SIGNETICS BIPOLAR & MOS MEMORY

DATA MANUAL

Rapid improvement in both the cost and performance of semiconductor memories has led to a dramatic increase in their usage in today's highly sophisticated electronic systems. Signetics has worked diligently over the the last 10 years to develop the various technologies necessary to satisfy the broad range of users' semiconductor memory requirements. As a result, in 1977, Signetics is able to offer the broadest bipolar and MOS memory product lines available in the industry.

Signetics offers a complete line of bipolar Schottky RAMs, PROMs and other special memory products for high speed applications. These products are available with organizations ranging from 64 to 1024 bits for the RAM family and 256 to 8K bits for the PROM family. All Signetics' bipolar products are fabricated with double level metalization for maximum packaging density and low cost. PROM fuses are constructed with nichrome links for the highest reliability and programming yield in the industry. Signetics will continue to advance bipolar memory "state of the art" in 1977 with the introduction of our new 16K PROM, 4K RAM and programmable array logic products.

The MOS memory standard product line spans the many diverse memory application requirements of today's industry. Signetics' dynamic RAMs offer high bit density coupled with low standby power, while our static RAM family offers speed and ease of use. Ultra-violet (UV) eraseable EPROMs are available for use in development programs, with their ROM counterparts, in 8K and 16K densities in volume production. All Signetics' MOS 2600 series ROMs have a single +5V power supply and all industry standard pinouts are available. The MOS memory division also offers a complete shift register and character generator line.

The 1977 Signetics Memory Data Manual contains all necessary data on currently available products and those products which will be available in the future. In addition, the following pages provide product selection guides to aid the user in quickly selecting the optimum product for his particular system application.

Signetics reserves the right to make changes in the products contained in this book in order to improve design or performance and to supply the best possible products. Signetics also assumes no responsibility for the use of any circuits described herein and makes no representations that they are free from patent infringement.

NOTES

1. Output circuit:
   OE = Open emitter
   OC = Open collector
   TS = Tri-state
2. Output logic:
   T = Transparent—input data appears on output during Write
   B = Blanked—output is blanked during Write
3. Temperature range:
   C = Commercial (0° C to +75° C)
   M = Military (-55° C to +125° C)
   All ECL 10,000 series (-30° C to +85° C)
4. Commercial (0°C to +75°C)

BIPOLAR MEMORY DATA SPECIFICATIONS

DESCRIPTION

The 10155 is a 16-bit ECL Content Addressable Memory (CAM) organized as an array of 8 words by 2 bits. Each cell of the array consists of a D-type latch and an exclusive-OR comparator, along with control logic for reading, writing and masking.

The modes of operation possible with the 10155 are associate, masked associate, read, write, and hybrid. Lines Y_0-Y_7 are used for linear word select in the read/write mode, and are used as outputs for match/mismatch information in the associate mode.

In associate operation, I_0 and I_1contain information to be compared. If the latches at a particular Y location are in a state matching the input data, that Y line goes low.

The Y outputs are open emitters, allowing expansion in multiples of 2 bits by tying additional 10155's to the Y bus lines. To inhibit comparison of a particular bit, the corresponding A_0 or A_1 line is held low.

In the read mode, the state of the selected cells appears on outputs D_0 and D_1. In the write mode, these outputs are transparent, following the state of I_0 and I_1.

In Hybrid mode, one of the I_0 or I_1 data inputs may be associated with the Q_{n0} or Q_{n1} cells respectively. If a match exists, the corresponding Y_n line(s) will go low, and can be used to address the other half of the memory for writing new data. Thus, it is possible to write I_1 in Q_{n1} where I_0 matches Q_{n0} or vice versa.

FEATURES

- **12ns associate time (max.)**
- **Linear address select**
- **Single bit masking**
- **50 Ω output drive**
- **ECL 10K compatible**
- **Open emitter match lines for easy bit expansion**
- **50k Ω input pulldown resistors (except on Y lines)**

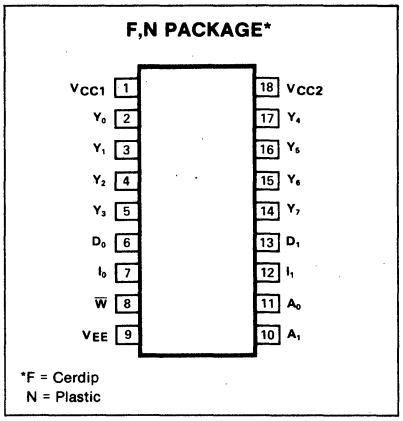
APPLICATION

- **Content addressable memory systems**

RECOMMENDED OPERATING VOLTAGES

- $V_{CC1} = V_{CC2} = 0V$
- $V_{EE} = -5.2V \pm 5\%$

PIN CONFIGURATION



*F = Cerdip
N = Plastic

TRUTH TABLE (POSITIVE LOGIC)

MODE	A_0	A_1	I_0	I_1	$\overline{W}$	D_0	D_1	Q_{n0}	Q_{n1}	Y_n
Associate[1]	1	1	1/0	1/0	X	0	0	Q_{n0}	Q_{n1}	$Q_{n0} \oplus I_0 + Q_{n1} \oplus I_1$
Associate[1,2] (masked)	1	0	1/0	X	1	0	D_1	Q_{n0}	Q_{n1}	$Q_{n0} \oplus I_0$
Associate[1,2] (masked)	0	1	X	1/0	1	D_0	0	Q_{n0}	Q_{n1}	$Q_{n1} \oplus I_1$
Read[3]	0	0	X	X	1	D_0[2]	D_1[2]	Q_{n0}	Q_{n1}	0 (Selected address)
Write[3,4]	0	0	1/0	1/0	0	I_0	I_1	I_0	I_1	0 (Selected address)
Hybrid[5]	1	0	1/0	1/0	0	0	I_1	Q_{n0}	$I_1 \cdot \overline{Y_n}$	$Q_{n0} \oplus I_0$
Hybrid[5]	0	1	1/0	1/0	0	I_1	0	$I_0 \cdot \overline{Y_n}$	Q_{n1}	$Q_{n1} \oplus I_1$

X = Don't care
Q_{n0} = Contents of address n, Bit 0 (n = 0 to 7)
Q_{n1} = Contents of address n, Bit 1

NOTES
1. 1 (high) = Mismatch, 0 (low) = Match
2. Read mode: $D_0 = Q_{00} \bullet \overline{Y_0} + Q_{10} \bullet \overline{Y_1} + \bullet\bullet\bullet + Q_{70} \bullet \overline{Y_7}$
   $D_1 = Q_{01} \bullet \overline{Y_0} + Q_{11} \bullet \overline{Y_1} \bullet\bullet\bullet + Q_{71} \bullet \overline{Y_7}$
3. In normal operation a single Y address is selected for read or write
4. Write is transparent
5. Simultaneous Associate and Write at all "Match" addresses.

NOTES

1. Each ECL 10K series device has been designed to meet the dc and ac specifications after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained.
2. Refer to dc characteristics.
3. Minimum allowed.
4. All typical values are at $T_A = +25°C$.

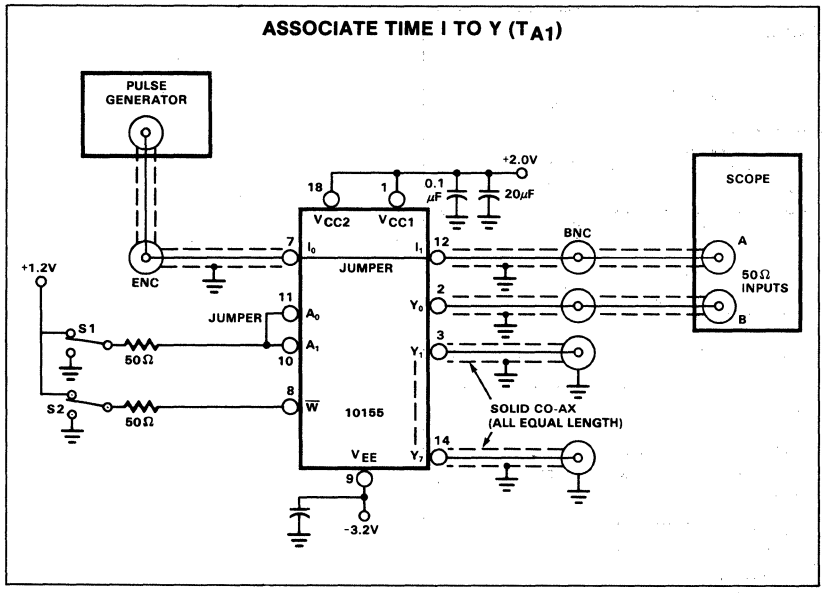
MEASUREMENT CIRCUIT



82S12-F,N • 82S112-F,N

DESCRIPTION

Data is stored in a single storage matrix which is addressed via 2 independent sets of address inputs, designated respectively as Port A and Port B.

Data can be read from memory via either Port A or B, through their respective output sets. However, input data (latched on the leading edge of write enable in the input data latches) is written only in memory locations specified by the address on Port A, regardless of Port B.

When both Port addresses are equal, data from the same location can be read in either or both Port output sets by means of output select lines S_A and S_B. During Write, new data stored in memory is immediately transferred on both Port output sets.

When both Port addresses are different, 2 different locations can be simultaneously read from memory. It is also possible to simultaneously read through Port B while writing new input data through Port A by utilizing the "A_N" address to specify the location of the word to be written, and the "B_N" address to specify the word to be read.

Both devices are ideally suited for high speed accumulator and buffer memories, and can be readily expanded to form larger arrays by means of their output select and write enable lines.

Both the 82S12 and 82S112 are available over the limited temperature range of +10°C to +75°C. Over this temperature range, specify N82S12/82S112F,N.

FEATURES

- **Address access time: 40ns max**
- **Write cycle time: 65ns max**
- **Power dissipation: 8.5mW/bit typ**
- **Input loading: −250μA max**
- **On-chip address decoding**
- **Output options:**
  - **82S12 Open collector**
  - **82S112 Tri-state**
- **Non-inverting outputs**
- **Input data latches**
- **Two write enable lines**
- **Separate output enable lines**
- **Output follows data input during write**
- **TTL compatible**

APPLICATIONS

- **Buffer memory**
- **Accumulator register**
- **Data routing/shifting**
- **ALU control**
- **Multiprocessor memory management**
- **Bandwidth increase by multi-operand fetch**
- **Communication controllers**
- **I/O data packing/unpacking**
- **Large FIFO memories**

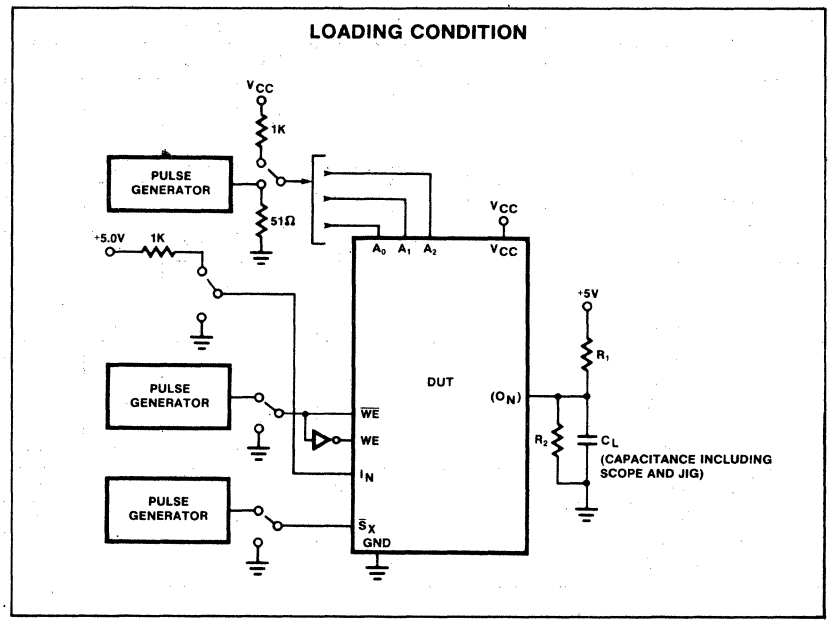
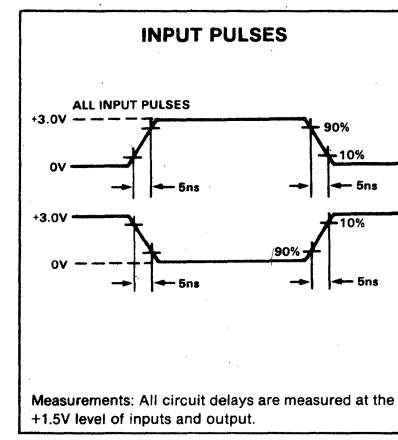
NOTES

1. All voltage values are with respect to network ground terminal.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. Test one at the time.
4. Measured with V_{IL} applied to $\overline{Sx}$ and a logic high stored.
5. Measured with a logic low stored. Output sink current is supplied through a resistor to V_{CC}.
6. Measured with V_{IH} applied to $\overline{Sx}$.
7. Duration of short circuit should not exceed 1 second.
8. I_{CC} is measured with all inputs at 4.5V and the outputs open.

TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



Measurements: All circuit delays are measured at the +1.5V level of inputs and output.

T_{WP}	Width of Write Enable pulse.
T_{WSA}	Required delay between beginning of valid Address and beginning of Write Enable pulse.
T_{WSD}	Required delay between beginning of valid Data Input and end of Write Enable pulse.
T_{WD}	Delay between beginning of Write Enable pulse and when Data Output reflects the Data Input.
T_{WHA}	Required delay between end of Write Enable pulse and end of valid Address.

DESCRIPTION

This family of Read/Write Random Access Memories is ideal for use in scratch pad and high-speed buffer memory applications.

These products are fully decoded memory arrays with separate input and output lines. They feature pnp inputs and 1 chip enable line for ease of memory expansion.

During Write, the outputs of each product assume a logic state by the output access time and the truth table.

The family is available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify the N prefix, and for the military temperature range (-55°C to +125°C) specify the S prefix. The 54/74S89/189 military temperature range product is ordered as S54S89/189. The S grade product is supplied in the F package only.

FEATURES

- **Output access time:**
  - **N82S25: 50ns**
  - **N3101A: 35ns**
  - **N54/74S89: 50ns**
  - **N54/74S189: 35ns**
- **Power dissipation: 6.25mW/bit, typ**
- **Input loading:**
  - **N grade: -100μA max**
  - **S grade: -150μA max**
- **On-chip address decoding**
- **Output options:**
  - **82S25: Open collector**
  - **3101A: Open collector**
  - **54/74S89: Open collector**
  - **54/74S189: Tri-state**
- **Schottky processed**
- **TTL compatible**

APPLICATIONS

- **Scratch pad memory**
- **Buffer memory**
- **Push down stacks**
- **Control store**

NOTES

1. All voltage measurements are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. Typical values are at $V_{CC} = +5.0V$ and $T_A = +25°C$.
3. Output sink current is supplied through a resistor to V_{CC}.
4. All sense outputs in low state.
5. To guarantee a Write into the slowest bit.
6. Positive current is defined as into the terminal referenced.
7. Positive logic definition: high ≈ +5.0V, low ≈ GND.
8. Test each input one at a time.

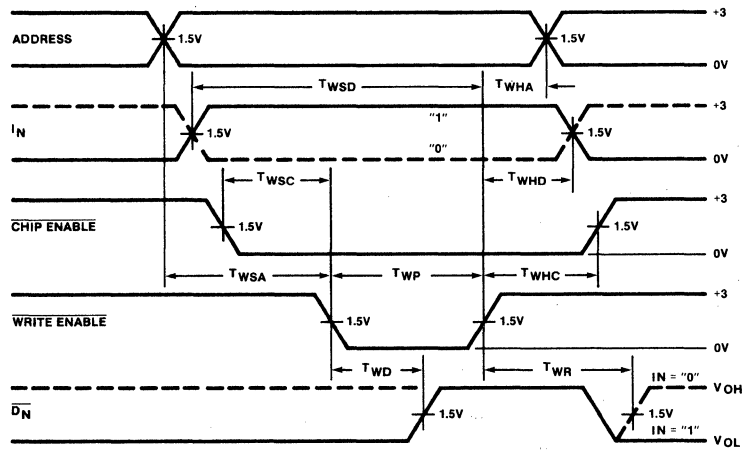
WRITE CYCLE



BIPOLAR MEMORY

82S21-F,N

DESCRIPTION

The 82S21 is ideally suited for high speed buffers and as the memory element in high speed accumulators.

Words are selected through a 5-input decoder when the chip enable input, CE is at logic high. $\overline{WS_0}$ and $\overline{WS_1}$ are the write select inputs for the bit 0 and bit 1 of the word selected. $\overline{WE}$ is the write control input. When $\overline{WS_N}$ and $\overline{WE}$ are both at logic low data on the DI_0 and DI_1 data lines are written into the addressed word. The read function is enabled when either $\overline{WS_N}$ or $\overline{WE}$ is at logic high.

An internal latch provides the Write-While-Read capability. When the latch control line (strobe) is logic high and data is being read from the 82S21, the latch is effectively bypassed. The data at the output will be that of the addressed word. When strobe goes from a logic high to logic low, the outputs are latched and will remain latched regardless of the state of any other address or control line. When strobe goes from low to high, the outputs unlatch and will assume the contents of the present address word.

FEATURES

- **Address access time: 50ns max**
- **Write cycle time:**
  Transparent mode: 45ns max
  Latched mode: 60ns max
- **Power dissipation: 7.5mW/bit typ**
- **32mA output sink capability**
- **On-chip output latches**
- **Bit masking control lines**
- **Write-While-Read function**
- **Non-inverting open collector outputs**
- **TTL compatible**

APPLICATIONS

- **Scratch pad memory**
- **Buffer memory**
- **Accumulator register**
- **Control store**

NOTES
1. All voltage values are with respect to network ground terminal.
2. All typical values are at $V_{CC} = 5V$, $T_A = +25°C$.
3. Test each input one at a time.
4. Measured with a logic low stored. Output sink current is supplied through a resistor to V_{CC}.
5. Measured with V_{IL} applied to CE, and V_{IH} to strobe.
6. I_{CC} is measured with all inputs at 4.5V, and the outputs open.

MEMORY TIMING DEFINITIONS

T_{CE} Delay between beginning of Chip Enable high (with Address valid) and when Data Output becomes valid.

T_{CD} Delay between when Chip Enable becomes low and Data Output is in high state.

T_{AA} Delay between beginning of valid Address (with Chip Enable high) and when Data Output becomes valid.

T_{WSC} Required delay between beginning of valid Chip Enable and beginning of Write Enable pulse.

T_{WHC} Required delay between end of Write Enable pulse and end of Chip Enable.

T_{WSA} Required delay between beginning of valid Address and beginning of Write Enable pulse.

T_{WHA} Required delay between end of Write Enable pulse and end of valid Address.

T_{WSD} Required delay between beginning of valid Data Input and end of Write Enable pulse.

T_{WHD} Required delay between end of Write Enable pulse and end of valid Input Data.

T_{WP} Width of Write Enable pulse.

T_{WD} Delay between beginning of Write Enable pulse and when Data Output reflects the contents of the Data Input.

T_{CES} Minimum delay between leading edge of Chip Enable and trailing edge of Strobe, for latching valid output data.

T_{CEH} Required delay between trailing edge of Strobe and end of Chip Enable, for latching valid output data.

T_{SLR} Minimum delay between Address valid time and trailing edge of Strobe, for latching valid output data.

T_{SW} Minimum width of Strobe pulse required to update contents of output data latches.

T_{ADH} Required delay between trailing edge of Strobe and end of valid Address.

T_{DL} Delay between leading edge of Strobe and when output data latches are released.

T_{LRW} Minimum delay required between trailing edge of Strobe and leading edges of Write Enable or Write Select for latching old output data (being read) while new data is being written (at the same address).

T_{SLW} Minimum delay between leading edge of Write Enable or Write Select and trailing edge of Strobe for latching data being written in output data latches.

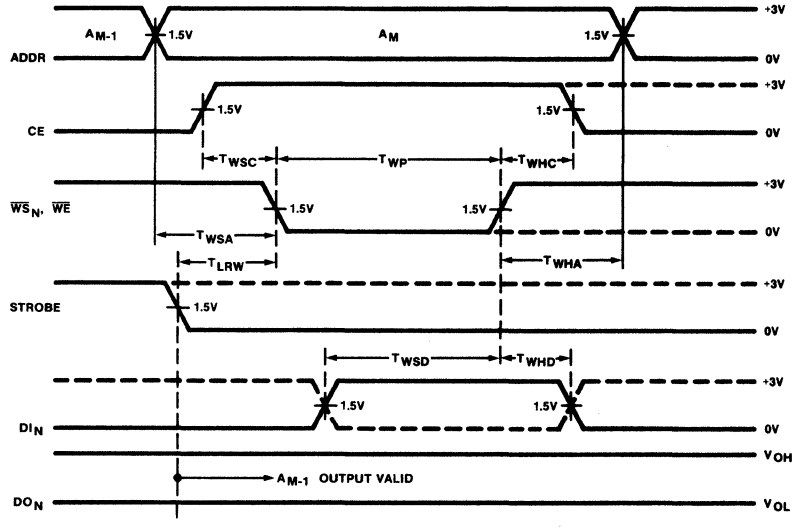
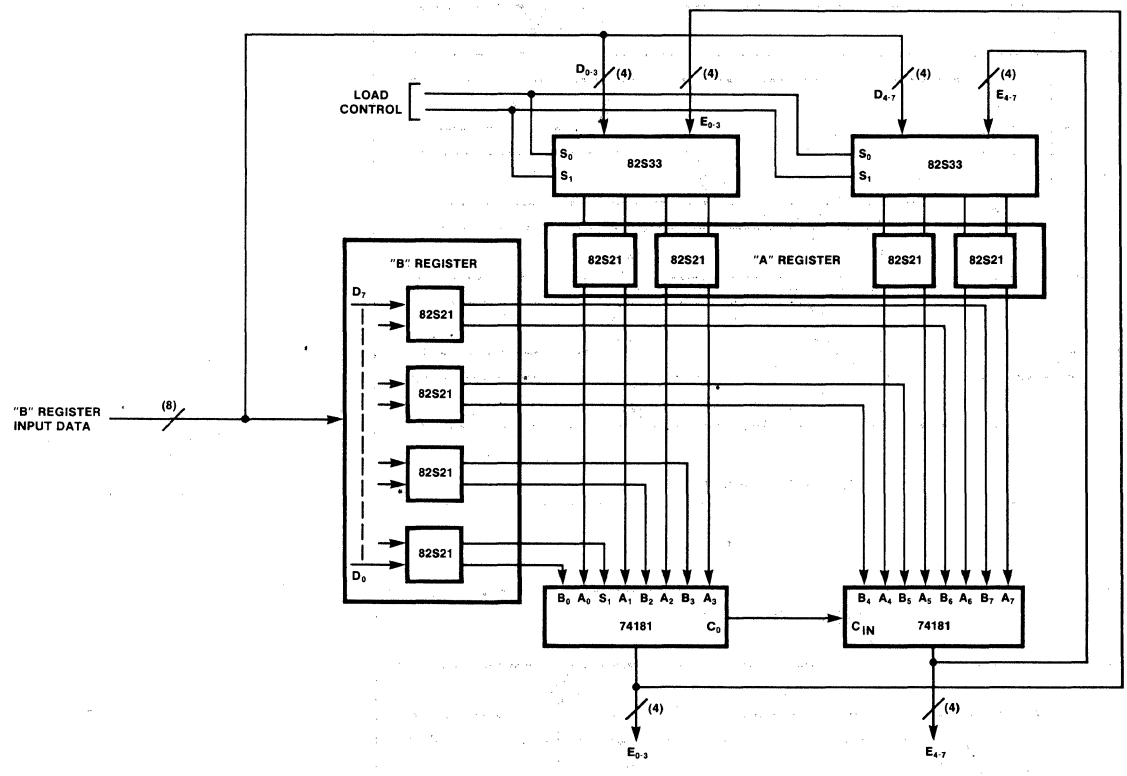
WRITE-WHILE-READ



TYPICAL APPLICATION

BASIC 8-BIT FULLY BUFFERED ACCUMULATOR



By use of the control lines S_0 and S_1 data is loaded into the "A" register through inputs D_X or from the outputs of the 74181's (E_X) to the 82S33's and stored in the 82S21's organized as a 32X8 RAM register. Data is loaded directly into the "B" register. With this arrangement, the function A+B → A (A plus B into A) can be performed in 70ns, typically, starting from data stored in the 82S21's.

DESCRIPTION

The 82S16/116 and 82S17/117 are read/write memory arrays which feature either open collector or tri-state output options for optimization of word expansion in bused organizations. Memory expansion is further enhanced by full on-chip address decoding, 3 chip enable inputs and pnp input transistors which reduce input loading to 25μA for a high level, and –100μA for a low level.

During Write operation, the logical state of the output of both devices follows the complement of the data input being written. This feature allows faster execution of Write-Read cycles, enhancing the performance of systems utilizing indirect addressing modes, and/or requiring immediate verification following a Write cycle.

