information about the Integrated Access Points (IAPs) that are contained within the AP. How many IAPs are listed depends on which product model you are using. To make configuration changes to these IAPs, go to [“IAP Settings” on page 313](#).

- **IAP:** Lists the IAPs that are available on the AP.
- **State:** Shows the current state of each IAP, either up or down. IAPs that are down are shown in RED. [Figure 45](#) shows an example where **iap7** is down.
- **AP Type:** Shows the types of 802.11 clients supported by this IAP (11/a/b/g/n) and the number of separate data streams transmitted and received by the antennas of each IAP for 802.11n. For example, 3x3 means that the IAP supports three transmit chains and three receive chains. See [“Up to Eight Simultaneous Data Streams—Spatial Multiplexing” on page 44](#).

Wireless Access Point

IAP Summary														
IAP	State	AP Type	Band	WiFi Mode	Bond	Channels	Channel Mode	Antenna	Cell Size	TX Power	RX Threshold	Stations	Distance	BSSID
iap1	up	.11abgn 3x3	monitor	abgn	off	monitor	dedicated monitor	internal omni	monitor	20	-95	0		00:0f:7d:56:87:80
iap2	down	.11abgn 3x3	5GHz	an	40mhz +1	36 40	default	internal directional	max	20	-90	0		00:0f:7d:56:87:90

Figure 45. Disabled IAP (Partial View)

- **Channel:** Shows which channel each IAP is using, and the channel setting. To avoid co-channel interference, adjacent radios should not be using adjacent channels. To make channel selections for a specific IAP, go to [“IAP Settings” on page 313](#).
- **Wi-Fi Mode:** Shows the 802.11 client types that the IAP has been configured to support.
- **Antenna:** Shows which antenna is being used by each IAP.
- **Cell Size:** Indicates which cell size setting is currently active for each IAP—small, medium, large, max, automatic, or manually defined by you.

Figure 46. IAP Cells

The cell size of an IAP is a function of its transmit power and determines the IAP’s overall coverage. To define cell sizes, go to [“IAP Settings” on page 313](#). For additional information about cell sizes and the importance of planning for and defining the optimum cell sizes for your AP, go to [“Coverage and Capacity Planning” on page 34](#).

- **Tx Power:** Shows the transmit power for each IAP.

- **Rx Threshold:** Shows the receive threshold for each IAP.
- **Stations:** Informs you how many client stations are currently associated with each IAP.
- **WDS Link/Distance:** The WDS Link on this radio (if any), and whether the link has been set to support [Long Distance Links](#). See [“WDS” on page 385](#).
- **MAC Address/BSSID:** Shows the MAC address for each IAP.
- **Description:** The description (if any) that you set for this IAP.

- **Network Assurance Section**

This section shows the results of ongoing network assurance testing. This is the same as information shown in [“Network Assurance” on page 113](#).

Network Assurances			
Setting	Hostname	IP Address	Status
DNS server 1		192.168.1.254	Connectivity OK
NTP primary server	time.nist.gov	216.171.120.36	Connectivity OK
NTP secondary server	pool.ntp.org	69.85.183.27	Connectivity OK
SNMP trap host 1	Asaya-WDS		Hostname unresolved
gig1 IP gateway		192.168.1.254	Connectivity OK
gig2 IP gateway		192.168.1.254	No connectivity

Operating Status		
Controller Temperature	Fan Speed	Compass Heading

Figure 47. Network Assurance and Operating Status

The AP checks connectivity to network servers that you have configured (for example, DNS and NTP servers) on an ongoing basis. For each Setting, this list shows the server’s **Host Name** (if any), **IP Address**, and **Status**.

Network assurance must be enabled on the AP in order to perform these connectivity tests and display this information. See [“Management Control” on page 238](#).

- **Operating Status Section**

This section shows the AP controller board’s current internal temperatures, current fan speed, and compass heading. (Figure 47)

Wireless Access Point

Notice that the Compass Heading field will only show a value if the AP model is one that includes a built-in compass. In order for this reading to be correct, the AP must be mounted with iap1 facing north. If the AP does not have an integrated compass, this field will just show a dash.

Access Point Information

This is a status only window that shows you the current firmware versions utilized by the AP, serial numbers assigned to each module, MAC addresses, licensing information, and recent boot timestamps. It will also show current internal temperatures, fan speed, and compass heading if the AP model supports these features.

Notice that the **License Features** row lists the features that are supported by your AP's license. See [“About Licensing and Upgrades”](#) on page 412 and [“Advanced Feature Sets”](#) on page 21 for more information.

You cannot make [configuration changes](#) in this window, but if you are experiencing issues with network services, you may want to print the content of this window for your records.

Access Point Configuration

This is a status only window that allows you to display the configuration settings assigned to the AP, based on the following filter options:

- **Running**—displays the current configuration (the one running now).
- **Saved**—displays the saved configuration from this session.
- **Lastboot**—displays the configuration as it was after the last reboot.
- **Factory**—displays the configuration established at the factory.

Figure 49. Show Configuration

If you want to see just the differences between the Running, Saved, Lastboot, and Factory configurations, you can do this by choosing a configuration option from the **Select Config** pull-down menu then selecting an alternative configuration option from the **Select Diff** pull-down menu.

To include the default configuration settings in the output, choose the configuration then click the **Include Defaults** check box. If **Include Defaults** is disabled, then only the changes from the default configuration are shown.

Admin History

It is useful to know who else is currently logged in to an AP while you're configuring it, or who has logged in since the AP booted. This status-only window shows you all administrator logins to the AP that have occurred since the last reboot. To determine who is currently logged in, check which entries say **active** in the **Logout Time** column.

User	IP Address	Interface	Via	Login Time	Logout Time	Session Time D:MM
admin	192.168.1.76	WAN	https	May-05 09:47	current	0:00:29

Figure 50. Admin Login History

Network Status Windows

The following Network Status windows are available:

- **Network**—displays a summary of network interface settings.
- **Network Map**—displays information about this AP and neighboring APs that have been detected.
- **Spanning Tree Status**—displays the spanning tree status of network links on this AP.
- **Routing Table**—displays information about routing on this AP.
- **ARP Table**—displays information about Address Resolution Protocol on this AP.
- **DHCP Leases**—displays information about IP addresses (leases) that the AP has allocated to client stations.
- **Connection Tracking/NAT**—lists connections that have been established for client stations.
- **CDP List**—lists neighboring network devices using Cisco Discovery Protocol.
- **LLDP List**—lists devices on the AP's network that support the Link Layer Discovery Protocol (LLDP).

Wireless Access Point

- **Network Assurance**—shows results of connectivity tests for network servers.
- **Undefined VLANs**—shows VLANs present on an 802.1Q connection to the AP, that are not configured in the AP's VLAN list.

Network

This window provides a snapshot of the configuration settings currently established for AP's wired interfaces. This includes the Gigabit interfaces and their bonding settings. [DNS Settings](#) are summarized as well. You can click on any item in the **Interface** or **Bond** columns to go to the associated configuration window.

The screenshot displays the Network Settings window with three summary tables. The top table is 'Ethernet Settings Summary', the middle is 'Bond Settings Summary', and the bottom is 'DNS Settings Summary'. The interface includes a user login status 'Logged in as admin' and a 'Ethernet Information Loaded' indicator.

Interface	State	Management	LED	Auto Neg.	Link	Duplex	Speed (Mbps)	MTU Size	DHCP	IP Address	Subnet Mask	Gateway
gig1	enabled	enabled	disabled	on	up	full	1000	1500	enabled	192.168.1.2...	255.255.255.0	192.168.1.254
gig2	enabled	enabled	disabled	on	down	full	10	1500	enabled	192.168.1.2...	255.255.255.0	192.168.1.254

Interface	Bond	Mode	Ports	Active VLANs	Mirror
gig1	bond1	link-backup	gig1 gig2	all	off
gig2	bond1	link-backup	gig1 gig2	all	off

Hostname	Domain	DNS Server 1	DNS Server 2	DNS Server 3
factoryap	gateway-swire.net	192.168.1.254		

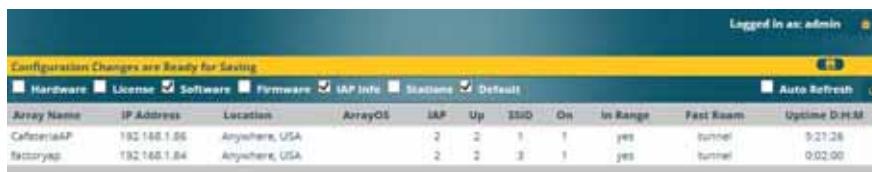

Figure 51. Network Settings

WMI windows that allow you to change or view configuration settings associated with the network interfaces include:

- **“Interfaces” on page 170**
- **“Bonds and Bridging” on page 173**
- **“DNS Settings” on page 180**
- **“Cisco Discovery Protocol (CDP) Settings” on page 181**

Network Map

This window offers detailed information about this AP and all neighboring APs, including how the APs have been set up within your network.

The screenshot shows a web interface for managing wireless access points. At the top, it says "Logged in as: admin" and "Configuration Changes are Ready for Saving". Below this is a navigation menu with tabs for Hardware, License, Software, Firmware, IAP Info, Stations, and Default. The "IAP Info" tab is selected. Below the menu is a table with columns: Array Name, IP Address, Location, Array OS, IAP, Up, SSID, On, In Range, Fast Room, and Uptime D:H:M. Two rows of data are visible: CafeteriaAP and FactoryAP.

Array Name	IP Address	Location	Array OS	IAP	Up	SSID	On	In Range	Fast Room	Uptime D:H:M
CafeteriaAP	192.168.1.85	Anywhere, USA		2	2	1	1	yes	tunnel	5:21:28
FactoryAP	192.168.1.84	Anywhere, USA		2	2	2	1	yes	tunnel	0:02:00

Figure 52. Network Map

The Network Map has a number of options at the top of the page that allow you to customize your output by selecting from a variety of information that may be displayed. You may sort the rows based on any column that has an active column header, indicated when the mouse pointer changes to the hand icon . Click **Refresh** to update the information at any time. Click **Auto Refresh** to instruct the AP to refresh this window automatically.

Content of the Network Map Window

By default, the network map shows the following status information for each AP:

- **Access Point Name:** The host name assigned to the AP. To establish the host name, go to [“Express Setup” on page 163](#). You may click the host name to access WMI for this AP.
- **IP Address:** The AP’s IP address. You may click the address to access WMI for this AP. If DHCP is enabled, the AP’s IP address is assigned by the DHCP server. If DHCP is disabled, you must assign a static IP address. To enable DHCP or to assign a static IP address for the AP, go to [“Express Setup” on page 163](#).
- **Location:** The location assigned to the AP. To establish the location information, go to [“Express Setup” on page 163](#).
- **Array OS:** The software version running on the AP.
- **IAP:** The number of IAPs on the AP.

Wireless Access Point

- **(IAP) Up:** Informs you how many IAPs are currently up and running. To enable or disable all IAPs, go to [“Express Setup” on page 163](#). To enable or disable individual IAPs, go to [“IAP Settings” on page 313](#).
- **SSID:** Informs you how many SSIDs have been assigned for the AP. To assign an SSID, go to [“SSID Management” on page 277](#).
- **(SSID) On:** Informs you how many SSIDs are enabled. To enable or disable SSIDs, go to [“SSID Management” on page 277](#).
- **In Range:** Informs you whether the AP is within wireless range of another Wireless AP.
- **Fast Roam:** Informs you whether or not the Xirrus fast roaming feature is enabled. This feature utilizes the Xirrus Roaming Protocol (XRP) ensuring fast and seamless roaming capabilities between IAPs or APs at both Layer 2 and Layer 3. To enable or disable fast roaming, go to [“Global Settings” on page 319](#).
- **Uptime (D:H:M):** Informs you how long the AP has been up and running (in Days, Hours and Minutes).

To see additional information, select from the following checkboxes at the bottom of the page. This will show the columns described below.

Hardware

- **Model:** The model number of each AP, plus the amount of RAM memory and the speed of the processor.
- **Serial:** Displays the serial number of each AP.

License

- **License:** The license key of each AP.
- **Licensed Features:** Lists the features enabled by the key.

Software (enabled by default)

- Enable/disable display of the AP OS column.

Firmware

- **Boot Loader:** The software version number of the boot loader on each AP.

- **SCD Firmware:** The software version number of the SCD firmware on each AP.

IAP Info (enabled by default)

- Enable/disable display of the IAP/Up columns.

Stations

- **Stations:** Tells you how many stations are currently associated to each AP. To de-authenticate a station, go to [“Stations” on page 127](#).

The columns to the right (**H**, **D**, **W**, and **M**) show the highest number of stations that have been associated over various periods of time: the previous hour, day, week, and month.

Default

- Sets the columns displayed to the default settings. By default, only Software and IAP Info are selected.

Spanning Tree Status

Multiple active paths between stations can cause loops in the network. If a loop exists in the network topology, the potential exists for the duplication of messages. The spanning tree protocol is a link management protocol that provides path redundancy while preventing undesirable loops. For a wireless network to function properly, only one active path can exist between two stations.

To facilitate path redundancy, the spanning tree protocol defines a tree that spans all stations in the network and forces certain redundant data paths into a standby (blocked) state. If one segment in the spanning tree becomes unreachable, the spanning tree algorithm reconfigures the network topology and reestablishes the link by activating the standby path. The spanning tree function is transparent to client stations.

VLAN Name	Number	Gigabit 1	Gigabit 2	WDS Client Links				WDS Host Links		
				1	2	3	4	1	2	3
none		forwarding	forwarding	forwarding						
VLAN11	11	forwarding	forwarding	forwarding						

Figure 53. Spanning Tree Status

This window shows the spanning tree status (forwarding or blocked) for path segments that terminate on the Gigabit ports and WDS links of this AP. You may sort the rows based on the **VLAN Name** or **Number** columns by clicking the column header. Click **Refresh** to update the information at any time. Click **Auto Refresh** to instruct the AP to refresh this window automatically.

Routing Table

This status-only window lists the entries in the AP's routing table. The table provides the AP with instructions for sending each packet to its next hop on its route across the network.

Destination	Mask	Gateway	Interface
192.168.1.0	255.255.255.0	0.0.0.0	S/G
0.0.0.0	0.0.0.0	192.168.1.254	S/G

[Configuring VLANs on an Open SSID](#)

ARP Table

This status-only window lists the entries in the AP's ARP table. For a device with a given IP address, this table lists the device's MAC address. It also shows the AP interface through which this device may be reached. The table typically includes devices that are on the same local area network segment as the AP.

Select	IP Address	MAC Address	Interface
<input checked="" type="checkbox"/>	192.168.1.254	ac:54:70:5c:15:8f	S/G
<input checked="" type="checkbox"/>	192.168.1.76	8c:89:a5:10:4f:a4	S/G
<input checked="" type="checkbox"/>	192.168.1.83	00:0c:29:1e:46:47	S/G
<input checked="" type="checkbox"/>	192.168.1.86	50:60:28:02:81:8c	S/G

Figure 55. ARP Table

[Routing Table](#)

[ARP Filtering](#)

DHCP Leases

This status-only window lists the IP addresses (leases) that the AP has allocated to client stations. For each, it shows the IP address assigned from one of the defined DHCP pools, and the MAC address and host name of the client station. The start and end time of the lease show how long the allocation is valid. The same IP address is normally renewed at the expiration of the current lease.

IP Address	MAC Address	Start Time	End Time	Time Left	Host Name
No DHCP Leases					

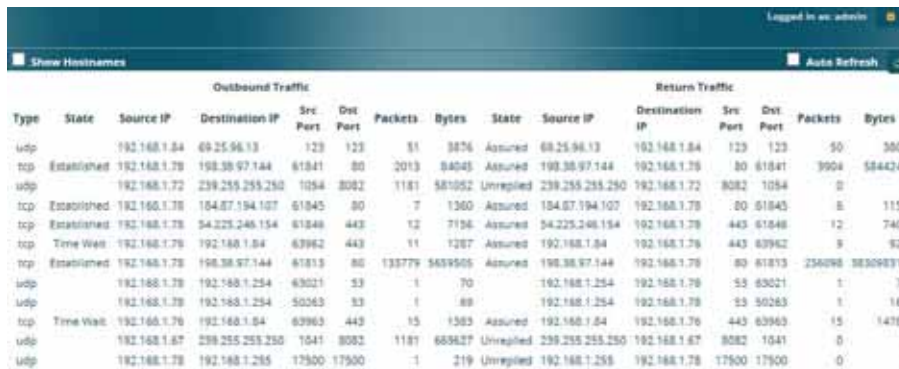

Figure 56. DHCP Leases

[Filters](#)

CDP List

This status-only window lists devices on the AP's network that support the Cisco Discovery Protocol (CDP).

Hostname	IP Address	Model	Interface	Native VLAN	Capabilities	Software
factoryap	192.168.1.84	Xr12-XR430, 1.6GB (400MHz)	Gig1/2	none	L256(switch)	Xr12-AGS Version 7.0.0 (May 06 2014), Build: 4922-beta

Figure 58. CDP List

The AP performs discovery on the network on an ongoing basis. This list shows the devices that have been discovered—Cisco devices and other devices on the network that have CDP running. For each, it shows the device's host name, IP address, manufacturer and model name, the device interface that is connected to the network (i.e., the port that was discovered), and the network capabilities of the device (switch, router, supported protocols, etc.).

CDP must be enabled on the AP in order to gather and display this information. For details and some restrictions, see [“Cisco Discovery Protocol \(CDP\) Settings” on page 181](#).

LLDP List

This status-only window lists devices on the AP’s network that support the Link Layer Discovery Protocol (LLDP).

Hostname	IP Address	Model	Interface	VLAN	Capabilities	Software
Switch4826GTS	172.20.43.231	4826GTS	Port 19	26	Bridge Router	Ethernet Routing Switch 4826GTS HW: 10 PoE S.S.0.1 SW: V.8.0.108

Figure 59. LLDP List

The AP performs discovery on the network on an ongoing basis. This list shows the devices that have been discovered—devices on the network that have LLDP running. For each, it shows the device’s host name, IP address, and model name, the device interface that is connected to the network (i.e., the port that was discovered), and the network capabilities of the device (switch, router, supported protocols, etc.).

LLDP must be enabled on the AP in order to gather and display this information. For details and some restrictions, see “LLDP Settings” on page 182.

Network Assurance

This status-only window shows the results of ongoing network assurance testing.

Setting	Hostname	IP Address	Status
DNS server 1		192.168.1.254	Connectivity OK
RADIUS primary server	Radius1		Hostname unresolved
RADIUS secondary server	Radius2		Hostname unresolved
SNMP trap host 1	Xirus-XM5		Hostname unresolved
Syslog email server	mail.xyzcorp.com	23.23.139.88	No connectivity
Syslog primary server		192.168.1.111	No connectivity
Syslog secondary server		192.168.1.112	No connectivity

Figure 60. Network Assurance

The AP checks connectivity to network servers that you have configured (for example, DNS and NTP servers) on an ongoing basis. For each server, this list shows the server’s host name (if any), IP address, and status.

Network assurance must be enabled on the AP in order to perform these connectivity tests and display this information. See [“Management Control”](#) on page 238.

See Also

[Management Control](#)

Undefined VLANs

This status-only window lists VLANs that are detected on the AP’s trunk ports (i.e., wired ports), but have not been configured on the AP. See [“VLANs”](#) on page 213.

Figure 61. Undefined VLANs

This feature alerts you to the fact that an 802.1Q trunk to the AP has VLANs that are not being properly handled on the AP. To reduce unnecessary traffic, only VLANs that are actually needed on the AP should normally be on the trunk, e.g., the management VLAN and SSID VLANs. In some cases such as multicast forwarding for Apple Bonjour you may want to extend other VLANs to the AP, in order to forward Bonjour or other multicast packets (see [“Advanced Traffic Optimization”](#) on page 324).

See Also

[VLANs](#)

RF Monitor Windows

Every Wireless AP includes an integrated RF spectrum analyzer as a standard feature. The spectrum analyzer allows you to characterize the RF environment by monitoring throughput, signal, noise, errors, and interference levels continually per channel. This capability uses the assigned threat-sensor (monitor) radio. The associated software is part of the ArrayOS.

The following RF Status windows are available:

- **IAP Monitoring**—displays current statistics and RF measurements for each of the AP's IAPs.
- **Spectrum Analyzer**—displays current statistics and RF measurements for each of the AP's channels.
- **Rogues**—displays rogue APs that have been detected by the AP.
- **Channel History**—charts ongoing statistics and RF measurements for one selected channel over time.
- **Radio Assurance**—displays counts of types of problems that caused each IAP to reset.

IAP Monitoring

The RF Monitor—IAP Monitoring window displays traffic statistics and RF readings observed by each AP IAP (radio). Note that the data is an instantaneous snapshot for the IAP—it is not an average or a cumulative total. To graph these values over time for a particular channel, see “[Channel History](#)” on page 122. For detailed information on the measurements displayed, please see “[Spectrum Analyzer Measurements](#)” on page 119.

Figure 62. RF Monitor—IAPs

Figure 62 presents the data as a graphical display, enabled by selecting the **Graph** checkbox on the upper left. If this option is not selected, data is presented as a numerical table.

Figure 63. RF Monitor—IAPs

You may sort the rows based on any column that has an active column header, indicated when the mouse pointer changes to the hand icon . Click **Refresh** to update the information at any time. Click **Auto Refresh** to instruct the AP to refresh this window automatically.

Spectrum Analyzer

*The RF measurements for this feature are obtained by the monitor radio. You **must** have a radio set to **monitor** mode for any data to be available. See “IAP Settings” on page 313.*

Spectrum Analysis is not available for APs or Access Points featuring 802.11ac IAPs.

Spectrum analysis on Wireless APs is a distributed capability that automatically covers the entire wireless network, since a sensor is present in every unit. APs monitor the network 24/7 and analyze interference anywhere in the network from your desk. There’s no need to walk around with a device as with traditional spectrum analyzers, thus you don’t have to be in the right place to find outside sources that may cause network problems or pose a security threat. The AP monitors all 802.11 radio bands (a/b/g/n), not just those currently used for data transmission.

The RF Spectrum Analyzer window displays instantaneous traffic statistics and RF readings for all channels, as measured by the AP’s monitor radio. This differs from the RF Monitor-Radio Monitoring window, which displays values measured by each IAP for its current assigned channel. For the spectrum analyzer, the monitor radio is in a listen-only mode, scanning across all wireless channels. Each channel is scanned in sequence, for a 250 millisecond interval per channel. The spectrum analyzer window presents the data as a graphical display of vertical bar graphs for each statistic as shown in [Figure 64](#) (the default presentation), or horizontally as bar graphs or numerical RF measurements. The measurements displayed are explained in “[Spectrum Analyzer Measurements](#)” on page 119.

As an aid to viewing data for a particular channel, click the channel number. The channel will be highlighted down the page (or across the page for a rotated view, in both text and graph modes). Click additional channels to highlight them for easy comparison. To remove the highlighting from a channel, click the channel number again. Click **Refresh** to update the information at any time. Click **Auto Refresh** to instruct the AP to refresh this window automatically.

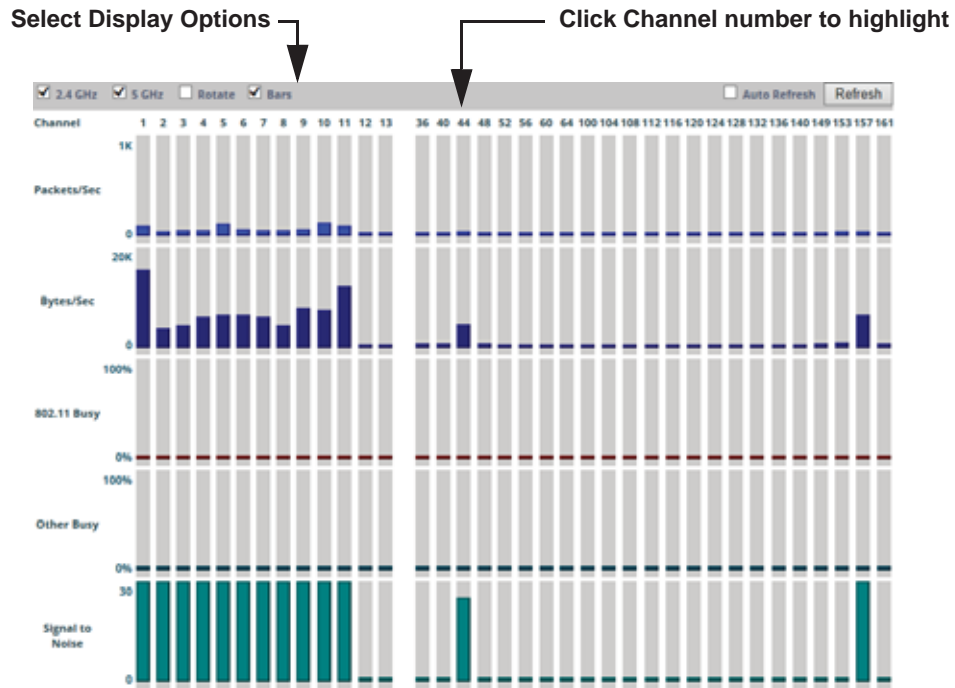

Figure 64. RF Spectrum Analyzer

The Spectrum Analyzer offers several display options:

- To display horizontal bar graphs, click the **Rotate** checkbox at the bottom of the data window.
- In the rotated view, if you wish to view data as a numerical table, click the **Text** checkbox. Click again to return to a graphical display. The text option is only available in the rotated view.
- When viewing a graphical display, click **Bars** to have the bar graphs displayed against a gray background—you may find this easier on the eyes. This operation is not available when Text is selected.
- You may sort the rows based on any column that has an active column header, indicated when the mouse pointer changes to the hand icon . Sorting is only available in the rotated view.

- At the bottom left of the frame, you may select whether to display only 2.4 GHz channels, 5 GHz channels, or both (the default is both). Note that the data is an instantaneous snapshot—it is not an average or a cumulative total.

Spectrum Analyzer Measurements

The spectrum analyzer displays the following information:

- **Packets/Sec:** Total number of wireless packets per second on the channel, both valid and errored packets.
- **Bytes/Sec:** Total number of wireless bytes per second on the channel, valid packets only.
- **802.11 Busy:** Percentage of time that 802.11 activity is seen on the channel.
- **Other Busy:** Percentage of time that the channel is unavailable due to non-802.11 activity.

The total busy time (802.11 Busy plus Other Busy) will never total more than 100%. The remaining time (100% minus total busy time) is quiet time—the time that no activity was seen on the channel.

- **Signal to Noise:** Average SNR (signal to noise ratio) seen on the channel, calculated from the signal seen on valid 802.11 packets less the noise floor level. A dash value “-” means no SNR data was available for the interval.
- **Noise Floor:** Average noise floor reading seen on the channel (ambient noise). A dash value “-” means no noise data was available for the interval.
- **Error Rate:** Percentage of the total number of wireless packets seen on the channel that have CRC errors. The Error rate percentage may be high on some channels since the monitor radio is set to receive at a very sensitive level, enabling it to hear packets from devices at far distances.
- **Average RSSI:** Average RSSI level seen on 802.11 packets received on the channel. A dash value “-” means no RSSI data was available for the interval.
- **Average Data Rate:** Average data rate over time (per byte, not per packet) seen on 802.11 packets received on the channel. A dash value “-” means

no data rate information was available for the interval. A higher data rate (above 6 Mbps) typically indicates user data traffic on the channel. Otherwise, the data rate reflects control packets at the lower basic rates.

Rogues

This window displays all detected access points, according to the classifications you select from the checkboxes at the top—**Blocked**, **Unknown**, **Known**, or **Approved**. This includes ad hoc access points (station-to-station connections). For more information about intrusion detection, rogue APs, and blocking, please see [“About Blocking Rogue APs”](#) on page 376.

Select	BSSID	SSID	Manufacturer	Channel	RSSI	Security	Type	Status	Discovered	Last Active
<input type="checkbox"/>	00:1c:10:2c:0d:e0	iksyst	Linksys	6	-89	none	ESS	unknown	May-08 18:25	active
<input type="checkbox"/>	24:76:7d:ef:77:8a	sco_7DEF7789	Sptvg	157	-21	AES+PSK	ESS	unknown	May-08 18:20	active

Figure 65. Intrusion Detection/Rogue AP List

The Intrusion Detection window provides the easiest method for classifying rogue APs as Blocked, Known, Approved, or Unknown. Choose one or more APs using the checkbox in the **Select** column, then use the buttons on the upper left to classify them with the following actions: **Approve**, **Set Known**, **Block**, or **Set Unknown**.

You can sort the results based on the following parameters by clicking the desired column header:

- SSID
- BSSID
- Manufacturer
- Channel
- RSSI
- Security
- Type
- Status
- Discovered
- Last Active

Wireless Access Point

You can refresh the list at any time by clicking on the **Refresh** button, or click in the **Auto Refresh** check box to instruct the AP to refresh the list automatically.

Channel History

Channel History is not available for APs or Access Points featuring 802.11ac IAPs.

The RF Monitor—Channel History window focuses on traffic statistics and RF readings observed for just one channel that you select in the **Channel** field. A new set of readings is added every 10 seconds for a 5 GHz channel, or every 5 seconds for a 2.4 GHz channel. For descriptions of the measurements displayed, please see “Spectrum Analyzer Measurements” on page 119.

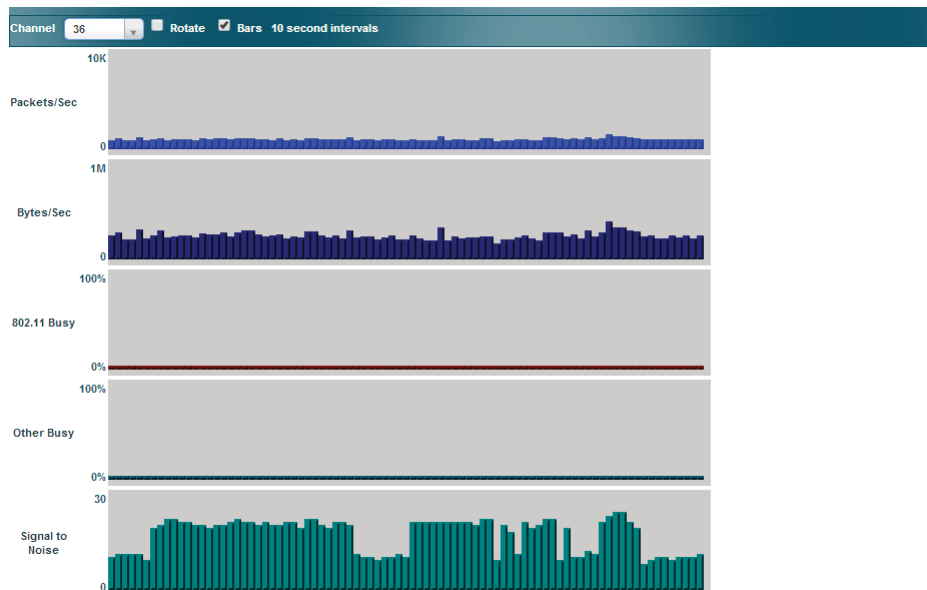

Figure 66. RF Monitor—Channel History

Figure 66 presents the data in graphical form. New data appears at the left, with older readings shifting to the right. To make the data appear as a bar chart, click the **Bar** checkbox which will shade the background.

You also have the option of clicking the **Rotate** checkbox to give each statistic its own column. In other words, the graph for each statistic will grow down the page as new readings display at the top. (Figure 67)

Wireless Access Point

Figure 67. RF Monitor—Channel History (Rotated)

If you select **Rotate** and **Text** together, data is presented as a numerical table. (Figure 68)

Click **Pause** to stop collecting data, or **Resume** to continue.

Packets/Sec	Bytes/Sec	802.11 Busy	Other Busy	Signal to Noise	Noise Floor	Error Rate	Average RSSI	Average Data Rate

Figure 68. RF Monitor—Channel History (Text)

Radio Assurance

When Radio Assurance mode is enabled, the monitor radio performs loopback tests on the AP's radios. When problems are encountered, the AP can take various actions to correct them by performing different levels of reset on the affected radio. This window shows which resets, if any, have been performed on which radios since the last reboot.

The AP's response to radio problems is controlled by the **Radio Assurance Mode** selected, as described in [“RF Resilience” on page 360](#). If you have selected **Failure Alerts & Repairs** (with or without reboots), then the AP can take corrective action if a problem is detected. Note that radio assurance requires RF Monitor Mode to be enabled in [Advanced RF Settings](#) to turn on self-monitoring functions. It also requires a radio to be set to monitoring mode. For a detailed discussion of the operation of this feature and the types of resets performed, see [“Radio Assurance” on page 530](#).

IAP	State	AP Type	Channel	WiFi Mode	Monitor	IAP Reset Counts by Type			
						Beacon	Phy	MAC	Sy
iap1	up	.11abgnac 3x3	1	bgn	0	0	0	0	
iap2	up	.11abgnac 3x3	mon	abgnac	0	0	0	0	

Figure 69. Radio Assurance

For each of the AP's radios, this window shows the radio's state, its type (IEEE 802.11 type, and antenna type—2x2 or 3x3), the assigned channel, and the selected 802.11 wireless mode. To the right, the table shows counts for the number of times, if any, that radio assurance has performed each of the following types of resets since the last reboot, as described in [Radio Assurance](#):

- Monitor
- Beacon
- Phy
- MAC
- System (i.e., reboot the AP)

Station Status Windows

The following Station Status windows are available:

- **Stations**—this list describes all stations associated to the AP.
- **Location Map**—displays a map showing the approximate locations of all stations associated to the AP.
- **RSSI**—for each associated station, this displays the Received Signal Strength Indicator at each of the AP's IAPs.
- **Signal-to-Noise Ratio (SNR)**—for each associated station, this displays the SNR at each of the AP's IAPs.
- **Noise Floor**—for each associated station, this displays the ambient noise (silence) value at each of the AP's IAPs.
- **Max by IAP**—for each IAP, this shows the historical maximum number of stations that have been associated to it over various periods of time.
- **Station Assurance**— displays stations that are having connectivity problems.

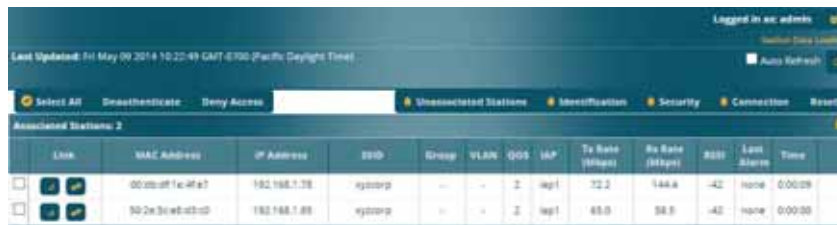

Stations

This window shows client stations currently visible to the AP. You may choose to view only stations that have **Associated** to the AP, or include stations that are **Unassociated** by selecting the appropriate buttons above the list. The list always shows the MAC address of each station, its IP address, the SSID used for the association, the **Group** (if any) that this station belongs to, its VLAN, its QoS, the IAP used for the association, transmit and receive rates, the **RSSI** for each station, and how long each association has been active (up time).

In the Link column, click the details button  to jump to a detailed statistics page for this station. Click  to see Application Control information.

You may click other buttons above the list to show a number of additional columns:

- **Identification:** shows more identifying information for the station—its **User Name, Host Name, Manufacturer, Device Type, and Device Class** (for example, notebook, iPad, etc.).
- **Security:** includes security settings used by the connection—**Encryption** type, **Cipher** used, and Key **Management** used by the station.
- **Connection Info:** shows the **Band** (5GHz or 2.4 GHz) used. Shows an additional RF measurement that affects the quality of the connection: **SNR** (signal to noise ratio).
- **Reset:** click this button to return the display to showing just the default columns.

Link	MAC Address	IP Address	SSID	Group	VLAN	QoS	IAP	Tx Rate (Mbps)	Rx Rate (Mbps)	RSSI	Last	Time
	00:0b:0f:1e:4f:e7	192.168.1.78	xyzcorp	--	--	2	wg1	32.2	144.4	-42	none	0:00:09
	30:2e:31:e6:d3:d0	192.168.1.88	xyzcorp	--	--	2	wg1	65.0	58.5	-42	none	0:00:00

Figure 70. Stations

You may sort the rows based on any column that has an active column header. Click again to reverse the sort order. You may select one or more specific stations and perform one of the following actions by clicking the associated button:

- **Deny Access:** Sends a de-authentication frame to the selected station and explicitly denies it access by adding its MAC address to the Deny List in the Access Control List window. To permit access again, go to [“Access Control List” on page 248](#) and delete the station from the **Deny** list.
- **Deauthenticate:** Sends a de-authentication frame to the selected station. The station may re-authenticate.

Click on the **Refresh** button to refresh the station list, or click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

[Station Statistics](#)

Location Map

The Location Map shows the approximate locations of stations relative to this AP. The location of each station is computed based on the [RSSI](#) of its signal as received by the AP. The distance is adjusted based on the environment setting that you selected. You may display just the stations associated to this AP, unassociated stations (shown in gray), or both. The station count is shown on the right, above the map. You may also choose to display only 5 GHz stations (shown in orange) or 2.4 GHz stations (shown in green), or both.

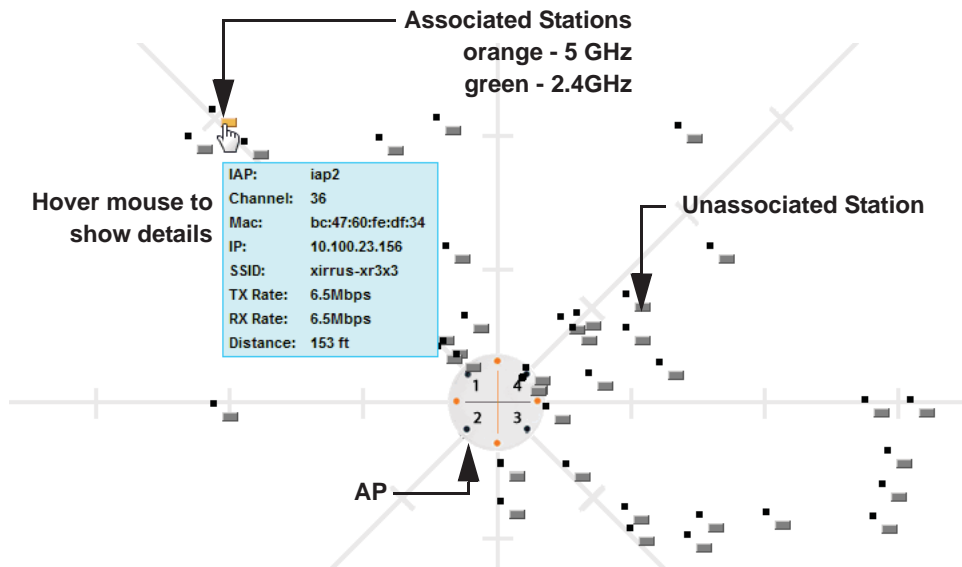

Figure 71. Location Map

The map and AP are shown as if you were looking down on the AP from above, say from a skylight on the roof. Thus the positions of the radios are a mirror image of the way they are typically drawn when looking at the face of the AP. Radios are marked on the map to show the orientation of the AP.

A station is identified by the type of **Preferred Label** that you select: **Netbios Name**, **IP Address**, **MAC Address**, or **Manufacturer**. If multiple stations are near each other, they will be displayed slightly offset so that one station does not

completely obscure another. You may minimize a station that is not of interest by clicking it. There is also a **Minimize All** button.

You may replace the range-finder background image above with your own custom image of the floor plan of the area served by the AP—see “[Working with the Custom Image](#)” on page 132

Hover the mouse over a station to show detailed information. (Figure 71) For a station that is associated to this AP, the details include:

- The **IAP**, **Channel**, and **SSID** to which the station is associated.
- The **MAC** and **IP** address and **Netbios** name of the station.
- The **TX Rate** and **RX Rate** of this connection.
- The approximate **Distance** of this station from the AP. The distance is estimated using the received signal strength and your environment setting. The environment determines the typical signal attenuation due to walls and other construction that affect signal reception.

Controls and items displayed on the Location Map window

The Location Map has its own scroll bars in addition to the browser's scroll bars. If you narrow the browser window, the map's scroll bar may be hidden. Use the browser's bottom scroll bar if you need to move it into view.

Figure 72. Controls for Location Map

- **Display Associated/Unassociated:** Select whether to display stations that are associated to the AP, stations that are not associated, or both.
- **Display 2.4 GHz/5 GHz:** Select whether to display 802.11bgn stations, or 802.11an stations, or both.
- **Preferred Label:** This field is located on the top of the window towards the right. It shows the type of label to be displayed for stations: NetBIOS is the default, else, an IP or MAC address will be used, in that order.
- **Auto Refresh:** Instructs the AP to refresh this window automatically.
- **Refresh:** Updates the stations displayed.

- **Custom Image:** Use this feature to replace the default background image with your own image of the floor plan of your location. Click the **Browse** button and browse to the desired file on your computer. This may be a .gif, .jpg, .jpeg, .png, .htm, or .html file. The scale of the file should be 100 feet per inch. Then click **Upload** (see below). For more information on using the custom, image, see [“Working with the Custom Image” on page 132](#).
- **Upload:** After browsing to the desired custom image, click the **Upload** button to install it. The map is redisplayed with your new background. No hash marks (for the map scale) are added to the image display.
- **Reset:** Click this button to restore the map display to the factory settings. All attributes are restored—including the stations selected for display, the scale, the rotation, and the background map.
-  **Rotate:** Click this button to rotate the orientation of the entire map. It rotates the map 45° counter-clockwise.
-  **Enlarge:** Click this button to enlarge (zoom in on) the map. The displayed **Scale** is updated with the new scale for the map.
-  **Reduce:** Click this button to reduce (zoom out on) the map. The displayed **Scale** is updated with the new scale for the map.
- **Environment:** This field is located on the top right of the window. Select the type of environment for this AP’s deployment: **Indoor open** (few walls or obstructions), **Indoor walled** (typical wall or cubicle

construction), or **Indoor dense** (many walls or obstructions, or unusually dense walls).

- **Scale:** This view-only value shows the approximate distance represented by each hash mark on the default map background.
- **Associated, Unassociated, Total Stations:** These view-only values show the station counts observed by the AP.

Station Status Windows

Working with the Custom Image

After you have uploaded a custom image (see **Custom Image** and **Upload** in “Controls and items displayed on the Location Map window” on page 130), you should move the display of the AP on your map to correspond with its actual location at your site.

To move the AP on the map, simply click it, then drag and drop it to the desired location. The AP will continue to follow the mouse pointer to allow you to make further changes to its location. When you are satisfied with its location, click the AP again to return to normal operation.

RSSI

For each station that is associated to the AP, the RSSI (Received Signal Strength Indicator) window shows the station’s RSSI value as measured by each IAP. In other words, the window shows the strength of the station’s signal at each radio. You may choose to display **Unassociated Stations** as well with a checkbox at the bottom of the window.

User Name	MAC Address	Network Name	IP Address	lap1	lap2
	00:0c:2f:1e:4f:e7		192.168.1.70	-49	-58
	50:2e:5c:e8:d3:c0		192.168.1.85	-46	-56

Figure 73. Station RSSI Values

By default, the RSSI is displayed numerically. You may display the relative strength using color if you select **Colorize Intensity**, with the strongest signals indicated by the most intense color. (Figure 73) If you select **Graph**, then the RSSI

Wireless Access Point

is shown on a representation of the AP, either colorized or numerically based on your selection. (Figure 74) The stations are listed to the left of the AP—click on a station to show its RSSI values on the AP.

Figure 74. Station RSSI Values—Colorized Graphical View

In either graphical or tabular view, you may sort the rows based on any column that has an active column header, indicated when the mouse pointer changes to the hand icon . Click on the **Refresh** button to refresh the station list, or click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

[RF Monitor Windows](#)

Signal-to-Noise Ratio (SNR)

For each station that is associated to the AP, the Signal-to-Noise Ratio (SNR) window shows the station's SNR value as measured by each IAP. In other words, the window shows the SNR of the station's signal at each IAP. The signal-to-noise ratio can be very useful for determining the cause of poor performance at a station. A low value means that action may need to be taken to reduce sources of noise in the environment and/or improve the signal from the station.

User Name	MAC Address	Netbios Name	IP Address	iap1	iap2
	00:1b:bf:1e:4f:e7	DSCHNEIDER_DELL	192.168.1.78	48	39
	50:2e:5c:e8:d3:c0		192.168.1.85	30	38

Figure 75. Station Signal-to-Noise Ratio Values

You may choose to display **Unassociated Stations** as well with a checkbox at the bottom of the window.

By default, the SNR is displayed numerically. (Figure 75) You may display the relative value using color if you select **Colorize Intensity**, with the highest SNR indicated by the most intense color. (Figure 76) If you select **Graph**, then the SNR is shown on a representation of the AP, either colorized or numerically based on your selection. The stations are listed to the left of the AP—click on a station to show its SNR values on the AP.

Figure 76. Station SNR Values—Colorized Graphical View

In either graphical or tabular view, you may sort the rows based on any column that has an active column header, indicated when the mouse pointer changes to

Wireless Access Point

the hand icon . Click on the **Refresh** button to refresh the station list, or click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

[Station Status Windows](#)

[RF Monitor Windows](#)

Noise Floor

For each station that is associated to the AP, the Noise Floor window shows the ambient noise affecting a station's signal as measured by each IAP. The noise floor is the RSSI value when the station is not transmitting, sometimes called a Silence value. In other words, the window shows the noise floor of the station's signal at each IAP. The noise floor value can be very useful for characterizing the environment of a station to determine the cause of poor performance. A relatively high value means that action may need to be taken to reduce sources of noise in the environment.

The screenshot shows a window titled "Noise Floor (-35 to -100)". At the top, there are checkboxes for "Colorize Intensity" (checked), "Graph", and "Unassociated Stations", along with "Auto Refresh" and a "Refresh" button. Below the window title is a table with the following columns: "User Name", "MAC Address", "Netbios Name", "IP Address", and eight columns for IAPs labeled "iap1" through "iap8". The table contains four rows of data:

User Name	MAC Address	Netbios Name	IP Address	iap1	iap2	iap3	iap4	iap5	iap6	iap7	iap8
XIRRUS\Patrick.Parker	00:14:d1:cf:f0:f5		10.100.25.33								
XIRRUS\jeff.plowman	00:21:5c:23:10:f9	JPLOWMAN-6910P	10.100.25.69								
XIRRUS\David.Levin	00:24:d7:77:0f:d4	XMS-SQA-5	10.100.14.105								
David.Levin	e0:f8:47:21:7e:5a	MACBOOKPRO-77D7	10.100.25.29								

Figure 77. Station Noise Floor Values

You may choose to display **Unassociated Stations** as well with a checkbox at the bottom of the window.

By default, the noise floor is displayed numerically. (Figure 77) You may display the relative value using color if you select **Colorize Intensity**, with the highest noise indicated by the most intense color. If you select **Graph**, then the ambient noise is shown on a representation of the AP, either colored or numerically based on your selection.(Figure 78) The stations are listed to the left of the AP—click on a station to show its values on the AP.

Figure 78. Station Noise Floor Values—Colorized Graphical View

In either graphical or tabular view, you may sort the rows based on any column that has an active column header, indicated when the mouse pointer changes to the hand icon . Click on the **Refresh** button to refresh the station list, or click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

Max by IAP

This status-only window shows the maximum number of client stations that have historically been associated to the AP. For each IAP, the list shows the IAP's state and channel number, the current number of stations associated, and the highest number of stations that have been associated over various periods of time: hour, day, week, month, and year. In other words, the Max Station Count shows the "high water mark" over the selected period of time—the maximum count of stations for the selected period, rather than a cumulative count of all stations that have associated. This information aids in network administration and in planning for additional capacity.

Radio	State	Channel	Current Stations	Max station count				
				Hour	Day	Week	Month	Year
lap1	1	manual	1	1	1	1	1	1
lap2	157+161	automatic	0	1	1	1	1	1

Figure 79. Max by IAP

You may click an IAP to go to the [IAP Settings](#) window. Click on the **Refresh** button to refresh the station list, or click **Auto Refresh** to instruct the AP to refresh this window automatically.

[Station Status Windows](#)

Station Assurance

Station assurance monitors the quality of the connections that users are experiencing on the wireless network. This window shows client stations that have had connectivity issues. You may enable or disable the station assurance feature and set thresholds for the problems that it checks, such as excessive packet retry or packet error rates, or stations that are unable to stay associated to the AP. Please see [“Station Assurance” on page 365](#) for more information about these settings. When the AP detects that a station has reached the threshold value for one or more of the issues checked, it adds the station to this page. In addition, an event is triggered, a trap is generated, and a Syslog message is logged.

For each station, this list shows the MAC address, its IP address, its host name, its device type, device class, and manufacturer. It also shows the values of the various statistics that were monitored for problems as described in [“Station Assurance” on page 365](#): associated time, authentication failures, packet error rate, packet retry rate, packet data rate, RSSI, signal to noise ratio (SNR), and distance.

Time	MAC Address	IP Address	Hostname	Device Type	Device Class	Manufacturer	Assoc Time	Auth Fails	Error Rate	Retry Rate	Data Rate	RSSI (dB)	SNR (dB)	Distance (ft)	Driver Check
No stations with current connectivity issues.															

Figure 80. Station Assurance

You may click the **Clear Inactive** button to remove stations that are no longer connected to the AP from the list. Click the **Clear All** button to remove all entries and start fresh to add problem stations to the list as they are detected. Click on the **Refresh** button to refresh the station list, or click **Auto Refresh** to instruct the AP to refresh this window automatically.

Statistics Windows

The following AP Statistics windows are available:

- **IAP Statistics Summary**—provides an overview of the statistical data associated with all IAPs. Expands to show links for displaying detailed statistics for individual IAPs.
- **Per-IAP Statistics**—provides detailed statistics for an individual IAP.
- **Network Statistics**—displays statistical data associated with each network (Ethernet) interface.
- **VLAN Statistics**—provides statistical data associated with your assigned VLANs.
- **WDS Statistics**—provides statistical data for all WDS client and host links.
- **IDS Statistics**—provides statistical data for intrusion detection.
- **Filter Statistics**—provides statistical data for all configured filters.
- **Station Statistics**—provides statistical data associated with each station.

IAP Statistics Summary

This is a status only window that provides an overview of the statistical data associated with all IAPs. It also shows the channel used by each IAP. For detailed statistics for a specific IAP, see “Per-IAP Statistics” on page 140. Click the **Unicast Stats Only** checkbox on the lower left to filter the results, or clear the checkbox to show statistics for all wireless traffic.

IAP	Channels	Receive Statistics by IAP				Transmit Statistics by IAP			
		Bytes	Packets	Errors	Retries	Bytes	Packets	Errors	Retries
Wap1	1	27042289	111829	88729	9646	28429991	408718	7	3693
Wap2	157	39899499	1872127	78486	548254	279329571	287786	1	863

Figure 81. IAP Statistics Summary Page

You can **Refresh** the data (update the window with the latest information) or **Clear** the data (reset all content to zero and begin counting again) at any time by

clicking on the appropriate button. You can also click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

Per-IAP Statistics

This is a status only window that provides detailed statistics for the selected IAP. Scroll the window down to see a breakout of the statistics by connection rate. For a summary of statistics for all IAPs, see [“IAP Statistics Summary” on page 139](#). Use the **Display Percentages** checkbox at the upper left to select the output format—check this option to express each statistic as a percentage of the total at the top of the column, or leave it blank to display raw numbers.

Receive Error statistics include:

- **Total Retries:** the count of packets that were sent more than once before being received correctly.
- **CRC error:** the count of packets that were corrupted on the air and were dropped. Some level of CRC errors are expected in wireless networks. Note that all IAPs operate in a mode where they are listening to everything all the time, which means they will see many CRC errors.
- **Fragment Errors:** the count of packets that were incomplete.
- **Encryption Errors:** the count of packets that had encryption problems.
- **Duplicates:** the count of packets that were received more than once. The duplicate packets are dropped.
- **Dropped Packets:** the count of packets that were dropped due to various receive errors, including being received when all receive queues were full. These packets are dropped after being received.
- **Overruns:** indicate the number of times that First-In-First-Out (FIFO) overflow errors occur.

Display Percentages Auto Refresh **Refresh** **Clear**

IDS Statistics

The Xirrus AP employs a number of IDS/IPS (Intrusion Detection System/Intrusion Prevention System) strategies to detect and prevent malicious attacks on the wireless network. This status-only window provides detailed intrusion detection statistics for the selected IAP.

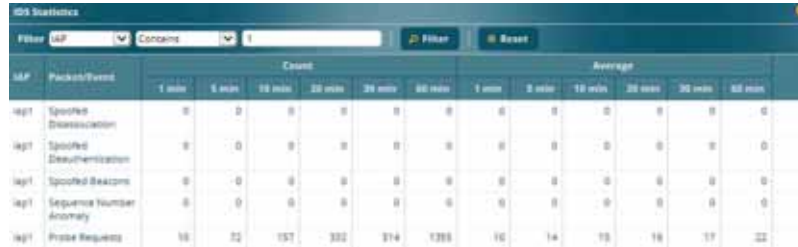

You must have **Intrusion Detection Mode** enabled to collect IDS statistics. See [“Intrusion Detection” on page 373](#). Information about IDS events is discussed in the [“IDS Event Log Window” on page 158](#).

IAP2	Association	0	0	0	0	1	1	0	0	0	0	0	-

Figure 86. IDS Statistics Page

Use the filter feature to show only information for a selected IAP or for selected event types. Select the type of **Filter: IAP** to select IAPs, or **Packet/Event** to select particular attack types. Select the type of string matching, for example, **Begins with** or **Contains**. Then enter the string to be matched and click the **Filter** button. For example, in [Figure 87](#), the filter **Packet/Event Contains assoc** finds events that include the string **assoc** in any position. If you have an AP with 12 IAPs, then **IAP**

Contains 1 will show entries for **iap1**, **iap10**, **iap11**, and **iap12**. Click the **Reset** button to return to showing all entries.

iAP	Packet/Event	Count						Average						
		1 min	5 min	10 min	20 min	30 min	50 min	1 min	5 min	10 min	20 min	30 min	50 min	
iap1	Spoofted Disassociation	0	0	0	0	0	0	0	0	0	0	0	0	0
iap1	Spoofted Deauthentication	0	0	0	0	0	0	0	0	0	0	0	0	0
iap1	Spoofted Beacons	0	0	0	0	0	0	0	0	0	0	0	0	0
iap1	Sequence Number Anomaly	0	0	0	0	0	0	0	0	0	0	0	0	0
iap1	Probe Requests	10	22	137	332	514	1285	10	14	15	16	17	22	

Figure 87. Filtered IDS Statistics

Many of the column headers may be clicked to sort the entries in ascending or descending order based on that column. You can **Refresh** the data (update the window with the latest information) at any time by clicking the **Refresh** button  on the upper right. You can also click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

Filter Statistics

The Filter Statistics window provides statistical data for all configured filters. The name, state (enabled—on or off), and type (allow or deny) of each filter is shown. For enabled filters, this window shows the number of packets and bytes that met the filter criteria. Click on a column header to sort the rows based on that column. Click on a filter name to edit the filter settings.

Detail		Auto Refresh		Refresh	Clear All
Name	Type	State	Packets	Bytes	
Global					
Air-cleaner-Mcast.1	deny	on	4054013	5210334627	
Air-cleaner-Mcast.2	deny	on	65294	13005313	
Air-cleaner-Mcast.3	deny	on	0	0	
Air-cleaner-Nbios.1	deny	on	90348	7050384	
Air-cleaner-Nbios.2	deny	on	492	113328	
Air-cleaner-Nbios.3	deny	on	0	0	
Multicast					
Air-cleaner-Mcast.1	deny	on	0	0

Station Statistics

This status-only window provides an overview of statistical data for all stations. Stations are listed by MAC address, and Receive and Transmit statistics are summarized for each. For detailed statistics for a specific station, click the desired MAC address in the **Station** column or click the details button  in the station's **Link** column, and see “Per-Station Statistics” on page 149.

Last Updated: Fri May 02 2014 21:36:24 GMT-0700 (Pacific Daylight Time)									
Station Statistics Summary									
Station	Receive Statistics by Station				Transmit Statistics by Station				Link
	Bytes	Packets	Errors	Retries	Bytes	Packets	Errors	Retries	
00:0b:0f:1e:4b:e7	172360238	2250021	37936	0	2884465060	2137402	0	0	

Figure 89. Station Statistics

Click on a column header to sort the rows based on that column. You can **Refresh** the data (update the window with the latest information) at any time by clicking the refresh button  . You can also click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

[Per-Station Statistics](#)
[Stations](#)

Per-Station Statistics

This window provides detailed statistics for the selected station. This window is accessed from the [Station Statistics](#) window—click the MAC address of the desired entry in the **Station** column to display its Per-Station Statistics window.

Receive and Transmit statistics are listed by **Rate**—this is the data rate in Mbps. For a summary of statistics for all stations, see “[Station Statistics](#)” on page 147.

You can **Refresh** the data (update the window with the latest information) at any time by clicking on the appropriate button. You can also click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

The screenshot shows a web interface for station statistics. At the top, it indicates the user is logged in as 'admin' and shows the last update time: 'Fri May 02 2014 21:37:47 GMT-0700 (Pacific Daylight Time)'. There are buttons for 'Show All' and 'Auto Refresh'. The main table is titled 'Station Statistics Summary for 00:0c:d1:1e:4f:c7' and is organized into sections for different data rates.

Rate	Receive Statistics by Rate				Transmit Statistics by Rate			
	Bytes	Packets	Errors	Retries	Bytes	Packets	Errors	Retries

[Station Statistics](#)

Application Control Windows

*This feature is only available if the AP license includes **Application Control**. See “[About Licensing and Upgrades](#)” on page 412.*

The Application Control feature provides real-time visibility of application usage by users across the wireless network. Network usage has changed enormously in the last few years, with the increase in smart phone and tablet usage stressing networks. Increasing traffic from legitimate business needs such as cloud- and web-based applications, streaming media and VoIP must be handled with an adequate quality of experience.

Application Control is discussed in the following topics:

- **About Application Control**—an overview of this feature.
- **Application Control**—displays information about applications running on the wireless network.
- **Stations (Application Control)**—displays a list of stations. Click one to analyze application control information for only that station.

About Application Control

The AP uses Deep Packet Inspection (DPI) to determine what applications are being used and by whom, and how much bandwidth they are consuming. These applications are rated by their degree of risk and productiveness. [Filters](#) can be used to implement per-application policies that keep network usage focused on productive uses:

- Usage of non-productive and risky applications like BitTorrent can be restricted using [Filters](#).
- Traffic for mission-critical applications like VoIP and WebEx may be given higher priority (QoS).
- Non-critical traffic from applications like YouTube may be given lower priority (QoS).
- Traffic flows for specific applications may be controlled by sending them into VLANs that are designated for that type of traffic.

Application Control can track application usage over time to monitor trends. Usage may be tracked by AP, VLAN, or station. Many hundreds of applications are recognized and grouped into a number of categories. The distributed architecture of Xirrus APs allows Application Control to scale naturally as you grow the network.

About Risk and Productivity

Application Control ranks applications in terms of their levels of risk and productivity.

Productivity indicates how appropriate an application is for business purposes. The higher the rating number, the more business-oriented an application is.

- 1—Primarily recreational
- 2—Mostly recreational
- 3—Combination of business and recreational purposes
- 4—Mainly used for business
- 5—Primarily used for business

Risk indicates how likely an application is to pose a threat to the security of your network. The higher the rating number, the more risky an application is.

- 1—No threat
- 2—Minimal threat
- 3—Some risk - may be misused
- 4—High risk - may be malware or allow data leaks
- 5—Very high risk - threat circumvents firewalls or avoids detection

Keeping Application Control Current

Applications are recognized using a signature file which may be updated using the [System Tools](#) page as new applications become popular (see “[Application Control Signature File Management](#)” on page 422).

Application Control

This display-only window provides a snapshot of the application usage on your AP. In order to view the Application Control window, the AP must have a license that supports this feature, and you must have enabled the **Application Control** option on the **Filter Lists** page (see “Filter Lists” on page 392).

Figure 91. Application Control

The Application Control window has three sections:

- **Selection Criteria** allow you to choose the type of data to show, and to filter for a single VLAN or station.
- **Pie Charts** present a color coded at-a-glance view of the top ten applications being used by the network.
- **Traffic Tables** beneath the pie charts list the applications in use along with traffic statistics. Unique **Productivity** and **Risk** ratings let you easily assess the nature of applications in use, so that you can take action using [Filter Management](#).

Selection Criteria

At the top of the window, the options in the gray ribbon allow you to customize the display with the following choices:

- **Display for VLAN:** Use the drop-down list if you wish to select just one VLAN to analyze, or leave the default value of **all** to see data from all VLANs.
- **Display for Station:** Use the drop-down list if you wish to select just one station to analyze (stations are listed by their MAC address), or leave the default value of **all** to see data from all stations. You may also use the Stations window to select a station to display. See [“Stations \(Application Control\)” on page 156](#).
- **Station Traffic:** Check this box if you wish to analyze traffic from stations, listing the applications that they are using.
- **AP Management Traffic:** Check this box if you wish to analyze management traffic on this AP, including the load due to functions such as Xirrus Roaming. Tracking traffic into the AP on the management side can alert you to nefarious activity—and even to traffic on the wired network that would best be blocked before it hits the AP. You may display both station and AP management traffic, if you wish.
- **By Application:** Check this box if you wish to analyze and list traffic by what specific applications are in use, such as WebEx or BitTorrent.

- **By Category:** Check this box if you wish to analyze and list traffic by the types of applications in use, such as Games or Collaboration.
- **Auto Refresh** instructs the AP to periodically refresh this window automatically. Use the **Refresh** button to refresh the window right now.

Pie Charts

Figure 92. Application Control (Pie Charts)

These charts provide a quick way to determine how your wireless bandwidth is being used. There are charts for **Station Traffic** and/or **AP Management Traffic**, depending on which checkboxes you selected. Similarly, there are charts for **By Application** and/or **By Category**, depending on your selections. The top ten applications or categories are listed, by percentage of bandwidth usage.

Figure 93. Application Control (Station Traffic)

These tables provide detailed information about how your wireless bandwidth is being used. There are tables for **Station Traffic** and/or **AP Management Traffic**, depending on which checkboxes you selected. Similarly, there are tables for **By Application** and/or **By Category**, depending on your selections.

In addition to showing traffic statistics, there are two unique and highly useful columns. **Risk** estimates the likelihood of an application causing problems for your business, such as a file-sharing utility introducing viruses or exposing you to legal problems. Risk is rated from 1 (low risk: for example, Google) to 5 (high risk: for example, BitTorrent). Risky applications (rated at 4 or 5) are flagged for your attention by highlighting the entry in pale red. **Productivity** estimates the value of an activity to your business, from 1 (unproductive: for example, Y8 gaming) to 5 (productive: for example, WebEx).

You may click the heading of any column to sort based on that column. Click again to sort in the reverse order. For instance, sort on **Risk** to find problem applications, or sort on **Productivity** to find applications that should be given increased or decreased handling priority.

When you find risky or unproductive applications consuming bandwidth on the network, you can easily create [Filters](#) to control them. See “[Filter Management](#)” on page 395. You may use filters to:

- Block problematic traffic, such as BitTorrent or Y8.
- Prioritize mission critical traffic—by increasing the QoS assigned to the traffic. See “[Understanding QoS Priority on the Wireless AP](#)” on page 271.
- Lower the priority of less productive traffic—use filters to decrease the QoS assigned to traffic for applications like YouTube and Facebook.

Stations (Application Control)

This status-only window shows client stations currently visible to the AP. The MAC address in the first column is a link. Click on a selected station, and the [Application Control](#) window opens with the **Display for Station** field set to that station, to perform a detailed analysis of its application usage.

Total Stations: 1 <input type="checkbox"/> Identification <input type="checkbox"/> Security <input type="checkbox"/> Connection Info <input type="checkbox"/> Auto Refresh <input type="button" value="Refresh"/>											
MAC Address	IP Address	SSID	Group	VLAN	QoS	Radio	TX Rate	RX Rate	RSSI	Last Alarm	Time D:H:M
00:db:df:1e:4e:e7	192.168.1.78	xyzcorp			2	lap1	39.0Mbps	144.4Mbps	-51	none	0:00:49

Figure 94. Stations (Application Control)

The rest of the fields and display options on this window (including the **Identification**, **Security**, and **Connection Info** checkboxes) are as described in “[Stations](#)” on page 127.

System Log Window

This is a status only window that allows you to review the system log, where system alerts and messages are displayed. Although there are no configuration options available in this window, you do have the usual choice of deciding how the event messages are sorted by clicking in the column header for the desired field (Time Stamp, Priority, or Message).

- **Time Stamp**—sorts the list based on the time the event occurred.
- **Priority**—sorts the list based on the priority assigned to the message.
- **Message**—sorts the list based on the message category

The displayed messages may be filtered by using the **Filter Priority** option, which allows control of the minimum priority level displayed. For example, you may choose (under **Services >System Log**) to log messages at or above Debug level but use **Filter Priority** to display only those at Information level and above.

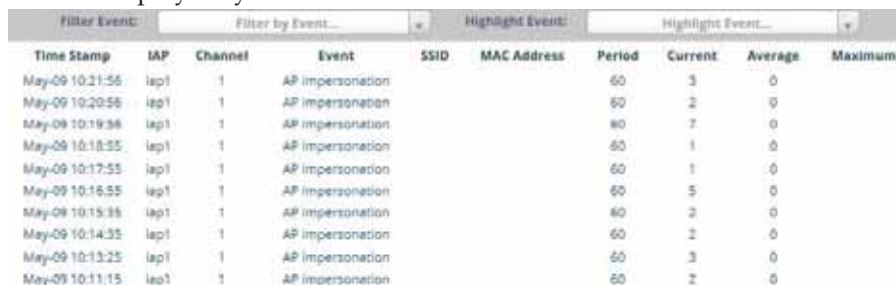

Figure 95. System Log (Alert Level Highlighted)

Use the **Highlight Priority** field if you wish to highlight messages at the selected priority level. Click on the **Refresh** button to refresh the message list, or click on the **Clear All** button at the upper left to delete all messages. You can also click in the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

IDS Event Log Window

This status only window displays the Intrusion Detection System (IDS) Event log, listing any detected attacks on your network. For descriptions of the types of attacks detected, as well as the settings to fine-tune IDS on the AP, please see “Intrusion Detection” on page 373.

The displayed messages may be filtered by using the **Filter Event** setting, which allows you to select just one type of intrusion to display. For example, you may choose to display only beacon flood attacks.

Filter Event:	Filter by Event...	Highlight Event:	Highlight Event...						
Time Stamp	IAP	Channel	Event	SSID	MAC Address	Period	Current	Average	Maximum
May-09 10:21:55	lap1	1	AP impersonation			60	3	0	
May-09 10:20:55	lap1	1	AP impersonation			60	2	0	
May-09 10:19:36	lap1	1	AP impersonation			60	2	0	
May-09 10:18:55	lap1	1	AP impersonation			60	1	0	
May-09 10:17:55	lap1	1	AP impersonation			60	1	0	
May-09 10:16:55	lap1	1	AP impersonation			60	5	0	
May-09 10:15:36	lap1	1	AP impersonation			60	2	0	
May-09 10:14:35	lap1	1	AP impersonation			60	2	0	
May-09 10:13:25	lap1	1	AP impersonation			60	3	0	
May-09 10:11:15	lap1	1	AP impersonation			60	2	0	

Figure 96. IDS Event Log

Use the **Highlight Event** field if you wish to highlight all events of one particular type in the list. Click on a column header to sort the rows based on that column. Click on the **Refresh** button to refresh the message list, or click the **Auto Refresh** check box to instruct the AP to refresh this window automatically.

Although there are no configuration options available in this window, you do have the usual choice of deciding how the event messages are sorted by clicking in the column header for the desired field.

- **Time Stamp**—the time that the event occurred.
- **IAP**—the affected radio.
- **Channel**—the affected channel.
- **Event**—the type of attack, as described in [Intrusion Detection](#).
- **SSID**—the SSID that was attacked.
- **MAC Address**—the MAC address of the attacker.

Wireless Access Point

- **Period**—the length of the window used to determine whether the count of this type of event exceeded the threshold.
- **Current**—the count of this type of event for the current period.
- **Average**—the average count per period of this type of event.
- **Maximum**—the maximum count per period of this type of event.

Configuring the Wireless AP

If you are a customer using XMS-9000-CL-x, then APs are managed via the Cloud, and local AP management interfaces are inaccessible.

The following topics include procedures for configuring the AP using the product's embedded Web Management Interface (WMI). Procedures have been organized into functional areas that reflect the [flow and content](#) of the WMI. The following WMI windows allow you to establish configuration parameters for your AP, and include:

- [“Express Setup” on page 163](#)
- [“Network” on page 169](#)
- [“Services” on page 185](#)
- [“VLANs” on page 213](#)
- [“Tunnels” on page 220](#)
- [“Security” on page 225](#)
- [“SSIDs” on page 268](#)
- [“Groups” on page 304](#)
- [“IAPs” on page 311](#)
- [“WDS” on page 385](#)
- [“Filters” on page 391](#)
- [“Clusters” on page 401](#)
- [“Mobile” on page 406](#)

After making changes to the configuration settings of an AP you must click the **Save** button  at the top of the configuration window, otherwise the changes you make will not be applied the next time the AP is rebooted.

Some pages or individual settings are only available if the AP's license includes appropriate features. If a setting is unavailable (grayed out), then your license or your AP model does not support the feature. See [“About Licensing and Upgrades” on page 412](#).

*If you have added modular IAPs to your AP, note that its model number will be automatically adjusted to reflect the count and types of IAPs currently installed. See **Upgrading with 802.11ac radio modules**.*

This chapter only covers using the configuration windows on the AP. To view status or use system tools on the AP, please see:

- **“Viewing Status on the Wireless AP” on page 95**
- **“Using Tools on the Wireless AP” on page 411**

Express Setup

Initial AP configuration via XMS sets items such as SSIDs and security, as described in “Zero-Touch Provisioning and Ongoing Management” on page 75. This page allows you to see many of these values, or change them locally.

The screenshot displays the WMI Express Setup configuration interface, organized into several sections:

- License:** License Key: 1P34Q-B75X6-9UR11-A. An **Apply** button is present.
- Contact Information:** Location: Anywhere, USA; Contact Name: J Smith; Contact Email: jsmith@xyzcorp.com; Contact Phone: 212 555-1212.
- Network Settings:** Host Name: factoryap; Address Type: DHCP, Static; Address: 192.168.1.84; Subnet Mask: 255.255.255.0; Gateway: 192.168.1.254. An **Apply** button is present.
- SSID Settings:** SSID Name (Replaces SSID "xirrus"): [empty]; Wireless Security: Open. An **Apply SSID Settings** button is present. Current SSIDs listed: guest, honeypot, xyzcorp.
- Admin Settings:** New Admin User (Replaces user "admin"): [empty]; New Admin Privilege Level: 1 read-write; New Admin Password: [empty]; Confirm Admin Password: [empty]. An **Apply Admin Settings** button is present.
- Time and Date Settings:** Time Zone: (GMT - 08:00) Pacific Time (US & Canada): Tijuana.
- Quick Configuration:** Apply Quick Configuration Template: Select a Te... An **Apply** button is present.
- IAP Settings:** Enable/Configure All IAPs: An **Execute** button is present.

Figure 97. WMI: Express Setup

When finished, click the **Save** button  if you wish to make your changes permanent.

Procedure for Performing an Express Setup

1. **License Key:** An unlicensed AP will automatically contact Xirrus to obtain its license, if it has Internet connectivity. If you need to enter a license manually, enter it here. The factory installed license key is listed here. See [“Licensing” on page 80](#).
2. Configure the **Contact Information** settings.
 - a. **Location:** Enter a brief but meaningful description that accurately defines the physical location of the AP. In an environment where multiple units are installed, clear definitions for their locations are important if you want to identify a specific unit.
 - b. **Contact Name:** Enter the name and contact information of the person who is responsible for administering the AP at the designated location.
 - c. **Contact Email:** Enter the email address of the admin contact you entered in Step 3.
 - d. **Contact Phone:** Enter the telephone number of the admin contact you entered in Step 3.
3. Configure the **Network** settings. Please see [“Interfaces” on page 170](#) for more information.
 - a. **Host Name:** Specify a unique [host name](#) for this AP. The host name is used to identify the AP on the network. Use a name that will be meaningful within your network environment, up to 64 alphanumeric characters. The default is the AP’s serial number.
 - b. **Address Type:** Choose **DHCP** to instruct the AP to use **DHCP** to assign IP addresses to the AP’s Ethernet interfaces, or choose **Static** if you intend to enter IP addresses manually. If you choose the Static IP option, you must enter the following **IP Settings**:

- c. **IP Settings:** If you choose the **Static** IP addressing option, enter the following:
 - **Address:** Enter a valid IP address for this AP. To use a remote connection (Web, [SNMP](#), or [SSH](#)), a valid IP address must be used.
 - **Subnet Mask:** Enter a valid IP address for the [subnet mask](#) (the default is 255.255.255.0). The subnet mask defines the number of IP addresses that are available on the routed subnet where the AP is located.
 - **Default Gateway:** Enter a valid IP address for the [default gateway](#). This is the IP address of the router that the AP uses to forward data to other networks.
 - Click the **Apply** button for this interface when done making IP changes.

For improved security, you should also take the additional steps described in “Securing Low Level Access to the AP” on page 81.

4. **SSID Settings:** This section specifies the wireless network name and security settings.
 - a. **SSID Name** is a unique name that identifies a wireless network. The default SSID is **xirrus**. Entering a value in this field will replace the this default SSID with the new name.

For additional information about SSIDs, go to the [Multiple SSIDs](#) section of “[Frequently Asked Questions](#)” on page 522.
 - b. **Wireless Security:** Select the desired wireless security scheme (Open, [WEP](#) or [WPA](#)). Make your selection from the choices available in the pull-down list.
 - **Open**—This option offers no data encryption and is not recommended, though you might choose this option if clients are required to use a VPN connection through a secure SSH utility, like PuTTY.

