Introduction	1
Hardware Installation	4
Using the Wireless Utility	5
Install Bluetooth	32

Chapter 1 Introduction

Thank you for using the Wireless MiniCard. The MM210-M is a single-band, quad-mode wireless network adapter with Bluetooth that works on all the frequencies allocated for WLAN operation everywhere in the world. It is in compliance with the IEEE802.11g, 802.11b standards, Bluetooth 2.0+ EDR. MM210-M features the compactness and high bus speed of the Minicard specifications which gives users of laptops, notebooks, tablet PCs, and other mobile computing devices transparent Internet access anywhere in the world through any WiFi network without software changes or additional hardware.

Able to provide greater than 54Mbps and Bluetooth real world throughput using high-speed spatial multiplexing modes, the MM210-M provides the freedom to work as you wish, wherever you wish, using whatever kind of application you wish to use. The adapter installs directly in any host device with a Mini PCI slot: just plug it in and you're ready to access local resources and/or the Internet at the highest speed the WLAN, the location, and the host computer can provide. It is ready to work "out of the box" in any embedded device or in any computer running Microsoft® Windows Vista, or XP. The MM210-M MiniCard is truly a "must-have" for every productivity-sensitive laptop, notebook, or tablet PC user and any bandwidth-sensitive embedded design.

Features and Benefits

• Standard Mini Card Connector with Multiple Interface Support

Module's 30.0 mm \times 30.0 mm footprint and minicard slot make it ideal for MiniCard attachment to an UMPC. Pin-selectable SPI, SDIO, USB, and UART interfaces.

Seamless Wireless Connectivity

The modules support the IEEE 802.11b/g standards for high speed and transparent interoperations with most home and business WLANs and all public hot spots around the world. Bluetooth v2.0+EDR supports the use of most recent user-end devices.

• Up-to-date, High-level Security

WEP, WPA, and WPA2 are supported to ensure maximum data privacy.

• Dynamic Rate Shifting

Wireless transmission speed is automatically adjusted on the basis of signal strength to achieve maximum availability and link reliability.

• BT and Cellular Coexistence

Industrial Bluetooth coexistence logics are included. There are two separated antenna for BT and WLAN. Coexist with cellular GSM, DCS, PCS and W-CDMA bands.

• Ultra Low Power Consumption

Excellent standby and Power Saving Mode current consumptions.

What is Wireless LAN?

Wireless Local Area Network (WLAN) systems offer a great number of advantages over traditional wired systems. WLANs are flexible and easy to setup and manage. They are also more economical than wired LAN systems.

Using radio frequency (RF) technology, WLANs transmit and receive data through the air. WLANs combine data connectivity with user mobility. For example, users can roam from a conference room to their office without being disconnected from the LAN.

Using WLANs, users can conveniently access shared information, and network administrators can configure and augment networks without installing or moving network cables.

WLAN technology provides users with many convenient and cost saving features:

- **Mobility:** WLANs provide LAN users with access to real-time information anywhere in their organization, providing service opportunities that are impossible with wired networks.
- Ease of Installation: Installing is easy for novice and expert users alike, eliminating the need to install network cables in walls and ceilings.
- Scalability: WLANs can be configured in a variety of topologies to adapt to specific applications and installations. Configurations are easily changed and range from peer-to-peer networks suitable for a small number of users to full infrastructure networks of thousands of users roaming over a broad area.

LAN Modes

Wireless LANs can be configured in one of two ways:

Ad-hoc Networking	Also known as a peer-to-peer network, an ad-hoc net- work is one that allows all workstations and computers in the network to act as servers to all other users on the network. Users on the network can share files, print to a shared printer, and access the Internet with a shared modem. However, with ad-hoc networking, users can only communicate with other wireless LAN computers that are in the wireless LAN workgroup, and are within range.
Infrastructure Networking	Infrastructure networking differs from ad-hoc network- ing in that it includes an access point. Unlike the ad- hoc structure where users on the LAN contend the shared bandwidth, on an infrastructure network the access point can manage the bandwidth to maximize bandwidth utilization.
	Additionally, the access point enables users on a wire- less LAN to access an existing wired network, allowing wireless users to take advantage of the wired networks resources, such as Internet, email, file transfer, and printer sharing.
	Infrastructure networking has the following advantages over ad-hoc networking:
	• Extended range: each wireless LAN computer within the range of the access point can commu- nicate with other wireless LAN computers within range of the access point.
	• Roaming: the access point enables a wireless LAN computer to move through a building and still be connected to the LAN.
	 Wired to wireless LAN connectivity: the access point bridges the gap between wireless LANs and their wired counterparts.