Both devices have fast read access and write cycle times, and thus are ideally suited in high-speed memory applications such as cache, buffers, scratch pads, writable control stores, etc.

All devices are available in the commercial temperature range (0°C to +75°C) and are specified as N82S16/116/17/117, F or N. The 82S16 and 82S17 are also available in the military temperature range (–55°C to +125°C) and are specified as S82S16/17.

FEATURES

- **Address access time:**
  82S116/117: 40ns max
- **Write cycle time:**
  82S116/117: 25ns max
- **Power dissipation: 1.5mW/bit typ**
- **Input loading:**
  N82S116/117: –100μA
- **Output follows complement of data input during Write**
- **On-chip address decoding**
- **Output option:**
  82S16/116: Tri-state
  82S17/117: Open collector
- **Schottky clamped**
- **TTL compatible**

APPLICATIONS

- **Buffer memory**
- **Writable control store**
- **Memory mapping**
- **Push down stack**
- **Scratch pad**

NOTES

1. All typical values are at $V_{CC} = 5V$, T_A +25°C.
2. All voltage values are with respect to network ground terminal.
3. Test each input one at the time.
4. Measured with a logic low stored and V_{IL} applied to $\overline{CE_1}$, $\overline{CE_2}$ and $\overline{CE_3}$.
5. Measured with a logic high stored. Output sink current is supplied through a resistor to V_{CC}.
6. Measured with V_{IH} applied to $\overline{CE1}$, $\overline{CE2}$ and $\overline{CE3}$.
7. Duration of the short-circuit should not exceed 1 second.
8. I_{CC} is measured with the write enable and memory enable inputs grounded, all other inputs at 4.5V, and the output open.
9. Minimum required to guarantee a Write into the slowest bit.

TEST LOAD CIRCUIT

MEMORY TIMING DEFINITIONS

T_{CE}	Delay between beginning of Chip Enable low (with Address valid) and when Data Output becomes valid.
T_{CD}	Delay between when Chip Enable becomes high and Data Output is in off state.
T_{AA}	Delay between beginning of valid Address (with Chip Enable low) and when Data Output becomes valid.
T_{WSC}	Required delay between beginning of valid Chip Enable and beginning of Write Enable pulse.
T_{WHD}	Required delay between end of Write Enable pulse and end of valid Input Data.
T_{WP}	Width of Write Enable pulse.
T_{WSA}	Required delay between beginning of valid Address and beginning of Write Enable pulse.
T_{WSD}	Required delay between beginning of valid Data Input and end of Write Enable pulse.
T_{WD}	Delay between beginning of Write Enable pulse and when Data Output reflects complement of Data Input.
T_{WHC}	Required delay between end of Write Enable pulse and end of Chip Enable.
T_{WHA}	Required delay between end of Write Enable pulse and end of valid Address.

DESCRIPTION

The 54/74S200/201 and 54/74S301 are read/write memory arrays which feature either open collector or tri-state output options for optimization of word expansion in bused organizations. Memory expansion is further enhanced by full on-chip address decoding, 3 chip enable inputs and pnp input transistors, which reduces input loading to 25μA for a high level and -250μA (S54S200/201/301) or -100μA (N74S200/201/301) for a low level.

The additional feature of output blanking during Write ($\overline{D}_O$ terminal "H" or "Hi-Z" state) permits $\overline{D}_O$ and D_{IN} terminals to share a common I/O line to reduce system interconnections. These devices have fast read access and write cycle times, and thus are ideally suited in high speed memory applications such as cache, buffers, scratch pads, writable control stores, etc.

They are available in both the commercial and military temperature ranges. The commercial temperature range (0°C to +75°C) is specified as N74S200/201/301, F or N, and the military temperature range (-55°C to +125°C) is specified as S54S200/201/301, F only.

FEATURES

- **Address access time:**
  N74S200/201/301: 50ns max
  S54S200/201/301: 70ns max
- **Write cycle time:**
  N74S200/201/301: 50ns max
  S54S200/201/301: 60ns max
- **Power dissipation : 1.5mW/bit typ**
- **Input loading:**
  N74S200/201/301: -100μA max
  S54S200/201/301: -250μA max
- **Output blanking during Write**
- **On-chip address decoding**
- **Output option:**
  54/74S200/201: Tri-state
  54/74S301: Open collector
- **Schottky clamped**
- **TTL compatible**

APPLICATIONS

- **Buffer memory**
- **Writable control store**
- **Memory mapping**
- **Push down stack**
- **Scratch pad**

NOTES

1. All typical values are at $V_{CC} = 5V$, $T_A = +25°C$.
2. All voltage values are with respect to network ground terminal.
3. Test each input one at a time.
4. Measured with a logic high stored. Output sink current is supplied through a resistor to V_{CC}.
5. Measured with logic stored, and V_{IL} applied to $\overline{CE1}$, $\overline{CE2}$ and $\overline{CE3}$.
6. Measured with V_{IH} applied to $\overline{CE1}$, $\overline{CE2}$ and $\overline{CE3}$.
7. Duration of the short circuit should not exceed 1 second.
8. I_{CC} is measured with the write enable and memory enable inputs grounded, all other inputs at 4.5V, and the output open.
9. See timing diagram notes.

NOTES

A. Waveform 1 is for the output with internal conditions such that the output is low except when disabled. Waveform 2 is for the output with internal conditions such that the output is high except when disabled.
B. When measuring delay times from address inputs, the chip enable inputs are low and the write enable input is high.
C. When measuring delay times from chip enable inputs, the address inputs are steady-state and the write enable input is high.
D. Input waveforms are supplied by pulse generators having the following characteristics: $t_r \leq 2.5$ns, $t_f \leq 2.5$ns, PRR ≤ 1MHz, and $Z_{OUT} \approx 50\Omega$.
E. t_{PLH} propagation delay time, low-to-high level output, t_{PHL} propagation delay time, high-to-low level output.
F. t_{ZH} propagation delay time, Hi-Z to high level output, t_{ZL} propagation delay time, Hi-Z to low level output.
G. T_{HZ} propagation delay time, high level to Hi-Z output, t_{LZ} propagation delay time, low level to Hi-Z output.
H. Minimum required to guarantee a Write into the slowest bit.

82S09-I,N

DESCRIPTION

The organization of this device allows byte manipulation of data, including parity. Where parity is not monitored, the ninth bit can be used as a flag or status indicator for each word stored. With a typical access time of 30ns, it is ideal for scratch-pad, push-down stacks, buffer memories, and other internal memory applications in which cost and performance requirements dictate a wide data path in favor of word depth.

The 82S09 features open collector outputs, chip enable input, and a very low current pnp input structure to enhance memory expansion.

During Write operation, the logic state of the device output follows the complement of the data input being written. This feature allows faster execution of Write-Read cycles, enhancing the performance of systems utilizing indirect addressing modes, and/or requiring immediate verification following a Write cycle.

The 82S09 is available in the commercial and military temperature ranges. For the commercial temperature ranges. (0°C to +75°C) specify N82S09, and for the military temperature range (-55°C to +125°C) specify S82S09.

FEATURES

- **Address access time:**
  N82S09: 45ns max
  S82S09: 80ns max
- **Write cycle time:**
  N82S09: 45ns max
  S82S09: 75ns max
- **Power dissipation: 1.3mW/bit typ**
- **Input loading:**
  N82S09: -100μA max
  S82S09: -150μA max
- **Output follows complement of data input during Write**
- **On-chip address decoding**
- **Schottky clamped**
- **Fully TTL compatible**

APPLICATIONS

- **Buffer memory**
- **Control register**
- **FIFO memory**
- **Push down stack**
- **Scratch pad**

T_{CE}	Delay between beginning of Chip Enable low (with Address valid) and when Data Output becomes valid.
T_{CD}	Delay between when Chip Enable becomes high and Data Output is in off state.
T_{AA}	Delay between beginning of valid Address (with Chip Enable low) and when Data Output becomes valid.
T_{WSC}	Required delay between beginning of valid Chip Enable and beginning of Write Enable pulse.
T_{WHD}	Required delay between end of Write Enable pulse and end of valid Input Data.
T_{WP}	Width of Write Enable pulse.
T_{WSA}	Required delay between beginning of valid Address and beginning of Write Enable pulse.
T_{WSD}	Required delay between beginning of valid Data Input and end of Write Enable pulse.
T_{WD}	Delay between beginning of Write Enable pulse and when Data Output reflects complement of Data Input.
T_{WHC}	Required delay between end of Write Enable pulse and end of Chip Enable.
T_{WHA}	Required delay between end of Write Enable pulse and end of valid Address.

DESCRIPTION

The 82S10/11, with a typical access time of 30ns, is ideal for cache buffer applications and for systems requiring very high speed main memory.

The 82S10/11 family requires single +5V power supply and features very low current pnp input structures. They include on-chip decoding and a chip enable input for ease of memory expansion, and feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

All devices are available in the commercial temperature range (0°C to +75°C) and are specified as N82S10/110/11/111. The 82S10 and 82S11 are also available in the military temperature range (-55°C to +125°C) and are specified as S82S10/11.

FEATURES

- **Address access time:**
  N82S10/11: 45ns max
  S82S10/11: 70ns max
  N82S110/111: 35ns max
- **Write cycle time:**
  N82S10/11: 45ns max
  S82S10/11: 75ns max
  N82S110/111: 40ns max
- **Power dissipation: 0.5W/bit typ**
- **Input loading:**
  N82S10/11: -250μA max
  S82S10/11: -250μA max
  N82S110/111: -250μA max
- **Output options:**
  82S10/110: Open collector
  82S11/111: Tri-state
- **On-chip address decoding**
- **Non-inverting output**
- **Blanked output during Write**
- **Fully TTL compatible**

APPLICATIONS

- **High speed main frame**
- **Cache memory**
- **Buffer storage**
- **Writable control store**

PIN CONFIGURATION

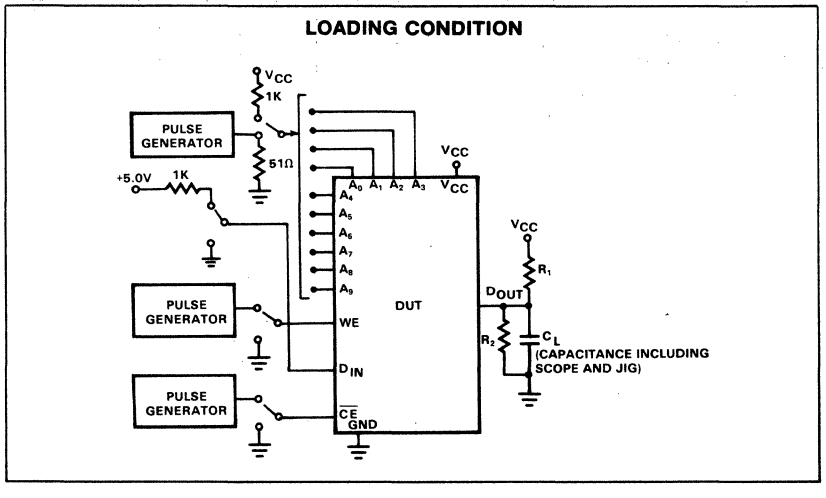
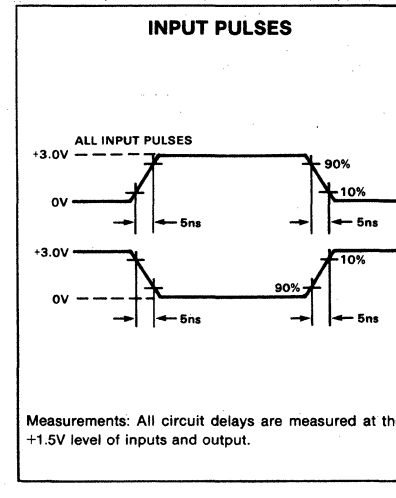
NOTES

1. All voltage values are with respect to network ground terminal.
2. The operating ambient temperature ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute and a 2-minute warm-up.
   Typical thermal resistance values of the package at maximum temperature are:
   Θ_{JA} junction to ambient at 400fpm air flow - 50°C/watt
   Θ_{JA} junction to ambient - still air - 90°C/watt
   Θ_{JA} junction to case - 20°C/watt
3. All typical values are at $V_{CC} = 5V$, $T_A = 25°C$.
4. Test each input one at a time.
5. Measured with a logic low stored. Output sink current is supplied through a resistor to V_{CC}.
6. Measured with V_{IL} applied to $\overline{CE}$ and a logic high stored.
7. Measured with V_{IH} applied to $\overline{CE}$.
8. Duration of the short circuit should not exceed 1 second.
9. I_{CC} is measured with the write enable and memory enable inputs grounded, all other inputs at 4.5V, and the output open.
10. Minimum required to guarantee a Write into the slowest bit.

TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



Measurements: All circuit delays are measured at the +1.5V level of inputs and output.

DESCRIPTION

The 82S208 and 82S210 data inputs and outputs are common (common I/O) with separate output disable (OD) line that allows ease of read/write operations using a common bus.

The address inputs have a latch feature controlled by a latch control pin ($\overline{L}$). In the Transparent mode, the $\overline{L}$ pin is held high and the read or write location is accessed directly from the address inputs. In the Latched mode, a negative transition on the $\overline{L}$ line causes the present address state to be held in the address latches, independent of any other control signals. A positive pulse on the $\overline{L}$ line will cause a new address state to be strobed into the latches.

FEATURES

- **Access time:**
  Address: 60ns max
  Strobe: 70ns max
- **On-chip address latches**
- **Tri-state outputs**
- **Schottky clamped TTL**

OBJECTIVE SPECIFICATION

82S400/400A - I • 82S401/401A - I

DESCRIPTION

The 82S400 and 82S401, with typical access time of 45ns, are ideal for cache buffer applications and for systems requiring very high speed main memory. The 82S400A and 82S401A are devices selected for speed compatibility with industry standard 1024-bit RAMs having 45ns access time.

Both devices require a single +5V power supply, feature very low current pnp input structures, and include on-chip decoding and a chip enable input for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

APPLICATIONS

- **High speed main frame**
- **Cache memory**
- **Buffer storage**
- **Writable control store**

FEATURES

- **Address access time:**
  82S400/401: 70ns max
  82S400A/401A: 45ns max
- **Write cycle time: 70ns max**
- **Power dissipation: 0.12mW/bit typ**
- **Input loading: -150μA max**
- **On-chip address decoding**
- **Output options:**
  82S400: Open collector
  82S401: Tri-state
- **Non-inverting output**
- **Blanked output during Write**
- **Fully TTL compatible**

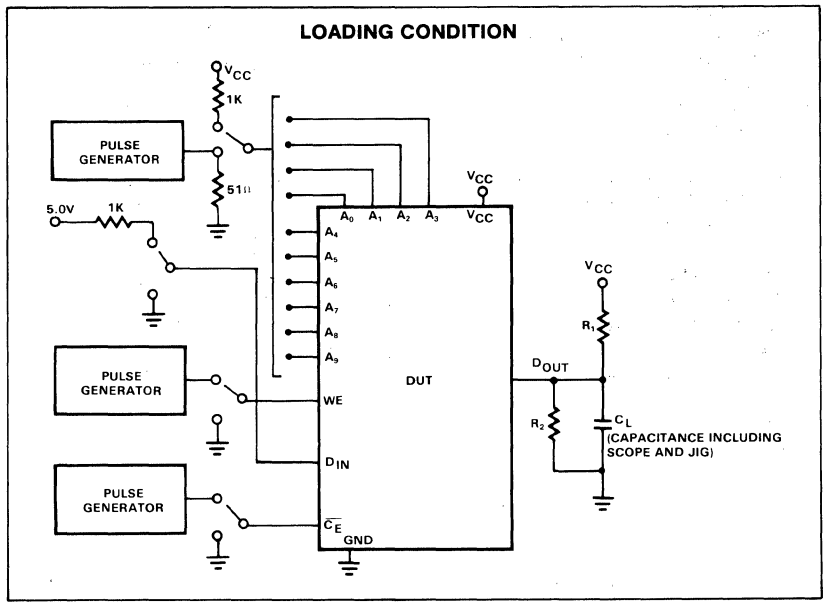
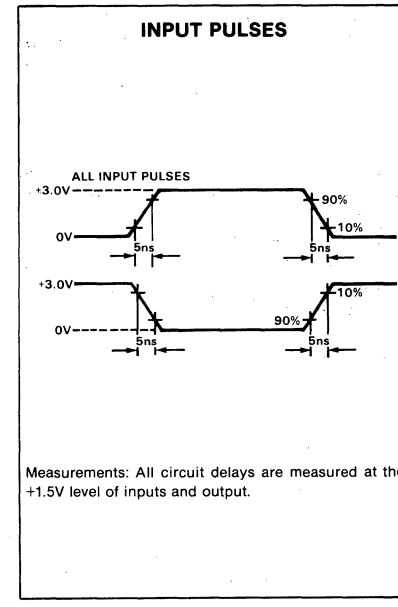
NOTES

1. All voltage values are with respect to network ground terminal.
2. All typical values are at V_{CC} = 5V, T_A 25°C.
3. Test each input one at a time.
4. Measured with a logic low stored. Output sink current is supplied through a resistor to V_{CC}.
5. Measured with V_{IL} applied to $\overline{CE}$ and a logic high stored.
6. Measured with V_{IH} applied to $\overline{CE}$.
7. Duration of the short circuit should not exceed 1 second.
8. I_{CC} is measured with the write enable and memory enable inputs grounded, all other inputs at 4.5V, and the output open.
9. Minimum required to guarantee a Write into the slowest bit.
10. The operating ambient temperature ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute and a 2-minute warm-up. Typical thermal resistance values of the package at maximum temperature are:
    Θ_{JA} junction to ambient at 400fpm air flow - 50°C/watt
    Θ_{JA} junction to ambient - still air - 90°C/watt
    Θ_{JA} junction to case - 20°C/watt

TEST LOAD CIRCUIT

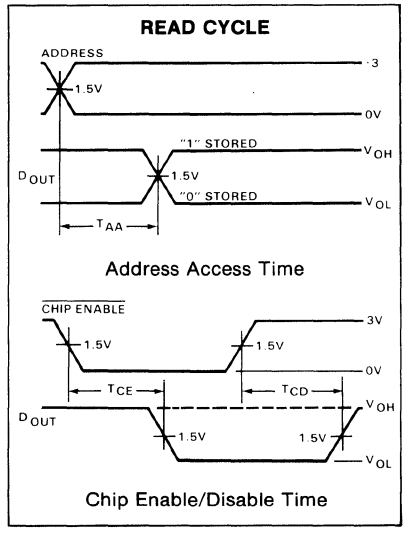


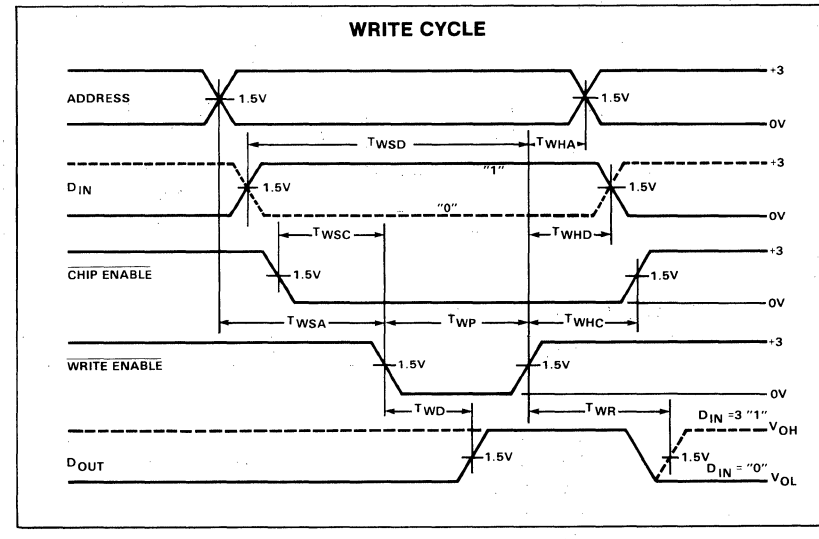
VOLTAGE WAVEFORM



Measurements: All circuit delays are measured at the +1.5V level of inputs and output.

TIMING DIAGRAMS





TIMING DEFINITIONS

T_{WR} Delay between end of Write Enable pulse and when Data Output becomes valid (assuming Address still valid—not as shown).

T_{CE} Delay between beginning of Chip Enable low (with Address valid) and when Data Output becomes valid.

T_{CD} Delay between when Chip Enable becomes high and Data Output is in off state.

T_{AA} Delay between beginning of valid Address (with Chip Enable low) and when Data Output becomes valid.

T_{WSC} Required delay between beginning of valid Chip Enable and beginning of Write Enable pulse.

T_{WHD} Required delay between end of Write Enable pulse and end of valid Input Data.

T_{WP} Width of Write Enable pulse.

T_{WSA} Required delay between beginning of valid Address and beginning of Write Enable pulse.

T_{WSD} Required delay between beginning of valid Data Input and end of Write Enable pulse.

T_{WD} Delay between beginning of Write Enable pulse and when Data Output is in off state.

T_{WHC} Required delay between end of Write Enable pulse and end of Chip Enable.

T_{WHA} Required delay between end of Write Enable pulse and end of valid Address.

DESCRIPTION

The 82S226 and 82S229 include on-chip decoding and 2 chip enable inputs for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S226 and 82S229 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S226/229, F or N, and for the military temperature range (-55°C to +125°C specify S82S226/229, F only.

FEATURES

- **Address access time:**
  N82S226/229: 50ns max
  S82S226/229 70ns max
- **Power dissipation: 0.5mW/bit typ**
- **Input loading:**
  N82S226/229: -100μA max
  S82S226/229: -150μA max
- **On-chip address decoding**
- **Output options:**
  82S226: Open collector
  82S229: Tri-state
- **Fully compatible with Signetics 82S126/129 1024-bit PROMs**
- **Fully TTL compatible**

APPLICATIONS

- **Volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

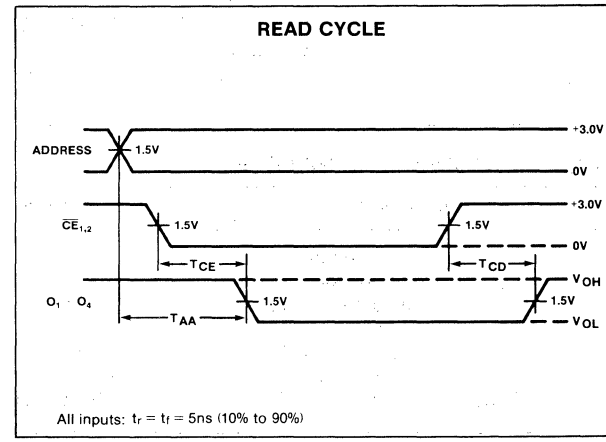
VOLTAGE WAVEFORM



DESCRIPTION

The 82S214 and 82S215 include on-chip decoding and 2 chip enable inputs for ease of memory expansion. They feature tri-state outputs for optimization of word expansion in bused organizations. A D-type latch is used to enable the tri-state output drivers. In the Transparent Read mode, stored data is addressed by applying a binary code to the address inputs while holding Strobe high. In this mode the bit drivers will be controlled solely by $\overline{CE}_1$ and CE_2 lines.

In the Latched Read mode, outputs are held in their previous state (high, low or high Z) as long as Strobe is low, regardless of the state of address or chip enable. A positive Strobe transition causes data from the applied address to reach the outputs if the chip is enabled, and causes outputs to go to the high Z state if the chip is disabled.

A negative Strobe transition causes outputs to be locked into their last Read Data condition if the chip was enabled, or causes outputs to be locked into the high Z condition if the chip was disabled.

Both 82S214 and 82S215 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S214/215, F or N, and for the military temperature range (-55°C to +125°C) specify S82S214/215, F.

FEATURES

- **Address access time:**
  N82S214/215: 60ns max
  S82S214/215: 90ns max
- **Power dissipation: 165μW/bit typ**
- **Input loading:**
  N82S214/215: -100μA max
  S82S214/215: -150μA max
- **On-chip data output registers**
- **On-chip storage latches**
- **Schottky clamped**
- **Fully compatible with Signetics 82S114/115 PROMs**
- **Fully TTL compatible**

APPLICATIONS

- **Microprogramming**
- **Hardwire algorithms**
- **Character generation**
- **Control store**
- **Sequential controllers**

T_{SL}	Strobe				60	35		90	35		
	Delatch time[5]			Latched read only							ns
T_{DL}	Strobe						30			35	

NOTES

1. Positive current is defined as into the terminal referenced.
2. Typical values are at V_{CC} = +5.0V and T_A = +25°C.
3. No more than one output should be grounded at the same time and strobe should be disabled. Strobe is in high state.
4. If the strobe is high, the device functions in a manner idential to conventional bipolar ROMs. The timing diagram shows valid data will appear T_A nanoseconds after the address has changed and T_{CE} nanoseconds after the output circuit is enabled. T_{CD} is the time required to disable the output and switch it to an "off" or high impedance state after it has been enabled.
5. In Latched Read Mode data from any selected address will be held on the output when strobe is lowered. Only when strobe is raised will new location data be transferred and chip enable conditions be stored. The new data will appear on the outputs if the chip enable conditions enable the outputs.