- 
- **WEP** (Wired Equivalent Privacy)—An optional IEEE 802.11 function that offers frame transmission privacy similar to a wired network. WEP generates secret shared encryption keys that both source and destination stations can use to alter frame bits to avoid disclosure to eavesdroppers.
 - **WPA** (Wi-Fi Protected Access)—A Wi-Fi Alliance standard that contains a subset of the IEEE 802.11i standard, using TKIP or AES as an encryption method and 802.1x for authentication. WPA is the stronger of the two wireless security schemes.
 - **WPA2** (Wi-Fi Protected Access 2)—WPA2 is the follow-on security method to WPA for wireless networks and provides stronger data protection and network access control. It offers Enterprise and consumer Wi-Fi users with a high level of assurance that only authorized users can access their wireless networks. Like WPA, WPA2 is designed to secure all versions of 802.11 devices, including 802.11a, 802.11b, 802.11g, and 802.11n, multi-band and multi-mode.
 - **WPA-Both** (WPA and WPA2)—This option makes use of both WPA and WPA2.

For more information about security, including a full review of all security options and settings, go to [“Understanding Security” on page 226](#).

- c. WEP Encryption Key/WPA Passphrase:** Depending on the wireless security scheme you selected, enter a unique WEP key or WPA passphrase. This field and the one below only appear if you select a **Wireless Security** option other than **Open**.
- d. Confirm Encryption Key/Passphrase:** If you entered a WEP key or WPA passphrase, confirm it here.
- e.** Click **Apply SSID Settings** when done.
- f. Current SSIDs:** This lists all of the currently defined SSIDs for you (regardless of whether they are enabled or not).

5. **Admin Settings:** This section allows you to change the default admin username, password, and privileges for the AP. You may change the password and leave the user name as is, but we suggest that you change both to improve AP security.
 - a. **New Admin User (Replaces user “admin”):** Enter the name of a new administrator user account. Be sure to record the new account name and password, because the default **admin** user will be deleted! Note that the AP also offers the option of authenticating administrators using a RADIUS server (see [“Admin Management” on page 231](#)).
 - b. **New Admin Privilege Level:** By default, the new administrator will have read/write privileges on the AP (i.e., the new user will be able to change the configuration of the AP). If you wish the new account to have different privileges, select the desired level from the drop-down list. For more information about user privileges, please see [“Admin Privileges” on page 233](#). Take care to make sure to leave yourself enough read/write privileges on at least one account to be able to administer the AP.
 - c. **New Admin Password:** Enter a new administration password for managing this AP. If you forget this password, you must reset the AP to its factory defaults so that the password is reset to **admin** (its default setting).
 - d. **Confirm Admin Password:** If you have entered a new administration password, confirm the new password here.
 - e. Click **Apply Admin Settings** when done.
6. **Time and Date Settings:** System time is synchronized using NTP (Network Time Protocol) by default. Use the drop-down list to select the **Time Zone**.
7. **Quick Configuration:** This offers predefined configuration options such as **Classroom** and **High-Density** that capture best practices from years of field experience. If one of the options in the drop-down list is appropriate

to your deployment, select it and click **Apply**. For example, the **High-Density** option uses best practices to configure the AP for high density settings such as lecture halls, convention centers, stadiums, etc.

8. **IAP Settings:**

Figure 98. LEDs are Switched On

Enable/Configure All IAPs: Click on the **Execute** button to enable and auto configure all IAPs (a message displays the countdown time—in seconds—to complete the auto-configuration task). When enabled, the IAP's LED is switched on.

9. Click the **Save** button  at the upper right to make your changes permanent, i.e., these settings will still be in effect after a reboot.

Network

This is a status-only window that provides a snapshot of the configuration settings currently established for the Ethernet interfaces. [DNS Settings](#) and other settings are summarized as well. You must go to the appropriate configuration window to make changes to any of the settings displayed here (configuration changes cannot be made from this window). You can click on any item in the **Interface** column to “jump” to the associated configuration window.

Ethernet Settings Summary												
Interface	State	Management	LED	Auto Neg	Link	Duplex	Speed (Mbps)	MTU Size	DHCP	IP Address	Subnet Mask	Gateway
gig1	enabl...	enabled	disabled	on	up	full	1000	1500	enabled	192.16...	255.25...	192.168.1...
gig2	enabl...	enabled	disabled	on	down	full	10	1500	enabled	192.16...	255.25...	192.168.1...

Bond Settings Summary					
Interface	Bond	Mode	Ports	Active VLANs	Mirror
gig1	bond1	link-backup	gig1 gig2	all	off
gig2	bond1	link-backup	gig1 gig2	all	off

DNS Settings Summary				
Hostname	Domain	DNS Server 1	DNS Server 2	DNS Server 3
factoryap	gateway.2wire.net	192.168.1.254		

Figure 99. Network Interfaces

WMI windows that allow you to change or view configuration settings associated with the network interfaces include:

- “Interfaces” on page 170
- “Bonds and Bridging” on page 173
- “DNS Settings” on page 180
- “Cisco Discovery Protocol (CDP) Settings” on page 181

Interfaces

XR-500, XR-1000, and some XR-2000 Series APs have one Gigabit Ethernet interface, while XR- 600, XR-4000 and some XR-2000 Series APs have two, and XR-6000 Series models have four. This window allows you to establish configuration settings for these interfaces.

The screenshot displays the network configuration interface for two Gigabit Ethernet ports. The top bar indicates the user is logged in as 'admin'. The interface is divided into two sections: 'Gigabit Ethernet 1 Settings' and 'Gigabit Ethernet 2 Settings'. Each section contains the following configuration options:

- Enable Interface:** Radio buttons for Yes (selected) and No.
- LED Indicator:** Radio buttons for Enabled (selected) and Disabled.
- Allow Management On Interface:** Radio buttons for Yes (selected) and No.
- Auto Negotiate:** Radio buttons for Yes (selected) and No.
- Duplex:** Radio buttons for Full (selected) and Half.
- Maximum Transmission Unit (MTU):** A text input field containing '1500'.
- Speed:** A dropdown menu showing 'Gigabit' for port 1 and '10 Megabit' for port 2.
- Configuration Server Protocol:** Radio buttons for DHCP (selected) and Static.
- IP Settings:** Text input fields for Address (192.168.1.84), Subnet Mask (255.255.255.0), and Default Gateway (192.168.1.254), with an 'Apply' button below.

Figure 100. Network Settings

When finished making changes, click the **Save** button  if you wish to make your changes permanent. When the status of a port changes, a Syslog entry is created describing the change.

Network Interface Ports

For the location of network interface ports on an AP, see the illustrations in “User Interfaces” on page 76.

Procedure for Configuring the Network Interfaces

Configure the **Gigabit** network interfaces. The fields for each of these interfaces are the same, and include:

1. **Enable Interface:** Choose **Yes** to enable this network interface, or choose **No** to disable the interface.
2. **LED Indicator:** Choose **Enabled** to allow the LED for this interface to blink with traffic on the port, or choose **Disabled** to turn the LED off. The LED will still light during the boot sequence, then turn off. This option is only available for the Gigabit interfaces.
3. **Allow Management on Interface:** Choose **Yes** to allow management of this AP via the selected network interface, or choose **No** to deny all management privileges for this interface.

For improved security, you should also take the additional steps described in “Securing Low Level Access to the AP” on page 81.

4. **Auto Negotiate:** This feature allows the AP to negotiate the best transmission rates automatically. Choose **Yes** to enable this feature, or choose **No** to disable this feature—the default is enabled. If you disable the Auto Negotiate feature, you must define the Duplex and Speed options manually (otherwise these options are not available). Both sides of the link **must** have the same values for the following settings, or the connection will have errors.
 - a. **Duplex:** Full-duplex mode transmits data in two directions simultaneously (for example, a telephone is a full-duplex device because both parties can talk and be heard at the same time). Half-duplex allows data transmission in one direction at a time only (for example, a walkie-talkie is a half-duplex device). If the Auto-

Negotiate feature is disabled, you can manually choose **Half** or **Full** duplex for your data transmission preference.

- b. MTU:** The Maximum Transmission Unit size. This is the largest packet size (in bytes) that the interface can pass along.
 - c. Speed:** If the Auto-Negotiate feature is disabled, you must manually choose the data transmission speed from the pull-down list. For the Gigabit interfaces the options are **10 Megabit** or **100 Megabit**. (Note that 1000 Megabit speed can only be set by Auto-Negotiation.)
- 5. Configuration Server Protocol / IP Settings:** Choose **DHCP** to instruct the AP to use **DHCP** when assigning IP addresses to the AP, or choose **Static IP** if you intend to enter IP addresses manually. If you select the Static IP option you must specify the IP address, IP subnet mask and default gateway.
 - a. Address:** If you selected the Static IP option, enter a valid IP address for the AP. To use any of the remote connections (Web, **SNMP**, or SSH), a valid IP address must be established.
 - b. Subnet Mask:** If you selected the Static IP option, enter a valid IP address for the **subnet mask** (the default for Class C is 255.255.255.0). The subnet mask defines the number of IP addresses that are available on the routed subnet where the AP is located.
 - c. Default Gateway:** If you selected the Static IP option, enter a valid IP address for the **default gateway**. This is the IP address of the router that the AP uses to send data to other networks. (You don't need to enter the gateway if it is on the same subnet as the AP.)
 - d.** Click the **Apply** button for this interface when done making IP changes.
- 6.** When done configuring all interfaces as desired, click the **Save** button  if you wish to make your changes permanent.

[Network Statistics](#)

[Spanning Tree Status](#)

Bonds and Bridging

On models with more than one Gigabit port these ports may be bonded, i.e. configured to work together in sets. For example, one port may provide active backup or load balancing for another, or other options as described in this section. XR-6000 Series APs have four Gigabit ports, and you may specify which ports are bonded to work together as a pair. You may also select more than two ports to work together in one group.

A special option lets you configure bridging between the Gigabit ports on an AP that has two of these ports.

Figure 101. Network Bonds and Bridging

You may use the mirror option to have all the traffic that is ingressing and egressing one bond be transmitted by the bond you are configuring. For example, if you configure Bond2 to mirror Bond1, then all traffic going in and out of Bond1's Gigabit ports will be transmitted out of Bond2's Gigabit ports. This way

of duplicating one bond's traffic to another bond is very useful for troubleshooting with a network analyzer.

If a set of Gigabit ports have been bonded, the IP address, IP mask, IP gateway, IP DHCP, and Management settings are shared between bonded ports. Any changes you make to these settings on one member will be reflected in the settings of the other members. Other settings may be configured individually.

Procedure for Configuring Network Bonds

Configure the bonding behavior of the **Gigabit** network interfaces. The fields for each of these bonds are the same, and include:

1. **Bridge Traffic Across All Ports:** Click this for Layer 2 bridging between *all* Gigabit ports. (Figure 102)

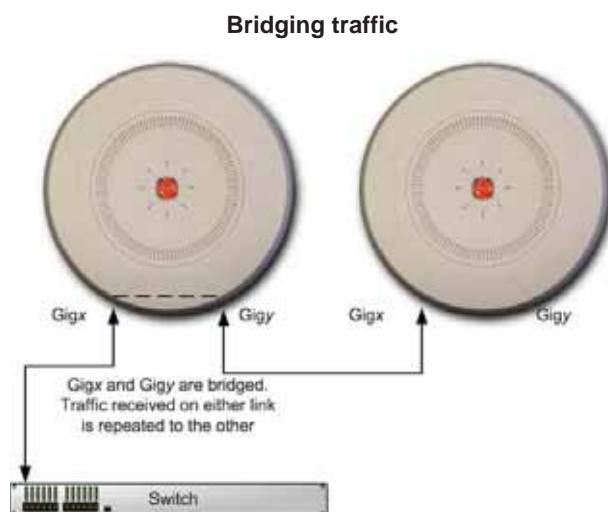

Figure 102. Bridging Traffic

Traffic received on Gig x is transmitted by Gig y ; similarly, traffic received on Gig y is transmitted by Gig x . The AP acts as a wired bridge—this allows APs to be chained and still maintain wired connectivity.

Each AP in a chain must have power supplied to its PoE port from a compatible power injector or powered switch port. An AP does not supply power to another AP.

When bridging is enabled, it configures the following bond settings for each bond. Do not make any manual changes to these settings afterwards if you wish to continue bridging.

- **Bond Mode** is set to **Active Backup** (the default value).
- Each port is in its own bond, by itself.
- **Bond Mirror** is **Off**.
- You will typically need to enable use of Spanning Tree manually, to prevent network loops.
- **Active VLANs** is set to **All**.

A bridge between ports **Gig1** and **Gig2** sets **Bond1** to contain only **Gig1**. **Bond2** contains only **Gig2**.

If you are bridging a chain of more than two APs, the endpoint AP is not actually bridging. It can be left with the default settings—**Bond1** is set to **Active Backup**, and will contain **Gig1** and **Gig2**.

Skip to [Step 7 on page 179](#).

2. If you are not enabling bridging, configure the bonding behavior of the **Gigabit** network interfaces as described in the following steps. The fields for each of these bonds are the same.
3. **Bond Mode**: Select the desired behavior for a set of bonded Gigabit Ethernet ports from the following options.

The modes below describe the relationship between a set of Gigabit ports—for example, load balancing or active backup. Use the **Bond Ports** field to select the ports that are bonded (set in [Step 4](#)). Two or more ports

may be bonded. You may also include just one single port in a bond—this is useful for mirroring one Gigabit port to another port ([Step c on page 178](#)). In APs that have four Gigabit ports, you have the option of bonding three or four ports together. In this discussion, we call two ports that are bonded **Gigx** and **Gigy**.

- a. **Active Backup (gig ports fail over to each other)**—This mode provides fault tolerance and is the default mode. Gigx acts as the primary link. Gigy is the backup link and is passive. Gigy assumes the IP properties of Gigx. If Gigx fails, the AP automatically fails over to Gigy. When a failover occurs in this mode, Gigy issues gratuitous ARPs to allow it to substitute for Gigx at Layer 3 as well as Layer 2. See [Figure 103 \(a\)](#). You may include more than two ports in the bond with Active Backup to provide additional fault tolerance. For example, if you have three Gigabit ports configured in a bond, if the first two ports in the bond were to go down, the AP would fail over traffic to the third Gigabit port.

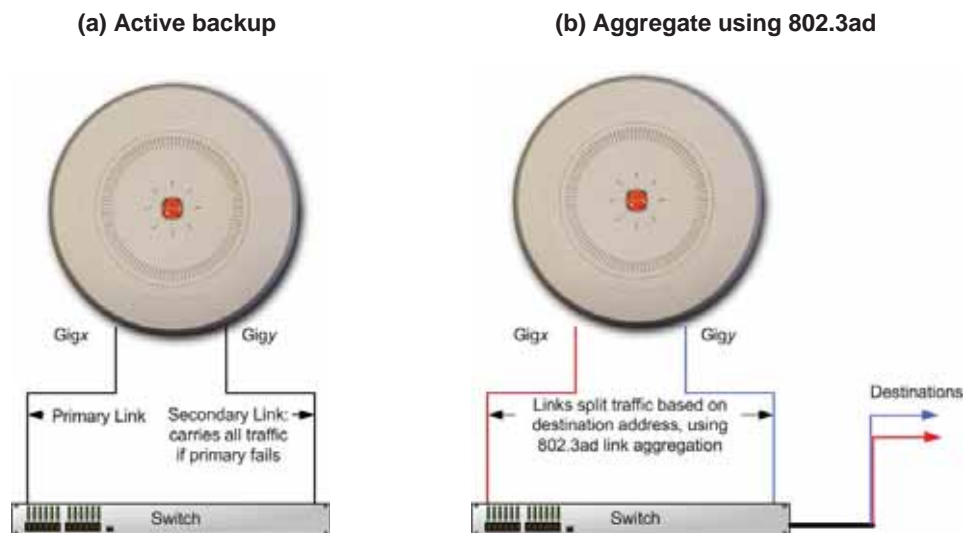

Figure 103. Port Modes (a, b)

- b. **Aggregate Traffic from gig ports using 802.3ad**—The AP sends network traffic across all member Gigabit ports to increase link speed to the network. These ports act as a single logical interface, using a load balancing algorithm to balance traffic across the ports. For non-IP traffic (such as ARP), the last byte of the destination MAC address is used to do the calculation. If the packet is a fragment or not TCP or UDP, the source and destination IP addresses are used to do the calculation. If the packet is TCP or UDP over IP then the source IP address, destination IP address, source port number and destination port number are all used to do the calculation. The network switch must also support 802.3ad. If a port fails, the connection degrades gracefully—the other port still transmits. See [Figure 103 \(b\)](#).
- c. **Transmit Traffic on all gig ports**—Transmits incoming traffic on all Gigabit ports. Any traffic received on Gigabit ports is sent to the onboard processor. This mode provides fault tolerance. See [Figure 104 \(c\)](#).

(c) Transmit on all ports

(d) Load balance traffic

Figure 104. Port Modes (c, d)

Wireless Access Point

on Bond x is passed on to the onboard processor as well as out Bond y . All traffic received on Bond y is passed on to the onboard processor as well as out Bond x . This allows a network analyzer to be plugged into Bond y to capture traffic for troubleshooting, while the bonded ports provide network connectivity for data traffic.

If each bond contains just one port, then you have the simple case of one port mirroring another.

Figure 105. Mirroring Traffic

7. When done configuring bonds and bridging as desired, click the **Save** button  if you wish to make your changes permanent.

[Spanning Tree Status](#)

DNS Settings

This window allows you to establish your **DNS** (Domain Name System) settings. The AP uses these DNS servers to resolve host names into IP addresses. The AP also registers its own Host Name with these DNS servers, so that others may address the AP using its name rather than its IP address. An option allows you to specify that the AP's DNS servers will be assigned via a DHCP server on the wired network.

Note that the DNS servers defined here are not used by wireless clients—servers for stations associated to the AP are defined along with DHCP pools. See “[DHCP Server](#)” on page 200. At least one DNS server must be set up if you want to offer clients associating with the AP the ability to use meaningful host names instead of numerical IP addresses. When finished, click the **Save** button  if you wish to make your changes permanent.

DNS Hostname:	FactoryAP
DNS Domain:	gateway.2wire.net
DNS Server 1:	192.168.1.254
DNS Server 2:	
DNS Server 3:	
Use DNS settings assigned by DHCP:	<input checked="" type="radio"/> On <input type="radio"/> Off

Figure 106. DNS Settings

Procedure for Configuring DNS Servers

1. **DNS Host Name:** Enter a valid DNS **host name**.
2. **DNS Domain:** Enter the DNS **domain** name.
3. **DNS Server 1:** Enter the IP address of the primary DNS server.
4. **DNS Server 2** and **DNS Server 3:** Enter the IP address of the secondary and tertiary DNS servers (if required).
5. **Use DNS settings assigned by DHCP:** If you are using DHCP to assign the AP's IP address, you may turn this option **On**. The AP will then obtain its DNS domain and server settings from the network DHCP

server that assigns an IP address to the AP, rather than using the DNS Server fields above. You may also configure that DHCP server to assign a host name to the AP.

6. Click the **Save** button  if you wish to make your changes permanent.

Cisco Discovery Protocol (CDP) Settings

CDP is a layer 2 network protocol used to share information (such as the device manufacturer and model, network capabilities, and IP address) with other directly connected network devices. Wireless APs can both advertise their presence by sending CDP announcements, and gather and display information sent by neighbors (see “[CDP List](#)” on page 112).

This window allows you to establish your CDP settings. When finished, use the Save button  if you wish to make your changes permanent.

Figure 107. CDP Settings

Procedure for Configuring CDP Settings

1. **Enable CDP:** When CDP is enabled, the AP sends out CDP announcements of the AP’s presence, and gathers CDP data sent by neighbors. When disabled, it does neither. CDP is disabled by default.

2. **CDP Interval:** The AP sends out CDP announcements advertising its presence at this interval. The default is 60 seconds.
3. **CDP Hold Time:** CDP information received from neighbors is retained for this period of time before aging out of the AP's neighbor list. Thus, if a neighbor stops sending announcements, it will no longer appear on the [CDP List](#) window after CDP Hold Time seconds from its last announcement. The default is 180 seconds.

[Network Statistics](#)

LLDP Settings

Link Layer Discovery Protocol (LLDP) is a Layer 2 network protocol used to share information (such as the device manufacturer and model, network capabilities, and IP address) with other directly connected network devices. APs can both advertise their presence by sending LLDP announcements, and gather and display information sent by neighbors (see [“LLDP List” on page 113](#)).

This window allows you to establish your LLDP settings. When finished, use the Save button  if you wish to make your changes permanent.

Enable LLDP:	<input type="radio"/> Yes	<input checked="" type="radio"/> No
LLDP Interval:	<input type="text" value="30"/>	seconds
LLDP Hold Time:	<input type="text" value="120"/>	seconds
Request Power:	<input type="radio"/> Yes	<input checked="" type="radio"/> No

Figure 108. LLDP Settings

Procedure for Configuring LLDP Settings

1. **Enable LLDP:** When LLDP is enabled, the AP sends out LLDP announcements of the AP's presence, and gathers LLDP data sent by neighbors. When disabled, it does neither. LLDP is disabled by default.
2. **LLDP Interval:** The AP sends out LLDP announcements advertising its presence at this interval. The default is 30 seconds.
3. **LLDP Hold Time:** LLDP information received from neighbors is retained for this period of time before aging out of the AP's neighbor list. Thus, if a neighbor stops sending announcements, it will no longer appear on the [LLDP List](#) window after LLDP Hold Time seconds from its last announcement. The default is 120 seconds.
4. **Request Power:** You must enable LLDP before enabling this feature. If Request Power is set to **Yes** and LLDP discovers a device port that supplies power to this AP (on a powered switch, for example), the AP checks that the port is able to supply the peak power that is required by this AP model. The Request Power feature does this by requesting this peak power (in watts) from the PoE source, and it expects the PoE source to reply with the amount of power allocated. If the AP does not receive a response confirming that the power allocated by the PoE source is equal to or greater than the power requested, then the AP issues a Syslog message and keeps the radios down for ten minutes. The radios may be enabled manually after this—see [“IAP Settings” on page 313](#).

Using this feature provides a more graceful way of handling an underpowered situation on a Wi-Fi device. When the radios are turned off, XMS can notify you, rather than having to hunt down an intermittent problem. This feature is disabled by default.

Request Power is available on XR-500/600 and XR-2000 models. It is especially useful for XR-2000 models ending in 5 or 6 (except for the XR-2435/2436), since these models draw PoE+ power levels. Some of these models use Request Power to draw higher power than the IEEE 802.3at maximum of 25.5W. Requested levels are:

XR-2225/2226 (two 2x2 radios) = 22.5W

XR-2235/2236 (two 3x3 radios) = 26.1W

XR-2425/2426 (four 2x2 radios) = 30W

Note that Request Power is not available on the XR-2435/2436. Additionally, it is not available on certain other APs, including these XR Series models: XR-1000, XR-4000, XR-6000, XR-7000.

Services

This is a status-only window that allows you to review the current settings and status for services on the AP, including DHCP, SNMP, Syslog, and Network Time Protocol (NTP) services. For example, for the DHCP server, it shows each DHCP pool name, whether the pool is enabled, the IP address range, the gateway address, lease times, and the DNS domain being used. There are no configuration options available in this window, but if you are experiencing issues with network services, you may want to print this window for your records.

The screenshot shows a web interface with a dark blue header containing the text "Logged in as: admin". Below the header are several summary tables for different services:

- Time Settings Summary:**

NTP Server Status	NTP Server 1 Address	NTP Server 2 Address
Enabled	time.nist.gov	pool.ntp.org
- Netflow Summary:**

State	Collector Host	Collector Port
Disabled		2055
- System Log Settings Summary:**

State		Log Levels						Log Servers : Ports				
on	off	Local Lines	Console	Local	1st	2nd	3rd	Email	Primary	Secondary	Tertiary	Email
		2000	8	7	8	8	8	4	:514	:514	:514	:25
- SNMP Settings Summary:**

SNMPv2 State	Trap Auth Failures	Trap Host IP 1	Trap Host IP 2	Trap Host IP 3	Trap Host IP 4
Enabled	Enabled	Avaya-WOS			
SNMPv3 State	SNMPv3 Security	Trap Port 1	Trap Port 2	Trap Port 3	Trap Port 4
Disabled	sha / aes	162	162	162	162
- DHCP Server Settings:**

DHCP Name	State	NAT	IP Range/Mask	IP Gateway	Default Lease	Maximum Lease	DNS Domain
-----------	-------	-----	---------------	------------	---------------	---------------	------------
- Wifi Tag Summary:**

State	UDP Port	Tag Channel BG	Ekahau Server
Disabled	1144	0	
- Location Summary:**

State	URL	Key	Period
Disabled			15

Figure 109. Services

The following sections discuss configuring services on the AP:

- [“Time Settings \(NTP\)” on page 186](#)
- [“NetFlow” on page 189](#)
- [“Wi-Fi Tag” on page 190](#)
- [“Location” on page 191](#)

- “System Log” on page 193
- “SNMP” on page 197
- “DHCP Server” on page 200
- “Proxy Services” on page 202

Time Settings (NTP)

This window allows you to manage the AP’s time settings, including synchronizing the AP’s clock with a universal clock from an Network Time Protocol (NTP) server. We recommend that you use NTP for proper operation of SNMP in XMS, since a lack of synchronization will cause errors to be detected. Synchronizing the AP’s clock with an NTP server also ensures that Syslog time-stamping is maintained across all units.

It is possible to use authentication with NTP to ensure that you are receiving synchronization from a known source. For example, the instructions for requesting a key for the NIST Authenticated NTP server are available at http://www.nist.gov/pml/div688/grp00/upload/ntp_instructions.pdf. The AP allows you to enter optional authentication information.

Configuration Changes are Ready for Saving

Logged in as: admin

Current Access Point Date and Time: Sat May 09 2014 20:59:39

Time Zone: (GMT) Greenwich Mean Time: Dublin, Lisbon, London

Auto Adjust Daylight Savings: Yes No

Use Network Time Protocol: Yes No

Adjust Time (hrs:min:sec): 08:59:06 PM

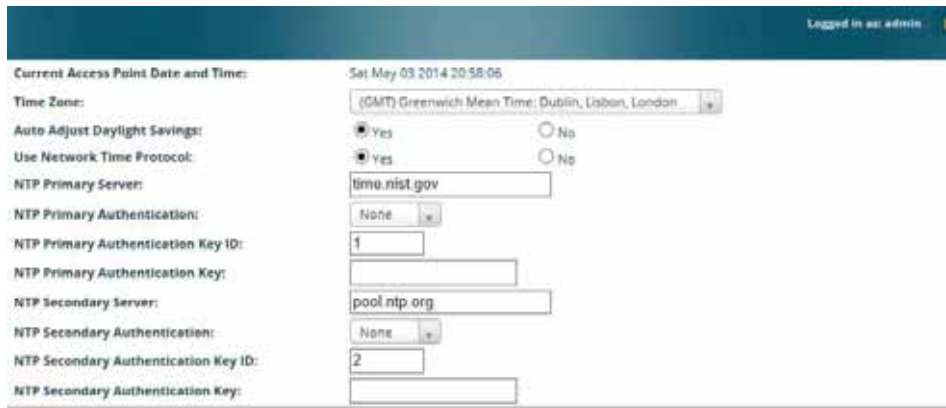

Adjust Date (month/day/year): 05/03/2014

Figure 110. Time Settings (Manual Time)

Procedure for Managing the Time Settings

1. **Current AP Date and Time:** Shows the current time.
2. **Time Zone:** Select the time zone you want to use (normally your local time zone) from the pull-down list.

3. **Auto Adjust Daylight Savings:** Check this box to have the system adjust for daylight savings automatically, else leave it unchecked (default).
4. **Use Network Time Protocol:** Select whether to set time manually or use NTP to manage system time.
5. **Setting Time Manually**
 - a. **Adjust Time (hrs:min:sec):** If you are not using NTP, use this field if you want to adjust the current system time. Enter a revised time (hours, minutes, seconds, am/pm) in the corresponding fields. Click **Set Time** to apply the changes.
 - b. **Adjust Date (month/day/year):** If you are not using NTP, use this field if you want to adjust the current system date. Enter a revised date (month, day and year) in the corresponding fields. Click **Set Date** to apply the changes.
6. **Using an NTP Server**
 - a. **NTP Primary Server:** If you are using NTP, enter the IP address or domain name of the NTP server.

The screenshot displays the 'Time Settings' configuration page. At the top right, it shows 'Logged in as: admin'. The main content area is divided into two columns. The left column lists settings, and the right column shows their current values. The settings include: 'Current Access Point Date and Time' (Sat May 03 2014 20:58:06), 'Time Zone' (GMT Greenwich Mean Time: Dublin, Lisbon, London), 'Auto Adjust Daylight Savings' (Yes selected), 'Use Network Time Protocol' (Yes selected), 'NTP Primary Server' (time.nist.gov), 'NTP Primary Authentication' (None), 'NTP Primary Authentication Key ID' (1), 'NTP Primary Authentication Key' (empty), 'NTP Secondary Server' (pool.ntp.org), 'NTP Secondary Authentication' (None), 'NTP Secondary Authentication Key ID' (2), and 'NTP Secondary Authentication Key' (empty).

Figure 111. Time Settings (NTP Time Enabled)

- 
- b. NTP Primary Authentication:** (optional) If you are using authentication with NTP, select the type of key: **MD5** or **SHA1**. Select **None** if you are not using authentication (this is the default).
 - c. NTP Primary Authentication Key ID:** Enter the key ID, which is a decimal integer.
 - d. NTP Primary Authentication Key:** Enter your key, which is a string of characters.
 - e. NTP Secondary Server:** Enter the IP address or domain name of an optional secondary NTP server to be used in case the AP is unable to contact the primary server. You may use the authentication fields as described above if you wish to set up authentication for the secondary server.

[System Log](#)

NetFlow

This window allows you to enable or disable the sending of NetFlow information to a designated collector. NetFlow is a proprietary but open network protocol developed by Cisco Systems for collecting IP traffic information. When NetFlow is enabled, the AP will send IP flow information (traffic statistics) to the designated collector.

Figure 112. NetFlow

NetFlow sends per-flow network traffic information from the AP. Network managers can use a NetFlow collector to view the statistics on a per-flow basis and use this information to make key decisions. Knowing how many packets and bytes are sent to and from certain IP addresses or across specific network interfaces allows administrators to track usage by various areas. Traffic flow information may be used to engineer networks for better performance.

Procedure for Configuring NetFlow

1. **Enable NetFlow:** Select one of the Netflow versions to enable NetFlow functionality: **v5**, **v9**, or **IPFIX**. Internet Protocol Flow Information Export (IPFIX) is an IETF protocol (www.ietf.org) performing many of the same functions as Netflow. Choose **Disable** if you wish to disable this feature.

If you select IPFIX, 64 bit counters are supported starting with Release 7.1. IPFIX uses IF-MIB, whose ifXTables support 64 bit counters.

2. **NetFlow Collector Host (Domain or IP):** If you enabled NetFlow, enter the domain name or IP address of the collector.
3. **NetFlow Collector Port:** If you enabled NetFlow, enter the port on the collector host to which to send data.

Wi-Fi Tag

This window enables or disables Wi-Fi tag capabilities. When enabled, the AP listens for and collects information about Wi-Fi RFID tags sent on the designated channel. These tags are transmitted by specialized tag devices (for example, AeroScout or Ekahau tags). A Wi-Fi tagging server then queries the AP for a report on the tags that it has received. The Wi-Fi tagging server uses proprietary algorithms to determine locations for devices sending tag signals.

Figure 113. Wi-Fi Tag

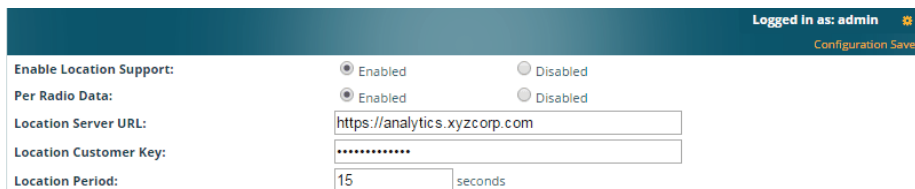

Procedure for Configuring Wi-Fi Tag

1. **Enable Wi-Fi Tag:** Choose **Yes** to enable Wi-Fi tag functionality, or choose **No** to disable this feature.
2. **Wi-Fi Tag UDP Port:** If Wi-Fi tagging is enabled, enter the UDP port that the Wi-Fi tagging server will use to query the AP for data. When queried, the AP will send back information on tags it has observed. For each, the AP sends information such as the MAC address of the tag transmitting device, and the RSSI and noise floor observed.
3. **Wi-Fi Tag Channel BG:** If you enabled Wi-Fi tagging, enter the 802.11 channel on which the AP will listen for tags. The tag devices must be set up to transmit on this channel. Only one channel may be configured, and it must be an 802.11b/g channel in the range of Channel 1 to 11.
4. **Ekahau Server:** If you enabled Wi-Fi tagging and you are using an Ekahau server, enter its IP address or hostname. Ekahau Wi-Fi Tag packets received by the AP will be encapsulated as expected by Ekahau, and forwarded to the server.

Location

The AP offers an integrated capability for capturing and uploading visitor analytics data, eliminating the need to install a standalone sensor network. This data can be used to characterize information such as guest or customer traffic and location, visit duration, and frequency. Use this Location window to configure the AP to send collected data to an analytics server, such as Euclid.

When Location Support is enabled, the AP collects information about stations, including the station ID and manufacturer, time and length of the visit and related time interval statistics, and signal strength and its related statistics. Data collected from stations comprises only basic device information that is broadcast by Wi-Fi enabled devices. Devices that are only detected are included, as well as those that actually connect to the AP. Multiple data points may be sent for a station— data is sent for each IAP that sees a probe request from the station. The AP sending the data also sends its own ID so that the server knows where the visitors were detected. Data messages are uploaded via HTTPS, and they are encrypted if a **Location Customer Key** has been entered. Data is sent as JSON (JavaScript Object Notation) objects, as described in “[Location Service Data Formats](#)” on page 533.

Logged in as: admin	
Configuration Saved	
Enable Location Support:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Per Radio Data:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Location Server URL:	<input type="text" value="https://analytics.xyzcorp.com"/>
Location Customer Key:	<input type="text" value="*****"/>
Location Period:	<input type="text" value="15"/> seconds

Figure 114. Location

Procedure for Configuring Location

1. **Enable Location Support:** Choose **Enabled** to enable the collection and upload of visitor analytic data, or choose **Disabled** to disable this feature.
2. **Per Radio Data:** Choose **Enabled** to enable the collection and upload of visitor analytic data on a per-radio basis, or choose **Disabled** to disable this feature.

- 3. Location Server URL:** If Location Support is enabled, enter the URL of the location/analytics server. If this URL contains the string **euclid**, then the AP knows that data is destined for a Euclid location server.

For a Euclid analytics server, use the URL that was assigned to you as a customer by Euclid. The AP will send JSON-formatted messages in the form required by Euclid via HTTPS.

For any other location analytics server, enter its URL. The AP will send JSON-formatted messages in the form described in [“Location Service Data Formats”](#) on page 533.

- 4. Location Customer Key:** (optional) If a **Location Customer Key** has been entered, data is sent encrypted using AES with that key.
- 5. Location Period:** If you enabled Location Support, specify how often data is to be sent to the server, in seconds.

System Log

This window allows you to enable or disable the Syslog server, define primary, secondary, and tertiary servers, set up email notification, and set the level for Syslog reporting for each server and for email notification—the Syslog service will send Syslog messages at the selected severity or above to the defined Syslog servers and email address. An option allows you to use a Splunk application to analyze AP events by sending data in key:value pairs, as described in “About Using Splunk for Xirrus APs” on page 196.

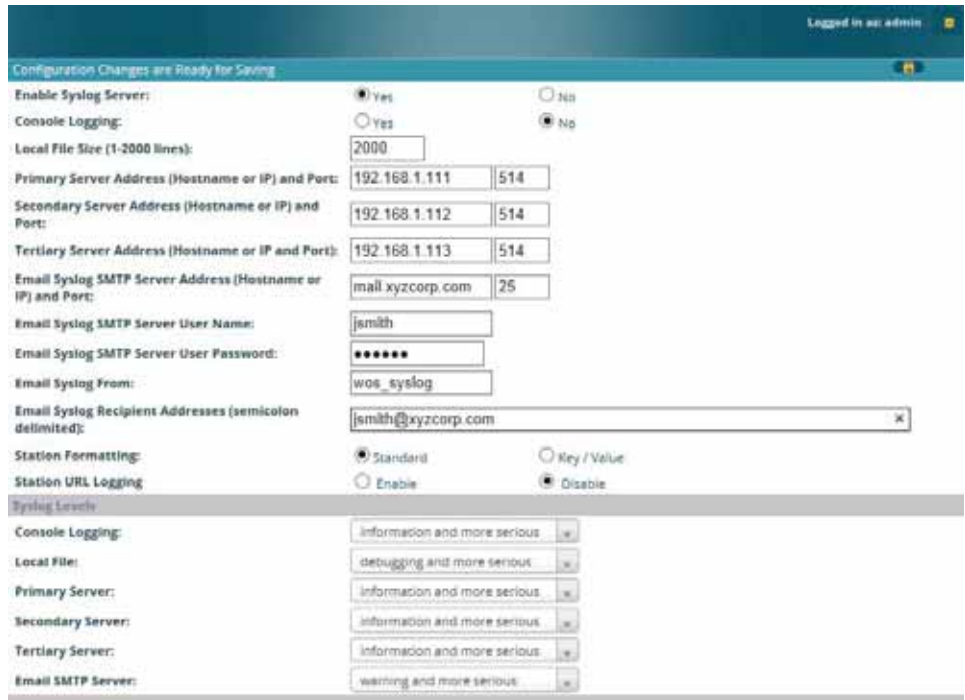

Figure 115. System Log

Procedure for Configuring Syslog

1. **Enable Syslog Server:** Choose **Yes** to enable Syslog functionality, or choose **No** to disable this feature.

- 
2. **Console Logging:** If you enabled Syslog, select whether or not to echo Syslog messages to the console as they occur. If you enable console logging, be sure to set the Console Logging level (see [Step 9](#) below).
 3. **Local File Size** (1-2000 lines): Enter a value in this field to define how many Syslog records are retained locally on the AP's internal Syslog file. The default is 2000.
 4. **Primary Server Address (Hostname or IP) and Port:** If you enabled Syslog, enter the hostname or IP address of the primary Syslog server. You may also change the port used on the server if you do not wish to use 514, the default port.
 5. **Secondary/Tertiary Server Address (Hostname or IP) and Port:** (Optional) If you enabled Syslog, you may enter the hostname or IP address of one or two additional Syslog servers to which messages will also be sent. You may also change the port used on each server if you do not wish to use 514, the default port. You may set one of the server addresses to the address of a server for Splunk (see "[About Using Splunk for Xirrus APs](#)" on page 196).
 6. **Email Notification:** (Optional) The following parameters allow you to send an email to a designated address each time a Syslog message is generated. The email will include the text of the Syslog message.
 - a. **Email Syslog SMTP Server Address (Hostname or IP) and Port:** The hostname or the IP address of the SMTP server to be used for sending the email. Note that this specifies the mail server, **not** the email recipient. You may also change the port used on the server if you do not wish to use 25, the default SMTP port.
 - b. **Email Syslog SMTP User Name:** Specify a user name for logging in to an account on the mail server designated in [Step a](#).
 - c. **Email Syslog SMTP User Password:** Specify a password for logging in to an account on the mail server designated in [Step a](#).
 - d. **Email Syslog SMTP From:** Specify the "From" email address to be displayed in the email.

- e. **Email Syslog SMTP Recipient Addresses:** Specify the entire email address of the recipient of the email notification. You may specify additional recipients by separating the email addresses with semicolons (;).
- 7. **Station Formatting:** If you are sending event information to a Splunk server, select **Key/Value** to send data in Splunk's expected format, otherwise leave this at the default value of **Standard**. See "[About Using Splunk for Xirrus APs](#)" on page 196.
- 8. **Station URL Logging:** When enabled, Syslog messages are sent for each URL that each station visits. Only HTTP destinations (port 80) are logged; HTTPS destinations (port 443) are not logged. All URLs in a domain are logged, so for example, if an HTTP request to yahoo.com generates requests to 57 other URLs, all are logged. Furthermore, each visit to the same URL generates an additional log message. No deep packet inspection is performed by the URL logging, so no [Application Control](#) information is included in the Syslog message.

The following information is included in the syslog message:

- Date / Time
- Source Device MAC and IP address
- Destination Port
- Destination Site address (e.g., 20.20.20.1)
- The specific URL (e.g., <http://20.20.20.1.24/online/images/img2.jpg>)

Station URL Logging is disabled by default.

- 9. **Syslog Levels:** For each of the Syslog destinations, choose your preferred level of Syslog reporting from the pull-down list. Messages with criticality at the selected level and above will be shown. The default level varies depending on the destination.
 - a. **Console Logging:** For messages to be echoed to the console, the default level is **Critical and more serious**. This prevents large numbers of non-critical messages from being displayed on the

console. If you set this level too low, the volume of messages may make it very difficult to work with the CLI or view other output on the console.

- b. **Local File:** For records to be stored on the AP's internal Syslog file, choose your preferred level of Syslog reporting from the pull-down list. The default level is **Debugging and more serious**.
- c. **Primary Server:** Choose the preferred level of Syslog reporting for the primary server. The default level is **Debugging and more serious**.
- d. **Secondary/Tertiary Server:** Choose the preferred level of reporting for the secondary/tertiary server. The default level is **Information and more serious**. (Optional)
- e. **Email SMTP Server:** Choose the preferred level of Syslog reporting for the email notifications. The default level is **Warning and more serious**. This prevents your mailbox from being filled up with a large number of less severe messages such as informational messages.

10. Click the **Save** button  if you wish to make your changes permanent.

About Using Splunk for Xirrus APs

Splunk may be used to provide visibility into client experience and analyze usage on APs. A Splunk application has been developed to present this operational intelligence at a glance. The app includes field extractions, event types, searches and dashboards to help shine a light on station status and activity

To use Splunk, set up your Splunk server with the Splunk application—available from apps.splunk.com at [Splunk for Xirrus XR Wireless APs](#). Configure the AP to send data to Splunk by setting a **Primary, Secondary, or Tertiary Server Address** to the IP address or hostname of your Splunk server. Then set **Station Formatting** to **Key/Value** to send data in Splunk's expected format.

You may specify Server Addresses for Syslog servers and a Splunk server on the same AP. Selecting the **Key/Value** option will not cause any problems with Syslog.

SNMP

This window allows you to enable or disable SNMP v2 and SNMP v3 and define the SNMP parameters. SNMP allows remote management of the AP by the XMS and other SNMP management tools. SNMP v3 was designed to offer much stronger security. You may enable either SNMP version, neither, or both.

The screenshot displays the SNMP configuration interface, organized into three main sections: SNMPv2 Settings, SNMPv3 Settings, and SNMP Trap Settings. At the top right, it indicates the user is logged in as 'admin'. The SNMPv2 section includes options to enable or disable SNMPv2, and fields for Read-Write and Read-Only Community Strings. The SNMPv3 section includes options to enable or disable SNMPv3, authentication and privacy algorithms (SHA, MD5, AES, DES), a Context Engine ID, and fields for Read-Write and Read-Only usernames and passwords. The SNMP Trap Settings section includes fields for up to four trap host IP addresses and their corresponding ports (all set to 162), a checkbox for 'Send Auth Failure Traps', and a 'Keepalive Trap Interval' set to 1.

Section	Parameter	Value
SNMPv2 Settings	Enable SNMPv2:	<input checked="" type="radio"/> Yes
	Read-Write Community String:	*****
	Read-Only Community String:	*****
SNMPv3 Settings	Enable SNMPv3:	<input checked="" type="radio"/> Yes
	Authentication:	<input checked="" type="radio"/> SHA
	Privacy:	<input checked="" type="radio"/> AES
	Context Engine ID:	80005215030007d568780
	Read-Write Username:	xirrus-rw
	Read-Write Authentication Password:	*****
	Read-Write Privacy Password:	*****
	Read-Only Username:	xirrus-ro
	Read-Only Authentication Password:	*****
	Read-Only Privacy Password:	*****
SNMP Trap Settings	Trap Host 1 IP Address:	Xirrus-XMS
	Trap Host 1 Port:	162
	Trap Host 2 IP Address:	
	Trap Host 2 Port:	162
	Trap Host 3 IP Address:	
	Trap Host 3 Port:	162
Send Auth Failure Traps:	<input checked="" type="radio"/> Yes	
Keepalive Trap Interval:	1	

Figure 116. SNMP

Complete SNMP details for the AP, including trap descriptions, are found in the Xirrus MIB, available at support.xirrus.com, in the **Downloads** section (login is required to download the MIB).

NOTE: If you are managing your APs with XMS (the Xirrus Management System), it is very important to make sure that your SNMP settings match those that you have configured for XMS. XMS uses both SNMP v2 and v3.

Procedure for Configuring SNMP

SNMPv2 Settings

1. **Enable SNMPv2:** Click the checkbox to the left of the **Enabled** label to enable or disable SNMP v2 functionality. When used in conjunction with the Xirrus Management System, SNMP v2 (**not** SNMP v3) must be enabled on each AP to be managed with XMS. The default for this feature is Enabled.
2. **SNMP Read-Write Community String:** Enter the read-write community string. The default is `xirrus`.
3. **SNMP Read-Only Community String:** Enter the read-only community string. The default is `xirrus_read_only`.

SNMPv3 Settings

4. **Enable SNMPv3:** Click the checkbox to the left of the **Enabled** label to enable or disable SNMP v3 functionality. The default for this feature is Disabled.
5. **Authentication:** Select the desired method for authenticating SNMPv3 packets: Secure Hash Algorithm (**SHA**) or Message Digest Algorithm 5 (**MD5**).
6. **Privacy:** Select the desired method for encrypting data: Data Encryption Standard (**DES**) or the stronger Advanced Encryption Standard (**AES**).

7. **Context Engine ID:** The unique identifier for this SNMP server. We recommend that you do not change this value. The Context Engine ID must be set if data collection is to be done via a proxy agent. This ID helps the proxy agent to identify the target agent from which data is to be collected.
8. **SNMP Read-Write Username:** Enter the read-write user name. This username and password allow configuration changes to be made on the AP. The default is **xirrus-rw**.
9. **SNMP Read-Write Authentication Password:** Enter the read-write password for authentication (i.e., logging in). The default is **xirrus-rw**.
10. **SNMP Read-Write Privacy Password:** Enter the read-write password for privacy (i.e., a key for encryption). The default is **xirrus-rw**.
11. **SNMP Read-Only Username:** Enter the read-only user name. This username and password do not allow configuration changes to be made on the AP. The default is **xirrus-ro**.
12. **SNMP Read-Only Authentication Password:** Enter the read-only password for authentication (i.e., logging in). The default is **xirrus-ro**.
13. **SNMP Read-Only Privacy Password:** Enter the read-only password for privacy (i.e., a key for encryption). The default is **xirrus-ro**.

SNMP Trap Settings

14. **SNMP Trap Host IP Address:** Enter the **IP Address** or hostname, as well as the **Port** number, of an SNMP management station that is to receive SNMP traps. You may specify up to four hosts that are to receive traps. Note that by default, **Trap Host 1** sends traps to **Xirrus-XMS**. Thus, the AP will automatically communicate its presence to XMS (as long as the network is configured correctly to allow this host name to be resolved—note that DNS is not normally case-sensitive).

For a definition of the traps sent by Xirrus Wireless APs, you may download the Xirrus MIB from support.xirrus.com (login required). Search for the string **TRAP** in the MIB file.

15. **Send Auth Failure Traps:** Click the checkbox to the left of the **Enabled** label to enable or disable log authentication failure traps.
16. **Keepalive Trap Interval** (minutes): Traps are sent out at this interval to indicate the presence of the AP on the network. Keepalive traps are required for proper operation with XMS. To disable keepalive traps, set the value to 0.
17. Click the **Save** button  if you wish to make your changes permanent.

[System Log](#)

[Time Settings \(NTP\)](#)

DHCP Server

This window allows you to create, enable, modify and delete **DHCP** (Dynamic Host Configuration Protocol) address pools. DHCP allows the AP to provide wireless clients with IP addresses and other networking information. The DHCP server will not provide DHCP services to the wired side of the network. If you do not use the DHCP server on the AP, then your wired network must be configured to supply DHCP addresses and gateway and DNS server addresses to wireless clients.

When you create a DHCP pool, you must define the **DHCP lease** time (default and maximum), the IP address ranges (pools) that the DHCP server can assign, and the gateway address and DNS servers to be used by clients.

Figure 117. DHCP Management

DHCP usage is determined in several windows—see [SSID Management](#), [Group Management](#), and [VLAN Management](#).

Procedure for Configuring the DHCP Server

1. **New Internal DHCP Pool:** Enter a name for the new DHCP pool, then click on the **Create** button. The new pool ID is added to the list of available DHCP pools. You may create up to 16 DHCP pools (up to 8 on the XR-500 Series).
2. **On:** Click this checkbox to make this pool of addresses available, or clear it to disable the pool.
3. **Lease Time—Default:** This field defines the default [DHCP lease](#) time (in seconds). The factory default is 300 seconds, but you can change the default at any time.
4. **Lease Time—Max:** Enter a value (in seconds) to define the maximum allowable DHCP lease time. The default is 300 seconds.
5. **Network Address Translation (NAT):** Check this box to enable the Network Address Translation feature. The NATed address uses the IP address of the AP's outbound gigabit Ethernet interface.
6. **Lease IP Range—Start:** Enter an IP address to define the start of the IP range that will be used by the DHCP server. The default is 192.168.1.100.
7. **Lease IP Range—End:** Enter an IP address to define the end of the IP range that will be used by the DHCP server. The DHCP server will only use IP addresses that fall between the start and end range that you define on this page. The default is 192.168.1.200.
8. **Subnet Mask:** Enter the subnet mask for this IP range for the DHCP server. The default is 255.255.255.0.
9. **Gateway:** If necessary, enter the IP address of the gateway.
10. **Domain:** Enter the DNS domain name. See [“DNS Settings” on page 180](#).

11. **DNS Servers** (1 to 3): Enter the IP address of the primary DNS server, secondary DNS server and tertiary DNS server. These DNS server addresses will be passed to stations when they associate, along with the assigned IP address. Note that if you leave these blank, no DNS information is sent to the stations. DHCP will **not** default to sending the DNS servers that are configured in DNS Settings. See also, “DNS Settings” on page 180.
12. Click the **Save** button  if you wish to make your changes permanent.

Proxy Services

XR-520/XR-1000 Series APs do not support HTTP/S proxy. You will receive an error message if you attempt to configure this feature.

If your organization uses a proxy server such as Blue Coat or Netbox Blue to control Internet access, use this page to configure proxy forwarding on the AP. Options are provided for proxying user traffic and AP management traffic.

Proxy services for user traffic are discussed in the following topics:

- [“About Proxy Forwarding” on page 203](#)
- [“Proxy Forwarding for HTTPS” on page 204](#)
- [“Summary of Proxy Forwarding Behavior on the AP” on page 205](#)
- [“Configuring Proxy Forwarding on Clients for HTTPS” on page 206](#)
- [“Procedure for Configuring Proxy Forwarding on the AP” on page 210](#)

Proxy services for management traffic are discussed in the following topics:

- [“About Using a Proxy Client for Management Traffic” on page 210](#)
- [“Procedure for Configuring Proxy Client for Management Traffic” on page 211](#)

About Proxy Forwarding

Figure 118. Proxy Forwarding Example

When you configure proxy forwarding settings on the AP, it forwards each HTTP request to the proxy server (for example, Blue Coat) at the specified URL, which checks if the policies that you have set up on the server are satisfied. If so, the proxy server sends the request on to the desired web site. An example is shown in Figure 118. The user of the laptop tries to open Facebook on a browser. The AP forwards this request to the proxy server that you have specified, after adding a prefix with the **user's ID** and the **SSID** (the SSID serves as a user group; for unauthenticated clients, the MAC address serves as the user name). The proxy server checks whether its configured policies permit this access for this user and SSID. If so, the frame is forwarded to the desired web site.

- SSID and client User Name restrictions permit the following characters.*
- Blue Coat permits only alphanumerics and + and /.
 - Netbox Blue permits only alphanumerics and dot, hyphen, underscore, and space characters.

Proxy forwarding on the AP is designed for proxy servers such as Blue Coat and Netbox Blue whose purpose is restricting Internet access to sites, applications and content, and the monitoring and reporting of this activity. It is not used for enhanced performance utilizing content caching.

*Blue Coat policy configuration:*

The AuthConnector utility is not used with the Xirrus implementation. Traffic must first be passed through the portal to dynamically add the User to Blue Coat's list of recognized Users, based on the User header inserted in the packets. When configuring Blue Coat Content Filtering policy, you may select "Users from Reporting". Only the User value can be used in this manner. The Group header value is not dynamically added to Blue Coat's Group list, and it can't be added manually.

Netbox Blue policy configuration:

Users and Groups are manually configured on the server. Users are manually assigned to Groups, and policy is applied on a per-Group basis.

Proxy forwarding on the AP is configured as described in ["Procedure for Configuring Proxy Forwarding on the AP"](#) on page 210. This proxies all HTTP traffic to the specified server. If you wish to proxy HTTPS traffic as well, you must take the additional steps described below.

Proxy Forwarding for HTTPS

There are two usage scenarios for proxy forwarding:

- Use proxy forwarding for HTTP traffic only: set up the AP per ["Procedure for Configuring Proxy Forwarding on the AP"](#) on page 210. HTTPS traffic is unaffected and proceeds in the usual way.
- Use proxy forwarding for both HTTP and HTTPS traffic: set up the AP per ["Procedure for Configuring Proxy Forwarding on the AP"](#) on page 210. Then you must set up browsers on client stations (laptops, smart phones, tablets, ...) to proxy both HTTP and HTTPS traffic to the AP. Each client must also download and install the SSL certificate from the Blue Coat or Netbox Blue proxy server. Follow the procedure below to perform these steps on each client. Note that when a proxy is set up and used for HTTPS, HTTP traffic will also use the proxy server, so configure both as instructed in ["Configuring Proxy Forwarding on Clients for HTTPS"](#) on page 206.

Summary of Proxy Forwarding Behavior on the AP

If proxy forwarding is **not** enabled in the AP and the client browser is **not** configured to use a proxy:

- HTTP traffic (port 80) and HTTPS traffic (port 443) pass transparently through the AP in the usual way.

If proxy forwarding **is** enabled for Blue Coat or Netbox Blue and the client browser is **not** configured to use a proxy (i.e., you do not wish to proxy secure traffic):

- The browser still uses HTTP (port 80) and this traffic is captured and proxied by the AP.
- The browser still uses HTTPS (port 443) and this traffic is passed transparently through the AP.
- If proxy forwarding is not working correctly, HTTP traffic (port 80) is blocked.

If proxy forwarding **is** enabled for Blue Coat or Netbox Blue and the client browser **is** configured to use a proxy:

- The browser is configured to proxy HTTPS to www.xirrus.com port 4388.
- The browser automatically proxies HTTP traffic to the **same** port that is used for HTTPS traffic—port 4388.
- All HTTP/HTTPS traffic is captured by the AP and proxied to Blue Coat or Netbox Blue per your settings.
- If AP proxy forwarding is not working correctly (for example, if the configuration is incorrect), all HTTP/HTTPS/4388 traffic is blocked.

Configuring Proxy Forwarding on Clients for HTTPS

To set the proxy server on an Apple laptop, skip to [Step 3](#).

1. For Windows laptops, click the desktop **Start** button. In the **Search programs and files** field, enter **Configure proxy server**. The Internet Properties dialog is displayed. ([Figure 119](#)) Click the **LAN Settings** button. The Local Area Network dialog displays.

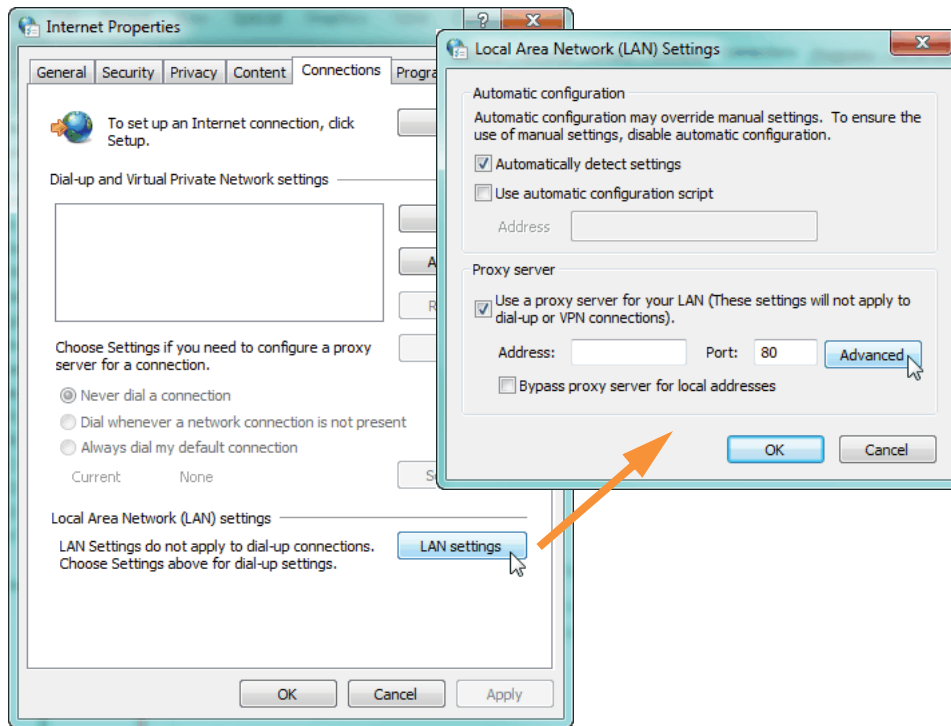

Figure 119. Set up a Proxy Server on each Client (Windows)

2. In the Proxy Server section, click the **Advanced** button. The Proxy Settings dialog displays. ([Figure 120](#))

For **HTTPS**: Enter any valid address, such as your company's web site in the **Proxy address to use** field. For example, **www.xyzcorp.com** as shown in [Figure 116](#). This field is not actually used, but Windows needs it to be a

valid address or domain name. You **must** set the **Port** to **4388**. This is **very important!** This is the AP port that should receive all HTTPS traffic if you are using a proxy server.

For **HTTP**: HTTP traffic will automatically use the same port that you have configured for HTTPS: 4388. We suggest that you enter your company's web site, **Port 4388** here to make it obvious that HTTP traffic is being proxied in this way.

Continue to [Step 5](#).

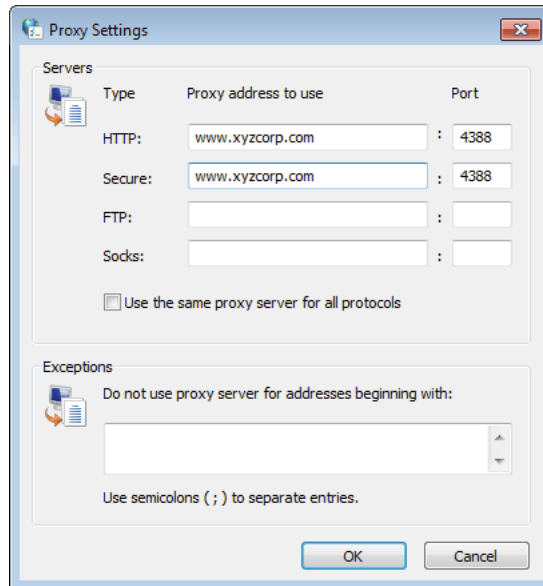

Figure 120. Specify Proxy Servers (Windows)

- For Apple laptops, open **System Preferences** and select **Network**. The Network dialog is displayed. (Figure 121) Click the **Advanced** button.

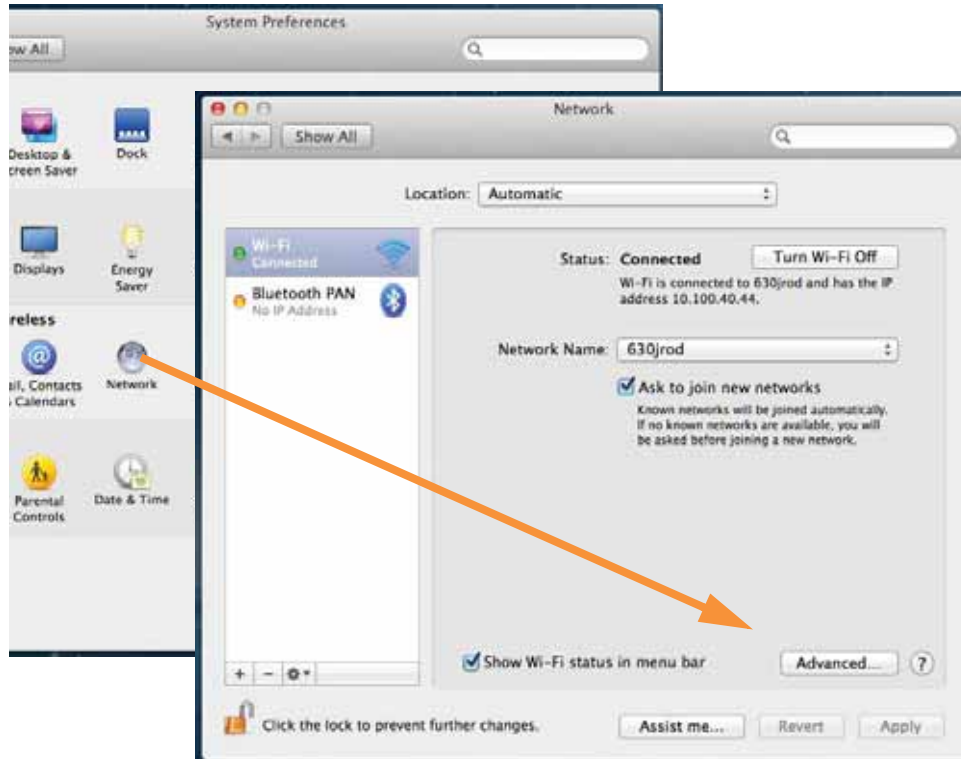

Figure 121. Set up a Proxy Server on each Client (Apple)

- Select the **Proxies** tab. (Figure 122)

Check **Secure Web Proxy (HTTPS)**: Under **Secure Web Proxy Server**, you can enter any valid address. We suggest that you enter **www.xirrus.com**. (This field is not actually used, but it must be a valid address or domain name). You **must** set the **Port** to **4388**. This is **very** important! This is the AP port that must receive all HTTPS traffic if you are using a proxy server for HTTPS.

Check **Web Proxy (HTTP)**: Under **Web Proxy Server**, we suggest that you enter **www.xirrus.com Port 4388** to make it obvious that HTTP traffic is being proxied in this way.

Figure 122. Specify Proxy Servers (Apple)

5. **SSL Certificate:** you must download and install the security certificate from your proxy server—Blue Coat or Netbox Blue. It must be installed on each of your client devices.

Procedure for Configuring Proxy Forwarding on the AP

1. **Enable:** If you wish to use proxy forwarding, select the proxy server type—**Blue Coat** or **Netbox Blue**.

Figure 123. Proxy Forwarding

2. **BlueCoat URL:** If you selected **Blue Coat** above, enter the URL of the proxy server, for example, **http://proxy.threatpulse.net**.
3. **Netbox Blue URL:** If you selected **Netbox Blue** above, enter the actual URL of the proxy server, for example, **xirus.netboxblue.com**. Note that this default URL is not an actual proxy server—this prevents you from unintentionally forwarding traffic.

About Using a Proxy Client for Management Traffic

Some deployments require that all Internet traffic, including management traffic, use proxy services. For instance, some school systems require *all* traffic to use a proxy server. The AP generates management traffic to implement essential functions such as licensing/activation, XMS-Cloud configuration, and XMS Guest Access authentication. The AP allows you to configure clients that are used to proxy such management traffic.

If your deployment requires proxying the AP's management traffic, rather than allowing that traffic to go directly out to the Internet, you will need to configure the following clients:

- **HTTP and HTTPS:** This traffic sends traps and fetches configurations from XMS. If you are using the XMS-Cloud Guest Access service, this also uses the HTTPS proxy client. You must enter the IP address and subnet

mask of the proxy server. If this server requires authentication, you may enter a user name and password as well.

- **SOCKS:** Other management functions use this form of socket to send traffic. For example, this socket is used by the XMS-Cloud configuration service which communicates with the XMS-Cloud using web sockets. Currently, two versions of SOCKS are broadly used on the Internet – Version 4 and Version 5. The service defaults to Version 5 if no version is declared.

The SOCKS proxy client requires a whitelist of networks that will not be proxied. At the least, this must include the loopback address and the subnet where the proxy server lives. Additional defined subnets should include DNS servers and authentication servers.

Procedure for Configuring Proxy Client for Management Traffic

1. **Enable:** For each proxy client, you must **Enable** it if you wish to use it.

Figure 124. Proxy Client for Management Traffic

2. **IP Address/Port:** For each proxy client, enter the IP Address and Port of the proxy server. For the **HTTP** and **HTTPS** proxy clients, you may specify a fully qualified domain name (FQDN) or an IP address. For

SOCKS, an FQDN is not allowed—an IP address is required. The default Port settings are standard defaults for these ports.

3. **Username/Password:** For each proxy client, if the proxy server requires authentication, enter the Username and Password here.
4. **SOCKS 4/ SOCKS 5:** Select the version of SOCKS in use on your proxy server. The default is SOCKS 5.
5. **Socks Network Whitelist:** Enter a whitelist of subnetworks that must not be proxied. Specify each subnet by entering its **Network** address and its subnet **Mask**, then click **Add**. At the least, create entries for the loopback address and the subnet where the proxy server lives. You should also enter subnets that include your DNS servers and authentication servers.

VLANs

This is a status-only window that allows you to review the current status of configured VLANs and VLAN Pools. VLANs are virtual LANs used to create broadcast domains. VLAN pools are provided for special situations where clients are to be assigned one of a set of VLANs that are treated as a pool. See “VLAN Pools” on page 215.

You should create VLAN entries on the AP for all of the VLANs in your wired network if you wish to make traffic from those VLANs available on the wireless network. Each tagged VLAN should be associated with a wireless SSID (see “VLAN Management” on page 216). The AP will discard any VLAN-tagged packets arriving on its wired ports, unless the same VLAN has been defined on the AP. See “Undefined VLANs” on page 114.

In addition to listing all VLANs, this window shows your settings for the Default Route VLAN and the Native (Untagged) VLAN (Step 1 page 217).

VLAN Summary									
Vlan Name	Number	Management	Roaming	Active	DHCP				
					State	IP Address	Subnet Mask	Gateway	
Administration	30	disabled	disabled	false	disabled				
Faculty	40	disabled	disabled	false	disabled				
VLAN-3101	3101	disabled	disabled	false	disabled				
VLAN-3102	3102	disabled	disabled	false	disabled				
VLAN-3103	3103	disabled	disabled	false	disabled				
VLAN-3104	3104	disabled	disabled	false	disabled				

VLAN Pools			
Pool	VLAN ID	VLAN Name	
- VLAN-PoolA - 4 item(s)			
VLAN-PoolA	3101	VLAN-3101	
VLAN-PoolA	3102	VLAN-3102	
VLAN-PoolA	3103	VLAN-3103	
VLAN-PoolA	3104	VLAN-3104	

Figure 125. VLANs

Understanding Virtual Tunnels

Xirrus APs support Layer 2 tunneling. This allows an AP to use tunnels to transport traffic for one or more SSID-VLAN pairs onto a single destination network through the Layer 3 core network. Tunnels may be implemented with:

- The Xirrus Tunnel Server (XTS)—see the *Xirrus Tunnel Server User's Guide*.
- [Virtual Tunnel Server \(VTS\)](#)—see below.

You may specify a tunnel for a VLAN as described below and in [“Procedure for Managing VLANs” on page 217](#). These tunnels are typically set up to be encrypted. Alternatively, the GRE tunnels created in [“Tunnel Management” on page 221](#) are not encrypted, offering much higher throughput and scaling better. If tunneled traffic is not traversing public networks, GRE is recommended. While VLAN tunnels and GRE can be used on the same AP simultaneously, more than one tunnel shouldn't be configured to tunnel the same traffic.

Virtual Tunnel Server (VTS)

Tunneling capability is provided by a Virtual Tunnel Server. You supply the server and deploy it in your network using open-source VTun software, available from vtun.sourceforge.net. To enable the AP to use tunneling for a VLAN, simply enter the IP address, port and secret for the tunnel server as described in [Step 12 on page 219](#).

VTun may be configured for a number of different tunnel types, protocols, and encryption types. For use with APs, we recommend the following configuration choices:

- Tunnel Type: Ether (Ethernet tunnel)
- Protocol: UDP
- Encryption Type: select one of the encryption types supported by VTun (AES and Blowfish options are available)
- Keepalive: yes

VTS Client-Server Interaction

The AP is a client of the Virtual Tunnel Server. When you specify a VTS for an active VLAN-SSID pair, the AP contacts the VTS. The server then creates a tunnel

session to the AP. VTun encapsulated packets will cross the Layer 3 network from the AP to the VTS. When packets arrive at the VTS, they will be de-encapsulated and the resultant packets will be passed to your switch with 802.1q VLAN tags for final Layer 2 processing. The process occurs in reverse for packets traveling in the other direction.

We recommend that you enable the VTun keep-alive option. This will send a keep-alive packet once per second to ensure that the tunnel remains active. Tunnels can be configured to come up on demand but this is a poor choice for wireless, since tunnel setup can take roughly 5-20 seconds and present a problem for authentication.

VLAN Pools

A VLAN pool is a set of VLANs. Using a pool allows a client associating to an AP to be assigned to one of the VLANs in the pool rather than to a particular VLAN. This is useful in special networking situations. For example, a large hotel uses four Internet access gateways to capture Wi-Fi users. Each gateway uses one VLAN. On the hotel's APs, we create a VLAN pool with the four gateway VLANs. When a client connects to an AP, it is assigned to one of the VLANs in the pool. This distributes users approximately evenly among the gateways, roughly balancing their loads.

Each client device is assigned to a pool VLAN with a computation based on the lower digits of its MAC address, so that the device will always be assigned to the same VLAN. This ensures that a client roaming from one AP to the next will be handled properly. Note that the VLAN assigned is also based on the VLANs in the pool, so that if changes are made to the pool, the client device may be assigned to a different VLAN.

You may specify a VLAN pool rather than a particular VLAN for SSIDs or for user groups. See [“Procedure for Managing SSIDs” on page 278](#) or [“Procedure for Managing Groups” on page 306](#).

You may create up to 16 VLAN pools, and each may contain up to the maximum number of VLANs that may be created on the AP. If a user has a VLAN assigned via RADIUS authentication, then this VLAN will be used rather than one from the

VLAN pool. If a user has a VLAN assigned via a [Group](#), then this VLAN will be used rather than one from the VLAN pool.

To set up a VLAN pool, see the next section.

VLAN Management

This window allows you to set up VLANs and VLAN Pools. After creating a new VLAN (added to the list of VLANs), you can modify the configuration parameters of an existing VLAN or delete a selected VLAN. For ArrayOS 6.6 and later releases, you may create up to 64 VLANs (up to 32 on XR-520).

Default Route:

Native VLAN:

VLAN Pools Reset All VLAN Pools

Create New Pool:

VLANs Reset All VLANs

Create New VLAN: ID:

VLAN Information	Management	FastRoaming	Tunnel Server	DHCP
100 100	Off	Off	None defined	disabled

VLAN: 100 (100)

Allow Management: Disabled

Fast Roaming: Disabled

DHCP: Disabled IP: Mask: Gateway:

Tunnel: Server: Port: Secret: Encrypt

VLAN Information	Management	FastRoaming	Tunnel Server	DHCP
200 200	Off	Off	None defined	disabled
210 210	Off	Off	None defined	disabled

Figure 126. VLAN Management

The Wireless AP supports dynamic VLAN assignments specified by RADIUS policy settings. When RADIUS sends these assignments, the AP dynamically assigns wireless stations to VLANs as requested. VLAN tags on traffic are passed through the AP (i.e., VLAN tags are not stripped). Once a station has been dynamically moved to a new VLAN, it will be shown in the Stations window as a member of the new VLAN. (Figure 70 on page 127)

It is critical to configure all VLANs to be used on the AP, even those that will be dynamically assigned.

Procedure for Managing VLANs

- 1. Default Route:** This option sets a default route from the AP. The AP supports a default route on native and tagged interfaces. Once the default route is configured the AP will attempt to use Address Resolution Protocol (ARP) to find the default router. ARP finds the MAC address of a device with a given IP address by sending out a broadcast message requesting this information. This option allows you to choose a default VLAN route from the pull-down list. The IP Gateway must be established for this function to work. After changing the **Default Route**, you *must* click the **Save** button  and then reboot.
- 2. Native VLAN:** This option sets whether the AP management is tagged or untagged. If you select a Native VLAN, then that VLAN will use an untagged (Native) link. Otherwise, the AP will use 802.1Q tagging and a specific VLAN ID with management enabled for management of the AP.

VLAN Pools

- 3.** See “VLAN Pools” on page 215 for a discussion of VLAN pools. To add a new pool, type its name in **Create New Pool**, and click ENTER. The new VLAN pool entry is added to the list.

4. First, create all of the VLANs that will belong to this pool. See [Step 5](#) below.

Click in the field for the new pool to display a list of VLANs. Add the desired VLANs to this pool, one at a time. This field also provides a search feature—type in a string, and a list will display all VLANs whose names contain that string in any position (VLAN names are searched, but not VLAN numbers). Click the **Apply** button on the right when done adding VLANs. Note that the same VLAN can be added to more than one pool. Be sure to consider any network implications of using the same VLAN in multiple pools.

Click **Reset** if you want to remove all of the VLANs from this pool, i.e., to empty it. Click **Remove** to delete this pool. You may use **Reset All Pools** on the bottom to delete all pools.

