**SECURITY SYSTEM**

# FCC COMPLIANCE STATEMENT

**CAUTION: Changes or modifications not expressly approved by Digital Security Controls could void your authority to use this equipment.**

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Re-orient the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/television technician for help.

The user may find the following booklet prepared by the FCC useful: "How to Identify and Resolve Radio/Television Interference Problems". This booklet is available from the U.S. Government Printing Office, Washington D.C. 20402, Stock # 004-000-00345-4.

## IMPORTANT INFORMATION

This equipment complies with Part 68 of the FCC Rules and, if the product was approved July 23, 2001 or later, the requirements adopted by the ACTA. On the side of this equipment is a label that contains, among other information, a product identifier. If requested, this number must be provided to the Telephone Company.

Product Identifier: US:F53AL01B9047  
USOC Jack: RJ-31X

## Telephone Connection Requirements

A plug and jack used to connect this equipment to the premises wiring and telephone network must comply with the applicable FCC Part 68 rules and requirements adopted by the ACTA. A compliant telephone cord and modular plug is provided with this product. It is designed to be connected to a compatible modular jack that is also compliant. See installation instructions for details.

## Ringer Equivalence Number (REN)

The REN is used to determine the number of devices that may be connected to a telephone line. Excessive RENs on a telephone line may result in the devices not ringing in response to an incoming call. In most but not all areas, the sum of RENs should not exceed five (5.0). To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local Telephone Company. For products approved after July 23, 2001, the REN for this product is part of the product identifier that has the format US: AAAEQ##TXXXX. The digits represented by ## are the REN without a decimal point (e.g., 03 is a REN of 0.3). For earlier products, the REN is separately shown on the label.

REN = 0.1B

## Incidence of Harm

If this equipment (SCW9047/SCW9045) causes harm to the telephone network, the telephone company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the Telephone Company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

## Changes in Telephone Company Equipment or Facilities

The Telephone Company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens the Telephone Company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

## Equipment Maintenance Facility

If trouble is experienced with this equipment (SCW9047/SCW9045) for repair or warranty information, contact the facility indicated below. If the equipment is causing harm to the telephone network, the Telephone Company may request that you disconnect the equipment until the problem is solved. This equipment is of a type that is not intended to be repaired by the end user.

DSC c/o APL Logistics 757 Douglas Hill Rd, Lithia Springs, GA 30122

## Additional Information

Connection to party line service is subject to state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.

Alarm dialing equipment must be able to seize the telephone line and place a call in an emergency situation. It must be able to do this even if other equipment (telephone, answering system, computer modem, etc.) already has the telephone line in use. To do so, alarm dialing equipment must be connected to a properly installed RJ-31X jack that is electrically in series with and ahead of all other equipment attached to the same telephone line. Proper installation is depicted in the figure below. If you have any questions concerning these instructions, you should consult your telephone company or a qualified installer about installing the RJ-31X jack and alarm dialing equipment for you.

## INDUSTRY CANADA STATEMENT

NOTICE: This product meets the applicable Industry Canada technical specifications.

Le présent matériel est conforme aux spécifications techniques applicables d'Industrie Canada.

The Ringer Equivalence Number (REN) for this terminal equipment is 0.1.

L'indice d'équivalence de la sonnerie (IES) du présent matériel est de 0.1.

The Ringer Equivalence Number is an indication of the maximum number of devices allowed to be connected to a telephone interface. The termination on an interface may consist of any combination of devices subject only to the requirement that the sum of the RENs of all the devices does not exceed five.

L'indice d'équivalence de la sonnerie (IES) sert à indiquer le nombre maximal de terminaux qui peuvent être raccordés à une interface téléphonique. La terminaison d'une interface peut consister en une combinaison quelconque de dispositifs, à la seule condition que la somme d'indices d'équivalence de la sonnerie de tous les dispositifs n'exécède pas 5.

The term "IC:" before the radio certification number only signifies that Industry Canada technical specifications were met.

Certification Number IC: 160A-9047

This Class B digital apparatus complies with Canadian ICES-003. Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

**New Zealand - The following is a list of warnings applicable when this equipment is connected to the New Zealand Telecom Network.**

### General Warning

The grant of a Telepermit for any item of terminal equipment indicates only that Telecom has accepted that the item complies with minimum conditions for connection to its network. It indicates no endorsement of the product by Telecom, nor does it provide any sort of warranty. Above all, it provides no assurance that any item will work correctly in all respects with another item of Telepermitted equipment of a different make or model, nor does it imply that any product is compatible with all of Telecom's network services.

### Reverse Numbering (decadic signalling)

Decadic signalling should not be used as it is being progressively phased out of the network. DTMF dialling is 100% available and it should always be used.

### Line Grabbing Equipment

This equipment is set up to carry out test calls at pre-determined times. Such test calls will interrupt any other calls that may be set up on the line at the same time. The timing set for such test calls should be discussed with the installer.

