

BORGESON

Steering You Forward

INTRODUCTION

Founded in Torrington, CT, Borgeson Universal began manufacturing universal joints for lathes and milling machines in 1914. By the 1920's, Ford was using Borgeson universal joints for the steering on some of their prototypes. Borgeson Universal continued to develop and refine u-joints for industrial, aerospace and OEM vehicle applications. When purchased in 1982 by the current owners, two avid Street Rodders, Borgeson soon began developing applications for Street Rods. Borgeson has continually improved and developed the original needle bearing universal joints into the most reliable, smoothest operating, strongest u-joints available today.

Seeking to expand, Borgeson ventured into manual steering gears with the acquisitions of Mullins Steering Gears in 2001 and in July 2012 Borgeson acquired all of the original equipment, tooling, drawings and the OE manufacturing rights for all Saginaw manual steering gear boxes. In 2016 Borgeson relocated from its home of over 100 years in Torrington CT and expanded yet again into a new 101,000 square foot manufacturing facility in Travelers Rest SC. This 101,000 square foot plant was designed and built for increased production and capacity to better serve our customers. We use the latest manufacturing and inventory control procedures to maintain stock, and take great pride in being able to ship most orders placed by 2:30 EST the same day. Today, Borgeson is the leading manufacturer and supplier of aftermarket steering components for the street rod, racing, specialty automotive, OEM and pickup truck markets.

We believe our growth is based on a policy of honesty and always listening to our customers, whether you are a corporation or working in your garage. We respond to your suggestions by developing needed innovations to help increase steering system safety and make building your vehicle more fun. Our dedication to safety has been recognized by the National Street Rod Association with safety product of the year awards in 1992 & 2001 as well as Street Rod Manufacturer Of The Year in 1999. Ultimately, your vehicle's safety depends on you. We strive to make Borgeson steering components as safe as possible. You can't buy a stronger, safer u-joint anywhere in the world! However, its effectiveness is only as good as the installation.

In this catalog, you will find many installation suggestions and guidelines that will help in the design of a safe, smooth operating steering system. Call if you have any questions. Our technical staff has over 95 years combined experience in the design and application of steering systems. Remember, auto manufacturers have thousands of engineers and millions of miles of road experience to rely on when designing a steering system. Without the benefit of those resources, the possibility of a malfunction is greater. So, overbuild your system and inspect it frequently. Safety should be your most important concern! We attend many shows during the year, so stop by our booth and say hello, we'll be happy to help!

A message from Borgeson president Gerry Zordan,

Over 100 years ago, John Borgeson built a wooden universal joint model, dated July 22nd, 1914, for application to the United States Patent Office. This is the oldest Borgeson universal joint that we are aware of. His goal was to provide high quality products at a fair price. 100 years later, that very same universal joint graces my office as a tribute to, and reminder of, where it all began.

For the last 35 years, since I purchased Borgeson, we have been dedicated to the same philosophies of creating the best quality products at fair prices while providing outstanding customer service. This continued business model has helped us to grow from a humble four part-time employees all those years ago, to 35 full-time employees, proudly dedicated to providing high quality products and outstanding customer service.

This growth and longevity is, in no small part, attributed to you, our valued customers. I thank you for the continued support and loyal patronage that has helped Borgeson Universal to become the great American company that it is today.

***Thank you, Gerry Zordan,
President, Borgeson Universal Co. Inc.***

Borgeson President Gerry Zordan

Borgeson Vice President Alan Zordan

SINGLE NEEDLE BEARING UNIVERSAL JOINTS

Needle Bearing U-Joints

Needle bearing u-joints have the distinct advantage of lasting much longer than non-needle bearing u-joints. Borgeson recommends only needle bearing u-joints for use on street vehicles. Our u-joints are made of specially selected steel and stainless steel for strength and longevity. The sealed precision needle bearings never need maintenance. Needle bearing u-joints outlast non-needle bearing joints by a factor of 10 to 1. Our needle bearing joints have zero backlash (radial play) for more precise steering and a better feel for the road. Although non-needle bearing joints are stronger than the same size needle bearing joint, this strength is offset by the maintenance required and the longevity factor. Non-needle bearing joints should be lubricated with each use and a rubber boot should be used to retain lubrication. Boots are not recommended for use with needle bearing joints.

Borgeson u-joints are machined in our factory on state of the art CNC equipment from solid billet steel or stainless steel. Ongoing engineering and testing ensures our components meet or exceed current automotive production vehicle requirements. Any of our four Double D (a round shaft with two flats) sizes, 14 different spline size yokes, and the '94 and later Mustang V style can be combined to mate components from many different manufacturers. They operate at angles up to 35°. For example, with our components, you could easily connect a GM column to a new Mustang rack and pinion or a Ford column to a Saginaw box. Similar to OEM u-joints, the staked needle bearing caps prevent loosening and adjustment malfunction.

DOUBLE NEEDLE BEARING UNIVERSAL JOINTS

Angles over 35° can be negotiated by using a Borgeson double universal joint. These double universal joints can accommodate angles up to 70°. Double universal joints are available in steel, stainless steel and polished stainless steel. Borgeson double universal joints are available in all of our popular spline and DD configurations.

TECH TIP: Because a double joint used in combination with a single joint will function the same as a three joint system, a shaft support bearing is required to prevent the shaft from "looping" and binding. *See page 7 for shaft support bearings.*

VIBRATION REDUCERS

Noise, vibration, and harshness are on top of the list of concerns for all automotive enthusiasts. With the more frequent use of rack and pinions and low profile tires, there are more road vibrations transmitted to the steering wheel than in the past. Using urethane to isolate all of the metal components, Borgeson has developed vibration reducers to diminish the annoying vibrations that are transmitted through the steering system and felt in the steering wheel. The use of the Borgeson vibration reducer results in an immediate improvement of the steering feel. As an added benefit, this reduction in vibration has been shown to increase the overall life of the steering components, including the steering column and box.

DESIGN AND INSTALLATION TIP:

Don't install a vibration reducer in the center of a length of shaft. It can cause excess flexing and possible binding. If your system requires the use of a support bearing, the vibration reducer must be used between the support bearing and the column. The support bearing can pick up chassis vibration and will transfer it up the steering shaft to the wheel reducing the effects of the vibration reducer.

Rubber Coupling/Rag Joints

On older factory applications, a flexible coupling was used to attach the column to the steering box when there was perfect alignment. If the original column or box is changed, the stock coupling may not work. If a conversion from a long input steering box to a short input with an aftermarket column is done, a flexible coupling needs to be added. Borgeson offers the largest variety of spline and double D sizes to fit most applications. Rag Joints are only available in steel.

Vibration Reducing Universal Joint Dimensions

Splined and Double D Shafting

We recommend splined or double D shafting, as its a simple and safe method of attaching your steering components. We offer 3/4" double D shafts in steel and stainless steel. Splined shafts are available in steel, stainless steel and polished stainless steel.

Telescoping Shaft

Borgeson offers two telescoping shaft assemblies in 24" and 36" overall lengths. These shafts can be used in a variety of applications and make installation and removal of steering system components simple and easy. By pulling or pushing on the assembly, the overall length can be shortened or lengthened. This telescopic shaft also meets NHTSA guidelines for collapsibility in passenger cars and adds a measure of safety.

SAFETY TIP: Welding can overheat the u-joint bearings causing loss of lubrication. **If welding is the only option, it should be done by a certified welder.** Drilling and pinning can be a safer option. *See page 28 for more information on pinning and proper shaft attachment.*

See our design section beginning on page 23 for information about measuring your system.