VLANs

5. **Create New VLAN:** Enter a name for the new VLAN in this field. **ID:** Enter a number for this VLAN (0-4094). Click the **Create VLAN** button. The new VLAN appears in the list. Entries are sorted alphabetically by VLAN name. Select the new entry to modify any of the settings below.
6. **Management:** Move the slider if you want to allow AP management over this VLAN.
7. **Fast Roaming:** Move the slider if you want to allow roaming over this VLAN.
8. **DHCP:** Move the slider if you want the DHCP server to assign the IP address, subnet mask and gateway address for this VLAN automatically, otherwise you must go to the next step and assign these parameters manually.
9. **IP Address:** If the DHCP option is disabled, enter a valid IP address for this VLAN association.
10. **Subnet Mask:** If the DHCP option is disabled, enter the subnet mask IP address for this VLAN association.

11. **Gateway:** If the DHCP option is disabled, enter the IP gateway address for this VLAN association.
12. **Tunnel Server:** If this VLAN is to be tunneled, enter the IP address or host name of the tunnel server that will perform the tunneling. For more information on virtual tunnels, please see [“Understanding Virtual Tunnels” on page 214](#).
13. **Tunnel Server Port:** If this VLAN is to be tunneled, enter the port number of the tunnel server.
14. **New Secret:** Enter the password expected by the tunnel server.
15. **Delete VLAN:** To delete the selected VLAN, simply click the **Delete** button to remove the VLAN from the list.
16. Click the **Save** button  if you wish to make your changes permanent.

[VLANs](#)

[Tunnels](#)

Tunnels

This read-only window allows you to review the tunnels that have been defined on the AP. It lists all tunnels and their settings, including the type of authentication and the local and remote endpoints for each tunnel.

Tunnels are discussed in these sections:

- [About Xirrus Tunnels](#)
- [Tunnel Management](#)
- [SSID Assignments](#)
- [VLAN Assignments](#)

Tunnel Name	Enabled	Type	SSID	Local Endpoint	Primary Remote Endpoint	Secondary Remote Endpoint	Follower			
							DHCP Option	MTU	Interval	Failures
Central	disabled	none	none				disabled	1400	10	0

Figure 127. Tunnel Summary

About Xirrus Tunnels

Xirrus APs offer GRE (Generic Routing Encapsulation) tunneling with VLAN support. This allows an AP to use tunnels to bridge Layer 2 traffic for one or more SSIDs onto a single destination network through the Layer 3 network. You may specify particular VLANs on an SSID to be tunneled, or tunnel all of the VLANs that are on this SSID. GRE tunneling is quite flexible, and can encapsulate many network layer protocols. As a result, it can support a variety of applications. For example, a Wi-Fi hotspot can allow guest logins and use the tunnel to give guests direct access to the Internet, without allowing access to the local network. In a small office, you may define a tunnel to connect users to the corporate office network. Tunnels may also be used when providing cellular offload capability. For non-GRE tunnels associated with particular VLANs, see [“Understanding Virtual Tunnels” on page 214](#).

Wireless Access Point

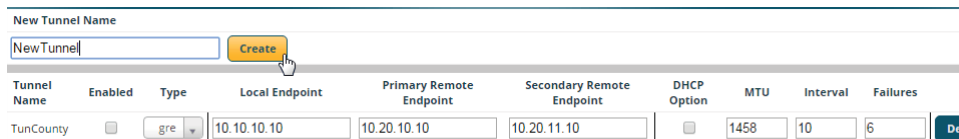

Tunnels may be implemented with:

- The Xirrus Tunnel Server (XTS)—see the *Xirrus Tunnel Server User's Guide*. For an additional discussion, see the *Xirrus Tunnel Solutions Application Note* in the Xirrus [Resource Center](#).
- VTS—see “[Virtual Tunnel Server \(VTS\)](#)” on page 214.

To create a tunnel, you specify the **Local Endpoint**, which should be one of the AP's wired ports, and the **Primary Remote Endpoint**. A **Secondary Remote Endpoint** may also be specified in case of a failure at the first endpoint. Traffic for the designated VLANs on an SSID is sent in GRE encapsulated packets across the Layer 3 network from the AP to the remote endpoint. When packets arrive, the encapsulation is stripped and the resultant packets are passed to your switch with 802.1q VLAN tags for final Layer 2 processing. The process occurs in reverse for packets traveling in the other direction.

Tunnel Management

This window allows you to create tunnels.

The screenshot shows the 'New Tunnel' configuration window. At the top, there is a text input field for 'New Tunnel Name' containing 'NewTunnel' and a 'Create' button. Below this is a table with columns: Tunnel Name, Enabled, Type, Local Endpoint, Primary Remote Endpoint, Secondary Remote Endpoint, DHCP Option, MTU, Interval, and Failures. The table contains one entry: 'TunCounty' with 'Enabled' checked, 'Type' set to 'gre', 'Local Endpoint' '10.10.10.10', 'Primary Remote Endpoint' '10.20.10.10', 'Secondary Remote Endpoint' '10.20.11.10', 'DHCP Option' checked, 'MTU' '1458', 'Interval' '10', and 'Failures' '6'. A 'Del' button is visible at the end of the row.

Tunnel Name	Enabled	Type	Local Endpoint	Primary Remote Endpoint	Secondary Remote Endpoint	DHCP Option	MTU	Interval	Failures
TunCounty	<input checked="" type="checkbox"/>	gre	10.10.10.10	10.20.10.10	10.20.11.10	<input checked="" type="checkbox"/>	1458	10	6

Figure 128. Tunnel Management

Procedure for Managing Tunnels

1. **New Tunnel Name:** Enter a name for the new tunnel in this field, then click on the **Create** button. The new tunnel is added to the list. You may create up to 250 Layer 3 tunnels.
2. **Enabled:** The new tunnel is created in the disabled state. Click this checkbox to enable it.
3. **Type:** Enter the type of tunnel, **none** or **gre**.

- 
4. **Local Endpoint:** Enter the IP address of the AP Gigabit or 10 Gigabit port where the tunnel is to begin.
 5. **Primary Remote Endpoint:** Enter the IP address of the remote endpoint of the tunnel.
 6. **Secondary Remote Endpoint:** This provides a failover capability. If the primary tunnel fails, traffic is switched over to the secondary tunnel. Enter the IP address of the remote endpoint of the secondary tunnel.
 7. **DHCP Option:** When this option is enabled, the AP snoops station DHCP requests and inserts relay agent information (Option 82, in the CIRCUIT-ID sub-option) into these DHCP packets. Information inserted includes AP BSSID, SSID name, and SSID encryption type. You may use this option here or on the [SSID Management](#) page, but not in both places. Information is inserted as a colon-separated text string in the CIRCUIT ID value field in this format: [AP_MAC];[SSID];[ENC]

[AP_MAC] length = 17 (aa:bb:cc:dd:ee:ff)

[SSID] length = length of SSID name

[ENC] length = 1 (encryption type: 'o' = open, 's' = non-open)

Note that this is a different format than is used for Option 82 with SSIDs.

8. **MTU:** Set maximum transmission unit (MTU) size.
9. **Interval:** The tunnel mechanism will ping the current remote endpoint periodically to ensure that it is still reachable. Enter the ping interval (in seconds).
10. **Failures:** Enter the number of consecutive ping failures that will cause the AP to consider the tunnel to be down. tunnel to failover to the other remote endpoint.
11. Click the **Save** button  if you wish to make your changes permanent.

12. Proceed to [SSID Assignments](#) to define the SSIDs for which each tunnel will bridge data. You may create up to 16 tunnels. Assign one or more SSIDs to each tunnel. You may restrict the tunnel to handling traffic for particular VLANs on each SSID if you wish, as described in [VLAN Assignments](#).

SSID Assignments

This window allows you to select the SSIDs to be bridged by each tunnel. Station traffic for SSIDs assigned will be bridged through the tunnel, but you may restrict which VLANs are tunneled for each SSID (see [VLAN Assignments](#), below). By default, all VLANs will be tunneled. When VLAN traffic is tunneled, it will be tagged accordingly.

SSID Assignments				
TUNNEL	County	Public	SS1	ALL SSIDs
TunCounty	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Figure 129. Tunnel SSID Assignments

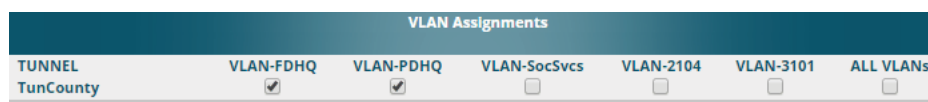

Procedure for Assigning SSIDs

This window lists the tunnels and SSIDs that you have defined.

1. For each tunnel, select the SSIDs that are to be bridged to the remote endpoint. Clear the checkbox for any SSID that you no longer wish to include in the tunnel. You may use the **ALL SSIDs** checkbox to toggle between selecting all SSIDs, or none.
2. Click the **Save** button  to make your changes permanent.

VLAN Assignments

When you assign an SSID to a tunnel, all VLANs on that SSID will be transported to the tunnel by default. This window allows you to select specific VLANs to be bridged by each tunnel. A VLAN's station traffic bridged through a tunnel will be tagged accordingly. Station traffic for a VLAN that is not tunneled is forwarded to the local subnet, i.e., dropped off locally at the edge of the switch network to which the AP is connected.

TUNNEL	VLAN-FDHQ	VLAN-PDHQ	VLAN-SocSvcs	VLAN-2104	VLAN-3101	ALL VLANs
TunCountry	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Figure 130. Tunnel VLAN Assignments

Procedure for Assigning SSIDs

This window lists the tunnels and VLANs that you have defined.

1. For each tunnel, select the VLANs that are to be bridged to the remote endpoint. Clear the checkbox for any VLAN that you no longer wish to include in the tunnel. You may use the **ALL VLANs** checkbox to toggle between selecting all VLANs, or none. Note that if you add any VLANs to this list, then they will be the **only** VLANs transported on this tunnel. Also note that many VLANs may be in use on an SSID if they are assigned to stations dynamically by a RADIUS server or by user groups (see “Groups” on page 304).
2. Click the **Save** button  to make your changes permanent.

Understanding Security

The Xirrus Wireless AP incorporates many configurable security features. After initially installing an AP, always change the default administrator password (the default is admin), and choose a strong replacement password (containing letters, numbers and special characters). When appropriate, issue read-only administrator accounts.

Other security considerations include:

- **SSH versus Telnet:** Be aware that Telnet is not secure over network connections and should be used only with a direct serial port connection. When connecting to the unit’s Command Line Interface (CLI) over a network connection, you must use a Secure SHell version 2 (SSH-2) utility. SSH-2 provides stronger security than SSH-1. The most commonly used freeware providing SSH tools is PuTTY.
- **Configuration auditing:** The optional XMS offers powerful management features for small or large wireless deployments, and can audit your configuration settings automatically. In addition, using the XMS eliminates the need for an FTP server.

- **Choosing an encryption method:** Wireless data encryption prevents eavesdropping on data being transmitted or received over the airwaves. The AP allows you to establish the following data encryption configuration options:
 - **Open**—this option offers no data encryption and is not recommended, though you might choose this option if clients are required to use a VPN connection through a secure SSH utility, like PuTTY.
 - **Wired Equivalent Privacy (WEP)**—this option provides minimal protection (though much better than using an open network). An early standard for wireless data encryption and supported by all Wi-Fi certified equipment, WEP is vulnerable to hacking and is therefore not recommended for use by Enterprise networks.
 - **Wi-Fi Protected Access (WPA and WPA2)**—these are much stronger encryption modes than WEP, using Temporal Key Integrity Protocol (TKIP) or Advanced Encryption Standard (AES) to encrypt data.

WPA solves security issues with WEP. It also allows you to establish encryption keys on a per-user-basis, with key rotation for added security. In addition, TKIP provides Message Integrity Check (MIC) functionality and prevents active attacks on the wireless network.

AES is the strongest encryption standard and is used by government agencies; however, old legacy hardware may not be capable of supporting the AES mode (it probably won't work on older wireless clients). Because AES is the strongest encryption standard currently available, WPA2 with AES is highly recommended for Enterprise networks.

Any of the above encryption methods can be used and an AP can support multiple encryption methods simultaneously, but only one method may be selected per SSID (except that selecting **WPA-Both** allows WPA and WPA2 to be used at the same time on the same SSID). Otherwise, if multiple security methods are needed, you must define multiple SSIDs.

The encryption mode (WEP, WPA, etc.) is selected in the **SSIDs >SSID Management** window (see “[SSID Management](#)” on page 277). The encryption standard used with WPA or WPA2 (AES or TKIP) is selected in the **Security>Global Settings** window under **WPA Settings** (see “[Global Settings](#)” on page 250).

- **Choosing an authentication method:** User authentication ensures that users are who they say they are. For this purpose, the AP allows you to choose between the following user authentication methods:

- **Pre-Shared Key**—users must manually enter a key (passphrase) on the client side of the wireless network that matches the key stored by the administrator in the AP.

This method should be used only for smaller networks when a RADIUS server is unavailable. If PSK must be used, choose a strong passphrase containing between 8 and 63 characters (20 is preferred). Always use a combination of letters, numbers and special characters. Never use English words separated by spaces.

- **RADIUS 802.1x with EAP**—802.1x uses a RADIUS server to authenticate large numbers of clients, and can handle different Extensible Authentication Protocol (EAP) authentication methods, including EAP-TLS, EAP-TTLS, EAP-PEAP, and LEAP-Passthrough. The RADIUS server can be internal (provided by the Wireless AP) or external. An external RADIUS server offers more functionality and security, and is recommended for large deployments. When using this method, user names and passwords must be entered into the RADIUS server for user authentication.
- **MAC Address Access Control Lists (ACLs)**—MAC address ACLs provide a list of client adapter MAC addresses that are allowed or denied access to the wireless network. Access Control Lists work well when there are a limited number of users—in this case, enter the MAC address of each user in the Allow list. In the event of a lost or stolen MAC adapter, enter the affected MAC

address in the Deny list. The Wireless AP will accept up to 1,000 ACL entries.

- **PCI DSS or FIPS 140-2 Security**—to implement the requirements of these security standards on the AP, please see [“Auditing PCI DSS” on page 585](#) or [“Implementing FIPS Security” on page 591](#).

Certificates and Connecting Securely to the WMI

When you point your browser to the AP to connect to the WMI, the AP presents an X.509 security certificate to the browser to establish a secure channel. One significant piece of information in the certificate is the AP’s host name. This ties the certificate to a particular AP and ensures the client that it is connecting to that host.

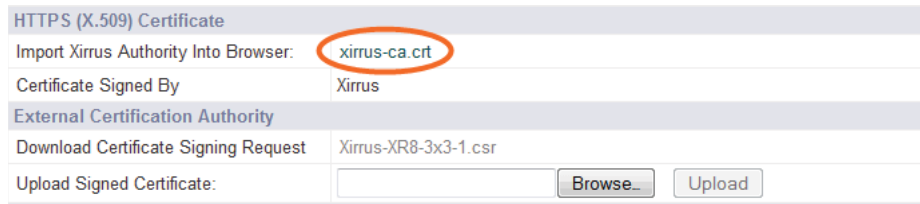

Certificate Authorities (CAs) are entities that digitally sign certificates, using their own certificates (for example, VeriSign is a well-known CA). When the AP presents its certificate to the client’s browser, the browser looks up the CA that signed the certificate to decide whether to trust it. Browsers ship with a small set of trusted CAs already installed. If the browser trusts the certificate’s CA, it checks to ensure the host name (and IP address) match those on the certificate. If any of these checks fail, you get a security warning when connecting to the WMI.

The AP ships with a default certificate that is signed by the Xirrus CA. You may choose to use this certificate, or to use a certificate issued by the CA of your choice, as described in the following sections:

- [Using the AP’s Default Certificate](#)
- [Using an External Certificate Authority](#)

Using the AP's Default Certificate

HTTPS (X.509) Certificate	
Import Xirus Authority Into Browser:	xirus-ca.crt
Certificate Signed By	Xirus
External Certification Authority	
Download Certificate Signing Request	Xirus-XR8-3x3-1.csr
Upload Signed Certificate:	<input type="text"/> <input type="button" value="Browse..."/> <input type="button" value="Upload"/>

Figure 132. Import Xirus Certificate Authority

The AP's certificate is signed by a Xirus CA that is customized for your AP and its current host name. By default, browsers will not trust the AP's certificate. You may import the Xirus certificate to instruct the browser to trust the Xirus CA on all future connections to APs. The certificate for the Xirus CA is available on the AP, so that you can import it into your browser's cache of trusted CAs (right alongside VeriSign, for example). On the [Management Control](#) window of the WMI you will see the `xirus-ca.crt` file. (Figure 132)

By clicking and opening this file, you can follow your browser's instructions and import the Xirus CA into your CA cache (see "[HTTPS \(X.509\) Certificate](#)" on [page 245](#) for more information). This instructs your browser to trust any of the certificates signed by the Xirus CA, so that when you connect to any of our APs you should no longer see the warning about an untrusted site. Note however, that this only works if you use the host name when connecting to the AP. If you use the IP address to connect, you get a lesser warning saying that the certificate was only meant for 'hostname'.

Since an AP's certificate is based on the AP's host name, any time you change the host name the AP's CA will regenerate and sign a new certificate. This happens automatically the next time you reboot after changing the host name. If you have already installed the Xirus CA on a browser, this new AP certificate should automatically be trusted.

When you install the Xirus CA in your browser, it will trust a certificate signed by any Xirus AP, as long as you connect using the AP's host name.

Using an External Certificate Authority

If you prefer, you may install a certificate on your AP signed by an outside CA.

The AP's certificate is used for security when stations attempt to associate to an SSID that has Web Page Redirect (captive portal) enabled. In this case, it is preferable for the AP to present a certificate from an external CA that is likely to be trusted by most browsers. When a WPR login page is presented, the user will not see a security error if the AP's certificate was obtained from an external CA that is already trusted by the user's browser.

WMI provides options for creating a Certificate Signing Request that you can send to an external CA, and for uploading the signed certificate to the AP after you obtain it from the CA. This certificate will be tied to the AP's host name and private key. See "External Certificate Authority" on page 246 for more details.

Admin Management

This window allows you to manage network administrator accounts (create, modify and delete). It also allows you to limit account access to a read only status. When finished, click the **Save** button  if you wish to make your changes permanent.

Figure 133. Admin Management

Procedure for Creating or Modifying Network Administrator Accounts

1. **Admin ID:** Enter the login name for a new network administrator ID. The length of the ID must be between 5 and 50 characters, inclusive.
2. **Read/Write:** Choose **1:read-write** if you want to give this administrator ID full read/write privileges, or choose **0:read-only** to restrict this user to read only status. In the read only mode, administrators cannot save changes to configurations. Or you may select one of your custom-defined privilege levels (see “[Admin Privileges](#)” on page 233).
3. **New Password:** Enter a password for this ID. The length of the password must be between 5 and 50 characters, inclusive.
4. **Verify:** Re-enter the password in this field to verify that you typed the password correctly. If you do not re-enter the correct password, an error message is displayed).
5. Click on the **Create** button to add this administrator ID to the list.
6. Click the **Save** button  if you wish to make your changes permanent.

Admin Privileges

This window provides a detailed level of control over the privileges of AP administrators. Administrators may be assigned one of eight **Privilege Levels**. You may define the privilege level of each major feature (**Configuration Section**) that may be configured on the AP. For example, say that you set the privilege level to 4 for Reboot AP, Security, Radius Server, and SNMP, and you leave all other configuration sections at the default privilege level of 1. In this case, any administrator with a privilege level of 4 or higher may perform any operation on the AP, while an administrator with a privilege level lower than 4 but at least 1 may perform any operation except those whose level was set to 4. An error message will be displayed if an operation is attempted without a sufficient privilege level.

Privilege Level	Name
Level 0	read-only
Level 1	read-write
Level 2	2
Level 3	3
Level 4	4
Level 5	5
Level 6	6
Level 7	7

Configuration Section	Minimum Privilege Level							
	0	1	2	3	4	5	6	7
Access Control List	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Administrator	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Open Authentication	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Boot Environment	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
CDP	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Cluster	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Console Interface	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Contact Information	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Figure 134. Admin Privileges

Privilege level 0 is **read-only**. As a minimum, all administrators have permission for read access to all areas of AP configuration. Higher privilege levels may be used to define additional privileges for specific configuration sections.

If you are using an [Admin RADIUS](#) server to define administrator accounts, please see “[RADIUS Vendor Specific Attribute \(VSA\) for Xirrus](#)” on page 532 to set the privilege level for each administrator.

Procedure for Configuring Admin Privileges

1. **Privilege Level Names** (optional): You may assign a **Name** to each Privilege Level. The name may be used to describe the access granted by this level. By default, levels 0 and 1 are named **read-only** and **read-write**, respectively, and levels 2 through 7 have the same name as their level number.
2. **Privilege Levels**: Use this section to assign a **Minimum Privilege Level** to selected **Configuration Sections** as desired. By default, all sections are assigned level 1. When you select a higher privilege level for a configuration section, then only administrators who have at least that privilege level will be able to make configuration changes to that section.
3. You may click ^ at the bottom of any row to toggle the values in the entire column to either on or off.
4. Click the **Save** button  if you wish to make your changes permanent.

[External Radius](#)

[Groups](#)

[Admin Management](#)

[Admin RADIUS](#)

[Security](#)

Admin RADIUS

This window allows you to set up authentication of network administrators via RADIUS. Using RADIUS to control administrator accounts for logging in to APs has these benefits:

- Centralized control of administrator accounts.
- Less effort—you don't have to set up user names and passwords on each AP; just enter them once on the RADIUS server and then all of the APs can pull from the RADIUS server.
- Enforced policies—you may set password rules (e.g., passwords must contain at least one number and be at least 12 characters in length), and you may set expiration times for passwords.

Admin RADIUS settings override any local administrator accounts configured on the [Admin Management](#) window. If you have Admin RADIUS enabled, all administrator authentication is done via the configured RADIUS servers. The only exception to this is when you are connected via the Console port (using CLI). If you are using the Console port, the AP will authenticate administrators using accounts configured on the [Admin Management](#) window first, and then use the RADIUS servers. This provides a safety net to be ensure that you are not completely locked out of an AP if the RADIUS server is down.

About Creating Admin Accounts on the RADIUS Server

Permissions for RADIUS administrator accounts are controlled by the RADIUS **Xirrus-Admin-Role** attribute. This is a Vendor Specific Attribute (VSA). To define the privileges permitted to an administrator account, set the value of its Xirrus-Admin-Role attribute to the desired **Privilege Level Name** string, as defined in [“Admin Privileges” on page 233](#). For more information about the RADIUS VSAs used by Xirrus, see [“RADIUS Vendor Specific Attribute \(VSA\) for Xirrus” on page 532](#).

When configuring administrator accounts on the RADIUS server, you must observe the same restrictions for length and legal characters as when creating these accounts on the AP using the [Admin Management](#) window: the user name and password must be between 5 and 50 characters, inclusive.

Configuration Changes are Ready for Saving

Admin RADIUS Settings

Enable Admin RADIUS: Yes No

Authentication Type: PAP CHAP MS-CHAP

Timeout (seconds):

Admin RADIUS Primary Server:

Port Number:

Shared Secret / Verify Secret:

Admin RADIUS Secondary Server:

Host Name / IP Address:

Port Number:

Shared Secret / Verify Secret:

Figure 135. Admin RADIUS

Procedure for Configuring Admin RADIUS

Use this window to enable/disable administrator authentication via RADIUS, and to set up primary and secondary servers to use for authentication of administrators attempting to log in to the AP.

1. Admin RADIUS Settings:

- a. Enable Admin RADIUS:** Click **Yes** to enable the use of RADIUS to authenticate administrators logging in to the AP. You will need to specify the RADIUS server(s) to be used.
- b. Authentication Type:** Select the protocol used for authentication of administrators, **CHAP** or **PAP** (the default).
 - Password Authentication Protocol (PAP), is a simple protocol. PAP transmits ASCII passwords over the network “in the clear” (unencrypted) and is therefore considered insecure.
 - Challenge-Handshake Authentication Protocol (CHAP) is a more secure protocol. The login request is sent using a one-way hash function.

Management Control

This window allows you to enable or disable the AP management interfaces and set their inactivity time-outs. The range is 300 (default) to 100,000 seconds.

The screenshot shows a configuration interface for Management Control. The 'General' section is active and contains the following settings:

- Maximum login attempts allowed (1 - 255):** A text input field containing the number '3', followed by an unchecked checkbox labeled 'Unlimited'.
- Failed login retry period (0 - 65535 seconds):** A text input field containing the number '0'.
- Status LED:** A checked checkbox.

Below the 'General' section are several collapsed menu items, each with a small upward-pointing arrow:

- Pre-Login Banner
- Post-Login Banner
- Management Transports
- Management Modes
- HTTPS (X.509) Certificate
- External Certificate Authority

Figure 136. Management Control

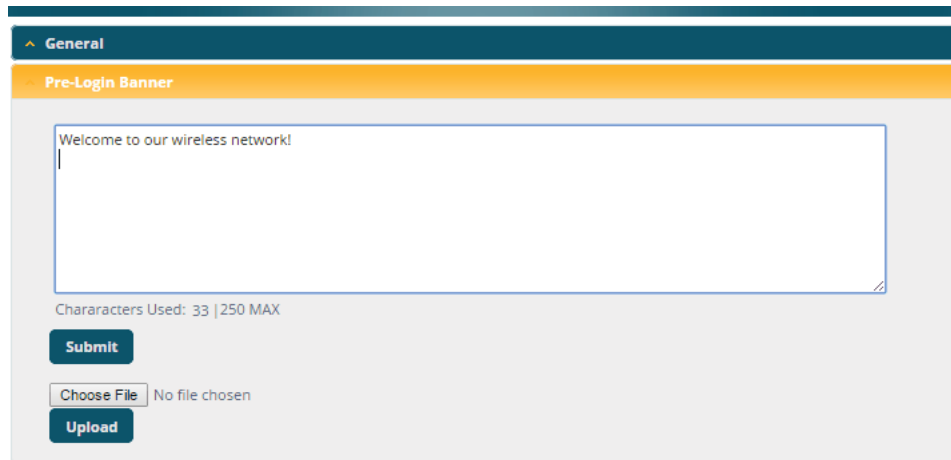

Procedure for Configuring Management Control

1. Management Settings:

- a. **Maximum login attempts allowed (1-255):** After this number of consecutive failing administrator login attempts via ssh or telnet, the **Failed login retry period** is enforced. The default is 3.
- b. **Failed login retry period (0-65535 seconds):** After the maximum number (defined above) of consecutive failing administrator login attempts via ssh or telnet, the administrator's IP address is denied access to the AP for the specified period of time (in seconds). The default is 0.
- c. **Pre-login Banner:** Text that you enter here will be displayed below the WMI login prompt. (Figure 137) Click the **Submit** button when done typing.

If you wish to display more than 256 characters of text (for instance, to display usage restrictions for the wireless network), you may

upload a text file. Click **Choose File** and browse to the file. Click **Upload** when done.

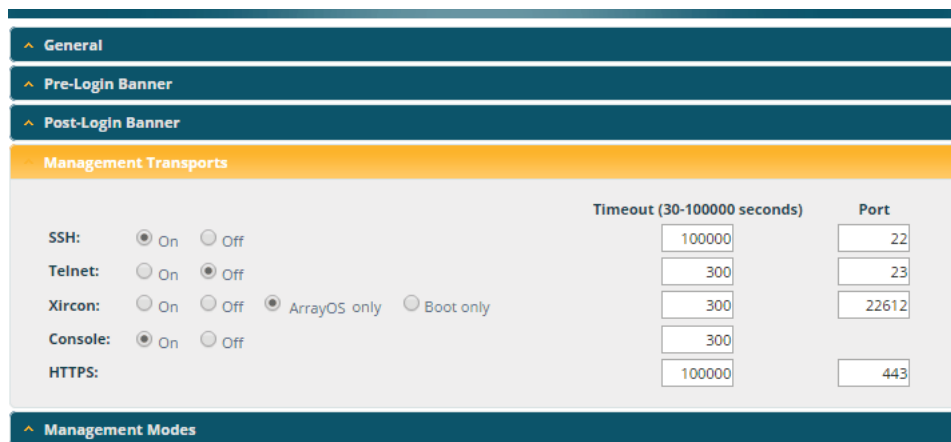

The screenshot shows a web interface for configuring a wireless access point. At the top, there is a dark blue header with the word "General" and a small upward-pointing triangle. Below this is a yellow header with the text "Pre-Login Banner". The main content area is a light gray box containing a text input field with the text "Welcome to our wireless network!". Below the input field, it says "Characters Used: 33 | 250 MAX". There are three buttons: a dark blue "Submit" button, a "Choose File" button (which is a file selector), and a dark blue "Upload" button. The "Choose File" button shows "No file chosen".

Figure 137. Pre-login Banner

- d. **Post-login Banner:** Text that you enter here will be displayed in a message box after a user logs in to the WMI.

If you wish to display more than 256 characters of text, upload a text file. Click **Choose File** and browse to the file, then click **Upload**.

	Timeout (30-100000 seconds)	Port
SSH: <input checked="" type="radio"/> On <input type="radio"/> Off	100000	22
Telnet: <input type="radio"/> On <input checked="" type="radio"/> Off	300	23
Xircon: <input type="radio"/> On <input type="radio"/> Off <input checked="" type="radio"/> ArrayOS only <input type="radio"/> Boot only	300	22612
Console: <input checked="" type="radio"/> On <input type="radio"/> Off	300	
HTTPS: <input type="radio"/> On <input type="radio"/> Off	100000	443

Figure 138. Management Transports

2. SSH

- a. **On/Off:** Choose **On** to enable management of the AP over a Secure Shell (SSH-2) connection, or **Off** to disable this feature. Be aware that only SSH-2 connections are supported by the AP. SSH clients used for connecting to the AP must be configured to use SSH-2.
- b. **Connection Timeout 30-100000 (Seconds):** Enter a value in this field to define the timeout (in seconds) before your SSH connection is disconnected. The value you enter here must be between 30 seconds and 100,000 seconds.
- c. **Port:** Enter a value in this field to define the port used by SSH. The default port is 22.

3. Telnet:

- a. **On/Off:** Choose **On** to enable AP management over a Telnet connection, or **Off** to disable this feature. SSH offers a more secure connection than Telnet, and is recommended over Telnet.
- b. **Connection Timeout 30-100000 (Seconds):** Enter a value in this field to define the timeout (in seconds) before your Telnet connection is

disconnected. The value you enter here must be between 30 seconds and 100,000 seconds.

- c. **Port:** Enter a value in this field to define the port used by Telnet. The default port is 23.

4. Xircon

The Xircon utility connects to Xirrus APs that do not have a physical console port, or whose console port is not accessible. Please see [“Securing Low Level Access to the AP” on page 81](#) for more information about Xircon. You can enable or disable Xircon access to the AP as instructed below.

! **Warning:** *If you disable Xircon access completely on models that have no console port, you **must** ensure that you do not lose track of the username and password to log in to CLI/WMI! There is no way to recover from a lost password, other than returning the AP to Xirrus.*

- a. **On/Off:** Choose **On** to enable Xircon access to the AP at the ArrayOS (CLI) and Xirrus Boot Loader (XBL) levels, or **Off** to disable access at both levels. Xircon access is **On** by default.
- b. **ArrayOS only:** Choose this radio button to enable Xircon access at the ArrayOS level only (i.e., Xircon can access CLI only). Access to the AP at the Xirrus Boot Loader (XBL) level is disabled.
- c. **Boot only:** Choose this radio button to enable Xircon access at the Xirrus Boot Loader (XBL) level only. ArrayOS level (CLI) access to the AP is disabled.
- d. **Connection Timeout 30-100000 (Seconds):** Enter a value in this field to define the timeout (in seconds) before your Xircon connection is disconnected. The value you enter here must be between 30 seconds and 100,000 seconds.
- e. **Port:** Enter a value in this field to define the port used by Xircon. The default port is 22612.

5. Console

- a. **On/Off:** Choose **On** to enable management of the AP via a serial connection, or choose **Off** to disable this feature.
- b. **Connection Timeout 30-100000 (Seconds):** Enter a value in this field to define the timeout (in seconds) before your serial connection is disconnected. The value you enter here must be between 30 seconds and 100,000 seconds.

6. HTTPS

- a. **Connection Timeout 30-100000 (Seconds):** Enter a value in this field to define the timeout (in seconds) before your HTTPS connection is disconnected. The value you enter here must be between 30 seconds and 100,000 seconds. Management via HTTPS (i.e., the Web Management Interface) cannot be disabled on this window. To disable management over HTTPS, you must use the Command Line Interface.
- b. **Port:** Enter a value in this field to define the port used by SSH. The default port is 443.

7. Management Modes

Management Modes configuration page showing the following settings:

- Network Assurance: On Off
- PCI Audit Mode: On Off
- FIPS 140-2, Level 2 Security: On Off
- Spanning Tree Protocol: Enable
- Period (60-900 seconds):

Figure 139. Management Modes

- a. **Network Assurance:** Click the **On** button to enable this mode. Network assurance checks network connectivity to each server that you configure, such as the NTP server, RADIUS servers, SNMP trap hosts, etc. By proactively identifying network resources that are unavailable, the network manager can be alerted of problems potentially before end-users notice an issue. The distributed intelligence of APs provides this monitoring at multiple points across the network, adding to the ability to isolate the problem and expedite the resolution

Connectivity is checked when you configure a server. If a newly configured server is unreachable, you will be notified directly and a Syslog entry is created. Configured servers are checked once per **Period** which by default is 300 seconds (five minutes). Servers are checked regardless of whether they are configured as IP addresses or host names.

If a server becomes unreachable, a Syslog message is generated. When the server again becomes reachable, another Syslog message is generated.

To view the status of all configured servers checked by this feature, please see [“Network Assurance” on page 113](#).

- b. **PCI Audit Mode:** Click the **On** button to enable this mode, which is provided as an aid to setting up APs to pass PCI DSS audit requirements. In PCI Audit Mode, the AP checks whether its configuration is appropriate for auditing PCI DSS wireless security. This mode does not change any other settings, but will inform you of any incorrect settings that exist. Furthermore, the AP will monitor changes that you make to its configuration in CLI or the WMI. PCI Mode will warn you (and issue a Syslog message) if the change is inappropriate for PCI DSS. A warning is issued when a non-compliant change is first applied to the AP, and also if you attempt to save a configuration that is non-compliant. Use this command in conjunction with [“The Xirrus AP PCI Compliance Configuration” on page 587](#) to ensure that you are using the AP in accordance with the

PCI DSS requirements. For more information, see [“Auditing PCI DSS” on page 585](#).

The `pci-audit` command checks items such as:

- Telnet is disabled.
 - Admin RADIUS is enabled (admin login authentication is via RADIUS server).
 - An external Syslog server is in use.
 - All SSIDs must set encryption to WPA or better (which also enforces 802.1x authentication)
- c. **FIPS 140-2, Level 2 Security:** Please see [“Implementing FIPS Security” on page 591](#) for more information, including step-by-step instructions for proceeding to implement FIPS Level 2 Security requirements on the AP.

Click the **On** button to enable FIPS. This will perform all of the setting changes necessary to make the AP comply with FIPS requirements. A message is displayed showing the changes that were performed. The AP continues to enforce FIPS requirements by preventing you from making non-compliant configuration changes. Click the **Off** button to stop enforcing FIPS requirements.

Note that when you enable FIPS, the AP does *not* save your previous settings, and it will not restore them if you click the **Off** button. If you think you may wish to disable FIPS and restore your previous configuration at some later time, use **Set Restore Point** to save a copy of your configuration before enabling FIPS (see [Step 4 on page 419](#) in [Using Tools on the Wireless AP](#)).

- d. **Spanning Tree Protocol:** this protocol is used in Layer 2 networks to turn off ports when necessary to prevent network loops. It is **Off** by default, and is turned on automatically if you are using [WDS](#) to interconnect APs using wireless links. Use the **On** button to enable spanning tree if your network topology requires it. See [“Spanning Tree Status” on page 109](#).

8. HTTPS (X.509) Certificate

ArrayOS releases 6.5 and above only support 2048-bit certificates, while previous releases only support 1024-bit certificates. When ArrayOS is upgraded to 6.5 or above, a new self-signed certificate will be automatically generated.

*If you have imported a previous (pre-Release 6.5 version) Xirrus CA-signed certificate into your browser, the trusted Xirrus CA needs to be updated. Delete the current Xirrus CA in the browser. Upgrade the AP to release 6.5 or above and then download the new **xirrus-ca.crt** file and import it into the browser as a trusted CA, as explained below.*

If you are using a certificate signed by an external CA, its use is not impacted in any way by this change.

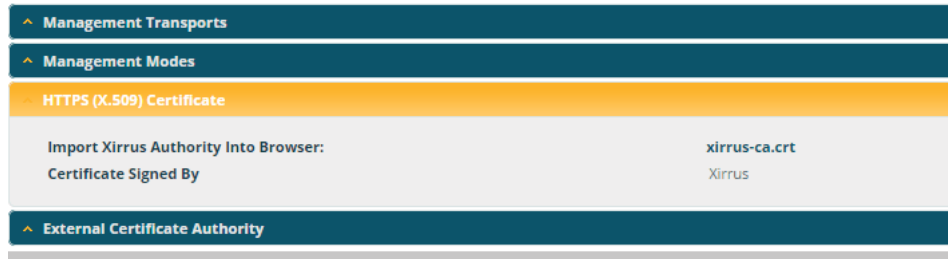

Figure 140. HTTPS (X.509) Certificate

- a. **Import Xirrus Authority into Browser:** This feature imports the Xirrus Certificate Authority (CA) into your browser (for a discussion, please see [“Certificates and Connecting Securely to the WMI”](#) on page 229). Click the link (**xirrus-ca.crt**), and then click **Open** to view or install the current Xirrus CA certificate. Click **Install Certificate** to start your browser’s Certificate Install Wizard. We recommend that you use this process to install Xirrus as a root authority in your browser.

When you assign a **Host Name** to your AP using the [Express Setup](#) window, then the next time you reboot the AP (or restart the HTTPS

service by turning it off and on again using the CLI), it automatically creates a security certificate for that host name. That certificate uses Xirrus as the signing authority. Thus, in order to avoid having certificate errors on your browser when using WMI:

- You must have assigned a host name to the AP and rebooted at some time after that.
 - Use **Import Xirrus Authority into Browser**
 - Access WMI by using the host name of the AP rather than its IP address.
- b. **HTTPS (X.509) Certificate Signed By:** This read-only field shows the signing authority for the current certificate.

9. External Certificate Authority

^ HTTPS (X.509) Certificate

External Certificate Authority

Create a Certificate Signing Request (CSR)

Common Name: XR4012802207C

Organization Name:

Organizational Unit Name:

Locality (City):

State or Province:

Country Name (2 Letter Code):

Email Address:

Create

Download Certificate Signing Request: No CSR created for XR4012802207C.csr

Upload Signed Certificate: No file chosen **Upload**

Figure 141. External Certificate Authority

This step and [Step 10](#) allow you to obtain a certificate from an external authority and install it on an AP. “[Using an External Certificate Authority](#)” on page 231 discusses reasons for using an external CA.

For example, to obtain and install a certificate from VeriSign on the AP, follow these steps:

- If you don't already have the certificate from the external (non-Xirrus) Certificate Authority, see [Step 10](#) to create a request for a certificate.
- Use option (a) to review the request and copy its text to send to VeriSign.
- When you receive the new certificate from VeriSign, upload it to the AP using option (b).

External Certification Authority has the following options:

- Download Certificate Signing Request:** After creating a certificate signing request (.csr file—[Step 10](#)), click the **View** button to review it. If it is satisfactory, click the name of the .csr file to display the text of the request. You can then copy this text and use it as required by the CA. You may also click on the filename of the .csr file to download it to your local computer.
- Upload Signed Certificate:** To use a custom certificate signed by an authority other than Xirrus, use the **Browse** button to locate the certificate file, then click **Upload** to copy it to the AP. The AP's web server will be restarted and will pick up the new certificate. This will terminate any current web sessions, and you will need to reconnect and re-login to the AP.

10. To create a Certificate Signing Request

- a. Fill in the fields in this section: **Common Name**, **Organization Name**, **Organizational Unit Name**, **Locality (City)**, **State or Province**, **Country Name**, and **Email Address**. Spaces may be used in any of the fields, except for Common Name, Country Name, or Email

Address. Click the **Create** button to create the certificate signing request. See [Step 9](#) above to use this request.

11. Click the **Save** button  if you wish to make your changes permanent.

[Global Settings](#)

[Internal Radius](#)

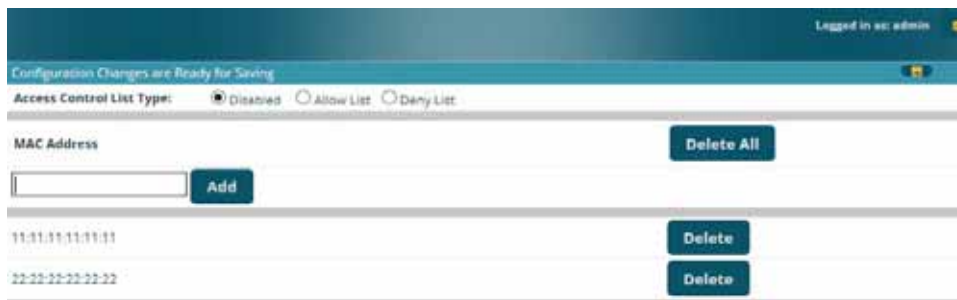

[Access Control List](#)

[Security](#)

Access Control List

This window allows you to enable or disable the use of the global Access Control List (ACL), which controls whether a station with a particular MAC address may associate to the AP. You may create station access control list entries and delete existing entries, and control the type of list.

There is only one global ACL, and you may select whether its type is an Allow List or a Deny List, or whether use of the list is disabled.

Access Control List configuration interface showing the following elements:

- Header: Logged in as: admin
- Status: Configuration Changes are Ready for Saving
- Access Control List Type: Disabled, Allow List, Deny List
- MAC Address input field with an **Add** button
- Table of existing entries:

MAC Address	Action
11-11-11-11-11-11	Delete
22-22-22-22-22-22	Delete
- Delete All** button

Figure 142. Access Control List

There is also a per-SSID ACL (see “Per-SSID Access Control List” on page 299). If the same MAC address is listed in both the global ACL and in an SSID’s ACL, and if either ACL would deny that station access to that SSID, then access will be denied.

Procedure for Configuring Access Control Lists

1. **Access Control List Type:** Select **Disabled** to disable use of the Access Control List, or select the ACL type—either **Allow List** or **Deny List**.
 - **Allow List:** Only allows the listed MAC addresses to associate to the AP. All others are denied.
 - **Deny List:** Denies the listed MAC addresses permission to associate to the AP. All others are allowed.

In addition to these lists, other authentication methods (for example, RADIUS) are still enforced for users.

2. **MAC Address:** If you want to add a MAC address to the ACL, enter the new MAC address here, then click on the **Add** button. The MAC address is added to the ACL. You may use a wildcard (*) for one or more digits to match a range of addresses. You may create up to 1000 entries.
3. **Delete:** You can delete selected MAC addresses from this list by clicking their **Delete** buttons.
4. Click the **Save** button  if you wish to make your changes permanent.

[External Radius](#)

[Global Settings](#)

[Internal Radius](#)

[Management Control](#)

[Security](#)

[Station Status Windows](#) (list of stations that have been detected by the AP)

Global Settings

This window allows you to establish the security parameters for your wireless network, including WEP, WPA, WPA2 and RADIUS authentication. When finished, click the **Save** button  if you wish to make your changes permanent.

For additional information about wireless network security, refer to “Security Planning” on page 56 and “Understanding Security” on page 226.

The screenshot displays the 'Global Settings (Security)' configuration page. At the top, it indicates 'Configuration Changes are Ready for Saving' and 'Logged in as: admin'. The 'Authentication Server Mode' section has three radio buttons: 'Internal Radius', 'External Radius' (selected), and 'Active Directory'. The 'WPA Settings' section includes:

- TKIP Enabled: Radio buttons for 'Yes' and 'No' (selected).
- AES Enabled: Radio buttons for 'Yes' (selected) and 'No'.
- WPA Group Rekey Time (seconds): A text input field and a 'Never' checkbox (checked).
- WPA Authentication: Radio buttons for 'EAP' (selected), 'PSK', and 'Hexadecimal'.
- WPA Preshared Key / Verify Key: Two text input fields with masked characters and radio buttons for 'ASCII' (selected) and 'Hexadecimal'.

 The 'WEP Settings' section features a 'Show Cleartext:' checkbox and four rows for 'Encryption Key 1 / Verify Key 1' through '4'. Each row has text input fields for the key, 'Key Size', 'ASCII', and 'Hex' options, and a 'Clear' button. The 'Default Key' is currently set to 'Key 1'.

Figure 143. Global Settings (Security)

Procedure for Configuring Network Security

1. **Authentication Server Mode:** Choose the type of Authentication Server that you will use for authenticating wireless users:
 - **Internal RADIUS** defines wireless user accounts locally on the AP. See “Internal Radius” on page 258.
 - **External RADIUS** defines wireless user accounts on a RADIUS server external to the AP. See “External Radius” on page 254.

- **Active Directory** defines wireless user accounts on an Active Directory server external to the AP. See “Active Directory” on page 260.

WPA Settings

These settings are used if the **WPA** or **WPA2** encryption type is selected on the **SSIDs >SSID Management** window or the **Express Setup** window (on this window, encryption type is set in the **SSID Settings: Wireless Security** field).

2. **TKIP Enabled:** Choose **Yes** to enable **TKIP** (Temporal Key Integrity Protocol), or choose **No** to disable TKIP.

TKIP encryption does not support high throughput rates for 802.11n, per the IEEE 802.11n specification.

TKIP should never be used for WDS links on APs.

3. **AES Enabled:** Choose **Yes** to enable **AES** (Advanced Encryption Standard), or choose **No** to disable AES. If both AES and TKIP are enabled, the station determines which will be used.
4. **WPA Group Rekey Time (seconds):** Enter a value to specify the group rekey time (in seconds). The default is **Never**.
5. **WPA Preshared Key / Verify Key:** If you enabled PSK, enter a passphrase here, then re-enter the passphrase to verify that you typed it correctly.

WEP Settings

These settings are used if the **WEP** encryption type is selected on the **SSIDs > SSID Management** window or the **Express Setup** window (on this window, encryption type is set in the **SSID Settings: Wireless Security** field).

Click the **Show Cleartext** button to make the text that you type in to the Key fields visible.

WEP encryption does not support high throughput rates or features like frame aggregation or block acknowledgments for 802.11n, per the IEEE 802.11n specification.

WEP should never be used for WDS links on APs.

6. Encryption Key 1 / Verify Key 1:

Key Size: Key length is automatically computed based on the Encryption Key that you enter

- 5 ASCII characters (10 hex) for 40 bits (WEP-64)
- 13 ASCII characters for (26 hex) 104 bits (WEP-128)

Encryption Key 1 / Verify Key 1: Enter an encryption key in ASCII or hexadecimal. The ASCII and translated hexadecimal values will appear to the right if you selected the **Show Cleartext** button.

Re-enter the key to verify that you typed it correctly. You may include special ASCII characters, except for the double quote symbol (“).

7. **Encryption Key 2 to 4/ Verify Key 2 to 4/ Key Mode/Length** (optional): If desired, enter up to four encryption keys, in the same way that you entered the first key.
8. **Default Key:** Choose which key you want to assign as the default key. Make your selection from the pull-down list.
9. Click the **Save** button  if you wish to make your changes permanent.

After configuring network security, the configuration must be applied to an SSID for the new functionality to take effect.

External Radius

This window allows you to define the parameters of an external RADIUS server for user authentication. To set up an external RADIUS server, you must choose **External Radius** as the **Authentication Server Mode** in “Global Settings” on page 250.

The screenshot displays the configuration page for an external RADIUS server. The interface is organized into several sections:

- Primary Server:** Host Name / IP Address: Radius1; Port Number: 1812; Shared Secret / Verify Secret: [masked]
- Secondary Server:** Host Name / IP Address: Radius2; Port Number: 1812; Shared Secret / Verify Secret: [masked]
- RADIUS Dynamic Authorization Settings:** Timeout (seconds): 600; DAS Port: 3799; DAS Event-Timestamp: Optional, Required; DAS Time Window: 300; NAS Identifier: [empty]
- RADIUS Attribute Formatting:** Called-Station-Id Attribute Format: BSSID, BSSID-SSID; Station MAC Format: lower-case (xxxxxxxxxx), UPPER-case (XXXXXXXXXX), lc-hyphenated (xx-xx-xx-xx-xx), UC-hyphenated (XX-XX-XX-XX-XX); Accounting: Off, On
- Accounting:** Accounting Interval (seconds): 300; Primary Server Host Name / IP Address: Radius1; Primary Server Port Number: 1813; Primary Server Shared Secret / Verify Secret: [masked]; Secondary Server Host Name / IP Address: Radius2; Secondary Server Port Number: 1813; Secondary Server Shared Secret / Verify Secret: [masked]

Figure 144. External RADIUS Server

If you want to include user group membership in the RADIUS account information for users, see “Understanding Groups” on page 304. User groups allow you to easily apply a uniform configuration to a user on the AP.

About Creating User Accounts on the RADIUS Server

An attribute of user (wireless client) accounts is controlled by RADIUS Vendor Specific Attributes (VSAs) defined by Xirrus. In particular, use the VSA named **Xirrus-Admin-Role** to set the privilege level for an account. For more information about the RADIUS VSAs used by Xirrus, see [“RADIUS Vendor Specific Attribute \(VSA\) for Xirrus” on page 532](#).

Procedure for Configuring an External RADIUS Server

1. **Primary Server:** This is the external RADIUS server that you intend to use as your primary server.
 - a. **Host Name / IP Address:** Enter the IP address or domain name of this external RADIUS server.
 - b. **Port Number:** Enter the port number of this external RADIUS server. The default is 1812.
 - c. **Shared Secret / Verify Secret:** Enter the shared secret that this external RADIUS server will be using, then re-enter the shared secret to verify that you typed it correctly.

The shared secret that you define must match the secret used by the external RADIUS server.

2. **Secondary Server (optional):** If desired, enter an alternative external RADIUS server. If the primary RADIUS server becomes unreachable, the AP will “failover” to the secondary RADIUS server (defined here).
 - a. **Host Name / IP Address:** Enter the IP address or domain name of this external RADIUS server.
 - b. **Port Number:** Enter the port number of this external RADIUS server. The default is 1812.
 - c. **Shared Secret / Verify Secret:** Enter the shared secret that this external RADIUS server will be using, then re-enter the shared secret to verify that you typed it correctly.

- 
3. **Settings (RADIUS Dynamic Authorization):** Some RADIUS servers have the ability to contact the AP (referred to as an NAS, see below) to terminate a user with a Disconnect Message (DM). Or RADIUS may send a Change-of-Authorization (CoA) Message to the AP to change a user's privileges due to changing session authorizations. This implements [RFC 5176—Dynamic Authorization Extensions to RADIUS](#).
 - a. **Timeout (seconds):** Define the maximum idle time before the RADIUS server's session times out. The default is 600 seconds.
 - b. **DAS Port:** RADIUS will use the DAS port on the AP for Dynamic Authorization Extensions to RADIUS. The default port is 3799.
 - c. **DAS Event-Timestamp:** The Event-Timestamp Attribute provides a form of protection against replay attacks. If you select **Required**, both the RADIUS server and the AP will use the Event-Timestamp Attribute and check that it is current within the **DAS Time Window**. If the Event-Timestamp is not current, then the DM or CoA Message will be silently discarded.
 - d. **DAS Time Window:** This is the time window used with the **DAS Event-Timestamp**, above.
 - e. **NAS Identifier:** From the point of view of a RADIUS server, the AP is a client, also called a Network Access Server (NAS). Enter the NAS Identifier (IP address) that the RADIUS servers expect the AP to use—normally the IP address of the AP's Gigabit1 port.
 4. **RADIUS Attribute Formatting Settings:** Some RADIUS servers, especially older versions, expect information to be sent to them in a legacy format. These settings are provided for the unusual situation that requires special formatting of specific types of information sent to the RADIUS server. Most users will not need to change these settings.
 - a. **Called-Station-Id Attribute Format:** Define the format of the **Called-Station-Id** RADIUS attribute sent from the AP—**BSSID:SSID** (default) or **BSSID**. This identifies the AP that is attempting to authenticate a client. **BSSID** is the MAC address of the IAP receiving the client signal. The **BSSID:SSID** option additionally identifies the

SSID to which the client wishes to connect. If your site is using Purple WiFi, you must use **Ethernet-MAC**, which identifies the AP using its wired network MAC address rather than a particular IAP. See [“Web Page Redirect for Purple WiFi Venues”](#) on page 294.

- b. **Station MAC Format:** Define the format of the **Station MAC** RADIUS attribute sent from the AP—lower-case or upper-case, hyphenated or not. The default is lower-case, not hyphenated.

5. **Accounting Settings:**

Note that RADIUS accounting start packets sent by the AP will include the client station's Framed-IP-Address attribute.

The RADIUS attribute Type-50 Acct-Multi-Session-Id is included in all RADIUS accounting messages generated by ArrayOS. This attribute is used, for example, by Aruba ClearPass to facilitate functions such as onboarding and guest access when stations are roaming between APs.

- a. **Accounting Interval (seconds):** Specify how often Interim records are to be sent to the server. The default is 300 seconds.
- b. **Primary Server Host Name / IP Address:** Enter the IP address or domain name of the primary RADIUS accounting server that you intend to use.
- c. **Primary Port Number:** Enter the port number of the primary RADIUS accounting server. The default is 1813.
- d. **Primary Shared Secret / Verify Secret:** Enter the shared secret that the primary RADIUS accounting server will be using, then re-enter the shared secret to verify that you typed it correctly.
- e. **Secondary Server Host Name / IP Address (optional):** If desired, enter an IP address or domain name for an alternative RADIUS accounting server. If the primary server becomes unreachable, the AP will “failover” to this secondary server (defined here).
- f. **Secondary Port Number:** If using a secondary accounting server, enter its port number. The default is 1813.

- g. **Secondary Shared Secret / Verify Secret:** If using a secondary accounting server, enter the shared secret that it will be using, then re-enter the shared secret to verify that you typed it correctly.
6. Click the **Save** button  if you wish to make your changes permanent.

Internal Radius

This window allows you to define the parameters for the AP's internal RADIUS server for user authentication. However, the internal RADIUS server will only authenticate wireless clients that want to associate to the AP. This can be useful if an external RADIUS server is not available. To set up the internal RADIUS server, you must choose **Internal Radius** as the **Authentication Server Mode** in “Global Settings” on page 250.

User Name	SSID Restriction	User Group	Password / Verify	
<input type="text"/>	Select SSID...	Select Group...	<input type="text"/>	Create
AlfredNeuman	xyzcorp	Select Group...	<input type="text"/>	Delete
BullySummers	xyzcorp	Select Group...	<input type="text"/>	Delete
JohnMcClaine	xyzcorp	Select Group...	<input type="text"/>	Delete

Figure 145. Internal RADIUS Server

*Clients using PEAP may have difficulty authenticating to the AP using the Internal RADIUS server due to invalid security certificate errors. To prevent this problem, the user may disable the **Validate Server Certificate** option on the station. Do this by displaying the station's wireless devices and then displaying the properties of the desired wireless interface. In the security properties, disable **Validate server certificate**. In some systems, this may be found by setting the authentication method to PEAP and changing the associated settings.*

Procedure for Creating a New User

- 1. User Name:** Enter the name of the user that you want to authenticate to the internal RADIUS server. You may enter up to 1000 users (up to 256 on the XR-500 Series, or up to 480 on two-radio APs).
- 2. SSID Restriction:** (Optional) If you want to restrict this user to associating to a particular SSID, choose an SSID from the pull-down list.
- 3. User Group:** (Optional) If you want to make this user a member of a previously defined user group, choose a group from the pull-down list. This will apply all of the user group's settings to the user. See ["Understanding Groups" on page 304](#).
- 4. Password:** (Optional) Enter a password for the user.
- 5. Verify:** (Optional) Retype the user password to verify that you typed it correctly.
- 6.** Click on the **Create** button to add the new user to the list.

Procedure for Managing Existing Users

- 1. SSID Restriction:** (Optional) If you want to restrict a user to associating to a particular SSID, choose an SSID from its pull-down list.
- 2. User Group:** (Optional) If you want to change the user's group, choose a group from the pull-down list. This will apply all of the user group's settings to the user. See ["Understanding Groups" on page 304](#).
- 3. Password:** (Optional) Enter a new password for the selected user.

4. **Verify Password:** (Optional) Retype the user password to verify that you typed it correctly.
5. If you want to delete one or more users, click their **Delete** buttons.
6. Click the **Save** button  if you wish to make your changes permanent.

Active Directory

XR-520/XR-1000 Series APs do not support Active Directory. You will receive an error message if you attempt to configure this feature.

This window allows you to configure 802.1x user authentication without needing to set up and use an [External Radius](#) server. The AP performs authentication by utilizing an Active Directory server that you have deployed within your network domain.

This window configures the settings required to connect to the Active Directory server. Additionally, [Active Directory Test Tools](#) are provided to ease the process of validating proper communication between the Active Directory server and the AP.

To use the Active Directory settings on this page you must choose **Active Directory** as the **Authentication Server Mode** in “[Global Settings](#)” on page 250.

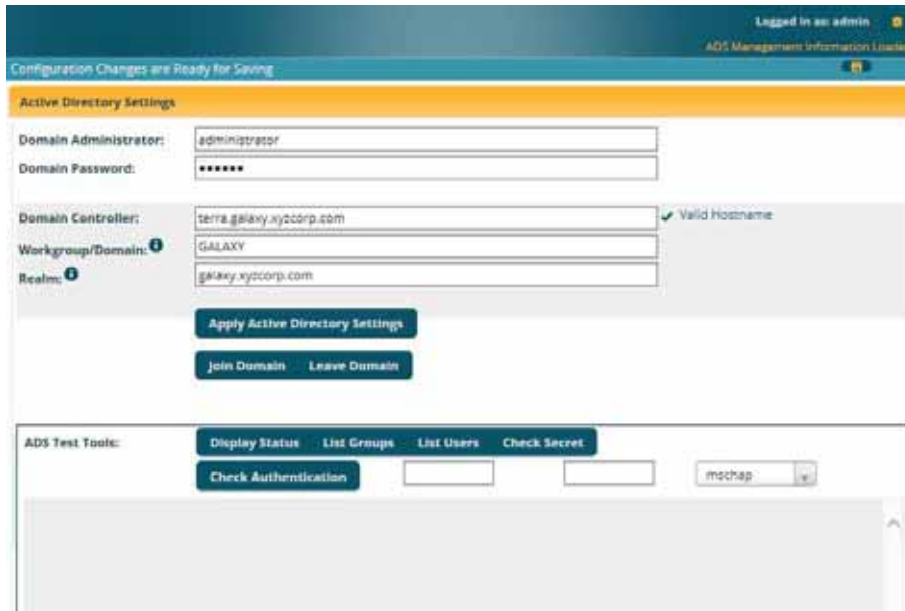

Figure 146. Active Directory Server

Procedure for Use of an Active Directory Server

1. Choose **Active Directory** as the **Authentication Server Mode** in “[Global Settings](#)” on page 250.
2. **Domain Administrator:** Enter the administrator account name for access to the domain controller. The AP will use this (together with the password) to create a machine account on the domain for the AP. This can be the name of any account that can join a machine to the domain.
3. **Domain Password:** The password for the **Domain Administrator** entered above.
4. **Domain Controller:** Enter the hostname to access the domain controller. This cannot be entered as an IP address. The AP will check that it is able to access the controller and place a checkmark to the right of the entry to indicate that it has been validated. Note that the checkmark only appears

after you have made a change requiring validation (i.e., entering a new hostname or changing an existing entry to a different hostname). If you return to this page at a later time, the checkmark will not be present.

5. **Workgroup/Domain:** Enter the Pre-Windows 2000 Domain name. This can be found by opening the Active Directory **Users and Computers**. Right click the domain in the left hand window and select **Properties**. This will display the **Domain name** that should be entered.

Figure 147. Finding the Domain Name from Active Directory

6. **Realm:** Realm name (may be the same as the domain name). **Workgroup** and **Realm** are both required. To find the Realm, open a command window on the server and type

```
echo %userdnsdomain%
```

 This will display the Realm.
7. Click **Apply Active Directory Settings** to use these settings.
8. You must click **Join Domain** to ask the domain controller to join the AP to the domain. The AP is added to the list of computers in the workgroup. The status of the request will be displayed in the area below the Test

Tools. The domain controller will give the AP a secret that may be used as a key to fetch information. The secret may be checked with the **Check Secret** test tool, below. You may click **Leave Domain** to ask the domain controller to remove the AP from the domain and revoke its secret.

9. You may use the tools below to check that the AP is able to access and use the Active Directory successfully, or to troubleshoot any problems.

Active Directory Test Tools

10. **Display Status:** Displays detailed status information for the Active Directory.
11. **List Groups:** Shows the groups defined in the Active Directory for this **Workgroup**.
12. **List Users:** Shows the users defined in the Active Directory for this **Workgroup**.
13. **Check Secret:** The continued validity of the secret granted by **Join Domain** may be checked with this test tool.
14. **Check Authentication:** Enter a **User** name and **Password**. Select the **Type** of encryption to be used (**MSCHAP**, **NTLM**, **PAP**, or **PEAP-MSCHAPv2**), to check that it will work with the Active Directory server. Then click **Check Authentication** to validate that the AP can authenticate the user with the selected type of encryption.

Rogue Control List

This window allows you to set up a control list for rogue APs, based on a type that you define. You may classify rogue APs as blocked, so that the AP will take steps to prevent stations from associating with the blocked AP. See [“About Blocking Rogue APs”](#) on page 376. The AP can keep up to 5000 list entries.

*The **RF Monitor > Intrusion Detection** window provides an alternate method for classifying rogues. You can list all Unknown stations and select all the rogues that you'd like to set to Known or Approved, rather than entering the SSID/BSSID as described below. See [“Rogues”](#) on page 120.*

Rogue BSSID/SSID	Blocked	Approved	Known	Match Only:	BSSID	SSID	Manufacturer	
<input type="text"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	Create
64:a7:0d*	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	Delete

Figure 148. Rogue Control List

Procedure for Establishing Rogue AP Control

1. **Rogue BSSID/SSID:** Enter the BSSID, SSID, or manufacturer string to match for the new rogue control entry. The **Match Only** radio buttons specify what to match (e.g., the MAC address, SSID, or manufacturer).

You may use the “*” character as a wildcard to match any string at this position. For example, 00:0f:7d:* matches any string that starts with 00:0f:7d:. Xirrus APs start with 00:0f:7d: or 50:60:28:00:0f:7d:*. By default, the Rogue Control List contains two entries that match **00:0f:7d:*** and **50:60:28:*** and apply the classification **Known** to all Xirrus APs.

2. **Rogue Control Classification:** Enter the classification for the specified rogue AP(s), either **Blocked**, **Known** or **Approved**.

3. **Match Only:** Select the match criterion to compare the **Rogue BSSID/SSID** string against: **BSSID**, **Manufacturer**, or **SSID**. The BSSID field contains the MAC address.
4. Click **Create** to add this rogue AP to the Rogue Control List.
5. **Rogue Control List:** If you want to edit the control type for a rogue AP, just click the radio button for the new type for the entry: **Blocked**, **Known** or **Approved**.
6. To delete rogue APs from the list, click their **Delete** buttons.
7. Click the **Save** button  if you wish to make your changes permanent.

[SSID Management](#)

OAuth 2.0 Management

This window displays a list of tokens granted by the AP for access to its RESTful API (see [“API Documentation” on page 428](#) for a description of the features available in the API). OAuth 2.0 is used to provide the tokens. The list will be blank until tokens have been issued as described below. You may revoke (delete) existing tokens from the list, if desired.

Xirrus APs use the OAuth 2.0 standard’s client credential grant model. This allows you to use administrator account credentials to obtain a token to access RESTful API on an individual AP. Please note that the AP will issue only **one** token on behalf on of any administrator account at any given time. If you have a need for multiple tokens, then the AP will need multiple administrator accounts.

Follow the steps below to obtain a token and use the RESTful API.

Token	Client ID	Scope	Grant Type	Auth Type
No tokens registered.				

Figure 149. OAuth 2.0 Management - Token List

Procedure for Obtaining a Token and Accessing RESTful API on the AP

1. Present User Credentials for a Permanent Token

A user-developed application must register by presenting the following information to the URL below:

```
https://[AP hostname or IP address]/oauth/authorize
```

- **grant_type:** password
- **username:** username of an administrator account on the AP.
- **client_id:** username of an administrator account on the AP (username and client_id must match).
- **password:** password for the same administrator account on the AP

The OAuth Authorization API provides a permanent token that the application may use to access the RESTful API. This token remains valid until the administrator revokes the token on the **OAuth 2.0 Management** page, unless the token file somehow becomes corrupted or is removed from the AP's file system.

The token will be removed if the original account associated with it is deleted.

2. Access the RESTful API

Once registration is completed and a permanent token has been provided, your application may access the API using the **client_id** and the token at the following URL:

```
https://[AP hostname or IP address]/api/v3/[api-name]
```

Wireless Access Point

Please see [“API Documentation”](#) on [page 428](#) for a description of the features available in the API.

SSIDs

This status-only window allows you to review **SSID** (Service Set Identifier) assignments. It includes the SSID name, whether or not an SSID is visible on the network, any security and **QoS** parameters defined for each SSID, associated **VLAN** IDs, radio availability, and DHCP pools defined per SSID. Click on an SSID's name to jump to the edit page for the SSID. There are no configuration options available on this page, but if you are experiencing problems or reviewing SSID management parameters, you may want to print this page for your records.

For a complete discussion of implementing Voice over Wi-Fi on the AP, see the [Voice over Wireless Application Note](#) in the [Xirrus Resource Center](#).

SSID	Authentication	Encryption	Security Settings	VLAN	VLAN Num	QoS	Band	Avaya Roaming	Broadcast	DHCP Pool	WPA	ACL	Fail	Mobile
system	802.1x	wpa-bom	unique-settings	none	0	2	Both	layer 2-only	on		off	off	off	none

SSID	Enabled	Active	Station Limit	SSID	Stations	SSID	Stations	Time On	Time Off	Days On
system	yes	yes	unlimited	unlimited	unlimited	unlimited	unlimited	always	never	All

SSID	Name	SSID	MAC

Whitelist Name	Broadcast SSID

Figure 150. SSIDs

The read-only **Limits** section of the SSIDs window allows you to review any limitations associated with your defined SSIDs. For example, this window shows the current state of an SSID (enabled or not), how much SSID and station traffic is allowed, time on and time off, days on and off, and whether each SSID is currently active or inactive.

For information to help you understand SSIDs and how multiple SSIDs are managed by the Wireless AP, go to [“Understanding SSIDs” on page 269](#) and the [Multiple SSIDs](#) section of [“Frequently Asked Questions” on page 522](#). For a description of how QoS operates on the AP, see [“Understanding QoS Priority on the Wireless AP” on page 271](#).

SSIDs are managed with the following windows:

- [“SSID Management” on page 277](#)
- [“Active IAPs” on page 298](#)
- [“Per-SSID Access Control List” on page 299](#)
- [“Honeypots” on page 300](#)
- [“Personal Wi-Fi” on page 302](#)

SSIDs are discussed in the following topics:

- [“Understanding SSIDs” on page 269](#)
- [“Understanding QoS Priority on the Wireless AP” on page 271](#)
- [“High Density 2.4G Enhancement—Honeypot SSID” on page 275](#)

Understanding SSIDs

The SSID (Service Set Identifier) is a unique identifier that wireless networking devices use to establish and maintain wireless connectivity. Multiple access points on a network or sub-network can use the same SSIDs. SSIDs are case-sensitive and can contain up to 32 alphanumeric characters (do not include spaces when defining SSIDs).

Multiple SSIDs

A BSSID (Basic SSID) refers to an individual access point radio and its associated clients. The identifier is the MAC address of the access point radio that forms the

BSS. A group of BSSs can be formed to allow stations in one BSS to communicate to stations in another BSS via a backbone that interconnects each access point.

The Extended Service Set (ESS) refers to the group of BSSIDs that are grouped together to form one ESS. The ESSID (often referred to as SSID or “wireless network name”) identifies the Extended Service Set. Clients must associate to a single ESS at any given time. Clients ignore traffic from other Extended Service Sets that do not have the same SSID.

Legacy access points typically support one SSID per access point. Wireless APs support the ability to define and use multiple SSIDs simultaneously.

Using SSIDs

The creation of different wireless network names allows system administrators to separate types of users with different requirements. The following policies can be tied to an SSID:

- The wireless security mode needed to join this SSID.
- The wireless Quality of Service (QoS) desired for this SSID.
- The wired VLAN associated with this SSID.

As an example, one SSID named **accounting** might require the highest level of security, while another named **guests** might have low security requirements.

Another example may define an SSID named **voice** that supports voice over Wireless LAN phones with the highest Quality of Service (QoS) definition. This SSID might also forward traffic to specific VLANs on the wired network.

[Understanding SSIDs](#)

Understanding QoS Priority on the Wireless AP

For a complete discussion of implementing Voice over Wi-Fi on the AP, see the [Voice over Wireless Application Note](#) in the [Xirrus Resource Center](#).

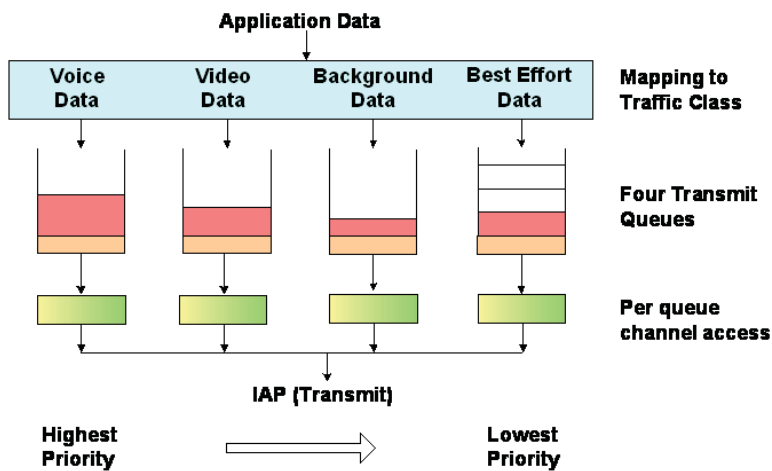

Figure 151. Four Traffic Classes

The Wireless AP's Quality of Service Priority feature (QoS) allows traffic to be prioritized according to your requirements. For example, you typically assign the highest priority to voice traffic, since this type of traffic requires delay to be under 10 ms. The AP has four separate queues for handling wireless traffic at different priorities, and thus it supports four traffic classes (QoS levels).

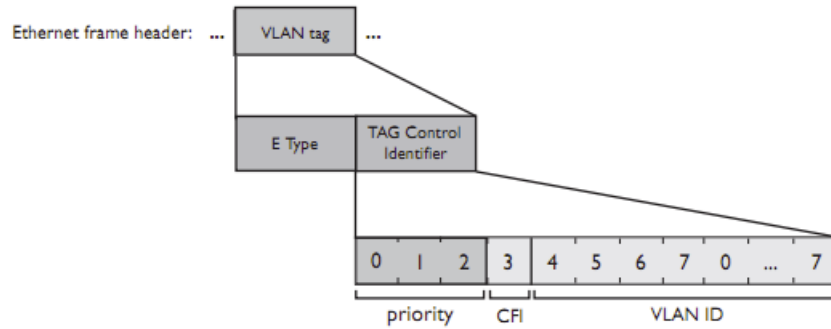

Figure 152. Priority Level—IEEE 802.1p (Layer 2)

IEEE802.1p uses three bits in an Ethernet frame header to define eight priority levels at the MAC level (Layer 2) for wired networks. Each data packet may be tagged with a priority level, i.e., a **user priority** tag. Since there are eight possible user priority levels and the AP implements four wireless QoS levels, user priorities are mapped to QoS as described below.

Figure 153. Priority Level—DSCP (DiffServ - Layer 3)

Differentiated Services Code Point or DiffServ (DSCP) uses 6 bits in the IPv4 or IPv6 packet header, defined in [RFC2474](#) and [RFC2475](#). The DSCP value classifies a Layer 3 packet to determine the Quality of Service (QoS) required. DSCP replaces the outdated Type of Service (TOS) field.

The description below describes how both of these priority levels are mapped to the AP's four traffic classes.

End-to-End QoS Handling

Wired QoS - Ethernet Port:

- Egress: Outgoing wired packets are IEEE 802.1p tagged at the Ethernet port for upstream traffic, thus enabling QoS at the edge of the network.

FROM AP QoS (Wireless)	TO Priority Tag 802.1p (Wired)
1 (Lowest priority)	1
0	0
2 (Default)	5
3 (Highest priority)	6

- Ingress: Incoming wired packets are assigned QoS priority based on their SSID and 802.1p tag (if any), as shown in the table below. This table follows the mapping recommended by IEEE802.11e.

FROM Priority Tag 802.1p (Wired)	TO AP QoS (Wireless)	Typical Use
0	0	Best Effort
1	1 (Lowest priority)	Background—explicitly designated as low-priority and non-delay sensitive
2	1	Spare
3	0	Excellent Effort
4	2	Controlled Load
5	2	Video
6	3	Voice - requires delay <10ms

FROM Priority Tag 802.1p (Wired)	TO AP QoS (Wireless)	Typical Use
7 (Highest priority)	3 (Highest priority)	Network control

Wireless QoS - Radios:

- Each SSID can be assigned a separate QoS priority (i.e., traffic class) from 0 to 3, where 3 is highest priority and 2 is the default. See [“SSID Management” on page 277](#). If multiple SSIDs are used, packets from the SSID with higher priority are transmitted first.
- The AP supports IEEE802.11e Wireless QoS for downstream traffic. Higher priority packets wait a shorter time before gaining access to the air and contend less with all other 802.11 devices on a channel.
- How QoS is set for a packet in case of conflicting values:
 - a. If an SSID has a QoS setting, and an incoming wired packet’s user priority tag is mapped to a higher QoS value, then the higher QoS value is used.
 - b. If a group or filter has a QoS setting, this overrides the QoS value above. See [“Groups” on page 304](#), and [“Filters” on page 391](#).
 - c. Voice packets have the highest priority (see [Voice Support](#), below).
 - d. If **DSCP to QoS Mapping Mode** is enabled, the IP packet is mapped to QoS level 0 to 3 as specified in the [DSCP Mappings](#) table. This value overrides any of the settings in cases a to c above.