The timing set for test calls from this equipment may be subject to 'drift'. If this proves to be inconvenient and your calls are interrupted, then the problem of timing should be discussed with the equipment installer. The matter should NOT be reported as a fault to Telecom Faults Service.

### D.C. Line Feed to Other Devices

During dialling, this device unit does not provide DC voltage to the series port connection and this may cause loss of memory functions for the terminal devices (local telephone) connected to T-1, R-1.

### General Operation (ringer sensitivity and loading)

This device only responds to Distinctive Alert cadences DA1 and DA2.

---

## About Your Security System

Your Security System has been designed to provide you with the greatest possible flexibility and convenience. Read this manual carefully and have your installer instruct you on your system's operation and on which features have been implemented in your system. All users of this system should be equally instructed in its use. Fill out the "System Information" page with all of your zone information and access codes and store this manual in a safe place for future reference.

**NOTE: The Self Contained Wireless Security System includes specific false alarm reduction features and is classified in accordance with ANSI/ SIA CP-01-2000 Control Panel Standard - Features for False Alarm Reduction. Please consult your installer for further information regarding the false alarm reduction features built into your system as all are not covered in this manual.**

### Fire Detection

This equipment is capable of monitoring fire detection devices such as smoke detectors and providing a warning if a fire condition is detected. Good fire detection depends on having adequate number of detectors placed in appropriate locations. This equipment should be installed in accordance with NFPA 72 (N.F.P.A., Batterymarch Park, Quincy MA 02269). Carefully review the Family Escape Planning guidelines in this manual.

**NOTE: Your installer must enable the fire detection portion of this equipment before it becomes functional.**

### Testing

To insure that your system continues to function as intended, you must test your system weekly. Please refer to the "Testing your System" section in this manual. If your system does not function properly, call your installing company for service.

### Monitoring

This system is capable of transmitting alarms, troubles & emergency information to a central station. If you initiate an alarm by mistake, immediately call the central station to prevent an unnecessary response.

**NOTE: The monitoring function must be enabled by the installer before it becomes functional.**

**NOTE: This system has a communicator delay of 30 seconds. It can be removed, or it can be increased up to 45 seconds by the installer.**

### Maintenance

With normal use, the system requires minimum maintenance. Note the following points:

- Do not wash the security equipment with a wet cloth. Light dusting with a slightly moistened cloth should remove normal accumulations of dust.
- Use the system test described in "Testing Your System" to check the battery condition. We recommend, however, that the standby batteries be replaced every 3-5 years.
- For other system devices such as smoke detectors, passive infrared, ultrasonic or microwave motion detectors or glassbreak detectors, consult the manufacturer's literature for testing and maintenance instructions.

### General System Operation

Your security system comprises an integrated alarm control/keypad and various sensors and detectors. The system is mounted by the main exit/entry location. The system is self-contained; electronics, fuses and standby battery are housed within the keypad unit.

**NOTE: Only the installer or service professional should have access to the system.**

The security system has several zones of area protection and each of these zones will be connected to one or more sensors (motion detectors, glassbreak detectors, door contacts, etc.). A sensor in alarm is indicated by messages on the LCD keypad.

Additional features include: Automatic Inhibit (Swinger Shutdown) for Alarm; Tamper and Trouble signals after 3 occurrences in a given set period; and a Programmable Keypad Lockout option.

# Controls & Indicators

## IMPORTANT NOTICE

A security system cannot prevent emergencies. It is only intended to alert you and – if included – your central station of an emergency situation. Security systems are generally very reliable but they may not work under all conditions and they are not a substitute for prudent security practices or life and property insurance. Your security system should be installed and serviced by qualified security professionals who should instruct you on the level of protection that has been provided and on system operations.

## Language Selection

Your system can display messages in different languages.

1. Press and hold both (< >) keys simultaneously.
2. Using the (< >) keys, scroll through the available languages.
3. Press (\*) to select your desired language.

## Arming & Disarming the System

### Arming (Turning On/Setting)

Close all sensors (i.e. stop motion and close doors). The Ready (✓) indicator should be on.

To arm, press and hold the Away Key for 2 seconds and/or enter your Access Code, or press (\*)(0) to Quick Arm. During the setting state (exit delay active) the Armed (🔒) and Ready (✓) indicators will turn on, and the keypad will sound one beep per second. You now have \_\_\_ seconds to leave the premises (please check with your installer to have this time programmed). To cancel the arming sequence, enter your access code.

### Away Arming (Turned On/Set)

When the exit delay is completed, the alarm system is armed/set and this is indicated on the keypad as follows: the Ready (✓) indicator will turn off, the Armed (🔒) indicator will remain on and the keypad will stop sounding.

### Quick Exit

If the system is armed and you need to exit, use the Quick Exit function to avoid disarming and rearming the system. Press and hold the Quick Exit key for 2 seconds or press (\*)(0). You now have 2 minutes to leave the premises through your exit door. When the door is closed again, the remaining exit time is cancelled.