Many other sizes are available. Visit www.borgeson.com for a full product listing.

Steel 3/4" Splined Shafts are splined 2" on both ends. They are available in 2" increments from 2" to 36". Each end can be trimmed up to 1" for an exact fit. Steel 3/4" round shafts that are splined on one end are available in 5", 16", and 36" lengths.

Steel Double D Shafts are available in 18" and 36" lengths only. They are easy to trim to get an exact fit.

Stainless Steel 3/4" Splined Shafts are available in 1/4" increments from 3" to 24" lengths, with 7/8" of spline on each end. Custom length stainless shafting is also available with 7/8" spline on each end, polished or unpolished. (polished shown)

Stainless Steel Double D Shafts are available in 12", 22" and 36" lengths. All stainless shafting is available polished or unpolished. (polished shown)

Telescoping Shafts

Borgeson offers two telescoping shaft assemblies in 24" and 36" overall lengths. These shafts can be used in a variety of applications and make installation and removal of steering system components simple and easy. Telescopic shafts can be easily trimmed to fit many applications.

SHAFT SUPPORTS & COUPLERS

Steering Supports

If more than two joints are used in a steering system, a support bearing must be used to prevent looping and binding. Use of a vibration reducer and two u-joints will also call for a support bearing to be used. The support must be mounted to the frame, not to a sheet metal section of the body; sheet metal will not withstand the stress. The shaft should fit easily through the support with no binding. A system with a double u-joint and a single u-joint has three flex points and will require a support bearing.

All support bearings work with round or DD shafting.

Rod end bearings with a 3/4" hole size are commonly used for supports. Rod end bearings are supplied with two jam nuts for mounting. They are available in steel, stainless steel and polished stainless steel. Our billet supports accommodate a 3/4" shaft. The billet supports are 2-1/2" long with two threaded holes in the end for mounting and are available in steel, aluminum, polished aluminum, stainless steel, and polished stainless steel. A 6" steel support is also available, which can be cut at any angle for a perfect fit. The 6" steel support has no mounting holes and must be welded in. Flange bearings are also available for supporting a shaft through the firewall.

Couplers and Adapters

A u-joint can sometimes be eliminated by using a 2" straight extension, called a coupler, to extend either the steering box, R&P shaft or the column shaft. The coupler can be welded and/or pinned to the un-splined end of a shaft. We offer shafts that are splined only on one end in 3 lengths: 5", 16" and 36". The 1"-48 and 1" DD couplers have a 1-1/4" hole that will accept either an adapter to reduce inside diameter to 3/4" smooth or another splined or 3/4" DD coupler. The coupler assembly would have to be pinned and/or welded together. Welding the coupler is acceptable because there are no moving parts to damage, and the coupler's steel is less susceptible to heat damage from welding. Couplers are available in the same spline or double D sizes as our u-joints. Couplers and adapters are available in steel only.

ADAPTERS

PIN & BLOCK RACING JOINTS

1"- Formula Car Shift Linkage, Drag Racing Steering

(not for circle track or road racing steering)

- 1/2", 5/8" or 3/4" smooth bore each end
- smooth bore with either 9/16"-26 or 5/8"-36 spline combination

1-1/4"- Oval Track Steering

- 5/8" or 3/4" smooth bore each end
- Smooth bore and any spline and DD (except 9/16"-17, 9/16"-36, 1"-48, 1" DD)

The advantage to the pin and block style of universal joint is a high strength to weight, size and cost ratio. These u-joints are manufactured from high strength billet alloy steel and then heat treated to obtain maximum strength. **Because the u-joints use pivot pins and blocks instead of sealed needle bearings, they must be checked and lubricated every time the vehicle is driven.** A rubber boot is also available to retain lubrication. The smaller sizes are ideal for fabricating shift linkage. Borgeson pin and block u-joints have a 30° maximum operating angle. **These u-joints are not for street use.**

INDUSTRIAL & SPECIALTY VEHICLE APPLICATIONS

Borgeson manufactures custom universal joints, steering shaft assemblies and OEM Saginaw manual steering gears for industrial, government and OEM applications. Borgeson has the personnel and technology to work with you to manufacture custom universal joints and shaft assemblies for your application. Contact our sales office for further information.

BORGESON

For AGRICULTURAL • AIRCRAFT • INDUSTRIAL
and MARINE APPLICATIONS

For INDUSTRY

Warner & Swasey Co., Pin Drafter Intersecting Draw Frame equipped with Borgeson Universal Joints, for use in the Textile Industry.

For AIRCRAFT

Borgeson Universal Joints have many uses in the Aircraft Industry.

For AGRICULTURE

Food Machinery and Chemical Corp. Universal Corn Cutter, utilizing Borgeson Universal Joints.

For MARINE APPLICATION

Borgeson Furnishes Universal Joints of Corrosion Resistant metal for Marine Applications.

TRADITIONAL STEERING COLUMNS & MOUNTS

Economy Stainless Steel Steering Column

Our economy stainless steel steering column is available in a polished or brushed finish. This column has a 1-3/4" tube with a 3" bell and will fit all standard 3-Bolt steering wheels. It has no provision for wiring. This column is available in an 18" Shorty version in addition to 26", 30", 34" lengths and has a 3/4"-36 spline shaft.

STAINLESS COLUMN PRICING		MSRP
All Brushed Finish Stainless Columns		\$169.00
All Polished Finish Stainless Columns		\$189.00

908053	908043	Stainless Steel Economy Column, 34" Length

Steering Column Drops

Drops are available in three styles and various hole diameters to fit most columns. We machine these from solid billet aluminum. The adjustable swivel easily accommodates different column and dash angles. Available in 1-3/4", 2", 2-1/4" and 2-3/8" diameter holes and lengths of 2", 3", 4", 5", 6" and 7". The 2-3/8" drop has a notch to clear the wire harness cover on GM columns.

Solid or Split Swivel Floor Mounts

Our easy to install, solid full circle design slides over the end of the steering column. This provides a secure way to mount the column to the floor. The inner collar pivots to accommodate any floor angle. Available for 1-1/2", 1-3/4", 2" and 2-1/4" columns. A split design that separates in half to clear the column shift lever is also available; the split design can be installed on a column already in the vehicle; available for 2" and 2-1/4" columns. We manufacture all floor mounts from solid billet aluminum.

COLUMN FLOOR MOUNT PRICING	MSRP
Solid Floor Mounts with Machined Finish	\$54.70
Solid Floor Mounts with Polished Finish	\$61.40

NEW 1949-51 FORD CAR POWER CONVERSION

Power Steering By
BORGESON
Steering You Forward

After years of effort, the steering specialists at Fatman Fab and Borgeson have found an answer to adding power steering to the factory '49-'51 Ford cars! A special reverse rotation box was the key, with a custom frame bracket and pitman arm that allow fitting to the stock or Fatman's Improved Steering Linkage kit. Although this is not recommended for use with the Flathead engine due to extremely tight exhaust clearance, small block Ford and Chevy engines will work well with recommended headers. Optional Column Saver kit will allow preserving the original column.

999062 Power steering conversion kit. Kit consists of a specially made Borgeson reverse rotation gearbox in a 14:1 ratio paired with a Fatman Fabrications custom fabricated bracket and pitman arm. Factory original steering column can be used with the conversion but will need to be shortened and adapted to the steering box. We offer a "Column Saver Kit" part #990044 for use with a stock column. Universal joints are available to use with an aftermarket column of your choice.