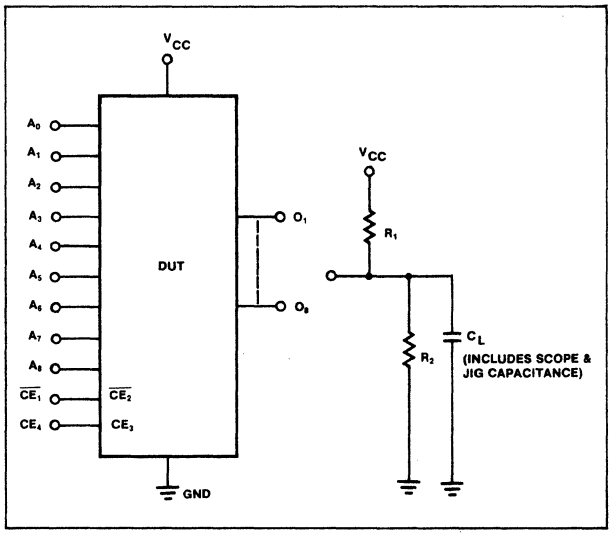
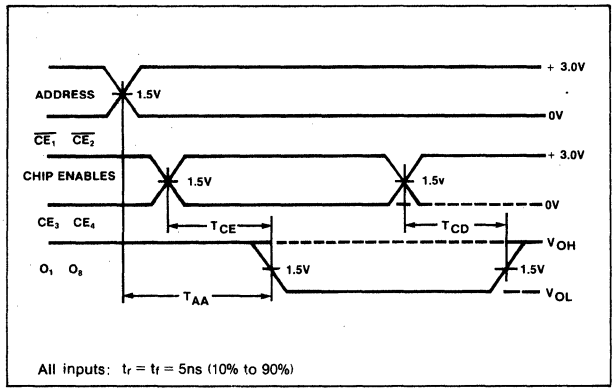
2. Typical values are at $V_{CC} = 5.0V$, $T_A = +25°C$.

TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



8228-F

DESCRIPTION

The 8228, available in a 16-pin dual-in-line package, can provide very high bit packing density by replacing 4 standard 256X4 ROMs.

This device includes on-chip decoding, and has a typical access time of 50ns with a power consumption of only .125mW per bit.

The standard 8228 ROM pattern is the USASCII Row Character Generator code; however, custom patterns are also available. The standard pattern is specified as the N8228I-CB162, while custom circuits are identified as N8228I-CXXX.

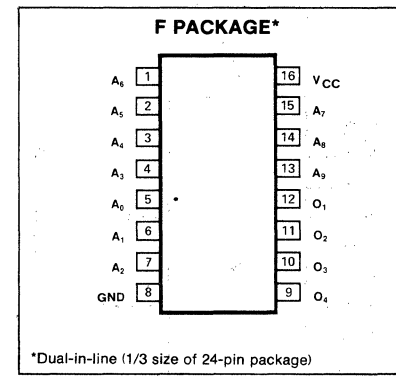
FEATURES

- **Buffered address lines**
- **Totem pole outputs**
- **Diode protected inputs**
- **Fully TTL compatible**

APPLICATIONS

- **Microprogramming**
- **Hardwired algorithms**
- **Character recognition**
- **Character generation**
- **Control store**

PIN CONFIGURATION



*Dual-in-line (1/3 size of 24-pin package)

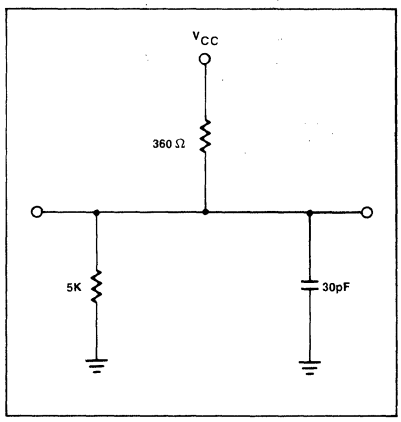
PARAMETER	TO	FROM	LIMITS			UNIT
			Min	Typ	Max	
Access time[1] T_{AA}	Output	Address		50	70	ns

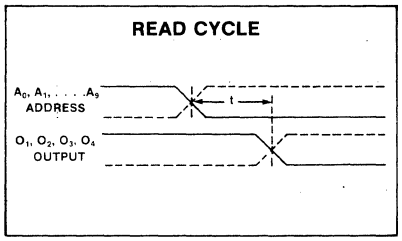
NOTES

1. Rise and fall time for this test must be less than 5ns. Input amplitudes are 3.0V and all measurements are made at 1.5V.
2. Positive current is defined as into the terminal referenced.
3. No more than 1 output should be grounded at the same time.
4. Manufacturer reserves the right to make design and process changes and improvements.

TEST LOAD CIRCUIT



VOLTAGE WAVEFORM



82S280-F,N • 82S281-F,N

DESCRIPTION

The 82S280 and 82S281 include on-chip decoding and 4 chip enable inputs for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S280 and 82S281 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S280/281, F or N, and for the military temperature range (-55°C to +125°C) specify S82S280/281, F only.

FEATURES

- **Address access time:**
  N82S280/281: 70ns max
  S82S280/281: 100ns max
- **Power dissipation: 60μW/bit typ**
- **Input loading:**
  N82S280/281: -100μA max
  S82S280/281: -150μA max
- **On-chip address decoding**
- **Output options:**
  82S280: Open collector
  82S281: Tri-state
- **Enable = $\overline{E1}$ • $\overline{E2}$ • E3 • E4**
- **Fully TTL compatible**

OBJECTIVE SPECIFICATION

82S290-F,N • 82S291-F,N

DESCRIPTION

The 82S290 and 82S291 include on-chip decoding and 3 programmable chip enable inputs for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S290 and 82S291 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S290/291, F or N, and for the military temperature range (-55°C to +125°C) specify S82S290/291, F.

FEATURES

- **Address access time:**
  N82S290/291: 80ns max
  S82S290/291: 100ns max
- **Power dissipation: 40μW/bit typ**
- **Input loading:**
  N82S290/291: -100μA max
  S82S290/291: -150μA max
- **On-chip address decoding**
- **Output options:**
  82S290: Open collector
  82S291: Tri-state
- **Fully compatible with Signetics 82S190/191 PROMs**
- **Fully TTL compatible**

APPLICATIONS

- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

PROGRAMMING INFORMATION

Programming Equipment for Signetics PROMs

Programming equipment is available from several manufacturers, including Curtis Enterprises, Data I/O, and Pro-Log. Choice of equipment varies from manual duplicators to fully automatic programmers which read paper tape coded in a variety of formats.

For more information, contact Signetics Memory Marketing or any of the following programmer manufacturers:

Curtis Enterprises

DESCRIPTION

The 82S23 and 82S123 are field programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard 82S23 and 82S123 devices are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

These devices include on-chip decoding and 1 chip enable input for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

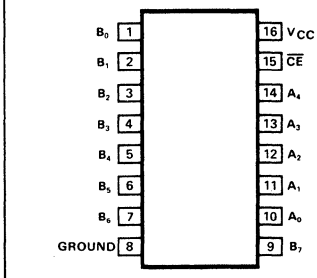
Both 82S23 and 82S123 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S23/123, N or F, and for the military temperature range (-55°C to +125°C) specify S82S23/123, F only.

FEATURES

- **Address access time:**
  N82S23/123: 50ns max
  S82S23/123: 65ns max
- **Power dissipation: 1.3mW/bit typ**
- **Input loading:**
  N82S23/123: -100μA max
  S82S23/123: -150μA max
- **On-chip address decoding**
- **Output options:**
  82S23: Open collector
  82S123: Tri-state
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

PIN CONFIGURATION

F,N PACKAGE



APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Format conversion**
- **Hardwired algorithms**
- **Random logic**
- **Code conversion**

T_R	Output pulse rise time		10		50	μs
t_P	$\overline{CE}$ programming pulse width		0.3	0.4	0.5	ms
t_V	Verify delay		50			μs
t_D	Pulse sequence delay		10			
T_{PRI}	Initial programming time	$V_{CC} = V_{CCP}$			12	sec
T_{PS}	Programming pause	$V_{CC} = 0V$	6			sec
$\frac{T_{PR}}{T_{PR}+T_{PS}}$	Programming duty cycle[4]				50	%

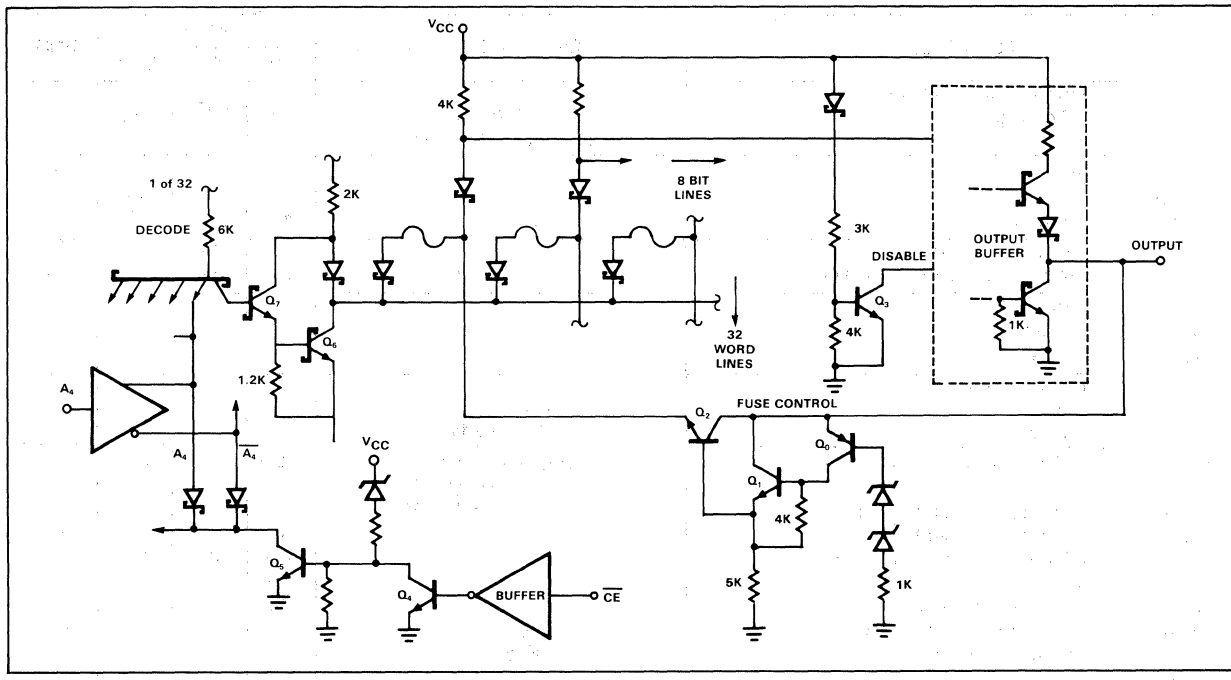
NOTES

1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. V_S is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
3. Care should be taken to insure that $+15.5 \pm 0.5V$ output voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
4. Continuous fusing for an unlimited time is also allowed, provided that a 50% duty cycle is maintained. This may be accomplished by using a programming time and pauses of 6μs each.