---

## Bell/Siren Sounds After Away Arming

### **Audible Exit Fault**

In an attempt to reduce false alarms, the Audible Exit Fault is designed to notify you of an improper exit when arming the system. In the event that you fail to securely close the Exit/Entry door during the allotted exit delay period, the system will sound the alarm to indicate an improper exit.

Your installer will tell you if this feature has been enabled on your system. If this occurs:

1. Re-enter the premises.
2. Enter your [access code] to disarm the system. You must do this before the entry delay timer expires.
3. Follow the Away arming procedure again, making sure to close the entry/exit door properly. (See "Away Arming (Turned On/Set)".)

### **Arming Error**

An error tone will sound if the system is unable to arm. This will happen if the system is not ready to arm (i.e. sensors are open), or if an incorrect user code has been entered. If this happens, ensure all sensors are secure, press (#) and try again. Please check with your installer to determine if arming is inhibited by any other means.

### **Disarming (Turning Off /Unsetting)**

Enter your access code to disarm anytime the system is armed (Armed (🔒) indicator is on). The keypad will sound a continuous tone after the entry delay has expired. Enter your code within \_\_\_\_\_ seconds to avoid an alarm condition (please check with your installer to have this time programmed).

### **Disarming Error**

If your code is invalid, the system will not disarm and a 2-second error tone will sound. If this happens, press (#) and try again.

### **Stay Arming (Partially Turning On / Part Setting)**

Stay arming will bypass the interior protection (i.e. motion sensors) and arm the perimeter of the system (i.e. doors and windows). Close all sensors (i.e. stop motion and close doors). The Ready (✔) indicator should be on.

Press and hold the Stay key for 2 seconds and/or enter your Access Code and do not leave the premises. During the setting state (exit delay active), the Armed (🔒) and Ready (✔) indicators will turn on.

When the exit delay is completed, the alarm system is armed/set and this is indicated on the keypad as follows: the Ready (✔) indicator will turn off, the Armed (🔒) indicator will remain on.

The Armed (🔒) indicator and a bypass message will be displayed. The system will automatically bypass certain interior sensors (i.e. motion sensors).

**NOTE: For SIA FAR listed panels, the Stay Arming Exit Delay will be twice as long as the Away Arming Exit Delay.**

### **Night Arming**

To fully arm the system when it has been armed in Stay Mode, press (\*)(1) at the keypad. All interior zones will now be armed except for devices programmed as Night Zones.

Night zones are only armed in Away mode, this permits limited movement within the premises when the system is fully armed. Ensure that your installer has provided you with a list identifying zones programmed as night zones.

When the interior zones have been activated (i.e., (\*)(1)) you must enter your access code to disarm the system to gain access to interior areas that have not been programmed as night zones.

### **Silent Exit Delay**

If the system is armed using the Stay key or using the "No Entry" Arming method ((\*)(9) [access code]), the audible progress annunciation (keypad buzzer) will be silenced and the exit time will be doubled for that exit period only.

---

## Remote Arming and Disarming

The system can be armed and/or disarmed using the remote control device (wireless key). When arming the system by using the Arm button on the wireless key, the system will acknowledge the command by sounding a single bell squawk (if bell squawk is enabled) and when disarming using the Disarm button on the wireless key the system will acknowledge the command by sounding two bell squawks (if bell squawk is enabled).

## Emergency Keys

Press the  (F),  (A) or  (P) key for 2 seconds to generate a Fire, Auxiliary or Panic alarm. The keypad sounder will beep indicating that the alarm input has been accepted and transmission to the central station is underway. The  (P) key may or may not sound the bell depending on Installer setup.

*NOTE: The Fire keys can be disabled by the installer.*

## When Alarm Sounds

The system can generate 2 different alarm sounds:

Continuous Siren = Intrusion (Burglary Alarm)

Temporal / Pulsed Siren = Fire Alarm

## Intrusion (Burglary) Alarm Continuous Siren

 If you are unsure of the source of the alarm approach with caution! If the alarm was accidental, enter your Access Code to silence the alarm. Call your central station to avoid a dispatch.

## Fire Alarm Pulsed Siren

 *Follow your emergency evacuation plan immediately!*

If the fire alarm was accidental (i.e. burned toast, bathroom steam, etc.), enter your Access Code to silence the alarm. Call your central station to avoid a dispatch.

## Time & Date Programming

Press   plus your Master Access Code. If you have a Time and Date trouble, press [8] from within the trouble menu. Press  to select Time and Date or use the   scroll keys to find the menu option and press  to select. Enter the time in 24-hr format (HH:MM), followed by the date (MM:DD:YY). Press  to exit programming.