990044 Column Saver Kit. This handy kit includes everything needed to maintain the stock steering column in your 1949-1951 Ford when installing the power conversion box. Kit includes weld-on 3/4" DD shaft extension, lower mast jacket bushing, flat washers for shimming and universal joint to connect to the Borgeson conversion box. Detailed instructions included for shortening the factory column.

1941-1951 FORD CONVERSION KIT AND ACCESSORIES

Part #	Description	MSRP
999062	Power Conversion Kit for 1949-1951 Ford Cars	\$935.00
990044	Original Steering Column "Column Saver Kit"	\$170.00

925121	Adapter Set. Adapts Conversion Box to -6AN for Custom Hose Applications	\$26.00
015225	1" DD X 11/16"-36 Spline Universal Joint for use with Aftermarket Columns	\$79.71

STREET ROD MANUAL STEERING BOXES

OEM Saginaw Manual Boxes

Borgeson is now the OEM manufacturer and re-manufacturer of Saginaw manual steering gears. Borgeson Saginaw manual steering boxes are assembled to the same demanding standards as our precision universal joints. Each box is carefully assembled, adjusted and inspected to our factory specifications. Borgeson offers both standard crossover steering boxes or reversed boxes for side steer applications. These steering boxes are made in the USA and have a 3 year warranty.

OEM Saginaw 140 Box

This is a real Vega box 100% made in the USA not a cheap copy. The Vega 140 is recommended only for vehicles under 2400 lbs. Steering ratio is 22:1. Reversed boxes are also available.

OEM Saginaw 525 Box

New OEM 525 boxes are available in either standard 24:1 ratio or a quick 16:1 ratio. Boxes are available with standard length or shortened input shafts. Available reversed for side steer applications.

*All Borgeson 700, 600, 525/122 and Vega steering boxes have the same three bolt pattern and can use this bracket. Not all steering boxes share the same mount pattern.

Power Steering Boxes & Accessories

Borgeson offers the Saginaw/Delphi 700 series in three different ratios, 2 fixed and one variable. Borgeson utilizes later model steering gears for more favorable steering feel, ratio and response. The variable ratio offers a quick final ratio with only 3 turns lock-to-lock but is not overly sensitive on-center for stable highway driving. The #800205 Variable Ratio 700 gear is an excellent upgrade for 65 and up GM Muscle cars looking to update their steering.

Note: All 1979 and earlier GM cars will require a new or rag joint coupler to use these later model boxes.

POWER STEERING PUMPS & ACCESSORIES

Self Contained Power Steering Pumps, Brackets & Pulleys

These are new manufactured Saginaw style self-contained power steering pumps made to precise tolerances.. Pumps are available with either a black powder coated or chrome reservoir. We also offer pumps preset to the lower operating pressure for Mustang rack and pinions, and pumps with two returns for Hydro-Boost brake applications. Our pump brackets are all designed for Saginaw self-contained pumps with two mounting locations on the rear of the reservoir. Brackets are designed with simplicity and ease of installation in mind.

See photos below for return tube locations.

SAGINAW POWER STEERING PUMPS

Remote Power Steering Reservoirs

Our billet aluminum power steering reservoir is available in either a polished or unpolished finish. The reservoir has an internal baffle plate and includes an O-Ring sealed cap and mounting bracket. It uses standard NPT fittings.

REMOTE POWER STEERING RESERVOIR

Part #	Description	MSRP
800600	Remote reservoir with bracket, Polished	\$132.84
800601	Remote reservoir with bracket, Unpolished	\$110.52

1962-79 MOPAR

Mopar Quick Ratio Modern Power Steering Conversion

Borgeson has developed a modern quick ratio power steering box for the 62-79 Mopar cars. This modern power steering box bolts directly to the stock k-frame and fits to your stock pitman arm. The Borgeson quick ratio power steering box offers a 14:1 ratio with only 3.5 turns lock-to-lock, 10lb. weight savings over a stock power box (23lbs. vs. 33lbs), increased exhaust clearance and a tight modern feel to the steering. The Borgeson conversion box can be used in both factory manual and power steering applications.

This box is offered in both 1-1/8" and 1-1/4" pitman shaft sizes. Be sure to measure to insure you receive the correct box.

Steering Column Modifications

The original steering column shaft will need to be cut and shortened for installation. Connection to the box is then made by drilling and pinning our #036425 Mopar vibration reducing universal joint coupler to the shortened steering column shaft. Drill bit and pins included with coupler.

1962-1979 MOPAR

Power Conversion Box & Components	MSRP
800126 Power Steering Conversion Box 62-79 Mopar 1-1/8" Sector Shaft	\$629.00

1958-64 CHEVY CAR

Modern Power Steering Conversion

Borgeson now offers a modern integral power steering conversion for your 1958-1964 full size Chevy. The Borgeson conversion box is a remanufactured GM Delphi 600 integral power steering gearbox. The Delphi 600 represents the latest generation of integral power steering gearbox technology with true modern power steering feel, feedback and a quick 14:1 ratio.

Borgeson has remanufactured this box to bolt directly to the factory mounting location and to fit the stock pitman arm. This box has been positioned to clear the larger four core radiators. The idler arm will need to be rotated to match the new angle of the steering box. A new universal joint and steering shaft will be required for connection to the stock column. Cars with factory power steering will require a drag link adapter or a manual center link.

348/409 Applications will require use of a remote style power steering pump.

1962-72 CHEVY II

1962-1966 Modern Power Steering Conversion (Floor Shift Only)

Borgeson offers a modern quick ratio power steering conversion box for your 1962-1966 Chevy II Nova. Borgeson has remanufactured this box to bolt directly to the factory mounting location and to fit the stock steering linkage without any interference or modification of the frame or shock tower. **The original factory column will need to be shortened for clearance of the power steering box.** Cars with factory power steering will require either a drag link adapter or a manual steering center link.

IMPORTANT INSTALLATION NOTES:

- Power conversion box is intended for use with stock steering columns only.
- **Floor Shift Only.** Any stock column can be modified to fit, however column shift is not possible with added length of steering box.
- Borgeson vibration reducing column shaft #990041 is recommended for installation.

#990041 Column Shaft

Modern Power Steering Conversion

Borgeson offers an integral power steering conversion for your 1955-1957 Chevy. The Borgeson conversion box is a remanufactured GM Delphi 600 integral power steering gearbox. The Delphi 600 represents the latest generation of integral power steering gearbox technology with true modern power steering feel, feedback and a sporty 12.7:1 ratio. Borgeson has remanufactured this box to bolt directly to the factory mounting location and to fit the stock pitman arm. Conversion requires shortening the stock steering column. (Details below)

Cars with factory power steering will require drag link adapter #990001 or manual steering linkage.

STEERING COLUMN MODIFICATIONS

Floor shift cars with stock column will need to trim the outer column tube back to the firewall. Replacement steering column shaft #990008 can then be used with rag joint #055034 to connect to the conversion box.

Column shift cars with stock column will require extensive modifications and sectioning. We have available pre shortened stock columns for the 55-56 and 57 cars. Shortened stock columns require rag joint #055049 to connect to the conversion box.

Aftermarket columns. The available direct replacement aftermarket columns are the proper length to use with our box and will connect with either rag joint #055034 or 055052 depending on the column shaft. **idit Direct Replacement Columns Available.**

Manual Steering Box Rebuild Kits

1963-82 CORVETTE

Corvette Modern Power Steering Conversion

Borgeson offers a modern integral power steering conversion for your 1963-1982 classic Corvette. The Borgeson conversion box is a remanufactured GM Delphi 600 integral power steering gearbox. The Delphi 600 represents the latest generation of integral power steering gearbox technology with true modern power steering feel, feedback and a sporty 12.7:1 ratio. Borgeson has remanufactured this box to bolt directly to the factory mounting location and to fit the stock pitman arm. The factory column will need to be collapsed or shortened approximately 2.5" for clearance of conversion box. (Details below)

Cars with factory power steering will require drag link adapter #990002 or manual steering linkage.

