Cleaning Chemicals Checklist

Understand your floor type

(it's essential to know since the wrong chemical can cause damage to your floor. For example, an oily surface needs water based Ultrascrub and food preparation areas need Bioscrub with biocidal cleaning activity)

Know your floor size

(This will help you decide how much chemical to order. They come in 5l, 20l tubs to 205 litre drums)

Cleaning Frequency

(Another factor in deciding how much chemical to order so you never run out)

Chemical dilution

(Make sure you have an easy way to get the dilution of the solution right and avoid guesswork. Usually 1 – 3 % solution to a full tank of water. Guesswork would result in too much residue from the chemical so the machine can't pick it up properly & it can block/hinder the water output)

Chemical Delivery & Customer Service

(Make sure you have a reliable, trustworthy supplier where customer service is a priority)

Storage

(Needs to be a priority for health and safety as well as keeping chemicals in good condition)

Safety

*(Keep your chemical data sheet visible so everyone is aware of what precautions to take, call us on **01684 850777** if you need a replacement or an extra copy)*

For expert advice or further information **call us on 01684 850777** or **e mail us at service@clemas.co.uk**