*NOTE: Your installer may have programmed your system to display the time and date while the keypad is idle. Press the  key to clear the date and time display if desired.*

## Bypassing Zones

Use the zone bypassing feature when you need access to a protected area while the system is armed, or when a zone is temporarily out of service, but you need to arm the system. Bypassed zones will not be able to sound an alarm. Bypassing zones reduces the level of security. If you are bypassing a zone because it is not working, call a service technician immediately so that the problem can be resolved and your system returned to proper working order. Ensure that no zones are unintentionally bypassed when arming your system. Zones cannot be bypassed once the system is armed. Bypassed zones are automatically cancelled each time the system is disarmed and must be bypassed again, if required, before the next arming.

*NOTE: 24-hour zones can only be unbypassed manually.*

---

## **Bypassing Zones**

With the system disarmed.

1. Press **\*** to enter the function menu. The keypad will display "Press \* for < > Zone Bypass".
2. Press **1** or **\***, then your [access code] (if required). The keypad will display "Scroll to < > Bypass Zones".
3. Enter the two-digit number of the zone(s) to be bypassed (01-34).

You can also use the **<|>** keys to find the zone to be bypassed, and then press **\*** to select the zone. The keypad will display "Zone Name". "B" will appear on the display to show that the zone is bypassed. If a zone is open (e.g., door with door contact is open), the keypad will display "Zone Name" O". If you bypass the open zone, a "B" will replace the "O".

4. To unypass a zone, enter the two-digit number of the zone(s) to be bypassed (01-34). You can also use the **<|>** keys to find the zone, and then press **\*** to select the zone. The "B" will disappear from the display to show that the zone is no longer bypassed.
5. To exit bypassing mode and return to the Ready state, press **#**.

## **Activating All Bypassed Zones**

To remove bypass (all zones):

1. Press **\*****1**, then your [access code] (if necessary).
2. Press **00**.
3. To exit bypassing mode and return to the Ready state, press **#**.

## **Recalling Bypassed Zones**

To recall the last set of bypassed zones:

1. Press **\*****1**, then your [access code] (if necessary).
2. Press **99**.
3. To exit bypassing mode and return to the Ready state, press **#**.

## **Bypass Group**

A Bypass Group is a selection of zones programmed into the system. If you bypass a group of zones on a regular basis, you can program them into the Bypass Group, so that you do not have to bypass each zone individually every time. Only one Bypass Group can be programmed.

### **To program a Bypass Group:**

1. Press **\*****1**, then your [access code] (if necessary).
2. Enter the two-digit numbers (01-34) of the zones to be included in the Bypass Group or use the **<|>** keys to find the zone to be included in the bypass group, then press **\*** to select the zone.
3. To save the selected zone into the group, press **95**.
4. To exit bypassing mode and return to the Ready state, press **#**.

**NOTE: If an access code is required to enter bypassing, only the Master Code and codes with Supervisory enabled can set the Bypass Group.**

### **To select a Bypass Group when arming the system:**

1. Press **\*****1**, then your [access code] (if necessary).
2. Press **91**. The next time the system is armed, the zones in this group will be bypassed.
3. To exit bypassing mode and return to the Ready state, press **#**.

**NOTE: A Bypass Group is only recalled if the system is armed/disarmed after programming the bypass group.**

**NOTE: This feature is not to be used in UL Listed installations.**

## Trouble Conditions

When a trouble condition is detected, the Trouble (▲) or System indicator will turn on, and the keypad will beep every 10 seconds. Press the (#) key to silence the beeps. Press (\*)(2) to view the trouble condition. The Trouble (▲) indicator will flash. Use the (◀)(▶) keys to view troubles..

Trouble Condition	Comments	Action
Service Required (Press [1] for more information)	Indicates Low Battery, System Trouble, System Tamper or RF Jam detected.	Call for service
Loss of AC Power	If the building and/or neighbourhood has lost electrical power, the system will continue to operate on battery for several hours.	Check AC connection Call for service
Telephone Line Fault	The system has detected that the telephone line is disconnected.	Call for service
Failure to Communicate	The system attempted to communicate with the monitoring station, but failed. This may be due to Telephone Line Fault.	Call for service
Sensor (or Zone) Fault	The system is experiencing difficulties with one or more sensors on the system. Press [5] to display the zone(s).	Call for service
Sensor (or Zone) Tamper	The system has detected a tamper condition with one or more sensors on the system. Press [6] to display zone(s).	Call for service
Sensor (or Zone) Low Battery	If the system has been equipped with wireless sensors, one or more has reported a low battery condition. Press [7] to display the zone(s). Press [7] again to display WLS keys.	Call for service
Loss of Time & Date	If complete power was lost (AC and Battery), the time and date will need to be re-programmed.	Re-program Time & Date (page 4)

## Alarm Memory

When an alarm occurs, the Alarm Memory Message will be displayed. To view which sensor(s) generated the alarm, press (\*)(3).

For the system keypad use the (◀)(▶) scroll keys to view the sensors in alarm memory.

Press (#) to exit. To clear the memory, arm and disarm the system.

If an alarm sounded while armed, the system will automatically go to alarm memory when you disarm the system. In this instance, you should approach with caution, as the intruder may still be within the building/premises.