STEERING COLUMN MODIFICATIONS

1963-1966 Cars will need to trim approximately 2.5" off the splined steering column shaft for installation. Conversion box will then connect to the stock column with rag joint #055034 (Must leave 3/4" of spline to properly engage the rag joint)

1967-1982 Cars have a factory collapsible steering column. Gently tap on the spline column shaft with a rubber mallet to collapse the shaft in on itself for the needed 2.5" of clearance. Conversion box will then connect to column with rag joint #055043.

1965-1970 Power Steering Conversions

Borgeson offers modern integral power steering conversions for 1965-1970 classic Mustangs. The Borgeson conversion box is a new manufactured modern integral power steering gearbox. The Borgeson integral power steering gearbox provides true modern power steering feel, feedback and a quick 14:1 ratio. Borgeson has manufactured this box to bolt directly to the factory mounting location and to fit the stock pitman arm. The column will need to be collapsed or shortened for clearance of conversion box. (Details below) Factory power steering cars will require either manual drag link #990050 or drag link adapter #990003

NOTE: 1967 Mustang owners must measure the sector shaft to see if it is 1" or 1-1/8" prior to purchase.

NOTE: Power conversion box will not fit with factory Z-Bar clutch linkage.

STEERING COLUMN MODIFICATIONS

1965-1967 Cars will need to trim the outer column tube for clearance of the rag joint and use replacement inner column shaft #990040. Conversion box will then connect to the stock column with rag joint #052534

1968-1970 Cars have a factory collapsible steering column. Gently tap on the rag joint flange with a rubber mallet to collapse the shaft in on itself for the needed clearance. Conversion box will then connect to column with half rag joint #990016.

1971-1973 Power Steering Upgrade

Borgeson now offers a modern Delphi 600 series power steering upgrade for the 1971-1973 classic Mustangs. The Borgeson upgrade is a remanufactured modern Delphi 600 series power steering gearbox with true modern power steering feel, feedback and a quick 14:1 ratio. Installation requires our #990018 rag joint connector and either #925118 or 925119 power steering hose kit.

Modern Power Steering Conversion

Borgeson has developed an integral power steering conversion box for the 1952-1964 Ford full size cars. The Borgeson conversion box is a new manufactured modern integral power steering gearbox. The Borgeson integral power steering gearbox provides true modern power steering feel, feedback and a quick 14:1 ratio. Borgeson has manufactured this box to bolt directly to the factory mounting location and connects to the stock manual steering linkage. The steering column will need to be shortened for installation of this conversion box. (Details below)

Cars with factory Bendix style power steering will require either manual steering linkage or a drag link adapter.

STEERING COLUMN MODIFICATIONS

1952-1957 & All Column Shift cars a steel coupler #312500 must be welded to a cut off inner column shaft. The outer column tube will be able to fit over the coupler leaving enough column tube to mount the shift linkage.

1958-1964 Floor shift applications we recommend the use of a rag joint #052549. The cut off column shaft will need to be ground into a DD profile to connect to the rag joint.

This conversion box fits the following Ford full size models:

- 1952-1956 Crestline, Customline, Mainline
- 1957-1960 Custom
- 1957-1962 Fairlane
- 1958-1964 Galaxie
- 1955-1957 Thunderbird

Box will also fit Mercury vehicles sharing the same platform.

Modern Power Steering Conversion

Borgeson offers an integral power steering conversion for your 1964-1977 Ford mid size. The Borgeson conversion box is a new manufactured modern integral power steering gearbox. The Borgeson integral power steering gearbox provides true modern power steering feel, feedback and a quick 14:1 ratio. Borgeson has manufactured this box to bolt directly to the factory mounting location and to fit the stock pitman arm. The column will need to be collapsed or shortened for clearance of conversion box. (Details below) Cars with factory Bendix style power steering will require either manual steering linkage or a drag link adapter.

STEERING COLUMN MODIFICATIONS

Stock column shift cars have variations throughout the years. We have not done in house fitting on column shift cars. Installations have been completed using our #312500 coupler. This fits within the column tube and may leave room for the factory shift linkage.

1964-1967 floor shift applications, you will need to trim away the outer column tube and cut off the inner steering column shaft. The column shaft will need to be ground into a DD profile to connect to rag joint #052549.

1968-1977 floor shift applications, you will need to trim away the outer column tube. The inner steering column shaft with rag joint flange will then collapse in on itself for clearance. Attach the shortened column to the box with half rag joint part #990016.

This conversion box will fit the following years and models:

- 1964-1970 Ford Fairlane
- 1966-1970 Ford Falcon**
- 1966-1970 Ford Ranchero & Falcon Ranchero
- 1968-1971 Ford Torino & Gran Torino
- 1970-1977 Ford Maverick

Box will also fit Mercury vehicles sharing the same platform.

**1960-1965 Falcons use either our #800110 or #800111 call for details.

1970-04 FORD TRUCK

If you have tried replacing the worn-out steering on your Ford, you've probably found that many OEM replacement steering assemblies are no longer available. Borgeson manufactures heavy duty bolt-in replacement assemblies for many model years of Ford pickups and Broncos. Borgeson incorporates a telescoping shaft that adds a measure of safety to the steering system. Ford has had many length variations over the years and sometimes within model years. Borgeson has accommodated this by making an assembly which can be trimmed down to get the exact fit for your application. This added length will also accommodate aftermarket body lifts. Borgeson also offers an upgrade to our standard assembly that incorporates a vibration reducer that greatly reduces the road shock felt through the steering wheel.

1966-1977 BRONCO

Bronco Power Steering Box & Components

Borgeson offers an integral power steering conversion for your 1966-1977 Bronco. The Borgeson conversion box is a modern power steering gearbox that has been modified to bolt directly to the factory mounting location and to fit the stock pitman arm. A new universal joint will be required for connection to the stock column and a new hose kit for connection to the pump of your choice. Complete kits are available for the most popular applications.

Bronco Power Conversion Kit

1972-1986 Jeep CJ 1987-2006 Wrangler and 1974-2000 Jeep Trucks

Jeep's original steering shaft assemblies were not designed for the added stress of body lifts and oversized tires. Borgeson's replacement assemblies offer a heavy duty telescoping shaft with either two precision needle bearing u-joints or a vibration reducer and a u-joint. The steering assembly is easy to install with common hand tools. Once installed, you will experience much tighter and more responsive steering. Steering shafts have a 5 year warranty.

1972-02 JEEP STEERING BOXES & PUMPS

Borgeson steering boxes & pumps are assembled to the same demanding standards as our precision u-joints, far surpassing the OEM standards. Each box is chemically cleaned, inspected and refinished. All components are thoroughly inspected and replaced or re-machined as needed. Each is then carefully assembled, adjusted and inspected to our factory specifications.

1979-08 DODGE TRUCK

Dodge Full Size Truck Shafts

Full size Dodge Pickups and Ramchargers have a type of steering coupler that has shown signs of wear in as little as 4000 miles, depending on how the truck is used. This wear causes play in the truck's steering. It's even more noticeable if your truck is used for plowing, towing or if oversized tires have been installed. Replacing the worn steering shaft with another OEM shaft only gives you a temporary fix. The Borgeson steering shaft assembly replaces the loose OEM parts with precision needle bearing u-joints and a telescopic shaft.