Table 1: LAN modes

Notes on wireless LAN configuration

When configuring a wireless LAN (WLAN), be sure to note the following points:

- Optimize the performance of the WLAN by ensuring that the distance between access points is not too far. In most buildings, WLAN cards operate within a range of 100 ~ 300 feet, depending on the thickness and structure of the walls.
- Radio waves can pass through walls and glass but not metal. If there is interference in transmitting through a wall, it may be that the wall has reinforcing metal in its structure. Install another access point to circumvent this problem.
- Floors usually have metal girders and metal reinforcing struts that interfere with WLAN transmission.

Chapter 2 Hardware Installation

This chapter covers how to installing the Wireless card in your embedded system.

Hardware description

The Wireless MiniCard has a standard Minicard interface for attaching to the Minicard connector on embedded system.

And this module has IPEX connector to connect to external antenna.

Outlook

Following is the Minicard outlook

Figure 1: MM210-M outlook

Chapter 3 Using the Wireless Utility

This module also come with a wireless utility, following describe how to use the utility.

Configuration Utility for 802.11b/g

The Client Card Configuration Utility allows configuration of MM210-M high throughput client cards through the following tabs:

- •Network Status—displays the status of the network to which the user is connected. The Configuration Utility initializes on this page.
- •Profile Manager—displays the current profiles and allows the user to set attributes for network type, security options, and protocols, as well as create/modify/delete profiles.
- •Site Survey—displays site survey information.
- •Statistics—displays the statistics of the current session.
- •Advanced—used to set protocol parameters.

•AutoLink—to set AutoLink connection

•Admin—used to import and export profiles.

•About—provides the information for the driver version number, firmware version number, Configuration Utility version number, and Medium Access Controller (MAC) address of the client card.

3.1 Network Status Tab

The **Network Status** tab displays the status of the network. When the Wireless client card Configuration Utility initializes, it displays the **Network Status** tab.

Network Status	Profile Manager	Site Survey	Statistics	Advanced	Auto Link	Admin About
Select Profile		-	Signal	Strength		512
<default></default>		×		100 %		A A¶ _g

Figure 2 :Network Status tab

3.1.1 Select Profile

The **Select Profile** section displays the name of the profile in use. Additional information about the profile is provided in the **Profile Manager**.

Select one of the profiles previously defined by clicking the **down arrow** and highlighting a profile from the pull-down list.

NELIONE	
MSHUME	

Figure 3: Select Profile

Profiles are created, modified, and deleted through the **ProfileManager**.

Note

This feature is disabled when Windows Zero Configuration Utility is enabled.

3.1.2 Link Information

The Link Information section contains the current information about the wireless connection.

Status:	Connected
Network SSID:	MSHOME
Network Type:	Infrastructure
Network BSSID:	00 0D 3A 24 02 49
Security:	Security Off
Tx/Rx Rates:	54 Mbps / 1 Mbps

Figure 4: Link Information Section

Field	Description
Status	Status of the wireless network connection:
	 Card Unplugged Client card is not plugged in, or client card is plugged in but not recognized.
	 Connected Client card is plugged in and connected to a wireless network.
	 No Connection Client card is plugged in, but no wireless connection.
	• No Radio Client card is plugged in, but the radio is turned off. Clear the Radio Off check box to turn the radio on.
	 Scanning for Scanning for available APs and wireless sta- tions in the area.
	• Waiting for peer Waiting for a peer station to connect to the wireless network (Ad-Hoc network only).
Network SSID	Network SSID label (i.e., Network Name). The Network Name is a text string of up to 32 characters.