## Door Chime (Entry/Exit Beeps)

To turn the door chime function on or off, press and hold the Chime key for 2 seconds or press (\*)(4).

## Access Code Programming

In addition to the Master Access Code, you can program up to 16 additional User Access codes. Press (\*)(5), plus your Master Access Code, the armed (🔒) indicator will turn on.

Enter the 2-digit number to be programmed (i.e. 06 for user access code 6; enter 40 for the Master Access Code) or use the (◀)(▶) keys to find the specific code and press (\*) to select. Enter the new 4 or 6-digit access code. When programming is complete, enter another 2-digit code to program or press (#) to exit.

The access codes have programmable attributes which allow zone bypassing, duress, supervisor or one-time use activation.

---

## Access Codes

### **[\*][5][Master Code] (when disarmed)**

The [\*][5] User's Programming command is used to program additional access codes.

**User Codes** - User Codes 1-16 are available for the System.

**Master Code (Access Code 40)** - The Master Code can only be changed by the Installer, if programmed.

**Supervisor Codes** - These codes are always valid when entering the (\*)(5) User Code Programming section. However, these codes can only program additional codes which have equal or lesser attributes. Once programmed, the Supervisor Codes receive the Master Code's attributes. These attributes are changeable. Any User Code can be made a supervisor code by enabling User Code Attribute 1 (please see below for details).

**Duress Codes** - Duress codes are standard User Codes that will transmit the Duress Reporting Code whenever the code is entered to perform any function on the system. Any User Code can be made a Duress Code by enabling User Code Attribute 2 (please see below for details).

**One Time Use Code** - This code permits temporary access to the system for a 24 Hr. time period. During the 24 Hr. period, the temporary user may disarm the system once. There is no restriction on the number of times the temporary user may arm the system during the time period.

**NOTE: Duress codes are not valid when entering [\*][5], [\*][6] or [\*][8] sections.**

**NOTE: Access codes cannot be programmed as a duplicate or as a "Code +/- 1".**

## User Code Attributes

1. The default attributes of a new code will be the attributes of the code used to enter (\*)(5) whether it is a new code or an existing code being programmed.
2. System Master (Code 40) has Attribute 3 ON by default.

**NOTE: These attributes are not changeable.**

### **Inherent Attributes (all codes except installer)**

**Arm / Disarm** - Any Access Code will be valid for arming and disarming the system.

**Command Outputs ([\*][7][1] and [\*][7][2])** - If these outputs require Access Code entry, any Access Code is valid for performing the [\*][7][1-2][Access Code] functions on the system.

### **Programmable Attributes ([\*][5][Master/Supervisor Code][99][Code])**

- 1 Supervisor Code
- 2 Duress Code
- 3 Zone Bypassing Enabled
- 4-6 For Future Use
- 7 Bell Squawk upon Arming/Disarming
- 8 One Time Use Code

## Bell Squawk Attribute

This attribute is used to determine whether an access code should generate an arming/disarming Bell Squawk upon entry of the code for Away arming. The Wireless Keys with access codes associated with them may generate Arming/Disarming Bell squawks. If desired, this option may be used with codes that are manually entered. Please contact your installer to have this programmed.

**NOTE: The Master Code cannot use the Bell Squawk attribute, but is required to enable it for other codes.**

**NOTE: This feature cannot prevent the Arm/Disarming squawks from being generated if an access code assigned to a WLS Key is manually entered at a keypad.**

## Erasing an Access Code

To erase a code, select the code and enter (\*) as the first digit. If (\*) is entered, the system will delete the code immediately and the user will be returned to select another code.

---

## User Function Commands

First disarm the system then enter  $\ast$ 6 [Master Code]

The  $\ast$ 6 command is used to gain access to the following list of Master functions of the system.

### [1] Time and Date

Enter 4 digits for 24 Hour System Time (HH-MM). Valid entries are 00-23 for the hour and 00-59 for minutes. Enter 6 digits for the Month, Day and Year (MM-DD-YY)

### [2]-[3] Future Use

### [4] System Test

The system's Bell Output (2s), Keypad Lights and Communicator are tested. This test will also measure the panel's standby battery.

### [5] Enable DLS / Allow System Service

If enabled, the installer will be able to access Installer Programming by DLS. In case of DLS access this provides a window where rings will be detected by the panel. The DLS window will remain open for 6hrs, during which time the installer will be able to enter DLS an unlimited number of times. After the 6-hr window has expired, access to programming via DLS will be unavailable until the window is re-opened.

### [6] User Call-up

If enabled by the Installer, the panel will make 1 attempt to call the downloading computer. The downloading computer must be waiting for the panel to call before downloading can be performed.

### [7] For Future Use

### [8] User Walk Test

Allows the user to enter the Walk Test mode. See Walk Test Mode on page 12.

## Changing Brightness/Contrast

When this option is selected, the keypad will allow you to scroll through 4 brightness levels and 10 contrast levels.