DODGE POWER STEERING UPGRADES

Borgeson 1994-02 Hi-Flow P/S Pump

Part #800328 Manufactured from *all new components* this is a direct replacement Hi-Flow power steering pump for the 1994-2002 Dodge Ram 2500 & 3500 trucks with the Cummins Turbo Diesel motor. This pump has the output pressure/flow calibrated to 1450-1550 PSI and 3.5 GPM to provide your Ram with all of the power its steering needs. Includes new powder coated reservoir, cap and drive key.

Part # 800328

Borgeson Dodge Box for 2003-08

Part # 800123 Borgeson has sourced and adapted this brand new massive "6-bolt" power steering box for the 2003-2008 Dodge trucks. This box has a massive pitman shaft with the largest bearing available for support. The top of the pitman shaft is supported by a 6-bolt top cover for ultimate pitman shaft stability. The Borgeson "Dodge Box" offers the largest piston diameter for the most available power assist and a modern variable valve that allows for stable highway driving and effortless parking and maneuvering. *This box has a pitman shaft that is compatible with all OEM and dropped pitman arms that fit the stock box.*

Part # 800123, 03-08 Dodge Box

Installation Note: Use of a Borgeson #000951 aftermarket steering shaft is recommended for ease of installation. To use this box with the stock steering shaft two flats must be ground on the steering box adapter to match the orientation flats on the stock steering shaft.

DODGE POWER STEERING

Part #	Description	MSRP
800123	03-08 Dodge Box Power Steering Box Upgrade.	\$695.00
800328	P/S Pump Upgrade for 94-02 Dodge Trucks with Cummins Diesel	\$195.00
925116	P/S Hose kit for 94-96 Dodge Diesel Trucks with Vacuum Brakes	\$65.00
925117	P/S Hose Kit for 97-02 Dodge Diesel Trucks with Hydro-Boost Brakes	\$105.00

1973-08 CHEVY/GMC TRUCK

1973-1994 Chevy & GMC

Full Size Trucks and SUVs

Factory steering shafts for many GM models are no longer available from GM, but your worn out steering shafts can now be replaced. The Borgeson direct replacement assemblies consist of a telescoping shaft, a needle bearing u-joint and a rag joint. A Borgeson heavy-duty truck assembly will fix that loose, wandering steering for good.

EXTREME-DUTY

TWO-JOINT STEERING ASSEMBLY 1973-1994

A two-joint system that eliminates the factory rag joint is also available. You should use the two-joint system if you use your truck for extra heavy-duty off-roading or have a body lift installed.

1999-2008 Chevy & GMC

Full Size Trucks and SUVs

You may already have experienced a "clunking or ratcheting" feel in the steering of your 1999-2008 Chevy truck. Borgeson's direct replacement assembly is a permanent solution to the problem.

CHEVY & GMC FULL SIZE STEERING ASSEMBLIES

CUSTOM STEERING SHAFT ASSEMBLIES **NEW**

Using a Borgeson telescopic shaft and the proper universal joints will allow you to build a custom steering shaft for many applications not listed. Telescopic shafts are available in 24" (telescopes from 21"-27") and 36" (telescopes from 33"-39") lengths. The telescopic shafts can be easily trimmed up to 10". Telescopic shafts have a 1" DD connection on one end and a 3/4" DD connection on the other. By selection the proper universal joint for each end you can put together a custom assembly for your application. The below listings are just a small sampling of the most popular universal joints. Many more options are available in the universal joint section of our catalog. If you can't find the correct joint or have any questions feel free to give us a call.

CUSTOM STEERING SHAFT ASSEMBLIES

014925	3/4" DD X 11/16"-36 Spline Universal Joint, for 11/16"-36 Spline Box Connections	\$79.71

STEERING SYSTEM DESIGN

Steering System Design

Often the steering system is designed late in the building process. We recommend that the steering be mocked up at the time the engine and exhaust components are installed. Positioning of the column, shafts, and u-joints with respect to the engine, exhaust and steering box early on can help in selecting the correct parts. With our wide selection of u-joints, shafts, and vibration reducers, any system can be designed or modified to result in a car that is not only safe, but a pleasure to drive. Keeping a system simple is the best course, but even a system with up to 10 u-joints can be designed as long as the proper phasing and supports are used. **Remember to use a support bearing if more than two joints are used.**