In particular, by default:

- DSCP 8 is set to QoS level 1.
- DSCP 40 is typically used for video traffic and is set to QoS level 2.
- DSCP 48 is typically used for voice traffic and is set to QoS level 3—the highest level

- All other DSCP values are set to QoS level 0 (the lowest level—Best Effort).

Packet Filtering QoS classification

- Filter rules can be used to redefine the QoS priority level to override defaults. See [“Filter Management” on page 395](#). This allows the QoS priority level to be assigned based on protocol, source, or destination.

Voice Support

- The QoS priority implementation on the AP gives voice packets the highest priority to support voice applications.

High Density 2.4G Enhancement—Honeypot SSID

Some situations pose problems for all wireless APs. For example, iPhones will remember every SSID and flood the airwaves with probes, even when the user doesn't request or desire this behavior. In very high density deployments, these probes can consume a significant amount of the available wireless bandwidth.

The AP “honeypot” SSID targets this problem. Simply create an SSID named **honeypot** (lower-case) on the AP, with no encryption or authentication (select **None/Open**). Once this SSID is created and enabled, it will respond to any station probe looking for a named open SSID (unencrypted and unauthenticated) that is *not* configured on the AP. It will make the station go through its natural authentication and association process. See [“Honeypots” on page 300](#).

The following SSIDs are excluded from being honeypotted:

- Explicitly whitelisted SSIDs. See [“Honeypots” on page 300](#).
- SSIDs that are encrypted and/or authenticated.
- SSIDs that are configured on this AP, whether or not they are enabled.

Traffic for a station connected to the honeypot SSID may be handled in various ways using other AP features:

- Traffic may be directed to WPR (captive portal) to display a splash page or offer the user the opportunity to sign in to your service (see [“Web Page Redirect \(Captive Portal\) Configuration” on page 287](#));
- Traffic may be filtered (see [“Filters” on page 391](#));

- or it may be dead-ended by defining a specific dead-end VLAN on the honeypot SSID to “trap” stations (see [“VLANs” on page 213](#)).

Use the honeypot feature carefully as it could interfere with legitimate SSIDs and prevent clients from associating to another available network. You may define a whitelist of allowed SSIDs which are not to be honeypotted. See [“Honeypots” on page 300](#). The Honey pots page also allows you to change the SSID name that is broadcast for the honeypot SSID.

SSID Management

This window allows you to manage SSIDs (create, edit, schedule, rename, and delete), assign security parameters and VLANs on a per SSID basis, and configure the Web Page Redirect (WPR captive portal) functionality.

The screenshot shows the configuration interface for an SSID. It is divided into several sections: 'Create a New SSID', 'SSID Factory' (with sub-sections for Overall Traffic, Traffic per Station, and Scheduling), 'Web Page Redirect Configuration', 'WPA Configuration', and 'Authentication Server Configuration'. Arrows point from text labels at the bottom to specific parts of the interface: 'Create new SSID' points to the 'Create a New SSID' section; 'Configure parameters' points to the 'SSID Factory' section; 'Configure WPR' points to the 'Web Page Redirect Configuration' section; 'Configure authentication server' points to the 'Authentication Server Configuration' section; and 'Set traffic limits / usage schedule' points to the 'Scheduling' section.

Configure parameters
Configure WPR
Configure WPA
Set traffic limits / usage schedule
Configure authentication server

Figure 154. SSID Management

Procedure for Managing SSIDs

1. **New SSID:** To create a new SSID, enter a new SSID name. SSID names are case sensitive and may only consist of the characters A-Z, a-z, 0-9, dash, and underscore. You may create up to 16 SSIDs (up to 8 on the XR-500 Series). You may create a special SSID named **honeypot** (lower-case) to reduce the amount of unnecessary traffic caused by stations probing for open SSID names that they have learned in the past—see [“High Density 2.4G Enhancement—Honeypot SSID”](#) on page 275. In this case, a **Honeypot Service Whitelist Configuration** section will appear below (see [Step 1](#) on page 301).

To rename an SSID or schedule a range of dates during which it may be used, see [“SSID Limits and Scheduling”](#) on page 284.

SSID List (top of page)

2. **SSID:** Shows all currently assigned SSIDs. When you create a new SSID, the SSID name appears in this table. Click any SSID in this list to select it.
3. **Enabled:** Check this box to activate this SSID or clear it to deactivate it. Once the SSID is enabled, its availability is also controlled by settings in [“SSID Limits and Scheduling”](#) on page 284.
4. **Brdcast:** Check this box to make the selected SSID visible to all clients on the network. Although the Wireless AP will not broadcast SSIDs that are hidden, clients can still associate to a hidden SSID if they know the SSID name to connect to it. Clear this box if you do not want this SSID to be visible on the network.
5. **Band:** Choose which wireless band the SSID will be beacons on. Select either **5 GHz**—802.11an, **2.4 GHz**—802.11bgn or **Both**.
6. **VLAN ID / Number:** (Optional) From the pull-down list, select a VLAN or VLAN Pool that you want this traffic to be forwarded to on the wired network. Select **numeric** to enter the number of a previously defined VLAN in the **Number** field. See [“VLANs”](#) on page 213 and [“VLAN Pools”](#) on page 215.

7. **QoS:** (Optional) Select a value in this field for QoS (Quality of Service) priority filtering. The QoS value must be one of the following:
 - 0—The lowest QoS priority setting, where QoS makes its best effort at filtering and prioritizing data, video and voice traffic without compromising the performance of the network. Use this setting in environments where traffic prioritization is not a concern.
 - 1—Medium, with QoS prioritization aggregated across all traffic types.
 - 2—High, normally used to give priority to video traffic.
 - 3—The highest QoS priority setting, normally used to give priority to voice traffic.

The QoS setting you define here will prioritize wireless traffic for this SSID over other SSID traffic, as described in [“Understanding QoS Priority on the Wireless AP” on page 271](#). The default value for this field is 2.

8. **DHCP Pool:** If you want to associate an internal DHCP pool to this SSID, choose the pool from the pull-down list. An internal DHCP pool must be created before it can be assigned. To create an internal DHCP pool, go to [“DHCP Server” on page 200](#).
9. **DHCP Option:** When this option is enabled, the AP snoops station DHCP requests and inserts relay agent information into these DHCP packets (option 82, in the CIRCUIT-ID sub-option). Information inserted includes AP MAC address and SSID name. You may use this option here or on the [Tunnel Management](#) page, but not in both places. Information is inserted as a colon-separated text string in the CIRCUIT ID value field, in this format: [AP_MAC]:[SSID]

[AP_MAC] length = 17 (aa-bb-cc-dd-ee-ff)

[SSID] length = length of SSID name

Example: aa-bb-cc-dd-ee-ff:mySSID

Note that the MAC address uses *dashes* as separators, and that format is different than that used for Option 82 with Tunnels.

10. Filter List: If you wish to apply a set of filters to this SSID's traffic, select the desired Filter List. See [“Filters” on page 391](#).

11. Authentication: The following authentication options are available (only valid encryption/authentication combinations are offered):

- **Open:** This option provides no authentication and is not recommended.
- **RADIUS MAC:** Uses an external RADIUS server to authenticate stations onto the wireless network, based on the user's MAC address. Accounting for these stations is performed according to the accounting options that you have configured specifically for this SSID or globally (see [Step 13](#) below).

If this SSID is on a VLAN, the VLAN must have management turned on in order to pass CHAP authentication challenges from the client station to the RADIUS server.

- **802.1x:** Authenticates stations onto the wireless network via a RADIUS server using 802.1x with EAP. The RADIUS server can be internal (provided by the Wireless AP) or external.

12. Encryption: Choose the encryption that will be required—specific to this SSID—either **None**, **WEP**, **WPA**, **WPA2** or **WPA-Both**. The None option provides no security and is not recommended; WPA2 provides the best Wi-Fi security.

Each SSID supports only one encryption type at a time (except that WPA and WPA2 are both supported on an SSID if you select WPA-Both). If you need to support other encryption types, you must define additional SSIDs. The encryption used with WPA or WPA2 is selected in [“Global Settings” on page 250](#). For an overview of the security options, see [“Security Planning” on page 56](#) and [“Understanding Security” on page 226](#).

13. Global: Check this box if you want this SSID to use the security settings established at the global level (see [“Global Settings” on page 250](#)). Clear this box if you want the settings established here to take precedence.

The screenshot displays four configuration sections for an SSID:

- Web Page Redirect Configuration:** Includes fields for Landing Page URL, Background Image, Logo Image, Header Text File, Footer Text File, and Authentication Timeout (1-10080 or none). It also has radio buttons for Server (Internal Splash, Internal Login, External Login, Cloud, External Splash, Landing Page Only) and RADIUS Authentication Type (PAP, HTTPS), along with fields for Redirect URL and Redirect Secret.
- WPR Whitelist Configuration:** A simple form with a Name field, a Create button, and a Delete All button.
- WPA Configuration:** Includes checkboxes for Encryption Ciphers (AES, TKIP) and Authentication (EAP, PSK, U-PSK). It has fields for Preshared Key and Verify Key, and a Set button.
- Authentication Service Configuration:** Includes radio buttons for Active Directory, Internal Radius, and External Radius. It has a table for configuring RADIUS servers with columns for Host / IP Address, Port, and Shared Secret. There is also an Accounting checkbox.

Arrows from the WPA Configuration section point to the Authentication Service Configuration section, with labels: "Set Encryption" pointing to the Authentication radio buttons, and "Configure Radius, Accounting" pointing to the RADIUS server table and Accounting checkbox.

Figure 155. SSID Management—Encryption, Authentication, Accounting

Additional sections will be displayed to allow you to configure encryption, authentication server, and RADIUS accounting settings.

- The **WPA Configuration** encryption settings have the same parameters as those described in [“Procedure for Configuring Network Security”](#) on page 250.

The **U-PSK** (User-PSK) Authentication settings are only used in conjunction with XMS-Cloud’s EasyPass Onboarding Portals. XMS-Cloud automatically configures this setting for an SSID when you create an Onboarding portal and you assign that SSID to the portal. Thus, you should *not* normally change this setting manually. Note that the User-PSK settings are only available here, on the [SSID](#)

[Management](#) page (i.e., they are configured per SSID rather than in [Global Settings](#)).

EasyPass Onboarding facilitates “Bring Your Own Device (BYOD)” usage. XMS-Cloud’s onboarding lets you create user accounts in advance, and a user can self-register a number of devices simply by connecting to the wireless network from each device. Each user account is assigned a User-Preshared Key (U-PSK) to be used for registering each device and accessing the wireless network.

U-PSK should only be enabled for an SSID that is assigned to an XMS-Cloud EasyPass Onboarding portal. XMS-Cloud will also automatically generate a unique Preshared Key for each user account.

U-PSK Cache Timeout (minutes)—this local cache on the AP stores the station’s preshared key that was authenticated by the cloud. The cache saves time the next time that the station associates to the AP, since there is no need to query the U-PSK cloud server again. U-PSK Cache Timeout specifies how long the cached entry is used before it must be re-validated.

U-PSK Server Error specifies what to do if the U-PSK server in the cloud cannot be accessed to check station authentication status. You may **Allow** station traffic if the server is unavailable, or **Block** it.

- To configure **Active Directory** settings, see “[Active Directory](#)” on [page 260](#)).
- The **External RADIUS** and **Accounting** settings are configured in the same way as for an external RADIUS server (see “[Procedure for Configuring an External RADIUS Server](#)” on [page 255](#)). Note that external RADIUS servers may be specified using IP addresses or domain names.

14. **Roaming**: For this SSID, select whether to enable fast roaming between IAPs or APs at **L2&L3** (Layer 2 and Layer 3), at **L2** (Layer 2 only), or disable roaming (**Off**). You may only select fast roaming at Layers 2 and 3 if this has been selected in [Global Settings](#). See “[Understanding Fast Roaming](#)” on [page 312](#).

- 15. WPR (Web Page Redirect, also called captive portal):** Check the checkbox to enable the Web Page Redirect functionality, or clear it to disable this option. If enabled, WPR configuration fields will be displayed under the SSID Limits section. This feature may be used to provide an alternate mode of authentication, or to simply display a splash screen when a user first associates to the wireless network. After that, it can (optionally) redirect the user to an alternate URL. For example, some wireless devices and users may not have a correctly configured 802.1x (RADIUS) supplicant. Utilizing WPR's Web-based login, users may be authenticated without using an 802.1x supplicant. See [“Web Page Redirect \(Captive Portal\) Configuration” on page 287](#) for details of WPR usage and configuration. If your venue is using Purple WiFi for guest access, see also [“Web Page Redirect for Purple WiFi Venues” on page 294](#).

You may specify “Whitelist” entries—a list of web sites to which users have unrestricted access, without needing to be redirected to the WPR page first. See [“Whitelist Configuration for Web Page Redirect” on page 293](#) for details.

When using WPR, it is particularly important to adhere to the SSID naming restrictions detailed in [Step 1](#).

- 16. Fallback:** Network Assurance checks network connectivity for the AP. When Network Assurance detects a failure, perhaps due to a bad link or WDS failure, if Fallback is set to **Disable** the AP will automatically disable this SSID. This will disassociate current clients, and prevent new clients from associating. Since the AP's network connectivity has failed, this gives clients a chance to connect to other, operational parts of the wireless network. No changes are made to WDS configuration. See [Step a on page 243](#) for more information on Network Assurance.
- 17. Mobile Device Management (MDM):** If you are an AirWatch customer and wish to have AirWatch manage mobile device access to the wireless network on this SSID, select **AirWatch** from the drop-down list. Before selecting this option, you must configure your [AirWatch](#) settings. See [“AirWatch” on page 406](#).

Note that you cannot use MDM and WPR on the same SSID.

The lower part of the window contains a few sections of additional settings to configure for the currently selected SSID, depending on the values chosen for the settings described above.

- [“SSID Limits and Scheduling” on page 284](#)
- [“Web Page Redirect \(Captive Portal\) Configuration” on page 287](#)
- [“Whitelist Configuration for Web Page Redirect” on page 293](#)
- [“WPA Configuration” on page 297](#)
- [“Authentication Service Configuration” on page 297](#)

SSID Limits and Scheduling

See [“Group Limits” on page 309](#) for a discussion of the interaction of SSID limits and group limits. To eliminate confusion, we recommend that you configure one set of limits or the other, but not both.

18. **Stations:** Enter the maximum number of stations allowed on this SSID. This step is optional. Note that the IAPs - Global Settings window also has a station limit option—**Max Station Association per IAP**, and the windows for [Global Settings .11an](#) and [Global Settings .11bgn](#) also have **Max Stations** settings. If multiple station limits are set, all will be enforced. As soon as any limit is reached, no new stations can associate until some other station has terminated its association.
19. **Overall Traffic:** Choose **Unlimited** if you do not want to place a restriction on the traffic for this SSID, or enter a value in the **Packets/Sec** field to force a traffic restriction.
20. **Traffic per Station:** Choose **Unlimited** if you do not want to place a restriction on the traffic per station for this SSID, or enter a value in the **Packets/Sec** field or the **Kbps** field to force a traffic restriction. If you set both values, the AP will enforce the limit it reaches first.

21. **Rename SSID:** Use this field if you wish to change the name of an SSID without changing any of its other settings. For example, a convention center might wish to change the SSID name based on the name of the current exhibition.

Scheduling

22. **Days Active:** Choose **Everyday** if you want this SSID to be active every day of the week, or select only the specific days that you want this SSID to be active. Days that are not checked are considered to be the inactive days.
23. **Time Active:** Choose **Always** if you want this SSID active without interruption, or enter values in the **Time On** and **Time Off** fields to limit the time that this SSID is active.
24. **Date on:** Use this and the following two fields for *SSID Scheduling*—this lets you set up an SSID in advance and specify a period of time for the SSID to be in service. For example, a convention center might wish to set up SSIDs ahead of time for exhibitions that are scheduled for the next six months, and have each SSID be used only for the specified period.

The SSID must be **Enabled** (see [Step 1 on page 278](#)), or the scheduling settings will be ignored. Note that once the SSID has reached its scheduled time and is in service, it will then obey the settings for **Days Active** and **Time Active** above.

Set **Date on** to **none** (the default) if you don't want this SSID to be delayed until later—that is, it will be put in service starting immediately. Select **Specific Date & Time** to have the SSID start become active at the specified date and time. Use the format YYYY-MM-DD [HH:MM], where time (hour and minute) is optional. For example, enter **2016:09:29 08:00**. Use **After Duration** to delay for the specified amount of time in days, hours, and minutes, before the SSID is in service (use the format DD HH:MM, including the hours and minutes). For example, to have the SSID become valid after one day, one hour and 30 minutes have passed, enter **1 01:30**.

- 
25. Use **Date off** to specify a date to take the SSID out of service without deleting it. At the specified date, the AP will turn the **Enabled** flag off. Leave **Expiration** and **Date off** set to **none** (the default) if you want this SSID to remain in service indefinitely after its scheduled start. Use **Specific Date & Time** to take the SSID out of service at the specified date and time. Use the format YYYY-MM-DD [HH:MM], where time (hour and minute) is optional. For example, enter **2016:09:29 18:00**. Use **After Duration** to keep the SSID in service for the specified amount of time in days, hours, and minutes (use the format DD [HH:MM], where hours and minutes are optional).
 26. Use **Expiration** to specify a date to *delete this SSID* when it is taken out of service at the specified date (i.e., this option cleans up after itself when it reaches the expiration time). Leave **Expiration** and **Date off** set to **none** (the default) if you want this SSID to remain in service indefinitely after its scheduled start. Use **Specific Date & Time** to delete the SSID at the specified date and time. Use the format YYYY-MM-DD [HH:MM], where time (hour and minute) is optional. For example, enter **2016:09:29 18:00**. Use **After Duration** to keep the SSID in service for the specified amount of time in days, hours, and minutes (use the format DD [HH:MM], where hours and minutes are optional).
 27. **Web Page Redirect Configuration:** see [“Web Page Redirect \(Captive Portal\) Configuration”](#) on page 287.
 28. To delete an SSID, click its **Delete** button  .
 29. Click the **Save** button  if you wish to make your changes permanent.

Web Page Redirect (Captive Portal) Configuration

If you enable WPR, the SSID Management window displays additional fields that must be configured.

If enabled, WPR displays a splash or login page when a client associates to the wireless network and opens a browser to any URL (provided the URL does not point to a resource directly on the client’s device). The user-requested URL is captured, the user’s browser is redirected to the splash or login page, and then the browser is redirected either to your specified landing page, if any, or else back to the captured URL. The landing page may be specified for a user group as well. See “Group Management” on page 306. Note that if you change the management HTTPS port, WPR uses that port, too. See “HTTPS” on page 242.

The screenshot shows the 'Web Page Redirect Configuration' window for an SSID. It contains several sections: 'Landing Page URL' with a text input field containing 'landingpage.greatschool.edu'; 'Background Image', 'Logo Image', 'Header Text File', and 'Footer Text File' each with a dropdown menu; 'Authentication Timeout' with a text input field containing '120'; 'Server' with radio buttons for 'Internal Splash', 'Internal Login' (selected), 'External Login', 'Cloud', 'External Splash', and 'Landing Page Only'; 'Timeout (seconds)' with a text input field and a checked 'Never' checkbox; 'RADIUS Authentication Type' with radio buttons for 'PAP', 'CHAP' (selected), and 'MS-CHAP'; 'HTTPS' with radio buttons for 'On' (selected) and 'Off'; and 'Redirect URL' and 'Redirect Secret' with empty text input fields.

Figure 156. WPR Internal Splash Page Fields (SSID Management)

Note that when clients roam between APs, their WPR Authentication will follow them so that re-authentication is not required.

You may select among several different modes for use of the Web Page Redirect feature, each displaying a different set of parameters that must be entered. For each of these modes, set **Authentication Timeout** to the length of time (in minutes) that an association using the captive portal will remain valid after a user is disconnected. If a user session is interrupted, say if a mobile device goes into power-save mode or a user closes a laptop lid, the user will not have to reauthenticate unless the length of the disconnection is longer than the timeout. The default is 120 minutes. The maximum timeout is 10080 minutes (seven days).

Web Page Redirect offers the following modes.

- **Internal Login** page

This option displays a login page (residing on the AP) instead of the first user-requested URL. There is an upload function that allows you to replace the default login page, if you wish. Please see [“Web Page Redirect \(Captive Portal\)” on page 423](#) for more information.

To set up internal login, set **Server** to **Internal Login**. Set **HTTPS** to **On** for a secure login, or select **Off** to use HTTP. You may also customize the login page with logo and background images and header and footer text. See [“Customizing an Internal Login or Splash page” on page 292](#).

The user name and password are obtained by the login page. Authentication occurs according to your selection—**PAP**, **CHAP**, or **MS-CHAP**. Note that if you select CHAP, then you cannot select **Active Directory** in [“Authentication Service Configuration” on page 297](#).

After authentication, the browser is redirected back to the captured URL. If you want the user redirected to a specific landing page instead, enter its address in **Landing Page URL**.

Both the Internal Login and External Login options of WPR perform authentication using your configured RADIUS servers.

- **Internal Splash page**

This option displays a splash page instead of the first user-requested URL. The splash page files reside on the AP. Note that there is an upload function that allows you to replace the default splash page, if you wish. Please see [“Web Page Redirect \(Captive Portal\)” on page 423](#) for more information. You may also customize the splash page with logo and background images and header and footer text. See [“Customizing an Internal Login or Splash page” on page 292](#).

To use an internal splash page, set **Server** to **Internal Splash**. Enter a value in the **Timeout** field to define how many seconds the splash screen is displayed before timing out, or select **Never** to prevent the page from timing out automatically. After the splash page, the user is redirected to the captured URL. If you want the user redirected to a specific landing page instead, enter its address in **Landing Page URL**.

- **External Login page**

This option redirects the user to a login page on an external web server for authentication, instead of the first user-requested URL. Login information (user name and password) must be obtained by that page, and returned to the AP for authentication.

Authentication occurs according to your configured RADIUS information. These parameters are configured as described in [“Procedure for Configuring Network Security” on page 250](#), except that the **RADIUS Authentication Type** is selected here, as described below. After authentication, the browser is redirected back to the captured URL. If you want the user redirected to a specific landing page instead, enter its address in **Landing Page URL**.

To set up external login page usage, set **Server** to **External Login**. Enter the URL of the external web server in **Redirect URL**, and enter that server’s shared secret in **Redirect Secret**.

Select the **RADIUS Authentication Type**. This is the protocol used for authentication of users, **CHAP** or **PAP** (the default).

- Password Authentication Protocol (**PAP**), is a simple protocol. PAP transmits ASCII passwords over the network “in the clear” (unencrypted) and is therefore considered insecure.
- Challenge-Handshake Authentication Protocol (**CHAP**) is a more secure Protocol. The login request is sent using a one-way hash function.

- **External Splash page**

This option displays a splash page instead of the first user-requested URL. The splash page files reside on an external web server.

To set up external splash page usage, set **Server** to **External Splash**. Enter the URL of the external web server in **Redirect URL**, and enter that server’s shared secret in **Redirect Secret**.

After the splash page, the user is redirected to the captured URL. If you want the user redirected to a specific landing page instead, enter its address in **Landing Page URL**.

- **Cloud**

This option is only used in conjunction with the Guest Access feature in [XMS-Cloud Next Generation \(XMS-9500-CL-x\)](#). If enabled, **Cloud** redirects the user to a login page hosted in the cloud by XMS for authentication, instead of the first user-requested URL. Login information (user name and password) is obtained by that Cloud Login page, and returned to the AP for authentication.

After authentication, the browser is redirected back to the captured URL. If you want the user redirected to a specific landing page instead, enter its address in **Landing Page URL**.

Cloud Login settings on the AP are entirely managed automatically by XMS-Cloud, based on the configuration that the network administrator has selected there. *You should not make any changes to the following settings configured by XMS.* XMS will set **Server** to **Cloud Login** and set the values of **Redirect URL** and **Redirect Secret**.

- **Landing Page Only**

This option redirects the user to a specific landing page. If you select this option, enter the desired address in **Landing Page URL**.

- **Personal Wi-Fi**

This option is only used in conjunction with the EasyPass Personal portal feature in [XMS-Cloud Next Generation \(XMS-9500-CL-x\)](#). Personal Wi-Fi settings on the AP are entirely managed automatically by XMS-Cloud, based on the settings that have been selected there. *You should not make any changes to the settings configured by XMS.* When an XMS-Cloud administrator creates an EasyPass Personal portal, XMS configures the corresponding SSID on the AP to enable **Personal Wi-Fi** and the **Cloud WPR** setting. XMS-Cloud also sets the values on the [Personal Wi-Fi](#) page.

When users connect to the SSID that runs the EasyPass Personal portal, they are redirected to a login page hosted in the cloud by XMS. After successful authentication, a user is redirected to a Personal Wi-Fi setup page to specify necessary parameters for this feature: a personal SSID name, preshared key (PSK) and expiration date. This personal SSID is configured on APs by XMS-Cloud. Users will typically set up the same SSID name and PSK that they use at home, which their smartphones, tablets, and other personal devices are already configured to connect with automatically. For example, if a hotel offers Xirrus Personal Wi-Fi, guests will be able to set up SSIDs that mimic their home networks. Their devices will automatically connect securely for the duration of the guest's stay (until the personal SSID expires). See ["Personal Wi-Fi" on page 302](#) for more details.

The personal SSID is created with the default values shown below.

Encryption / Authentication: 8WPA2-PSK/02.1x	Broadcast: on
Band: both	VLAN Name/Pool: none
QoS: 2	Filter list: none
Roaming: L2	WPR: off
Fallback: off	Mobile Device Mgmt: none
ACL Mode: off	
SSID Active: yes	SSID expiration: per user setting in XMS-C
DHCP Pool: uses SSID's name, see below	DHCP Opt: off

A DHCP pool is created for each personal SSID using the SSID Name. NAT is enabled, and the IP subnet is 192.168.1.0/24.

In IAP—Global Settings, Block Inter-Station Traffic is set to No.

Customizing an Internal Login or Splash page

You may customize these pages with a logo and/or background image, and header and/or footer text, as shown below in [Figure 157](#).

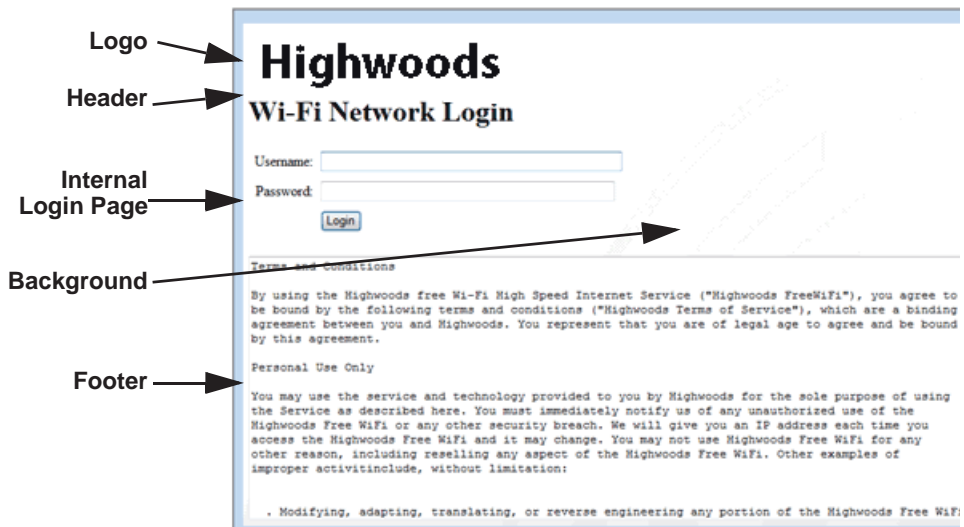

Figure 157. Customizing an Internal Login or Splash Page

- **Background Image**—specify an optional jpg, gif, or png file to display in the background of the page. Other customizations (logo, header, footer) will overlay the background, so that it will not be visible in those areas.
- **Logo Image**—specify an optional jpg, gif, or png file to display at the top of the page.
- **Header Text File**—specify an optional .txt file to display at the top of the page (beneath the logo, if any).
- **Footer Text File**—specify an optional .txt file to display at the bottom of the page.

Whitelist Configuration for Web Page Redirect

On a per-SSID basis, the whitelist allows you to specify Internet destinations that stations can access without first having to pass the WPR (captive portal) login/splash page. Note that a whitelist may be specified for a user group as well. See “Group Management” on page 306.

Figure 158. Whitelist Configuration for WPR

To add a web site to the whitelist for this SSID, enter it in the provided field, then click **Create**. You may enter an IP address or a domain name. Up to 32 entries may be created.

Example whitelist entries:

- Hostname: www.yahoo.com (but not www.yahoo.com/abc/def.html)
- Wildcards are supported: *.yahoo.com
- IP address: 121.122.123.124

Some typical applications for this feature are:

- to add allowed links to the WPR page
- to add a link to terms of use that may be hosted on another site
- to allow embedded video on WPR page

Note the following details of the operation of this feature:

- The list is configured on a per-SSID basis. You must have **WPR** enabled for the SSID to see this section of the SSID Management page.
- When a station that has not yet passed the WPR login/splash page attempts to access one of the white-listed addresses, it will be allowed access to that site as many times as requested.

- The station will still be required to pass through the configured WPR flow for all other Internet addresses.
- The whitelist will work against all traffic -- not just http or https
- Indirect access to other web sites is not permitted. For example, if you add www.yahoo.com to the whitelist, you can see that page, but not all the ads that it attempts to display.
- The whitelist feature does not cause traffic to be redirected to the whitelist addresses.

Web Page Redirect for Purple WiFi Venues

Purple WiFi is a cloud-based solution that sets up a WiFi hotspot in a business or venue. It offers a number of features such as user analytics, filtering of inappropriate content, marketing, and social media options.

Once you have signed up with Purple WiFi, set up APs as described below. For more details of operation, see “Purple WiFi Client Login Process Details” on page 296.

To deploy APs in a venue that uses Purple WiFi to provide guest access, use the following WPR (captive portal) configuration.

1. On the [SSID Management](#) Page, enable **WPR** on each SSID that is to offer Purple WiFi guest access.
2. Then set the following **Web Page Redirect Configuration** options:
 - **Server:** select **External Login**.
 - **Landing Page URL:** set this to the URL provided by Purple WiFi when you set up your account with them.
 - **Redirect URL:** set this to the URL provided by Purple WiFi when you set up your account with them. For example:

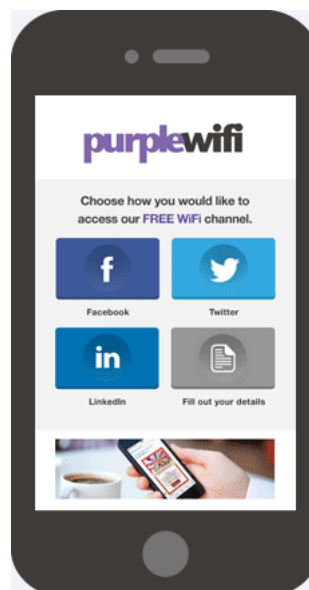

Figure 159. Purple WiFi Guest Access

<http://purpleportal.net/access/>

- **Redirect Secret:** Enter the password provided to you by Purple WiFi.
3. In the next section on the same page, create **WPR Whitelist Configuration** entries as directed by Purple WiFi for web sites that should not be redirected. Note that if an asterisk is part of the entry, you must include this character. For example:

*.purpleportal.net

*.facebook.com

api.twitter.com

connect.facebook.net

4. Set the Authentication Server for client access to be the server provided to you by Purple WiFi:
- If you did not select **Global** in [Step 13 on page 280](#), then the Authentication Server will be specific to this SSID, rather than the server used globally on the AP. In the section labeled **Authentication Service Configuration**, enter the following:
 - Set the **Authentication Server** type to **External RADIUS**.
 - Enter the **Host or IP Address**, **Port**, and the **Shared Secret** (password) of the **Primary Server** provided by Purple WiFi.
 - If you did select **Global** in [Step 13 on page 280](#), then the SSID uses the Authentication Server that you defined on the Security > [External Radius](#) Page for global use on the AP. This must be the server provided to you by Purple WiFi. It will be used for all client authentication, unless you define other SSIDs that don't use the global server.

On the Security > [Global Settings](#) Page:

 - Set the **Authentication Server Mode** to **External Radius**.

On the Security > [External Radius](#) Page:

 - Enter the **Host Name or IP Address**, **Port**, and the **Shared Secret** (password) of the **Primary Server** provided by Purple WiFi.

5. Regardless of whether you selected a global authentication server in [Step 13 on page 280](#), you need the following setting for compatibility with Purple WiFi. On the Security > [External Radius](#) Page, in the **RADIUS Attribute Formatting** section:
 - Set **Called-Station-Id Attribute Format** to **Ethernet MAC**.

Purple WiFi Client Login Process Details

This is an overview of the interaction between the AP and Purple WiFi when a client connects. The client is not aware of any of these details and is led through the process by Purple WiFi's simple interface.

1. A client (smartphone, iPad, etc.) connects to an SSID at a Purple WiFi customer site.
2. The SSID is configured for WPR. As soon as the client opens a browser, it is redirected to the configured Purple WiFi portal page that was configured in the AP **External Login** page, via the **Redirect URL**.
3. The AP contacts the **Redirect URL** along with the AP's MAC address (**Ethernet MAC**). This is used to match the Purple WiFi customer site against a database of AP MAC addresses managed by Purple WiFi, which delivers a customized splash page.
4. The Purple WiFi splash page prompts the end user to log into a social media site.
5. Upon successful authorization at the social media site, a record is then created in the Purple WiFi (**External RADIUS**) database for the client.
6. The Purple WiFi splash page then redirects the browser back to the login script on the AP along with the authentication information (username/password), and the AP then performs an external RADIUS authentication request against the Purple WiFi RADIUS servers (as configured on the AP).

7. If RADIUS authenticates successfully, then the end user is given access to the full Internet, outside of your internal network. Future connections to the same Access Point are automatically authenticated with no user action required.

WPA Configuration

If you set **Encryption** for this SSID to one of the WPA selections ([Step 12 on page 280](#)) and you did not check the **Global** checkbox ([Step 13](#)), this section will be displayed. The **WPA Configuration** encryption settings have the same parameters as those described in “[Procedure for Configuring Network Security](#)” on page 250.

Authentication Service Configuration

The RADIUS settings section will be displayed if you set **Authentication** ([Step 11 on page 280](#)) to anything but **OPEN**, and you set **Encryption** ([Step 12](#)) to anything but **WEP**, and you did not check the **Global** checkbox ([Step 13](#)). This means that you wish to set up a RADIUS server or Active Directory server to be used for this particular SSID. If **Global** is checked, then the security settings (including the RADIUS server, if any) established at the global level are used instead (see “[Global Settings](#)” on page 250).

The RADIUS and accounting settings are configured in the same way as for an external RADIUS server (see “[Procedure for Configuring an External RADIUS Server](#)” on page 255). If you select **Active Directory**, then the settings are configured in “[Active Directory](#)” on page 260. Note that if you select **Active Directory**, then you cannot use CHAP authentication.

AirWatch

Active IAPs

By default, when a new SSID is created, that SSID is active on all IAPs. This window allows you to specify which IAPs will offer that SSID. Put differently, you can specify which SSIDs are active on each IAP.

This feature is useful in conjunction with [WDS](#). You may use this window to configure the WDS link IAPs so that only the WDS link SSIDs are active on them.

IAP / Channel			
SSID	iap1	iap2	All IAPs
	1	157+161	
guest	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	
honeypot	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	
xyzcorp	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	
All SSIDs			TOGGLE ALL

Figure 160. Setting Active IAPs per SSID

Procedure for Specifying Active IAPs

- 1. SSID:** For a given SSID row, check the IAPs that should offer that SSID to clients. Uncheck any IAPs which should not offer that SSID.
- 2. All IAPs:** This button, in the last column, may be used to allow or deny this SSID on all IAPs, i.e., switch all IAPs between allow or deny.
- 3. All SSIDs:** This button, in the bottom row, may be used to allow or deny all SSIDs on this IAP.
- 4. Toggle All:** This button, on the lower left, may be used to allow or deny all SSIDs on all IAPs.
- 5.** Click the **Save** button  if you wish to make your changes permanent.

Per-SSID Access Control List

This window allows you set up Access Control Lists (ACLs) on a per-SSID basis, to control whether a station with a particular MAC address may associate to a particular SSID. You may create access control list entries and delete existing entries, and control the type of list (allow or deny).

There is one ACL per SSID, and you may select whether its type is an **Allow** list or a **Deny** list, or whether use of this list is **Disabled**. You may create up to 1000 entries per SSID.

There is also a global ACL (see “Access Control List” on page 248). If the same MAC address is listed in both the global ACL and in an SSID’s ACL, and if either ACL would deny that station access to that SSID, then access will be denied.

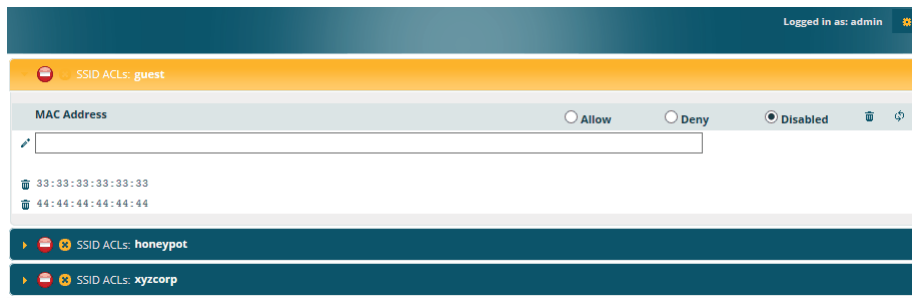

Figure 161. Per-SSID Access Control List

Procedure for Configuring Access Control Lists

1. **SSID:** Select the line for the SSID whose ACL you wish to manage. Click the line to hide or expand (display) the list.
2. **Access Control List Type:** Select **Disabled** to disable use of the Access Control List for this SSID, or select the ACL type—either **Allow** or **Deny**.
 - **Allow:** Only allows the listed MAC addresses to associate to the AP. All others are denied. The plus symbol  appears before the SSID name for an allow list.

- **Deny List:** Denies the listed MAC addresses permission to associate to the AP. All others are allowed. The minus symbol  appears before the SSID name for a deny list.
- **Disabled:** A red dot  appears before the SSID name for a disabled list. A green dot  appears before the SSID name for an allow or deny list.

In addition to these lists, other authentication methods (for example, RADIUS) are still enforced for users.

3. **MAC Address:** If you want to add a MAC address to the ACL for the selected SSID, enter the new MAC address. You may use a wildcard (*) for one or more digits to match a range of addresses. **Delete:** You may delete selected MAC addresses from this list by clicking their **Delete** buttons  .
4. Click the **Save** button  if you wish to make your changes permanent.

Honeypots

Use the honeypot feature carefully as it could interfere with legitimate SSIDs.

The honeypot SSID feature prevents the airwaves from being crowded with probes for named SSIDs. These probes are automatically generated by some popular wireless devices. When you create and enable a honeypot SSID on an AP, it responds to any station probe looking for a named open SSID (unencrypted and unauthenticated) that is *not* configured on the AP. For more details, see [“High Density 2.4G Enhancement—Honeypot SSID”](#) on page 275.

This page allows you to create a honeypot SSID, enter a whitelist of SSID names that are not to be honeypotted, and define alternate names for the SSID that will be broadcast instead of “honeypot”.

Figure 162. Honeypot Whitelist

Procedure for Configuring Honeypot Whitelists

1. **Create a honeypot:** If you have not already created an SSID named **honeypot**, you will be asked whether you wish to create one. Click **Yes**. You must have an SSID named honeypot to use this feature.
2. **Honeypot Whitelists:** This section only appears if you have created an SSID named honeypot. You may define a whitelist of allowed SSIDs which are not to be honeypotted, as described in [“High Density 2.4G Enhancement—Honeypot SSID” on page 275](#). Type in each SSID name, and click **Create** to add it to the whitelist. Up to 50 SSIDs may be listed. The SSID names entered in this list are not case-sensitive.

You may use the “*” character as a wildcard to match any string at this position. For example, xir* matches any string that starts with **XIR** or **xir**. You may use a ? as a wildcard to match a single character by surrounding the SSID name in quotes. For example, “xirru?” will match any six-character long string that starts with **xirru** (again, the match is not case-sensitive). If you do not use a wildcard, then the SSID name entered must be matched exactly in order to be whitelisted (except that case is not considered).

3. **Honeypot Broadcasts:** This section only appears if you have created an SSID named honeypot. You may define one or more alias names for this SSID. They will be broadcast *instead of* the name **honeypot**.

Personal Wi-Fi

The settings on this page will apply to all of the Personal Wi-Fi SSIDs that are created by users after they connect to an EasyPass Personal portal. See “[Personal Wi-Fi](#)” on page 290. These settings are only used in conjunction with the EasyPass Personal portal feature in [XMS-Cloud Next Generation \(XMS-9500-CL-x\)](#), and they are entirely managed automatically by XMS-Cloud, based on the settings that have been selected there. *You should not make any changes to the settings configured by XMS.*

Figure 163. Personal Wi-Fi

Settings for Personal Wi-Fi

1. **Limit - All Stations (0-12):** the maximum number of personal SSIDs that may exist on this AP at one time. The default value is 4.
2. **Limit - Per Station (0-4):** the maximum simultaneous number of personal SSIDs that can be created by a single station. The default value is 1.
3. **Expiration Default:** the expiration time for a personal SSID—after this time, the SSID will be deleted. Note that the user may specify an expiration date for a particular personal SSID when it is set up. If expiration times are specified both on this page and for a particular personal SSID, the SSID will expire at whichever time occurs first.

You may enter a **Specific Date & Time** for the personal SSID to expire. Use the format YYYY-MM-DD [HH:MM], where time (hour and minute)

Wireless Access Point

is optional. For example, enter **2016:09:29 08:00**. If the hour and minute are omitted, they are assumed to be 23:59.

Use **After Duration** to specify the length of time before the SSID expires, in days, hours, and minutes. Use the format **DD [HH:MM]**, where hours and minutes are optional. For example, to have the SSID expire after one day, one hour and 30 minutes have passed, enter **1 01:30**.

Set **Expiration** to **Never** (the default) if you want this SSID to remain in service indefinitely after its scheduled start.

Groups

This is a status-only window that allows you to review user (i.e., wireless client) [Group](#) assignments. It includes the group name, Radius ID, Device ID, [VLAN](#) IDs and [QoS](#) parameters and roaming layer defined for each group, and DHCP pools and web page redirect information defined for the group. You may click on a group's name to jump to the edit page for the group. There are no configuration options available on this page, but if you are experiencing problems or reviewing group management parameters, you may want to print this page for your records.

The **Limits** section of this window shows any limitations configured for your defined groups. For example, this window shows the current state of a group (enabled or disabled), how much group and per-station traffic is allowed, time on and time off, and days on and off.

For information to help you understand groups, see [Understanding Groups](#) below. For an in-depth discussion, please see the *User Groups Application Note* in the Xirrus [Resource Center](#).

Group Name	Radius ID	Device ID	Filter List	VLAN	Num	QoS	Avaya Roaming	DHCP Pool	WPR	Whitelist
employees				none	0	0	layer 2-only			
execs				none	0	0	layer 2-only			
managers				none	0	0	layer 2-only			

Group Name	Enabled	Fallback Options	Traffic in pps			Traffic in Kbps			Time On	Time Off	Days On	Active
			Station Limit	Group	Station	Group	Station					
employees	No	Disabled	unlimited	unlimited	unlimited	unlimited	unlimited	always	never	All	No	
execs	No	Disabled	unlimited	unlimited	unlimited	unlimited	unlimited	always	never	All	No	

Figure 164. Groups

Understanding Groups

User groups allow administrators to assign specific network parameters to users (wireless clients) through RADIUS privileges rather than having to map users to an SSID tailored for that set of privileges. Groups provide flexible control over user privileges without the need to create large numbers of SSIDs.

A group allows you to define a set of parameter values to be applied to selected users. For example, you might define the user group **Students**, and set its VLAN,

security parameters, web page redirect (WPR), and traffic limits. When a new user is created, you can apply all of these settings just by making the user a member of the group. The group allows you to apply a uniform configuration to a set of users in one step.

In addition, you can restrict the group so that it only applies its settings to group members who are connecting using a specific device type, such as iPad or phone. Thus, you could define a group named **Student-Phone** with **Device ID** set to **Phone**, and set the group's **VLAN Number** to 100. This group's settings will only be applied to group members who connect using a phone, and they will all use VLAN 100. Note that settings for the group in the RADIUS server will override any settings on this WMI page.

Almost all of the parameters that can be set for a group are the same as SSID parameters. This allows you to configure features at the user group level, rather than for an entire SSID. If you set parameter values for an SSID, and then enter different values for the same parameters for a user group, the **user group values have priority** (i.e., group settings will override SSID settings).

Group names are case-sensitive and can contain up to 32 alphanumeric characters (do not include spaces when defining Groups).

Using Groups

User accounts are used to authenticate wireless clients that want to associate to the AP. These accounts are established in one of two ways, using the **Security> Internal Radius** window or the **Security> External Radius** window. In either case, you may select a user group for the user, and that user group's settings will apply to the user:

- **Internal Radius**—when you add or modify a user entry, select a user group to which the user will belong.
- **External Radius**—when you add or modify a user account, specify the **Radius ID** for the user group to which the user will belong. This must be the same Radius ID that was entered in the [Group Management](#) window. When the user is authenticated, the external Radius server will send the Radius ID to the AP. This will allow the AP to identify the group to which the user belongs.

See Also[External Radius](#)[Internal Radius](#)[SSIDs](#)[Understanding QoS Priority on the Wireless AP](#)[Web Page Redirect \(Captive Portal\) Configuration](#)[Understanding Fast Roaming](#)

Group Management

This window allows you to manage groups (create, edit and delete), assign usage limits and other parameters on a per group basis, and configure the Web Page Redirect (captive portal) functionality.

Figure 165. Group Management

Procedure for Managing Groups

- 1. New Group Name:** To create a new group, enter a new group name next to the Create button, then click **Create**. You may create up to 16 groups (up to 8 on the XR-500 Series).

To configure and enable this group, proceed with the following steps.

- 2. Group:** This column lists currently defined groups. When you create a new group, the group name appears in this list. Click on any group to select it, and then proceed to modify it as desired.

3. **Enabled:** Check this box to enable this group or leave it blank to disable it. When a group is disabled, users that are members of the group will behave as if the group did not exist. In other words, the options configured for the SSID will apply to the users, rather than the options configured for the group.
4. **Fallback:** Network Assurance checks network connectivity for the AP. When Network Assurance detects a failure, perhaps due to a bad link or [WDS](#) failure, if Fallback is set to **Disable** the AP will automatically disable users in this group. This will disassociate current clients, and prevent them from re-associating. Since the AP's network connectivity has failed, this gives clients a chance to connect to other, operational parts of the wireless network. See [Step a on page 243](#) for more information on Network Assurance.
5. **Radius ID:** Enter a unique Radius ID for the group, to be used on an external Radius server. When adding a user account to the external server, this Radius ID value should be entered for the user. When the user is authenticated, Radius sends this value to the AP. This tells the AP that the user is a member of the group having this Radius ID.
6. **Device ID:** You may select a device type from this drop-down list, for example, **Notebook**, **phone**, **iPhone**, or **Android**. This allows you to apply the group settings only if a station authenticates as a user that is a member of the group and the station's device type matches **Device ID**. **Select none** if you do not want to consider the device type. If you have a Radius ID you should not enter a Device ID.
7. **VLAN ID:** (Optional) From the pull-down list, select a VLAN or VLAN Pool for this user's traffic to use (see ["VLANs" on page 213](#) and ["VLAN Pools" on page 215](#)). This user group's VLAN settings supersede Dynamic VLAN settings (which are passed to the AP by the Radius server). To avoid confusion, we recommend that you avoid specifying the VLAN for a user in two places.
8. **QoS Priority:** (Optional) Select a value in this field for QoS (Quality of Service) priority filtering. The QoS value must be one of the following:

- 0—The lowest QoS priority setting, where QoS makes its best effort at filtering and prioritizing data, video and voice traffic without compromising the performance of the network. Use this setting in environments where traffic prioritization is not a concern.
- 1—Medium; QoS prioritization is aggregated across all traffic types.
- 2—High, normally used to give priority to video traffic.
- 3—The highest QoS priority setting, normally used to give priority to voice traffic.

The QoS setting you define here will prioritize wireless traffic for this group versus other traffic, as described in [“Understanding QoS Priority on the Wireless AP” on page 271](#). The default value for this field is 2.

9. **DHCP Pool:** (Optional) To associate an internal DHCP pool to this group, select it from the pull-down list. Only one pool may be assigned. An internal DHCP pool must be created before it can be assigned. To create a DHCP pool, go to [“DHCP Server” on page 200](#).
10. **Filter List:** (Optional) If you wish to apply a set of filters to this user group’s traffic, select the desired Filter List. See [“Filters” on page 391](#).
11. **Xirrus Roaming:** (Optional) For this group, select roaming behavior. Select **L2&L3** to enable fast roaming between IAPs or APs at Layer 2 and Layer 3. If you select **L2**, then roaming uses Layer 2 only. You may only select fast roaming at Layers 2 and 3 if this has been selected in [Global Settings](#). You may select **Off** to disable fast roaming. See [“Understanding Fast Roaming” on page 312](#).
12. **Web Page Redirect (WPR):** (Optional) Check this box if you wish to enable the Web Page Redirect (captive portal) functionality. This will open a **Web Page Redirect** details section in the window, where your WPR parameters may be entered. This feature may be used to display a splash screen when a user first associates to the wireless network. After that, it can (optionally) redirect the user to an alternate URL. See [“Web Page Redirect \(Captive Portal\) Configuration” on page 287](#) for details of WPR configuration. Note that the Group Management window only allows you to set up an **Internal Splash** page and a **Landing Page URL**.

The authentication options that are offered on the SSID Management page are not offered here. Since the group membership of a user is provided to the AP by a Radius server, this means the user has already been authenticated.

You may create a WPR Whitelist on a per-group basis if you wish. See [“Whitelist Configuration for Web Page Redirect” on page 293](#) for details of WPR Whitelist usage and configuration.

Group Limits

The Limits section allows you to limit the traffic or connection times allowed for this user group. Note that the IAPs—Global Settings window and the SSID management windows also have options to limit the number of stations, limit traffic, and/or limit connection times. If limits are set in more than one place, all limits will be enforced:

- As soon as any station limit is reached, no new stations can associate until some other station has terminated its association.
- As soon as any traffic limit is reached, it is enforced.
- If any connection date/time restriction applies, it is enforced.

You can picture this as a logical AND of all restrictions. For example, suppose that a station’s SSID is available Monday - Friday between 8:00am and 5:00pm, and the User Group is available Monday, Tuesday, Wednesday between 6:00am and 8:00pm, then the station will be allowed on MWF between 8:00am and 5:00pm.

To eliminate confusion, we recommend that you configure one set of limits or the other, but not both.

- 13. Stations:** Enter the maximum number of stations allowed on this group. The default is 1536.
- 14. Overall Traffic:** Check the **Unlimited** checkbox if you do not want to place a restriction on the traffic for this group, or enter a value in the Packets/Sec field and make sure that the Unlimited box is unchecked to force a traffic restriction.

15. **Traffic per Station:** Check the **Unlimited** checkbox if you do not want to place a restriction on the traffic per station for this group, or enter a value in the **Packets/Sec** or **Kbps** field and make sure that the Unlimited box is unchecked to force a traffic restriction.
16. **Days Active:** Choose **Everyday** if you want this group to be active every day of the week, or select only the specific days that you want this group to be active. Days that are not checked are considered to be the inactive days.
17. **Time Active:** Choose **Always** if you want this group active without interruption, or enter values in the **Time On** and **Time Off** fields to limit the time that group members may associate.
18. To delete an entry, click its **Delete** button.
19. Click the **Save** button  if you wish to make your changes permanent.

[SSIDs](#)

IAPs

This status-only window summarizes the status of the Integrated Access Points. For each IAP, it shows whether it is up or down, the channel and wireless mode, the antenna that it is currently using, its cell size and transmit and receive power, how many users (stations) are currently associated to it, whether a WDS link distance has been set for it, and its BSSID (MAC address).

IAP	State	AP Type	Band	WiFi Mode	Bond	Primary Channel	Channel Mode	Antenna	Cell Size	TX Power	RX Thresh	Stations	Distance	BSSID
iap1	up	.11abgnac...	2.4GHz	bgn	off	1	manual	intern...	max	20	-90	0		50:60:28:22:ce:a0:e2
iap2	up	.11abgnac...	5GHz	anac	40mhz...	157	auto...	intern...	max	20	-90	1		50:60:28:22:ce:90:e2

Figure 166. IAPs

The **Channel Mode** column displays some status information that is not found elsewhere: the source of a channel setting. (Figure 167) If you set a channel manually (via [IAP Settings](#)), it will be listed as **manual**. If an autochannel operation changed a channel, then it is labeled as **auto**. If the channel is set to the current factory default setting, the source will be **default**. This column also shows whether the channel selection is **locked**, or whether the IAP was automatically switched to this channel because the AP detected the signature of **radar** in operation on a conflicting channel (see also, [Step 8 on page 321](#)).

IAP	State	AP Type	Band	WiFi Mode	Bond	Primary Channel	Channel Mode
iap1	up	.11abgnac...	2.4GHz	bgn	off	1	manual
iap2	up	.11abgnac...	5GHz	anac	40mhz...	157	automatic

Figure 167. Source of Channel Setting

There are no configuration options in this window, but if you are experiencing problems or simply reviewing the IAP assignments, you may print this window for your records. Click any IAP name to open the associated configuration page.

APs have a fast roaming feature, allowing them to maintain sessions for applications such as voice, even while users cross boundaries between APs. Fast roaming is set up in the [Global Settings](#) window and is discussed in:

- [“Understanding Fast Roaming” on page 312](#)

IAPs are configured using the following windows:

- [“IAP Settings” on page 313](#)
- [“Global Settings” on page 319](#)
- [“Global Settings .11an” on page 335](#)
- [“Global Settings .11bgn” on page 341](#)
- [“Global Settings .11n” on page 347](#)
- [“Global Settings .11u” on page 352](#)
- [“Global Settings .11ac” on page 350](#)
- [“Advanced RF Settings” on page 358](#)
- [“Hotspot 2.0” on page 367](#)
- [“NAI Realms” on page 370](#)
- [“NAI EAP” on page 371](#)
- [“Intrusion Detection” on page 373](#)
- [“LED Settings” on page 380](#)
- [“DSCP Mappings” on page 381](#)

[“Roaming Assist” on page 382](#)*See Also*

[IAP Statistics Summary](#)

Understanding Fast Roaming

To maintain sessions for real-time data traffic, such as voice and video, users must be able to maintain the same IP address through the entire session. With traditional networks, if a user crosses VLAN or subnet boundaries (i.e., roaming between domains), a new IP address must be obtained.

Mobile wireless users are likely to cross multiple roaming domains during a single session (especially wireless users of VoIP phones). **Layer 3 roaming** allows

Wireless Access Point

a user to maintain the same IP address through an entire real-time data session. The user may be associated to any of the VLANs defined on the AP. The Layer 3 session is maintained by establishing a tunnel back to the originating AP. You should decide whether or not to use Layer 3 roaming based on your wired network design. Layer 3 roaming incurs extra overhead and may result in additional traffic delays. You may configure one SSID for Layer 3 fast roaming with up to 25 APs.

Fast Roaming is configured on two pages. To enable the fast roaming options that you want to make available on your AP, see [Step 29](#) to [Step 31](#) in “[Global Settings](#)” on page 319. To choose which of the enabled options are used by an SSID or Group, see “[Procedure for Managing SSIDs](#)” on page 278 (Step 14) or “[Procedure for Managing Groups](#)” on page 306.

IAP Settings

This window allows you to enable/disable IAPs, define the wireless mode for each IAP, specify the channel and bond width and the cell size for each IAP, lock the channel selection, establish transmit/receive parameters, and reset channels. Buttons at the top of the list allow you to **Reset Channels**, **Enable All IAPs**, or **Disable All IAPs**. When finished, click the **Save** button  if you wish to make your changes permanent.

Figure 168. IAP Settings

You may also access this window by clicking on the AP image at the lower left of the WMI window—click the Xirrus logo in the center of the AP. See “User Interface” on page 89.

Procedure for Auto Configuring IAPs

You can auto-configure channel and cell size of radios by clicking on the **Auto Configure** buttons on the appropriate WMI page as shown below (auto configuration only applies to enabled radios):

- For all radios, go to “Advanced RF Settings” on page 358.
- For all 802.11a settings, go to “Global Settings .11an” on page 335.
- For all 802.11bg settings, go to “Global Settings .11bgn” on page 341.
- For all 802.11n settings, go to “Global Settings .11n” on page 347.
- For all 802.11ac settings, go to “Global Settings .11ac” on page 350.

Procedure for Manually Configuring IAPs

1. The row for each IAP summarizes its settings. Click to expand it and display the settings. Click again to collapse the entry.
2. In the **Enable** field select **enabled**, or select **disabled** if you want to turn off the IAP. The state of the channel is displayed with a green dot  if enabled, and a red dot  if disabled.
3. In the **Band** field, select the wireless band for this IAP from the choices available in the pull-down menu, either **2.4GHz** or **5 GHz**. Choosing the **5GHz** band will automatically select an adjacent channel for bonding. If the band displayed is **auto**, the **Band** is about to be changed based on a new **Channel** selection that you made that requires the change.

For XR-520 Series APs only:

- iap1* may be set to either band or to monitor (also see the Timeshare option in “RF Monitor” on page 359).
- iap2* is permanently set to 5 GHz.

One of the IAPs must be set to **monitor** mode if you wish to support [Spectrum Analyzer](#), Radio Assurance (loopback testing), and [Intrusion Detection](#) features. Monitoring has a **Timeshare** mode option, which is especially useful for small APs with two IAPs allowing one IAP to be shared between monitoring the airwaves for problems and providing services to stations. See **RF Monitor Mode** in “[Advanced RF Settings](#)” on [page 358](#) to set this option.

4. In the **WiFi Mode** field, select the IEEE 802.11 wireless mode (or combination) that you want to allow on this IAP. The drop-down list will only display the appropriate choices for the selected **Band**. For example, the 5 GHz band allows you to select **ac-only**, **anac**, **an**, **a-only**, or **n-only**, while 2.4GHz includes 802.11b and 802.11g choices. When you select a WiFi Mode for any IAP, your selection in the **Channel** column will be checked to ensure that it is a valid choice for that WiFi Mode.

By selecting appropriate WiFi Modes for the radios on your APs, you can greatly improve wireless network performance. For example, if you have 802.11n and 802.11ac stations using the same IAP, throughput on that radio is reduced greatly for the 802.11ac stations. By supporting 802.11n stations only on selected radios in your network, the rest of your 802.11ac IAPs will have greatly improved performance. Take care to ensure that your network provides adequate coverage for the types of stations that you need to support.

5. In the **Channel** field, select the [channel](#) you want this IAP to use from the channels available in the pull-down list. The list shows the channels available for the IAP selected (depending on which band the IAP is using). Channels that are shown in gray are unavailable. They are either already in use, or not offered for the selected Band.

The channels that are available for assignment to IAPs will differ, depending on the country of operation. If **Country** is set to **United States** in the [Global Settings](#) window, then 21 channels are available to 802.11an radios.

As mandated by FCC/IC law, APs continually scan for signatures of radar. If such a signature is detected, the AP will switch operation from conflicting channels to new ones. The AP will switch back to the original channel after 30 minutes if the channel is clear. If a radio was turned off because there were no available channels not affected by radar, the AP will now bring that radio back up after 30 minutes if that channel is clear. The 30 minute time frame complies with FCC/IC regulations.

6. Set **Channel Lock** to **Block auto-channel assignment** if you want to lock in your channel selection so that an autochannel operation (see [Advanced RF Settings](#)) can't change it. A locked padlock  will be displayed for the IAP.
7. The **Bond** field works together with the **Channel** selected above. (For 802.11n IAPs, it also obeys the bonding options selected on the [Global Settings .11n](#) page.) Also see the discussion in “[80 MHz and 160 MHz Channel Widths \(Bonding\)](#)” on page 48. Bonding is available on all APs, including two-radio models. For 802.11n, two 20MHz channels may be bonded to create one 40 MHz channel with double the data rate. 802.11ac offers an additional option to bond four 20MHz channels to create one 80MHz channel with four times the data rate.
 - **Channel number**—If a channel number appears, then this channel is already bonded to the listed channel.
 - **Off**—Do not bond this channel to another channel.
 - **40 MHz**—Bond this channel to an adjacent channel. The bonded channel is selected automatically by the AP based on the **Channel** ([Step 5](#)). The choice of bonded channel is static—fixed once the selection is made.
 - **80 MHz**—Bond this channel to three adjacent channels. The bonded channels are selected automatically by the AP based on the **Channel** ([Step 5](#)). The choice of bonded channels is static—fixed once the selection is made.

The top line for the IAP will show the channels that have been assigned based on the width of the bond.

8. In the **Cell Size** field, select **auto** to allow the optimal cell size to be automatically computed (see also, [“RF Power and Sensitivity” on page 361](#)). To set the cell size yourself, choose either **small**, **medium**, **large**, or **max** to use the desired pre-configured **cell** size. Alternatively, you can set the wireless cell size manually by specifying the transmit and receive power—in dB—in the **Tx Power** (transmit) and **Rx Threshold** (receive) fields. If you set manual values, the Cell Size field will display the value **manual** after the page is refreshed.

The default for Cell Size is **max**. If you select a value other than **auto**, the cell size will not be affected by cell size auto configuration. Note that ultra low power **Tx dBm** settings are possible. Values from -15dB to 5dB are provided specifically to help in high density 2.4 GHz environments.

When other APs are within listening range of this one, setting cell sizes to **Auto** allows the AP to change cell sizes so that coverage between cells is maintained. Each cell size is optimized to limit interference between sectors of other APs on the same channel. This eliminates the need for a network administrator to manually tune the size of each cell when installing multiple APs. In the event that an AP or a radio goes offline, an adjacent AP can increase its cell size to help compensate.

The number of users and their applications are major drivers of bandwidth requirements. The network architect must account for the number of users within the AP’s cell diameter. In a large office, or if multiple APs are in use, you may choose **Small** cells to achieve a higher data rate, since walls and other objects will not define the cells naturally.

For additional information about cell sizes, go to [“Coverage and Capacity Planning” on page 34](#).

9. If you are using **WDS** to provide backhaul over an extended distance, use **WDS Distance (Miles)** to prevent timeout problems associated with long transmission times. Set the approximate distance in miles between this IAP and the connected AP in this column. This increases the wait time for frame transmission accordingly.

- 
10. The **Antenna** field displays the antenna that has automatically been selected for this IAP.
 11. If desired, enter a description for this IAP in the **Description** field.
 12. You may reset all of the enabled IAPs by clicking the **Reset Channels** button at the top of the list. A message will inform you that all enabled radios have been taken down and brought back up.
 13. Buttons at the top of the list allow you to **Enable All IAPs** or **Disable All IAPs**.
 14. Click the **Save** button  if you wish to make your changes permanent.

Figure 169. Global Settings (IAPs)

This window allows you to establish global IAP settings. Global IAP settings include enabling or disabling all IAPs (regardless of their operating mode), and changing settings for beacons, station management, and advanced traffic optimization—including multicast processing, load balancing, and roaming. Changes you make on this page are applied to all IAPs, without exception.

Procedure for Configuring Global IAP Settings

1. **Country:** This is a display-only value. Once a country has been set, it may not be changed.

The channels that are available for assignment to IAPs will differ, depending on the country of operation. If **Country** is set to **United States**, then 25 channels are available for 802.11a/n.

If no country is displayed, the channel set defaults to channels and power levels that are legal worldwide—this set only includes the lower eight 5 GHz channels.

2. **IAP Control:** Click on the **Enable All IAPs** button to enable all IAPs for this AP, or click on the **Disable All IAPs** button to disable all IAPs.
3. **Short Retries:** This sets the maximum number of transmission attempts for a **frame**, the length of which is less than or equal to the RTS Threshold, before a failure condition is indicated. The default value is 7. Enter a new value (1 to 128) in the **Short Retry Limit** field if you want to increase or decrease this attribute.
4. **Long Retries:** This sets the maximum number of transmission attempts for a **frame**, the length of which is greater than the RTS Threshold, before a failure condition is indicated. The default value is 4. Enter a new value (1 to 128) in the **Long Retry Limit** field if you want to increase or decrease this attribute.
5. **Wi-Fi Alliance Mode:** Set this **On** if you need AP behavior to conform completely to Wi-Fi Alliance standards. This mode is normally set to **Off**.

Beacon Configuration

6. **Beacon Interval:** When the AP sends a beacon, it includes with it a beacon interval, which specifies the period of time before it will send the beacon again. Enter the desired value in the **Beacon Interval** field, between 20 and 1000 Kusecs. A Kusec is 1000 microseconds = 1 millisecond. The value you enter here is applied to all IAPs.
7. **DTIM Period:** A Delivery Traffic Indication Message (DTIM) is a signal sent as part of a beacon by the AP to a client device in sleep mode, alerting the device to broadcast traffic awaiting delivery. The **DTIM Period** is a multiple of the **Beacon Interval**, and it determines how often DTIMs are sent out. By default, the DTIM period is 1, which means that it is the same as the beacon interval. Enter the desired multiple, between 1 and 255. The value you enter here is applied to all IAPs.
8. **802.11h Beacon Support:** This option enables beacons on all of the AP's radios to conform to 802.11h requirements, supporting dynamic frequency selection (DFS) and transmit power control (TPC) to satisfy regulatory requirements for operation in Europe.
9. **802.11k Beacon Support:** 802.11k offers faster and more efficient roaming. When enabled, each beacon lists the channels that nearby APs offer. This supports improved channel scanning, resulting in faster roam times and increased battery life due to shorter scan times since the station knows where to look for nearby APs. The AP will also respond to requests from stations for an 802.11K Neighbor Report with additional information about nearby APs. This setting is enabled by default.
10. **802.11w Protected Management Support:** This option protects the wireless network infrastructure against spoofing by outside APs. Authenticate, De-authenticate, Associate, and Dis-associate management frames are sent in a secured manner when this option is enabled.

- 
11. **WMM Power Save:** Click **On** to enable Wireless Multimedia Power Save support, as defined in IEEE802.11e. This option saves power and increases battery life by allowing the client device to doze between packets to save power, while the AP buffers downlink frames. The default setting is **On**.
 12. **WMM ACM Video:** Click **On** to enable Wireless Multimedia Admission Control for video traffic. When admission control for video is enabled, the AP evaluates a video request from a client device against the network load and channel conditions. If the network is not congested, it accepts the request and grants the client the medium time for its traffic stream. Otherwise, it rejects the request. This enables the AP to maintain QoS when the WLAN becomes congested after a connection has already been established. Some clients contain sufficient intelligence to decide to either delay the traffic stream, associate with a different AP, or establish a best-effort traffic stream outside the operation of WMM-Admission Control. The default setting is **Off**. Note that the QoS priority of traffic queues is voice, video, best effort, background—this gives the highest priority to voice transmissions.
 13. **WMM ACM Voice:** Click **On** to enable Wireless Multimedia Admission Control for voice calls. As for **WMM ACM Video** above, when admission control for voice is enabled, the AP evaluates a voice request from a client device against the network load and channel conditions. If the network is not congested, it accepts the request and grants the client the medium time for its call. Otherwise, it rejects the request. Some clients contain sufficient intelligence to decide to either delay the traffic stream, associate with a different AP, or establish a best-effort traffic stream outside the operation of WMM-Admission Control. The default setting is **Off**.

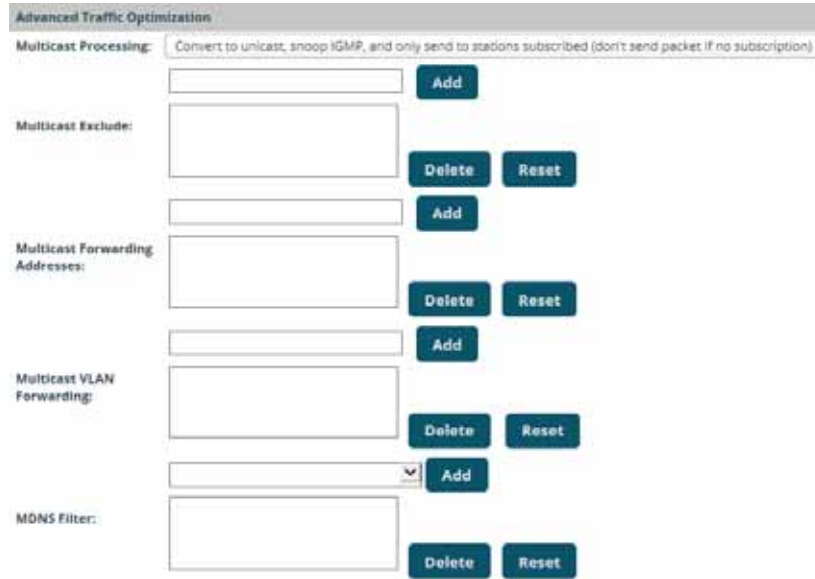

Station Management

14. **Station Re-Authentication Period:** This specifies an interval (in seconds) for station reauthentications. This is the minimum time period between station authentication attempts, enforced by the AP. This feature is part of the [Xirrus Advanced RF Security Manager \(RSM\)](#).

15. **Station Timeout Period:** Specify a time (in seconds) in this field to define the timeout period for station associations.
16. **Max Station Association per Access Point:** This option allows you to define how many station associations are allowed per AP, or enter **unlimited**. Note that the **Max Station Association per IAP** limit (below) may not be exceeded, so entering **unlimited**, in practice, will stop at the per-IAP limit.
17. **Max Station Association per IAP:** This defines how many station associations are allowed per IAP. Note that the SSIDs > [SSID Management](#) window also has a station limit option—**Station Limit**, and the windows for [Global Settings .11an](#) and [Global Settings .11bgn](#) also have **Max Stations** settings. If multiple station limits are set, all will be enforced. As soon as any limit is reached, no new stations can associate until some other station has terminated its association.
18. **Block Inter-Station Traffic:** This option allows you to block or allow traffic between wireless clients that are associated to the AP. Choose either **Yes** (to block traffic) or **No** (to allow traffic).
19. **Allow Over Air Management:** Choose **Yes** to enable management of the AP via the IAPs, or choose **No** (recommended) to disable this feature.

Advanced Traffic Optimization

Advanced Traffic Optimization

Multicast Processing: Convert to unicast, snoop IGMP, and only send to stations subscribed (don't send packet if no subscription)

Multicast Exclude:

Multicast Forwarding Addresses:

Multicast VLAN Forwarding:

MDNS Filter:

Figure 170. Multicast Processing

- 20. Multicast Processing:** This sets how multicast traffic is handled. Multicast traffic can be received by a number of subscribing stations at the same time, thus saving a great deal of bandwidth. In some of the options below, the AP uses IGMP snooping to determine the stations that are subscribed to the multicast traffic. IGMP (Internet Group Management Protocol) is used to establish and manage the membership of multicast groups.

Multicast handling options are only applicable to traffic transmitted from the AP to wireless stations. Select one of the following options:

- **Send multicasts unmodified.** This is useful when multicast is not needed because no video or audio streaming is required or when it is used only for discovering services in the network. Some situations where you might use this option are:

- for compatibility with ordinary operation, i.e., there is no optimization or modification of multicast traffic.
- if you have an application where many subscribers need to see the multicast—a large enough number that it would be less efficient to convert to unicast and better just to send out multicast even though it must be sent out at the speed of the slowest connected station.

An example of a situation that might benefit from the use of this mode is ghosting all the laptops in a classroom using multicast. One multicast stream at, say, 6 Mbps is probably more efficient than thirty unicast streams.

The next three options convert multicast to unicast. Packets are sent directly to the stations at the best possible data rates. This approach significantly improves the quality of the voice and video multicast streams.

- **Convert to unicast and send unicast packets to all stations.** This may be useful in link-local multicast situations.
 - **Convert to unicast, snoop IGMP, and only send to stations subscribed (send as multicast if no subscription).** This option is useful when you need to stream voice or video multicast traffic to all stations, but some stations are capable of subscribing to multicast groups while other stations are not. The stations that do not subscribe will not benefit from conversion to unicast; their video or voice quality may be compromised.
 - **Convert to unicast, snoop IGMP, and only send to stations subscribed (don't send packet if no subscription).** This option is useful in well controlled environments when you need to stream voice or video multicast traffic only to stations that are capable of subscribing to multicast groups and there is no need for the rest of the stations to receive the data stream.
- 21. Multicast Exclude:** This is a list of multicast IP addresses that will not be subject to multicast-to-unicast conversion. This list is useful on networks where applications such as those using multicast Domain Name System

(mDNS) are in use. For example, Apple Bonjour finds local network devices such as printers or other computers using mDNS. By default, the list contains the IPv4 multicast address for Apple Bonjour mDNS: 224.0.0.251. For an additional discussion of optimizing Apple Bonjour handling, see the *Bonjour Director Application Note* in the Xirrus [Resource Center](#).

To add a new IP address to the list, type it in the top field and click the **Add** button to its right. You may only enter IP addresses—host names are not allowed. This is because mDNS is a link local multicast address, and does not require IGMP to the gateway.

To remove an entry, select it in the list and click **Delete**. To remove *all* entries from the list, click **Reset**.

22. Multicast Forwarding

Multicast Forwarding is a Xirrus feature that forwards selected multicast traffic between wired VLANs and wireless SSIDs. For example, Apple devices use mDNS to advertise and find services, using local network multicasts that are not routed. This creates an issue when you are using Apple devices on the Wireless LAN, and have other devices that provide services connected on the wired infrastructure in a different VLAN, for example, printers and AppleTV devices. One way to address this issue is to set up multicast forwarding between the wireless SSID and the wired VLAN. This requires the wired VLAN to be trunked to the AP. Once configured correctly, mDNS traffic will be forwarded from the specified wireless network(s) to the specified wired VLANs and vice-versa, subject to any mDNS service filtering defined ([Step 24](#)).