1. Press  $\ast$ 6 [Master code].
2. Use the  $\langle \rangle$  keys to scroll to either Brightness Control or Contrast Control.
3. Press  $\ast$  to select the setting you want to adjust.
4. a) 'Brightness Control': There are 4 backlighting levels. Use the  $\langle \rangle$  keys to scroll to the desired level.  
b) 'Contrast Control': There are 10 different display contrast levels. Use the  $\langle \rangle$  keys to scroll to the desired contrast level.
5. To exit, press #.

## Changing the Buzzer Level

When this option is selected, the keypad will allow you to scroll through 21 different buzzer levels. A level of 00 disables the buzzer.

1. Press  $\ast$ 6 [Master Code].
2. Use the  $\langle \rangle$  keys to scroll to Buzzer Control.
3. There are 21 different levels, use the  $\langle \rangle$  keys to scroll to the desired level.

## Viewing the Event Buffer

The event buffer will show you a list of the last 128 events that have occurred on your system.

1. Press  $\ast$ 6 [Master Code].
2. To select Event Buffer viewing, press  $\ast$ .
3. The keypad will display the event number and the time and date. Press  $\ast$  to switch between this information and the event details.
4. Use the  $\langle \rangle$  keys to scroll through the events in the buffer.
5. To exit event buffer viewing, press #.

## Reference Sheets

Fill out the following information for future reference and store this guide in a safe place.

### System Information

#### Enabled?

[F] FIRE     [A] AUXILIARY     [P] PANIC

The Exit Delay Time is \_\_\_\_\_ seconds.

The Entry Delay Time is \_\_\_\_\_ seconds.

#### For Service

##### Central Station Information

Account#: \_\_\_\_\_ Telephone#: \_\_\_\_\_

##### Installer Information :

Company: \_\_\_\_\_ Telephone#: \_\_\_\_\_

*If you suspect a false alarm signal has been sent to the central monitoring station, call the station to avoid an unnecessary response.*

#### Access Codes

Master Code [40] : \_\_\_\_\_

Code	Access Code	Code	Access Code
01		09	
02		10	
03		11	
04		12	
05		13	
06		14	
07		15	
08		16

## Testing Your System

**NOTE: Inform your Monitoring Station when you begin and end System Testing.**

### Testing Your System Sounder

The System Test provides several system tests, and a two-second check of the sounder.

1. Press **\*** **6** [Master Code] **4**.
2. The following will occur:
  - The system activates all sounders for 2 seconds. All display lights and all pixels will turn ON.
  - The Ready, Armed, Trouble and Power LED's will flash for the duration of the test
3. To exit the function menu, press **#**.

### Testing Your Entire System

All smoke detectors in this installation must be tested by your smoke detector installer or dealer once a year to ensure they are functioning correctly. It is the user's responsibility to test the system weekly (excluding smoke detectors). Ensure you follow all the steps in the 'Testing Your System' section above.

**NOTE: Should the system fail to function properly, call your installation company for service immediately.**

1. Prior to testing, ensure that the system is disarmed and the Ready light is on.
2. Press **#** and close all zones to return the system to the Ready state.
3. Perform a System Test by following the steps in the previous section.
4. To test the zones, activate each detector in turn (e.g., open each door/window or walk in motion detector areas).

The System will display the following message when each zone (detector) is activated: "Secure System Before Arming <>", "Secure System or Enter Code" or "Secure or Arm System". Use the **<** **>** keys to view which zones are open. The message will disappear when the zones are closed.

### Walk Test Mode

The installer or user can initiate a Walk Test mode for the system. While in Walk Test mode, The Ready, Armed, and Trouble LED's will flash to indicate that Walk Test is active. When the system automatically terminates the Walk Test mode, it will announce with an audible warning (5 beeps every 10 seconds), beginning five minutes prior to the termination of the test.

### Allowing Computer Access To Your System

From time to time, your installer may need to send information to or retrieve information from your security system. Your installer will do this by having a computer call your system over the telephone line. You may need to prepare your system to receive this 'downloading' call. To do this:

1. Press **\*** **6** [Master code] **5** at the keypad. This allows downloading for a limited period of time. During this time, the system will answer incoming downloading calls.

For more information on this feature, please ask your installer.

## Guidelines for Locating Smoke Detectors

Research has shown that all hostile fires in homes generate smoke to a greater or lesser extent. Experiments with typical fires in homes indicate that detectable quantities of smoke precede detectable levels of heat in most cases. For these reasons, smoke alarms should be installed outside of each sleeping area and on each storey of the home.

The following information is for general guidance only and it is recommended that local fire codes and regulations be consulted when locating and installing smoke alarms.

It is recommended that additional smoke alarms beyond those required for minimum protection be installed. Additional areas that should be protected include: the basement; bedrooms, especially where smokers sleep; dining rooms; furnace and utility rooms; and any hallways not protected by the required units.