Shaft Support Placement

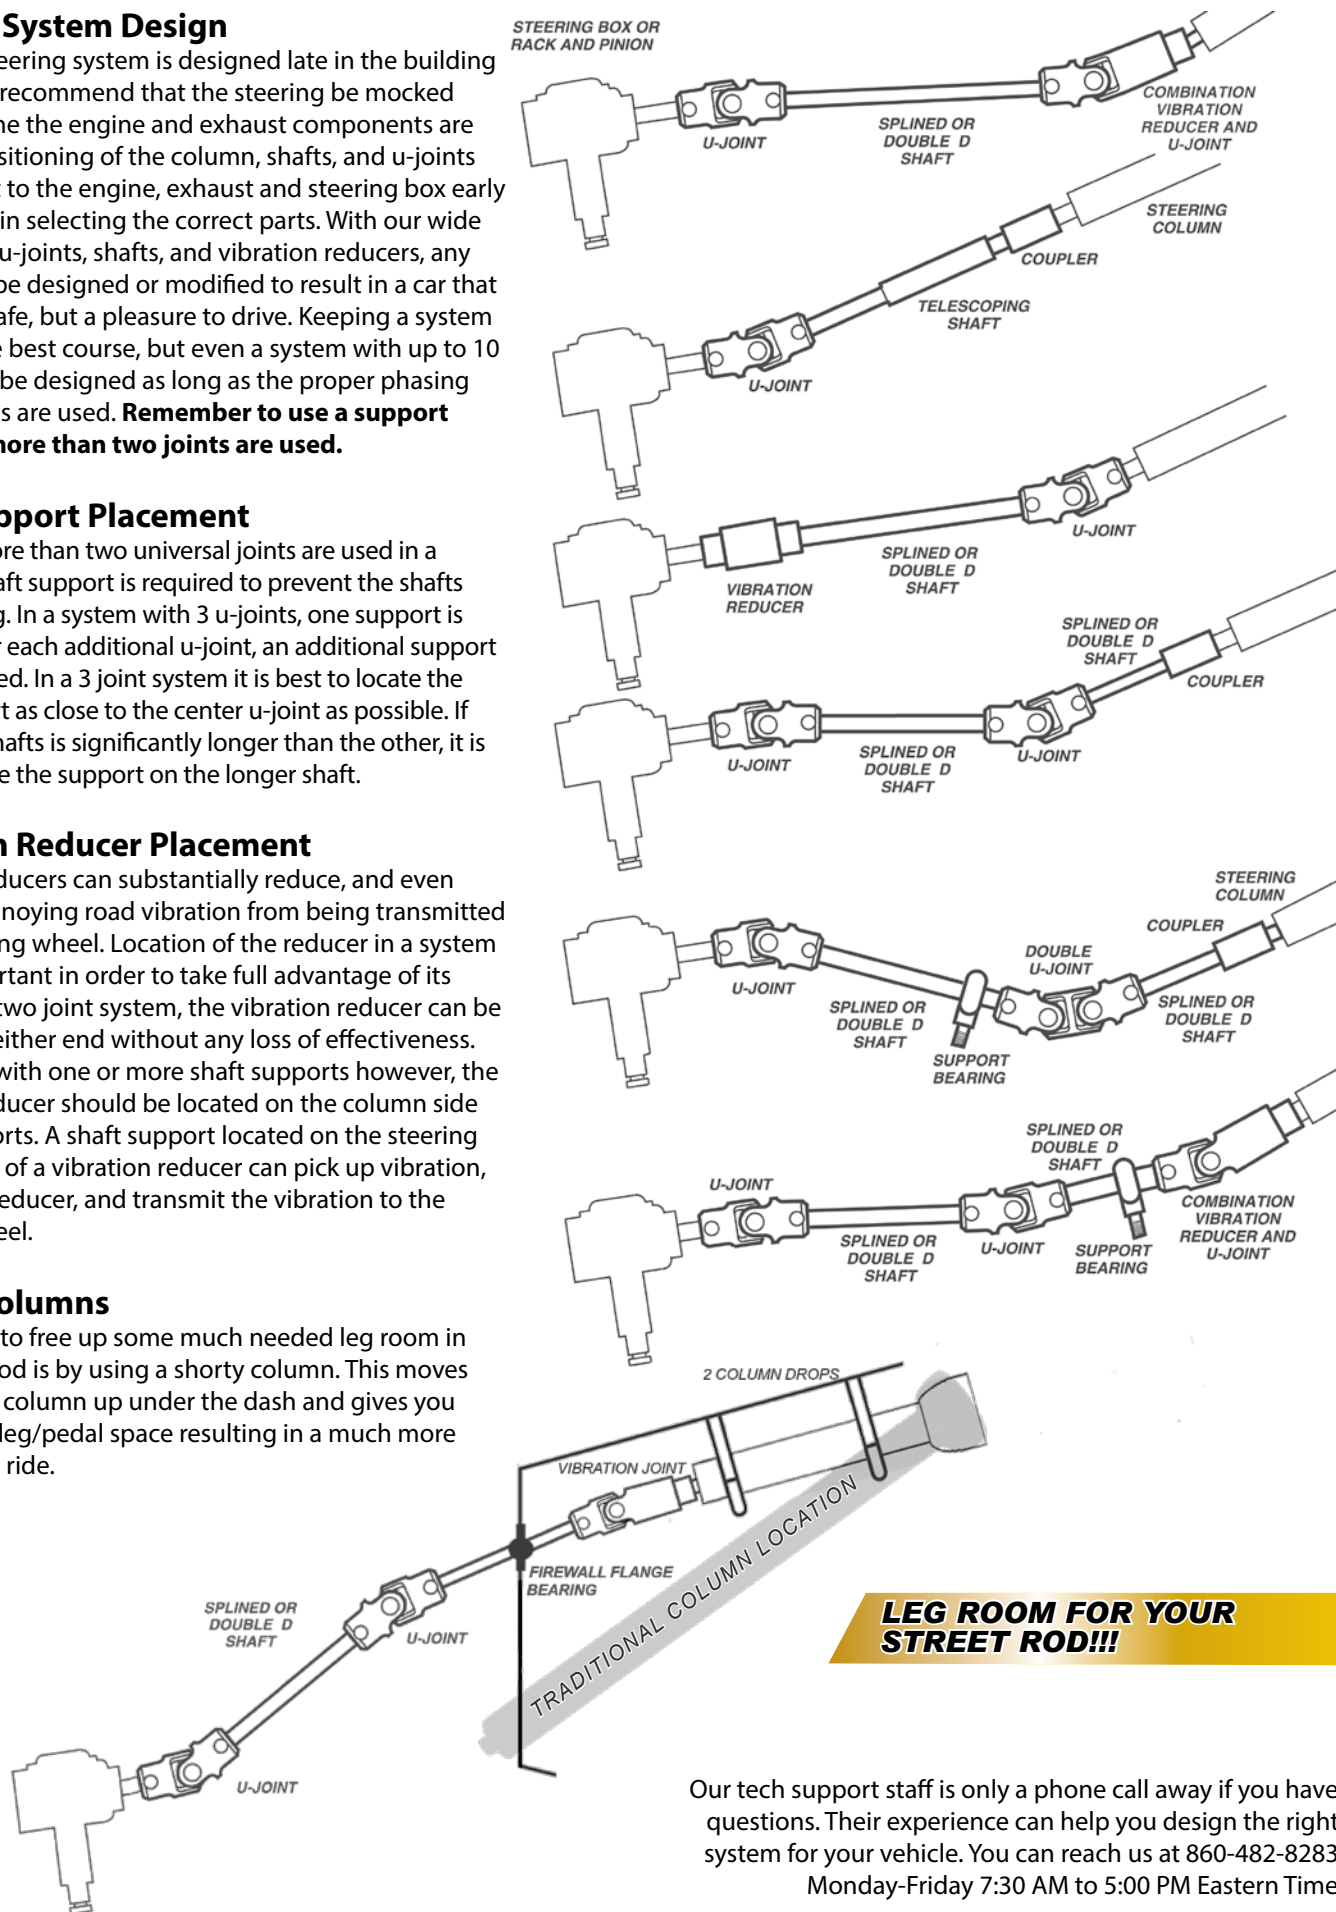

Any time more than two universal joints are used in a system, a shaft support is required to prevent the shafts from looping. In a system with 3 u-joints, one support is required. For each additional u-joint, an additional support will be needed. In a 3 joint system it is best to locate the shaft support as close to the center u-joint as possible. If one of the shafts is significantly longer than the other, it is best to locate the support on the longer shaft.

Vibration Reducer Placement

Vibration reducers can substantially reduce, and even eliminate annoying road vibration from being transmitted to the steering wheel. Location of the reducer in a system is very important in order to take full advantage of its effects. In a two joint system, the vibration reducer can be installed at either end without any loss of effectiveness. In a system with one or more shaft supports however, the vibration reducer should be located on the column side of the supports. A shaft support located on the steering column side of a vibration reducer can pick up vibration, bypass the reducer, and transmit the vibration to the steering wheel.

Shorty Columns

A great way to free up some much needed leg room in your street rod is by using a shorty column. This moves the steering column up under the dash and gives you much more leg/pedal space resulting in a much more comfortable ride.

LEG ROOM FOR YOUR STREET ROD!!!

Our tech support staff is only a phone call away if you have questions. Their experience can help you design the right system for your vehicle. You can reach us at 860-482-8283 Monday-Friday 7:30 AM to 5:00 PM Eastern Time

Steering Column Length and Column Drop Size

Before determining the column length, it is important to have your seat and pedals in the final locations. Using a pie tin tacked to a wooden dowel is an excellent way to decide on steering column position and length. With one person sitting in the car and holding the "steering wheel" in position, another person can take measurements of column length and position. Keep in mind, many traditional style steering wheels are flat, while other aftermarket wheels are dished. This is also the perfect time to determine how much drop you'll need to put the column in a comfortable driving position. Measure from the mounting surface on the dash to the center of the steering column. This is the length of the drop you will need.

Steering Box Installation Angle

One thing frequently overlooked when building or modifying a car is the position of the steering box. Steering boxes are often positioned with the input shaft level creating a much more complex steering linkage. A great way to simplify your steering linkage is to position the steering box with the input shaft angled up toward the steering column. This method has been used by the OEM's for years to simplify the connection to the steering column.

Steering Ratio

Steering box ratio. This is the relationship between input motion and output motion on the steering box. The ratio is expressed as 24:1, 22:1, 16:1, etc. For example, in a 24:1 ratio box, the pitman shaft rotates one degree for every 24 degrees of input shaft rotation. The higher the first number, the more input shaft rotation is required to get the same amount of output shaft rotation. Dividing the first number in the ratio by four, gives the number of turns lock to lock.