Field	Description
Network Type	 Type of environment connected to: Infrastructure Mode In this mode, wireless clients send and receive information through APs. When a wireless client communicates with another, it transmits to the AP. First the AP receives the information and rebroadcasts it, then other devices receive the information. The APs are strategically located within an area to provide optimal coverage for wireless clients. A large WLAN uses multiple APs to provide coverage over a wide area. APs can connect to a LAN through a wired Ethernet connection. APs send and receive information from the LAN through the wired connection. Ad-Hoc Mode In this mode, wireless clients send and receive information to other wireless clients without using an AP. This type of WLAN only contains wireless clients. Use Ad-Hoc mode to connect network computers at home or in small office, or to
Network BSSID	Network Basic Service Set Identifier. The BSSID is a 48-bit identity used to identify a particular BSS within an area. In Infra- structure BSS networks, the BSSID is the MAC address of the AP. In independent BSS or Ad-Hoc networks, the BSSID is generated randomly.
Security	Reports the type and level of security set. The security level is set through the Profile Setting of the Profile Manager tab. Configure security settings also through the Site Survey tab when connecting to a network.
Tx/Rx Rates	Current Tx Rate and Rx Rate of the channel being monitored.

3.1.3 Signal Strength / Wireless Mode Indicator

The color-coded **Signal Strength** bar displays the signal strength of the last packet received by the client card.

Figure 5: Signal Strength

Signal strength is reported as a percentage. A signal in the red indicates a bad connection. A signal in the green indicates a good connection.

The Wireless Mode indicator shows the data rates the client card operates. There are two modes:

- 802.11b
 - 802.11g (backward compatible to 802.11b)

3.1.4 Internet Protocol (TCP/IP)

The Internet Protocol specifies the format of packets, also called datagrams, and the addressing scheme. Most networks combine IP with a higher-level protocol called TCP, which establishes a virtual connection between a destination and a source.

DHCP Option:	Disable
IP Address:	192.168.2.35
Subnet Mask:	255.255.255.0
Default Gateway:	-

Figure 6:Internet Potocol Section

Field	Description
DHCP Option	Dynamic Host Configuration Protocol. Either enabled or dis- abled.
IP Address	An identifier for a computer or device on a TCP/IP network. The format of an IP address is a 32-bit numeric address written as four numbers separated by periods. Each number can be 0 to 255.
Subnet Mask	A mask used to determine what subnet an IP address belongs to. An IP address has two components, the network address and the host address. The first two numbers represent the Class B network address, and the second two numbers identify a particular host on this network.
Default Gateway	The default node on a network that serves as an entrance to another network. In enterprises, the gateway is the computer that routes the traffic from a workstation to the outside network that is serving the Web pages. In homes, the gateway is the ISP that connects the user to the Internet.

Table 3 Internet Protocol Section Description

3.1.5 Actual Throughput Performance

This section of the **Network Status** tab displays the Current Tx Rate and the Current Rx Rate of the channel being monitored.

Figure 7: actual throughput diagrams

Note

These are actual throughput diagrams (without the WLAN overhead delivered by the client card).

3.1.6 Radio On/Off Check Box

Selecting the Radio Off check box turns off the radio. Clearing the check box turns on the radio.

Radio Off (Alt+F2)

Figure 8:Radio On/Off Check Box

Another way to turn the radio on or off is to right-click the **Configuration Utility** icon in **System Tray** and select **Turn Radio Off** to turn the radio off. When the radio is off, select **Turn Radio On** to turn the radio back on.

Restore Turn Radio Off
Exit

Figure 9: Radio On/Off in the System Tray

The system hot key **Alt+F2** can also be used to turn the radio on/off.

When the radio is off, there is no radio activity, and the following tabs are disabled:

- Profile Manager
- Site Survey
- Statistics
- Advanced
- AutoLink

Note

This feature is disabled when Windows Zero Configuration Utility is enabled.

3.2 Profile Manager Tab

The Profile Manager tab displays the profiles available and allows you to create, modify, and delete profiles.

etwork Status	Profile Manager	Site Survey	Stalistics	Advanced	d AutoLink	Admin	About

Figure 10: Figure 14: Profile Manager Tab

Note

The Profile Manager tab is not accessible when Windows Zero Configuration Utility is enabled.

PROFILE MANAGER—PROFILE LIST

The section on the left side of this tab lists all of the profiles available. Highlighting a profile selects it. If the check box next to the profile is selected, that profile is used in auto-configuration mode when the link is lost. If it is not selected, that profile is excluded in auto-configuration. The buttons associated with this window are as follows.