On smooth ceilings, detectors may be spaced 9.1m (30 feet) apart as a guide. Other spacing may be required depending on ceiling height, air movement, the presence of joists, uninsulated ceilings, etc. Consult National Fire Alarm Code NFPA 72, CAN/ULC-5553-M86 or other appropriate national standards for installation recommendations.

- Do not locate smoke detectors at the top of peaked or gabled ceilings; the dead air space in these locations may prevent the unit from detecting smoke.
- Avoid areas with turbulent air flow, such as near doors, fans or windows. Rapid air movement around the detector may prevent smoke from entering the unit.
- Do not locate detectors in areas of high humidity.
- Do not locate detectors in areas where the temperature rises above 38°C (100°F) or falls below 5°C (41°F).
- Smoke detectors should always be installed in accordance with NFPA 72, the National Fire Alarm Code. Smoke detectors should always be located in accordance with:

*'Smoke detectors shall be installed outside of each separate sleeping area in the immediate vicinity of the bedrooms and on each additional storey of the family living unit, including basements and excluding crawl spaces and unfinished attics. In new construction, a smoke detector also shall be installed in each sleeping room'. Split level arrangement: Smoke detectors are required where shown. Smoke detectors are optional where a door is not provided between living room and recreation room'.*

## Household Fire Safety Audit

Read this section carefully for important information about fire safety.

Most fires occur in the home. To minimize this danger, we recommend that a household fire safety audit be conducted and a fire escape plan be developed.

1. Are all electrical appliances and outlets in a safe condition? Check for frayed cords, overloaded lighting circuits, etc. If you are uncertain about the condition of your electrical appliances or household service, have a professional evaluate these units.
2. Are all flammable liquids stored safely in closed containers in a well-ventilated cool area? Cleaning with flammable liquids should be avoided.
3. Are fire-hazardous materials (matches) well out of reach of children?
4. Are furnaces and wood-burning appliances properly installed, clean and in good working order? Have a professional evaluate these appliances.

## Fire Escape Planning

There is often very little time between the detection of a fire and the time it becomes deadly. It is thus very important that a family escape plan be developed and rehearsed.

1. Every family member should participate in developing the escape plan.
2. Study the possible escape routes from each location within the house. Since many fires occur at night, special attention should be given to the escape routes from sleeping quarters.
3. Escape from a bedroom must be possible without opening the interior door.

### *Consider the following when making your escape plans:*

- Make sure that all border doors and windows are easily opened. Ensure that they are not painted shut, and that their locking mechanisms operate smoothly.
- If opening or using the exit is too difficult for children, the elderly or handicapped, plans for rescue should be developed. This includes making sure that those who are to perform the rescue can promptly hear the fire warning signal.
- If the exit is above the ground level, an approved fire ladder or rope should be provided as well as training in its use.
- Exits on the ground level should be kept clear. Be sure to remove snow from exterior patio doors in winter; outdoor furniture or equipment should not block exits.
- Each person should know of a predetermined assembly point where everyone can be accounted for (e.g., across the street or at a neighbor's house). Once everyone is out of the building, call the Fire Department.
- A good plan emphasizes quick escape. Do not investigate or attempt to fight the fire, and do not gather belongings or pets as this wastes valuable time. Once outside, do not re-enter the house. Wait for the fire department.
- Write the fire escape plan down and rehearse it frequently so that should an emergency arise, everyone will know what to do. Revise the plan as conditions change, such as the number of people in the home, or if there are changes to the building's construction.
- Make sure your fire warning system is operational by conducting weekly tests. If you are unsure about system operation, contact your installing dealer.
- We recommend that you contact your local fire department and request further information on fire safety and escape planning. If available, have your local fire prevention officer conduct an in-house fire safety inspection.

# WARNING Please Read Carefully

## Note to Installers

This warning contains vital information. As the only individual in contact with system users, it is your responsibility to bring each item in this warning to the attention of the users of this system.

## System Failures

This system has been carefully designed to be as effective as possible. There are circumstances, however, involving fire, burglary, or other types of emergencies where it may not provide protection. Any alarm system of any type may be compromised deliberately or may fail to operate as expected for a variety of reasons. Some but not all of these reasons may be:

### ■ Inadequate Installation

A security system must be installed properly in order to provide adequate protection. Every installation should be evaluated by a security professional to ensure that all access points and areas are covered. Locks and latches on windows and doors must be secure and operate as intended. Windows, doors, walls, ceilings and other building materials must be of sufficient strength and construction to provide the level of protection expected. A reevaluation must be done during and after any construction activity. An evaluation by the fire and/or police department is highly recommended if this service is available.

### ■ Criminal Knowledge

This system contains security features which were known to be effective at the time of manufacture. It is possible for persons with criminal intent to develop techniques which reduce the effectiveness of these features. It is important that a security system be reviewed periodically to ensure that its features remain effective and that it be updated or replaced if it is found that it does not provide the protection expected.

### ■ Access by Intruders

Intruders may enter through an unprotected access point, circumvent a sensing device, evade detection by moving through an area of insufficient coverage, disconnect a warning device, or interfere with or prevent the proper operation of the system.