Steering ratio and effort. A quicker ratio steering box will have fewer turns of the steering wheel lock-to-lock but this does have an effect on drivability. In manual steering applications a quick ratio box, while enhancing the way the car feels at speed, will greatly increase steering effort during low speed and parking. In power steering applications it is quite common for quicker ratios to be used as the power assist overcomes the added steering effort. Selecting too quick of a ratio without properly building the suspension can result in a diving feel during 5-10 MPH turns.

Variable Ratio Steering. True variable ratio steering is accomplished with the gear cut of the sector shaft and rack block inside the steering gear. The center tooth of a variable ratio power steering gear box is cut at a slower ratio, this makes the on center feel and reaction of a variable ratio box more stable at highway speeds. The pitch of the sector shaft gear then changes to a quicker ratio off center. This gives quicker response when more turning is required like parking, yet minimizes the overall turns lock-to-lock.

Pitman Arm Length

Steering speed can be adjusted by box ratio or pitman arm length. The longer the pitman arm, the quicker the steering will be. That is, a longer pitman arm means less steering wheel movement is required to produce the same amount of front wheel movement. So if you are looking to speed up or slow down the steering, changing the pitman arm is an easy way to do it.

STEERING SYSTEM DESIGN HOW TO...

Determine splined shaft length with two u-joints:

1. Measure the distance from the end of the column to the box/rack (Dimension C).
2. Subtract 3" from this measurement.
3. Order the next even size shaft (Dimension B).

Note: We stock stainless and polished stainless shafting in 1/4" increments up to 24"

EXAMPLE If "C" is 18" —subtract 3" (1-1/2" for each joint). "B" is 15". Order a 16" shaft and trim a total of 1" from the shaft, either from one or both ends.

Determine splined shaft length with one u-joint and u-joint/vibration reducer combination.

1. Measure the distance from the end of the column to the box/rack (Dimension C).
2. Subtract 4" from this measurement.
3. Order the next even size shaft (Dimension B).

Note: We stock stainless and polished stainless shafting in 1/4" increments up to 24"

EXAMPLE If "C" is 19" —subtract 4" (1-1/2" for a joint and 2-1/2" for the vibration reducer). "B" is 15". Order a 16" shaft and trim 1" from the shaft, either from one or both ends.

Determine splined shaft length with three or more u-joints.

1. Buy the u-joints first.
2. Install a joint on the column and one on the box/rack.
3. Use dowels or PVC pipe and mock up the system around obstacles.
4. Order the correct shaft lengths based on dowel/PVC lengths.

Add a vibration reducer to an existing steering system.

There are various ways of adding a vibration reducer to a system. Because of the difference in shafts, u-joints, racks, boxes, and columns, we recommend you call our technical support staff. We can suggest options that will result in the best steering system for you.

Rag Joint Angles of Operation

Rag joints are designed to dampen vibrations, they are not designed to accommodate an angle. **If you do not have a straight connection a rag joint should NOT be used.**

U-joint Angles of Operation

The Borgeson needle bearing u-joints will operate smoothly up to 35°. The double needle bearing u-joints will operate smoothly up to 70°. The u-joints must not be altered in any way. Pin and block style u-joints will operate at 30° smoothly.

Splines and Irregular Shapes: the STRONGEST Method.

Detroit uses irregularly shaped shafts such as splined or a Double D configuration and inserts them into a similarly shaped hole with practically no play and then secures them by staking or clamping. Since steering failures are practically unheard of in modern production cars, one should strongly consider this method as having significant merit.

Borgeson offers splined shafts and joints which give the option of easy disassembly when repairs on the vehicle become necessary. Another advantage is the ability to rotate the shaft in relation to the u-joint in small increments. This makes it easier to position the u-joints in the correct relationship to each other.

A flat should be filed on the splined shaft where the set screw will clamp (figure A). This will prevent damage to the spline and allow for easier disassembly. Always lock the set screw with a lock nut, Loc-Tite or similar product. The shaft must be flush with the inside of the yoke (figure B), not so short that it sacrifices strength or so long that it interferes with the center workings of the joint.

To determine the spline size of a component, measure the outside diameter and count the number of splines. If there is a flat spot on the shaft and some of the splines are missing, (figure C) count halfway around where there are splines and double that number. We need to know how many teeth are in a theoretical full circle. If you have something unusual or you're unsure about measuring the spline, make an impression of it in clay and send it to us.

A Double D (figure D) shaft has two flats on the shaft that correspond to two flats in the female end of the u-joint. The disadvantage of this style is the lack of adjustability because the shaft can only be rotated 180°. The Double D shaft should have a dimple machined on the shaft for the set screw to clamp to (figure D).

Pinning

Common practice is to use two 3/16" diameter roll pins in each yoke at right angles to each other and approximately 3/8" apart. (figure E) An even stronger connection can be made by using hardened shear pins. Pinning can be used when the shaft can be removed from the vehicle and supported properly when inserting the pins. Driving pins in while the assembly is in the car could cause damage. The major drawback to pinning is that a 3/4" diameter shaft is weakened by 30%, smaller shafts are weakened to an even greater extent.

If you are considering using bolts instead of roll pins, don't. **NEVER USE BOLTS!** Always use roll pins. Roll pins are driven in and fit very tightly in the drilled hole. Bolts often fit loosely inside the drilled hole and repeated back and forth movement, even though very slight, can cause the bolt to work harden and fail.

STEERING SYSTEM DESIGN

CAUTION: Collapsibility

Every steering system should include some means of directing energy away from the driver in the event of a collision. One method of reducing the chance of this happening is to intentionally design angles into the steering system so that the force of a collision deflects the column away from the driver. A second method is to use the Borgeson telescopic intermediate shaft.

Problem:

Here is a straight column *WITHOUT* a collapsible intermediate shaft. Without a collapsible shaft, the column may be forced into the passenger compartment in the event of a collision.

Solution: A

With a telescopic intermediate shaft the column slides together, compacting before it gets a chance to enter the passenger compartment.

Solution: B

Here is an example of a steering system with angular collapsibility. An angle designed into steering shaft deflects the column upward upon impact.

CAUTION: Shaft Size

BORGESON DOES NOT RECOMMEND USING LESS THAN 3/4" DIAMETER SHAFTS

All Borgeson spline and DD shafts are 3/4" diameter. We will not sell a shaft with a smaller diameter due to safety considerations. A 5/8" shaft is 42% weaker than a 3/4" shaft and can be twisted with a 14" steering wheel.

Borgeson does not recommend using tubing for a steering connection. It is unsafe to pin and there are too many wall thicknesses and alloys available to insure proper strength.

U-Joint Orientation

When two joints are used on a shaft, the forks of the yokes closest to each other should be in line, or "in phase." Premature wear or binding can result if the u-joints are not phased properly. Sometimes if the u-joints are at a severe angle, even if they are phased correctly, a hard spot in the steering may occur for no apparent reason. If this happens, index the u-joints two or three splines in one direction. The hard spot should disappear or be minimized.

CORRECT PHASING

INCORRECT PHASING

CAUTION: Do Not Use Flex Cable

Another less common (and definitely not recommended) method of getting from the column to the rack or box is to use flex cabling from a Pinto (this cable is no longer available from Ford). Ford only used these for a couple of years before switching to joints and shafts, which should tell you something. When a heavier engine is put into a larger heavier car, a flex cable is not reliable.