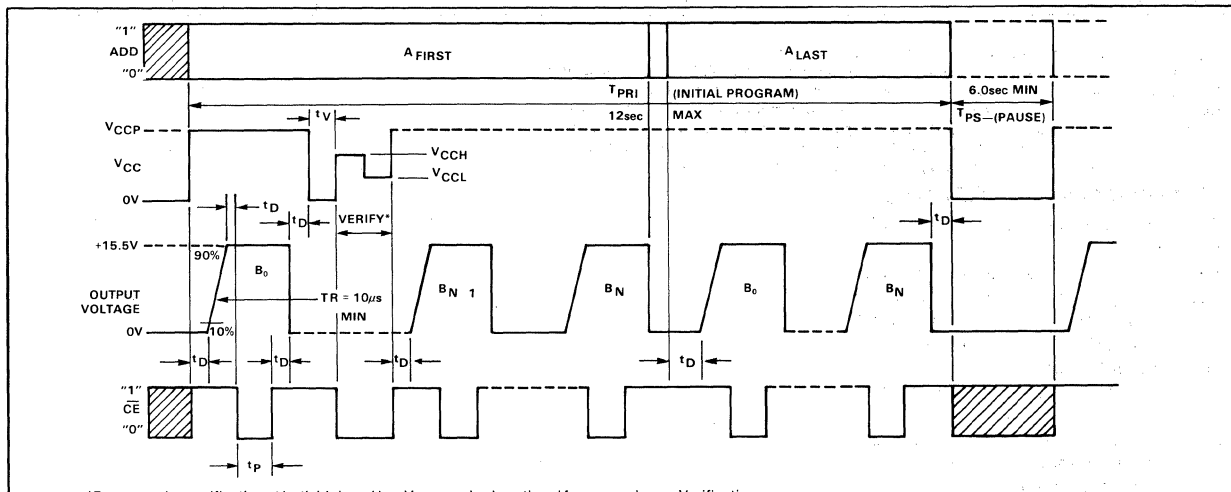
PROGRAMMING PROCEDURE

1. Terminate all device outputs with a 10KΩ resistor to V_{CC}.
2. Select the address to be programmed, and raise V_{CC} to $V_{CCP} = +10 \pm 0.5V$.
3. After 10μs delay, apply $I_{OUT} = 65 \pm 3mA$ to the output to be programmed. Program one output at a time.
4. After 10μs delay, pulse the CE input to logic low for 0.3 to 0.5μs.
5. After 10μs delay, remove I_{OUT} from the programmed output.
6. After 10μs delay, return V_{CC} to 0V.
7. To verify programming, after 50μs delay, raise V_{CC} to $V_{CCH} = +5.5 \pm .2V$, and apply a logic low level to the CE input. The programmed output should remain in the high state. Again, lower V_{CC} to $V_{CCL} = +4.5 \pm .2V$, and verify that the programmed output remains in the high state.
8. Raise V_{CC} to $V_{CCP} = +10 \pm 0.5V$ and repeat steps 3 through 7 to program other bits at the same address.
9. After 10μs delay, repeat steps 2 through 8 to program all other address locations.

TYPICAL FUSING PATH



TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional for convenience. Verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

10139-F,N

DESCRIPTION

The 10139 is organized as an array of 32 words and 8 bits. The initial unprogrammed state is 0 (low). The user may program 1's to obtain any desired pattern. Outputs go to the 0 (low) state when the chip enable input is high, allowing wired-OR output connections. A 50Ω output drive capability makes the part suitable for use in high performance ECL systems.

FEATURES

- **Access time: 15ns typ**
- **Power dissipation: 580mW typ**
- **Field programmable (Ni-Cr link)**
- **Fully decoded**
- **High impedance inputs (50kΩ pulldown)**
- **Open emitter outputs (50Ω drive)**
- **Fully compatible with Signetics ECL 10K products**

APPLICATIONS

- **Programmable logic**
- **Control stores**
- **Microprogramming**
- **Hardwired algorithms**

RECOMMENDED OPERATING VOLTAGE

- **V_{CC} = GND, V_{EE} = -5.2V ± 5%**

PIN CONFIGURATION

Input pulse conditions: $V_0 = 0.31V$, $V_1 = 1.11V$, $t_r = 2$ns (20 to 80%), $t_f = 2$ns (20 to 80%)

NOTES

1. Dc and ac specifications apply after thermal equilibrium has been established, with transverse air flow greater than 500 linear ft/min.
2. For ac tests, all input and output cables to the scope are equal lengths of 50Ω coaxial cable. Wire length should be < 1/4 inch from TP_{IN} to input pin and TP_{OUT} to output pin. A 50Ω termination to ground is located in each scope input. Unused outputs are connected to a 50Ω resistor to ground.
3. Test procedures are shown for only 1 input or set of input conditions. Other inputs are tested in the same manner.

PROGRAMMING SYSTEMS SPECIFICATIONS

*Maximum is specified to minimize the amount of time V_{CC} is at 12V.

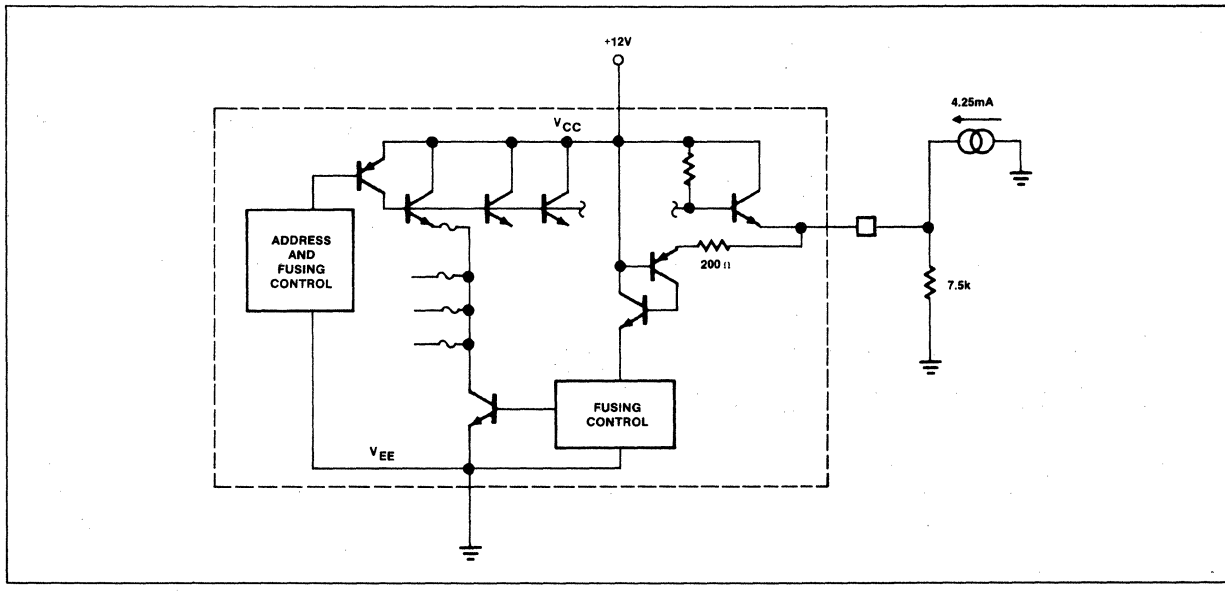
10139-F,N

PROGRAMMING PROCEDURE

The 10139 is shipped with all bits at logical low. To program logical high's, proceed as follows:

1. Connect a 7.5kΩ resistor from each output to ground. This prevents crosstalk into unselected outputs during programming.
2. Connect pin 8 (V_{EE}) to ground and pin 16 (V_{CC}) to +5.2V.
3. Address the desired word location using 0 to 1.0V for a logic low and 4.0 to 4.6V for a logic high.
4. Raise V_{CC} to 12V. Wait 100μs (min) for settling. Maximum time at 12V is 1.0 sec.
5. Apply a +4.25mA current pulse to the first output to be programmed. Output pin voltage will be approximately 1.2V above V_{CC}, and the 7.5kΩ resistor will take 1.75mA. Pulse duration is 0.5 to 1.0ms. Other outputs may be programmed sequentially using a delay of .01 to 1.0ms between current pulses.
6. Return V_{CC} to 5.2V and verify the word. Repeat step 5 once only if any bit failed to program.
7. Repeat steps 3, 4, 5 and 6 for all address locations to be programmed.
8. Verify complete truth table.

TYPICAL FUSING PATH



82S27-F

DESCRIPTION

The 82S27 is field programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard 82S27 is supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

The device includes on-chip decoding, 2 chip enable inputs, and open collector outputs for ease of memory expansion.

The 82S27 is available in the commercial temperature range (0°C to +75°C) and is specified as N82S27, F.

FEATURES

- **Address access time: 40ns max**
- **Power dissipation: 0.6mW/bit typ**
- **Input loading: 1.6mA max**
- **On-chip address decoding**
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

NOTES

1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. V_S is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
3. Care should be taken to insure the 17 ± 0.5V output voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
4. Measured with a 1K dummy load connected across the fusing source.
5. Continuous fusing for an unlimited time is also allowed, provided that a 50% duty cycle is maintained. This may be accomplished by following each Program Verify cycle with a rest period (V_{CC} = 0V) of 0.5ms.

PROGRAMMING PROCEDURE

The 82S27 is shipped with all bits at logical low. To write logical high, proceed as follows:

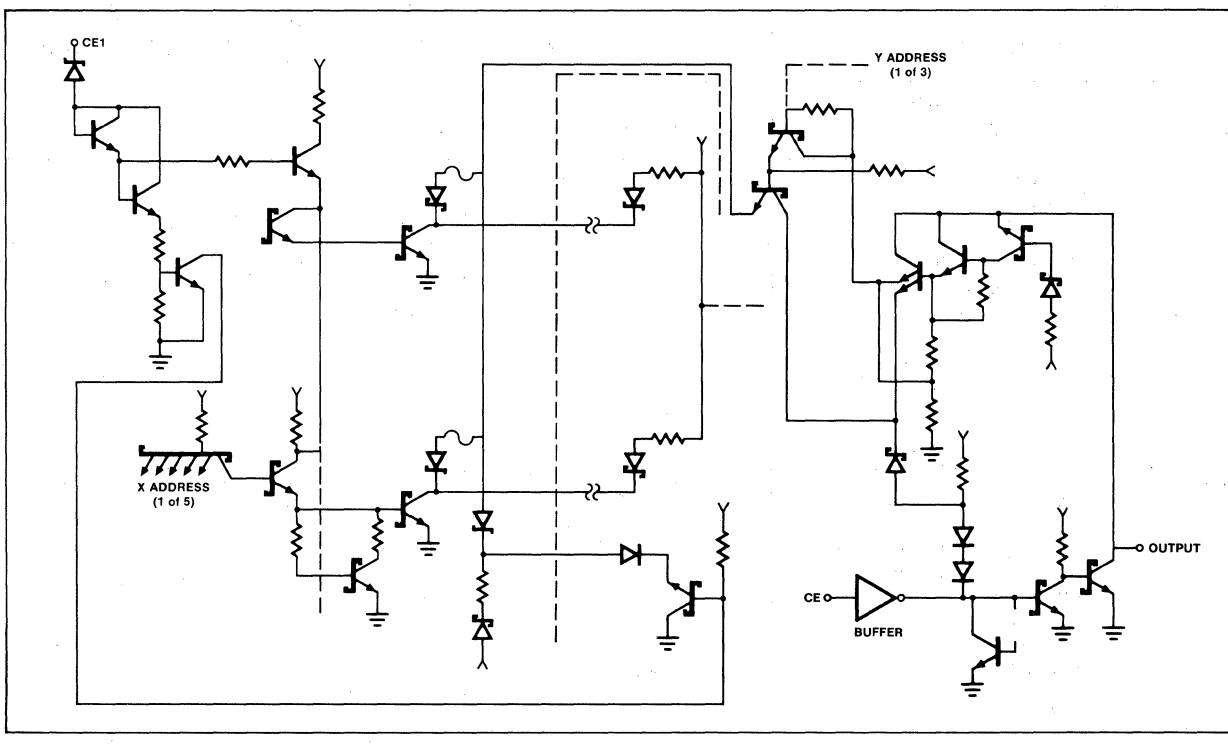
Set-up

1. Apply GND to pin 12.
2. Terminate all device outputs with a 10kΩ resistor to V_{CC}.
3. Set $\overline{CE}_2$ to logic low.

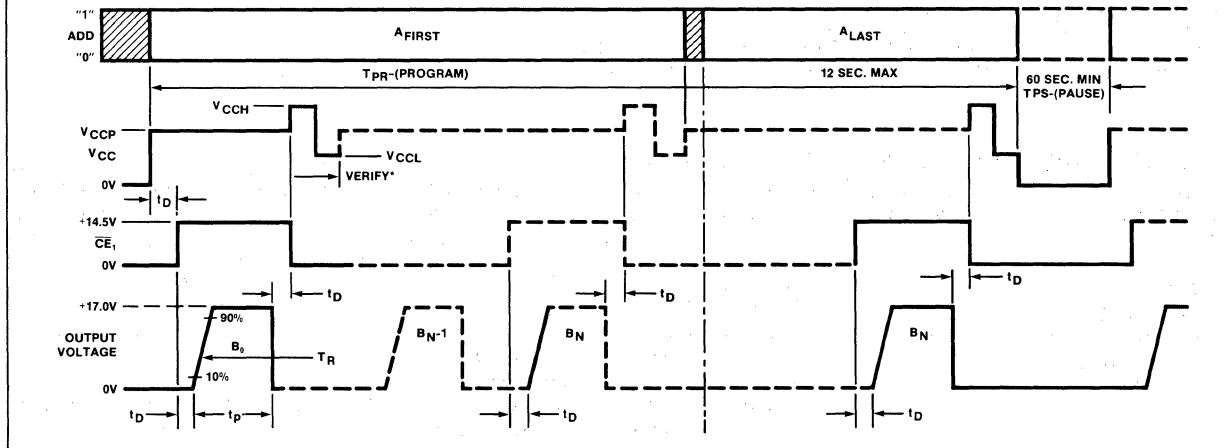
Program-Verify Sequence

1. Raise V_{CC} to V_{CCP}, and address the word to be programmed by applying TTL high and low logic levels to the device address inputs.
2. After 10μs delay, apply to $\overline{CE}_1$ (pin 13) a voltage source of 14.5 ± 0.5V, with 15mA sourcing current capability.
3. After 10μs delay, apply a voltage source of +17.0 ± 0.5V to the output to be programmed. The source must have a current limit of 115mA. Prgram one output at the time.
4. After 10μs delay, remove +17.0V supply from programmed output.
5. To verify programming, after 10μs delay, return $\overline{CE}_1$ to 0V. Raise V_{CC} to V_{CCH} = +5.25 ± .25V. The programmed output should remain in the high state. Again, lower V_{CC} to V_{CCL} = +4.75 ± .25V, and verify that the programmed output remains in the high state.
6. Raise V_{CC} to V_{CCP}, and repeat steps 2 through 5 to program other bits at the same address.
7. Repeat steps 1 through 6 to program all other address locations.