### ■ Power Failure

Control units, intrusion detectors, smoke detectors and many other security devices require an adequate power supply for proper operation. If a device operates from batteries, it is possible for the batteries to fail. Even if the batteries have not failed, they must be charged, in good condition and installed correctly. If a device operates only by AC power, any interruption, however brief, will render that device inoperative while it does not have power. Power interruptions of any length are often accompanied by voltage fluctuations which may damage electronic equipment such as a security system. After a power interruption has occurred, immediately conduct a complete system test to ensure that the system operates as intended.

### ■ Failure of Replaceable Batteries

This system's wireless transmitters have been designed to provide several years of battery life under normal conditions. The expected battery life is a function of the device environment, usage and type. Ambient conditions such as high humidity, high or low temperatures, or large temperature fluctuations may reduce the expected battery life. While each transmitting device has a low battery monitor which identifies when the batteries need to be replaced, this monitor may fail to operate as expected. Regular testing and maintenance will keep the system in good operating condition.

### ■ Compromise of Radio Frequency (Wireless) Devices

Signals may not reach the receiver under all circumstances which could include metal objects placed on or near the radio path or deliberate jamming or other inadvertent radio signal interference.

### ■ System Users

A user may not be able to operate a panic or emergency switch possibly due to permanent or temporary physical disability, inability to reach the device in time, or unfamiliarity with the correct operation. It is important that all system users be trained in the correct operation of the alarm system and that they know how to respond when the system indicates an alarm.

### ■ Smoke Detectors

Smoke detectors that are a part of this system may not properly alert occupants of a fire for a number of reasons, some of which follow. The smoke

detectors may have been improperly installed or positioned. Smoke may not be able to reach the smoke detectors, such as when the fire is in a chimney, walls or roofs, or on the other side of closed doors. Smoke detectors may not detect smoke from fires on another level of the residence or building.

Every fire is different in the amount of smoke produced and the rate of burning. Smoke detectors cannot sense all types of fires equally well. Smoke detectors may not provide timely warning of fires caused by carelessness or safety hazards such as smoking in bed, violent explosions, escaping gas, improper storage of flammable materials, overloaded electrical circuits, children playing with matches or arson.

Even if the smoke detector operates as intended, there may be circumstances when there is insufficient warning to allow all occupants to escape in time to avoid injury or death.

### ■ Motion Detectors

Motion detectors can only detect motion within the designated areas as shown in their respective installation instructions. They cannot discriminate between intruders and intended occupants. Motion detectors do not provide volumetric area protection. They have multiple beams of detection and motion can only be detected in unobstructed areas covered by these beams. They cannot detect motion which occurs behind walls, ceilings, floor, closed doors, glass partitions, glass doors or windows. Any type of tampering whether intentional or unintentional such as masking, painting, or spraying of any material on the lenses, mirrors, windows or any other part of the detection system will impair its proper operation.

Passive infrared motion detectors operate by sensing changes in temperature. However their effectiveness can be reduced when the ambient temperature rises near or above body temperature or if there are intentional or unintentional sources of heat in or near the detection area. Some of these heat sources could be heaters, radiators, stoves, barbecues, fireplaces, sunlight, steam vents, lighting and so on.

### ■ Warning Devices

Warning devices such as sirens, bells, horns, or strobes may not warn people or waken someone sleeping if there is an intervening wall or door. If warning devices are located on a different level of the residence or premise, then it is less likely that the occupants will be alerted or awakened. Audible warning devices may be interfered with by other noise sources such as stereos, radios, televisions, air conditioners or other appliances, or passing traffic. Audible warning devices, however loud, may not be heard by a hearing-impaired person.

### ■ Telephone Lines

If telephone lines are used to transmit alarms, they may be out of service or busy for certain periods of time. Also an intruder may cut the telephone line or defeat its operation by more sophisticated means which may be difficult to detect.

### ■ Insufficient Time

There may be circumstances when the system will operate as intended, yet the occupants will not be protected from the emergency due to their inability to respond to the warnings in a timely manner. If the system is monitored, the response may not occur in time to protect the occupants or their belongings.

### ■ Component Failure

Although every effort has been made to make this system as reliable as possible, the system may fail to function as intended due to the failure of a component.

### ■ Inadequate Testing

Most problems that would prevent an alarm system from operating as intended can be found by regular testing and maintenance. The complete system should be tested weekly and immediately after a break-in, an attempted break-in, a fire, a storm, an earthquake, an accident, or any kind of construction activity inside or outside the premises. The testing should include all sensing devices, keypads, consoles, alarm indicating devices and any other operational devices that are part of the system.

### ■ Security and Insurance

Regardless of its capabilities, an alarm system is not a substitute for property or life insurance. An alarm system also is not a substitute for property owners, renters, or other occupants to act prudently to prevent or minimize the harmful effects of an emergency situation.