Use multicast forwarding together with multicast VLAN forwarding ([Step 23](#)) and mDNS filtering ([Step 24](#)) to make services available across VLANs as follows:

- In **Multicast Forwarding Addresses**, enter a list of multicast addresses that you want forwarded, for example, 224.0.0.251 (the multicast address for Bonjour).

- In **Multicast VLAN Forwarding**, enter a list of VLANs that participate in the multicast forwarding.
- In **MDNS Filter**, specify the mDNS service types that are allowed to be forwarded.
 - If you leave this field blank, then there is *no* filter, and *mDNS packets for all service types are passed*.
 - If you enter service types, then this acts as an allow filter, and *mDNS packets are passed **only** for the listed service types*.

Note that mDNS filtering may be used to filter the mDNS packet types that are forwarded within the same VLAN. Also, in conjunction with multicast forwarding, it may be used to filter the mDNS packet types that are forwarded across configured VLANs.

After you have entered these settings, when multicast packets arrive from the wired network from one of the **Multicast Forwarding Addresses** on any VLAN specified in **Multicast VLAN Forwarding**, they are forwarded to the corresponding wireless SSID for that VLAN.

Multicast packets coming in from the wireless network on an SSID tied to one of the specified VLANs and matching one of the **Multicast Forwarding Addresses** are forwarded to the specified VLANs on the wired network.

No modifications are made to the forwarded packets – they are just forwarded between specified VLANs and associated SSIDs.

Xirrus strongly recommends the use of MDNS Filters (Step 24) when using multicast forwarding. Only allow required services to be forwarded.

Carefully monitor results, as forwarding may flood your network with multicast traffic. Experience has shown Bonjour devices to be very chatty. Also note that since this is link local multicast traffic, it will be sent to every wired port in the VLAN, as IGMP snooping does not work with link local multicast addresses.

To specify **Multicast Forwarding Addresses**: enter each IP address in the top field and click the **Add** button to its right. You may only enter IPv4

multicast addresses - host names are not allowed. To remove an entry, select it in the list and click **Delete**. To remove *all* entries from the list, click **Reset**.

- 23. Multicast VLAN Forwarding:** This is a list of VLANs that participate in the multicast forwarding. Please see the description of multicast forwarding in [Step 22](#) above.

The VLANs you enter must be explicitly defined (see “VLANs” on page 213) in order to participate in multicast forwarding. In fact, the AP discards packets from undefined VLANs.

Multicast VLAN Forwarding operates as follows:

- If you leave this field blank, then there is *no* filter, and *Multicast Forwarding traffic is passed across all VLANs*.
- If you enter VLANs, then this acts as an allow filter, and *Multicast Forwarding traffic is passed **only** to the listed VLANs*.

To add a new VLAN to the list, enter its number or name in the top field and click the **Add** button to its right. You may enter multiple VLANs at once, separated by a space. To remove an entry, select it in the list and click **Delete**. To remove *all* entries from the list, click **Reset**.

These VLANs must be trunked to the AP from the LAN switch, and be defined on the AP. See [“VLAN Management” on page 216](#) and [“SSID Management” on page 277](#).

*Note that Multicast Forwarding and mDNS Filtering capabilities also work if both devices are wireless. For example, let's say that AppleTV is using wireless to connect to an SSID that is associated with VLAN 56, and the wireless client is on an SSID that is associated with VLAN 58. Normally the wireless client would not be able to use Bonjour to discover the AppleTV because they are on separate VLANs. But if you add 224.0.0.251 to the **Multicast Forwarding Addresses**, then add VLANs 56 and 58 to the **Multicast VLAN Forwarding** list, then the wireless client will be able to discover the AppleTV. In this same scenario you could add AppleTV to the **MDNS Filter** list so that only MDNS packets for the AppleTV service type would be forwarded between VLANs 56 and 58.*

Note that all the VLANs that you add to this list do not have to be associated with SSIDs. As an example, say that AppleTV is on the wired network on VLAN 56, while the wireless device is connected to an SSID that is associated to VLAN 58. In this case, VLAN 56 and 58 need to be defined on the AP but only VLAN 58 needs to be associated to a SSID.

- 24. MDNS Filter:** There are many different types of services that may be specified in multicast query and response packets. The mDNS filters let you restrict forwarding, so that multicast packets are forwarded only for the services that you explicitly specify. This list may be used to restrict the amount of Apple Bonjour multicast traffic forwarding. For example, you may restrict forwarding to just AppleTV and printing services. Please see the description of multicast forwarding in [Step 22](#) above.

The **MDNS Filter** operates as follows:

- If you leave this field blank, then there is *no* filter, and *mDNS packets for all service types are passed*.
- If you enter service types, then this acts as an allow filter, and *mDNS packets are passed **only** for the listed service types*.

To add an mDNS packet type to the list of packets that may be forwarded, select it from the drop-down list in the top field and click the **Add** button to its right. The drop-down list offers packet types such as **AirTunes**,

Apple-TV, iChat, iPhoto, iTunes, iTunes-Home-Sharing, Internet-Printing, Mobile-Device-Sync, and Secure-Telnet.

For example, to allow mirroring of an iPad on an Apple-TV, select **Apple-TV**.

You may define your own type if you do not see the service you want in the drop-down list. Simply enter the mDNS service name that you would like to allow through. Custom mDNS packet types must be prefixed with an underscore, e.g., **_airvideosever**.

To remove an entry, select it in the list and click **Delete**. To remove *all* entries from the list, click **Reset**.

Broadcast Rates: Optimized Standard

Load Balancing: Off On

IPv6 Filtering: Off On

ARP Filtering: Off Pass-thru Proxy

Xirrus Roaming Layer: 2 and 3 2 only

Xirrus Roaming Mode: Off Broadcast Tunneled

Share Roaming Info With: All In Range Target Only

Xirrus Roaming Targets:

Figure 171. Additional Optimization Settings

25. **Broadcast Rates:** This changes the rates of broadcast traffic sent by the AP (including beacons). When set to **Optimized**, each broadcast or multicast packet that is transmitted on each radio is sent at the lowest transmit rate used by any client associated to that radio at that time. This results in each IAP broadcasting at the highest AP TX data rate that can be heard by all associated stations, improving system performance. The rate is determined dynamically to ensure the best broadcast/multicast performance possible. The benefit is dramatic. Consider a properly

designed network (having -70db or better everywhere), where virtually every client should have a 54Mbps connection. In this case, broadcasts and multicasts will all go out at 54Mbps vs. the standard rate. Thus, with broadcast rate optimization on, broadcasts and multicasts use between 2% and 10% of the bandwidth that they would in Standard mode.

When set to **Standard** (the default), broadcasts are sent out at the lowest basic rate only—6 Mbps for 5GHz clients, or 1 Mbps for 2.4GHz clients. The option you select here is applied to all IAPs.

26. **Load Balancing (ACExpress™):** Wi-Fi is a shared medium and only one device can transmit data at any time. Faster devices supporting 802.11ac standards have to wait until the slower devices finish transmitting data. This brings down the overall throughput of the network. For example, an 802.11n client operates more than four times slower than an 802.11ac client, and thus will take four times more air time to communicate a given amount of data. This starves the available bandwidth from faster clients, reducing performance significantly. Xirrus solves this issue with ACExpress that automatically separates devices onto different IAPs by their speeds and capability.

ACExpress identifies station capabilities based on fingerprinting and automatically groups devices by performance. It works on all modes (802.11a/b/g/n/ac) and bands (2.4GHz and 5GHz). This results in improved performance for every WLAN client and optimized use of wireless radio resources. Factors including wireless band, number of spatial streams, 802.11ac and 802.11n capability, and signal to noise ratio are considered.

This feature also provides automatic load balancing designed to distribute wireless stations across multiple radios rather than having stations associate to the closest radios with the strongest signal strength, as they normally would. In wireless networks, the station selects the radio to which it will associate. The AP cannot actually force load balancing, however it can “encourage” stations to associate in a more optimal fashion to underused radios of the most advantageous type. This option enables or disables active load balancing between the AP IAPs.

If you select **On** and an IAP is not the best choice for network performance, that IAP will send an “AP Full” message in response to Probe, Association, or Authentication requests. This deters persistent clients from forcing their way onto overloaded IAPs.

Note that ACEXpress load balancing is **not** used if:

- A station is re-associating—if it was already associated to this IAP, it is allowed back on this IAP immediately. This prevents the station from being bounced between different IAPs.
- The IAP’s **Band**, **WiFi Mode**, and **Channel** settings are not at their default values. For example, if the IAP’s WiFi mode is set to 11n-only, load balancing will not be used. See “IAP Settings” on page 313.
- If station counts (specified at the IAP, SSID, or band level) are already exceeded.
- If a station has already been turned down a number of times when attempting to associate, i.e., the station will eventually be allowed onto the IAP after a number of attempts have failed.

Choose **Off** to disable load balancing.

27. **ARP Filtering:** Address Resolution Protocol finds the MAC address of a device with a given IP address by sending out a broadcast message requesting this information. ARP filtering allows you to reduce the proliferation of ARP messages by restricting how they are forwarded across the network.

You may select from the following options for handling ARP requests:

- **Off:** ARP filtering is disabled. ARP requests are broadcast to radios that have stations associated to them.
- **Pass-thru:** The AP forwards the ARP request. It passes along only ARP messages that target the stations that are associated to it. This is the default value.
- **Proxy:** The AP replies on behalf of the stations that are associated to it. The ARP request is not broadcast to the stations.

Note that the AP has a broadcast optimization feature that is always on (it is not configurable). Broadcast optimization restricts all broadcast packets (not just ARP broadcasts) to only those radios that need to forward them. For instance, if a broadcast comes in from VLAN 10, and there are no VLAN 10 users on a radio, then that radio will not send out that broadcast. This increases available air time for other traffic.

28. **IPv6 Filtering:** this setting allows blocking of IPv6 traffic which may be a concern for IT managers. The Xirrus AP currently bridges IPv6 traffic. Set IPv6 filtering **On** if you wish to prevent the forwarding of IPv6 packets through the AP in both directions—wired network to wireless and wireless network to wired. The default is **Off**.
29. **Xirrus Roaming Layer:** Select whether to enable roaming capabilities between IAPs or APs at Layer **2 and 3**, or at Layer **2 only**. Depending on your wired network, you may wish to allow fast roaming at Layer 3. This may result in delayed traffic.
30. **Xirrus Roaming Mode:** This feature utilizes the Xirrus Roaming Protocol (RP) ensuring fast and seamless roaming capabilities between IAPs or APs at Layer 2 and Layer 3 (as specified in [Step 31](#)), while maintaining security. Fast roaming eliminates long delays for re-authentication, thus supporting time-sensitive applications such as Voice over Wi-Fi (see [“Understanding Fast Roaming”](#) on page 312 for a discussion of this feature). RP uses a discovery process to identify other Xirrus APs as fast roaming targets. This process has two modes:
 - **Broadcast**—the AP uses a broadcast technique to discover other APs that may be targets for fast roaming.
 - **Tunneled**—in this Layer 3 technique, fast roaming target APs must be explicitly specified.

To enable fast roaming, choose **Broadcast** or **Tunneled**, and set additional fast roaming attributes ([Step 31](#)). To disable fast roaming, choose **Off**. If you enable Fast Roaming, the following ports **cannot** be blocked:

- **Port 22610**—reserved for Layer 2 roaming using UDP to share PMK information between APs.

- 
- **Ports 15000 to 17999**—reserved for Layer 3 roaming (tunneling between subnets).
31. **Share Roaming Info With:** Three options allow your AP to share roaming information with all APs; just with those that are within range; or with specifically targeted APs. Choose either **All**, **In Range** or **Target Only**, respectively.
- a. **Xirrus Roaming Targets:** If you chose **Target Only**, use this option to add target MAC addresses. Enter the MAC address of each target AP, then click on **Add** (add as many targets as you like). To find a target's MAC address, open the **AP Info** window on the target AP and look for **IAP MAC Range**, then use the starting address of this range.

To delete a target, select it from the list, then click **Delete**.

Figure 172. Global Settings .11an

Procedure for Configuring Global 802.11an IAP Settings

- 802.11a Data Rates:** The AP allows you to define which data rates are supported for all 802.11an radios. Select (or deselect) data rates by clicking in the corresponding **Supported** and **Basic** data rate check boxes.
 - Basic Rate**—a wireless station (client) must support this rate in order to associate.
 - Supported Rate**—data rates that can be used to transmit to clients.

- 
2. **Data Rate Presets:** The Wireless AP can optimize your 802.11a data rates automatically, based on range or throughput. Click **Optimize Range** to optimize data rates based on range, or click **Optimize Throughput** to optimize data rates based on throughput. The **Restore Defaults** button will take you back to the factory default rate settings.
 3. **802.11a IAP Control:** Click **Enable 802.11a IAPs** to enable all 802.11an IAPs for this AP, or click **Disable 802.11a IAPs** to disable all 802.11an IAPs.
 4. **Channel Configuration:** Click **Auto Configure** to instruct the AP to determine the best channel allocation settings for each 802.11an IAP and select the channel automatically, based on changes in the environment. This is the recommended method for 802.11a channel allocation (see [“RF Spectrum Management” on page 362](#)).

Click **Factory Defaults** if you wish to instruct the AP to return all IAPs to their factory preset channels. As of release 6.3, APs no longer all use the same factory preset values for channel assignments. Instead, if the AP has been deployed for a while and already has data from the spectrum analyzer and Xirrus Roaming Protocol about channel usage on neighboring APs, it performs a quick auto channel using that information (without doing a full RF scan) to make an intelligent choice of channel assignments. If the AP has been rebooted and has no saved configuration or is just being deployed for the first time, it has no prior data about its RF environment. In this case, it will pick a set of compatible channel assignments at random.

*On the XR-500/600 and XR-1000 Series models, the **Factory Defaults** button will not restore iap1 to monitor mode. You will need to restore this setting manually. Also, you may need to set **Timeshare Mode** again - see [“RF Monitor” on page 359](#).*

The following options may be selected for auto configuration:

- **Non-Radar:** give preference to channels that are not required to use dynamic frequency selection (DFS) to avoid communicating in the same frequency range as some radar (also see [Step 8 on page 321](#)).

Channels Required to Use DFS Radar Avoidance in USA			
36+40	Non-radar	116+120+124+128	DFS required
44+48	Non-radar	132+136	DFS required
52+56	DFS required	140+144	DFS required
60+64	DFS required	149+153	Non-radar
100+104	DFS required	157+161	Non-radar
108+112	DFS required	165	Non-radar

Channels Required to Use DFS Radar Avoidance in Europe			
36+40	Non-radar	116+120*	DFS required
44+48	Non-radar	124*+128*	DFS required
52+56	DFS required	132+136	DFS required
60+64	DFS required	140+144	DFS required
100+104	DFS required	149+153	Non-radar
108+112	DFS required	157+161	Non-radar
* Channels 120, 124, 128 use a 10 minute Channel Availability Check (CAC) time in Europe		165	Non-radar

- **Negotiate:** negotiate air-time with other APs before performing a full scan.

- **Full Scan:** perform a full traffic scan on all channels on all IAPs to determine the best channel allocation.
- **Include WDS:** automatically assign 5GHz to WDS client links.

*To use the Auto Cell Size feature, any IAPs that will use Auto Cell must have Cell Size set to **auto**.*

For Auto Cell by Channel, it is not necessary for RF Monitor Mode to be turned on, or for there to be a radio set to monitor mode. For Auto Cell by Band, RF Monitor Mode must be set to Dedicated or Timeshare mode, and there must be a radio set to monitor mode. See “RF Monitor” on page 359.

5. **Set Cell Size:** Cell Size may be set globally for all 802.11an IAPs to **Auto**, **Large**, **Medium**, **Small**, or **Max** using the buttons.

For an overview of RF power and cell size settings, please see “RF Power and Sensitivity” on page 361, “Capacity and Cell Sizes” on page 36, and “Fine Tuning Cell Sizes” on page 37.

6. **Auto Cell By Channel:** By default, this feature is **On**, and auto cell will adjust the cell size for a radio when nearby APs have radios on the same channel within earshot of each other, so that the two radios minimize interference with each other. If this option is unchecked, then auto cell will adjust the cell size for a radio when nearby APs have radios on the same band, even if they are using different channels (called Auto Cell by Band, or Multichannel Auto Cell). This will result in smaller cell sizes. See “Fine Tuning Cell Sizes” on page 37.
7. **Auto Cell Period (seconds):** You may set up auto-configuration to run periodically, readjusting optimal cell sizes for the current conditions. Enter a number of seconds to specify how often auto-configuration will run. If you select **None**, then auto-configuration of cell sizing will not be run periodically. You do not need to run Auto Cell often unless there are a lot of changes in the environment. If the RF environment is changing often, running Auto Cell every twenty-four hours (86400 seconds) should be sufficient). The default value is **None**.

8. **Auto Cell Size Overlap (%)**: Enter the percentage of cell overlap that will be allowed when the AP is determining automatic cell sizes. For 100% overlap, the power is adjusted such that neighboring APs that hear each other best will hear each other at -70dB. For 0% overlap, that number is -90dB. The default value is **50%**.
9. **Auto Cell Min Cell Size**: Use this setting if you wish to set the minimum cell size that Auto Cell may assign. The values are **Default**, **Large**, **Medium**, or **Small**.
10. **Auto Cell Min Tx Power (dBm)**: Enter the minimum transmit power that the AP can assign to a radio when adjusting automatic cell sizes. The default value is **10**.
11. **Auto Cell Max Rx Threshold (dBm)**: Enter the maximum receive threshold that the AP can assign to a radio when adjusting automatic cell sizes. The default value is **-80**.
12. **Auto Cell Configuration**: Click this button to instruct the AP to determine and set the best cell size for each 802.11an IAP whose **Cell Size** is **auto** on the [IAP Settings](#) window, based on changes in the environment. This is the recommended method for setting cell size. You may look at the Tx and Rx values on the [IAP Settings](#) window to view the cell size settings that were applied.
13. **Fragmentation Threshold**: This is the maximum size for directed data [packets](#) transmitted over the 802.11an radio. Larger frames fragment into several packets, their maximum size defined by the value you enter here. Smaller fragmentation numbers can help to “squeeze” packets through in noisy environments. Enter the desired **Fragmentation Threshold** value in this field, between 256 and 2346.
14. **RTS Threshold**: The Request To Send (RTS) Threshold specifies the [packet](#) size. Packets larger than the RTS threshold will use CTS/RTS prior to transmitting the packet—useful for larger packets to help ensure the success of their transmission. Enter a value between 1 and 2347.
15. **Max Stations**: This defines how many station associations are allowed per 802.11an IAP. Note that the IAPs > Global Settings window and

SSIDs—SSID Management window also have station limit settings—**Max Station Association per IAP** ([page 323](#)) and **Station Limit** ([page 284](#)), respectively. If multiple station limits are set, all will be enforced. As soon as any limit is reached, no new stations can associate until some other station has terminated its association.

Figure 173. Global Settings .11bgn

Procedure for Configuring Global 802.11b/g IAP Settings

1. **802.11g Data Rates:** The AP allows you to define which data rates are supported for all 802.11g radios. Select (or deselect) 11g data rates by clicking in the corresponding **Supported** and **Basic** data rate check boxes.
 - **Basic Rate**—a wireless station (client) must support this rate in order to associate.
 - **Supported Rate**—data rates that can be used to transmit to clients.
2. **802.11b Data Rates:** This task is similar to Step 1, but these data rates apply only to 802.11b IAPs.
3. **Data Rate Presets:** The Wireless AP can optimize your 802.11b/g data rates automatically, based on range or throughput. Click **Optimize Range** button to optimize data rates based on range, or click on the **Optimize Throughput** to optimize data rates based on throughput. **Restore Defaults** will take you back to the factory default rate settings.
4. **802.11b/g IAP Control:** Click **Enable All 802.11b/g IAPs** to enable all 802.11b/g IAPs for this AP, or click **Disable All 802.11b/g IAPs** to disable them.
5. **Channel Configuration:** Click **Auto Configure** to instruct the AP to determine the best channel allocation settings for each 802.11b/g IAP and select the channel automatically, based on changes in the environment. This is the recommended method for channel allocation (see [“RF Spectrum Management” on page 362](#)).

Click **Factory Defaults** if you wish to instruct the AP to return all IAPs to their factory preset channels. As of release 6.3, APs no longer all use the same factory preset values for channel assignments. Instead, if the AP has been deployed for a while and already has data from the spectrum analyzer and Xirrus Roaming Protocol about channel usage on neighboring APs, it performs a quick auto channel using that information (without doing a full RF scan) to make an intelligent choice of channel assignments. If the AP has been rebooted and has no saved configuration or is just being deployed for the first time, it has no prior data about its RF

environment. In this case, it will pick a set of compatible channel assignments at random.

*On the XR-500/600 and XR-1000 Series, the **Factory Defaults** button will not restore `iap1` to monitor mode. You will need to restore this setting manually. Also, you may need to set **Timeshare Mode** again - see “RF Monitor” on page 359.*

The following options may be selected for auto configuration:

- **Negotiate:** negotiate air-time with other APs before performing a full scan.
 - **Full Scan:** perform a full traffic scan on all channels on all IAPs to determine the best channel allocation.
 - **Non-Radar:** give preference to channels without radar-detect. See table in “Procedure for Configuring Global 802.11an IAP Settings” on page 335.
 - **Include WDS:** automatically assign 5GHz to WDS client links.
6. **Set Cell Size/ Autoconfigure:** Cell Size may be set globally for all 802.11b/g IAPs to **auto**, **large**, **medium**, **small**, or **max** using the drop down menu.

For an overview of RF power and cell size settings, please see “RF Power and Sensitivity” on page 361, “Capacity and Cell Sizes” on page 36, and “Fine Tuning Cell Sizes” on page 37.

7. **Auto Cell By Channel:** By default, this feature is **On**, and auto cell will adjust the cell size for a radio when nearby APs have radios on the same channel within earshot of each other, so that the two radios minimize interference with each other. If this option is unchecked, then auto cell will adjust the cell size for a radio when nearby APs have radios on the same band, even if they are using different channels (called Auto Cell by Band, or Multichannel Auto Cell). This will result in smaller cell sizes. See “Fine Tuning Cell Sizes” on page 37.

*To use the Auto Cell Size feature, any IAPs that will use Auto Cell must have Cell Size set to **auto**.*

*For **Auto Cell by Channel**, it is not necessary for RF Monitor Mode to be turned on, or for there to be a radio set to monitor mode. For **Auto Cell by Band**, RF Monitor Mode must be set to **Dedicated** or **Timeshare** mode, and there must be a radio set to monitor mode. See “RF Monitor” on page 359.*

8. **Auto Cell Period (seconds):** You may set up auto-configuration to run periodically, readjusting optimal cell sizes for the current conditions. Enter a number of seconds to specify how often auto-configuration will run. If you select **None**, then auto-configuration of cell sizing will not be run periodically. You do not need to run Auto Cell often unless there are a lot of changes in the environment. If the RF environment is changing often, running Auto Cell every twenty-four hours (86400 seconds) should be sufficient). The default value is **None**.
9. **Auto Cell Size Overlap (%):** Enter the percentage of cell overlap that will be allowed when the AP is determining automatic cell sizes. For 100% overlap, the power is adjusted such that neighboring APs that hear each other best will hear each other at -70dB. For 0% overlap, that number is -90dB. The default value is **50%**.
10. **Auto Cell Min Cell Size:** Use this setting if you wish to set the minimum cell size that Auto Cell may assign. The values are **Default**, **Large**, **Medium**, or **Small**.
11. **Auto Cell Min Tx Power (dBm):** Enter the minimum transmit power that the AP can assign to a radio when adjusting automatic cell sizes. The default value is **10**.
12. **Auto Cell Max Rx Threshold (dBm):** Enter the maximum receive threshold that the AP can assign to a radio when adjusting automatic cell sizes. The default value is **-80**.

13. **Auto Cell Configuration:** Click **Auto Configure** to instruct the AP to determine and set the best cell size for each enabled 802.11b/g IAP whose **Cell Size** is **auto** on the [IAP Settings](#) window, based on changes in the environment. This is the recommended method for setting cell size. You may look at the Tx and Rx values on the [IAP Settings](#) window to view the cell size settings that were applied.
14. **802.11g Only:** Choose **On** to restrict use to 802.11g mode only. In this mode, no 802.11b rates are transmitted. Stations that only support 802.11b will not be able to associate.
15. **802.11g Protection:** You should select **Auto CTS** or **Auto RTS** to provide automatic protection for all 802.11g radios in mixed networks (802.11b and g). You may select **Off** to disable this feature, but this is not recommended. Protection allows 802.11g stations to share the IAP with older, slower 802.11b stations. Protection avoids collisions by preventing 802.11b and 802.11g stations from transmitting simultaneously. When **Auto CTS** or **Auto RTS** is enabled and any 802.11b station is associated to the IAP, additional frames are sent to gain access to the wireless network.
 - Auto CTS requires 802.11g stations to send a slow Clear To Send frame that locks out other stations. Automatic protection reduces 802.11g throughput when 802.11b stations are present—Auto CTS adds less overhead than Auto RTS. The default value is Auto CTS.
 - With Auto RTS, 802.11g stations reserve the wireless media using a Request To Send/Clear To Send cycle. This mode is useful when you have dispersed nodes. It was originally used in 802.11b only networks to avoid collisions from “hidden nodes”—nodes that are so widely dispersed that they can hear the AP, but not each other.

When there are no 11b stations associated and an auto-protection mode is enabled, the AP will not send the extra frames, thus avoiding unnecessary overhead.
16. **802.11g Slot:** Choose **Auto** to instruct the AP to manage the 802.11g slot times automatically, or choose **Short Only**. Xirrus recommends using **Auto** for this setting, especially if 802.11b devices are present.

- 
17. **802.11b Preamble:** The [preamble](#) contains information that the AP and client devices need when sending and receiving packets. All compliant 802.11b systems have to support the long preamble. A short preamble improves the efficiency of a network's throughput when transmitting special data, such as voice, VoIP (Voice-over IP) and streaming video. Select **Auto** to instruct the AP to manage the preamble (long and short) automatically, or choose **Long Only**.
 18. **Fragmentation Threshold:** This is the maximum size for directed data [packets](#) transmitted over the 802.11b/g IAP. Larger frames fragment into several packets, their maximum size defined by the value you enter here. Enter the desired **Fragmentation Threshold** value, between 256 and 2346.
 19. **RTS Threshold:** The RTS (Request To Send) Threshold specifies the [packet](#) size. Packets larger than the RTS threshold will use CTS/RTS prior to transmitting the packet—useful for larger packets to help ensure the success of their transmission. Enter a value between 1 and 2347.
 20. **Max Stations:** This defines how many station associations are allowed per 802.11bgn IAP. Note that the IAPs > Global Settings window and SSIDs > SSID Management window also have station limit settings—**Max Station Association per IAP** ([page 323](#)) and **Station Limit** ([page 284](#)), respectively. If multiple station limits are set, all will be enforced. As soon as any limit is reached, no new stations can associate until some other station has terminated its association.

Figure 174. Global Settings .11n

Procedure for Configuring Global 802.11n IAP Settings

1. **802.11n Data Rates:** The AP allows you to define which data rates are supported for all 802.11n radios. Select (or deselect) 11n data rates by clicking in the corresponding **Supported** and **Basic** data rate check boxes.
 - **Basic Rate**—a wireless station (client) must support this rate in order to associate.
 - **Supported Rate**—data rates that can be used to transmit to clients.
2. **802.11n Mode:** Select **Enabled** to allow the AP to operate in 802.11n mode.

If you select **Disabled**, then 802.11n operation is disabled on the AP.
3. **TX Chains:** Select the number of separate data streams transmitted by the antennas of each IAP. The maximum number of chains is determined by whether the AP has 2x2 or 3x3 radios. The default value is always the maximum supported by the radio type. See [“Up to Eight Simultaneous Data Streams—Spatial Multiplexing” on page 44](#).
4. **RX Chains:** Select the number of separate data streams received by the antennas of each IAP. This number should be greater than or equal to **TX Chains**. The maximum number of chains is determined by whether the AP has 2x2 or 3x3 radios. The default value is always the maximum supported by the radio type. See [“Up to Eight Simultaneous Data Streams—Spatial Multiplexing” on page 44](#).
5. **Guard interval:** Select **Short** to increase the data transmission rate by decreasing wait intervals in signal transmission. Select **Long** to use the standard interval. The default is Short.
6. **Auto bond 5 GHz channels:** Select **Enabled** to use Channel Bonding on 5 GHz channels and automatically select the best channels for bonding. The default is **Enabled**. See [“80 MHz and 160 MHz Channel Widths \(Bonding\)” on page 48](#).

7. **5 GHz Channel Bonding:** Select **Dynamic** to have auto-configuration for bonded 5 GHz channels be automatically updated as conditions change. For example, if there are too many clients to be supported by a bonded channel, dynamic mode will automatically break the bonded channel into two channels. Select **Static** to have the bonded channels remain the same once they are selected. The Dynamic option is only available when **Auto bond 5 GHz channels** is enabled. The default is **Dynamic**. See [“80 MHz and 160 MHz Channel Widths \(Bonding\)”](#) on page 48.
8. **2.4 GHz Channel Bonding:** Select **Dynamic** to have auto-configuration for bonded 2.4 GHz channels be automatically updated as conditions change. Select **Static** to have the bonded channels remain the same once they are selected. The default is **Dynamic**. See [“80 MHz and 160 MHz Channel Widths \(Bonding\)”](#) on page 48.
9. **Global channel bonding:** These buttons allow you to turn channel bonding on or off for all IAPs in one step. The effect of using one of these buttons will be shown if you go to the **IAP Settings** window and look at the **Bond** column. Clicking **Enable bonding on all IAPs** causes all IAPs to be bonded to their auto-bonding channel immediately, if appropriate. For example, the IAP will not be bonded if it is set to monitor mode, and 2.4 GHz radios will not be bonded. Click **Disable bonding on all IAPs** to turn off bonding on all IAPs immediately. See [“80 MHz and 160 MHz Channel Widths \(Bonding\)”](#) on page 48. Settings in [Step 7](#) and [Step 8](#) are independent of global channel bonding.

Global Settings .11ac

This window allows you to establish global 802.11ac IAP settings. These settings include enabling or disabling 802.11ac mode for the entire AP, specifying the number of data streams used in spatial multiplexing, and setting a short or long guard interval.

Before changing your settings for 802.11ac, please read the discussion in “About IEEE 802.11ac” on page 42.

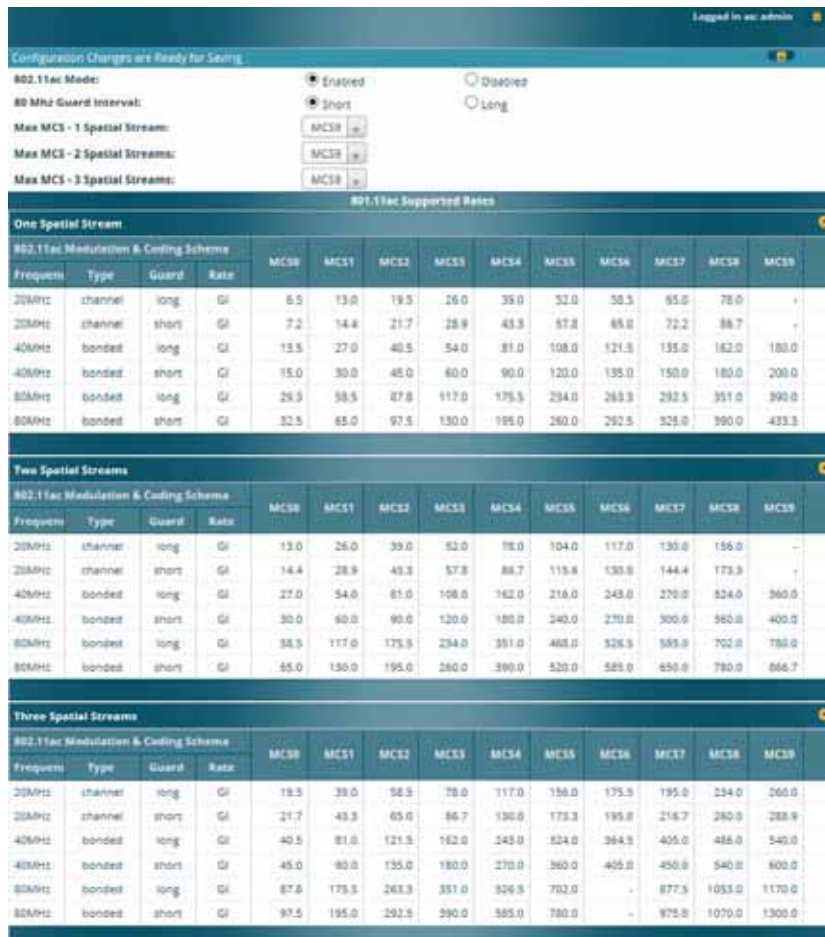

Figure 175. Global Settings .11ac

Procedure for Configuring Global 802.11ac IAP Settings

1. **802.11ac Mode:** Select **Enabled** to allow the AP to operate in 802.11ac mode. **If you select Disabled, then 802.11ac operation is disabled on the AP.**
2. **80 MHz Guard interval:** This is the length of the interval between transmission of symbols (the smallest unit of data transfer) when you are using 80MHz bonded channels. (See [“80 MHz and 160 MHz Channel Widths \(Bonding\)”](#) on page 48.) Select **Short** to increase the data transmission rate by decreasing wait intervals in signal transmission. Select **Long** to use the standard interval. The default is Short.
3. **Max MCS:** Select the highest Modulation and Coding Scheme level that may be used with **1 or 2 Spatial Streams**. For models with 3x3 radios, there is also a setting for **3 Spatial Streams**. This setting may be used to limit the highest level of modulation to 64-QAM, or allow 256-QAM with its higher data rate. It also determines the coding scheme used for error correction. Higher MCS levels allocate fewer bits to error correction, and thus a higher proportion is used for data transfer. The default **Max MCS** value is **MCS9**.

The higher the MCS values, the higher the data rate, as shown in **802.11ac Supported Rates**, below. Higher MCS levels require higher signal-to-noise ratios (i.e., a less noisy environment) and shorter transmission distances. See [“Higher Precision in the Physical Layer”](#) on page 47.

The maximum number of separate data streams that may be transmitted by the antennas of each IAP is determined by whether the AP has 2x2 or 3x3 radios. For a device that has 2x2 radios, such as the XR-620, the settings for three spatial streams are not shown. See [“Up to Eight Simultaneous Data Streams—Spatial Multiplexing”](#) on page 44.

4. **802.11ac Supported Rates:** This list shows the optimum data rates that can be expected, based on the number of spatial streams that a station can handle, and on your settings for Max MCS, Guard Interval, and the use of bonded channels, up to 80MHz wide.

Global Settings .11u

Understanding 802.11u

As the number of access points available in public venues increases, mobile devices users have a harder time distinguishing usable SSIDs from the tens, if not hundreds of access points visible. Using the 802.11u protocol, access points may broadcast information about the services and access that they offer and to respond to queries for additional information related to the facilities that the downstream service network provides.

The type of information broadcast or available from 802.11u-compliant access points includes:

- **Access Network Type.** Indicates the type of network available. For example: public or private, free or charged, etc.
- **Internet Connectivity.** Indicates whether the network provides Internet connectivity.
- **Authentication.** Indicates whether additional authentication steps will be required to use the network as well as the network authentication types that are in use.
- **Venue Information.** The type and name of the location where the access point is found.
- **Identification.** A globally unique identification for the access point.
- **IPv4/IPv6 Addressing.** Indicate the type of IP addressing (IPv4 and/or IPv6) and NATing that is performed by the network.
- **Roaming Consortium.** The service network may be connected to one or more roaming providers, called consortia, that allow access points from multiple service providers to be used transparently through a single paid service. The access point may advertise multiple consortia to mobile devices.
- **Domain Names.** A list of domain names to which the mobile user may end up belonging based on authentication credentials used.

Wireless Access Point

- **Cellular Networks.** The service network may have arrangements with one or more cellular service providers who can transparently provide wireless and Internet connectivity.

The screenshot shows the '802.11u Global Settings' configuration page. At the top, it indicates 'Configuration Changes are Ready for Saving' and 'Logged in as admin'. The settings are organized into several sections:

- 802.11u Interworking:** Radio buttons for 'Off' (selected) and 'On'.
- Access Network Type:** A dropdown menu set to 'Private network'.
- Internet Connectivity:** Radio buttons for 'Provided', 'Unspecified' (selected), and 'Enabled'.
- Additional Step Required for Access:** Radio buttons for 'Disabled' (selected) and 'Enabled'.
- Venue Group:** A dropdown menu set to 'Unspecified'.
- Venue Type:** A dropdown menu set to 'Unspecified'.
- HESID:** An empty text input field.
- IPv4 Availability:** A dropdown menu set to 'IPv4 address availability not known'.
- IPv6 Availability:** A dropdown menu set to 'IPv6 availability not known'.
- Roaming Consortium:** A list of entries with 'Add', 'Delete', and 'Reset' buttons.
- Domain Names:** A list of entries with 'Add', 'Delete', and 'Reset' buttons.
- Cell Network:** Fields for 'MCC' and 'MNC' with an 'Add' button, and a list of entries with 'Delete' and 'Reset' buttons.
- Network Authentication Types:** A list of entries with 'Add', 'Delete', and 'Reset' buttons.
- Venue Names:** Fields for 'English' and 'Chinese' with 'Add' buttons, and a list of entries with 'Delete' and 'Reset' buttons.

Figure 176. 802.11u Global Settings

Procedure for Configuring 802.11u Settings

Use this window to establish the 802.11u configuration.

- 
1. **802.11u Internetworking.** Click **On** to enable 802.11u protocol operation.
 2. **Access Network Type:** This indicates the type of network supported by the access point. The choices are:
 - a. **Chargeable public network**
 - b. **Emergency services only network**
 - c. **Free public network**
 - d. **Personal device network**
 - e. **Private network with guest access**
 - f. **Test or experimental network**
 - g. **Wildcard**—all of the networks above are supported.
 3. **Internet Connectivity.** Click **Provided** if Internet connectivity is available through the access point from the back end provider to which the mobile user ends up belonging. Click **Unspecified** otherwise—for example, depending on the SLAs (service level agreements) of the mobile user, Internet access may or may not be provided.
 4. **Additional Step Required for Access.** Click **Disabled** if no additional authentication steps will be required to complete the connection and **Enabled** otherwise. The available authentication techniques are described in the **Network Authentication Types** field ([Step 13](#)).
 5. **Venue Group.** Select the general type of venue that the access point is located in. Various choices are available, including **Business**, **Residential**, and **Outdoor**. For each **Venue Group**, a further set of sub-choices are available in the **Venue Type** field below. The particular name of the venue is specified in the **Venue Names** field ([Step 14](#)).
 6. **Venue Type.** For each of the **Venue Group** choices, a further set of sub-choices are available. For example, if you set **Venue Group** to **Assembly**, the choices include **Amphitheater**, **Area**, **Library**, and **Theatre**.

7. **HESsid.** Enter the globally unique homogeneous ESS ID. This SSID is marked as being HotSpot 2.0 capable. This SSID attribute is global—if 802.11u is enabled and HotSpot 2.0 is enabled, then all SSIDs will have HotSpot 2.0 capability.
8. **IPv4 Availability.** Select the type of IPv4 addressing that will be assigned by the network upon connection. NATed addresses are IP addresses that have been changed by mapping the IP address and port number to IP addresses and new port numbers routable by other networks. **Double NATed** addresses go through two levels of NATing. **Port restricted IPv4 addresses** refer to specific UDP and TCP port numbers associated with standard Internet services; for example, port 80 for web pages. The choices for this field are:
 - a. **Double NATed private IPv4 address available**
 - b. **IPv4 address not available**
 - c. **IPv4 address availability not known**
 - d. **Port-restricted IPv4 address available**
 - e. **Port-restricted IPv4 address and double NATed IPv4 address available**
 - f. **Port-restricted IPv4 address and single NATed IPv4 address available**
 - g. **Public IPv4 address available**
 - h. **Single NATed private IPv4 address available**
9. **IPv6 Availability.** Select the type of IPv6 addressing that is available from the network upon connection.
 - a. **IPv6 address not available**
 - b. **IPv6 address availability not known**
 - c. **IPv6 address available**

- 
10. **Roaming Consortium.** Each of the roaming consortia has an organizational identifier (OI) obtained from IEEE that unique identifies the organization. This is similar to the OUI part of a MAC address. Use this control to build up a list of OIs for the consortia available. Enter the OI as a hexadecimal string of between 6 and 30 characters in the **Add** field and click **Add**. The OI will appear in the list. An OI may be deleted by selecting it in the list and clicking **Delete**. All OIs may be deleted by clicking **Reset**.
 11. **Domain Names.** Use this control to build up a list of domain names. Enter the name in the **Add** field and click **Add**, and it will appear in the list. A name may be deleted by selecting it in the list and clicking **Delete**. All names may be deleted by clicking **Reset**.
 12. **Cell Network.** Each of the cell networks is identified by a mobile country code (MCC) and mobile network code (MNC). Use this control to build up a list of cell networks. Enter the MCC as a three digit number and the MNC as a two or three digit number and click **Add**. The cell network will appear in the list. A cell network may be deleted by selecting it in the list and clicking **Delete**. All networks may be deleted by clicking **Reset**.
 13. **Network Authentication Types.** Each network authentication that is in use on the network should be specified in this list. The choices are:
 - a. **Acceptance of terms and conditions.** This choice displays a web page asking for the user's acceptance of terms and conditions of use. The URL should be specified in the URL field before clicking **Add**.
 - b. **DNS redirection.** Rather than use the DNS server on the network, the redirection points to a different server.
 - c. **HTTP/HTTPS redirection.** This choice causes the user's first web page reference to be redirected to a different URL for login or other information. The URL should be specified in the URL field before clicking **Add**.
 - d. **On-line enrollment supported.** This choice indicates that the user may sign up for network access as part of the authentication process.

When **Add** is clicked the authentication type and optional URL will appear in the list. An authentication type may be deleted by selecting it in the list and clicking **Delete**. All authentication types may be deleted by clicking **Reset**.

- 14. Venue Names.** The list of names associated with the venue are specified here. A venue name may be added to the list in English or Chinese. Enter the name in the appropriate field and click **Add**. The name will appear in the list. A name may be deleted by selecting it in the list and clicking **Delete**. All names may be deleted by clicking **Reset**.

Advanced RF Settings

This window allows you to establish RF settings, including automatically configuring channel allocation and cell size, and configuring radio assurance and standby modes. Changes you make on this page are applied to all IAPs, without exception.

Figure 177. Advanced RF Settings

About Standby Mode

Standby Mode supports the AP-to-AP fail-over capability. When you enable Standby Mode, the AP functions as a backup unit, and it enables its radios if it detects that its designated target AP has failed. The use of redundant APs to provide this fail-over capability allows APs to be used in mission-critical

applications. In Standby Mode, an AP monitors beacons from the target AP. When the target has not been heard from for 40 seconds, the standby AP enables its radios until it detects that the target AP has come back online. Standby Mode is off by default. Note that you must ensure that the configuration of the standby AP is correct. This window allows you to enable or disable Standby Mode and specify the primary AP that is the target of the backup unit. See also, “[Failover Planning](#)” on page 52.

Procedure for Configuring Advanced RF Settings

RF Monitor

1. **RF Monitor Mode:** RF monitoring permits the operation of features like intrusion detection. The monitor may operate in **Dedicated** mode, or in **Timeshare** mode which allows the radio to divide its time between monitoring and acting as a standard radio that allows stations to associate to it. **Timeshare** mode is especially useful for small APs with two IAPs, such as the XR-500/600 and XR-1000 Series, allowing one IAP to be shared between monitoring the airwaves for problems and providing services to stations. Settings allow you to give priority to monitoring or wireless services, depending on your needs. The default Monitor Mode is **Off** for the XR-500/600 Series, **Timeshare** mode for XR-1000 Series, and **Dedicated** for higher models.

If **Timeshare** mode is selected, you may adjust the following settings:

- **Timeshare Scanning Interval (6-600):** number of seconds between monitor (off-channel) scans.
- **Timeshare Station Threshold (0-240):** when the number of stations associated to the monitor radio exceeds this threshold, scanning is halted.
- **Timeshare Traffic Threshold (0-50000):** when the number of packets per second handled by the monitor radio exceeds this threshold, scanning is halted.

RF Resilience

- Radio Assurance Mode:** When this mode is enabled, the monitor radio performs loopback tests on the AP. This mode requires RF Monitor Mode to be enabled (**Dedicated** or **Timeshare** mode, see [Step 1](#)) to support self-monitoring functions. It also requires a radio to be set to monitoring mode (see [“Enabling Monitoring on the AP”](#) on page 529).

Operation of Radio Assurance mode is described in detail in [“AP Monitor and Radio Assurance Capabilities”](#) on page 529.

The Radio Assurance mode scans and sends out probe requests on each channel, in turn. It listens for all probe responses and beacons. These tests are performed continuously (24/7). If no beacons or probe responses are observed from a radio for a predetermined period, Radio Assurance mode will take action according to the preference that you have specified:

- **Failure alerts only**—The AP will issue alerts in the Syslog, but will not initiate repairs or reboots.
 - **Failure alerts & repairs, but no reboots**—The AP will issue alerts and perform resets of one or all of the radios if needed.
 - **Failure alerts & repairs & reboots if needed**—The AP will issue alerts, perform resets, and schedule reboots if needed.
 - **Disabled**—Disable radio assurance tests (no self-monitoring occurs). Loopback tests are disabled by default.
- Enable Standby Mode:** Choose **Yes** to enable this AP to function as a backup unit for the target AP, or choose **No** to disable this feature. See [“About Standby Mode”](#) on page 358.
 - Standby Target Address:** If you enabled the Standby Mode, enter the MAC address of the target AP (i.e., the address of the primary AP that is being monitored and backed up by this AP). To find this MAC address, open the AP Info window on the target AP, and use the Gigabit1 MAC Address.

RF Power and Sensitivity

For an overview of RF power and cell size settings, please see “Capacity and Cell Sizes” on page 36 and “Fine Tuning Cell Sizes” on page 37.

*To use the Auto Cell Size feature, the following additional settings are required: all IAPs that will use Auto Cell must have **Cell Size** set to **auto**. See “Procedure for Manually Configuring IAPs” on page 314.*

It is not necessary for RF Monitor Mode to be turned on, and you don't need to have any radio set to monitor mode. See “RF Monitor” on page 359.

5. **Set Cell Size:** Cell Size may be set globally for all enabled IAPs to **Auto**, **Large**, **Medium**, **Small**, or **Max** using the buttons.
6. **Auto Cell Period (seconds):** You may set up auto-configuration to run periodically, readjusting optimal cell sizes for the current conditions. Enter a number of seconds to specify how often auto-configuration will run. If you select **None**, then auto-configuration of cell sizing will not be run periodically. You do not need to run Auto Cell often unless there are a lot of changes in the environment. If the RF environment is changing often, running Auto Cell every twenty-four hours (86400 seconds) should be sufficient). The default value is **None**.
7. **Auto Cell Size Overlap (%):** Enter the percentage of cell overlap that will be allowed when the AP is determining automatic cell sizes. For 100% overlap, the power is adjusted such that neighboring APs that hear each other best will hear each other at -70dB. For 0% overlap, that number is -90dB. The default value is **50%**.
8. **Auto Cell Min Cell Size:** Use this setting if you wish to set the minimum cell size that Auto Cell may assign. The values are **Default**, **Large**, **Medium**, or **Small**.
9. **Auto Cell Min Tx Power (dBm):** Enter the minimum transmit power that the AP can assign to a radio when adjusting automatic cell sizes. The default value is **10**.

- 
10. **Auto Cell Configuration:** Click this button to instruct the AP to determine and set the best cell size for each enabled IAP whose **Cell Size** is **auto** on the [IAP Settings](#) window, based on changes in the environment. This is the recommended method for setting cell size. You may look at the Tx and Rx values on the [IAP Settings](#) window to view the cell size settings that were applied.
 11. **Sharp Cell:** This feature reduces interference between neighboring APs or other Access Points by limiting to a defined boundary (cell size) the trailing edge bleed of RF energy. Choose **On** to enable the Sharp Cell functionality, or choose **Off** to disable this feature. See also, “[Fine Tuning Cell Sizes](#)” on page 37. This feature is available on 802.11n radios on APs, but not on 802.11ac radios.

The Sharp Cell feature only works when the cell size is Small, Medium, or Large (or Auto)—but not Max. If IAP cell size is set to Max, the Sharp Cell feature will be disabled for that radio.

RF Spectrum Management

12. **Configuration Status:** Shows the status of auto channel configuration. If an operation is in progress, the approximate time remaining until completion is displayed; otherwise **Idle** is displayed.
13. **Band Configuration:** Automatic band configuration is the recommended method for assigning bands to the abgn IAPs. It runs only on command, assigning IAPs to the 2.4GHz or 5GHz band when you click the **Auto Configure** button. The AP uses its radios to listen for other APs on the same channel, and it assigns bands based on where it finds the least interference.

Auto band assigns as many IAPs to the 5 GHz band as possible when there are other APs within earshot. It does this by determining how many APs are in range and then picking the number of radios to place in the 2.4 GHz band. Note that for another AP to be considered to be in range, the other AP must be visible via both the wireless and wired networks—the AP must be listed in the [Network Map](#) table, its entry must have **In**

Range set to **Yes**, and it must have at least one active IAP with an SSID that has broadcast enabled.

Auto band runs separately from auto channel configuration. If a radio's band is changed, associated stations will be disconnected and will then reconnect.

- 14. Channel Configuration:** Automatic channel configuration is a method for channel allocation. When the AP performs auto channel configuration, you may optionally instruct it to first negotiate with any other nearby APs that have been detected, to determine whether to stagger the start time for the procedure slightly. Thus, nearby APs will not run auto channel at the same time. This prevents APs from interfering with each other's channel assignments.

*Note that Auto Channel normally assigns individual channels. However, if you select **Auto bond 5GHz channels** on the **Global Settings .11n** page, and have 40MHz channels set up prior to running Auto Channel, those bonds will be preserved. 80MHz bonds will not be preserved.*

The **Configuration Status** field displays whether an Auto Configure cycle is currently running on this AP or not.

Click **Auto Configure** to instruct the AP to determine the best channel allocation settings for each enabled IAP and select the channel automatically, based on changes in the environment. This is the recommended method for channel allocation (see [“RF Spectrum Management” on page 362](#)). The following options may be selected for auto configuration:

- **Negotiate:** negotiate air-time with other APs before performing a full scan. Negotiating is slower, but if multiple APs are configuring channels at the same time the Negotiate option ensures that multiple APs don't select the same channels. Turning off the Negotiate option allows the **Auto Configure** button to manually perform auto channel without waiting, and may be used when you know that no other nearby APs are configuring their channels.

- **Full Scan:** perform a full traffic scan on all channels on all IAPs to determine the best channel allocation.
- **Non-Radar:** give preference to channels without radar-detect. See table in “[Procedure for Configuring Global 802.11an IAP Settings](#)” on page 335.
- **Include WDS:** automatically assign 5GHz to WDS client links.

Click **Factory Defaults** if you wish to instruct the AP to return all IAPs to their factory preset channels. APs do not use the same factory preset values for channel assignments. Instead, if the AP has been deployed for a while and already has data from the spectrum analyzer and Xirrus Roaming Protocol about channel usage on neighboring APs, it performs a quick auto channel using that information (without doing a full RF scan) to make an intelligent choice of channel assignments. If the AP has been rebooted and has no saved configuration or is just being deployed for the first time, it has no prior data about its RF environment. In this case, it will pick a set of compatible channel assignments at random.

*On XR-500/600 and XR-1000 Series models, the **Factory Defaults** button will not restore iap1 to monitor mode. You will need to restore this setting manually. Also, you may need to set **RF Monitor Mode** to **Timeshare Mode** again - see “[RF Monitor](#)” on page 359.*

- 15. Auto Channel Configuration Mode:** This option allows you to instruct the AP to auto-configure channel selection for each enabled IAP when the AP is powered up. Choose **On AP PowerUp** to enable this feature, or choose **Disabled** to disable this feature.
- 16. Auto Channel Configure on Time:** This option allows you to instruct the AP to auto-configure channel selection for each enabled IAP at a time you specify here. Leave this field blank unless you want to specify a time at which the auto-configuration utility is initiated. Time is specified in hours and minutes, using the format: **[day]hh:mm [am | pm]**. If you omit the optional **day** specification, channel configuration will run daily at the

specified time. If you do not specify am or pm, time is interpreted in 24-hour military time. For example, Sat 11:00 pm and Saturday 23:00 are both acceptable and specify the same time.

17. **Channel List Selection:** This list selects which channels are available to the auto channel algorithm. Channels that are not checked are left out of the auto channel selection process. Note that channels that have been locked by the user are also not available to the auto channel algorithm.
18. **Auto Channel List: Use All Channels** selects all available channels (this does not include locked channels). **Use Defaults** sets the auto channel list back to the defaults. This omits newer channels (100-140)—many wireless NICs don't support these channels.

Station Assurance

Station assurance monitors the quality of the connections that users are experiencing on the wireless network. You can quickly detect stations that are having problems and take steps to correct them. Use these settings to establish threshold values for errors and other problems. Station assurance is enabled by default, with a set of useful default thresholds that you may adjust as desired.

When a connection is experiencing problems and reaches one of these thresholds in the specified period of time, the AP responds with several actions: an event is triggered, a trap is generated, and a Syslog message is logged. For example, if a client falls below the threshold for **Min Average Associated Time**, this “bouncing” behavior might indicate roaming problems with the network’s RF design, causing the client to bounce between multiple APs and not stay connected longer than the time to re-associate and then jump again. This can be corrected with RF adjustments. Station assurance alerts you to the fact that this station is encountering problems.

Station Assurance	
Enable Station Assurance:	<input checked="" type="radio"/> Yes <input type="radio"/> No
Period:	60 seconds
Min Average Associated Time:	20 seconds
Max Authentication Failures:	10
Max Packet Error Rate:	20 %
Max Packet Retry Rate:	35 %
Min Packet Data Rate:	10 Mbps
Min Received Signal Strength:	-85 dB
Min Signal to Noise Ratio:	10 dB
Max Distance from Array:	2000 feet

Figure 178. Station Assurance (Advanced RF Settings)

19. **Enable Station Assurance:** This is enabled by default. Click No if you wish to disable it, and click Yes to re-enable it. When station assurance is enabled, the AP will monitor connection quality indicators listed below and will display associated information on the [Station Assurance Status](#) page. When a threshold is reached, an event is triggered, a trap is generated, and a Syslog message is logged.
20. **Period:** In seconds, the period of time for a threshold to be reached. For example, the AP will check whether Max Authentication Failures has been reached in this number of seconds.
21. **Min Average Associated Time:** (seconds) Station assurance detects whether the average length of station associations falls below this threshold during a period.
22. **Max Authentication Failures:** Station assurance detects whether the number of failed login attempts reaches this threshold during a period.
23. **Max Packet Error Rate:** (%) Station assurance detects whether the packet error rate percentage reaches this threshold during a period.
24. **Max Packet Retry Rate:** (%) Station assurance detects whether the packet retry rate percentage reaches this threshold during a period.
25. **Min Packet Data Rate:** (Mbps) Station assurance detects whether the packet data rate falls below this threshold during a period.

26. **Min Received Signal Strength:** (dB) Station assurance detects whether the strength of the signal received from the station falls below this threshold during a period.
27. **Min Signal to Noise Ratio:** (dB) Station assurance detects whether the ratio of signal to noise received from the station falls below this threshold during a period.
28. **Max Distance from AP: Min Received Signal Strength:** (feet) Station assurance detects whether the distance of the station from the AP reaches this threshold during a period.

Hotspot 2.0

Understanding Hotspot 2.0

Hotspot 2.0 is a part of the Wi-Fi Alliance's Passpoint certification program. It specifies additional information above and beyond that found in 802.11u, which allows mobile clients to automatically discover, select, and connect to networks based on preferences and network optimization. Mobile clients that support Hotspot 2.0 are informed of an access point's support via its beacon message.

Hotspot 2.0 messages forward several types of information to clients, including:

- **Uplink and Downlink Speeds**
- **Link Status**
- **Friendly Name**
- **Connection Capabilities** The access point will restrict the protocols that can be used by a specification of protocol and port numbers.

Procedure for Hotspot 2.0 Settings

Use this window to establish the Hotspot 2.0 configuration.

1. **Hotspot 2.0.** Click **Enabled** to enable Hotspot 2.0 operation.
2. **Downstream Group-addressed Forwarding.** Click **Enabled** to allow the access point to forward group-addressed traffic (broadcast and multicast) to all connected devices. Click **Disabled** to cause the access point to convert group-addressed traffic to unicast messages.
3. **WAN Downlink Speed.** Enter the WAN downlink speed in kbps into the field.
4. **WAN Uplink Speed.** Enter the WAN uplink speed in kbps into the field.

Configuration Changes are Ready for Saving

Figure 179. Hotspot 2.0 Settings

5. **English/Chinese Operator Friendly Name.** Enter an English or Chinese name into one of the fields. An incorrectly entered name can be deleted by clicking the corresponding **Delete**.
6. **Connection Capabilities.** A Hotspot 2.0 access point limits the particular protocols that clients may use. The set of default protocols is shown initially. This table specifies the protocols in terms of:
 - a. A common **Name**, such as FTP or HTTP.

- b. A **Protocol** number. For example 1 for ICMP, 6 for TCP, 17 for UDP, and 50 for Encapsulated Security Protocol in IPsec VPN connections.
- c. **Port** number for UDP/TCP connection.
- d. **Status**: one of **open**, **closed** or **unknown**.

Any of the entries may be deleted by clicking the corresponding **Delete** button. New entries may be created by entering the name of the protocol in the box beside the **Create** button, and then clicking **Create**. The new protocol will be added to the list with zeros in the protocol fields and **unknown** for the status. Enter the appropriate **Protocol** and **Port** values before setting the **Status** field to **open**.

NAI Realms

Understanding NAI Realm Authentication

A network access identifier (NAI) is a specification of a particular user. A NAI takes the general form of an e-mail address. Examples of NAIs are:

```
joe@example.com
fred@foo-9.example.com
jack@3rd.depts.example.com
fred.smith@example.com
```

Figure 180. NAI Realms

The **NAI Realm** is the part of the NAI following the @ sign. For example, you might enter: **example.com**, **3rd.depts.example.com**, and **foo-9.example.com**. Use the **NAI Realms** page, in conjunction with the **NAI EAP** page, to specify the authentication techniques to be used to access that realm with appropriate parameters.

Procedure for NAI Realms Settings

Use this window to establish the names of the supported realms.

1. **Enter the realm name.** Enter the name of a realm in the box to the left of the **Create** button and click **Create**. The realm will be added to the **NAI Realms** list. Any of the realms may be deleted by clicking the corresponding **Delete** button.
2. **Enter Authentication Information.** The **NAI EAP** page is used to specify authentication for a realm. Click on the name of a realm to go to the NAI EAP page for that realm. See “NAI EAP” on page 371.

NAI EAP

This window allows specification of the authentication techniques for a realm.

The screenshot shows the NAI EAP configuration interface. At the top, there is a dropdown menu for 'NAI Realm' set to 'xirus.com'. Below this is a table with two columns: 'Number' and 'EAP Method'. The table contains five rows, with the first row (Number 1, EAP Method EAP-AKA) highlighted in orange. Below this table is another section titled 'EAP 1 Auth Parameter Configuration' which contains a table with three columns: 'Number', 'Type', and 'Value or Vendor ID / Type'. This table also has five rows, with the first row (Number 1, Type Credential Type, Value or Vendor ID / Type Certificate) highlighted in orange.

Number	EAP Method
1	EAP-AKA
2	EAP-FAST
3	EAP-SIM
4	EAP-TLS
5	None

Number	Type	Value or Vendor ID / Type
1	Credential Type	Certificate
2	None	None
3	None	None
4	None	None
5	None	None

Figure 181. NAI EAP

Procedure for NAI Realms Settings

1. Select the realm to be configured in the **NAI Realm** drop down.
2. Select **EAP Methods**. Each realm may support up to five EAP authentication methods. Beside each of the five numbers (1, 2, 3, 4, 5) select the method from the drop down. The choices are:

- 
- EAP-AKA
 - EAP-AKA' (EAP-AKA prime)
 - EAP-FAST
 - EAP-MSCHAP-V2
 - EAP-SIM
 - EAP-TLS
 - EAP-TTLS
 - GTC
 - MD5-Challenge
 - None
 - PEAP

3. **Specify Authentication Parameters.** Each of the authentication methods may specify up to five authentication parameters. To specify the parameters click on the number corresponding to the authentication method; i.e. 1, 2, 3, 4, or 5. This displays the **EAP *n* Auth Parameter Configuration** below the list of **EAP Methods**. For up to five of the parameters, select the **Type** and **Value or Vendor ID / Type**. The choices for the **Type** are:

- **Credential Type**
- **Expanded EAP Method**
- **Expanded Inner EAP Method**
- **Inner Authentication EAP Method Type**
- **Non-EAP Inner Authentication Type**
- **None**
- **Tunneled EAP Method Credential Type**

For each type, a value or a vendor ID and type must be specified, as applicable.

Intrusion Detection

The Xirrus AP employs a number of IDS/IPS (Intrusion Detection System/Intrusion Prevention System) strategies to detect and prevent malicious attacks on the wireless network. Use this window to adjust intrusion detection settings.

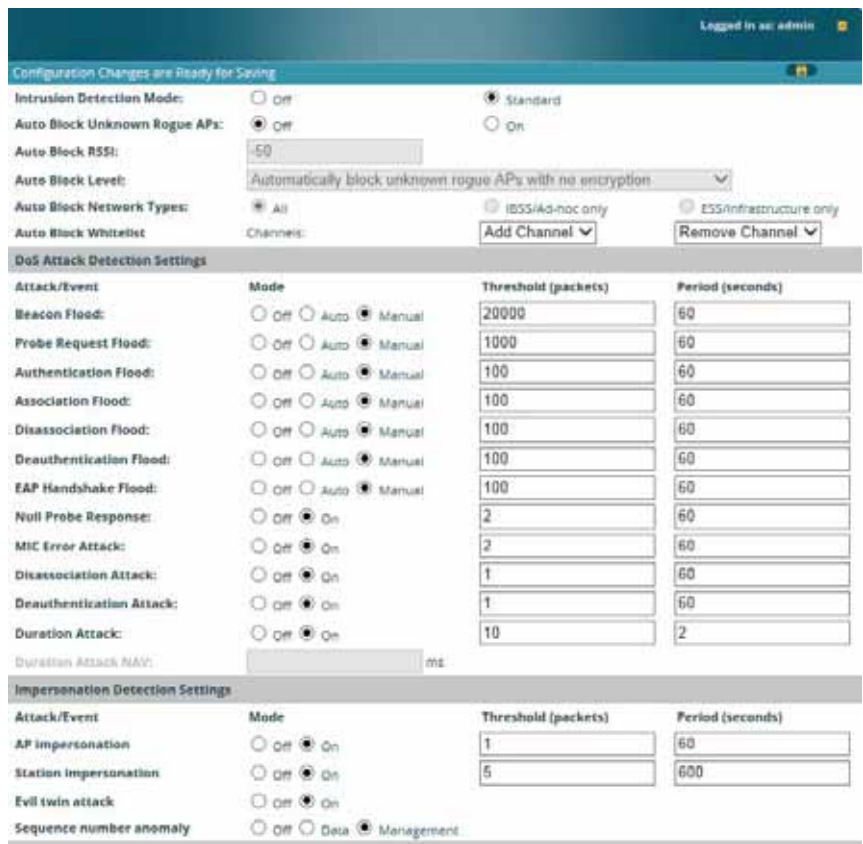

Figure 182. Intrusion Detection Settings

The AP provides a suite of intrusion detection and prevention options to improve network security. You can separately enable detection of the following types of problems:

- **Rogue Access Point Detection and Blocking**

Unknown APs are detected, and may be automatically blocked based on a number of criteria. See [“About Blocking Rogue APs” on page 376](#).

- **Denial of Service (DoS) or Availability Attack Detection**

A DoS attack attempts to flood an AP with communications requests so that it cannot respond to legitimate traffic, or responds so slowly that it becomes effectively unavailable. The AP can detect a number of types of DoS attacks, as described in the table below. When an attack is detected, the AP logs a Syslog message at the Alert level.

- **Impersonation Detection**

These malicious attacks use various techniques to impersonate a legitimate AP or station, often in order to eavesdrop on wireless communications. The AP detects a number of types of impersonation attacks, as described in the table below. When an attack is detected, the AP logs a Syslog message at the Alert level.

Type of Attack	Description
<i>DoS Attacks</i>	
Beacon Flood	Generating thousands of counterfeit 802.11 beacons to make it hard for stations to find a legitimate AP.
Probe Request Flood	Generating thousands of counterfeit 802.11 probe requests to overburden the AP.
Authentication Flood	Sending forged Authenticates from random MAC addresses to fill the AP's association table.
Association Flood	Sending forged Associates from random MAC addresses to fill the AP's association table.

Type of Attack	Description
Disassociation Flood	Flooding the AP with forged Disassociation packets.
Deauthentication Flood	Flooding the AP with forged Deauthenticates.
EAP Handshake Flood	Flooding an AP with EAP-Start messages to consume resources or crash the target.
Null Probe Response	Answering a station probe-request frame with a null SSID. Many types of popular NIC cards cannot handle this situation, and will freeze up.
MIC Error Attack	Generating invalid TKIP data to exceed the AP's MIC error threshold, suspending WLAN service.
Disassociation Attack (Omerta)	Sending forged disassociation frames to all stations on a channel in response to data frames.
Deauthentication Attack	Sending forged deauthentication frames to all stations on a channel in response to data frames.
Duration Attack (Duration Field Spoofing)	Injecting packets into the WLAN with huge duration values. This forces the other nodes in the WLAN to keep quiet, since they cannot send any packet until this value counts down to zero. If the attacker sends such frames continuously it silences other nodes in the WLAN for long periods, thereby disrupting the entire wireless service.
<i>Impersonation Attacks</i>	
AP impersonation	Reconfiguring an attacker's MAC address to pose as an authorized AP. Administrators should take immediate steps to prevent the attacker from entering the WLAN.
Station impersonation	Reconfiguring an attacker's MAC address to pose as an authorized station. Administrators should take immediate steps to prevent the attacker from entering the WLAN.
Evil twin attack	Masquerading as an authorized AP by beaconing the WLAN's service set identifier (SSID) to lure users.

Type of Attack	Description
Sequence number anomaly	<p>A sender may use an Add Block Address request (ADDDBA - part of the Block ACK mechanism) to specify a sequence number range for packets that the receiver can accept.</p> <p>An attacker spoofs an ADDDBA request, asking the receiver to reset its sequence number window to a new range. This causes the receiver to drop legitimate frames, since their sequence numbers will not fall in that range.</p>

About Blocking Rogue APs

If you classify a rogue AP as **blocked** (see [“Rogue Control List” on page 264](#)), then the AP will take measures to prevent stations from staying associated to the rogue. When the monitor radio is scanning, any time it hears a beacon from a blocked rogue it sends out a broadcast “deauth” signal using the rogue’s BSSID and source address. This has the effect of disconnecting all of a rogue AP’s clients approximately every 5 to 10 seconds, which is enough to make the rogue unusable.

The Intrusion Detection window allows you to set up **Auto Block** parameters so that unknown APs get the same treatment as explicitly blocked APs. This may result in many APs being blocked so use caution with auto block, and be sure to abide by applicable regulations. See [the Caution on page 377](#). By default, auto blocking is turned off. Auto blocking provides two parameters for qualifying blocking so that APs must meet certain criteria before being blocked. This keeps the AP from blocking every AP that it detects. You may:

- Set a minimum RSSI value for the AP—for example, if an AP has an RSSI value of -90, it is probably a harmless AP belonging to a neighbor and not in your building.
- Block based on encryption level.
- Block based on whether the AP is part of an ad hoc network or infrastructure network.
- Specify channels to be whitelisted. Rogues discovered on these channels are excluded from auto blocking. This allows specified channels to be freely used by customer or guests for their APs.

RF Intrusion Detection and Auto Block Mode

Procedure for Configuring Intrusion Detection

1. **Intrusion Detection Mode:** This option allows you to choose the **Standard** intrusion detection method, or you can choose **Off** to disable this feature. See [“AP Monitor and Radio Assurance Capabilities” on page 529](#) for more information.
 - **Standard**—enables the monitor radio to collect Rogue AP information.
 - **Off**—intrusion detection is disabled.
2. **Auto Block Unknown Rogue APs:** Enable or disable auto blocking (see [“About Blocking Rogue APs” on page 376](#)). You will be shown a Caution statement (below) and the WMI will ask whether you wish to proceed.

! *CAUTION: Selecting and engaging Auto Block may result in many APs being blocked. User caution in configuring and operating any form of Auto Block is highly recommended, as auto-blocking may be subject to significant statutory and U.S. Federal Communications Commission (FCC) regulatory controls, restrictions, enforcement actions and penalties.*

User is solely responsible for making sure that all uses of any auto-blocking feature(s) of this product are fully compliant with all applicable statutes, regulations, FCC enforcement actions and rules, etc. regarding Wi-Fi blocking. See for example FCC Enforcement Advisory No. 2015-01 dated January 27, 2015.

All uses of any auto-blocking feature(s) in this product are solely at User's discretion and individual choice. User assumes all liability and responsibility for all such uses. Xirrus assumes no liability or responsibility for any discretionary decision by User to configure, engage and to use any auto-blocking feature(s) of this product.

Note that in order to set Auto Block RSSI and Auto Block Level, you must set Auto Block Unknown Rogue APs to **On**. Then the remaining Auto Block fields will be active.

- 
3. **Auto Block RSSI:** Set the minimum RSSI for rogue APs to be blocked. APs with lower RSSI values will not be blocked. They are assumed to be farther away, and probably belonging to neighbors and posing a minimal threat.
 4. **Auto Block Level:** Select rogue APs to block based on the level of encryption that they are using. The choices are:
 - Automatically block unknown rogue APs regardless of encryption.
 - Automatically block unknown rogue APs with no encryption.
 - Automatically block unknown rogue APs with WEP or no encryption.
 5. **Auto Block Network Types:** Select rogues to automatically block by applying the criteria above only to networks of the type specified below. The choices are:
 - **All**—the unknown rogues may be part of any wireless network.
 - **IBSS/AD Hoc only**—only consider auto blocking rogues if they belong to an ad hoc wireless network (a network of client devices without a controlling Access Point, also called an Independent Basic Service Set—IBSS).
 - **ESS/Infrastructure only**—only consider auto blocking rogue APs if they are in infrastructure mode rather than ad hoc mode.
 6. **Auto Block Whitelist:** Use this list to specify channels to be excluded from automatic blocking. If you have enabled **Auto Block**, it will not be applied to rogues detected on the whitelisted channels. Use the **Add Channel** drop-down to add entries to the **Channels** list, one at a time. You can delete entries from the list by selecting them from the **Remove Channel** drop-down list.

DoS Attack Detection Settings

7. **Attack/Event:** The types of DoS attack that you may detect are described in the [Type of Attack Table page 374](#). Detection of each attack type may be separately enabled or disabled. For each attack, a default **Threshold** and **Period (seconds)** are specified. If the number of occurrences of the type of packet being detected exceeds the threshold in the specified number of seconds, then the AP declares that an attack has been detected. You may modify the **Threshold** and **Period**.

For the Flood attack settings, you also have a choice of **Auto** or **Manual**.

- **Manual** mode—threshold and period settings are used to detect a flood. Packets received are simply counted for the specified time period and compared against the flood threshold. The default for all of the floods is **Manual** mode.
 - **Auto** mode—the AP analyzes current traffic for packets of a given type versus traffic over the past hour to determine whether a packet flood should be detected. In this mode, threshold and period settings are ignored. This mode is useful for floods like beacon or probe floods, where the numbers of such packets detected in the air can vary greatly from installation to installation.
8. **Duration Attack NAV (ms):** For the duration attack, you may also modify the default duration value that is used to determine whether a packet may be part of an attack. If the number of packets having at least this duration value exceeds the **Threshold** number in the specified **Period**, an attack is detected.

Impersonation Detection Settings

9. **Attack/Event:** The types of impersonation attack that you may detect are described in [Impersonation Attacks page 375](#). Detection of each attack type may be turned **On** or **Off** separately. For **AP** or **Station Impersonation** attacks, a default **Threshold** and **Period (seconds)** are specified. If the number of occurrences of the type of packet being detected exceeds the threshold in the specified number of seconds, then

the AP declares that an attack has been detected. You may modify the **Threshold** and **Period**.

10. **Sequence number anomaly:** You may specify whether to detect this type of attack in **Data** traffic or in **Management** traffic, or turn **Off** this type of detection.

LED Settings

This window assigns behavior preferences for the AP's IAP LEDs.

Figure 183. LED Settings

Procedure for Configuring the IAP LEDs

1. **LED State:** This option determines which event triggers the LEDs, either when the IAP is enabled or when a station associates with the IAP. Choose **On Radio Enabled** or **On First Association**, as desired. You may also choose **Disabled** to keep the LEDs from being lit. The LEDs will still light during the boot sequence, then turn off.
2. **LED Blink Behavior:** This option allows you to select when the IAP LEDs blink, based on the activities you check here. From the choices available, select one or more activities to trigger when the LEDs blink. For default behavior, see “[AP LED Operating Sequences](#)” on page 73.
3. Click the **Save** button  if you wish to make your changes permanent.

See Also

[Global Settings](#)

[Global Settings .11an](#)

2. **DSCP to QoS Mapping:** The radio buttons in this table show all DSCP values (0 to 63), and the QoS level to which each is mapped. To change the QoS level applied to a DSCP value, click the desired QoS level (0 to 3) underneath it.

Roaming Assist

Roaming assist is a Xirrus feature that helps clients roam to APs that will give them high quality connections. Some smart phones and tablets will stay connected to a radio with poor signal quality, even when there's a radio with better signal strength within range. When roaming assist is triggered, the AP "assists" the device by deauthenticating it when certain parameters are met. This encourages a client with a high roaming threshold (i.e., a device that may not roam until signal quality has seriously dropped) to move to an AP that gives it a better signal. The deauthentication is meant to cause the client to choose a different radio. You can specify the device types that will be assisted in roaming.