TYPICAL FUSING PATH



TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional. For convenience, verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

DESCRIPTION

The 82S126 and 82S129 are field programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard 82S126 and 82S129 devices are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

These devices include on-chip decoding and 2 chip enable inputs for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S126 and 82S129 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S126/129, F or N, and for the military temperature range (-55°C to +125°C) specify S82S126/129, F only.

FEATURES

- **Address access time:**
  N82S126/129: 50ns max
  S82S126/129: 70ns max
- **Power dissipation: 0.5mW/bit typ**
- **Input loading:**
  N82S126/129: -100μA max
  S82S126/129: -150μA max
- **On-chip address decoding**
- **Output options:**
  82S126: Open collector
  82S129: Tri-state
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

NOTES

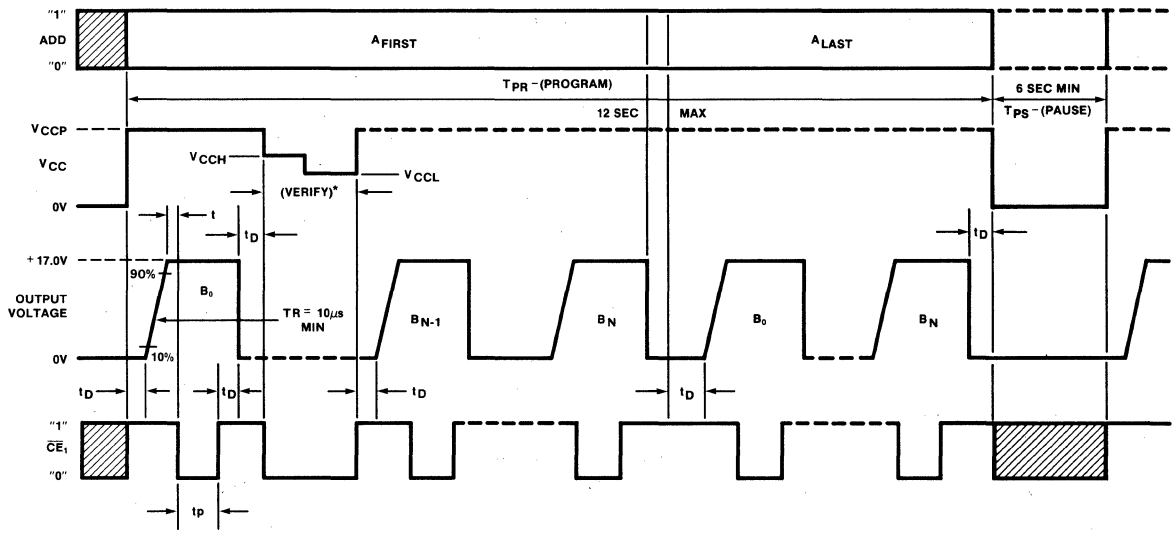
1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. V_S is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
3. Care should be taken to insure the $17 \pm 1V$ output voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
4. Programming duty cycle is 50% after continuous programming at 100% duty cycle.
5. This is an updated method of programming and does not obsolete any programming systems presently being used.

PROGRAMMING PROCEDURE

1. Terminate all device outputs with a 10kΩ resistor to V_{CC}. Apply $\overline{CE}_1$ = High, $\overline{CE}_2$ = Low.
2. Select the Address to be programmed, and raise V_{CC} to $V_{CCP} = 8.75 \pm .25V$.
3. After 10μs delay, apply $V_{OUT} = +17 \pm 1V$ to the output to be programmed. Program one output at the time.
4. After 10μs delay, pulse the $\overline{CE}_1$ input to logic low for 0.3 to 0.5ms.
5. After 10μs delay, remove +17V from the programmed output.
6. To verify programming, after 10μs delay, lower V_{CC} to $V_{CCH} = +5.5 \pm .2V$, and apply a logic low level to the CE input. The programmed output should remain in the high state. Again, lower V_{CC} to V_{CCL} = +4.5 ± .2V, and verify that the programmed output remains in the high state.
7. Raise V_{CC} to $V_{CCP} = 8.75 \pm .25V$, and repeat steps 3 through 6 to program other bits at the same address.
8. After 10μs delay, repeat steps 2 through 7 to program all other address locations.

TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional. For convenience verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

10149-F

DESCRIPTION

The 10149 is field programmable, meaning that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard device is supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

The 10149 is suitable for use in high performance ECL systems. The outputs are capable of driving 500Ω loads.

A chip enable input is provided for ease of memory expansion.

FEATURES

- **Address access time: 20ns max**
- **Power dissipation: 0.66mW/bit typ**
- **High impedance inputs (50kΩ pulldown)**
- **Open emitter outputs (50kΩ drive)**
- **On-chip address decoding**
- **No separate fusing pins**
- **Fully compatible with ECL 10K series**

APPLICATIONS

- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

RECOMMENDED OPERATING RANGES

- **$V_{CC1} = V_{CC2} = GND$**
- **$V_{EE} = -5.2V \pm 5\%$**
- **$T_A = -30°C$ to $+85°C$ ambient**

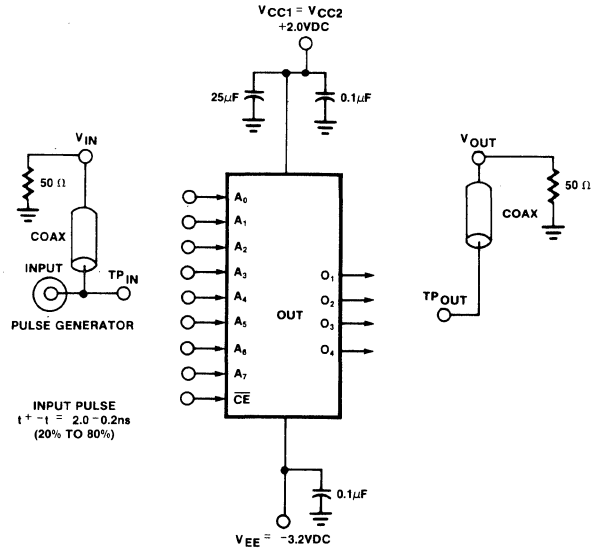
NOTES

1. All voltage measurements are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. Vdc ± 1%.
3. Each ECL 10K series device has been designed to meet the dc specification after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Voltage levels will shift approximately 4mV with an air flow of 200 linear fpm. Outputs are terminated through a 50Ω resistor to -2V.

10149-F

TEST LOAD CIRCUIT



NOTES

A. For ac tests, all input and output cables to the scope are equal lengths of 50Ω coaxial cable. Wire length should be < 1/4 inch from TP_{IN} to input pin and TP_{OUT} to output pin. A 50Ω termination to ground is located in each scope input. Unused outputs are connected to a 50Ω resistor to ground.

B. Test procedures are shown for only one input or set of input conditions. Other inputs are tested in the same manner.

C. Normal practice in test fixtures layout should be followed. Lead lengths, particularly to the power supply, should be as short as possible. A 10μF capacitor between V_{CC1} and V_{CC} terminals, located as close to the device as possible, is recommended to reduce ringing.

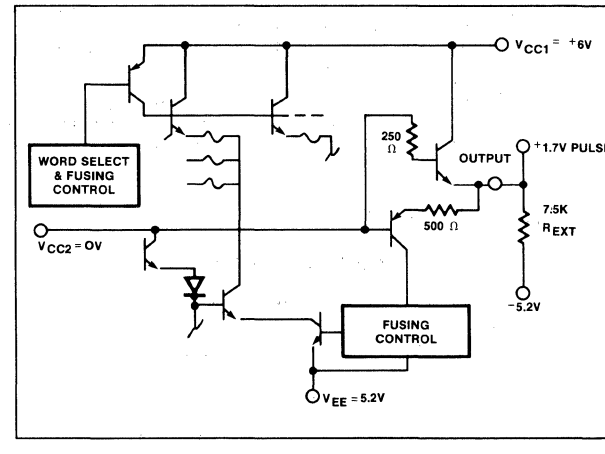
TYPICAL FUSING PATH



PROGRAMMING PROCEDURE

The 10149 is shipped with all bits at logical low. To write logical high, proceed as follows:

1. Terminate all device outputs with 7.5kΩ to -5.2V.
2. Connect V_{EE} (pin 8) to -5.2V ± 5% and V_{CC2} (pin 16) to GND (0V).
3. Address the desired location by applying a voltage of -.75 ± .15V for a high and a voltage of -1.80 ± .20V for a low at the address inputs.
4. Apply +6.0V ± 5% to V_{CC1} (pin 1).
5. Allow a minimum delay of 100μs and apply a voltage of +1.7V ± 0.2V to the output to be programmed. Program one output at a time.
6. Hold the output programming voltage for 0.25 to 0.5ms, and then disconnect the voltage source from the programmed output.
7. Allow a minimum delay of 100μs and then reduce V_{CC1} to GND (0V) to verify programmed output.
8. Repeat steps 4 through 7 to program other bits of the word.
9. Change the address and repeat steps 4 through 8 until the entire bit pattern is programmed into your custom 10149.
10. Verify complete truth table.

DESCRIPTION

The 82S114 and 82S115 are field programmable and include on-chip decoding and 2 chip enable inputs for ease of memory expansion. They feature tri-state outputs for optimization of word expansion in bused organizations. A D-type latch is used to enable the tri-state output drivers. In the Transparent Read mode, stored data is addressed by applying a binary code to the address inputs while holding Strobe high. In this mode the bit drivers will be controlled solely by CE1 and CE2 lines.

In the Latched Read mode, outputs are held in their previous state (high, low, or high Z) as long as Strobe is low, regardless of the state of address or chip enable. A positive Strobe transition causes data from the applied address to reach the outputs if the chip is enabled, and causes outputs to go to the high Z state if the chip is disabled.

A negative Strobe transition causes outputs to be locked into their last Read Data condition if the chip was enabled, or causes outputs to be locked into the high Z condition if the chip was disabled.

Both 82S114 and 82S115 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S114/115, F or N, and for the military temperature range (-55°C to +125°C) specify S82S114/115, F.

FEATURES

- **Address access time:**
  N82S114/115: 60ns max
  S82S114/115: 90ns max
- **Power dissipation: 165μW/bit typ**
- **Input loading:**
  N82S114/115: -100μA max
  S82S114/115: -150μA max
- **On-chip storage latches**
- **Schottky clamped**
- **Fully compatible with Signetics 82S214 and 82S215 ROMs**
- **Fully TTL compatible**

APPLICATIONS

- **Microprogramming**
- **Hardwire algorithms**
- **Character generation**
- **Control store**
- **Sequential controllers**

NOTES on following page.

NOTES

1. Typical values are at V_{CC} = +5.0V and T_A = +25°C.
2. No more than one output should be grounded at the same time and strobe should be disabled. Strobe is in high state.
3. If the strobe is high, the device functions in a manner identical to conventional bipolar ROMs. The timing diagram shows valid data will appear T_A nanoseconds after the address has changed the T_{CE} nanoseconds after the output circuit is enabled. T_{CD} is the time required to disable the output and switch it to an off or high impedance state after it has been enabled.
4. In Latched Read Mode data from any selected address will be held on the output when strobe is lowered. Only when strobe is raised will new location data be transferred and chip enable conditions be stored. The new data will appear on the outputs if the chip enable conditions enable the outputs.
5. During operation the fusing pins FE1 and FE2 may be grounded or left floating.
6. Positive current is defined as into the terminal referenced.

NOTES

1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. V_S is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
3. Care should be taken to insure the 17 ± 1V output voltage is maintained during the entire fusing cycle.
4. Continuous fusing for an unlimited time is also allowed, provided that a 60% duty cycle is maintained. This may be accomplished by following each Program-Verify cycle with a Rest period (V_{CC} = 0V) of 3ms.