Button	Description
Apply Profile	Applies the profile selected. Apply the profile by double-clicking the desired profile.
Move Up / Down	Moves the list up and down in the window. All profiles with the Network Type set to Infrastructure are dis- played before the profiles with the Network Type set to Ad-Hoc. In auto-configuration mode, the selected profiles at the top of the list have higher priority than selected profiles at the bottom of the list.
Delete	Deletes a profile
Create	Creates a profile
Save	Saves changes made to a selected profile

Table 4:	Profile	List Se	ction De	scription
		100000	erron De	

PROFILE MANAGER—PROFILE SETTING The Profile Settings are used to set, modify, and display information about the profile selected in the **Profile List** section. The information is divided into three tabs:

- Network Info
- Security
- Protocol

3.2.1 Profile Setting—Network Info Tab

The Profile Manager initially displays the Network Info tab.

Network Info	Security	Protocol	
Profile Na	ime:	Winter Park	
Network !	SSID:	Winter Park	
Network	Туре:	Infrastructure	~
Wireless I	Mode:	Auto	~
Prefered I	Channel:	Auto Select	~

Channel V	Vidth:	Auto	*
Guard Inte	erval:	Auto	~
Extension	Channel:	Auto	~
Antenna 9	election:	Auto	~

Figure 11: Network Info Tab (Infrastructure Network)

The Network Info tab fields are as follows.

Field Description Name of profile selected **Profile Name** Network SSID Network SSID label Network Type • Infrastructure When an Infrastructure network is selected, the Profile Setting displays the Wireless Mode field. • Ad-Hoc When an Ad-Hoc network is selected, the Profile Setting displays an additional Preferred Channel field. Wireless Mode • Auto Connects to 802.11g network, or 802.11b network (Infrastructure network only). • 802.11g Connects to either 802.11g network or 802.11b network. • 802.11b Connects to 802.11b network only. **Preferred Channel** Channel being used (Ad-Hoc network only) Sets the channel bandwidth. Available options are Auto, 20 Channel Width MHz. The default is Auto. Sets the Guard Interval. Available options are Auto, Standard, Guard Interval and Short. The default is Auto.

Table 5: Network Info Tab Description

Field	Description
Extension Channel	Sets the extension channel mode when bandwidth is 40 MHz. Available options are Auto, None, Lower, and Upper. The default is Auto.
Antenna Selection	Sets the antenna selections. Available options are Auto, An- tenna A, Antenna B, 2 by 2, and 2 by 3. The default is Auto.

Note

The fields **Wireless Mode** and **Preferred Channel** are used only when an Ad-Hoc network is started by the client card. These two attributes are ignored if the client card is connected to an existing Ad-Hoc network with the same desired SSID.

3.2.2 Profile Setting—Security Tab

Clicking the Security tab displays the following security options:

- Authentication Mode
- Encryption Mode (Security off, WEP, TKIP, and AES)
- WEP Key Setting (Passphrase Key or Authentication Protocol)

Network Info	Security	Protocol

	Cantinu	ALTER Kow	

Figure 12: Security tab

3.2.2.1 Non-EAP Authentication Modes

The MM210-M Configuration Utility currently supports the following non-EAP authentication modes:

- Open System—Open Authentication (no key or a pre-shared WEP key is
- . required).
- Shared Key—Shared Authentication (a pre-shared WEP key is required)
- Auto Switch—Auto Select Authentication modes (Open System or Shared Key, WEP key required)
- WPA-PSK—WPA Pre-Shared Key
- WPA2-PSK—WPA2 Pre-Shared Key

3.2.2.2 EAP Authentication Modes

The MM210-M Configuration Utility currently supports the following EAP authentication modes:

- 802.1x (TLS/PEAP)
- . WPA (TLS/PEAP/LEAP)
- WPA2 (TLS/PEAP/LEAP)
- CCX (LEAP)

3.2.2.2.1 WPA-PSK/WPA2-PSK SUPPORT

In Infrastructure mode, if WPA-PSK/WPA2-PSK is selected as the Authentication Mode, the encryption method AES or TKIP can be selected.

Figure 28: Protocol Tab

DO NOT CHANGE SETTINGS

If this check box is selected, the protocol setting is not changed when the profile is applied.

USE BELOW SETTINGS If the **Do not change setting** check box is not selected, the protocol settings include the following parameters.