The roaming threshold is the difference in signal strength between radios that will trigger a deauthentication. If the client's signal is lower than the sum of the threshold and the stronger neighbor radio's RSSI, then we "assist" the client. For example:

```
Threshold = -5
RSSI of neighbor AP = -65
RSSI of client = -75
-75 < (-5 + -65) : Therefore client will roam
```

Another example:

```
Threshold = -15
RSSI of neighbor AP = -60
RSSI of station = -70
-70 > (-15 + -60) : Client will not roam
```

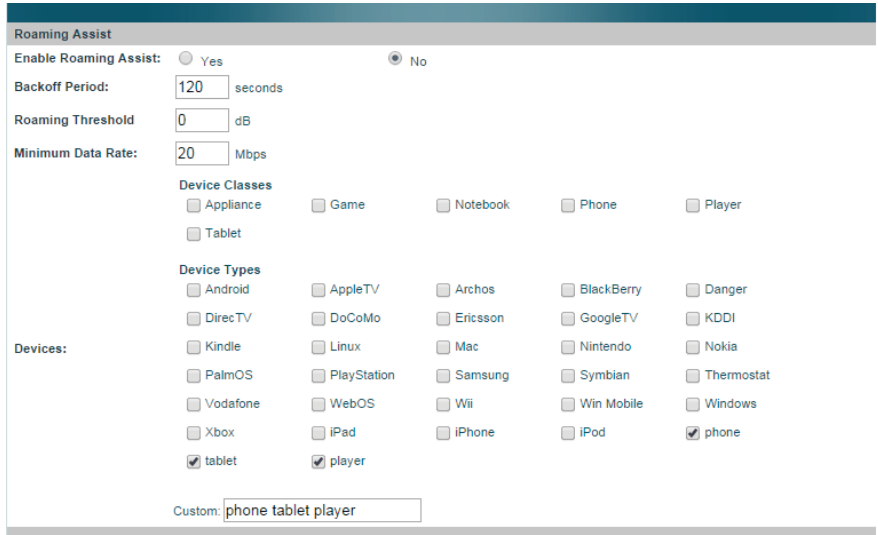

Figure 185. Roaming Assist

Procedure for Configuring Roaming Assist

1. **Enable Roaming Assist:** Use the **Yes** and **No** buttons to enable or disable this feature.
2. **Backoff Period:** After deauthenticating a station, it may re-associate to the same radio. To prevent the AP from repeatedly deauthenticating the station when it comes back, there is a backoff period. This is the number of seconds the station is allowed to stay connected before another deauthentication.
3. **Roaming Threshold:** This is the difference in signal strength between radios that will trigger a deauthentication, as described in the discussion above. In most cases, this will be a negative number. Triggering occurs regardless of whether the data rate falls below the Minimum Data Rate.
4. **Minimum Data Rate:** Roaming assist will be triggered if the station's packet data rate is below this value (1-99 Mbps), regardless of whether the Roaming Threshold has been reached.

- 
5. **Device Classes:** If you select any classes of device, such as **Phone** and **Notebook**, then roaming assist will *only* be applied to those kinds of stations. Many small, embedded devices (such as phones, tablets, and music players) are sticky—they have high roaming thresholds that tend to keep them attached to the same radio despite the presence of radios with better signal strength. You may check off one or more entries, but use care since roaming assist may cause poor results in some cases.

If no Device Classes or Device Types are selected, then all devices are included in roaming assist. If you select entries in both Device Classes and Device Types, then stations matching any of your selected types/classes will be assisted when the Roaming Threshold or Minimum Data Rate trigger is satisfied.

6. **Device Types:** If you select any types of device, such as **iPhone** and **Samsung**, then roaming assist will *only* be applied to those types of stations and to your selected Device Types as well, when the Roaming Threshold or Minimum Data Rate trigger is satisfied. If no Device Classes or Device Types are selected, then all devices are considered for roaming assist.

WDS

This is a status-only window that provides an overview of all WDS links that have been defined. Wireless Distribution System (WDS) is a system that enables the interconnection of access points wirelessly, allowing your wireless network to be expanded using multiple access points without the need for a wired backbone to link them. The **Summary of WDS Client Links** shows the WDS links that you have defined on this AP and identifies the target AP for each by its base MAC address. The **Summary of WDS Host Links** shows the WDS links that have been established on this AP as a result of client APs associating to this AP (i.e., the client APs have this AP as their target). The summary identifies the source (client) AP for each link. Both summaries identify the IAPs that are part of the link and whether the connection for each is up or down. See “[WDS Planning](#)” on page 63 for an overview.

Summary of WDS Client Links								
Link	State	Max IAPs	Target Array	Target SSID	Distance	IAP(s)	Channel(s)	Connection(s)
1	Off	1						
2	Off	1						
3	Off	1						
4	Off	1						

Summary of WDS Host Links								Host Link Stations: not
Link	State	Num IAPs	Source Array	Source SSID	Distance	IAP(s)	Channel(s)	Connection(s)
1	Off							
2	Off							
3	Off							
4	Off							

Figure 186. WDS

About Configuring WDS Links

A WDS link connects a client AP and a host AP (see [Figure 187 on page 386](#)). The host must be the AP that has a wired connection to the LAN. Client links from one or more APs may be connected to the host, and the host may also have client links. See “[WDS Planning](#)” on page 63 for more illustrations.

The configuration for WDS is performed on the client AP only, as described in “[WDS Client Links](#)” on page 387. No WDS configuration is performed on the host AP. First you will set up a client link, defining the target (host) AP and SSID, and the maximum number of IAPs in the link. Then you will select the IAPs to be used

in the link. When the client link is created, each member IAP will associate to a radio on the host AP.

You may wish to consider configuring the WDS link IAPs so that only the WDS link SSIDs are active on them. See “Active IAPs” on page 298.

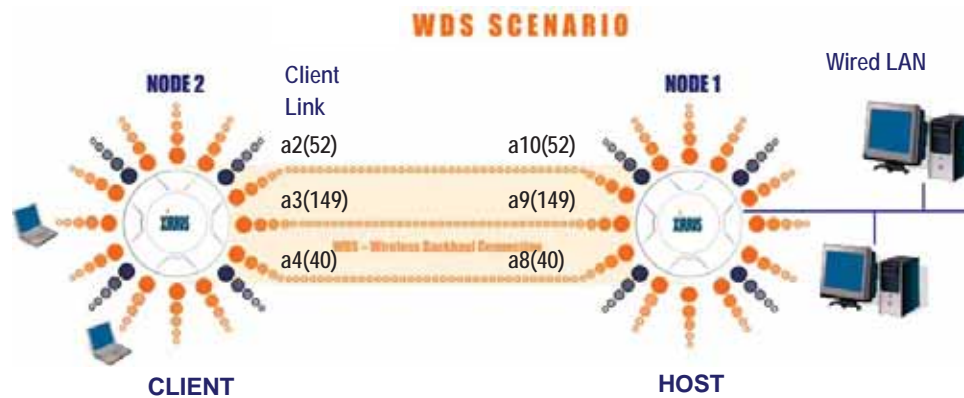

Figure 187. Configuring a WDS Link

Once some IAP has been selected to act as a WDS client link, you will not be allowed to use auto-configured cell sizing on that IAP (since the cell must extend all the way to the other AP).

When configuring WDS, if you use WPA-PSK (Pre-Shared Key) as a security mechanism, ensure that EAP is disabled. Communication between two APs in WDS mode will not succeed if the client AP has both PSK and EAP enabled on the SSID used by WDS. See *SSID Management*.

TKIP encryption does not support high throughput rates, per IEEE 802.11n. TKIP should **never** be used for WDS links on APs.

WDS is available on most Xirrus APs, including models with two radios (WDS will operate on either of the radios). If WDS is not available, the settings are grayed out or not shown.

Long Distance Links

If you are using WDS to provide backhaul over an extended distance, use the **WDS Dist. (Miles)** setting to prevent timeout problems associated with long transmission times. (See “IAP Settings” on page 313) Set the approximate distance in miles between this IAP and the connected AP in the **WDS Dist. (Miles)** column. This will increase the wait time for frame transmission accordingly.

IAP Channel Assignment:

Figure 188. WDS Client Links

Procedure for Setting Up WDS Client Links

1. **Host Link Stations:** Check the **Allow** checkbox to instruct the AP to allow stations to associate to IAPs on a host AP that participates in a WDS link. The WDS host IAP will send beacons announcing its availability to wireless clients. This is disabled by default.

Once some IAP has been selected to act as a WDS client link, no other association will be allowed on that IAP. However, wireless associations will be allowed on the WDS host side of the WDS session.

In situations like the one in the next step, where WDS is used by an AP mounted on a high speed train, STP can add significant delay (often on the order of 30 to 60 seconds) while initially analyzing network topology. In such a situation, it may be desirable to disable STP. See “Management Control” on page 238.

Caution: If Spanning Tree Protocol (“Management Control” on page 238) is disabled and a network connection is made on the WDS Client AP’s Gigabit link that can reach the WDS Host AP, broadcast and multicast packets will not be blocked. A broadcast storm may cause a network outage.

2. **Roaming RSSI Threshold:** If an AP is deployed on a mobile site (on a train, for example), you can use WDS to implement a wireless backhaul that will roam between APs at fixed locations. When another candidate AP for WDS host target is found, the client link will roam to the new AP if its RSSI is stronger than the RSSI of the current host connection by at least the **Roaming RSSI Threshold**. The default is 6 dB.
3. **Roaming RSSI Averaging Weight:** This weight changes how much the latest RSSI reading influences the cumulative weighted RSSI value utilized in checking the threshold (above) to make a roaming decision. The higher the weight, the lower the influence of a new RSSI reading. This is not exactly a percentage, but a factor in the formula for computing the current RSSI value based on new readings:

$$\text{StoredRSSI} = (\text{StoredRSSI} * \text{RoamingAvgWeight} + \text{NewRSSIReading} * (100 - \text{RoamingAvgWeight})) / 100$$

This prevents erroneous or out-of-line RSSI readings from causing the WDS link to jump to a new AP. Such readings can result from temporary obstructions, external interference, etc.

4. Click the **Save** button  after you are finished making changes on this page if you wish to make your changes permanent.

WDS Client Link Setting:

5. **Enable/Disable/Reset All Links:** Click the appropriate button to:
 - **Enable All Links**—this command activates all WDS links configured on the AP.
 - **Disable All Links**—this command deactivates all WDS links configured on the AP. It leaves all your settings unchanged, ready to re-enable.
 - **Reset All Links**—this command tears down all links configured on the AP and sets them back to their factory defaults, effective immediately.
6. **Client Link:** Shows the ID (1 to 4) of each of the four possible WDS links.
7. **Enabled:** Check this box if you want to enable this WDS link, or uncheck the box to disable the link.
8. **Max IAPs Allowed (1-3):** Enter the maximum number of IAPs for this link, between 1 and 3.
9. **Target AP Base MAC Address:** Enter the base MAC address of the target AP (the host AP at the other side of this link). To find this MAC address, open the **WDS** window on the *target* AP, and use **This AP Address** located on the right under the Summary of WDS Host Links. To allow any Xirrus AP to be accepted as a WDS target, enter the Xirrus OUI: **00:0f:7d:00:00:00** or **50:60:28:00:00:00** (this is useful for roaming in a mobile deployment, as described in [Step 2 on page 388](#)).
10. **Target SSID:** Enter the SSID that the target AP is using.

11. **Username:** Enter a username for this WDS link. A username and password is required if the SSID is using PEAP for WDS authentication from the internal RADIUS server.
12. **Password:** Enter a password for this WDS link.
13. **Clear Settings:** Click on the **Clear** button to reset all of the fields on this line.

WDS Client Link IAP Assignments:

14. For each desired client link, select the IAPs that are part of that link. The IAP channel assignments are shown in the column headers.
15. **IAP Channel Assignment:** Click **Auto Configure** to instruct the AP to automatically determine the best channel allocation settings for each IAP that participates in a WDS link, based on changes in the environment. These changes are executed immediately, and are automatically applied.

Filters

The Wireless AP’s integrated firewall uses stateful inspection to speed the decision of whether to allow or deny traffic. Filters are used to define the rules used for blocking or passing traffic. Filters can also set the VLAN and QoS level for selected traffic.

The air cleaner feature offers a number of predetermined filter rules that eliminate a great deal of unnecessary wireless traffic. See “Air Cleaner” on page 468.

Filters may be used based on your experience with [Application Control Windows](#) to eliminate or cap the amount of traffic allowed for less desirable applications.

Stateful Filtering:	enabled										
Application Control:	enabled										
Name	Type	Layer	Protocol	Port	Application	Source	Destination	Set QOS	Set DSCP	Set VLAN	Enabled
FiltersAppCtrl											No
Air-cleaner-Arp.1	deny	2	arp	any		iface iap	iface iap				Yes
Air-cleaner-Dhcp.1	deny	2	udp	bootps		iface gig	ff.ff.ff.ff.ff/48				Yes
Air-cleaner-Dhcp.2	deny	2	udp	bootpc-dhcp		iface iap	ff.ff.ff.ff.ff/48				Yes
NoDownload	deny	3	any	any	ApDnload	any	any				Yes
AppsAllow	allow	3	any	any	Apps1	any	any				Yes
Global											No
foo-filters	allow	3	any	any	vpn_tun	any	any				No

Figure 189. Filters

User connections managed by the firewall are maintained statefully—once a user flow is established through the AP, it is recognized and passed through without application of all defined filtering rules. Stateful inspection runs automatically on the AP. The rest of this section describes how to view and manage filters.

Filters are organized in groups, called [Filter Lists](#). A filter list allows you to apply a uniform set of filters to [SSIDs](#) or [Groups](#) very easily. Similarly, you can use a custom Application Control list to create a set of applications that are handled as a group for convenience when creating filters.

The read-only Filters window provides you with an overview of all filter lists and Application Control lists that have been defined for this AP, and the filters that have been created in each list. Filters are listed in the left side column by name

under the filter list to which they belong. Each filter entry is a link that takes you to its [Filter Management](#) entry, and the list includes information about the type of filter, the protocol it is filtering, which port it applies to, source and destination addresses, and QoS and VLAN assignments.

Filter Lists

This window allows you to create filter lists and custom Application Control lists. These lists offer you ease of management of groups of filters and applications. The AP comes with one predefined filter list, named **Global**, which cannot be deleted. Filter lists (including Global) may be applied to [SSIDs](#) or to [Groups](#). Only one filter list at a time may be applied to a group or SSID (although the filter list may contain a number of filters). All filters are created within filter lists.

Use a custom Application Control list to create a set of applications that may then be handled as a group when creating filters. Thus, one filter can apply to an entire group of applications. This keeps the number of filters down and makes them much easier to manage. For example, you can include BitTorrent, Netflix, and Fox Sports in an Application Control list, and then create a single filter to block all three during business hours.

Stateful Filtering: Enabled Disabled

Application Control: Enabled Disabled

Filter Lists

Filter List	On	Filters	SSIDs	User Groups	Delete
FiltersAppCtl	<input type="checkbox"/>	5			Delete
Global	<input type="checkbox"/>	1	all	all	

Create

Application Control Lists

List Name: Applications

ApDnload: 24/7 Media BigUpload Bittorrent Apply Reset Remove

Apps1: ESPN Etsy Facebook FOX Sports Apply Reset Remove

Create New List: Enter new List Name

Figure 190. Filter Lists

Procedure for Managing Filter Lists

1. **Stateful Filtering:** Stateful operation of the integrated firewall can be **Enabled** or **Disabled**. If you have a large number of filters and you don't want to apply them in a stateful manner, you may use this option to turn the firewall off.
2. **Application Control:** Operation of the Application Control feature may be **Enabled** or **Disabled**. See ["Application Control Windows"](#) on page 150.

*The Application Control feature is only available if the AP license includes **Application Control**. If a setting is unavailable (grayed out), then your license does not support the feature. See ["About Licensing and Upgrades"](#) on page 412.*

Filter Lists

3. **New Filter List Name:** Enter a name for the new filter list in this field, then click on the Create button to create the list. All new filters are disabled when they are created. The new filter list is added to the Filter List table in the window. Click on the filter list name, and you will be taken to the [Filter Management](#) window for that filter list. You may create up to 16 filter lists (up to 8 on the XR-500 Series).
4. **On:** Check this box to enable this filter list, or leave it blank to disable the list. If the list is disabled, you may still add filters to it or modify it, but none of the filters will be applied to data traffic.
5. **Filters:** This read-only field displays the number of filters that belong to this filter list.
6. **SSIDs:** This read-only field lists the [SSIDs](#) that use this filter list.
7. **User Groups:** This read-only field lists the [Groups](#) that use this filter list.
8. **Delete:** Click this button to delete this filter list. The **Global** filter list may not be deleted.

Custom Application Control List

9. **Create New List:** Enter a name for the new Application Control list in this field, followed by the ENTER key. The new list is added to the Application Control Lists table, and this list may be used to create filters. You may create up to 15 lists (on the XR-520, the limits are reduced to 8 lists and 125 applications per list).

Click in the field for the new Application Control list to display a list of applications. Add the desired applications to this list, one at a time. Up to 250 applications may be added. This field also provides a search feature—type in a string, and the list will display only the choices whose names contain that string in any position. Click the **Apply** button on the right when done adding applications to this list.

Click **Reset** if you want to remove all of the entries from this field, i.e., to empty it. Click **Remove** to delete this Application Control list. You may use **Reset All Lists** on the bottom to delete all lists.

10. Click the **Save** button  if you wish to make your changes permanent.
11. Click a filter list to go to the [Filter Management](#) window to create and manage the filters that belong to this list.

Filter Management

This window allows you to create and manage filters that belong to a selected filter list, based on the filter criteria you specify. Filters are an especially powerful feature when combined with the intelligence provided by the “Application Control Windows” on page 150.

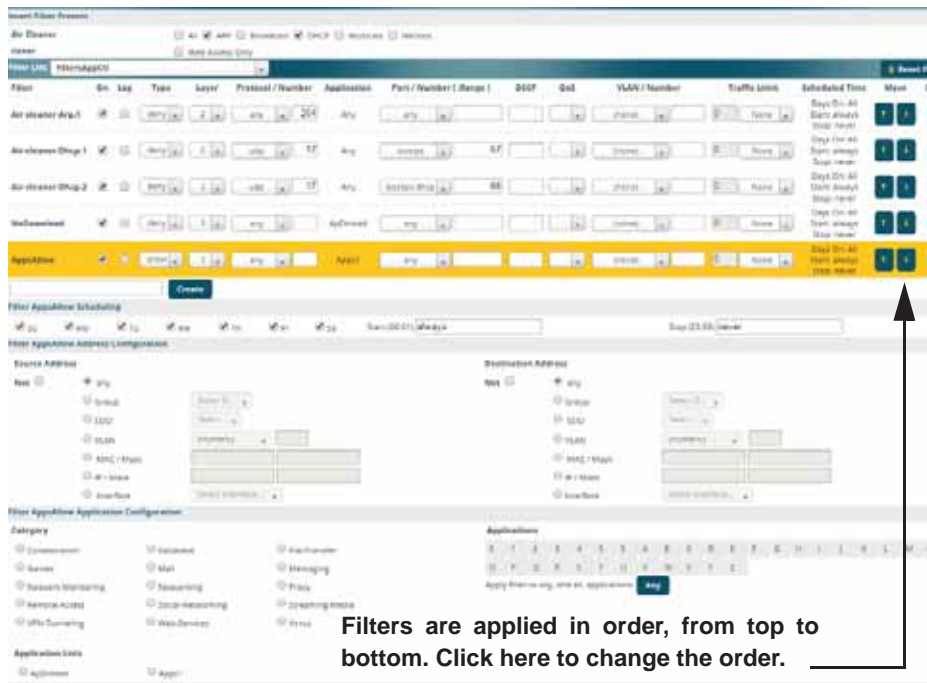

Figure 191. Filter Management

Based on Application Control’s analysis of your wireless traffic, you can create filters to enhance wireless usage for your business needs:

- Usage of non-productive and risky applications like BitTorrent can be restricted.
- Traffic for mission-critical applications like VoIP and WebEx may be given higher priority (QoS).

- Non-critical traffic from applications like YouTube may be given lower priority (QoS) or bandwidth allowed may be capped per station or for all stations.
- Traffic flows for specific applications may be controlled by sending them into VLANs that are designated for that type of traffic.
- Filters may be applied at specified times—for example, no games allowed from 8 AM to 6 PM.

Note that filtering is secondary to the stateful inspection performed by the integrated firewall. Traffic for established connections is passed through without the application of these filtering rules.

Procedure for Managing Filters

1. **Insert Filter Presets:** A number of predefined “Air Cleaner” filters are available using these buttons. You can use these rules to eliminate a great deal of unnecessary wireless traffic, resulting in improved performance. **Web Access Only** may be selected to allow only web access protocols to be used. For more information, please see [“Air Cleaner” on page 468](#). When you select one of the filter presets, the appropriate filters will be added to the list, so that you can see exactly what settings have been used.
2. **Filter List:** Select the filter list to display and manage on this window. All of the filters already defined for this list are shown, and you may create additional filters for this list. You may create up to 50 filters per list (up to 25 per list on the XR-500 Series).
3. **Add a New Filter:** To add a new filter, enter its name in the field next to the **Create** button at the bottom of the filter list, then click **Create**. All new filters are added to the table of filters in the window. The filter name must be unique within the list, but it may have the same name as a filter in a different filter list. Two filters with the same name in different filter lists will be completely unrelated to each other—they may be defined with different parameter values.

Viewing or modifying existing filter entries:

4. **Filter:** Select a filter entry if you wish to modify it. Source and destination details are displayed below the bottom of the list.
5. **On:** Use this field to enable or disable this filter.
6. **Log:** Log usage of this filter to Syslog.
7. **Type:** Choose whether this filter will be an **Allow** filter or a **Deny** filter. If you define the filter as an Allow filter, then any traffic that meets the filter criteria will be allowed. If you define the filter as a Deny filter, any traffic that meets the filter criteria will be denied.
8. **Layer:** Select network layer 2 or 3 for operation of this filter.
9. **Protocol/Number:** Choose a specific filter protocol from the pull-down list, or choose **numeric** and enter a **Number**, or choose **any** to instruct the AP to use the best filter. This is a match criterion.
10. **Application:** Shows an application to filter, based on settings from [Step 22](#) and [Step 23](#). If an application has been selected, you should not enter **Protocol** or **Port**—application filters have intelligence built into them, and perform filtering that you cannot accomplish with just port and protocol. See [“Application Control Windows” on page 150](#).
11. **Port/Number:** This is a match criterion. From the pull-down list, choose the target port type for this filter. Choose **any** to instruct the AP to apply the filter to any port, or choose **1-65534** and enter a **Number**.

To enter a **Range** of port numbers, separate the start and end numbers with a colon as shown: **Start # : End #**.

12. **DSCP:** Differentiated Services Code Point or DiffServ (DSCP) —Optional. Set packets ingressing from the wireless network that match the filter criteria to this DSCP level (0 to 63) before sending them out on the wired network. Select the level from the pull-down list. Level 0 has the lowest priority; level 63 has the highest priority. By default, this field is blank and the filter does not modify DSCP level. See [“Understanding QoS Priority on the Wireless AP” on page 271](#).

- 
13. **QoS:** (Optional) Set packets ingressing from the wired network that match the filter criteria to this QoS level (0 to 3) before sending them out on the wireless network. Select the level from the pull-down list. Level 0 has the lowest priority; level 3 has the highest priority. By default, this field is blank and the filter does not modify QoS level. See [“Understanding QoS Priority on the Wireless AP”](#) on page 271.
 14. **VLAN/Number:** (Optional) Set packets that match the filter criteria to this VLAN. Select a VLAN from the pull-down list, or select **numeric** and enter the number of a previously defined VLAN (see [“VLANs”](#) on page 213).
 15. **Traffic Limit:** Instead of simply allowing the specified traffic type, you may cap the amount of traffic allowed that matches this filter. First choose the units for the limit: kbps for all stations in total or per station, or packets per second (pps) for all stations in total or per station. Then enter the numeric limit in the field to the left.
 16. **Scheduled Time:** shows the times at which this filter is active, if you have established a schedule in [Step 19](#).
 17. **Move Up/Down:** The filters are applied in the order in which they are displayed in the list, with filters on the top applied first. To change an entry’s position in the list, just click its **Up** or **Down** button.
 18. To delete a filter, click its **Delete** button.

Select an existing filter entry in the list to view or modify **Scheduling** or **Address Configuration**, shown below the list of filters:

19. **Scheduling:** Use these fields if you wish to specify a scheduled time for this filter to be active. Check the checkboxes for the days that the filter is to be active. By default, the filter is active all day on each selected day. You may also specify a time of day for the filter to be active by entering a **Start** and **Stop** time in 24:00 hour format (i.e., 6:30 PM is 18:30). To use this feature, you must enter both a Start and a Stop time.

You cannot apply one filter for two or more scheduled periods, but you can create two filters to achieve that. For example, one filter could deny

the category Games from 9:00 to 12:00, and another could deny them from 13:00 to 18:00. Similarly, you might create two rules for different days—one to deny Games Mon-Fri 8:00 to 18:00, and another to deny them on Sat. from 8:00 to 12:00.

- 20. **Source Address:** Define a source address to match as a filter criterion. Click the radio button for the desired type of address (or other attribute) to match. Then specify the value to match in the field to the right of the button. Choose **Any** to use any source address. Check **Not** to match any address except for the specified address.
- 21. **Destination Address:** Define a destination address to match as a filter criterion. Click the radio button for the desired type of address (or other attribute) to match. Then specify the value to match in the field to the right of the button. Choose **any** to use any destination address. Check **Not** to match any address except for the specified address.

Below the Source and Destination Addresses, you may enter a **Category** or an **Application** or an **Application List** to be matched by the filter:

- 22. **Category:** If you wish this filter to apply to a particular category of application, such as **File-Transfer** or **Database**, select it from the listed options.

Figure 192. Filter Category or Application

- 23. **Applications:** If you wish this filter to apply to a specific application, such as **WebEx**, click the letter or number that it starts with. Then select the desired application. You may select a **Category** or an **Application**, but not both.

24. **Application Lists:** If you wish this filter to apply to a previously configured [Custom Application Control List](#), select the desired list. You may not select a **Category** or an **Application** in addition to the list.
25. Click the **Save** button  if you wish to make your changes permanent.

[VLANs](#)

Clusters

An XR-500 or XR-1000 Series AP cannot act as the Cluster controller. It will operate correctly as a member of a cluster.

Clusters allow you to configure multiple APs at the same time. Using WMI (or CLI), you may define a set of APs that are members of the cluster. Then you may enter Cluster mode for a selected cluster, which sends all successive configuration commands issued via CLI or WMI to all of the member APs. When you exit cluster mode, configuration commands revert to applying only to the AP to which you are connected.

The Clusters window displays a summary of defined clusters and members.

Cluster	Member	IP Address	User	Password
main	CafeteriaAP	192.168.1.86	admin	*****

Figure 193. Clusters

Clusters are discussed in the following topics:

- **Cluster Management**

Cluster Management

An XR-500 or XR-1000 Series AP cannot act as the Cluster controller. It will operate correctly as a member of a cluster.

Clusters are displayed and managed in the single Cluster Management window. This window allows new clusters to be created and APs to be added or removed from clusters.

The Clusters window provides you with an overview of all clusters that have been defined for this AP, and the APs that have been added to each. Clusters are listed and cluster members may be displayed by expanding a cluster entry. Each AP entry displays its IP Address, Username, and Password. All existing clusters

are shown, along with the number of APs currently in each. Up to 16 clusters may be created, with up to 50 APs in each.

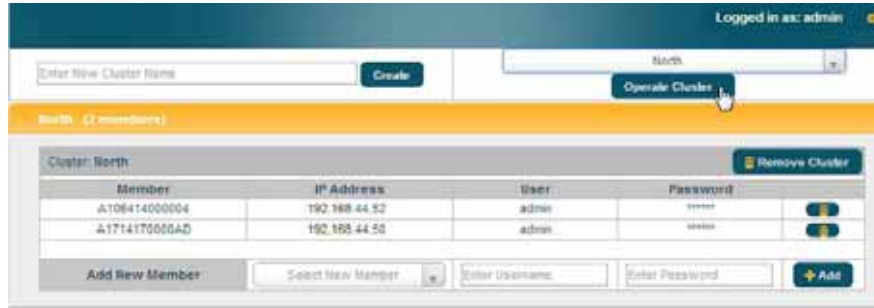

Figure 194. Cluster Management

Procedure for Managing Cluster Definition

1. **New Cluster Name:** Enter a name for the new cluster in the field to the left of the **Create** button, then click **Create** to add this entry. The new cluster is added to the list in the window.
2. **Delete:** To delete a cluster, expand the entry for the cluster and click its **Remove Cluster** button.
3. Click the **Save** button  if you wish to make your changes permanent.
4. Expand the entry for a cluster to add or remove APs in the cluster.

Note that the AP on which you are currently running WMI is not automatically a member of the cluster. If you would like it to be a member, you must add it explicitly.

Procedure for Managing Clusters

1. **Edit Cluster:** Expand the entry for the cluster to be managed. All of the APs already defined for this cluster are shown, and you may add additional APs to this list.
2. **Add New Member:** Select a new cluster member from the **Select New Member** drop-down list. This list shows Arrays/APs that are accessible to this AP for management purposes.
3. **User/Password:** In these columns, enter the administrator name and password for access to the AP.
4. Click the **+Add** button to enter the AP.
5. To delete an AP, click its  button.
6. Click the **Save** button  if you wish to make your changes permanent.

In Cluster Mode, all configuration operations that you execute in WMI or CLI are performed on the members of the cluster. They are **not** performed on the AP where you are running WMI, unless it is a member of the cluster.

You must use the **Save** button  at the top of configuration windows to permanently save your changes in Cluster Mode, just as you would in normal operation. When you are done configuring APs in the cluster, return to this window and click the  button to leave Cluster Mode.

Procedure for Operating in Cluster Mode

1. **Operate:** Select a defined cluster from the menu to the left of the **Operate Cluster** button and then click on the **Operate Cluster** button.
2. Select a WMI page for settings that you wish to configure for the cluster, and proceed to make the desired changes.
3. Proceed to any additional pages where you wish to make changes.

Wireless Access Point

You may terminate cluster mode operation by clicking the  button to the right of the row.

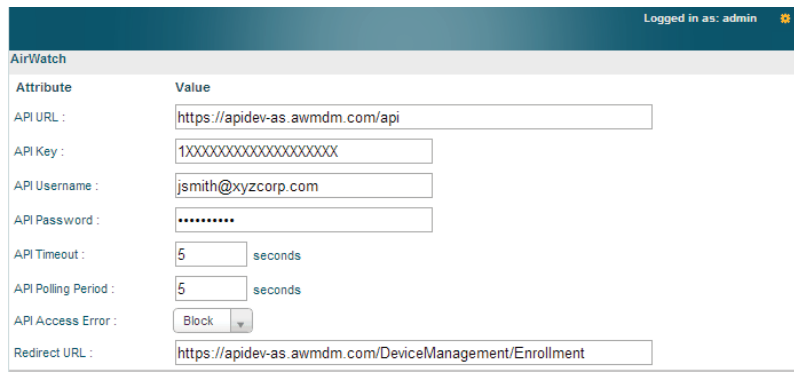

Mobile

Mobile Device Management (MDM) servers enable you to manage large-scale deployments of mobile devices. They may include capabilities to handle tasks such as enrolling devices in your environment, configuring and updating device settings over-the-air, enforcing security policies and compliance, securing mobile access to your resources, and remotely locking and wiping managed devices.

Xirrus APs support the AirWatch MDM, using an AirWatch API call to determine the status of a user's device and allow access to the wireless network only if the device is enrolled and compliant with the policies of the service.

AirWatch

Individual SSIDs may be configured to require AirWatch enrollment and compliance before a mobile device such as a smartphone or tablet is admitted to the wireless network. The AP uses the AirWatch API with the settings below to request that AirWatch check whether the mobile device is enrolled and compliant with your wireless policies.

Attribute	Value
API URL :	https://apidev-as.awmdm.com/api
API Key :	1XXXXXXXXXXXXXXXXXXXXX
API Username :	jsmith@xyzcorp.com
API Password :	*****
API Timeout :	5 seconds
API Polling Period :	5 seconds
API Access Error :	Block
Redirect URL :	https://apidev-as.awmdm.com/DeviceManagement/Enrollment

Figure 196. AirWatch Settings

Before configuring AirWatch settings on the AP, you must have an AirWatch account, already set up with your organization's compliance policies and other configuration as required by AirWatch.

The AP settings entered on this page are mostly taken from AirWatch. Once you have entered these settings, your users will be constrained to follow a set of steps to access the wireless network, as described in [“User Procedure for Wireless Access” on page 408](#).

Procedure for Managing AirWatch

If you have configured the **Mobile Device Management** setting on one or more SSIDs to use **AirWatch**, then the API specified below will be used to determine the admissibility of a mobile device requesting a connection to the wireless network.

1. **API URL:** Obtain this from your AirWatch server’s **System / Advanced / Site URLs** page. Copy the **REST API URL** string into this field. This specifies the AirWatch API that the AP will call to determine the enrollment and compliance status of a mobile device attempting to connect to the AP. The steps that the user will need to take are described in [“User Procedure for Wireless Access” on page 408](#).
2. **API Key:** Obtain this from your AirWatch server. Go to the **System / Advanced / API / REST** page, **General** tab, and copy the **API Key** string into this field. The key is required for access to the API.
3. **API Username:** Enter the user name for your account on the AirWatch server.
4. **API Password:** Enter the password for your account on the AirWatch server.
5. **API Timeout:** (seconds) If AirWatch does not respond within this many seconds, the request fails.
6. **API Polling Period:** (seconds) Mobile device enrollment and compliance status will be checked via polling at this interval. Note that there may thus be a delay before the mobile device will be admitted.
7. **API Access Error:** Specify whether or not to allow access if AirWatch fails to respond. The default is to **Block** access.

- 
8. **Redirect URL:** Obtain this from your AirWatch server. Go to the **System / Advanced / Site URLs** page, and copy the **Enrollment URL** string into this field. When a mobile device that is not currently enrolled with AirWatch attempts to connect to the AP, the device displays a page directing the user to install the AirWatch agent and go to the AirWatch enrollment page. Note that Android devices will need another form of network access (i.e. cellular) to download the agent, since un-enrolled devices will not have access to download it via the AP. See [“User Procedure for Wireless Access” on page 408](#) for more details.
 9. You must configure the **Mobile Device Management** setting on one or more SSIDs to use **AirWatch**, as described in [Procedure for Managing SSIDs](#) (see [Step 17 on page 283](#)).

User Procedure for Wireless Access

1. A user attempts to connect a mobile device to an SSID that uses AirWatch.
2. The device will authenticate according to the SSID’s authentication settings (Open, Radius MAC, 802.1x).
3. The user browses to any destination on the Internet.

The AP asks the user to wait while it checks device enrollment and compliance status by querying the AirWatch API with the device MAC address.

Device enrollment and compliance status will be checked via polling so there may be a delay before the device will be allowed in. That delay will depend on the API Polling Period setting.

4. If AirWatch responds that the device is enrolled and compliant, the device will be allowed into the network. The device will be considered compliant if AirWatch finds that the device does not violate any applicable policies for that device. (If no policies are assigned to the device in AirWatch, then the device is compliant by default.)

5. If the device is not enrolled, all user traffic will be blocked, except that HTTP traffic is redirected to an intermediate page on the AP that tells the user to download and install the AirWatch agent. The page displays a link to the AirWatch-provided device enrollment URL. This link is a pass-through that allows the user to go through the enrollment process. The user will need to enter your organization's AirWatch Group ID and individual account credentials when requested.

Once the agent is installed, the user must start again at [Step 1](#).

Android devices must go to the PlayStore to install the agent BEFORE they can go through the enrollment process. This means un-enrolled devices need another form of network access (i.e., cellular or an unrestricted SSID) to download this agent, as they are not permitted access to the PlayStore.

Once the agent is installed, the user must start again at [Step 1](#).

6. If the device is enrolled with AirWatch but not compliant with applicable policies, all traffic will be blocked as in [Step 5](#) above, and the HTTP traffic will be redirected to an intermediate page on the AP that tells the user which policies are out of compliance.

This page contains a button for the user to click when the compliance issues have been corrected. This button causes AirWatch to again check device compliance. The user's browser is redirected to a "wait" page until the AP has confirmed compliance with AirWatch. The user's browser is then redirected to a page announcing that the device is now allowed network access.

If the AP is unable to access AirWatch to obtain enrollment and compliance status (for example, due to bad credentials, timeout, etc.), device access to the network will be granted according to the **API Access Error** setting (**Allow** or **Block**). If this field is set to **Block**, traffic will be blocked as in [Step 5](#) above and HTTP traffic will be redirected to an informational page that informs the user that AirWatch cannot be contacted at this time and advises the user to contact the network administrator. If this field is set to **Allow**, then the device will be allowed network access.

Using Tools on the Wireless AP

These WMI windows allow you to perform administrative tasks on your AP, such as upgrading software, rebooting, uploading and downloading configuration files, and other utility tasks. Tools are described in the following sections:

- **“System Tools” on page 412**
- **“CLI” on page 426**
- **“API Documentation” on page 428**
- **“Options” on page 433**
- **“Logout” on page 434**

*If you have added modular IAPs to your AP, note that its model number will be automatically adjusted to reflect the count and types of IAPs currently installed. See **Upgrading with 802.11ac radio modules**.*

This section does not discuss using status or configuration windows. For information on those windows, please see:

- **“Viewing Status on the Wireless AP” on page 95**
- **“Configuring the Wireless AP” on page 161**

STATUS

← Status is shown here

Figure 197. System Tools

This window allows you to manage files for software images, configuration, and Web Page Redirect (WPR), manage the system’s configuration parameters, reboot the system, and use diagnostic tools. The page contains a number of sections that you may expand.

About Licensing and Upgrades

If you are a customer using XMS, when you upgrade an AP using XMS, your license will automatically be updated for you first.

The AP’s license determines some of the features that are available on the AP. For example, the Application Control feature is an option that must be separately licensed. To check the features supported by your license, see [“Access Point Information” on page 102](#).

When upgrading the AP for a new major release, the AP needs the new license key that enables the operation of that release before upgrading. If you do not obtain the new license first, the AP will display a message and revert to the previous software image, rather than trying to run new software for which it is not licensed. Major releases will need a new license key, but minor releases will not. For example, to upgrade from ArrayOS Release 7.0.5 to Release 7.1, you must enter a new license key. To upgrade from ArrayOS Release 7.0.1 to Release 7.0.3, use your existing license key.

If you are not using XMS to perform a software upgrade, you may use the **Auto-provisioning Start** button to get an updated license from Xirrus before performing an upgrade. See [“Configuration Management” on page 417](#).

If you will be entering license keys and performing upgrades on many APs, the effort will be streamlined by using the Xirrus Management System (XMS), especially if you are using XMS Cloud.

Procedure for Configuring System Tools

These tools are broken down into the following sections:

- [System](#)
- [Remote Boot Services](#)
- [Configuration Management](#)
- [Diagnostics](#)
- [Application Control Signature File Management](#)
- [Web Page Redirect \(Captive Portal\)](#)
- [Network Tools](#)
- [Progress Bar and Status Frame](#)

System

Note that the top line of this section shows the current software version running on the AP. See [Figure 197](#).

1. License Key

If you are a customer using XMS-Cloud, your license will be updated for you automatically; with other XMS versions, you can easily upgrade all members of a profile network to a new ArrayOS release, including updating license keys.

If you need an updated license (for example, if you are upgrading an AP to a new major release—say, from 7.0 to 7.1, and you are not using XMS to perform network-wide updates), you may obtain one through **Auto-provisioning**. See [“Configuration Management” on page 417](#).

If you need to enter a new license key manually, use the **License Key** field to enter it, then click the **Apply** button to the right.

A valid license is required for AP operation, and it controls the features available on the AP. If you upgrade your AP for additional features, you will be provided with a license key to activate those capabilities.

A license update will automatically save a copy of the current configuration of the AP. See [Step 3 on page 418](#).

If you attempt to enter an invalid key, you will receive an error message and the current key will not be replaced.

Trial licenses: If you enter a trial license to try new premium features, then when the trial expires the perpetual license will be restored automatically without requiring a reboot. When the trial expires, the current AP configuration will not be lost.

Operating System Software Upload: This feature upgrades the ArrayOS to a newer version provided by Xirrus. **Please note that you typically will need an updated license key to cover the upgrade’s features before clicking the Upgrade button.** For customers using XMS-Cloud, your

license will be updated for you automatically; with other XMS versions, you can easily upgrade all members of a profile network to a new ArrayOS release. See [“About Licensing and Upgrades” on page 412](#) for details. Click the **Choose File** button to locate the software upgrade file, then click on the **Upload** button to upload the new file to the AP. Progress of the operation will be displayed in a progress bar. Completion status of the operation is shown in the **Status** section.

This operation does not run the new software or change any configured values. The existing software continues to run on the AP until you reboot, at which time the uploaded software will be used. An upgrade will, however, automatically save a copy of the current configuration of the AP. See [Step 3 on page 418](#).

If you have difficulty upgrading the AP using the WMI, see [“Upgrading the AP Using the Boot Loader” on page 537](#) for a lower-level procedure you may use.

*Software Upgrade always uploads the file in binary mode. If you transfer any image file to your computer to have it available for the Software Upgrade command, it is **critical** to remember to transfer it (ftp, tftp) in **binary mode!***

- 2. Active Software Image:** Use the **Set Active Image** drop-down list to display all of the software versions that are on your AP. Select the version from the list that you would like to become the active version the next time that you reboot.
- 3. Remove a Software Image:** Use the **Set Image to remove** drop-down list to display all of the software versions that are on your AP. Select a version from the list to remove it. *Note that there is no Apply button for this—the image is removed with no further action on your part.*
- 4. Save & Reboot or Reboot:** Use **Save & Reboot** to save the current configuration and then reboot the AP. The AP will reboot using the software version that you have selected in **Active Software Image**, above. The LEDs on the AP indicate the progress of the reboot, as described in [“Powering Up the Wireless AP” on page 72](#). Alternatively, use the **Reboot**

button to discard any configuration changes which have not been saved since the last reboot. You may specify an optional **Delay** period in seconds to wait before the reboot starts.

Remote Boot Services

(Automatic updates from remote image or configuration file)

Remote Boot Services	
Remote TFTP Server:	<input type="text"/>
Remote Boot Image:	<input type="text"/>
Remote Configuration:	<input type="text"/>

Figure 198. Remote Boot Services

The AP software image or configuration file can be downloaded from an external server. In large deployments, all APs can be pointed to one TFTP server instead of explicitly initiating software image uploads to all APs. When the AP boots, the AP will download the software image from the specified TFTP server. Similarly, if you decide to change a setting in the APs, you can simply modify a single configuration file. After the APs are rebooted, they will automatically download the new configuration file from a single location on the specified TFTP server.

- 1. Remote TFTP Server:** This field defines the path to a TFTP server to be used for automated remote update of software image and configuration files when rebooting. You may specify the server using an IP address or host name.
- 2. Remote Boot Image:** When the AP boots up, it fetches the software image file specified here from the TFTP server defined above, and upgrades to this image before booting. This must be an AP image file with a **.bin** extension.

Make sure to place the file on the TFTP server. If you disable the remote boot image (by blanking out this field) or if the image can't be transferred, the AP will fall back to booting whatever image is on the compact flash.

The Remote Boot Image or Remote Configuration update happens every time that the AP reboots. If you only want to fetch the remote image or configuration file one time, be sure to turn off the remote option (blank out the field on the System Tools page) after the initial download. When a remote boot image is used, the image is transferred directly into memory and is never written to the compact flash.

- 3. **Remote Configuration:** When the AP boots up, it fetches the specified configuration file from the TFTP server defined above, and applies this configuration **after** the local configuration is applied. The remote configuration must be an AP configuration file with a **.conf** extension. Make sure to place the file on the TFTP server.

A partial configuration file may be used. For instance, if you wish to use a single configuration file for all of your APs but don't want to have the same IP address for each AP, you may remove the **ipaddr** line from the file. You can then load the file on each AP and the local IP addresses will not change.

A remote configuration is never saved to the compact flash unless you issue a Save command.

Configuration Management

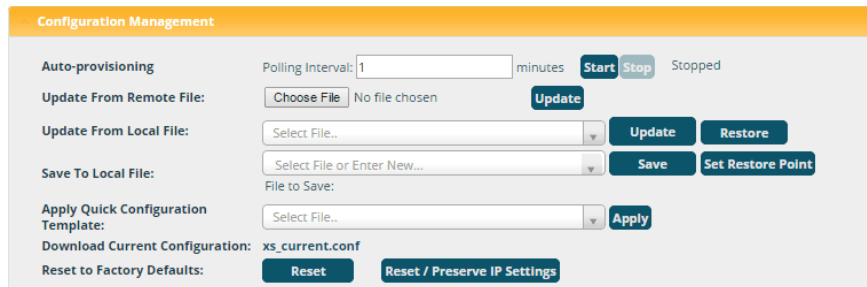

Figure 199. Configuration Management

- 1. If you need an updated license (for example, if you are upgrading an AP to a new major release—say, from 7.0 to 7.1, and you are not using XMS to

perform network-wide updates), you may obtain one through **Auto-provisioning**. Click the **Start** button, and the AP will contact the Xirrus server with its serial number and MAC address to obtain and install its latest license. If the AP is unable to access the activation server, it will continue to attempt to contact the server at intervals specified by the **Polling Interval** (the default value is one minute). Click the **Stop** button if you wish to stop contacting the server.

2. **Update from Remote File:** This field allows you to define the path to a configuration file (one that you previously saved—see [Step 4](#) and [Step 6](#) below). Click on the **Browse** button if you need to browse for the location of the file, then click **Update** to update your configuration settings.
3. **Update from Local File:** This field updates AP settings from a local configuration file on the AP. Select one of the following files from the drop-down list:

- **factory.conf:** The factory default settings.
- **lastboot.conf:** The setting values from just before the last reboot.
- **saved.conf:** The last settings that were explicitly saved using the **Save** button  at the top of each window.
- **history/saved-yyyymmdd-pre-update.conf:**
history/saved-yyyymmdd-post-update.conf:

Two files are automatically saved for a software upgrade or for a license change (including the setting values from just before the upgrade/change was performed, and the initial values afterward. The filename includes the date.

- **history/saved-yyyymmdd-auto.conf:** Each time you use the **Save** button, an “auto” file is saved with the settings current at that time.
- **history/saved-yyyymmdd-pre-reset.conf:**
history/saved-yyyymmdd-post-reset.conf:

Each time you use one of the **Reset to Factory Default** buttons, two files are saved: the setting values from just before the reset, and the initial values afterward. The filename includes the reset date.

- **history/saved-yyyyymmdd-hhmm.conf:** The setting values that were explicitly saved using the **Set Restore Point** button (see [Step 4](#) below).

Click **Update** to update your configuration settings by appending to the current AP configuration. Click **Restore** to replace the AP configuration with the configuration file selected.

Note that the History folder allows a maximum of 16 files. The oldest file is automatically deleted to make room for each new file.

4. **Save to Local File:** There are a few options for explicitly requesting the AP to save your current configuration to a file on the AP:
 - To view the list of configuration files currently on the AP, click the down arrow to the right of this field. If you wish to replace one of these files (i.e., save the current configuration under an existing file name), select the file, then click **Save**. Note that you cannot save to the file names **factory.conf**, **lastboot.conf**, and **saved.conf** - these files are write-protected.
 - You may enter the desired file name, then click **Save**.
 - Click **Set Restore Point** to save a copy of the current configuration, basing the file name on the current date and time. For example:

history/saved-20100318-1842.conf

Note that the configuration is automatically saved to a file in a few situations, as described in [Step 3](#) above.

***Important!** When you have initially configured your AP, or have made significant changes to its configuration, we strongly recommend that you save the configuration to a file in order to have a safe backup of your working configuration.*

5. **Apply Quick Configuration Template:** This offers predefined configuration options such as **Classroom** and **High-Density** that capture best practices from years of field experience. If one of the options in the drop-down list is appropriate to your deployment, select it and click

Apply. For example, the **High-Density** option uses best practices to configure the AP for high density settings such as lecture halls, convention centers, stadiums, etc.

6. **Download Current Configuration:** Click on the link titled `xs_current.conf` to download the AP's current configuration settings to a file (that you can upload back to the AP at a later date). The system will prompt you for a destination for the file. The file will contain the AP's current configuration values.
7. **Reset to Factory Defaults:** Click on the **Reset/Preserve IP Settings** button to reset the system's current configuration settings to the factory default values, *except for the AP's management IP address which is left unchanged*. This function allows you to maintain management connectivity to the AP even after the reset. This will retain the Gigabit Ethernet port's IP address (see ["Interfaces" on page 170](#)), or if you have configured management over a VLAN it will maintain the management VLAN's IP address (see ["VLAN Management" on page 216](#)). *All other previous configuration settings will be lost.*

Click **Reset** to reset all of the system's current configuration settings to the factory default values, including the management IP address—*all previous configuration settings will be lost*. The AP's Gigabit Ethernet ports default to using DHCP to obtain an IP address.

If the IP settings change, the connection to the WMI may be lost.

Diagnostics

- 8. Diagnostic Log:** Click the **Create** button to update the AP information for use by Xirrus Customer Support personnel. The name of the log file ends with `diagnostic.log`, and may have an additional prefix. (Figure 200)

Figure 200. Saving the Diagnostic Log

This feature is only used at the request of Customer Support. It saves all of the information regarding your AP, including status, configuration, statistics, log files, and recently performed actions.

The diagnostic log is always saved on your `C:\` drive, so you should immediately rename the file to save it. This way, it will not be lost the next time you save a diagnostic log. Often, Customer Support will instruct you to save two diagnostic logs about ten minutes apart so that they can examine the difference in statistics between the two snapshots (for example, to see traffic and error statistics for the interval). Thus, you must rename the first diagnostic log file.

All passwords are stored on the AP in an encrypted form and will not be exposed in the diagnostic log.

- 9. Health Log:** This file is created automatically, but only if the AP encounters unexpected and serious problems. Normally this file will not exist. The Diagnostic Log **Update** button has no effect on this file whatsoever. When a health log exists, the filename `xs_health.log.bz2` is displayed in blue and provides a link to the log file. Click the link to download this file or to open it with your choice of application. This file is normally only used at the request of Customer Support.

- 10. Archiving Log:** This log saves internal status information that may be needed by Xirrus Customer Support personnel. Click the **Start** button to start accumulating this information. The size of the file is self-limiting so that you do not need to be concerned about it consuming too much storage space. Click the **Stop** button to stop accumulating data and make it available in a tar file, named `engineeringlogs_<hostname>.tar`. A link to this tar file appears. Click it to download the file. If you wish to click the **Start** button again to accumulate data for a later time interval, you should first download and rename the current file before it gets overwritten.

You may use the **Clear** button to remove the tar file and all temporary data from the AP's memory.

This feature should only be used at the request of Customer Support.

Application Control Signature File Management

Application Control recognizes applications using a file containing the signatures of hundreds of applications. This file may be updated regularly to keep up as Internet usage evolves over time. The latest signature file is available from the same location that you use to download the latest ArrayOS release: [ArrayOS - XR Platform Latest Release](#). Note that new ArrayOS releases will automatically contain the latest signature file available at the time of the build.

See “[Application Control Windows](#)” on page 150 for more information about using Application Control.

Application Control Signature File	
Upload Signature File:	Choose File No file chosen Upload
Active Signature File:	unknown
Manage Signature Files:	No custom DPI signature files have been uploaded.

Figure 201. Managing Application Control Signature files

- 11. Upload Signature File:** First, download the latest signature file from the Xirrus Customer Support site: [ArrayOS - XR Platform Latest Release](#) to your file system. Click the **Browse** button, then browse to locate the new signature file. Click the **Upload** button when it appears. The new file will be uploaded to the AP and will be used for identifying applications. **You must turn Application Control off and back on again** on the Filter Lists page to make the new signature file take effect. See [“Filter Lists” on page 392](#). No reboot is required.

Active Signature File shows which file is currently being used by Application Control. If you have installed any custom DPI signature files, you may use **Manage Signature Files**.

Web Page Redirect (Captive Portal)

The AP uses a Perl script and a cascading style sheet to define the default splash/login Web page that the AP delivers for WPR. You may replace these files with files for one or more custom pages of your own. See [Step 14](#) below to view the default files. See [Step 15 page 283](#) for more information about WPR and how the splash/login page is used.

Each SSID that has WPR enabled may have its own page. Custom files for a specific SSID **must** be named based on the SSID name. For example, if the SSID is named **Public**, the default `wpr.pl` and `hs.css` files should be modified as desired and renamed to `wpr-Public.pl` and `hs-Public.css` before uploading to the AP. If you modify and upload files named `wpr.pl` and `hs.css`, they will replace the factory default files and will be used for any SSID that does not have its own custom files, per the naming convention just described. Be careful not to replace the default files unintentionally.

Figure 202. Managing WPR Splash/Login page files

12. **Upload File:** Use this to install files for your own custom WPR splash/login page (as described above) on the AP. Note that uploaded files are not immediately used - you must reboot the AP first. At that time, the AP looks for and uses these files, if found.

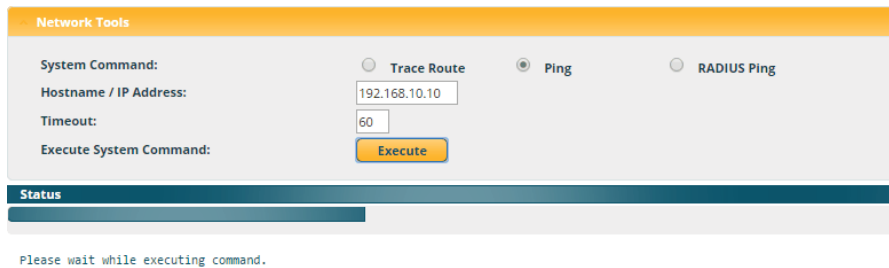

Click **Choose File** to locate the splash/login page files, then click on the **Upload** button to upload the new files to the AP. You must reboot to make your changes take effect.

13. **Remove File:** Enter the name of the WPR file you want to remove, then click on the **Delete** button. You can use the **List Files** button to show you a list of files that have been saved on the AP for WPR. The list is displayed in the **Status** section at the bottom of the WMI window. You must reboot to make your changes take effect.

14. **Download Sample Files:** Click on a link to access the corresponding sample WPR files:

- **wpr.pl**—a sample Perl script.
- **hs.css**—a sample cascading style sheet.

Network Tools

The screenshot shows a web interface titled "Network Tools". Under the "System Command:" section, there are three radio buttons: "Trace Route", "Ping" (which is selected), and "RADIUS Ping". Below these, there are two input fields: "Hostname / IP Address:" with the value "192.168.10.10" and "Timeout:" with the value "60". An "Execute System Command:" label is followed by an "Execute" button. Below this section is a "Status" section, which is currently empty. At the bottom of the interface, there is a message: "Please wait while executing command."

Figure 203. System Command (Ping)

15. **System Command:** Choose **Trace Route**, **Ping**, or **RADIUS Ping**. For Trace Route and Ping, fill in **IP Address** and **Timeout**. Then click the **Execute** button to run the command.

The RADIUS Ping command is a simple utility that tests connectivity to a RADIUS server by attempting to log in with the specified Username and Password. When using a RADIUS server, this command allows you to verify that the server configuration is correct and whether a particular Username and Password are set up properly. If a client is having trouble accessing the network, you can quickly determine if there is a basic RADIUS problem by using the RADIUS Ping tool. For example, in [Figure 204 \(A\)](#), RADIUS Ping is unable to contact the server. In [Figure 204 \(B\)](#), RADIUS Ping verifies that the host information and secret for a RADIUS server are correct, but that the user account information is not.

Select RADIUS allows you to select a RADIUS server that you have already configured. When you make a choice in this field, additional fields will be displayed. Set **Select RADIUS** to [External Radius](#), [Internal Radius](#), or a server specified for a particular SSID, or select **Other Server** to specify another server by entering its **Host** name or IP address, **Port**, and shared **Secret**.

Enter the **RADIUS Credentials: Username** and **Password**. Select the **Authentication Type**, **PAP** or **CHAP**. Click the **Execute** button to run the command. The message **Testing RADIUS connection** appears. Click **OK** to proceed.

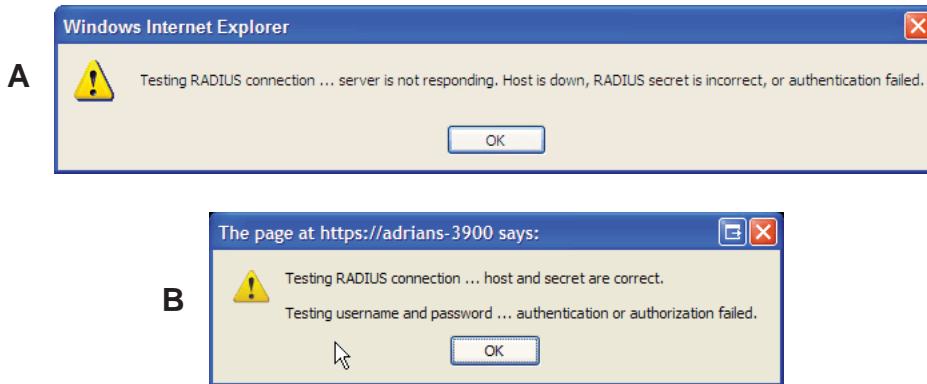

Figure 204. Radius Ping Output

16. **IP Address:** For Ping or Trace Route, enter the IP address of the target device.
17. **Timeout:** For Ping or Trace Route, enter a value (in seconds) before the action times out.
18. **Execute System Command:** Click **Execute** to start the specified command. Progress of command execution is displayed in the **Progress** frame. Results are displayed in the **Status** frame.

Progress Bar and Status Frame

The **Progress** bar is displayed for commands such as Software Upgrade and Ping. The **Status** frame presents the output from system commands (Ping and Trace Route), as well as other information, such as the results of software upgrade.

CLI

The WMI provides this window to allow you to use the AP's Command Line Interface (CLI). You can enter commands to configure the AP, or display information using show commands. You will not need to log in - you already logged in to the AP when you started the WMI.

```
factoryap# show ssid
SSID Summary Table
SSID Name      Authentication & Security

factoryap#
```

Figure 205. CLI Window

Wireless Access Point

To enter a command, simply type it in. The command is echoed and output is shown in the normal way—that is, the same way it would be if you were using the CLI directly. You may use the extra scroll bar inside the right edge of the window to scroll through your output. If output runs past the right edge of the screen, there is also a horizontal scroll bar at the bottom of the page.

This window has some minor differences, compared to direct use of the CLI via the console or an SSH connection:

- The CLI starts in **config** mode. All configuration and show commands are available in this mode. You can “drill down” the mode further in the usual way. For example, you can type **interface iap** to change the mode to **config-iap**. The prompt will indicate the current command mode, for example:

```
My-AP(config-iap) #
```
- You can abbreviate a command and it will be executed if you have typed enough of the command to be unambiguous. The command will not auto-complete, however. Only the abbreviated command that you actually typed will be shown. You can type a partial command and press Tab to have the command auto-complete. If the partial command is ambiguous a list of legal endings is displayed.
- Entering **quit** will return you to the previously viewed WMI page.
- Most, but not all, CLI commands can be run in this window. Specifically the **run-test** menu of commands is **not** available in this window. To use the run-test command, please connect using SSH and use CLI directly, or use the [System Tools](#) described in this chapter, such as Trace Route, Ping, and RADIUS Ping.

Help commands (the ? character) are available, either at the prompt or after you have typed part of a command.

API Documentation

APs provide an API interface conforming to the RESTful API model. Developers may use this read-only API to read status, statistics, and settings from the AP. The interactive API Documentation page provides documentation for the API.

You may use the AP's API for purposes such as integrating with third party applications or creating your own applications for network monitoring and analysis. Using the RESTful API eliminates the need to use CLI scripting, or to use SNMP which can be cumbersome for polling large amounts of data. Results are returned in JavaScript Object Notation (JSON) format, a text-based open standard designed for human-readable data interchange. The API documentation is tightly integrated with the server code. The API Documentation page allows you to interact with the API in a sandbox UI that gives clear insight into how the API responds to parameters and options.

Security for the API is provided with OAuth, as described in [“OAuth 2.0 Management” on page 265](#). Once registration is completed and a permanent token for this AP has been obtained, your application may access the RESTful API using the **client_id** and the **token** at the following URL:

```
https://[AP hostname or IP address]/api/v3/[api-name]
```

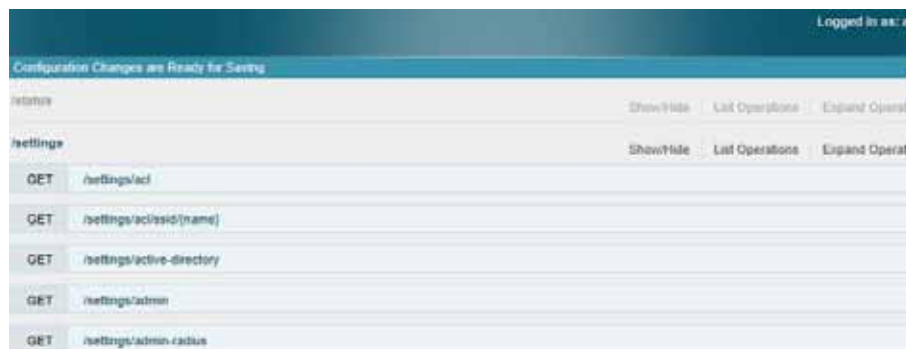

Figure 206. API Documentation

Wireless Access Point

The API Documentation page lists all of the APIs that are available, lists their calling parameters, if any, and allows you to perform sample calls and view sample output.

Status/Settings

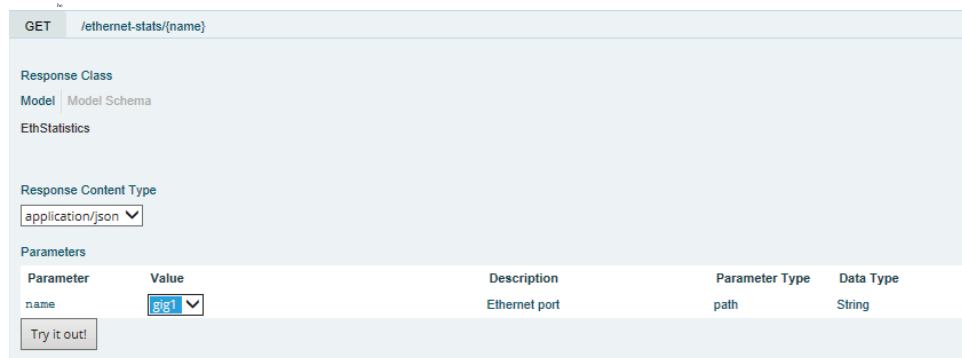

The RESTful API on the AP is broken into these two main headings: **status** and **settings**. Each is a node that may be clicked to expand or collapse the list of corresponding API requests available on the AP. Since this is a read-only API, the list consists exclusively of GET operations.

The figure below shows part of the list displayed by clicking **/settings**. Click again to collapse (hide) the list.

Status requests include **GET** requests for many of the status and statistics items described in the chapter titled, “[Viewing Status on the Wireless AP](#)” on page 95. **Settings** requests include **GET** requests for many of the settings described in the chapter titled, “[Configuring the Wireless AP](#)” on page 161

GET Requests

Each request name in the list is a link. Click it to see more information and to try the API and see its output.

GET /ethernet-stats/{name}

Response Class

Model | Model Schema

EthStatistics

Response Content Type

application/json

Parameters

Parameter	Value	Description	Parameter Type	Data Type
name	g0/1	Ethernet port	path	String

Try it out!

Figure 207. API — GET Request Details

The figure above shows the GET request for **ethernet-stats{name}**. Click again to collapse (hide) the API details.

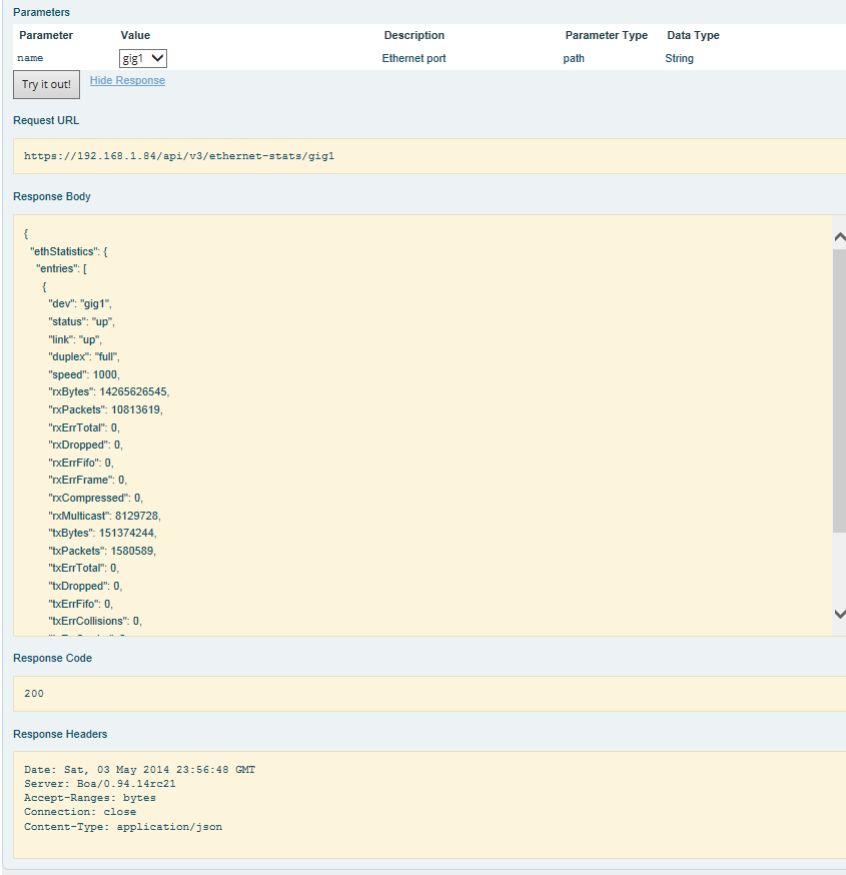

High-level details are shown, including the **Response Class** name and the **Response Content Type** (limited to JSON at this time).

Trying a GET Request

The **Try it out!** button allows you to send the GET request to the AP API and see its response. Developers can use this feature to design and implement applications that use this response.

Enter any necessary **Parameters** and click the **Try it out!** button. Most GET requests do not use any parameters. If they are required, their names will be listed and there will be a field or a drop-down list to specify each one. An example is shown in [Figure 207](#). In some cases, there may be two versions of a request, with and without parameters. For example, **GET /ethernet-stats/{name}** returns status and statistics for a particular Ethernet port, while **GET /ethernet-stats/** returns information for all Ethernet ports.

The screenshot displays an API tool interface with the following sections:

- Parameters:** A table with columns: Parameter, Value, Description, Parameter Type, Data Type. The 'name' parameter is set to 'gig1', with a description of 'Ethernet port', parameter type of 'path', and data type of 'String'. There are 'Try it out' and 'Hide Response' buttons.
- Request URL:** A text box containing the URL: `https://192.168.1.84/api/v3/ethernet-stats/gig1`.
- Response Body:** A large text area containing a JSON object. The JSON structure is:

```
{  "ethStatistics": {    "entries": [      {        "dev": "gig1",        "status": "up",        "link": "up",        "duplex": "full",        "speed": 1000,        "rxBytes": 14265626545,        "rxPackets": 10813619,        "rxErrTotal": 0,        "rxDropped": 0,        "rxErrFifo": 0,        "rxErrFrame": 0,        "rxCompressed": 0,        "rxMulticast": 6129728,        "txBytes": 151374244,        "txPackets": 1580589,        "txErrTotal": 0,        "txDropped": 0,        "txErrFifo": 0,        "txErrCollisions": 0,        "txCompressed": 0      }    ]  }}
```
- Response Code:** A text box showing the status code: `200`.
- Response Headers:** A text box showing the following headers: `Date: Sat, 03 May 2014 23:56:48 GMT`, `Server: Boa/0.94.14rc21`, `Accept-Ranges: bytes`, `Connection: close`, and `Content-Type: application/json`.

Figure 208. API — GET Request Response

The figure above shows the response for **ethernet-stats{name}**. The response is produced in the human-readable JSON format. The status and statistics data shown are as described in “[Viewing Status on the Wireless AP](#)” on page 95. Click **Hide Response** if you wish to hide the output.

The **Response Code** and the **Response Header** are standard for HTTP(S).

API Documentation Toolbar

Figure 209. API Documentation Toolbar

The Status and Settings sections each have a toolbar as shown above, offering the following options.

- **Show/Hide**—expands or collapses this list of GET requests. Hiding and then showing again displays the requests as they were before, i.e., expanded GET requests will still be expanded when displayed again.
- **List Operations**—expands this list of GET requests. Each individual entry is collapsed.
- **Expand Operations**—shows all of the GET requests in this list. Each individual entry is expanded.
- **Raw**—shows the source XML code for this list of GET requests. Click the link for the API Documentation page again to return to the normal display.

Options

This window allows you to customize the behavior of the WMI.

Figure 210. WMI Display Options

Procedure for Configuring Options

1. **Refresh Interval in Seconds:** Many of the windows in the Status section of the WMI have an Auto Refresh option. You may use this setting to change how often a status or statistics window is refreshed, if its auto refresh option is enabled. Enter the desired number of seconds between refreshes. The default refresh interval is 30 seconds.

Logout

Click on the Logout button to terminate your session. When the session is terminated, you are presented with the login window.

Figure 211. Login Window

The Command Line Interface

This section covers the commands and the command structure used by the AP's Command Line Interface (CLI), and provides a procedure for establishing an SSH connection to the AP. Topics discussed include:

- [“Establishing a Secure Shell \(SSH\) Connection” on page 435.](#)
- [“Getting Started with the CLI” on page 437.](#)
- [“Top Level Commands” on page 440.](#)
- [“Configuration Commands” on page 452.](#)
- [“Sample Configuration Tasks” on page 497.](#)

Some commands are only available if the AP's license includes appropriate features or if the AP model supports it. If a command is unavailable, an error message will notify you. See [“About Licensing and Upgrades” on page 412.](#)

See Also

[Zero-Touch Provisioning and Ongoing Management](#)
[Network Map](#)
[System Tools](#)

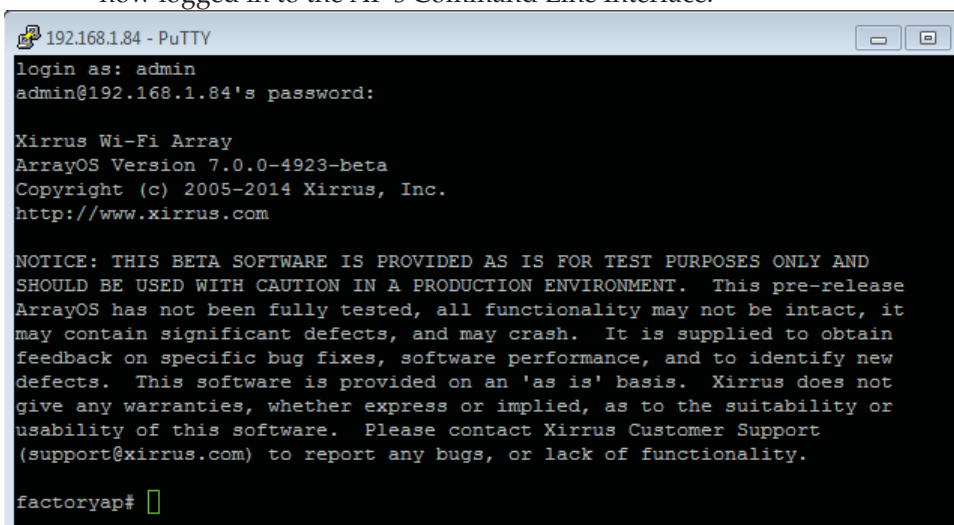

Establishing a Secure Shell (SSH) Connection

Use this procedure to initialize the system and log in to the Command Line Interface (CLI) via a Secure Shell (SSH) utility, such as PuTTY. When connecting to the unit's Command Line Interface over a network connection, you must use a Secure SHell version 2 (SSH-2) utility. Make sure that your SSH utility is set up to use SSH-2.

1. Start your SSH session and communicate with the AP via its IP address.
 - If the AP is connected to a network that uses DHCP, use the address assigned by DHCP. We recommend that you have the network

administrator assign a reserved address to the AP for ease of access in the future.

- If the network does not use DHCP, use the factory default address 10.0.2.1 to access either the Gigabit 1 or Gigabit 2 Ethernet port. You may need to change the IP address of the port on your computer that is connected to the AP—change that port’s IP address so that it is on the same 10.0.2.xx subnet as the AP port.
2. At the login prompt, enter your user name and password (the default for both is **admin**). Login names and passwords are case-sensitive. You are now logged in to the AP’s Command Line Interface.

```

factoryap#
```

Figure 212. Logging In

Getting Started with the CLI

The root command prompt (**Root Command Prompt**) is the first prompt you see after logging in to the CLI. If you are at a level other than the root command prompt you can return to this prompt at any time by using the **exit** command to step back through each command prompt level. The root command prompt you see in the CLI window is determined by the host name you assigned to your AP. The prompt **Xirrus_Wi-Fi_AP** is displayed throughout this document simply as a sample **host name** assigned to the AP. To terminate your session at any time, use the **quit** command.

Entering Commands

When typing commands, you need only type enough characters to uniquely specify the command. For example, you can type the abbreviated term **config** to access the configure prompt, or even simply type **c**, since no other top level command starts with “c”.

