Executive Summary

The management of user access has long been a challenge for organizations. Central to this challenge is the concept of creating defined user roles. Used correctly, roles provide a means of simplification and allow organizations to adapt enterprise access to the needs of the business. The result is greater IT operational efficiency, business agility, and improved security through a set of preventative controls.

Introduction

The purpose of this document is to describe how OpenManage Essentials (OME) supports and implements role-based access control (RBAC) at its operations level. This document also explains the implementation of role-based access control architecture and the role-level permissions assigned in OpenManage Essentials.

Role-Based Access Control Implementation

After installation launch OpenManage Essentials, the **OmeAdministrators**, **OmePowerUsers** and **OmeUsers** user groups would be created under **Windows Local Users and Groups**.

To verify the creation of OpenManage Essentials groups on a Windows machine, perform the following steps:

1. Log in as an administrator.
2. Right-click **My Computer** and select **Manage**.
3. Navigate to **Configuration -> Local Users and Groups -> Groups**. The OpenManage Essentials groups are listed in the **Groups** pane. These are the **OmeAdministrators**, **OmePowerUsers** and **OmeUsers** groups (Figure 1).

Figure 1. User Group

Role-Based Access Control Implementation in OpenManage Essentials

After you have verified that the OpenManage Essentials groups have been created, on a Windows machine, add user(s) to the OpenManage Essentials groups. Add user(s) to OmeAdministrators first, later to OmePowerUsers and then to OmeUsers. You must be logged in as an Administrator to perform this procedure. To add users, perform the following steps:

1. Navigate to **Local Users and Groups -> Groups**.
2. Right-click **OmeAdministrators** and select **Add to Group**.
3. In the **Properties** window, click **Add**.
4. In the **Select Users** window, enter the user name.
5. Click **Check Names** and click **OK**. The user name appears in the **Members** list in the **Properties** window.
6. Click **OK**.

Note: For details on adding a Windows user account to a group, refer to:

<http://windows.microsoft.com/en-US/windows-vista/Add-a-user-account-to-a-group>

Note: The users you add must also belong to the built-in local Administrator group.

Log in as the user that belongs to the OmeAdministrators group and confirm that this user has full permissions to perform all of the OpenManage Essentials operations.

Similarly, add users to the OmePowerUser and OmeUsers group and confirm that these users have restricted privileges and can do read-only operations.

Role-Based Security and its Implementation

Figure 3. Select users to a group

Using Security Roles and Permissions

OpenManage Essentials provides security through role-based access control, authentication, and encryption. Role-based access control manages security by determining the operations run by the user in particular roles. Each user is assigned with one or many roles, and each role is assigned certain user

privileges that are permitted to users in that role. With role-based access control, security administration corresponds closely to an organization's structure.

Role-Based Access Control Architecture in OpenManage Essentials

Figure 4. A simplified RBAC Model

Typical role-based access control architecture (Figure 4) has the following three components:

- Users: Create a user with credentials
- Roles: Assign the user to specific roles
- Permissions: Assign access control to the above role

Figure 5. Role-based access control implementation in OpenManage Essentials

Role-Based Security and its Implementation

OmeAdministrators have full permissions to perform the following tasks:

- Add multiple Discovery Ranges
- Deploy OMSA on a remote machine
- Execute any remote task and view the report

OmeUsers only have read permissions. OmeUsers can view reports and export the report details to an external file.

Note: A guest user must be a member of OmeAdministrators or OmeUser to access OpenManage Essentials.

OpenManage Essentials Roles and Associated Permissions

OpenManage Essentials users have read-only access and cannot perform other operations. They can log in to the console, run discovery and inventory tasks, view settings, and acknowledge events. The Windows Users group is a member of this group.

OpenManage Essentials Administrators have full access to all of the operations within OpenManage Essentials.

OmeAdministrators Console View

When logged in to OpenManage Essentials, the top-right corner of the screen displays details about the user who is logged in (Figure 6). In this figure, the user permission is displayed as OmeAdministrators. This user can perform any task defined in OpenManage Essentials.

Figure 6. OmeAdministrators console

The screenshot shows the OpenManage Essentials console in a Windows Internet Explorer browser. The top navigation bar includes the Dell logo and 'OPENMANAGE ESSENTIALS'. A user information popup in the top right corner displays the following details:

- Specifies the current user. The current user belongs to the following groups:(ID: 3)
- OmeAdministrators
- OmeGuests
- OmeUsers

The main dashboard area is titled 'Home Portal' and features several widgets:

- Devices by Status:** A pie chart showing 42 total devices, with segments for Unknown (13), Normal (14), Warning (20), and Critical (15).
- Alerts by Severity:** A pie chart showing 1.2k total alerts, with segments for Info (69), Normal (44), and Critical (1.2k).
- Alerts Table:** A table displaying filtered alerts. The table has columns for Severity, Acknowledged, Time, Device, Details, Category, and Solution. Two alerts are visible:

Severity	Acknowledged	Time	Device	Details	Category	Solution
Critical		10/19/2012 4:23:14 AM		System is down: win-i6gruvfax32.dmc-ad.com	System Events	ome
Critical		10/19/2012 4:22:36 AM		System is down: win-i6gruvfax32.dmc-ad.com	System Events	ome

Right-click options include all operations pertaining to modification, for example, Edit, Rename, Delete, and Disable (Figure 7).

Figure 7. Right-click options enabled

OmePowerUsers Console View

When logged in to OpenManage Essentials, the top-right corner of the screen displays details about the user who is logged in (Figure 8). In this figure, the user permission is displayed as OmePowerUsers. The users have the same ability as the OmeAdministrators except they cannot edit preferences.

Figure 8. OmePowerUsers console

Right-click options include all operations pertaining to modification, for example, Edit, Rename, Delete, and Disable. But modification under Preferences tab is not allowed (Figure 9).

Figure 9. Preferences tab view

Role-Based Security and its Implementation

OmeUser Console View

In the OmeUsers console view (Figure 10), note that the logged-in OmeUser does not have Administrator privileges. Users have permissions to perform any task defined in OpenManage Essentials at the operations level. These privileges are usually read-only and do not provide any options pertaining to modification.

Figure 10. OmeUsers console

Role-Based Security and its Implementation

Right-click options pertaining to modification, for example, Edit, Rename, Delete, and Disable are disabled (Figure 11).