Field	Description
Power Save Mode	Sets the power mode. Available options are Continuous Access or Max Power Save. The default setting is Con- tinuous Access.
Preamble (802.11b)	Sets the Radio Preamble to Auto, Short or Long. This option takes effect only when attaching to an 802.11b network.
Transmit Rate	The range of the data rate depends on the type of AP that the client card is connected to. The default setting is Auto Select.
Fragment Threshold	Sets the fragmentation threshold (the size that packets are fragmented into for transmission). The default setting is 2346.
Region Code	Sets the region code. Available options are FCC (U.S.), IC (Canada), ETSI (Europe), Spain, France, and MKK (Japan).
RTS/CTS Threshold	Sets the packet size at which the AP issues a Request- To-Send (RTS) or Clear-to-Send (CTS) frame before sending the packet. The default setting is 2347.
Reset	Resets the protocol settings to their default values

Table 11: Protocol Tab Description

3.3 Site Survey Tab

The **Site Survey** tab displays a list of all peer-to-peer (Ad-Hoc) and AP stations within range of the client card.

Figure 29: Site Survey Tab

3.3.1 Site Survey—Networks Filter

This section lets you customize which sites are displayed in the Site Survey list:

- Display Peer-To-Peer stations—selecting this check box displays all peer-to-peer (Ad-Hoc) stations within range.
- Display 802.11g Access Points—selecting this check box displays all 802.11g APs within range.
- Display 802.11b Access Points—selecting this check box displays all 802.11b APs within range.

3.3.2 Site Survey—List of Detected Stations

This section reports information on the peer-to-peer (Ad-Hoc) stations or AP stations detected.

	Network SSID	MAC Address	Security	WMM	EWC	CH.	Signal	^

	<						>	

Figure 30: Site Survey-List of Detected Stations

Table 12:	List of	Detected	Stations	Description
-----------	---------	----------	----------	-------------

Field	Description
Network SSID	Network SSID label (i.e., the Network Name). The Net- work Name is a text string.
MAC Address	MAC address, a hardware address that uniquely identi- fies each node of a network
Security	Security enabled or disabled
СН	Channel used by the detected device
Signal	Signal strength of the detected device as a percentage
Icons	The following icons may be displayed left of the Network SSID:
	 An antenna icon with a subscript b indicates an 802.11b AP.
	 An antenna icon with a subscript g indicates an 802.11g AP.
	• A circle around the antenna icon means the client card is connected to this network.
	 A slash icon indicates an Ad-Hoc network.
WMM	Wireless Multimedia Enhancements (WMM) supported by the detected device
Network Type	Type of environment connected to: Ad-Hoc or Infrastruc- ture

3.3.3 Site Survey—Filter Button

Clicking the Filter button displays the Advanced Filter window.

Any BSSID
C Find ashord, with this BCCID.
Find network with this BSSID:
00 00 00 00 00 00
🗸 only
to channel

Figure 31: Figure 36: Site Survey—Advanced Filter Window

3.3.3.1 Network SSID

- **Any SSID**—no specific SSID is used when scanning for available net works in the area.
- Find network with this SSID—the utility searches for the specified SSID.

3.3.3.2 Network BSSID

- **Any BSSID**—no specific BSSID is used when scanning for available networks in the area.
- **Find network with this BSSID**—the utility searches for the specified BSSID.

3.3.3.3 Select Channel

- **Scan all channels**—all channels are scanned when searching for available networks in the area.
- Scan channel Only—only the specified channel is scanned when searching for available networks in the area.
- Scan Channel to Channel—a range of channels are scanned when searching for available networks in the area.

3.3.4 Site Survey—Refresh Button

Clicking the **Refresh** button requests a survey of the wireless networks in the area.

3.3.5 Site Survey—Associate Button

Select an available network, and then click the **Associate** button to establish a connection. Alternatively, the connection can be established by double-clicking the selected network.

3.4 Statistics Tab

Clicking the Statistics tab displays the statistics of the current connect session.

twork Status	Profile Manager	Site Survey	Statistics	Advanced	Auto Link	Admin Abo
Signal Streng	th					
		00 %				N
Transmit			Receive			
Elenent	Data		Elem	ent	Data

Figure 32: Statistics Tab

3.4.1 Signal Strength

The color-coded Signal Strength bar displays the signal strength of the last packet received by the client card. Signal strength is reported as a percentage. A signal in the red indicates a bad connection. A signal in the green indicates a good connection.

3.4.2 Transmit Section

The Transmit section displays the information on the packets sent.