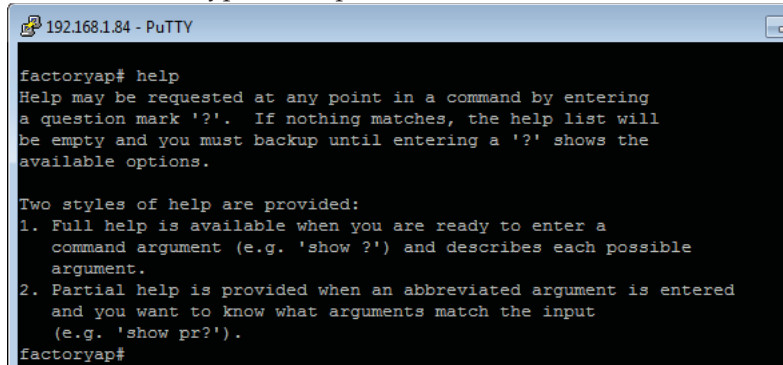

Getting Help

The CLI offers the following two levels of assistance:

- help Command

The **help** command is only available at the root command prompt. Initiating this command generates a window that provides information about the types of help that are available with the CLI.

```

factoryap# help
Help may be requested at any point in a command by entering
a question mark '?'. If nothing matches, the help list will
be empty and you must backup until entering a '?' shows the
available options.

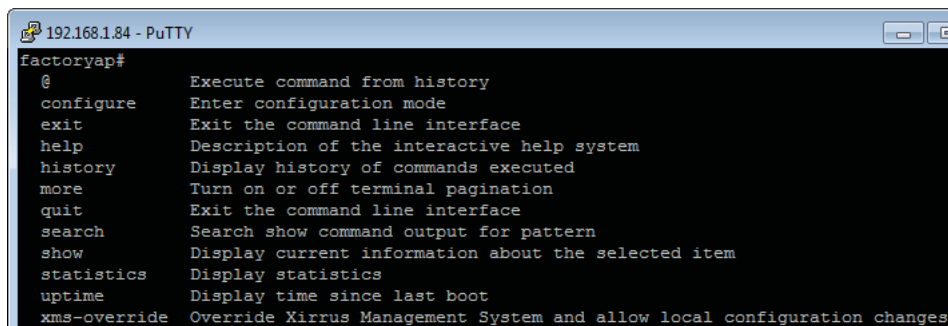

Two styles of help are provided:
1. Full help is available when you are ready to enter a
   command argument (e.g. 'show ?') and describes each possible
   argument.
2. Partial help is provided when an abbreviated argument is entered
   and you want to know what arguments match the input
   (e.g. 'show pr?').
factoryap#

```

Figure 213. Help Window

- ? Command

This command is available at any prompt and provides either FULL or PARTIAL help. Using the ? (question mark) command when you are ready to enter an argument will display all the possible arguments (full help). Partial help is provided when you enter an abbreviated argument and you want to know what arguments will match your input.

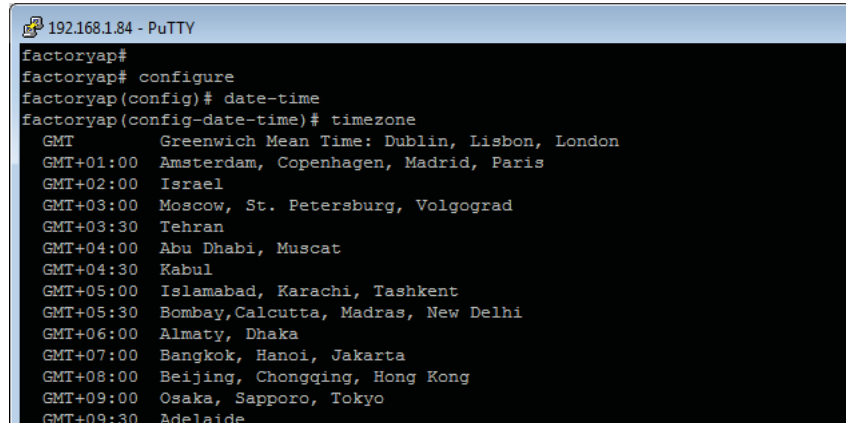

```

factoryap#
@          Execute command from history
configure  Enter configuration mode
exit       Exit the command line interface
help       Description of the interactive help system
history    Display history of commands executed
more       Turn on or off terminal pagination
quit       Exit the command line interface
search     Search show command output for pattern
show       Display current information about the selected item
statistics Display statistics
uptime     Display time since last boot
xms-override Override Xirrus Management System and allow local configuration changes
factoryap#

```

Figure 214. Full Help

Figure 215 shows an example of how the Help system can provide the argument and format when specifying the time zone under the **date-time** command.

```
192.168.1.84 - PuTTY
factoryap#
factoryap# configure
factoryap(config)# date-time

```

Figure 215. Partial Help

Top Level Commands

This section offers an at-a-glance view of all top level commands—organized alphabetically. Top level commands are defined here as commands that are directly accessible from the root command prompt that consists of the name of the AP followed by a “#” sign (e.g. **MyAP#**). When inputting commands, be aware that all commands are **case-sensitive**.

All other commands are considered second level configuration commands—these are the commands you use to configure specific elements of the AP’s features and functionality. For a listing of these commands with examples of command formats and structure, go to [“Configuration Commands” on page 452](#).

Root Command Prompt

The following table shows the top level commands that are available from the root command prompt [**MyAP**].

Command	Description
@	Type @n to execute command n (as shown by the history command).
configure	Enter the configuration mode. See “Configuration Commands” on page 452 .
exit	Exit the CLI and terminate your session—if this command is used at any level other than the root command prompt you will simply exit the current level (step back) and return to the previous level.
help	Show a description of the interactive help system. See also, “Getting Help” on page 437 .
history	List history of commands that have been executed.
more	Turn terminal pagination ON or OFF.
quit	Exit the Command Line Interface (from any level).
search	Search for pattern in show command output.

Command	Description
show	Display information about the selected item. See “show Commands” on page 445 .
statistics	Display statistical data about the AP. See “statistics Commands” on page 450 .
uptime	Display the elapsed time since the last boot.
xms-override	Override XMS managed mode and allow local configuration changes according to your user privileges. See “Managing APs Locally or Using XMS” on page 85 .

configure Commands

The following table shows the second level commands that are available with the top level **configure** command [**MyAP(config)#**].

Command	Description
@	Type @n to execute command n (as shown by the history command).
acl	Configure the Access Control List.
activation	Start or stop activation server polling
admin	Define administrator access parameters.
auth	Configure Oauth tokens.
authentication-server	Configure authentication server parameters
boot-env	Display or modify boot loader environment variables.
cdp	Configure Cisco Discovery Protocol settings.
clear	Remove/clear the requested elements.

Command	Description
cluster	Make configuration changes to multiple APs.
contact-info	Contact information for assistance on this AP.
date-time	Configure date and time settings.
dhcp-server	Configure the DHCP Server.
dns	Configure the DNS settings.
end	Exit the configuration mode.
exit	Go UP one mode level.
file	Manage the file system.
filter	Define protocol filter parameters.
group	Define user groups with parameter settings
help	Description of the interactive Help system.
history	List history of commands that have been executed.
hostname	Host name for this AP.
interface	Select the interface to configure.
lldp	Configure LLDP settings
load	Load running configuration from flash
location	Location name for this AP.
location-reporting	Configure location server settings.
management	Configure AP management parameters
mdm	Configure mobile device management server settings.
more	Turn ON or OFF terminal pagination.

Command	Description
netflow	Configure NetFlow data collector.
no	Disable (if enabled) or set to default value.
proxy-fwd	Configure Proxy Forwarding settings.
quick-config	Apply configuration template for typical deployment scenario.
quit	Exit the Command Line Interface.
reboot	Reboot the AP.
reset	Reset all settings to their factory default values and reboot.
restore	Reset all settings to their factory default values and reboot.
revert	Revert to saved configuration after specified delay in seconds if configuration not saved.
roaming-assist	Set parameters for roaming assistance.
run-tests	Run selective tests.
save	Save the running configuration to FLASH.
search	Search for pattern in show command output.
security	Set the security parameters for the AP.
show	Display current information about the selected item.
snmp	Enable, disable or configure SNMP.
ssid	Configure the SSID parameters.
station-assurance	Location name for this AP.
statistics	Display statistics.

Command	Description
syslog	Enable, disable or configure the Syslog Server.
tunnel	Configure tunnels.
uptime	Display time since the last boot.
vlan	Configure VLAN parameters.
wifi-tag	Configure VLAN parameters.
xms-override	Override XMS managed mode and allow local configuration changes according to your user privileges. See “Managing APs Locally or Using XMS” on page 85.

show Commands

The following table shows the second level commands that are available with the top level **show** command [**MyAP# show**].

Command	Description
acl	Display the Access Control List.
active-directory	Show Active Directory information.
admin	Display the administrator list or login information.
applications	Application statistics.
arp	ARP table information.
associated-stations	Display stations that have associated to the AP.
auth	Show Open Authentication tokens.
authentication-server	Authentication server settings summary.
bond	Bond information
boot-env	Display Boot loader environment variables.
capabilities	Display detailed station capabilities.
cdp	Display Cisco Discovery Protocol settings.
channel-list	Display list of AP's 802.11an and bgn channels.
cluster	Display Cluster summary.
clear-text	Display and enter passwords and secrets in the clear.
conntrack	Display the Connection Tracking table.
console	Display terminal settings.
contact-info	Display contact information.

Command	Description
country-list	Display countries that the AP can be set to support.
date-time	Display date and time settings summary.
dhcp-leases	Display IP addresses (leases) assigned to stations by the DHCP server.
dhcp-pool	Display internal DHCP server settings summary information.
diff	Display the difference between configurations.
dns	Display DNS summary information.
env-ctrl	Display the environmental controller status for the outdoor enclosure.
error-numbers	Display the detailed error number in error messages.
ethernet	Display Ethernet interface summary information.
external-radius	Display summary information for the external RADIUS server settings.
factory-config	Display the AP factory configuration information.
filter	Display filter information.
filter-list	Filter list information.
group	User Group summary.
iap	Display IAP configuration information.
ids-event-log	IDS event log.
ids-stats	IDS statistics
internal-radius	Display the users defined for the embedded RADIUS server.
intrude-detect	Intrusion detection information.

Command	Description
lastboot-config	Display AP configuration at the time of the last boot-up.
lldp	Link Layer Discovery Protocol information.
location-reporting	Location server reporting information.
mac-table	MAC address bridging table
management	Display settings for managing the AP, plus Standby, FIPS, and other information.
mdm	MDM (Mobile Device Management) information
netflow	NetFlow information
network-assurance	Network Assurance status
network-map	Display network map information.
proxy-fwd	Display Proxy Forwarding summary.
radio-assurance	Radio Assurance status.
realtime-monitor	Display realtime statistics for all IAPs.
roaming-assist	Roaming assist settings
roaming-stations	Roaming station information
rogue-ap	Display rogue AP information.
route	Display the routing table.
rsi-map	Display RSSI map by IAP for station.
running-config	Display configuration information for the AP currently running.
saved-config	Display the last saved AP configuration.
security	Display security settings summary information.

Command	Description
self-test	Display self test results.
snmp	Display SNMP summary information.
spanning-tree	Display spanning tree information.
spectrum-analyzer	Display spectrum analyzer measurements.
ssid	Display SSID summary information.
station-assurance	Station assurance information.
stations	Display station information.
statistics	Display statistics.
syslog	Display the system log.
syslog-settings	Display the system log (Syslog) settings.
system-info	System information
temperature	Display the current board temperatures.
tunnel	Tunnel information
unassociated-stations	Display unassociated station information.
undefined-vlan	Undefined VLANs detected
uptime	Display time since last boot.
vlan	Display VLAN information.
wds	Display WDS information.
wifi-tag	Display WiFi tag summary.
wpr-whitelist	Show WPR whitelist
xrp-tunnels	XRP tunnel information.

Wireless Access Point

Command	Description
<code><cr></code>	Display configuration or status information.
IAP-NAME <code>iap1, iap2</code>	IAP interface information

statistics Commands

The following table shows the second level commands that are available with the top level **statistics** command [**MyAP# statistics**].

Command	Description
ethernet	Display statistical data for all Ethernet interfaces.
filter	Display statistics for defined filters (if any). FORMAT: statistics filter [detail]
filter-list	Display statistics for defined filter list (if any). FORMAT: statistics filter <filter-list>
iap	Display statistical data for the defined IAP. FORMAT: statistics iap iap2
station	Display statistical data about associated stations. FORMAT: statistics station billw
vlan	Display statistical data for the defined VLAN. You must use the VLAN number (not its name) when defining a VLAN. FORMAT: statistics vlan 1
wds	Display statistical data for the defined active WDS (Wireless Distribution System) links. FORMAT: statistics wds 1
<cr>	Display configuration or status information.

Wireless Access Point

Command	Description
Ethernet Name eth0, gig1, gig2	Display statistical data for the defined Ethernet interface (either eth0, gig1 or gig2). FORMAT: statistics gig1
IAP-NAME iap1, iap2	IAP interface information

Configuration Commands

All configuration commands are accessed by using the **configure** command at the root command prompt (**MyAP#**). This section provides a brief description of each command and presents sample formats where deemed necessary. The commands are organized alphabetically. When inputting commands, be aware that all commands are **case-sensitive**.

To see examples of some of the key configuration tasks and their associated commands, go to [“Sample Configuration Tasks” on page 497](#).

acl

The **acl** command [**MyAP(config)# acl**] is used to configure the Access Control List.

Command	Description
add	Add a MAC address to the list. FORMAT: acl add AA:BB:CC:DD:EE:FF
del	Delete a MAC address from the list. FORMAT: acl del AA:BB:CC:DD:EE:FF
disable	Disable the Access Control List FORMAT: acl disable
enable	Enable the Access Control List FORMAT: acl enable
reset	Delete all MAC addresses from the list. FORMAT: acl reset

admin

The **admin** command [MyAP(config-admin)#] is used to configure the Administrator List.

Command	Description
add	Add a user to the Administrator List. FORMAT: admin add [userID]
del	Delete a user to the Administrator List. FORMAT: admin del [userID]
edit	Modify user in the Administrator List. FORMAT: admin edit [userID]
privilege-name	Define administrator privilege level names
privilege-section	Define administrator privilege level required by config section.
radius	Define a RADIUS server to be used for authenticating administrators. FORMAT: admin radius [disable enable off on timeout <seconds> auth-type [PAP CHAP]] admin radius [primary secondary] port <portid> server [<ip-addr> <host>] secret <shared-secret>
reset	Delete all users and restore the default user. FORMAT: admin reset

auth

The **auth** command [MyAP(config)# **auth**] is used to configure OAuth tokens.

Command	Description
del	Delete an OAuth token. FORMAT: auth del <OAuth token>
reset	Delete all OAuth tokens. FORMAT: auth reset

See also, “OAuth 2.0 Management” on page 265.

cdp

The **cdp** command [MyAP(config)# **cdp**] is used to configure the Cisco Discovery Protocol.

Command	Description
disable	Disable the Cisco Discovery Protocol FORMAT: cdp disable
enable	Enable the Cisco Discovery Protocol FORMAT: cdp enable
hold-time	Select CDP message hold time before messages received from neighbors expire. FORMAT: cdp hold-time [# seconds]

Command	Description
interval	The AP sends out CDP announcements at this interval. FORMAT: cdp interval [# seconds]
off	Disable the Cisco Discovery Protocol FORMAT: cdp off
on	Enable the Cisco Discovery Protocol FORMAT: cdp on

clear

The **clear** command [MyAP(config)# **clear**] is used to clear requested elements.

Command	Description
arp	Clear the arp table entry for a requested IP address, or clear all entries if no IP address is entered. FORMAT: clear arp [ipaddress]
authentication	Deauthenticate a station (specified by MAC address, hostname, or IP address). If you specify the permanent option, then the station is deauthenticated and put on the access control list. FORMAT: clear authentication [permanent] [authenticated station]
history	Clear the history of CLI commands executed. FORMAT: clear history
screen	Clear the screen where you're viewing CLI output. FORMAT: clear screen
station- assurance	Clear all station assurance data, but continue to collect new data. FORMAT: clear station-assurance
statistics	Clear the statistics for thee change, but it won't show up requested element. FORMAT: clear statistics [ethname all-eth applications filters iap station vlan wds]

Command	Description
syslog	Clear all Syslog messages, but continue to log new messages. FORMAT: clear syslog
undefined-vlan	Clear undefined VLAN information. FORMAT: clear undefined-vlan

cluster

The **cluster** command [MYAP(config)# **cluster**] is used to create and operate clusters. Clusters allow you to configure multiple APs at the same time. Using CLI (or WMI), you may define a set of APs that are members of the cluster. Then you may switch the AP to Cluster operating mode for a selected cluster, which sends all successive configuration commands issued via CLI or WMI to all of the member APs. When you exit cluster mode, configuration commands revert to applying only to the AP to which you are connected.

For more information, see [“Clusters” on page 401](#).

Command	Description
add	Create a new AP cluster. Enters edit mode for that cluster to allow you to specify the APs that belong to the cluster. FORMAT: cluster add [cluster-name]
del	Delete an AP cluster. Type del? to list the existing clusters. FORMAT: cluster del [cluster-name]
edit	Enter edit mode for selected cluster to add or delete APs that belong to the cluster. FORMAT: cluster edit [cluster-name]
operate	Enter Cluster operation mode. All configuration commands are applied to all of the selected cluster's member APs until you give the end command (see above). FORMAT: cluster operate [cluster-name]
reset	Delete all clusters. FORMAT: cluster reset

contact-info

The **contact-info** command [MyAP(config)# **contact-info**] is used for managing administrator contact information.

Command	Description
email	Add an email address for the contact (must be in quotation marks). FORMAT: contact-info email ["contact@mail.com"]
name	Add a contact name (must be in quotation marks). FORMAT: contact-info name ["Contact Name"]
phone	Add a telephone number for the contact (must be in quotation marks). FORMAT: contact-info phone ["8185550101"]

date-time

The **date-time** command [MyAP(config-date-time)#] is used to configure the date and time parameters. Your AP supports the Network Time Protocol (NTP) in order to ensure that the AP's internal time is accurate. NTP is set to UTC time by default; however, you can set the time zone so that your AP will display local time. This is done by defining an offset from the UTC value. For example, Pacific Standard Time is 8 hours behind UTC time, so the offset from UTC time would be -8.

Command	Description
dst_adjust	Enable adjustment for daylight savings. FORMAT: date-time dst_adjust
no	Disable daylight savings adjustment. FORMAT: date-time no dst_adjust
ntp	Enable the NTP server. FORMAT: date-time ntp on (or off to disable)
offset	Set an offset from Greenwich Mean Time. FORMAT: date-time no dst_adjust
set	Set the date and time for the AP. FORMAT: date-time set [10:24 10/23/2007]
timezone	Configure the time zone. FORMAT: date-time timezone [-8]

dhcp-server

The **dhcp-server** command [MyAP(config-dhcp-server)#] is used to add, delete and modify DHCP pools.

Command	Description
add	Add a DHCP pool. FORMAT: dhcp-server add [dhcp pool]
del	Delete a DHCP pool. FORMAT: dhcp-server del [dhcp pool]
edit	Edit a DHCP pool FORMAT: dhcp-server edit [dhcp pool]
reset	Delete all DHCP pools. FORMAT: dhcp-server reset

dns

The `dns` command [MyAP(config-dns)#] is used to configure your DNS parameters.

Command	Description
domain	Enter your domain name. FORMAT: dns domain [www.mydomain.com]
server1	Enter the IP address of the primary DNS server. FORMAT: dns server1 [1.2.3.4]
server2	Enter the IP address of the secondary DNS server. FORMAT: dns server1 [2.3.4.5]
server3	Enter the IP address of the tertiary DNS server. FORMAT: dns server1 [3.4.5.6]
use-dhcp	Enable or disable updates to DNS settings via DHCP. FORMAT: dns use-dhcp [off on]

file

The **file** command [MyAP(config-file)#] is used to manage files.

Command	Description
active-image	Validate and commit a new AP software image.
backup-image	Validate and commit a new backup software image.
cat	List file contents.
check-image	Validate a new AP software image.
chkdsk	Check flash file system.
copy cp	Copy a file to another file. FORMAT: file copy [sourcefile destinationfile]
create-text	Create a text file on the flash file system, <EOF> to finish.
dir	List the contents of a directory. FORMAT: file dir [directory]
erase	Delete a file from the FLASH file system. FORMAT: file erase [filename]
format	Format flash file system.
ftp	Open an FTP connection with a remote server. Files will be transferred in binary mode. FORMAT: file ftp host {<hostname> <ip>} [port <port_#>] [user {anonymous <username> password <passwd> }] { put <source_file> [<dest_file>] get <source_file> [<dest_file>] } Note: Any time you transfer any kind of software image file for the AP, it must be transferred in binary mode, or the file may be corrupted.

Command	Description
http-get	<p>Perform an HTTP file download. This is the preferred method of downloading files for XMS Cloud.</p> <p>FORMAT: http-get [no-cert-check] <url> [<local_file>]</p> <p>no-cert-check causes the AP to download the file even if the SSL certificate is invalid, expired, or not signed by a recognized CA</p> <p><url> is a standard HTTP URL, e.g. https://file.example.com:8080/mydir/myfile.ext.</p> <ul style="list-style-type: none"> ● http:// or https:// may be omitted, in which case HTTP is assumed <p><local_file> is an optional parameter that describes the path and name where the file should be saved</p> <ul style="list-style-type: none"> ● if no local_file is specified, the file will be saved in the root of the flash storage ● the local_file does support specifying a directory, which will be created if it doesn't already exist
list	<p>List the contents of a file.</p> <p>FORMAT: file list [filename]</p>
mkdir	Create a directory on the flash file system.
mv	Rename a file on the flash file system.

Command	Description
remote-config	<p>When the AP boots up, it fetches the specified configuration file from the TFTP server defined in the file remote-server command, and uses this configuration. This must be an AP configuration file with a .conf extension.</p> <p>A partial configuration file may be used. For instance, if you wish to use a single configuration file for all of your APs but don't want to have the same IP address for each AP, you may remove the ipaddr line from the file. You can then load the file on each AP and the local IP addresses will not change.</p> <p>FORMAT: file remote-config <config-file.conf></p> <p>Note: If you enter file remote-config ?, the help response suggests possibilities by listing all of the configuration files that are currently in the AP's flash.</p>
remote-image	<p>When the AP boots up, it fetches the named image file from the TFTP server defined in the file remote-server command, and upgrades to this file before booting. This must be an AP image file with a .bin extension.</p> <p>FORMAT: file remote-image <image-file.bin></p> <p>Note: This will happen every time that the AP reboots. If you only want to fetch the remote-image one time be sure to turn off the remote image option after the initial download.</p>
remote-server	<p>Sets up a TFTP server to be used for automated remote update of software image and configuration files when rebooting.</p> <p>FORMAT: file remote-server A.B.C.D</p>
rename	Rename a file.
rm	Delete a file from the flash file system.

Command	Description
rmdir	Delete a directory on the flash file system.
scp	Copy a file to or from a remote system. You may specify the port to use.
tftp	Open a TFTP connection with a remote server. FORMAT: file tftp host {<hostname> <ip>} [port <port_#>] [user {anonymous <username> password <passwd> }] { put <source_file> [<dest_file>] get <source_file> [<dest_file>] } Note: Any time you transfer any kind of software image file for the AP, it must be transferred in binary mode, or the file may be corrupted.

filter

The **filter** command [MyAP(config-filter)#] is used to manage protocol filters and filter lists.

Command	Description
add	Add a filter. Details about the air cleaner feature are after the end of this table. FORMAT: filter add [air-cleaner name]
add-list	Add a filter list. FORMAT: filter add-list [name]
del	Delete a filter. FORMAT: filter del [name]
del-list	Delete a filter list. FORMAT: filter del-list [name]
edit	Edit a filter. FORMAT: filter edit [name type]
edit-list	Edit a filter list FORMAT: filter edit-list [name type]
enable	Enable a filter list. FORMAT: filter enable
move	Change a filter priority. FORMAT: filter move [name priority]

Command	Description
off	Disable a filter list. FORMAT: filter off
on	Enable a filter list. FORMAT: filter on
reset	Delete all protocol filters and filter lists. FORMAT: filter reset
stateful	Enable or disable stateful filtering (firewall). FORMAT: Stateful [enable disable on off]
track-apps	Enable or disable application tracking. FORMAT: filter track-apps [enable disable on off]

Air Cleaner

The air cleaner feature offers a number of predetermined filter rules that eliminate a great deal of unnecessary wireless traffic, resulting in improved performance. You may select **all** of the air cleaner rules for the greatest effect, or only specific rules, such as **broadcast** or **multicast**, to eliminate only a particular source of traffic. The following options are offered:

```
MyAP(config)# filter add air-cleaner
all          All air cleaner filters
arp         Eliminate station to station ARPs over the air
broadcast   Eliminate broadcast traffic from the air
dhcp        Eliminate stations serving DHCP addresses from the air
multicast   Eliminate chatty multicast traffic from the air
netbios     Eliminate NetBIOS traffic from the air
```

Wireless Access Point

If you select all, the rules shown in [Figure 216](#) are added to the predefined filter list named **Global**. These rules assume that you have station-to-station blocking enabled, that a DHCP server is on the AP's wired connection, and that you want to block most all multicast and all broadcast traffic not vital to normal operation. If you find that there is a particular type of multicast or broadcast traffic that you want to allow, just add a specific allow filter for it before the deny filter in this list that would normally block it. Add or delete any of the Multicast rules as necessary for a specific site. Remember that the order of the rules is important.

```
MyA(config)# show filter
Global Filter List
```

Name	Type	Layer	Protocol	Port	Source	Destination	Set Qos	Set VLAN	State
Air-cleaner-Arp.1	deny	2	arp	any	iface iap	iface iap			on
Air-cleaner-Dhcp.1	deny	2	udp	bootps	iface gig	ff:ff:ff:ff:ff:ff/48			on
Air-cleaner-Dhcp.2	deny	2	udp	bootpc-dhcp	iface iap	ff:ff:ff:ff:ff:ff/48			on
Air-cleaner-Nbios.1	deny	2	udp	netbios-ns	any	any			on
Air-cleaner-Nbios.2	deny	2	udp	netbios-dgm	any	any			on
Air-cleaner-Nbios.3	deny	2	udp	netbios-ssn	any	any			on
Air-cleaner-Mcast.1	deny	2	any	any	any	01:00:00:00:00:00/8			off
Air-cleaner-Mcast.2	deny	2	any	any	any	33:00:00:00:00:00/8			off
Air-cleaner-Mcast.3	deny	2	any	any	any	09:00:00:00:00:00/8			off
Air-cleaner-Bcast.1	allow	2	arp	any	any	ff:ff:ff:ff:ff:ff/48			on
Air-cleaner-Bcast.2	allow	2	udp	bootps	any	ff:ff:ff:ff:ff:ff/48			on
Air-cleaner-Bcast.3	allow	2	udp	bootpc-dhcp	any	ff:ff:ff:ff:ff:ff/48			on
Air-cleaner-Bcast.4	allow	2	udp	22610	any	ff:ff:ff:ff:ff:ff/48			on
Air-cleaner-Bcast.5	deny	2	any	any	any	ff:ff:ff:ff:ff:ff/48			on

```
Stateful filtering: enabled
```

Figure 216. Air Cleaner Filter Rules

Explanations of some sample rules are below.

- **Air-cleaner-Arp.1** blocks ARPs from one client from being transmitted to clients via all of the radios. The station to station block setting doesn't block this traffic, so this filter eliminates this unnecessary traffic.
- **Air-cleaner-Dhcp.1** drops all DHCP client traffic coming in from the Gigabit interface. This traffic doesn't need to be transmitted by the radios since there shouldn't be any DHCP server associated to the radios and offering DHCP addresses. For large subnets the DHCP discover/request broadcast traffic can be significant.
- **Air-cleaner-Dhcp.2** drops all DHCP server traffic coming in from the radio interfaces. There should not be any DHCP server associated to the

radios. These rogue DHCP servers are blocked from doing any damage with this filter. There have been quite a few cases in public venues like schools and conventions where such traffic is seen.

- **Air-cleaner-Mcast.1** drops all multicast traffic with a destination MAC address starting with 01. This filters out a lot of IP multicast traffic that starts with 224.
- **Air-cleaner-Mcast.2** drops all multicast traffic with a destination MAC address starting with 33. A lot of IPv6 traffic and other multicast traffic is blocked by this filter.
- **Air-cleaner-Mcast.3** drops all multicast traffic with a destination MAC address starting with 09. A lot of Appletalk traffic and other multicast traffic is blocked by this filter. Note that for OSX 10.6.* Snow Leopard no longer supports Appletalk.
- **Air-cleaner-Bcast.1** allows all ARP traffic (other than the traffic that was denied by **Air-cleaner-Arp.1**). This is needed because **Air-cleaner-Bcast.5** would drop this valid traffic.
- **Air-cleaner-Bcast.4** allows all XRP traffic from APs to be received from the wire. This is needed because **Air-cleaner-Bcast.5** would drop this valid traffic.
- **Air-cleaner-Bcast.5** drops all other broadcast traffic that hasn't previously been explicitly allowed. This filter will catch all UDP broadcast traffic as well as all other known and unknown protocol broadcast traffic.

group

The **group** command [MyAP(config)# **group**] is used to create and configure user groups. User groups allow administrators to assign specific network parameters to users through RADIUS privileges rather than having to map users to a specific SSID. Groups provide flexible control over user privileges without the need to create large numbers of SSIDs. For more information, see “Groups” on page 304.

Command	Description
add	Create a new user group. FORMAT: group add [group-name]
del	Delete a user group. FORMAT: group del [group-name]
edit	Set parameters values for a group. FORMAT: group edit [group-name]
reset	Reset the group. FORMAT: group reset

hostname

The **hostname** command [MyAP(config)# **hostname**] is used to change the hostname used by the AP.

Command	Description
hostname	Change the hostname of the AP. FORMAT: hostname [name]

interface

The **interface** command [**MyAP(config)# interface**] is used to select the interface that you want to configure. To see a listing of the commands that are available for each interface, use the **?** command at the selected interface prompt. For example, using the **?** command at the **MyAP(config-gig1)#** prompt displays a listing of all commands for the **gig1** interface.

Command	Description
bond1	Bond 1.
bond2	Bond 2.
console	Select the console interface. The console interface is used for management purposes only. FORMAT: interface console
gig1	Select the Gigabit 1 interface. FORMAT: interface gig1
gig2	Select the Gigabit 2 interface. FORMAT: interface gig2
iap	Select an IAP. FORMAT: interface iap
IAP-NAME iap1, iap2	IAP interface information

load

The **load** command [MyAP(config)# **load**] loads a configuration file.

Command	Description
factory.conf	Load the factory settings configuration file. FORMAT: load [factory.conf]
lastboot.conf	Load the configuration file from the last boot-up. FORMAT: load [lastboot.conf]
[myfile].conf	If you have saved a configuration, enter its name to load it. FORMAT: load [myfile.conf]
saved.conf	Load the configuration file with the last saved settings. FORMAT: load [saved.conf]

location

The **location** command [MyAP(config)# **location**] is used to set the location descriptive string for the AP.

Command	Description
<cr>	Set the location for the AP. FORMAT: location [newlocation]

location-reporting

The **location-reporting** command [MyAP(config)# **location-reporting**] is used to configure Location Server settings. See also, “[Location](#)” on page 191.

Command	Description
cust-key	Set Location Server customer key. FORMAT: location-reporting cust-key enc <loc-server-customer-key>
disable off	Disable location-reporting. FORMAT: location-reporting disable
enable on	Enable location-reporting. FORMAT: location-reporting enable
period	Set Location Server reporting period (seconds). FORMAT: location-reporting period <#-seconds>
url	Set URL of Location Server. FORMAT: location-reporting url <loc-server-URL>

management

The **management** command [MyAP(config)# **management**] enters management mode, where you may configure management parameters.

Command	Description
<cr>	Enter management mode. FORMAT: management <cr>

The following types of settings may be configured in management mode:

Setting	Description
activation	Start or stop activation server polling.
banner	Configure login banner messages.
clear	Remove/clear requested elements.
cloud	Enable/disable Cloud access.
console	Configure console management parameters.
fips	Enable/disable FIPS 140-2, Level 2 Security. See “Implementing FIPS Security” on page 591.
help	Description of the interactive help system.
history	Display history of commands executed.
https	Enable/disable HTTPS access.
license	Set access point software license key
load	Load running configuration from flash.
max-auth-attempts	Maximum number of authentication (login) attempts (0 means unlimited).
more	Turn on or off terminal pagination.

Setting	Description
network-assurance	Enable/disable network assurance.
pci-audit	Enable/disable PCI (Payment Card Industry) audit mode. See “Auditing PCI DSS” on page 585.
quick-config	Apply quick configuration template.
quit	Exit the command line interface.
reauth-period	Time between failed CLI login attempts.
restore	Restore to previous saved config.
revert	Revert to saved configuration after delay if configuration not saved.
save	Save running configuration to flash.
search	Search show command output for pattern.
show	Display current information about the selected item.
spanning-tree	Enable/disable Spanning Tree Protocol.
ssh	Enable/disable SSH access.
standby	Configure standby parameters.
statistics	Display statistics.
telnet	Enable/disable telnet access.
top	Return to top level of configuration mode.
uptime	Display time since last boot.
xms-override	Override XMS managed mode and allow local configuration changes according to your user privileges. See “Managing APs Locally or Using XMS” on page 85.

Setting	Description
xircon	Enable/disable Xircon access. See <i>Xircon User's Guide</i> for more information.

mdm

The **mdm** command [**MyAP(config)# mdm**] is used to configure Mobile Device Management Server settings. See also, “[Mobile](#)” on page 406.

Command	Description
airwatch api	<p>Set Location Server customer key. FORMAT: mdm airwatch api The following types of settings may be configured in management mode:</p> <ul style="list-style-type: none"> ● access-error Set AirWatch API access error action ● key Set AirWatch API key ● password Set AirWatch API password ● poll-period Set AirWatch API poll period ● timeout Set AirWatch API timeout ● url Set AirWatch API URL ● username Set AirWatch API username
redirect-url	<p>Set URL to redirect clients to. FORMAT: mdm airwatch redirect-url <URL-string></p>

more

The **more** command [MyAP(config)# **more**] is used to turn terminal pagination ON or OFF.

Command	Description
disable off	Turn OFF terminal pagination. FORMAT: more off
enable on	Turn ON terminal pagination. FORMAT: more on

netflow

The **netflow** command [MyAP(config-netflow)#] is used to enable or disable, or configure sending IP flow information (traffic statistics) to the collector you specify.

Command	Description
collector	Set the Netflow collector IP address or fully qualified domain name (host.domain). Only one collector may be set. If port is not specified, the default is 2055. FORMAT: netflow collector host {<ip-addr> <domain>} [port <port#>]
disable off	Disable netflow. FORMAT: netflow disable
ipfix	Enable NetFlow IPFIX probe.
off	Disable netflow. FORMAT: netflow off
v5	Enable NetFlow v5 probe.
v9	Enable Netflow v9 probe.

no

The **no** command [MyAP(config)# **no**] is used to disable a selected element or set the element to its default value.

Command	Description
2.4GHz	Disable all 2.4GHz IAPs.
5GHz	Disable all 5GHz IAPs.
acl	Disable the Access Control List. FORMAT: no acl
clear-text	Disable entry and display of passwords and secrets in the clear.
gig1	Disable gig1.
gig2	Disable gig2.
https	Disable https access. FORMAT: no https
intrude-detect	Disable intrusion detection. FORMAT: no intrude-detect
management	Disable management on all Ethernet interfaces. FORMAT: no management
more	Disable terminal pagination. FORMAT: no more
ntp	Disable the NTP server. FORMAT: no ntp

Command	Description
snmp	Disable SNMP features. FORMAT: no snmp
spanning-tree	Disable spanning tree.
ssh	Disable ssh access. FORMAT: no ssh
syslog	Disable the Syslog services. FORMAT: no syslog
telnet	Disable Telnet access. FORMAT: no telnet

quick-config

The **quick-config** command is used to apply configuration templates to the AP for typical deployment scenarios.

Command	Description
Classroom	Configure AP for classroom deployment. FORMAT: quick-config Classroom Configures the AP for use in classroom settings (K-12 schools, Higher education, etc.)
High-density	Configure AP for high density deployment. FORMAT: quick-config High-density Configures the AP for use in high density settings (lecture halls, convention centers, stadiums, etc.)

quit

The **quit** command [MyAP(config)# **quit**] is used to exit the Command Line Interface.

Command	Description
<cr>	Exit the Command Line Interface. FORMAT: quit If you have made any configuration changes and your changes have not been saved, you are prompted to save your changes to Flash. At the prompt, answer Yes to save your changes, or answer No to discard your changes.

authentication-server

The **authentication-server** command [MyAP(config-authserver)#] is used to configure the external and internal RADIUS server parameters.

Command	Description
active-directory	Configure Active Directory parameters.
external-radius	Configure an external RADIUS server. FORMAT: authentication-server external-radius To configure a RADIUS server (primary, secondary, or accounting server, by IP address or host name), and the reporting interval use: authentication-server external-radius accounting
internal-radius	Configure the internal RADIUS server. FORMAT: authentication-server internal-radius

Wireless Access Point

Command	Description
use	Choose the active RADIUS server (either external or internal). FORMAT: authentication-server use external (or internal)

reboot

The **reboot** command [MyAP(config)# **reboot**] is used to reboot the AP. If you have unsaved changes, the command will notify you and give you a chance to cancel the reboot.

Command	Description
<cr>	Reboot the AP. FORMAT: reboot
delay	Reboot the AP after a delay of 1 to 60 seconds. FORMAT: reboot delay [n]

reset

The **reset** command [MyAP(config)# **reset**] is used to reset all settings to their default values then reboot the AP.

Command	Description
<cr>	Reset all configuration parameters to their factory default values. FORMAT: reset The AP is rebooted automatically.
preserve-ip-settings	Preserve all ethernet and VLAN settings and reset all other configuration parameters to their factory default values. FORMAT: reset preserve-ip-settings The AP is rebooted automatically.

restore

The **restore** command [**MyAP(config)# restore**] is used to restore configuration to a version that was previously saved locally.

Command	Description
?	Use this to display the list of available config files. FORMAT: restore ?
<filename>	Enter the name of the locally saved configuration to restore. FORMAT: restore <config-filename>

roaming-assist

The **roaming-assist** command [MyAP(config)# **roaming-assist**] is used to configure roaming assistance settings. See also, “Roaming Assist” on page 382.

Command	Description
data-rate	Set minimum packet data rate before roaming, in Mbps. FORMAT: roaming-assist data-rate <1-99>
devices	Set device types or classes to assist. FORMAT: roaming-assist devices all unidentified DEVICE-CLASS <ID-string> DEVICE-TYPE <ID-string>
disable off	Disable roaming assist. FORMAT: roaming-assist disable
enable on	Enable roaming assist. FORMAT: roaming-assist enable
period	Set roaming assist backoff period (seconds). FORMAT: roaming-assist period <#-seconds>
threshold	Set roaming RSSI threshold in db relative to RSSI of nearest AP. FORMAT: roaming-assist threshold <-50 to 50>

run-tests

The **run-tests** command [MyAP(run-tests)#] is used to enter run-tests mode, which allows you to perform a range of tests on the AP.

Command	Description
@	Execute command from history
ad-authenticate	Test domain user authentication.
ad-check-secret	Check machine trust secret.
ad-debug-info	Display detailed Active Directory information.
ad-list-groups	List all domain groups.
ad-status	Display Active Directory status.
capture	Execute a packet capture.
clear	Remove/clear requested elements.
diagnostic-log	Generate diagnostic log file.
end	Exit configuration mode.
help	Description of the interactive help system.
history	Display history of commands executed.
iperf	Execute iperf utility. FORMAT: run-tests iperf
led	LED test. FORMAT: run-tests led [flash rotate]
memtest	Execute memory tests. FORMAT: run-tests memtest
more	Turn on or off terminal pagination.

Command	Description
ping	Execute ping utility. FORMAT: run-tests ping [host-name ip-addr]
quick-config	Apply quick configuration template.
quit	Exit the command line interface.
radius-ping	Special ping utility to test the connection to a RADIUS server. FORMAT: run-tests radius-ping [external ssid <ssidnum>] [primary secondary] user <raduser> password <radpasswd> auth-type [CHAP PAP] run-tests radius-ping [internal server <radserver> port <radport> secret <radsecret>] user <raduser> password <radpasswd> auth-type [CHAP PAP] You may select a RADIUS server that you have already configured (ssid or external or internal) or specify another server .
restore	Restore to previous saved configuration.
revert	Revert to saved configuration after delay if configuration is not saved.
save	Save running configuration to flash.
search	Search show command output for pattern.
show	Display current information about the selected item.
site-survey	Enable or disable site survey mode. FORMAT: run-tests site-survey [on off enable disable]

Command	Description
ssh	Execute ssh utility. FORMAT: run-tests ssh [hostname ip-addr] [command-line-switches (optional)]
tcpdump	Execute tcpdump utility to dump traffic for selected interface or VLAN. Supports 802.11 headers. FORMAT: run-tests tcpdump
telnet	Execute telnet utility. FORMAT: run-tests telnet [hostname ip-addr] [command-line-switches (optional)]
traceroute	Execute traceroute utility. FORMAT: run-tests traceroute [host-name ip-addr]
uptime	Display time since last boot.

security

The **security** command [MyAP(config-security)#] is used to establish the security parameters for the AP.

Command	Description
wep	Set the WEP encryption parameters. FORMAT: security wep
wpa	Set the WEP encryption parameters. FORMAT: security wpa

snmp

The **snmp** command [MyAP(config-snmp)#] is used to enable, disable, or configure SNMP.

Command	Description
trap	Configure traps for SNMP. Up to four trap destinations may be configured, and you may specify whether to send traps for authentication failure. FORMAT: snmp trap
v2	Enable SNMP v2. FORMAT: snmp v2
v3	Enable SNMP v3. FORMAT: snmp v3

ssid

The **ssid** command [MyAP(config-ssid)#] is used to establish your SSID parameters.

Command	Description
add	Add an SSID. FORMAT: ssid add [newssid]
del	Delete an SSID. FORMAT: ssid del [oldssid]
edit	Edit an existing SSID. FORMAT: ssid edit [existingssid]
reset	Delete all SSIDs and restore the default SSID. FORMAT: ssid reset
stations	Set station limit for this SSID.
traffic	Set traffic limits for this SSID

syslog

The **syslog** command [MyAP(config-syslog)#] is used to enable, disable, or configure the Syslog server.

Command	Description
console	Enable or disable the display of Syslog messages on the console, and set the level to be displayed. All messages at this level and lower (i.e., more severe) will be displayed. FORMAT: syslog console [on/off] level [0-7]
disable off	Disable the Syslog server. FORMAT: syslog disable
email	Disable the Syslog server. FORMAT: syslog email from [email-from-address] level [0-7] password [email-acct-password] server [email-server-IPaddr] test [test-msg-text] to-list [recipient-email-addresses] user [email-acct-username]
enable on	Enable the Syslog server. FORMAT: syslog enable
local-file	Set the size and/or severity level (all messages at this level and lower will be logged). FORMAT: syslog local-file size [1-500] level [0-7]
no	Disable the selected feature. FORMAT: syslog no [feature]

Command	Description
primary	Set the IP address of the primary Syslog server and/or the severity level of messages to be logged. FORMAT: syslog primary [1.2.3.4] level [0-7]
secondary	Set the IP address of the secondary (backup) Syslog server and/or the severity level of messages to be logged. FORMAT: syslog primary [1.2.3.4] level [0-7]
sta-format	Select format of station information in Syslog messages.
sta-url-log	Enable or disable station URL logging.
tertiary	Set Tertiary Syslog Server parameters.
time-format	Select format of date/time information in Syslog messages.

tunnel

The **tunnel** command [MyAP(config-tunnel)#] is used to establish your tunnel parameters.

Command	Description
add	Add a tunnel. FORMAT: tunnel add [newtunnel]
delete	Delete a tunnel. FORMAT: tunnel delete [oldtunnel]

Command	Description
edit	Modify an existing tunnel. FORMAT: tunnel edit [existingtunnel]
reset	Delete all existing tunnels. FORMAT: tunnel reset

uptime

The **uptime** command [**MyAP(config)# uptime**] is used to display the elapsed time since you last rebooted the AP.

Command	Description
continuous	Continuously update information.
<cr>	Display time since last reboot. FORMAT: uptime

vlan

The **vlan** command [**MyAP(config-vlan)#**] is used to establish your VLAN parameters.

Command	Description
add	Add a VLAN. FORMAT: vlan add [newvlan]

Command	Description
default-route	Assign a VLAN for the default route (for outbound management traffic). FORMAT: vlan default-route [defaultroute]
delete	Delete a VLAN. FORMAT: vlan delete [oldvlan]
edit	Modify an existing VLAN. FORMAT: vlan edit [existingvlan]
native-vlan	Assign a native VLAN (traffic is untagged). FORMAT: vlan native-vlan [nativevlan]
no	Disable the selected feature. FORMAT: vlan no [feature]
reset	Delete all existing VLANs. FORMAT: vlan reset

wifi-tag

The **wifi-tag** command [MyAP(config-wifi-tag)#] is used to enable or disable Wi-Fi tag capabilities. When enabled, the AP listens for and collects information

about Wi-Fi RFID tags sent on the designated channels. See also “Wi-Fi Tag” on page 190.

Command	Description
disable off	Disable wifi-tag. FORMAT: wifi-tag disable
enable on	Enable wifi-tag. FORMAT: wifi-tag enable
refresh	Disable and enable WiFi tag.
server	Set hostname or IP address of the tag server.
tag-channel-bg	Set an 802.11b or g channel for listening for tags. FORMAT: wifi-tag tag-channel-bg <1-255>
udp-port	Set the UDP port which a tagging server will use to query the AP for tagging information. FORMAT: wifi-tag udp-port <1025-65535>

Sample Configuration Tasks

This section provides examples of some of the common configuration tasks used with the Wireless AP, including:

- [“Configuring a Simple Open Global SSID” on page 498.](#)
- [“Configuring a Global SSID using WPA-PEAP” on page 499.](#)
- [“Configuring an SSID-Specific SSID using WPA-PEAP” on page 500.](#)
- [“Enabling Global IAPs” on page 501.](#)
- [“Disabling Global IAPs” on page 502.](#)
- [“Enabling a Specific IAP” on page 503.](#)
- [“Disabling a Specific IAP” on page 504.](#)
- [“Setting Cell Size Auto-Configuration for All IAPs” on page 505](#)
- [“Setting the Cell Size for All IAPs” on page 506.](#)
- [“Setting the Cell Size for a Specific IAP” on page 507.](#)
- [“Configuring VLANs on an Open SSID” on page 508.](#)
- [“Configuring Radio Assurance Mode \(Loopback Tests\)” on page 509.](#)

To facilitate the accurate and timely management of revisions to this section, the examples shown here are presented as screen images taken from a Secure Shell (SSH) session (in this case, PuTTY). Depending on the application you are using to access the Command Line Interface, and how your session is set up (for example, font and screen size), the images presented on your screen may be different than the images shown in this section. However, the data displayed will be the same.

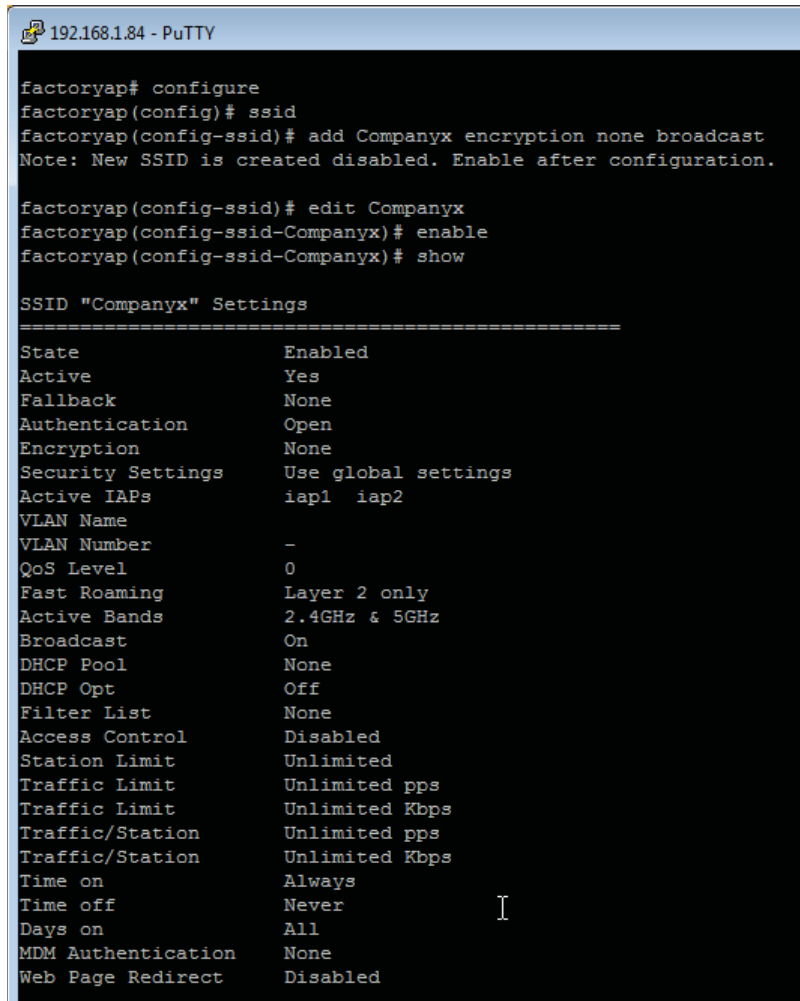

Some of the screen images shown in this section have been modified for clarity. For example, the image may have been “elongated” to show all data without the need for additional images or scrolling. We recommend that you use the Adobe PDF version of this User’s Guide when reviewing these examples—a hard copy document may be difficult to read.

As mentioned previously, the root command prompt is determined by the host name assigned to your AP.

Configuring a Simple Open Global SSID

This example shows you how to configure a simple open global SSID.

```
192.168.1.84 - PuTTY
factoryap# configure
factoryap(config)# ssid
factoryap(config-ssid)# add Companyx encryption none broadcast
Note: New SSID is created disabled. Enable after configuration.

factoryap(config-ssid)# edit Companyx
factoryap(config-ssid-Companyx)# enable
factoryap(config-ssid-Companyx)# show

SSID "Companyx" Settings
=====
State                Enabled
Active               Yes

Figure 223. Disabling a Specific IAP

Setting Cell Size Auto-Configuration for All IAPs

This example shows how to set the cell size for all enabled IAPs to be auto-configured (**auto**). (See “Fine Tuning Cell Sizes” on page 37.) The **auto_cell** option may be used with **global_settings**, **global_a_settings**, or **global_bg_settings**. It sets the cell size of the specified IAPs to **auto**, and it launches an auto-configuration to adjust the sizes. Be aware that if the **intrude-detect** feature is enabled on the **monitor** radio, its cell size is unaffected by this command. Also, any IAPs used in WDS links are unaffected.

Auto-configuration may be set to run periodically at intervals specified by **auto_cell period** (in seconds) if **period** is non-zero. The percentage of overlap allowed between cells in the cell size computation is specified by **auto_cell overlap** (0 to 100). This example sets auto-configuration to run every 1200 seconds with an allowed overlap of 5%.

```

Figure 224. Setting Cell Size Auto-Configuration for All IAPs

Setting the Cell Size for All IAPs

This example shows you how to establish the cell size for all IAPs (radios), regardless of the wireless technology they use. Be aware that if the **intrude-detect** feature is enabled on the monitor radio the cell size cannot be set globally—you must first disable the intrude-detect feature on the monitor radio.

In this example, the cell size is being set to **small** for all IAPs. You have the option of setting IAP cell sizes to small, medium, large, or max. See also, “[Fine Tuning Cell Sizes](#)” on page 37.

Setting the default route enables the AP to send management traffic, such as Syslog messages and SNMP information to a destination behind a router.

Figure 227. Configuring VLANs on an Open SSID

Configuring Radio Assurance Mode (Loopback Tests)

The AP uses its built-in monitor radio to monitor other radios in the AP. Tests include sending probes on all channels and checking for a response, and checking whether beacons are received from the other radio. If a problem is detected, corrective actions are taken to recover. Loopback mode operation is described in detail in [“AP Monitor and Radio Assurance Capabilities” on page 529](#).

The following actions may be configured:

- **alert-only**—the AP will issue an alert in the Syslog.
- **repair-without-reboot**—the AP will issue an alert and reset radios at the Physical Layer (Layer 1) and possibly at the MAC layer. The reset should not be noticed by users, and they will not need to reassociate.
- **reboot-allowed**—the AP will issue an alert, reset the radios, and schedule the AP to reboot at midnight (per local AP time) if necessary. All stations will need to reassociate to the AP.
- **off**—Disable IAP loopback tests (no self-monitoring occurs). Radio Assurance mode is off by default.

This is a global IAPs setting—the monitor radio will monitor all other radios according to the settings above, and it cannot be set up to monitor particular radios. Radio assurance mode requires Intrusion Detection to be set to Standard.

The following example shows you how to configure a loopback test.

```

192.168.39.125 - PuTTY

Xirrus-WiFi-Array# config
Xirrus-WiFi-Array(config)# interface iap
Xirrus-WiFi-Array(config-iap)# global_settings

Appendix B: FAQ and Special Topics

This appendix provides valuable support information that can help you resolve technical difficulties. Before contacting Xirrus, review all topics below and try to determine if your problem resides with the Wireless AP or your network infrastructure. Topics include:

- [“General Hints and Tips” on page 521](#)
- [“Frequently Asked Questions” on page 522](#)
- [“AP Monitor and Radio Assurance Capabilities” on page 529](#)
- [“RADIUS Vendor Specific Attribute \(VSA\) for Xirrus” on page 532](#)
- [“Location Service Data Formats” on page 533](#)
- [“Upgrading the AP Using the Boot Loader” on page 537](#)

General Hints and Tips

This section provides some useful tips that will optimize the reliability and performance of your Wireless APs.

- The Wireless AP requires careful handling. For best performance, units should be mounted in a dust-free and temperature-controlled environment.
- If using multiple APs in the same area, maintain a distance of at least 100 feet (30m) between APs if there is direct line-of-sight between the units, or at least 50 feet (15 m) if a wall or other barrier exists between the units.
- Keep the Wireless AP away from electrical devices or appliances that generate RF noise. Because the AP is generally mounted on ceilings, be aware of its position relative to lighting (especially fluorescent lighting).
- If you are deploying multiple units, the AP should be oriented so that the monitor radio is oriented in the direction of the least required coverage, because when in monitor mode the radio does not function as an AP servicing stations.
- The Wireless AP should only be used with Wi-Fi certified client devices.

Frequently Asked Questions

This section answers some of the most frequently asked questions, organized by functional area.

Multiple SSIDs

Q. What Are BSSIDs and SSIDs?

A. BSSID (Basic Service Set Identifier) refers to an individual access point radio and its associated clients. The identifier is the MAC address of the access point radio that forms the BSS.

A group of BSSs can be formed to allow stations in one BSS to communicate to stations in another BSS by way of a backbone that interconnects each access point.

The Extended Service Set (ESS) refers to the group of BSSIDs that are grouped together to form one ESS. The ESSID (often referred to as SSID or “wireless network name”) identifies the Extended Service Set. Clients must associate to a single ESS at any given time. Clients ignore traffic from other Extended Service Sets that do not have the same SSID.

Legacy access points typically support one SSID per access point. Xirrus Wireless APs support the ability for multiple SSIDs to be defined and used simultaneously.

Q. What would I use SSIDs for?

A. The creation of different wireless network names allows system administrators to separate types of users with different requirements. The following policies can be tied to an SSID:

- Minimum security required to join this SSID.

- The wireless Quality of Service (QoS) desired for this SSID.
- The wired VLAN associated with this SSID.

As an example, one SSID named **accounting** might require the highest level of security, while another SSID named **guests** might have low security requirements.

Another example may define an SSID named **voice** that supports voice over Wireless LAN phones with the highest possible Quality of Service (QoS) definition. This type of SSID might also forward traffic to specific VLANs on the wired network.

Q. How do I set up SSIDs?

- A.** Use the following procedure as a guideline. For more detailed information, go to [“SSIDs” on page 268](#).
1. From the Web Management Interface, go to the [SSID Management](#) page.
 2. Select **Yes** to make the SSID visible to all clients on the network. Although the Wireless AP will not broadcast SSIDs that are hidden, clients can still associate to a hidden SSID if they know the SSID name to connect to it.
 3. Select the minimum security that will be required by users for this SSID.
 4. If desired (optional), select a Quality of Service (QoS) setting for this SSID. The QoS setting you define here will prioritize wireless traffic for this SSID over other SSID wireless traffic.
 5. If desired (optional), select a VLAN that you want this traffic to be forwarded to on the wired network.
 6. If desired (optional), you can select which radios this SSID will not be available on—the default is to make this SSID available on all radios.
 7. Click on the **Save** button  if you wish to make your changes permanent.

8. If you need to edit any of the SSID settings, you can do so from the [SSID Management](#) page.

Security

Q. How do I ensure that I meet FIPS requirements?

- A.** To meet the Level 2 security requirements of FIPS 140-2, follow the instructions in [“Implementing FIPS Security”](#) on page 591.

Q. How do I configure the AP for PCI DSS auditing?

- A.** A. To audit PCI DSS requirements, follow the instructions in [“Auditing PCI DSS”](#) on page 585.

Q. How do I know my management session is secure?

- A.** Follow these guidelines:

- Administrator passwords

Always change the default administrator password (the default is **admin**), and choose a strong replacement password. When appropriate, issue **read only** administrator accounts.

- SSH versus Telnet

Be aware that Telnet is not secure over network connections and should be used only with a direct serial port connection. When connecting to the unit’s Command Line Interface over a network connection, you must use a Secure SHell (SSH) utility. The most commonly used freeware providing SSH tools is PuTTY. The AP only allows SSH-2 connections, so your SSH utility must be set up to use SSH-2.

- **Configuration auditing**
Do not change approved configuration settings. The optional XMS offers powerful management features for small or large Wireless AP deployments, and can audit your configuration settings automatically. In addition, using the XMS eliminates the need for an FTP server.

Q. Which wireless data encryption method should I use?

- A.** Wireless data encryption prevents eavesdropping on data being transmitted or received over the airwaves. The Wireless AP allows you to establish the following data encryption configuration options:

- **Open**
This option offers no data encryption and is **not recommended**, though you might choose this option if clients are required to use a VPN connection through a secure SSH utility, like PuTTY.
- **Wired Equivalent Privacy (WEP)**
This option provides minimal protection (though much better than using an open network). An early standard for wireless data encryption and supported by all Wi-Fi certified equipment, WEP is vulnerable to hacking and is therefore not recommended for use by Enterprise networks.
- **Wi-Fi Protected Access (WPA)**
This is a much stronger encryption model than WEP and uses TKIP (Temporal Key Integrity Protocol) with AES (Advanced Encryption Standard) to prevent WEP cracks.

TKIP solves security issues with WEP. It also allows you to establish encryption keys on a per-user-basis, with key rotation for added security. In addition, TKIP provides Message Integrity Check (MIC) functionality and prevents active attacks on the wireless network.

AES is the strongest encryption standard and is used by government agencies; however, old legacy hardware may not be capable of supporting the AES mode (it probably won't work on

older wireless clients). Because AES is the strongest encryption standard currently available, it is highly recommended for Enterprise networks.

Any of the above encryption modes can be used (and can be used at the same time).

TKIP encryption does not support high throughput rates, per the IEEE 802.11n.

Q. Which user authentication method should I use?

A. User authentication ensures that users are who they say they are. For example, the most obvious example of authentication is logging in with a user name and password. The Wireless AP allows you to choose between the following user authentication methods:

- Pre-Shared Key

Users must manually enter a key (pass phrase) on the client side of the wireless network that matches the key stored by the administrator in your Wireless APs.

- RADIUS 802.1x with EAP

802.1x uses a RADIUS server to authenticate large numbers of clients, and can handle different EAP (Extensible Authentication Protocol) authentication methods, including EAP-TLS, EAP-TTLS and EAP-PEAP. The RADIUS server can be internal (provided by the Wireless AP) or external. An external RADIUS server offers more functionality and is **recommended** for large Enterprise deployments.

When using this method, user names and passwords must be entered into the RADIUS server for user authentication.

- MAC Address ACLs (Access Control Lists)

MAC address ACLs provide a list of client adapter MAC addresses that are allowed or denied access to the wireless network. Access Control Lists work well when there are a limited

number of users—in this case, enter the MAC addresses of each user in the **Allow** list. In the event of a lost or stolen MAC adapter, enter the affected MAC address in the **Deny** list.

Q. Why do I need to authenticate my Wireless AP units?

A. When deploying multiple Wireless APs, you may need to define which units are part of which wireless network (for example, if you are establishing more than one network). In this case you need to employ the XMS, which can authenticate your APs automatically and ensure that only authorized units are associated with the defined wireless network.

Q. What is rogue AP (Access Point) detection?

A. The Wireless AP has integrated monitor capabilities, which can constantly scan the local wireless environment for rogue APs (non-Xirrus devices that are not part of your wireless network), unencrypted transmissions, and other security issues. Administrators can then classify each rogue AP and ensure that these devices do not interrupt or interfere with the network.

[General Hints and Tips](#)

[Multiple SSIDs](#)

[VLAN Support](#)

VLAN Support

Q. What Are VLANs?

A. Virtual Local Area Networks (VLANs) are a logical grouping of network devices that share a common network broadcast domain. Members of a particular VLAN can be on any segment of the physical network but logically only members of a particular VLAN can see each other.

VLANs are defined and implemented using the wired network switches that are VLAN capable. Packets are tagged for transmission on a

particular VLAN according to the IEEE 802.1Q standard, with VLAN switches processing packets according to the tag.

Q. What would I use VLANs for?

- A.** Logically separating different types of users, systems, applications, or other logical division aids in performance and management of different network devices. Different VLANs can also be assigned with different packet priorities to prioritize packets from one VLAN over packets from another VLAN.

VLANs are managed by software settings—instead of physically plugging in and moving network cables and users—which helps to ease network management tasks.

Q. What are Wireless VLANs?

- A.** Wireless VLANs allow similar functionality to the wired VLAN definitions and extend the operation of wired VLANs to the wireless side of the network.

Wireless VLANs can be mapped to wireless SSIDs so that traffic from wired VLANs can be sent to wireless users of a particular SSID. The reverse is also true, where wireless traffic originating from a particular SSID can be tagged for transmission on a particular wired VLAN.

Sixteen SSIDs can be defined on your AP, allowing a total of sixteen VLANs to be accessed (one per SSID).

As an example, to provide guest user access an SSID of **guest** might be created. This SSID could be mapped to a wired VLAN that segregates unknown users from the rest of the wired network and restricts them to Internet access only. Wireless users could then associate to the wireless network via the **guest** SSID and obtain access to the Internet through the selected VLAN, but would be unable to access other privileged network resources.

AP Monitor and Radio Assurance Capabilities

All models of the Wireless AP have integrated monitoring capabilities to check that the AP's radios are functioning correctly, and act as a threat sensor to detect and prevent intrusion from rogue access points.

Enabling Monitoring on the AP

Any radio may be set to monitor the AP or to be a normal radio. In order to enable the functions required for intrusion detection and for monitoring the other AP radios, you **must** configure one monitor radio on the IAP Settings window as follows:

- Check the **Enabled** checkbox.
- Set **Mode** to **Monitor**.
- Set **Channel** to **Monitor**.

The settings above will automatically set the **Antenna** selection to **Internal-Omni.**, also required for monitoring. See the [“IAP Settings” on page 313](#) for more details. The values above are the factory default settings for the AP.

You must also enable **RF Monitor Mode** on the AP (either **Timeshare** or **Dedicated**). See [“Advanced RF Settings” on page 358](#).

How Monitoring Works

When the monitor radio has been configured as just described, it performs these steps continuously (24/7) to check the other radios on the AP and detect possible intrusions:

1. The monitor radio scans all channels with a 200ms dwell time, hitting all channels about once every 10 seconds.
2. Each time it tunes to a new channel it sends out a probe request in an attempt to smoke out rogues.
3. It then listens for all probe responses and beacons to detect any rogues within earshot.
4. AP radios respond to that probe request with a probe response.

Intrusion Detection is enabled or disabled separately from monitoring. See [Step 1](#) in [“Intrusion Detection”](#) on page 373.

Radio Assurance

The AP is capable of performing continuous, comprehensive tests on its radios to assure that they are operating properly. Testing is enabled using the **Radio Assurance Mode** setting (see [“Advanced RF Settings”](#) on page 358). When this mode is enabled, the monitor radio performs loopback tests on the AP. Radio Assurance Mode requires **Intrusion Detection** to be set to **Standard** (See [Step 1](#) in [“Intrusion Detection”](#) on page 373).

When **Radio Assurance Mode** is enabled:

1. The AP keeps track of whether or not it hears beacons and probe responses from the AP's radios.
2. After 10 minutes (roughly 60 passes on a particular channel by the monitor radio), if it has not heard beacons or probe responses from one of the AP's radios it issues an alert in the Syslog. If repair is allowed (see [“Radio Assurance Options”](#) on page 531), the AP will reset and reprogram that particular radio at the Physical Layer (PHY—Layer 1). This action takes under 100ms and stations are not deauthenticated, thus users should not be impacted.
3. After another 10 minutes (roughly another 60 passes), if the monitor still has not heard beacons or probe responses from the malfunctioning radio it will again issue an alert in the Syslog. If repair is allowed, the AP will reset and reprogram the MAC (the lower sublayer of the Data Link Layer) and then all of the PHYs. This is a global action that affects all radios. This action takes roughly 300ms and stations are not deauthenticated, thus users should not be impacted.
4. After another 10 minutes, if the monitor still has not heard beacons or probe responses from that radio, it will again syslog the issue. If reboot is allowed (see [“Radio Assurance Options”](#) on page 531), the AP will schedule a reboot. This reboot will occur at one of the following times, whichever occurs first:

- When no stations are associated to the AP
- Midnight

Radio Assurance Options

If the monitor detects a problem with an AP radio as described above, it will take action according to the preference that you have specified in the **Radio Assurance Mode** setting on the [Advanced RF Settings](#) window (see [Step 2](#)):

- **Failure alerts only**—The AP will issue alerts in the Syslog, but will not initiate repairs or reboots.
- **Failure alerts & repairs, but no reboots**—The AP will issue alerts and perform resets of the PHY and MAC as described above.
- **Failure alerts & repairs & reboots if needed**—The AP will issue alerts, perform resets of the PHY and MAC, and schedule reboots as described above.
- **Disabled**—Disable loopback tests (no self-monitoring occurs). Loopback tests are disabled by default.

RADIUS Vendor Specific Attribute (VSA) for Xirrus

A RADIUS VSA is defined for Xirrus APs to control administrator privilege settings for user accounts. The RADIUS VSA is used by APs to define the following attribute for administrator accounts:

- **AP administrators**—the **Xirrus-Admin-Role** attribute sets the privilege level for this account. Set the value to the string defined in **Privilege Level Name** as described in [“About Creating Admin Accounts on the RADIUS Server”](#) on page 235.

Note that the VSA key (VENDOR value) for Xirrus is 21013:1.

dm	Device Mfg
dt	Device Type
dc	Device Class
px	Coordinate x
py	Coordinate y
pz	Coordinate z

Location Service Data Formats

Xirrus APs are able to capture and upload visitor analytics data, acting as a sensor network in addition to providing wireless connectivity. This data is sent to the location server in different formats, based on the type of server. The **Location Server URL**, **Location Customer Key**, and **Location Period** for reporting data are configured under Location settings. See “[Location](#)” on page 191 for details. If a **Location Customer Key** has been entered, data is sent encrypted using AES with that key.

Euclid Location Server

If the **Location Server URL** contains the string **euclid**, then it specifies a Euclid server. Data is sent at the specified intervals, in the proprietary format expected by the Euclid location server.

Non-Euclid Location Server

If the **Location Server URL** doesn't contain the string “euclid”, then data is sent as a JSON object at the specified intervals, with the following fields.

Field		Name	Description
In		Location Name	AP location string
ld		Location Data	Defined below
	vn	Version Number	Set to 1
	ma	MAC Address	Base IAP MAC Address
	mc	Message Count	Running message count (resets to 0 when AP is rebooted)
	lt	Location Table	Table of Stations and APs heard during this window
		si	Station ID Station MAC address (AES encrypted if cust-key is not blank)

Field	Name	Description
bi	BSSID	BSSID that the station is on (AES encrypted if cust-key is not blank). Only stations that are associated to this AP will have a bi (BSSID) field, i.e., for unassociated stations the bi (BSSID) field will not be included.
sm	Station OUI	OUI of Station manufacturer (the top 3 bytes of the MAC address that can be used to look up the manufacturer), unencrypted ***
ap	AP Flag	1=AP, 0=Station ***
dm	Device Mfg	Station manufacturer
dt	Device Type	Type of device, such as iPhone or Android ***
dc	Device Class	Category of device, such as phone or notebook ***
px	Coordinate x	These location coordinates are sent to the AP by XMS-Enterprise. They appear only if the AP has been placed on an XMS map. *
py	Coordinate y	
pz	Coordinate z	
cn	Count	Count of frames heard from device during this window ***
ot	Origin Time	Timestamp of first frame in this window (Unix time in seconds) ***
ct	Current Time	Timestamp of last frame in this window (Unix time in seconds) ***
cf	Current Frequency	Frequency (MHz) last frame was heard on ***
il	Interval Low	Minimum interval between frames (within 24 hr period) ***
ih	Interval High	Maximum interval between frames (within 24 hr period) ***
sl	Signal Low	Minimum signal strength (within 24 hr period) ***

Field		Name	Description
	sh	Signal High	Maximum signal strength (within 24 hr period) ***
	so	Signal Origin	Signal strength of first frame heard ***
	sc	Signal Current	Signal strength of last frame heard
	pr	Probe Request	For each radio hearing a probe request from a station: BSSID of receiving radio and the corresponding signal strength of last probe heard for the station on that radio ** ***

* X, y, and z indicate the station location in terms of the number of pixels from the top left (x=0, y=0, z=0) on the XMS map, where x and y are the horizontal and vertical axes on the map, respectively, and z is typically the station's distance below the AP from the mounting site. The scale is the distance covered by a pixel in feet or meters based on the map's scale setting.

** Sample format with four radios receiving a station's probe request:

```
"pr":{"00:0f:7d:44:03:20":-69,"00:0f:7d:44:03:30":-68,"00:0f:7d:44:03:40":-70,
"00:0f:7d:44:03:60":-60}
```

*** If the word **xirrus** is found in the URL, the AP assumes that you are using location based services for stations, and reduces the size of messages by dropping unneeded fields from the output. Specifically, the following fields will be dropped from the output for each station:

```
ap (dropped for stations, but included for rogue APs)
dt          ct          sl
dc          cf          sh
sm          il          so
cn          ih          pr
ot
```

In addition, with **xirrus** in the URL, only those stations whose RSSI (signal strength) is highest when compared to the station's RSSI at neighboring APs will

be sent. This also helps to minimize the number and size of messages, and largely eliminates duplicate data being sent. Note that if a station's RSSI is the same at two or more APs, then they will all send data, so there is a chance of seeing duplicates.

Upgrading the AP Using the Boot Loader

This procedure does not apply to Boot Loader versions 7000 or higher (these recent versions are supplied with ArrayOS 7.3 and above). See “Access Point Information” on page 102 to view the Boot Loader version on the AP.

If you are experiencing difficulties communicating with the AP using the Web Management Interface, the AP provides lower-level facilities that may be used to accomplish an upgrade via the Boot Loader (XBL).

1. Log in to your Xirrus customer support account and download the latest software update. The software update is provided as a zip file. Unzip the contents to a local temp directory. Take note of the extracted file name in case you need it later on—you may also need to copy this file elsewhere on the network depending on your situation.
2. Install a TFTP server software package if you don't have one running. It may be installed on any computer on your network, including your desktop or laptop. The Solar Winds version is freeware and works well.

<http://www.solarwinds.com>

The TFTP install process creates the **TFTP-Root** directory on your C: drive, which is the default target for sending and receiving files. This may be changed if desired. Place the extracted Xirrus software update file(s) on this directory.

You must make the following change to the default configuration of the Solar Winds TFTP server. In the **File** menu, select **Configure**, then select the **Security** tab. Click **Send files** and click **OK**.

3. Determine the IP address of the computer hosting the TFTP server. (To display the IP address, open a command prompt and type **ipconfig**)
4. Connect your AP to the computer running TFTP: a) if the AP has a Console port, connect a serial cable to it and open a terminal program; or b) use Xircon to communicate with the AP. [Download Xircon and see the](#)

[User's Guide here](#). You may also find this useful: [How can I access my AP if it does not seem to be accessible via IP? How do I access an AP via console or Xircon?](#)

Attach a network cable to the AP's Gig1 port, if it is not already part of your network. Boot your AP and watch the progress messages. When **Press space bar to exit to bootloader:** is displayed, press the space bar. The rest of this procedure is performed using the bootloader.

The following steps assume that you are running DHCP on your local network.

5. Type **dhcp** and hit return. This instructs the AP to obtain a DHCP address and use it during this boot in the bootloader environment.
6. Type **dir** and hit return to see what's currently in the compact flash.
7. Type **update server <TFTP-server-ip-addr> XS-7.x.x-xxxx.bin** (the actual file name will vary depending on AP model and software version—use the file name from your software update) and hit return. The software update will be transferred to the AP's memory and will be written to the compact flash card. (See output below.)
8. Type **dir** and hit return to verify that the new image is in the compact flash.
9. Type **env set bootfile_active XS-7.x.x-xxxx.bin** (the actual file name of the new image) and hit return. This sets the new image to be the current image—the image to load when the AP reboots.
10. Type **env save** and hit return to save the change you just made.
11. Type **boot** and hit return. Your AP will reboot, running your new version of software.

Sample Output for the Upgrade Procedure:

The user actions are highlighted in the output below, for clarity. Output will be in the form shown below, but may not be exactly the same.

Appendix C: Notices (XD and XR500/600 Series Only)

This Appendix contains Notices, Warnings, and Compliance information for the XD and XR500/600 Series only.

For Notices, Warnings, and Compliance information for outdoor products, please see the Quick Installation Guide for that product.

For Notices, Warnings, and Compliance information for all other APs, please see "Notices (XR-1000 to XR-6000 Indoor Models)" on page 561.

This appendix contains the following information:

- **"Notices" on page 543**
- **"EU Directive 1999/5/EC Compliance Information" on page 549**
- **"Compliance Information (Non-EU)" on page 556**
- **"Safety Warnings" on page 557**
- **"Translated Safety Warnings" on page 558**
- **"Software License and Product Warranty Agreement" on page 559**
- **"Hardware Warranty Agreement" on page 559**

Notices

Wi-Fi Alliance Certification

www.wi-fi.org

FCC Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate RF energy and, if not

installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following safety measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced wireless technician for help.

! *FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.*

This device complies with Part 15 of the FCC Rules, with operation subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause unwanted operation.

For XD2 models available in the USA/Canada market, only channels 1~11 can be operated in the 2.4GHz band. Selection of other channels is not possible.

This device and its antenna(s) must not be co-located or operating in conjunction with any other antenna or transmitter except in accordance with FCC multi-transmitter product procedures.

This device is restricted for indoor use.

Use of a shielded twisted pair (STP) cable must be used for all Ethernet connections in order to comply with EMC requirements.

Operations in the 5.15-5.25GHz band are restricted to indoor usage only.

IMPORTANT NOTE: FCC Radiation Exposure Statement

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. To ensure compliance with FCC and Industry Canada

Wireless Access Point

RF exposure requirements, this device must be installed in a location where the antennas of the device will have a minimum distance of at least 30 cm (12 inches) from all persons, except that XD2 models must have a minimum distance of at least 20 cm (8 inches) from all persons. Using higher gain antennas and types of antennas not certified for use with this product is not allowed. The device shall not be co-located with another transmitter.

High Power Radars

High power radars are allocated as primary users (meaning they have priority) in the 5250MHz to 5350MHz and 5650MHz to 5850MHz bands. These radars could cause interference and/or damage to LE-LAN devices.

Non-Modification Statement

Unauthorized changes or modifications to the device are not permitted. Use only the supplied internal antenna, or external antennas supplied by the manufacturer. Modifications to the device will void the warranty and may violate FCC regulations.

Cable Runs for Power over Ethernet (PoE)

If using PoE, the AP must be connected to PoE networks without routing cabling to the outside plant—this ensures that cabling is not exposed to lightning strikes or possible cross over from high voltage.

Battery Warning

- ! **Caution!** *The AP contains a battery which is not to be replaced by the customer. Danger of Explosion exists if the battery is incorrectly replaced. Replace only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer's instructions.*

UL Statement

Use only with listed ITE product.

Industry Canada Statement (XD Series)

This device complies with Industry Canada license-exempt RSS standards (RSS 247), and standards for Digital Transmission Systems (DTSS), Frequency Hopping Systems (FHSs) and License-Exempt Local Area Network (LE-LAN) Devices. Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes: (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

For product available in the USA/Canada market, only channel 1~11 can be operated. Selection of other channels is not possible.

Pour les produits disponibles aux États-Unis / Canada du marché, seul le canal 1 à 11 peuvent être exploités. Sélection d'autres canaux n'est pas possible.

This device and its antenna(s) must not be co-located or operating in conjunction with any other antenna or transmitter except in accordance with IC multi-transmitter product procedures.

Cet appareil et son antenne (s) ne doit pas être co-localisés ou fonctionner en association avec une autre antenne ou transmetteur.

Dynamic Frequency Selection (DFS) for devices operating in the bands 5250- 5350 MHz, 5470-5600 MHz and 5650-5725 MHz

Sélection dynamique de fréquences (DFS) pour les dispositifs fonctionnant dans les bandes 5250-5350 MHz, 5470-5600 MHz et 5650-5725 MHz

The device for operation in the band 5150-5250 MHz is only for indoor use to reduce the potential for harmful interference to co-channel mobile satellite systems.

Les dispositifs fonctionnant dans la bande 5150-5250 MHz sont réservés uniquement pour une utilisation à l'intérieur afin de réduire les risques de brouillage préjudiciable aux systèmes de satellites mobiles utilisant les mêmes canaux.

Wireless Access Point

Users should also be advised that high-power radars are allocated as primary users (i.e. priority users) of the bands 5250-5350 MHz and 5650-5850 MHz and that these radars could cause interference and/or damage to LE-LAN devices.

De plus, les utilisateurs devraient aussi être avisés que les utilisateurs de radars de haute puissance sont désignés utilisateurs principaux (c.-à-d., qu'ils ont la priorité) pour les bandes 5250-5350 MHz et 5650-5850 MHz et que ces radars pourraient causer du brouillage et/ou des dommages aux dispositifs LAN-EL.

For indoor use only.

Pour une utilisation en intérieur uniquement.

IMPORTANT NOTE:

IC Radiation Exposure Statement:

This equipment complies with IC RSS-102 radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20 cm between the radiator and your body.

Cet équipement est conforme aux limites d'exposition aux rayonnements IC établies pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20 cm de distance entre la source de rayonnement et votre corps.

Industry Canada Statement (non-XD Series)

This device complies with RSS-210 of the Industry Canada Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Ce dispositif est conforme à la norme CNR-210 d'Industrie Canada applicable aux appareils radio exempts de licence. Son fonctionnement est sujet aux deux conditions suivantes: (1) le dispositif ne doit pas produire de brouillage préjudiciable, et (2) ce dispositif doit accepter tout brouillage reçu, y compris un brouillage susceptible de provoquer un fonctionnement indésirable.

Caution:

(i) the device for operation in the band 5150-5250 MHz is only for indoor use to reduce the potential for harmful interference to co-channel mobile satellite systems;

(ii) high-power radars are allocated as primary users (i.e. priority users) of the bands 5250-5350 MHz and 5650-5850 MHz and that these radars could cause interference and/or damage to LE-LAN devices.

When operating the XR-600 Series in the band 5250-5350 MHz with a maximum e.i.r.p. greater than 200 mW in Canada, please adjust antenna/EUT to comply with the following e.i.r.p. elevation mask, where θ is the angle above the local horizontal plane (of the Earth) as shown below:

- (i) -13 dB(W/MHz) for $0^\circ \leq \theta < 8^\circ$
- (ii) $-13 - 0.716 (\theta - 8)$ dB(W/MHz) for $8^\circ \leq \theta < 40^\circ$
- (iii) $-35.9 - 1.22 (\theta - 40)$ dB(W/MHz) for $40^\circ \leq \theta \leq 45^\circ$
- (iv) -42 dB(W/MHz) for $\theta > 45^\circ$

Avertissement:

(i) les dispositifs fonctionnant dans la bande 5 150-5 250 MHz sont réservés uniquement pour une utilisation à l'intérieur afin de réduire les risques de brouillage préjudiciable aux systèmes de satellites mobiles utilisant les mêmes canaux;

(ii) De plus, les utilisateurs devraient aussi être avisés que les utilisateurs de radars de haute puissance sont désignés utilisateurs principaux (c.-à-d., qu'ils ont la priorité) pour les bandes 5 250-5 350 MHz et 5 650-5 850 MHz et que ces radars pourraient causer du brouillage et/ou des dommages aux dispositifs LAN-EL.

IMPORTANT NOTE:

IC Radiation Exposure Statement:

To ensure compliance with Industry Canada RF exposure requirements, this device must be installed in a location where the antennas of the device will have a minimum distance of at least 30 cm (12 inches) from all persons. Using higher gain antennas and types of antennas not certified for use with this product is not allowed. The device shall not be co-located with another transmitter.

Installez l'appareil en veillant à conserver une distance d'au moins 30 cm entre les éléments rayonnants et les personnes. Cet avertissement de sécurité est conforme aux limites d'exposition définies par la norme CNR-102 at relative aux fréquences radio.

EU Directive 1999/5/EC Compliance Information

This Appendix contains Notices, Warnings, and Compliance information for the XD and XR500/600 Series only. For other models, see the notes at the beginning of this appendix.

This section contains compliance information for the Xirrus Wireless AP family of products. The compliance information contained in this section is relevant to the European Union and other countries that have implemented the EU Directive 1999/5/EC.

Declaration of Conformity

- Cesky [Czech]** Toto zahzení je v souladu se základními požadavky a ostatními odpovídajícími ustanoveními Směrnice 1999/5/EC.
- Dansk [Danish]** Dette udstyr er i overensstemmelse med de væsentlige krav og andre relevante bestemmelser i Direktiv 1999/5/EF.
- Deutsch [German]** Dieses Gerät entspricht den grundlegenden Anforderungen und den weiteren entsprechenden Vorgaben der Richtlinie 1999/5/EU.
- Eesti [Estonian]** See seande vastab direktiivi 1999/5/EU olulistele nõuetele ja teistele asjakohastele sätetele.
- English** This equipment is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.
- Español [Spain]** Este equipo cumple con los requisitos esenciales así como con otras disposiciones de la Directiva 1999/5/CE.
- Ελληνική [Greek]** Αυτός ο εξοπλισμός είναι σε συμμόρφωση με τις ουσιαστικές απαιτήσεις και άλλες σχετικές διατάξεις της Οδηγίας 1999/5/EC.

- Français [French]** Cet appareil est conforme aux exigences essentielles et aux autres dispositions pertinentes de la Directive 1999/5/EC.
- Íslenska [Icelandic]** Þetta tæki er samkvæmt grunnkröfum og öðrum viðeigandi ákvæðum Tilskipunar 1999/5/EC.
- Italiano [Italian]** Questo apparato é conforme ai requisiti essenziali ed agli altri principi sanciti dalla Direttiva 1999/5/CE.
- Latviski [Latvian]** Šī iekārta atbilst Direktīvas 1999/5/EK būtiskajā prasībām un citiem ar to saistītajiem noteikumiem.
- Lietuvių [Lithuanian]** Šis įrenginys tenkina 1995/5/EB Direktyvos esminius reikalavimus ir kitas šios direktyvos nuostatas.
- Nederlands [Dutch]** Dit apparaat voldoet aan de essentiële eisen en andere van toepassing zijnde bepalingen van de Richtlijn 1995/5/EC.
- Malti [Maltese]** Dan l-apparant huwa konformi mal-htigiet essenzjali u l-provedimenti l-oħra rilevanti tad-Direttiva 1999/5/EC.
- Magyar [Hungarian]** Ez a készülék teljesíti az alapvető követelményeket és más 1999/5/EK irányelvben meghatározott vonatkozó rendelkezéseket.
- Norsk [Norwegian]** Dette utstyret er i samsvar med de grunnleggende krav og andre relevante bestemmelser i EU-direktiv 1999/5/EF.
- Polski [Polish]** Urządzenie jest zgodne z ogólnymi wymaganiami oraz szczególnymi mi warunkami określony mi Dyrektywą. UE:1999/5/EC.
- Português [Portuguese]** Este equipamento está em conformidade com os requisitos essenciais e outras provisões relevantes da Directiva 1999/5/EC.

- Slovensko [Slovenian]** Ta naprava je skladna z bistvenimi zahtevami in ostalimi relevantnimi popoji Direktive 1999/5/EC.
- Slovensky [Slovak]** Toto zariadenie je v zhode so základnými požiadavkami a inými príslušnými nariadeniami direktiv: 1999/5/EC.
- Suomi [Finnish]** Tämä laite täyttää direktiivin 1999/5//EY olennaiset vaatimukset ja on siinä asetettujen muiden laitetta koskevien määräysten mukainen.
- Svenska [Swedish]** Denna utrustning är i överensstämmelse med de väsentliga kraven och andra relevanta bestämmelser i Direktiv 1999/5/EC.

Assessment Criteria

The following standards were applied during the assessment of the product against the requirements of the Directive 1999/5/EC:

- Radio: EN 301 893 and EN 300 328 (if applicable)
- EMC: EN 301 489-1 and EN 301 489-17
- Safety: EN 60950, EN 62311 and EN 50385

CE Marking

For the Xirrus Wireless AP, the CE mark and Class-2 identifier opposite are affixed to the equipment and its packaging:

Russian Certification Marking

For the Xirrus XR-500, XR-520H, XR-2000, and XR-4000 Series Wireless APs, the approval mark is affixed to the equipment:

WEEE Compliance

- Natural resources were used in the production of this equipment.
- This equipment may contain hazardous substances that could impact the health of the environment.
- In order to avoid harm to the environment and consumption of natural resources, we encourage you to use appropriate take-back systems when disposing of this equipment.
- The appropriate take-back systems will reuse or recycle most of the materials of this equipment in a way that will not harm the environment.
- The crossed-out wheeled bin symbol (in accordance with European Standard EN 50419) invites you to use those take-back systems and advises you not to combine the material with refuse destined for a land fill.
- If you need more information on collection, reuse and recycling systems, please contact your local or regional waste administration.
- Please contact Xirrus for specific information on the environmental performance of our products.

National Restrictions

In the majority of the EU and other European countries, the 2.4 GHz and 5 GHz bands have been made available for the use of Wireless LANs. The following table provides an overview of the regulatory requirements in general that are applicable for the 2.4 GHz and 5 GHz bands.

Frequency Band (MHz)	Max Power Level (EIRP) (mW)	Indoor	Outdoor
2400–2483.5	100	X	X **
5250–5350 *	200	X	N/A
5470–5725*	1000	X	X

**Dynamic frequency selection and Transmit Power Control is required in these frequency bands.*

***France is indoor use only in the upper end of the band.*

The requirements for any country may change at any time. Xirrus recommends that you check with local authorities for the current status of their national regulations for both 2.4 GHz and 5 GHz wireless LANs.

The following countries have additional requirements or restrictions than those listed in the above table:

Belgium

The Belgian Institute for Postal Services and Telecommunications (BIPT) must be notified of any outdoor wireless link having a range exceeding 300 meters. Xirrus recommends checking at www.bipt.be for more details.

Draadloze verbindingen voor buitengebruik en met een reikwijdte van meer dan 300 meter dienen aangemeld te worden bij het Belgisch Instituut voor postdiensten en telecommunicatie (BIPT). Zie www.bipt.be voor meer gegevens.

Les liaisons sans fil pour une utilisation en extérieur d'une distance supérieure à 300 mètres doivent être notifiées à l'Institut Belge des services Postaux et des Télécommunications (IBPT). Visitez www.bipt.be pour de plus amples détails.

Greece

A license from EETT is required for the outdoor operation in the 5470 MHz to 5725 MHz band. Xirrus recommends checking www.eett.gr for more details.

Η δη ιουργβίκτ ωνεζωτερικο ρουστη ζ νησν νοτ των 5470–5725 MHz ε ιτρ ετάιωνο ετάά όάδειά της EETT, ου ορηγεβτάι στερά ά ό σ φωνη γν η του ΓΕΕΘΑ. ερισσότερες λε τομ ρειεωστο www.eett.gr

Italy

This product meets the National Radio Interface and the requirements specified in the National Frequency Allocation Table for Italy. Unless this wireless LAN product is operating within the boundaries of the owner's property, its use requires a "general authorization." Please check with www.comunicazioni.it/it/ for more details.

Questo prodotto é conforme alla specifiche di Interfaccia Radio Nazionali e rispetta il Piano Nazionale di ripartizione delle frequenze in Italia. Se non viene installato all'interno del proprio fondo, l'utilizzo di prodotti wireless LAN richiede una "autorizzazione Generale." Consultare www.comunicazioni.it/it/ per maggiori dettagli.

Norway, Switzerland and Liechtenstein

Although Norway, Switzerland and Liechtenstein are not EU member states, the EU Directive 1999/5/EC has also been implemented in those countries.

Calculating the Maximum Output Power

The regulatory limits for maximum output power are specified in EIRP (radiated power). The EIRP level of a device can be calculated by adding the gain of the antenna used (specified in dBi) to the output power available at the connector (specified in dBm).

Antennas

The Xirrus Wireless AP employs integrated antennas that cannot be removed and which are not user accessible. Nevertheless, as regulatory limits are not the same throughout the EU, users may need to adjust the conducted power setting for the radio to meet the EIRP limits applicable in their country or region. Adjustments can be made from the product's management interface—either Web Management Interface (WMI) or Command Line Interface (CLI).

Operating Frequency

The operating frequency in a wireless LAN is determined by the access point. As such, it is important that the access point is correctly configured to meet the local regulations. See [National Restrictions](#) in this section for more information.

If you still have questions regarding the compliance of Xirrus products or you cannot find the information you are looking for, please contact us at:

Compliance Information (Non-EU)

This Appendix contains Notices, Warnings, and Compliance information for the XD and XR500/600 Series only. For other models, see the notes at the beginning of this appendix.

This section contains compliance information for the Xirrus Wireless AP family of products. The compliance information contained in this section is relevant to the listed countries (outside of the European Union and other countries that have implemented the EU Directive 1999/5/EC).

Declaration of Conformity—Brazil

For XR-500 Only

Declaration of Conformity

Mexico XR-520: Dictamen #: 1402D00742
XR-600: Dictamen #: 1402CE08098

XR-520: Cofetel Cert #: RCPXIXR13-1003

Thailand This telecommunication equipment conforms to NTC technical requirement.

Safety Warnings

This Appendix contains Notices, Warnings, and Compliance information for the XD and XR500/600 Series only. For other models, see the notes at the beginning of this appendix.

Safety Warnings

Read all user documentation before powering this device. All Xirrus interconnected equipment should be contained indoors. This product is not suitable for outdoor operation. Please verify the integrity of the system ground prior to installing Xirrus equipment. Additionally, verify that the ambient operating temperature does not exceed 50°C (40°C for the XR500/600 Series).

Circuit Breaker Warning

The XR Series Wireless AP relies on the building's installation for over current protection. Ensure that a fuse or circuit breaker no larger than 120 VAC, 15A (U.S.) or 240 VAC, 10A (International) is used on all current-carrying conductors.

- ! **Explosive Device Proximity Warning**
Do not operate the XR Series Wireless AP near unshielded blasting caps or in an explosive environment unless the device has been modified to be especially qualified for such use.

- ! **Lightning Activity Warning**
Do not work on the XR Series Wireless AP or connect or disconnect cables during periods of lightning activity.

Translated safety warnings appear below.

Translated Safety Warnings

This Appendix contains Notices, Warnings, and Compliance information for the XD and XR500/600 Series only. For other models, see the notes at the beginning of this appendix.

Avertissements de Sécurité

- ! **Sécurité**
Lisez l'ensemble de la documentation utilisateur avant de mettre cet appareil sous tension. Tous les équipements Xirrus interconnectés doivent être installés en intérieur. Ce produit n'est pas conçu pour être utilisé en extérieur. Veuillez vérifier l'intégrité de la terre du système avant d'installer des équipements Xirrus. Vérifiez également que la température de fonctionnement ambiante n'excède pas 50°C (40°C pour XR-520).

- ! **Proximité d'appareils explosifs**
N'utilisez pas l'unité XR Wireless AP à proximité d'amorces non blindées ou dans un environnement explosif, à moins que l'appareil n'ait été spécifiquement modifié pour un tel usage.

- ! **Foudre**
N'utilisez pas l'unité XR Wireless AP et ne branchez pas ou ne débranchez pas de câbles en cas de foudre.
- ! **Disjoncteur**
L'unité XR Wireless AP dépend de l'installation du bâtiment pour ce qui est de la protection contre les surintensités. Assurez-vous qu'un fusible ou qu'un disjoncteur de 120 Vca, 15 A (États-Unis) ou de 240 Vca, 10 A (International) maximum est utilisé sur tous les conducteurs de courant.

Software License and Product Warranty Agreement

For Software License and Product Warranty information, please see <http://www.xirrus.com/support/eula/>.

Hardware Warranty Agreement

For Hardware Warranty information, please see <http://www.xirrus.com/support/eula/>.

Appendix D: Notices (XR-1000 to XR-6000 Indoor Models)

This Appendix contains Notices, Warnings, and Compliance information for these indoor model series: XR-1000, XR-2000, XR-4000, and XR-6000. This includes the models just listed whether or not they have been upgraded to have IEEE 802.11ac Wave2 wireless capability by replacing existing radios with XI-AC3470 modules.

For the XR-500/600/XD Series, please see “Notices (XD and XR500/600 Series Only)” on page 543.

For models including the letter H (such as the XR-520H and XH2-120), please see the Quick Installation Guide for that model.

This appendix contains the following information:

- “Notices” on page 561
- “EU Directive 1999/5/EC Compliance Information” on page 566
- “Compliance Information (Non-EU)” on page 573
- “Safety Warnings” on page 575
- “Translated Safety Warnings” on page 576
- “Software License and Product Warranty Agreement” on page 578
- “Hardware Warranty Agreement” on page 578

Notices

Wi-Fi Alliance Certification

www.wi-fi.org

FCC Notice

This device complies with Part 15 of the FCC Rules, with operation subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause unwanted operation.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate RF energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following safety measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Consult the dealer or an experienced wireless technician for help.

Use of a shielded twisted pair (STP) cable must be used for all Ethernet connections in order to comply with EMC requirements.

High Power Radars

High power radars are allocated as primary users (meaning they have priority) in the 5250MHz to 5350MHz and 5650MHz to 5850MHz bands. These radars could cause interference and/or damage to LE-LAN devices.

Non-Modification Statement

Unauthorized changes or modifications to the device are not permitted. Use only the supplied internal antenna, or external antennas supplied by the manufacturer. Modifications to the device will void the warranty, void the user's authority to operate the equipment, and may violate FCC regulations (Reference: FCC Part 15, section 15.21). Please see the Xirrus Web site for a list of all approved antennas.

Cable Runs for Power over Gigabit Ethernet (PoGE)

If using PoGE, the Array must be connected to PoGE networks without routing cabling to the outside plant—this ensures that cabling is not exposed to lightning strikes or possible cross over from high voltage.

UL Statement

Use only with listed ITE product.

Battery Warning

- ! **Caution!** The AP contains a battery which is not to be replaced by the customer. Danger of Explosion exists if the battery is incorrectly replaced. Replace only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer's instructions.

RF Radiation Hazard Warning (FCC and Industry Canada)

For APs with IEEE 802.11ac Wave2 radios, install the unit being careful to keep the separation distances indicated in the table below between radiating elements of access point and users. This is consistent with the security warning exposure limits specified by the RSS-102 to relative radio frequencies.

Pour les appareils IEEE 802.11ac Wave2, installez l'appareil en veillant à conserver les distances de séparation indiquées dans la table ci-dessus entre les éléments rayonnants et les personnes. Cet avertissement de sécurité est conforme aux limites d'exposition définies par la norme CNR-102 relative aux fréquences radio.

802.11ac Wave2 Modules (Radios) in AP	FCC Separation Distance (cm)	IC Separation Distance (cm)
1 module	20.0	21.2
XR6000 - 12 modules	51.3	51.6
XR4000 - 8 modules	44.0	50.8
XR2000 - 4 modules	31.1	39.9

For other APs, to ensure compliance with FCC and Industry Canada (IC) RF exposure requirements, this device must be installed in a location where the antennas of the device will have a minimum distance of at least 30 cm (12 inches) from all persons.

Pour les autres appareils, installez l'appareil en veillant à conserver une distance d'au moins 30 cm entre les éléments rayonnants et les personnes. Cet avertissement de sécurité est conforme aux limites d'exposition définies par la norme CNR-102 et relative aux fréquences radio.

Industry Canada Notice and Marking

This Class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

The term "IC:" before the radio certification number only signifies that Industry Canada technical specifications were met.

Under Industry Canada regulations, this radio transmitter may only operate using an antenna of a type and maximum (or lesser) gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

Conformément à la réglementation d'Industrie Canada, le présent émetteur radio peut fonctionner avec une antenne d'un type et d'un gain maximal (ou inférieur) approuvé pour l'émetteur par Industrie Canada. Dans le but de réduire les risques de brouillage radioélectrique à l'intention des autres utilisateurs, il faut choisir le type d'antenne et son gain de sorte que la puissance isotrope rayonnée équivalente (p.i.r.e.) ne dépasse pas l'intensité nécessaire à l'établissement d'une communication satisfaisante.

This device complies with Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes: (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Wireless Access Point

This equipment should be installed and operated with a minimum distance of 30cm between the radiator and your body.

Cet équipement doit être installé et utilisé à une distance minimale de 30cm entre le radiateur et votre corps.

High Power Radars

High power radars are allocated as primary users (meaning they have priority) in the 5250MHz to 5350MHz and 5650MHz to 5850MHz bands. These radars could cause interference and/or damage to LELAN devices used in Canada.

Les utilisateurs de radars de haute puissance sont désignés utilisateurs principaux (c.-à-d., qu'ils ont la priorité) pour les bandes 5 250 - 5 350 MHz et 5 650 - 5 850 MHz. Ces radars pourraient causer du brouillage et/ou des dommages aux dispositifs LAN-EL.

EU Directive 1999/5/EC Compliance Information

This Appendix contains Notices, Warnings, and Compliance information for these indoor model series: XR-1000, XR-2000, XR-4000, and XR-6000. This includes the models just listed whether or not they have been upgraded to have IEEE 802.11ac Wave2 wireless capability by replacing existing radios with XI-AC3470 modules.

For Notices, Warnings, and Compliance information for other models, see the notes at the beginning of this chapter.

This section contains compliance information for the Xirrus Wireless Array family of products. The compliance information contained in this section is relevant to the European Union and other countries that have implemented the EU Directive 1999/5/EC.

Declaration of Conformity

- Cesky [Czech]** Toto zahzení je v souladu se základními požadavky a ostatními odpovídajícími ustanoveními Směrnice 1999/5/EC.
- Dansk [Danish]** Dette udstyr er i overensstemmelse med de væsentlige krav og andre relevante bestemmelser i Direktiv 1999/5/EF.
- Deutsch [German]** Dieses Gerät entspricht den grundlegenden Anforderungen und den weiteren entsprechenden Vorgaben der Richtlinie 1999/5/EU.
- Eesti [Estonian]** See seande vastab direktiivi 1999/5/EU olulistele nõuetele ja teistele asjakohastele sätetele.
- English** This equipment is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.
- Español [Spain]** Este equipo cumple con los requisitos esenciales así como con otras disposiciones de la Directiva 1999/5/CE.

- Ελληνική [Greek]** Αυτόζ ο εξοπλισμός είναι σε συμμόρφωση με τις ουσιώδεις απαιτήσεις και ύλλες σχετικές διατάξεις της Οδηγιάζ 1999/5/EC.
- Français [French]** Cet appareil est conforme aux exigences essentielles et aux autres dispositions pertinentes de la Directive 1999/5/EC.
- Íslenska [Icelandic]** Þetta tæki er samkvæmt grunnkröfum og öðrum viðeigandi ákvæðum Tilskipunar 1999/5/EC.
- Italiano [Italian]** Questo apparato é conforme ai requisiti essenziali ed agli altri principi sanciti dalla Direttiva 1999/5/CE.
- Latviski [Latvian]** Šī iekārta atbilst Direktīvas 1999/5/EK būtiskajā prasībām un citiem ar to saistītajiem noteikumiem.
- Lietuvių [Lithuanian]** Šis įrenginys tenkina 1995/5/EB Direktyvos esminius reikalavimus ir kitas šios direktyvos nuostatas.
- Nederlands [Dutch]** Dit apparaat voldoet aan de essentiële eisen en andere van toepassing zijnde bepalingen van de Richtlijn 1995/5/EC.
- Malti [Maltese]** Dan l-apparant huwa konformi mal-htigiet essenzjali u l-provedimenti l-oħra rilevanti tad-Direttiva 1999/5/EC.
- Magyar [Hungarian]** Ez a készülék teljesíti az alapvető követelményeket és más 1999/5/EK irányelvben meghatározott vonatkozó rendelkezéseket.
- Norsk [Norwegian]** Dette utstyret er i samsvar med de grunnleggende krav og andre relevante bestemmelser i EU-direktiv 1999/5/EF.
- Polski [Polish]** Urządzenie jest zgodne z ogólnymi wymaganiami oraz szczególnymi mi warunkami określony mi Dyrektywą. UE:1999/5/EC.

- Portuguès [Portuguese]** Este equipamento está em conformidade com os requisitos essenciais e outras provisões relevantes da Directiva 1999/5/EC.
- Slovensko [Slovenian]** Ta naprava je skladna z bistvenimi zahtevami in ostalimi relevantnimi popoji Direktive 1999/5/EC.
- Slovensky [Slovak]** Toto zariadenie je v zhode so základnými požiadavkami a inými príslušnými nariadeniami direktiv: 1999/5/EC.
- Suomi [Finnish]** Tämä laite täyttää direktiivin 1999/5//EY olennaiset vaatimukset ja on siinä asetettujen muiden laitetta koskevien määräysten mukainen.
- Svenska [Swedish]** Denna utrustning är i överensstämmelse med de väsentliga kraven och andra relevanta bestämmelser i Direktiv 1999/5/EC.

Assessment Criteria

The following standards were applied during the assessment of the product against the requirements of the Directive 1999/5/EC:

- Radio: EN 301 893 and EN 300 328 (if applicable)
- EMC: EN 301 489-1 and EN 301 489-17
- Safety: EN 50371 to EN 50385, EN 60601, and EN60950

CE Marking

For the Xirrus Wireless Array, the CE mark and Class-2 identifier opposite are affixed to the equipment and its packaging:

WEEE Compliance

- Natural resources were used in the production of this equipment.
- This equipment may contain hazardous substances that could impact the health of the environment.
- In order to avoid harm to the environment and consumption of natural resources, we encourage you to use appropriate take-back systems when disposing of this equipment.
- The appropriate take-back systems will reuse or recycle most of the materials of this equipment in a way that will not harm the environment.
- The crossed-out wheeled bin symbol (in accordance with European Standard EN 50419) invites you to use those take-back systems and advises you not to combine the material with refuse destined for a land fill.
- If you need more information on collection, re-use and recycling systems, please contact your local or regional waste administration.
- Please contact Xirrus for specific information on the environmental performance of our products.

National Restrictions

In the majority of the EU and other European countries, the 2.4 GHz and 5 GHz bands have been made available for the use of Wireless LANs. The following table provides an overview of the regulatory requirements in general that are applicable for the 2.4 GHz and 5 GHz bands.

Frequency Band (MHz)	Max Power Level (EIRP) (mW)	Indoor	Outdoor
2400–2483.5	100	X	X **
5250–5350 *	200	X	N/A
5470–5725*	1000	X	X

**Dynamic frequency selection and Transmit Power Control is required in these frequency bands.*

***France is indoor use only in the upper end of the band.*

The requirements for any country may change at any time. Xirrus recommends that you check with local authorities for the current status of their national regulations for both 2.4 GHz and 5 GHz wireless LANs.

The following countries have additional requirements or restrictions than those listed in the above table:

Belgium

The Belgian Institute for Postal Services and Telecommunications (BIPT) must be notified of any outdoor wireless link having a range exceeding 300 meters. Xirrus recommends checking at www.bipt.be for more details.

Draadloze verbindingen voor buitengebruik en met een reikwijdte van meer dan 300 meter dienen aangemeld te worden bij het Belgisch Instituut voor postdiensten en telecommunicatie (BIPT). Zie www.bipt.be voor meer gegevens.

Wireless Access Point

Les liaisons sans fil pour une utilisation en extérieur d'une distance supérieure à 300 mètres doivent être notifiées à l'Institut Belge des services Postaux et des Télécommunications (IBPT). Visitez www.bipt.be pour de plus amples détails.

Greece

A license from EETT is required for the outdoor operation in the 5470 MHz to 5725 MHz band. Xirrus recommends checking www.eett.gr for more details.

Η δη ιουργβάικτ ωνεξωτερικο ρουστη ζ νησν νοτ των 5470–5725 MHz ε ιτρ ετάιωνο ετάά άάδειά της EETT, ου ορηγεβτάι στερά ά ό σ φωνη γν η του ΓΕΕΘΑ. ερισσότερες λε τομ ρειεωστο www.eett.gr

Italy

This product meets the National Radio Interface and the requirements specified in the National Frequency Allocation Table for Italy. Unless this wireless LAN product is operating within the boundaries of the owner's property, its use requires a "general authorization." Please check with www.comunicazioni.it/it/ for more details.

Questo prodotto é conforme alla specifiche di Interfaccia Radio Nazionali e rispetta il Piano Nazionale di ripartizione delle frequenze in Italia. Se non viene installato all'interno del proprio fondo, l'utilizzo di prodotti wireless LAN richiede una "autorizzazione Generale." Consultare www.comunicazioni.it/it/ per maggiori dettagli.

Norway, Switzerland and Liechtenstein

Although Norway, Switzerland and Liechtenstein are not EU member states, the EU Directive 1999/5/EC has also been implemented in those countries.

Calculating the Maximum Output Power

The regulatory limits for maximum output power are specified in EIRP (radiated power). The EIRP level of a device can be calculated by adding the gain of the antenna used (specified in dBi) to the output power available at the connector (specified in dBm).

Antennas

The Xirrus Wireless Array employs integrated antennas that cannot be removed and which are not user accessible. Nevertheless, as regulatory limits are not the same throughout the EU, users may need to adjust the conducted power setting for the radio to meet the EIRP limits applicable in their country or region. Adjustments can be made from the product's management interface—either Web Management Interface (WMI) or Command Line Interface (CLI).

Operating Frequency

The operating frequency in a wireless LAN is determined by the access point. As such, it is important that the access point is correctly configured to meet the local regulations. See [National Restrictions](#) in this section for more information.

Russia CU Approval (XR-2000/4000 Series)

For the Xirrus XR-2000 and XR-4000 Series Wireless Arrays, the approval mark is affixed to the equipment:

If you still have questions regarding the compliance of Xirrus products or you cannot find the information you are looking for, please contact us at:

Safety Warnings

This Appendix contains Notices, Warnings, and Compliance information for these indoor model series: XR-1000, XR-2000, XR-4000, and XR-6000. This includes the models just listed whether or not they have been upgraded to have IEEE 802.11ac Wave2 wireless capability by replacing existing radios with XI-AC3470 modules.

For Notices, Warnings, and Compliance information for other models, see the notes at the beginning of this chapter.

Safety Warnings

Read all user documentation before powering this device. All Xirrus interconnected equipment should be contained indoors. This product is not suitable for outdoor operation. Please verify the integrity of the system ground prior to installing Xirrus equipment. Additionally, verify that the ambient operating temperature does not exceed 50°C.

Explosive Device Proximity Warning

Do not operate the XR Series Wireless Array near unshielded blasting caps or in an explosive environment unless the device has been modified to be especially qualified for such use.

Lightning Activity Warning

Do not work on the XR Series Wireless Array or connect or disconnect cables during periods of lightning activity.

Circuit Breaker Warning

The XR Series Wireless Array relies on the building's installation for over current protection. Ensure that a fuse or circuit breaker no larger than 120 VAC, 15A (U.S.) or 240 VAC, 10A (International) is used on all current-carrying conductors.

Translated safety warnings appear on the following page.

Translated Safety Warnings

This Appendix contains Notices, Warnings, and Compliance information for these indoor model series: XR-1000, XR-2000, XR-4000, and XR-6000. This includes the models just listed whether or not they have been upgraded to have IEEE 802.11ac Wave2 wireless capability by replacing existing radios with XI-AC3470 modules.

For Notices, Warnings, and Compliance information for other models, see the notes at the beginning of this chapter.

Avertissements de Sécurité

Sécurité

Lisez l'ensemble de la documentation utilisateur avant de mettre cet appareil sous tension. Tous les équipements Xirrus interconnectés doivent être installés en intérieur. Ce produit n'est pas conçu pour être utilisé en extérieur. Veuillez vérifier l'intégrité de la terre du système avant d'installer des équipements Xirrus. Vérifiez également que la température de fonctionnement ambiante n'excède pas 50°C (40°C pour XR-520).

Proximité d'appareils explosifs

N'utilisez pas l'unité XR Wireless Array à proximité d'amorces non blindées ou dans un environnement explosif, à moins que l'appareil n'ait été spécifiquement modifié pour un tel usage.

Foudre

N'utilisez pas l'unité XR Wireless Array et ne branchez pas ou ne débranchez pas de câbles en cas de foudre.

! Disjoncteur

L'unité XR Wireless Array dépend de l'installation du bâtiment pour ce qui est de la protection contre les surintensités. Assurez-vous qu'un fusible ou qu'un disjoncteur de 120 Vca, 15 A (États-Unis) ou de 240 Vca, 10 A (International) maximum est utilisé sur tous les conducteurs de courant.

Software License and Product Warranty Agreement

For Software License and Product Warranty information, please see <http://www.xirrus.com/support/eula/>.

Hardware Warranty Agreement

For the Hardware Warranty Agreement, please see <http://www.xirrus.com/support/eula/>.

Appendix E: Medical Usage Notices

Xirrus XR-1000/2000/4000/6000 Series wireless devices have been tested and found to comply with the requirements of IEC 60601-1-2.

Section 5.2.1.1 - The Xirrus wireless device needs special precautions regarding EMC and must be installed and put into service according to the EMC information provided in this User's Guide and in the Quick Installation Guide for the Xirrus AP or AP.

Portable and mobile RF communications equipment can affect Medical Electrical Equipment.

Section 5.2.2.1 (c)

Table 1

Guidance and manufacturer's declaration – electromagnetic emissions		
The Xirrus wireless device is intended for use in the electromagnetic environment specified below. The customer or the user of the Xirrus device should assure that it is used in such an environment.		
Emissions test	Compliance	Electromagnetic environment – guidance
RF emissions CISPR 11	Group 1	The Xirrus wireless device uses RF energy only for its internal function. Therefore, its RF emissions are very low and are not likely to cause any interference in nearby electronic equipment.
RF emissions CISPR 11	Class A	Xirrus wireless devices are suitable for use in all establishments other than domestic and those directly connected to the public low-voltage power supply network that supplies buildings used for domestic purposes.
Harmonic emissions IEC 61000-3-2	Not Applicable	
Voltage fluctuations/flicker emissions IEC 61000-3-3	Not Applicable	

Section 5.2.2.1 (d) – The Xirrus wireless device should not be used adjacent to or stacked with other equipment. If adjacent or stacked use is necessary, the equipment should be observed to verify normal operation in the configuration in which it will be used.

Section 5.2.2.1 (f)

Table 2

Guidance and manufacturer's declaration – electromagnetic immunity			
Xirrus wireless devices are intended for use in the electromagnetic environment specified below. The customer or the user of the Xirrus wireless device should assure that it is used in such an environment.			
Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment - guidance
Electrostatic Discharge (ESD) IEC 61000-4-2	± 6 kV contact ± 8 kV air	± 6 kV contact ± 8 kV air	Floors should be wood, concrete or ceramic tile. If floors are covered with synthetic material, the relative humidity should be at least 30%.
Electrical fast transient/burst IEC 61000-4-4	± 2 kV for power supply lines ± 1 kV for input/output lines	Not applicable for power supply lines ± 1 kV for input/output lines	
Surge IEC 61000-4-5	± 1 kV line(s) to line(s) ± 2 kV line(s) to earth	Not applicable	Not applicable
Voltage dips, short interruptions and voltage variations on power supply input lines IEC 61000-4-11	<5% U_t (>95% dip in U_t) for 0.5 cycle 40% U_t (60% dip in U_t) for 5 cycles 70% U_t (30% dip in U_t) for 25 cycles <5% U_t (>95% dip in U_t) for 5 s	Not applicable	Not applicable
Power frequency (50/60 Hz) magnetic field IEC 61000-4-8	3 A/m	3 A/m	Power frequency magnetic fields should be at levels characteristic of a typical location in a typical commercial or hospital environment.
NOTE U_t is the a.c. mains voltage prior to application of the test level.			

Section 5.2.2.1 (g) Xirrus Wireless devices have no essential performance per IEC 60601-1-2.

Section 5.2.2.2 – Tables 4 and 6

Table 4 for non-life supporting equipment

Guidance and manufacturer’s declaration – electromagnetic immunity			
Xirrus wireless devices are intended for use in the electromagnetic environment specified below. The customer or the user of the Xirrus device should assure that it is used in such an environment.			
Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment - guidance
Conducted RF IEC 61000-4-6	3 Vrms 150 kHz to 80 MHz	3 V	<p>Portable and mobile RF communication equipment should be no closer to any part of the Xirrus wireless device, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter.</p> <p>Recommended separation distance</p> $d = 1.17 \cdot \sqrt{P}$
Radiated RF IEC61000-4-3	3 V/m 80 MHz to 2.5 GHz	3 V/m	$d = 1.17 \cdot \sqrt{P} \quad 80 \text{ MHz to } 800 \text{ MHz}$ $d = 2.33 \cdot \sqrt{P} \quad 800 \text{ MHz to } 2.5 \text{ GHz}$ <p>Where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and d is the recommended separation distance in metres (m).</p> <p>Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey^a, should be less than the compliance level in each frequency range^b.</p> <p> Interference may occur in the vicinity of equipment marked with this symbol:</p>

NOTE 1 At 80 MHz and 800 MHz, the higher frequency range applies.
NOTE 2 These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.
^a Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which Xirrus wireless devices are used exceeds the applicable RF compliance level above, the Xirrus wireless device should be observed to verify normal operation. If abnormal performance is observed, additional measures maybe necessary, such as re-orienting or relocating the Xirrus wireless device.
^b Over the frequency range 150 kHz to 80 MHz, field strengths should be less than 3 V/m.

Table 6 for non-life supporting equipment

Recommended separation distances between Medical Electrical Equipment and Xirrus Wireless Devices			
Xirrus wireless devices are intended for use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or the user of the Xirrus wireless device can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communication equipment (transmitters) and the Xirrus wireless device as recommended below, according to the maximum output power of the communications equipment.			
Rated maximum output power of transmitter W	Separation distance according to frequency of transmitter m		
	150 kHz to 80 MHz $d = 1.17 * \sqrt{P}$	80 MHz to 800 MHz $d = 1.17 * \sqrt{P}$	800 MHz to 2.5 GHz $d = 2.33 * \sqrt{P}$
0.01	0.12	0.12	0.23
0.1	0.37	0.37	0.74
1	1.17	1.17	2.33
10	3.7	3.7	7.37
100	11.7	11.7	23.3
For transmitters rated a maximum output power not listed above, the recommended separation distance d in metres (m) can be estimated using the equation applicable to the frequency of the transmitter, where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.			
NOTE 1 At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies.			
NOTE 2 These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection for structures, objects and people.			

Section 5.2.2.5

RF Channels Supported in the US	
2.4GHz (Exact channels available will be based on country of operation)	1 2 3 4 5 6 7 8 9 10 11
5GHz (Exact channels available will be based on country of operation)	UNII I – Non-DFS Channels: 36 40 44 48 UNII-2A – DFS channel: 52 56 60 64 UNII-2C – DFS channels: 100 104 108 112 116 120 124 128 132 136 140 144 UNI III – Non-DFS Channels: 149 153 157 161 165

RF Channels Supported in Europe	
2.4GHz (Exact channels available will be based on country of operation)	1 2 3 4 5 6 7 8 9 10 11 12 13
5GHz (Exact channels available will be based on country of operation)	UNII I – Non-DFS Channels: 36 40 44 48 UNII-2A – DFS channel: 52 56 60 64 UNII-2C – DFS channels: 100 104 108 112 116 120 124 128 132 136 140 144 UNI III – Non-DFS Channels: 149 153 157 161 165

Both single channels (20MHz bandwidth) and bonded channels (40MHz bandwidth) are supported.

! *Xirrus wireless devices may be interfered with by other equipment, even if that other equipment complies with CISPR EMISSION requirements.*

Section 5.2.2.6

The types of modulation used include CCK, QSPK, BPSK, DSS, OFDM, 16-QAM, and 64-QAM.

The regulatory limits for maximum output power are specified in EIRP (radiated power). The EIRP level is the transmit power setting for the IAP (specified in dBm). The table below shows worst case EIRP—actual values may be reduced based on country specific regulatory restrictions.

Maximum EIRP	
2.4GHz	36dBm
5150-5250MHz	23dBm
5250-5350MHz	30dBm
5470-5725MHz	30dBm
5725-5850MHz	36dBm

Appendix F: Auditing PCI DSS

The Payment Card Industry (PCI) Data Security Standard (DSS) was developed by major credit card companies to help those that process credit card transactions (or cardholder information) in order to secure cardholder information and protect it from unauthorized access, fraud and other security issues. The major contributors to the standard are VISA, MasterCard, American Express, JCB, and Discover. The standard also helps consolidate various individual standards that were developed by each of the listed card companies. Merchants or others who process credit card transactions are required to comply with the standard and to prove their compliance by way of an audit from a Qualified Security Assessor.

PCI DSS lays out a set of requirements that must be met in order to provide adequate security for sensitive data.

Payment Card Industry Data Security Standard Overview

The PCI Data Security Standard (PCI DSS) has 12 main requirements that are grouped into six *control objectives*. The following table lists each control objective and the specific requirements for each objective. For the latest updates to this list, check the PCI Security Standards Web site: www.pcisecuritystandards.org.

PCI DSS Control Objectives and Associated Requirements
<p>Objective: Build and Maintain a Secure Network</p> <ul style="list-style-type: none">● Requirement 1: Install and maintain a firewall configuration to protect cardholder data.● Requirement 2: Do not use vendor-supplied defaults for system passwords and other security parameters.
<p>Objective: Protect Cardholder Data</p> <ul style="list-style-type: none">● Requirement 3: Protect stored cardholder data.● Requirement 4: Encrypt transmission of cardholder data across open, public networks.

PCI DSS Control Objectives and Associated Requirements

PCI DSS and Wireless

The Xirrus AP provides numerous security features that allow it to be a component of a PCI DSS-compliant network. The following sections indicate the specific features that allow the AP to operate in a PCI DSS mode.

The Xirrus AP PCI Compliance Configuration

The check list below is designed to help ensure that APs are configured in a manner that is supportive of PCI Data Security Standards. Detailed configuration steps for each item are found in the referenced section of the User’s Guide.

✓	Xirrus AP Configuration for PCI DSS	See...
()	Register at the Xirrus Support Site to ensure notification and access to software updates.	support.xirrus.com
()	Confirm that the latest version of AOS is being used by checking the Xirrus web site.	
()	Enable PCI Mode after configuring the AP in a PCI compliant state to ensure configuration changes cannot be saved that would invalidate a PCI compliant configuration. This item is covered on the following pages.	The pci-audit Command, p. 588
()	Allow only necessary protocols and networks to be accessed by configuring your corporate firewall or using the internal AP firewall.	Filters, p. 391
()	Change the default Admin account password.	Express Setup, p. 163 Admin Management, p. 231 SNMP, p. 197 SSIDs, p. 268 and Global Settings, p. 250 SSIDs, p. 268 SSIDs, p. 268
()	Remove any unnecessary admin or user accounts.	
()	Change the SNMP community string from the default password.	
()	Use WPA2 and 802.1x authentication.	
()	Change default SSID to a user-defined SSID.	
()	Disable SSID broadcast for all PCI compliant SSIDs.	
()	Enable Secure Shell (ssh) for CLI (command line) access.	Management Control, p. 238 Global Settings, p. 319
()	Confirm telnet access is disabled (done by default).	
()	Confirm management over the wireless network is disabled.	

✓	Xirrus AP Configuration for PCI DSS	See...
()	Check that external RADIUS servers have been configured for use with 802.1x and WPA/WPA2 wireless security.	SSIDs , p. 268 and Global Settings , p. 250
()	Ensure that AP Administration Accounts are being validated by External RADIUS servers.	Admin RADIUS , p. 235
()	Ensure that each AP is physically inaccessible such that console ports and management ports are not accessible.	See Indoor Enclosure
()	Enable Syslog messaging and define a Syslog server on the wired network to receive Syslog messages.	System Log , p. 193
()	Enable NTP and define an NTP server (optional).	Time Settings (NTP) , p. 186
()	Enable the RF Monitor radio in the AP. Categorize known or approved devices as such. Respond to any alert of unknown or unapproved wireless devices discovered by the RF Monitor.	IAP Settings , p. 313 Rogue Control List , p. 264 Rogues , p. 120

The pci-audit Command

The AP provides a CLI command, `pci-audit` (part of the `management` command), that checks whether the AP's configuration satisfies PCI DSS wireless requirements. This command does not change any parameters, but will inform you of any violations that exist. Furthermore, the command `pci-audit enable` will put the AP in PCI Mode and monitor changes that you make to the AP's configuration in CLI or the WMI. PCI Mode will warn you (and issue a Syslog message) if the change violates PCI DSS requirements. A warning is issued when a non-compliant change is first applied to the AP, and also if you attempt to save a configuration that is non-compliant. Use this command in conjunction with [The Xirrus AP PCI Compliance Configuration](#) above to ensure that you are using the AP in accordance with the PCI DSS requirements.

The pci-audit command checks items such as:

- Telnet is disabled.
- Admin RADIUS is enabled (admin login authentication is via RADIUS server).
- An external Syslog server is in use.
- All SSIDs must set encryption to WPA or better (which also enforces 802.1x authentication)

Sample output from this command is shown below.

```
SS-AP(config)# pci-audit
PCI audit failure: telnet enabled.
PCI audit failure: admin RADIUS authentication disabled.
PCI audit failure: SSID ssid2 encryption too weak.
PCI audit failure: SSID ssid3 encryption too weak.
PCI audit failure: SSID ssid4 encryption too weak.
PCI audit failure: SSID ssid5 encryption too weak.
PCI audit failure: SSID ssid6 encryption too weak.
```

Figure 229. Sample output of pci-audit command

Appendix G: Implementing FIPS Security

APs may be configured to satisfy the requirements for Level 2 of *Federal Information Processing Standard (FIPS) Publication 140-2*. This appendix lists simple steps that must be followed exactly to implement FIPS 140-2, Level 2 on Xirrus APs. The procedures include physical actions, and parameters that must be set in the Web Management Interface (WMI) or Command Line Interface (CLI).

FIPS certification is granted to specific products running specific software releases. Please log in to support.xirrus.com and see the XR Series FIPS Certification library for the latest information.

To set up the AP for FIPS 140-2, Level 2, perform the following procedures:

- “Securing the AP Physically” on page 591
- “To implement FIPS 140-2, Level 2 using WMI” on page 593
- - or - “To implement FIPS 140-2, Level 2 using CLI:” on page 596
- “To check if AP is in FIPS mode:” on page 596

The settings that are required for FIPS Level 2 are discussed in:

- “About FIPS Configuration” on page 597

Securing the AP Physically

Operator Required Actions

The Cryptographic Officer is responsible for the following:

- Applying tamper evident seals to the cryptographic module.
- Controlling any unused tamper evident seals.
- Configuring, controlling, and observing changes to the module (e.g., reconfigurations) where the seals are removed or installed.
- Periodically inspecting the tamper evident seals.

Apply supplied tamper-evident seals to the AP as indicated in the figures below.

IMPORTANT:

- Before you apply the tamper-evident seal, clean the area of any grease, dirt, or oil. We recommend using alcohol-based cleaning pads for this.
- Each seal must be applied to straddle both sides of an opening or seam so that it will show if an attempt has been made to open or tamper with the AP or enclosure.

Applying Tamper Evident Seals

This section describes applying seals for indoor APs. For outdoor deployments, special outdoor AP models for FIPS must be ordered—these are modified at the factory for FIPS Level 2 compliance.

Indoor Enclosure, showing AP installed

Place 4 tamper evident seals as shown

Figure 230. Tamper Evident Seal Application for Indoor Enclosure

1. For Indoor APs: Install the AP in a properly mounted locking Indoor Enclosure, per the instructions in its *Quick Install Guide*. Verify that the AP is operational, then close and lock the enclosure.

Figure 231. Tamper Evident Seal Application Close-up

2. Apply four seals, near the middle of each of the sides of the enclosure and straddling the slight gap between the metal back and the plastic dome cover as shown below. **IMPORTANT: Make sure that each seal straddles a seam.**

To implement FIPS 140-2, Level 2 using WMI

You must enable FIPS 140-2, Level 2 Security on the AP by turning on the FIPS setting. For details of the configuration changes that are enforced by that command, see [“About FIPS Configuration” on page 597](#).

To enable FIPS using the Web Management Interface (WMI), follow the steps below after the AP has Internet connectivity. (To do this using the CLI, please see [“To implement FIPS 140-2, Level 2 using CLI:” on page 596](#).)

1. Open a web browser and enter the hostname of the AP. By default, this is its serial number, which may be found on the back of the AP and on the label of the box that it came in. For example, enter the URL `https://XR4012807707A`. Log in—the default user name/password is **admin/admin**. If you have any difficulties, please see [“AP Management Interfaces” on page 76](#).

The following steps must be performed in the order shown—you must enable FIPS 140-2 before you create SSIDs. Otherwise, FIPS mode will change the PSK keys of SSIDs, and you will not know what the keys are.

- First verify that the software release running on the unit has been certified for FIPS (see the [Note on page 591](#)). Click **Status > Access Point** in the menu on the left of the WMI window. Then click **Information**. In the **Software Configuration** section, check the **System Software Version**. ([Figure 232](#)) If you have the desired software version, skip to [Step 4](#).

HARDWARE

License Features	AOS 7.1 for 2 3x3 radios + RF Performance Manager + RF Analysis Manager + RF Security Manager + Application Control + Public Safety Band + 802.11ac + 802.11n		
OPERATING STATUS			
Time This Boot	Fri 2014-Oct-10 19:33:24 GMT		
Time Last Boot	Fri 2014-Oct-10 19:32:07 GMT		

Figure 232. AP Information

- If you need to run a different software release, first log in to your account at support.xirrus.com. Download the desired FIPS-certified software image (see the [Note on page 591](#)). Click **Tools > System Tools** in the menu on the left of the WMI window. Follow the directions in [Step — System Upgrade](#) under “System” on [page 414](#).
- Click **Configuration > Security** in the menu on the left of the WMI window. Then click **Management Control**. In the **Management Modes** section, set **FIPS 140-2, Level 2 Security** to **On**. ([Figure 233](#)) The AP will change the required settings, then reboot.

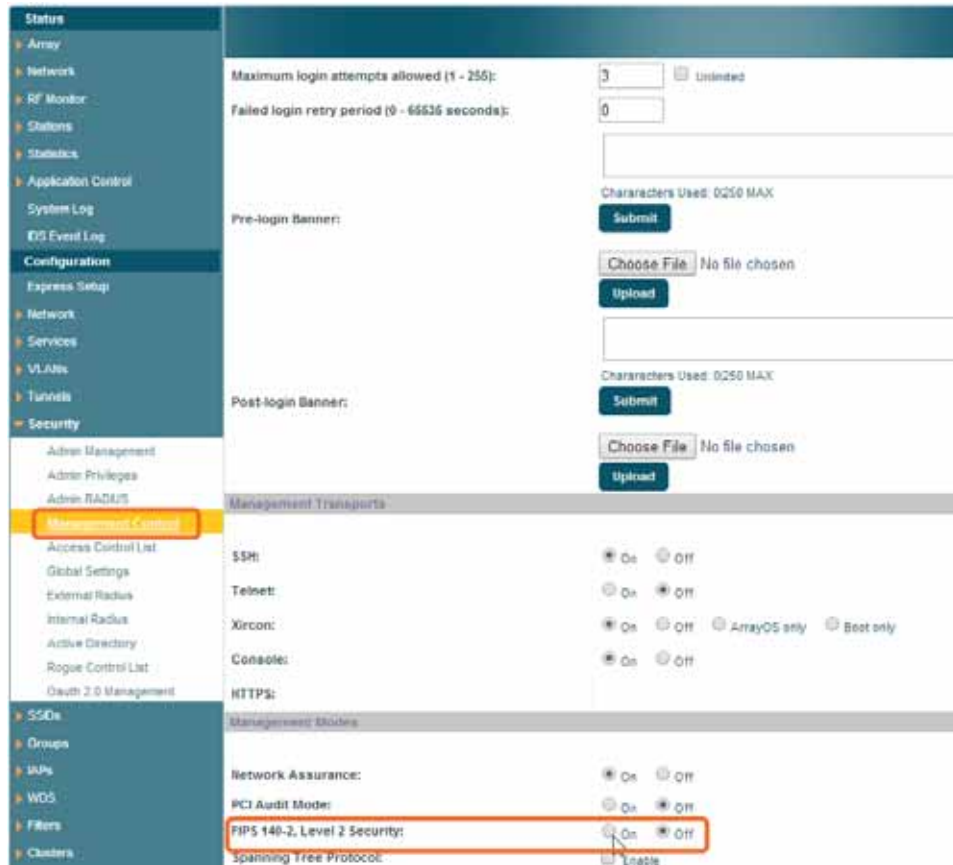

Figure 233. Security - Management Control Window

5. You may now proceed to define SSIDs, as described in “SSIDs” on page 227.

To implement FIPS 140-2, Level 2 using CLI:

For details of the settings that are enforced for FIPS Level 2, see “About FIPS Configuration” on page 597.

The following steps must be performed in the order shown—you must enable FIPS 140-2 before you create SSIDs. Otherwise, FIPS mode will change the PSK keys of SSIDs, and you will not know what the keys are.

1. Use the following command to check that the System Software version running on the unit is one that has been certified for FIPS (see the [Note on page 591](#)).

```
AP# show system-info
```

If necessary, upgrade the AP to a certified release. (See [Step 3](#) in the previous procedure.)

2. The following CLI commands will perform all of the settings required to put the AP in FIPS mode.

```
AP# config
AP(config)# management
AP(config-mgmt)# fips on
```

3. You may now proceed to define SSIDs, as described in “[SSIDs](#)” on [page 227](#).
4. Use the **fips off** command if you wish to stop enforcing FIPS security requirements on the AP.

```
AP(config-mgmt)# fips off
```

To check if AP is in FIPS mode:

You may determine whether or not the AP is running in FIPS mode.

- In the WMI, open the **Security > Management Control** page and view the **FIPS 140-2, Level 2 Security** setting.

- In the CLI, enter **show management** and check the **FIPS 140-2 Mode** setting.

[The Command Line Interface](#)

About FIPS Configuration

When you put the AP in FIPS mode, it checks that the following settings are in effect, and changes them as needed.

1. Telnet is disabled. See [“Management Control”](#) on page 238.
2. SSH is enabled. See [“Management Control”](#) on page 238.
3. SNMP (v1/v2/v3) is disabled. See [“SNMP”](#) on page 197.
4. Xircon is disabled. See [“Management Control”](#) on page 238.
5. XMS-Cloud management is disabled. See [“management”](#) on page 475.
6. Management over IAP is disabled. See [“Global Settings”](#) on page 319.
7. Fast roaming is disabled. See [“Global Settings”](#) on page 319.
8. RADIUS administrator authentication is disabled. See [“Admin RADIUS”](#) on page 235.
9. Global security settings: AES is enabled, TKIP is disabled, PSK is enabled, EAP is disabled, WPA Pre-Shared Key is set to the FIPS default hex value: 0123456789abcdef0123456789abcdef0123456789abcdef0123456789abcdef
See [“Global Settings”](#) on page 250.
10. SSID security settings: Encryption is set to WPA2, AES is enabled, TKIP is disabled, PSK is enabled, EAP is disabled, WPA Pre-Shared Key is set to the FIPS default hex value: 0123456789abcdef0123456789abcdef0123456789abcdef0123456789abcdef
See [“SSID Management”](#) on page 277.

11. These additional features are not allowed in FIPS mode: FTP, TFTP, and zero-touch activation. Only FIPS approved ciphers are used for SSH/HTTPS in FIPS mode.
12. When FIPS mode is enabled/disabled, CSPs (critical security parameters) are zeroed, configuration is saved and the system is rebooted.

Glossary of Terms

802.11a

A supplement to the IEEE 802.11 WLAN specification that describes radio transmissions at a frequency of 5 GHz and data rates of up to 54 Mbps.

802.11ac

A supplement to the IEEE 802.11 WLAN specification. Operates in the 5 GHz range, using a number of advanced techniques to achieve a maximum speed of 1.3 Gbps. These techniques include improvements on the methods used for 802.11n, below.

802.11b

A supplement to the IEEE 802.11 WLAN specification that describes radio transmissions at a frequency of 2.4 GHz and data rates of up to 11 Mbps.

802.11d

A supplement to the Media Access Control (MAC) layer in 802.11 to promote worldwide use of 802.11 WLANs. It allows Access Points to communicate information on the permissible radio channels with acceptable power levels for user devices. Because the 802.11 standards cannot legally operate in some countries, 802.11d adds features and restrictions to allow WLANs to operate within the rules of these countries.

802.11g

A supplement to the IEEE 802.11 WLAN specification that describes radio transmissions at a frequency of 2.4 GHz and data rates of up to 54 Mbps.

802.11n

A supplement to the IEEE 802.11 WLAN specification that describes enhancements to 802.11a/b/g to greatly enhance reach, speed, and capacity.

802.1Q

An IEEE standard for MAC layer [frame](#) tagging (also known as encapsulation). Frame tagging uniquely assigns a user-defined ID to each frame. It also enables a switch to communicate [VLAN](#) membership information across multiple (and multi-vendor) devices by frame tagging.

AES

(Advanced Encryption Standard) A data encryption scheme that uses three different key sizes (128-bit, 192-bit, and 256-bit). AES was adopted by the U.S. government in 2002 as the encryption standard for protecting sensitive but unclassified electronic data.

authentication

The process that a station, device, or user employs to announce its identify to the network which validates it. IEEE 802.11 specifies two forms of authentication, open system and shared key.

bandwidth

Specifies the amount of the frequency spectrum that is usable for data transfer. In other words, it identifies the maximum data rate a signal can attain on the medium without encountering significant attenuation (loss of power).

beacon interval

When a device in a wireless network sends a beacon, it includes with it a beacon interval, which specifies the period of time before it will send the beacon again. The interval tells receiving devices on the network how long they can wait in low power mode before waking up to handle the beacon. Network administrators can adjust the beacon interval—usually measured in milliseconds (ms) or its equivalent, kilo-microseconds (Kmsec).

bit rate

The transmission rate of binary symbols ('0' and '1'), equal to the total number of bits transmitted in one second.

BSS

(Basic Service Set) When a WLAN is operating in infrastructure mode, each access point and its connected devices are called the Basic Service Set.

BSSID

The unique identifier for an access point in a [BSS](#) network. See also, [SSID](#).

CDP

(Cisco Discovery Protocol) CDP is a layer 2 network protocol which runs on most Cisco equipment and some other network equipment. It is used to share information with other directly connected network devices. Information such as the model, network capabilities, and IP address is shared. Wireless APs can both advertise their presence by sending CDP announcements, and gather and display information sent by neighbors.

cell

The basic geographical unit of a cellular communications system. Service coverage of a given area is based on an interlocking network of cells, each with a radio base station (transmitter/receiver) at its center. The size of each cell is determined by the terrain and forecasted number of users.

channel

A specific portion of the radio spectrum—the channels allotted to one of the wireless networking protocols. For example, 802.11ac and 802.11g use 14 channels in the 2.4 GHz band, only 3 of which don't overlap (1, 6, and 11).

CoS

(Class of Service) A category based on the type of user, type of application, or some other criteria that QoS systems can use to provide differentiated classes of service.

default gateway

The gateway in a network that a computer will use to access another network if a gateway is not specified for use. In a network using subnets, a default gateway is the router that forwards traffic to a destination outside of the subnet of the transmitting device.

DHCP

(Dynamic Host Configuration Protocol) A method for dynamically assigning IP addresses to devices on a network. DHCP issues IP addresses automatically within a specified range to client devices when they are first powered up.

DHCP lease

The DHCP lease is the amount of time that the DHCP server grants to the DHCP client for permission to use a particular IP address. A typical DHCP server allows its administrator to set the lease time.

DNS

(Domain Name System) A system that maps meaningful domain names with complex numeric IP addresses. DNS is actually a separate network—if one DNS server cannot translate a domain name, it will ask a second or third until a server is found with the correct IP address.

domain

The main name/Internet address of a user's Internet site as registered with the InterNIC organization, which handles domain registration on the Internet. For example, the “domain” address for Google is: `http://www.google.com`, broken down as follows:

- **http://** represents the Hyper Text Teleprocessing Protocol used by all Web pages.
- **www** is a reference to the World Wide Web.
- **google** refers to the company.
- **com** specifies that the domain belongs to a commercial enterprise.

DTIM

(Delivery Traffic Indication Message) A DTIM is a signal sent as part of a beacon by an access point to a client device in sleep mode, alerting the device to a packet awaiting delivery.

EAP

(Extensible Authentication Protocol) When you log on to the Internet, you're most likely establishing a PPP connection via a remote access server. The password, key, or other device you use to prove that you are authorized to do so is controlled via PPP's Link Control Protocol (LCP). However, LCP is somewhat inflexible because it has to specify an authentication device early in the process. EAP allows the system to gather more information from the user before deciding which authenticator to use. It is called extensible because it allows more authenticator types than LCP (for example, passwords and public keys).

EDCF

(Enhanced Distributed Coordinator Function) A QoS extension which uses the same contention-based access mechanism as current devices but adds “offset contention windows” that separate high priority packets from low priority packets (by assigning a larger random backoff window to lower priorities than to higher priorities). The result is “statistical priority,” where high-priority packets usually are transmitted before low-priority packets.

encapsulation

A way of wrapping protocols such as TCP/IP, AppleTalk, and NetBEUI in Ethernet frames so they can traverse an Ethernet network and be unwrapped when they reach the destination computer.

encryption

Any procedure used in cryptography to translate data into a form that can be decrypted and read only by its intended receiver.

Fast Ethernet

A version of standard Ethernet that runs at 100 Mbps rather than 10 Mbps.

FCC

(Federal Communications Commission) US wireless regulatory authority. The FCC was established by the Communications Act of 1934 and is charged with regulating Interstate and International communications by radio, television, wire, satellite and cable.

FIPS

The [Federal Information Processing Standard \(FIPS\) Publication 140-2](#) establishes a computer security standard used to accredit cryptographic modules. The standard is a joint effort by the U.S. and Canadian governments.

frame

A packet encapsulated to travel on a physical medium, like Ethernet or Wi-Fi. If a packet is like a shipping container, a frame is the boat on which the shipping container is loaded.

Gigabit 1 through 4

The Gigabit Ethernet interfaces on XR Series APs. XR-4000 Series APs have two gigabit interfaces, while XR-6000 Series and higher models have four gigabit interfaces. See also, [Gigabit Ethernet](#).

Gigabit Ethernet

A version of Ethernet with data transfer rates of 1 Gigabit (1,000 Mbps).

Group

A user group, created to define a set of attributes (such as VLAN, traffic limits, and Web Page Redirect) and privileges (such as fast roaming) that apply to all users that are members of the group. This allows a uniform configuration to be easily applied to multiple user accounts. The attributes that can be configured for user groups are almost identical to those that can be configured for SSIDs.

host name

The unique name that identifies a computer on a network. On the Internet, the host name is in the form **comp.xyz.net**. If there is only one Internet site the host name is the same as the **domain** name. One computer can have more than one host name if it hosts more than one Internet site (for example, **home.xyz.net** and **comp.xyz.net**). In this case, **comp** and **home** are the host names and **xyz.net** is the domain name.

IPsec

A Layer 3 authentication and encryption protocol. Used to secure VPNs.

LLDP

The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used for advertising identities, capabilities, and neighbors on an IEEE 802 local area network

MAC address

(Media Access Control Address) A 6-byte hexadecimal address assigned by a manufacturer to a device.

Mbps

(Megabits per second) A standard measure for data transmission speeds (for example, the rate at which information travels over the Internet). 1 Mbps denotes one million bits per second.

MTU

(Maximum Transmission Unit) The largest physical packet size—measured in bytes—that a network can transmit. Any messages larger than the MTU are divided into smaller [packets](#) before being sent. Every network has a different MTU, which is set by the network administrator. Ideally, you want the MTU to be the same as the smallest MTU of all the networks between your machine and a message's final destination. Otherwise, if your messages are larger than one of the intervening MTUs, they will get broken up (fragmented), which slows down transmission speeds.

NTP

(Network Time Protocol) An Internet standard protocol (built on top of TCP/IP) that ensures the accurate synchronization (to the millisecond) of computer clock times in a network of computers. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust the client's clock.

packet

Data sent over a network is broken down into many small pieces—packets—by the Transmission Control Protocol layer of TCP/IP. Each packet contains the address of its destination as well the data. Packets may be sent on any number of routes to their destination, where they are reassembled into the original data. This system is optimal for connectionless networks, such as the Internet, where there are no fixed connections between two locations.

PLCP

(Physical Layer Convergence Protocol) Defined by IEEE 802.6, a protocol specified within the Transmission Convergence layer that defines exactly how cells are formatted within a data stream for a particular type of transmission facility.

POE

This refers to the optional Xirrus-supplied Power over Gigabit Ethernet modules that provide DC power to APs. Power is supplied over the same Cat 5e or Cat 6 cable that supplies the data connection to your gigabit Ethernet switch, thus eliminating the need to run a power cable.

preamble

Preamble (sometimes called a header) is a section of data at the head of a [packet](#) that contains information that the access point and client devices need when sending and receiving packets. [PLCP](#) Has two structures, a long and a short preamble. All compliant 802.11b systems have to support the long preamble. The short preamble option is provided in the standard to improve the efficiency of a network's throughput when transmitting special data, such as voice, VoIP (Voice-over IP) and streaming video.

private key

In cryptography, one of a pair of keys (one public and one private) that are created with the same algorithm for encrypting and decrypting messages and digital signatures. The private key is provided only to the requestor and never shared. The requestor uses the private key to decrypt text that has been encrypted with the public key by someone else.

PSK

(Pre-Shared Key) A TKIP passphrase used to protect your network traffic in WPA.

public key

In cryptography, one of a pair of keys (one public and one private) that are created with the same algorithm for encrypting and decrypting messages and digital signatures. The public key is made publicly available for encryption and decryption.

QoS

(Quality of Service) QoS can be used to describe any number of ways in which a network provider prioritizes or guarantees a service's performance.

RADIUS

(Remote Authentication Dial-In User Service) A client-server security protocol, developed to authenticate, authorize, and account for dial-up users. The RADIUS server stores user profiles, which include passwords and authorization attributes.

RSSI

(Received Signal Strength Indicator) A measure of the energy observed by an antenna when receiving a signal.

SDMA

(Spatial Division Multiple Access) A wireless communications mode that optimizes the use of the radio spectrum and minimizes cost by taking advantage of the directional properties of antennas. The antennas are highly directional, allowing duplicate frequencies to be used for multiple zones.

SNMP

(Simple Network Management Protocol) A standard protocol that regulates network management over the Internet.

SNTP

(Simple Network Time Protocol) A simplified version of NTP. SNTP can be used when the ultimate performance of the full NTP implementation described in RFC 1305 is not needed or justified.

SSH

(Secure SHell) Developed by SSH Communications Security, Secure Shell is a program to log into another computer over a network, to execute commands in a remote machine, and to move files from one machine to another. The AP only allows SSH-2 connections. SSH-2 provides strong authentication and secure communications over insecure channels. SSH-2 protects a network from attacks, such as IP spoofing, IP source routing, and DNS spoofing. Attackers who has managed to take over a network can only force SSH to disconnect—they cannot “play back” the traffic or hijack the connection when encryption is enabled. When using SSH-2’s `slogin` (instead of `rlogin`) the entire login session, including transmission of password, is encrypted making it almost impossible for an outsider to collect passwords. Be aware that your SSH utility must be set up to use SSH-2.

SSID

(Service Set Identifier) Every wireless network or network subset (such as a [BSS](#)) has a unique identifier called an SSID. Every device connected to that part of the network uses the same SSID to identify itself as part of the family—when it wants to gain access to the network or verify the origin of a data packet it is sending over the network. In short, it is the unique name shared among all devices in a WLAN.

subnet mask

A mask used to determine what subnet an IP address belongs to. An IP address has two components: (1) the network address and (2) the host address. For example, consider the IP address 150.215.017.009. Assuming this is part of a Class B network, the first two numbers (150.215) represent the Class B network address, and the second two numbers (017.009) identify a particular host on this network.

TKIP

(Temporal Key Integrity Protocol) Provides improved data encryption by scrambling the keys using a hashing algorithm and, by adding an integrity-checking feature, ensures that the encryption keys haven't been tampered with.

transmit power

The amount of power used by a radio transceiver to send the signal out. Transmit power is generally measured in milliwatts, which you can convert to dBm.

User group

See [Group](#).

VLAN

(Virtual LAN) A group of devices that communicate as a single network, even though they are physically located on different LAN segments. Because VLANs are based on logical rather than physical connections, they are extremely flexible. A device that is moved to another location can remain on the same VLAN without any hardware reconfiguration.

VLAN tagging

(Virtual LAN tagging) Static port-based VLANs were originally the only way to segment a network without using routing, but these port-based VLANs could only be implemented on a single switch (or switches) cabled together. Routing was required to transfer traffic between unconnected switches. As an alternative to routing, some vendors created proprietary schemes for sharing VLAN information across switches. These methods would only operate on that vendor's equipment and were not an acceptable way to implement VLANs. With the adoption of the [802.11n](#) standard, traffic can be confined to VLANs that exist on

Wireless Access Point

multiple switches from different vendors. This interoperability and traffic containment across different switches is the result of a switch's ability to use and recognize 802.1Q tag headers—called VLAN tagging. Switches that implement 802.1Q tagging add this tag header to the frame directly after the destination and source MAC addresses. The tag header indicates:

1. That the packet has a tag.
2. Whether the packet should have priority over other packets.
3. Which VLAN it belongs to, so that the switch can forward or filter it correctly.

WDS (Wireless Distribution System)

WDS creates wireless backhauls between APs. These links between APs may be used rather than having to install data cabling to each AP.

WEP

(Wired Equivalent Privacy) An optional IEEE 802.11 function that offers frame transmission privacy similar to a wired network. The Wired Equivalent Privacy generates secret shared encryption keys that both source and destination stations can use to alter frame bits to avoid disclosure to eavesdroppers.

Wi-Fi Alliance

A nonprofit international association formed in 1999 to certify interoperability of wireless Local Area Network products based on IEEE 802.11 specification. The goal of the Wi-Fi Alliance's members is to enhance the user experience through product interoperability.

Wireless AP

A high capacity wireless networking device consisting of multiple radios arranged in a circular AP.

WPA

(Wi-Fi Protected Access) A Wi-Fi Alliance standard that contains a subset of the IEEE 802.11i standard, using TKIP as an encryption method and 802.1x for authentication.

WPA2

(Wi-Fi Protected Access 2) WPA2 is the follow-on security method to WPA for wireless networks and provides stronger data protection and network access control. It offers Enterprise and consumer Wi-Fi users with a high level of assurance that only authorized users can access their wireless networks. Like WPA, WPA2 is designed to secure all versions of 802.11 devices, including 802.11a, 802.11b, 802.11g, and 802.11n, multi-band and multi-mode.

Xirrus Management System (XMS)

A Xirrus product used for managing large Wireless AP deployments from a centralized Web-based interface.

Xirrus Release 7.6 1/11/16