CAUTION: Welding

Welding joints is a common practice in racing, however, it is not a method we at Borgeson would recommend. Hairline cracks, which may be all but invisible to the unaided eye, could cause a weld to fail under severe stress. It may also be illegal in some states to weld steering system components on a car used on the street. Improper grounding can cause damage which will result in the failure of the steering. Overheating, which can occur at relatively low temperatures, can distort the yoke and melt the grease out of the needle bearings or damage the seals. This can prevent the joint from operating freely and it may fail. Cooling a weld too quickly can cause cracks, leading to sudden failure. Also, welding is a permanent connection that makes disassembly almost impossible should it become necessary. **Caution: Welding on steering components is illegal in some states. Check first.**

CAUTION: Keying and Set Screws

Using a key, as is done in many industrial applications, can transmit power effectively from the shaft to the joint. A key, however, is not suitable to take sudden shock (such as from a pothole or accident) which can distort or shear the key or shaft keyway. This may cause play to develop in the system or, even worse, failure. It should be noted that in industrial applications, keys are designed to shear, preventing damage to expensive components. In automotive applications a sheared key will cause extensive damage by causing a loss of control of the vehicle. **Set screws should never be used to secure smooth bore joints.** They should only be used as a method to prevent a splined or Double D shaft from disengaging from the joint. An indentation or flat should be made for the set screw on splined or DD shafts.

CAUTION: Bolts for Connection

NEVER USE BOLTS! Always use roll pins. Roll pins are driven in and fit very tightly in the drilled hole. Bolts often fit loosely inside the drilled hole and repeated back and forth movement, even though very slight, can cause the bolt to work harden and fail.

CAUTION: Corvair Steering Boxes

Corvairs were rear-engined cars; this means there was very little weight on the front tires. The steering box used in these cars was a very light duty box. **It is not recommended for use in a street rod with the engine in the front. Steering gear failure could cause a severe accident.**

CAUTION: Vega Steering Boxes

We recommend a maximum weight limit of 2400 lbs. for a vehicle using a Saginaw 140 (Vega) steering Box. We recommend the 525 Saginaw box for vehicles exceeding 2400 lbs.

Diagnosing Power Steering Problems

When trying to determine what is causing a problem in your power steering, keep this in mind: If the problem occurs only in one direction, the problem is probably in the box or rack. If the problem is in both directions, it is most likely the pump, dirty fluid or hoses. Be sure there are no kinks or obstructions in your power steering hoses and that they are the right inside diameter for the application.

Dirty Steering System

Before changing any single component of the steering system, inspect the cleanliness of your system. Dirty or black fluid can quickly ruin new steering components. If changing the box or rack, rub your finger on the inside of the reservoir. If it isn't clean, you must flush the pump and hoses with clean fluid before installing new components.

Bleeding Power Steering

All power steering systems are designed to be self-bleeding, but sometimes they need a little help. After installing new components, fill the reservoir and let it sit for a few minutes. Raise the front end of the vehicle and turn the wheels back and forth slowly with the engine off to allow the steering box to draw fluid. Keep the reservoir full. When the fluid level stops dropping, start the vehicle and continue turning the wheels. When the fluid level remains constant the system is fully bled. Put cardboard under the front tires while testing your steering system. The cardboard will slide on the floor and prevent wearing flat spots on the tires from excessive turning of the wheels while not moving.

Steering Box Adjustment

All Borgeson steering boxes are set at the factory to the proper specifications. Any adjustments of the box beyond that will void the warranty and cause premature wear on the steering box. Please do not try to adjust your steering box. Please contact us if you feel your steering box needs adjustment.

Power Steering Pressure

GM power steering pumps will produce up to 1,500 PSI. We recommend 1,200 PSI for steering box applications and 800–900 PSI for Mustang rack & pinions. If a pump is generating too much pressure for the rack or box you are using, the steering will be over assisted resulting in twitchy steering at speed. This can be corrected by adjusting the pumps internal pressure valve. To properly adjust this pressure order part #899001-Pressure Reducing Kit.

STEERING TROUBLESHOOTING

Many factors influence power steering troubleshooting. Here is a list of common steering and driving complaints, their causes, and some suggestions to fix it.

Road Wander:

Vehicle wanders left/right without any definite input from the steering wheel requiring constant small correction to drive straight.

- Low or unequal tire pressure.
- Steering linkage from column to box or rack loose or worn
- Front-end alignment out of specification. (Inadequate positive Caster)
- Steering box or rack worn or out of adjustment
- Steering tie rod ends worn or loose

No Recovery or Return to Center:

Vehicle fails to return to center after a turn or requires steering input to return to center.

- Binding of steering linkage or components
- Front-end alignment out of specification. (Inadequate positive Caster)
- Steering box or rack improperly adjusted.

Over-steering / Darting:

Vehicle over steers and is overly sensitive to all steering wheel input requiring constant correction.

- Excessive P/S pump pressure / mismatched components.
- Steering linkage from column to box or rack loose or worn
- Steering box or rack worn or out of adjustment

Lost motion at steering wheel:

Excessive free play felt in the steering wheel before the wheels actually begin to turn.

- Steering linkage from column to box or rack loose or worn
- Steering box or rack worn or out of adjustment
- Steering tie rod ends worn or loose
- Steering gear loose on frame

High Steering Effort in both directions:

An abnormal amount of force is required to turn the wheels in both directions.

- Low tire pressure
- Low P/S fluid level
- Insufficient P/S pump pressure and flow
- Excessive P/S fluid temperature
- Binding of steering linkage or components

Intermittent / Loss of power steering:

After servicing the P/S system you experience either a loss of power steering or intermittent assist.

- Low P/S fluid level
- P/S Belt broken or slipping
- Air trapped in the P/S system
- Dirt or contaminants trapped in the P/S pump bypass valve

Packaging, Shipping & Inventory

Shipping Information

It is our policy to charge only the actual shipping charges. We ship via UPS or Fed Ex with either Ground, 3 Day, 2nd Day or Next Day Air. On small shipments to the west coast, we recommend 3 Day because it cuts about 3 days in transit and is not much more expensive than the regular ground service.

Warranty

Borgeson will not be liable for personal or property damage caused by the use or misuse of any product that we manufacture or sell. We have no control over installation and/or use of our products. We will repair or replace, at our option, any product found to be defective in either material or workmanship subject to our inspection. Normal wear is excluded from this warranty. Any product that has been abused, altered, or incorrectly installed is not covered. Our sole remedy shall be repair or replacement, no monetary refund will be granted. Any parts used in competition are excluded from this warranty.

Return Policy

It is our policy to accept any inventory product purchased directly from us and currently offered for sale for exchange or, at our option, a refund. All items are subject to a 10% restocking fee. Products must be in resalable condition with no paint or alterations. If rework is necessary, the cost of the rework will be deducted from the credit allowed. If a product was purchased from a Borgeson dealer, the return must be handled through that dealer. Before any item can be returned to us, a Return Authorization Number must be obtained from us. COLLECT CALLS OR C.O.D. SHIPMENTS ARE NOT ACCEPTED. The Return Authorization Number must be clearly marked on the outside of the box and paperwork with replacement instructions must be included.

Claims For Damage In Shipping

Claims for damaged or lost merchandise are to be made to the freight carrier. If you receive a damaged package or a package that looks like it has been tampered with, make a written note on this to the freight carrier when you sign for the package. A verbal note to the driver is not sufficient. Carefully open and be sure to save the damaged container as visible proof. This is the first thing they will ask to see. Notify the local office of the freight carrier as soon as possible (within 48 hours).

Maintenance & Inspection

The steering system must be in perfect operating condition at all times. It should be checked on a regular basis. Components should move freely with no play. If play develops, replace worn parts as necessary. Check all set screws, clamp screws and pins for tightness. Welds are especially difficult to inspect by eye, but look for any visible cracks.