Element	Data	
Total Packet	74	
Unicast Packet	74	
Multicast Packet	0	
Single Retries	3	
Multiple Retries	2	
Failed Count	0	
RTS Success	0	
RTS Failure	0	
ACK Error	0	

Figure 33: Transmit Section

Field	Description
Total Packet	Reports the total number of packets transmitted
Unicast Packet	Reports the number of packets transmitted by the client card that were destined for a single network node
Multicast Packet	Reports the number of packets transmitted by the client card that were destined for more than one network node
Single Retries	Reports the number of packets that require one retry be- fore the client card received an acknowledgement.
	NOTE: After the client card sends a packet, it waits for an acknowledge from the receiving radio to confirm that the packet was successfully received. If the acknowledge is not received within a specified period of time, the client card retransmits the packet.
Multiple Retries	Reports the number of packets that require more than one retry before the client card received an acknowledgement
Failed Count	Reports the number of packets that were not successfully transmitted because the client card did not receive an acknowledge within the specified period of time
RTS Success	Reports the number of RTS attempts that were successful
RTS Failure	Reports the number of RTS attempts that were not successful
ACK Error	Reports the number of unicast transmit attempts for which no acknowledgement was received

Table 13: Transmit Section Description

3.4.3 Receive Section

The **Receive** section displays the information on the packets received.

Element	Data	
Total Packet	1080	
Unicast Packet	1070	
Multicast Packet	10	
Duplicate Frame	15	
Received Beacons	839	
Beacon Loss	26	

Figure 34: Receive Section

Field	Description
Total Packet	Reports the total number of packets received
Unicast Packet	Reports the number of packets received by the client card that were destined for a single network node
Multicast Packet	Reports the number of packets received by the client card that were destined for more than one network node
Duplicate Frame	Reports the number of duplicate frames received
Received Beacons	Reports the number of beacons received after association is established
Beacon Loss	Reports the number of missing beacons after association is established

Table 14: Receive Section Description

3.4.4 Protocol Section

The $\ensuremath{\text{Protocol}}$ section displays the information on the protocol status.

Element	Data
Preamble	Long
Tx Power	Auto

Figure 35: Protocol Section

Field	Description
Preamble	Displays radio preamble type: • Auto
	Short
	• Long
Tx Power	Displays transmit power mode: • Auto
	• High
	• Medium
	• Low

Table 15	Protocol	Section	Description
----------	----------	---------	-------------

3.5 Advanced Tab

The **Advanced** tab displays the advanced parameters available for the installed MM210-M client cards.

MIMO Powersave	
Off 🗸	

Figure 37: Miscellaneous Section

Field	Description
Auto connect if link loss or no connection (Use checked profiles in <profile man-<br="">ager>)</profile>	Clear this check box to disable the auto- configuration feature. Whenever there is a link loss, auto-configuration tries to estab- lish a connection to the checked profiles in the Profile Manager window.
Boost Mode	Select this check box for performance enhancement.
Enable WMM	Select this check box to enable/disable the Wireless Multimedia Enhancements (WMM) feature.
Worldwide regulatory domain	Select this check box to set the regulatory domain

3.6 AutoLink Tab

To enable AutoLink mode, proceed as follows:

- 1. Toggle the AutoLink button on the Access Point to enable AutoLink mode.
- 2. Toggle the AutoLink button on the client to enter AutoLink mode.

Figure 38: Access Point Autolink Button Within 60 seconds, the AutoLink will be completed.

Figure 39: Auto Link Tab (Client)

AutoLink is complete.

3.7 Admin Tab

The Admin tab allows you to import and export profiles.

Network Status Profile Mana	ger Site Survey	Statistics	Advanced	Auto Link	Admin	Abou

Figure 40: Admin Tab

3.7.1 Admin Tab—Import Profiles

To import a profile, proceed as follows:

- 1. 1. Click Import Profiles.
- 2. 2. Select the path and filename of the profile.
- 3. 3. Click Open.

3.7.2 Admin Tab—Export Profiles

To export a profile, proceed as follows:

- 1. 1. Click Export Profiles.
- 2. 2. Select or enter the path and filename of the profile.
- 3. 3. Click Save.

3.8 About Tab

The About tab displays information about the MM210-M Client Card Configuration Utility.

Figure 41: About Tab

Chapter 4 Install Bluetooth

MM210-M also support Bluetooth function. Below shows how to install Bluetooth device.

4.1 How to install Bluetooth device

BlueSoleil (Standard) Edition Quick Installation Guide

System Requirement

A PC running Windows 2000 or Xp:

- Processor Minimum: 266 MHz; Recommend: 1GHz
- Memory Minimum: 64 MB RAM;
- Recommend: 256 MB RAM
- 12 MB free space on hard disk

1. Install BlueSoleil

- 1.1 Click setup.exe to start installation.
- 1.2 Choose the setup language.

Choose S	etup Language X	1
Z	Select the language for this installation from the choices below.	
	English (United States)	
	OK Cancel	

1.3 Go ahead following the instructions of the Wizard.

fall and the set of Shield W	/izard
	Welcome to the InstallShield Wizard for BlueSoleil
6	The InstallShield(R) Wizard will install BlueSoleil on your computer. To continue, click Next.
	WARNING: This program is protected by copyright law and international treaties.
	< Back Next > Cancel

1.4 Restart your system.

👘 BlueSo	leil Installer Information		\times
1	You must restart your system changes made to BlueSoleil to restart now or No if you plan	n for the configuration o take effect. Click Yes to to restart later.	
	Yes	No	

1.5 Insert your Bluetooth device into USB/other port.

2. Start up BlueSoleil

2.1 Start up BlueSoleil following the instructions in the image.

10-CD						
🛛 🧰 Programs	•	(h)	Accessories	•		
Documents	•		Startup Microsoft Visual Studio 6.0	ŝ		
		(CSR BlueSuite	⊁		
Seconds		G	IVT BlueSoleil	•	3	BlueSoleil Help
Search	•	(Winamp	•	*	BlueSoleil
i 🤣 Help		¢,	Adobe ¥	2	6	Uninstall BlueSoleil
2 Run						
Shut Down						
🛱 Start 🛛 🚮 🦽 🗐 💿 👋						

2.2 Click OK to close update-checking tip message.

Versi	on Information	
8	The latest BlueSoleil version is: BlueSoleil 2.0.0.0 VoIP Release 051103 If you want to update, please <u>read more</u>	<u>QK</u>

2.3 On the BlueSoleil main window, single-click the red central ball to start searching the Bluetooth devices in range. They'll be found and displayed as various device icons on the orbit.

- 2.4 Double click one device icon to browse its service.
- Note:In some cases, you need to make the trusted relationship between BlueSoleil and the remote device by inputting the same passkey on both sides. On BlueSoleil side, the following dialog will pop up, you can enter the passkey here.

Enter	Bluetooth Pa	sskey	
A remote device needs a Bluetooth Passkey to create Paired relationship for future connections. Please use the same passkey on			ŪK
	this device and on the remote device: <u>Cancel</u> Remote Device: AP[000CBF00F985]		
	Address O	0:0C:BF:00:F9:85	
	Passkey:	****	
Time Left: 25 s			

2.5 After the pairing procedure succeeds, a tick sign will appear beside the device icon. The available services icons will be highlighted.

2.6 Single click one of the highlighted service icons, BlueSoleil will establish a *Bluetooth* connection to the remote device. The device icon changes to green color and a line appears between the red ball and the device icon.

3. Notice for Windows 2000/XP

Expected outcome:

- 3.1 Installed Files & Directories (by default):
 - <Windows program files>\\VT Corporation\BlueSoleil BlueSoleil execution and support files.
 - <Current user>\My Documents\Bluetooth Support directory. This is the directory for Object Push and Synchronization. Received cards and other objects will be put here.
- 3.2 Installed devices:
 - 11 Bluetooth Serial ports(e.g. COM3-COM13)
 - Bluetooth PAN Network Adapter
 - 4 Bluetooth virtual Modern
 - Bluetooth AV Audio Device
 - Bluetooth SCO Audio Device
 - Bluetooth HID Enum device
 - Bluetooth Vcomm Manager
 - Bluetooth HID Manager

*Operational with reduced performance

FCC Notices

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

CAUTION: Change or modification not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

--Reorient or relocate the receiving antenna.

--Increase the separation between the equipment and receiver.

--Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

--Consult the dealer or an experienced radio/TV technician for help.

CAUTION:

Any changes or modifications not expressly approved by the grantee of this device could void the user's authority to operate the equipment.

RF exposure warning:

This equipment must be installed and operated in accordance with provided instructions and the antenna(s) used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter. End-users and installers must be provide with antenna installation instructions and transmitter operating conditions for satisfying RF exposure compliance."