RECOMMENDED PROGRAMMING PROCEDURE

The 82S114/115 are shipped with all bits at logical low. To write logical high, proceed as follows:

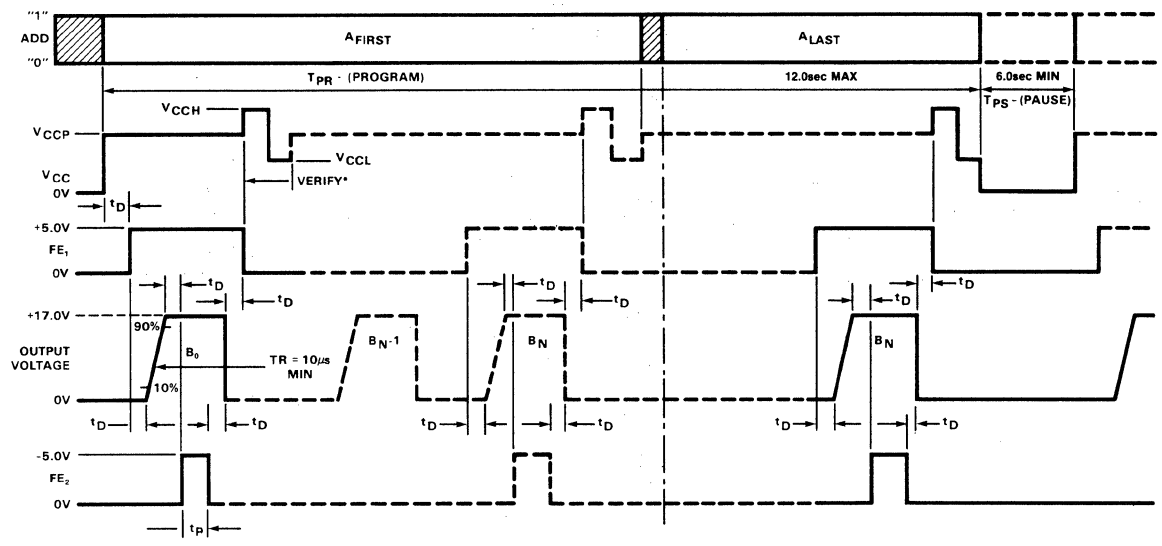
SET-UP

1. Apply GND to pin 12.
2. Terminate all device outputs with a 10kΩ resistor to V_{CC}.
3. Set $\overline{CE}_1$ to logic low, and CE_2 to logic high (TTL levels).
4. Set Strobe to logic high level.

Program-Verify Sequence

1. Raise V_{CC} to V_{CCP}, and address the word to be programmed by applying TTL high and low logic levels to the device address inputs.
2. After 10μs delay, apply to FE_1 (pin 13) a voltage source of +5.0 ± 0.5V, with 10mA sourcing current capability.
3. After 10μs delay, apply a voltage source of +17.0 ± 1.0V to the output to be programmed. The source must have a current limit 200mA. Program on output at the time.
4. After 10μs delay, raise FE_2 (pin 11) from 0V to +5.0 ± 0.5V for a period of 1ms, and then return to 0V. Pulse source must have a 10mA sourcing current capability.
5. After 10μs delay, remove +17.0V supply from programmed output.
6. To verify programming, after 10μs delay, return FE_1 to 0V. Raise V_{CC} to V_{CCH} = +5.5 ± .2V. The programmed output should remain in the high state. Again, lower V_{CC} to V_{CCL} = +4.5 ± .2V, and verify that the programmed output remains in the high state.
7. Raise V_{CC} to V_{CCP} and repeat steps 2 through 6 to program other bits at the same address.
8. Repeat steps 1 through 7 to program all other address locations.

TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional. For convenience, verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

82S130-F,N • 82S131-F,N

DESCRIPTION

The 82S130 and 82S131 are field programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard 82S130 and 82S131 are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

These devices include on-chip decoding and 1 chip enable input for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S130 and 82S131 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0° to +75°C) specify N82S130/131, F or N, and for the military temperature range (-55°C to +125°C) specify S82S130/131, F.

FEATURES

- **Address access time:**
  N82S130/131: 50ns max
  S82S130/131: 70ns max
- **Power dissipation: 0.3mW/bit typ**
- **Input loading:**
  N82S130/131: -100μA max
  S82S130/131: -150μA max
- **On-chip address decoding**
- **Output options:**
  82S130: Open collector
  82S131: Tri-state
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

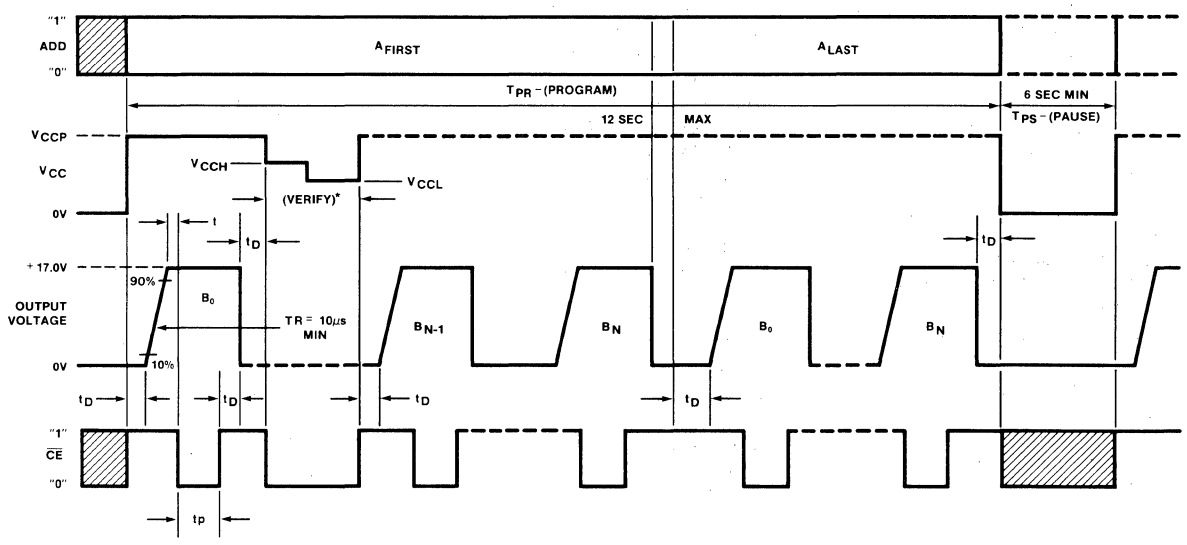
1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. VS is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
3. Care should be taken to insure the 17 ± 1V output voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
4. Programming duty cycle is 50% after continuous programming at 100% duty cycle.
5. This is an updated method of programming and does not obsolete any programming systems presently being used.

PROGRAMMING PROCEDURE

1. Terminate all device outputs with a 10K resistor to V_{CC}. Apply $\overline{CE}_1$ = High.
2. Select the Address to be programmed, and raise V_{CC} to V_{CCP} = 8.75 ± .25V.
3. After 10μs delay, apply V_{OUT} = +17 ± 1V to the output to be programmed. Program one output at the time.
4. After 10μs delay, pulse the $\overline{CE}_1$ input to logic low for 0.3 to 0.5ms.
5. After 10μs delay, remove +17V from the programmed output.
6. To verify programming, after 10μs delay, lower V_{CC} to V_{CCH} = +5.5 ± .2V, and apply a logic low level to the CE input. The programmed output should remain in the high state. Again, lower V_{CC} to V_{CCL} = +4.5 ± .2V, and verify that the programmed output remains in the high state.
7. Raise V_{CC} to V_{CCP} = 8.75 ± .25V, and repeat steps 3 through 6 to program other bits at the same address.
8. After 10μs delay, repeat steps 2 through 7 to program all other address locations.

TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional. For convenience, verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

82S140-F,N • 82S141-F,N

DESCRIPTION

The 82S140 and 82S141 are field programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard 82S140 and 82S141 are supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

These devices include on-chip decoding and 4 chip enable inputs for ease of memory expansion. They feature either open collector or tri-state outputs for optimization of word expansion in bused organizations.

Both 82S140 and 82S141 devices are available in the commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S140/141, F, and for the military temperature range (-55°C to +125°C) specify S82S140/141, F.

FEATURES

- **Address access time:**
  N82S140/141: 60ns max
  S82S140/141: 90ns max
- **Power dissipation: .17mW/bit typ**
- **Input loading:**
  N82S140/141: -100μA max
  S82S140/141: -150μA max
- **On-chip address decoding**
- **Output options:**
  S82S140: Open collector
  S82S141: Tri-state
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Fully TTL compatible**

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

F_L	Fusing attempts per link				2	cycle

NOTES

1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. V_S is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
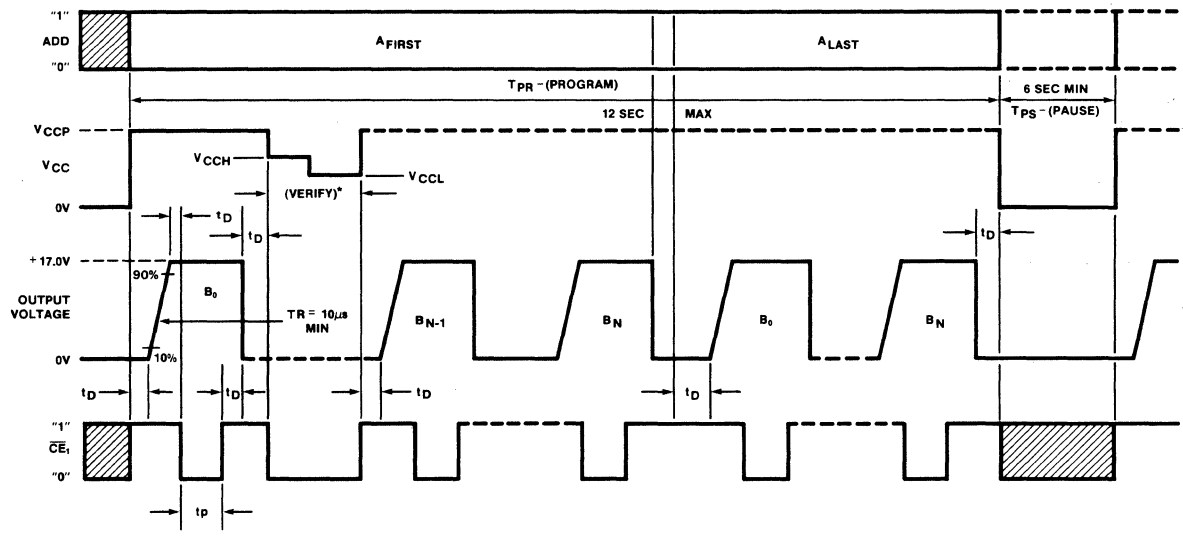
3. Care should be taken to insure the $17 \pm 1V$ output voltage is maintained during the entire fusing cycle.
4. Programming duty cycle is 50% after continuous programming at 100% duty cycle.
5. This is an updated method of programming and does not obsolete any programming systems presently being used.

PROGRAMMING PROCEDURE

1. Terminate all device outputs with a 10kΩ resistor to V_{CC}. Apply $\overline{CE}_1$ = High, $\overline{CE}_2$ = Low, CE_3 = High and CE_4 = High.
2. Select the Address to be programmed, and raise V_{CC} to V_{CCP} = 8.75 ± .25V.
3. After 10μs delay, apply V_{OUT} = +17 ± 1V to the output to be programmed. Program one output at the time.
4. After 10μs delay, pulse the $\overline{CE}_1$ input to logic low for 0.3 to 0.5ms.
5. After 10μs delay, remove +17V from the programmed output.
6. To verify programming, after 10μs delay, lower V_{CC} to V_{CCH} = +5.5 ± .2V, and apply a logic low level to the $\overline{CE}_1$ input. The programmed output should remain in the high state. Again, lower V_{CC} to V_{CCL} = +4.5 ± .2V, and verify that the programmed output remains in the high state.
7. Raise V_{CC} to V_{CCP} = 8.75 ± .25V, and repeat steps 3 through 6 to program other bits at the same address.
8. After 10μs delay, repeat steps 2 through 7 to program all other address locations.

TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional. For convenience, verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

82S2708-F,N

DESCRIPTION

The 82S2708 is field programmable, which means that custom patterns are immediately available by following the fusing procedure given in this data sheet. The standard 82S2708 is supplied with all outputs at logical low. Outputs are programmed to a logic high level at any specified address by fusing a Ni-Cr link matrix.

This device includes on-chip decoding and 1 chip enable input for ease of memory expansion. It features tri-state outputs for optimization of word expansion in bused organizations.

The 82S2708 is available in both the commercial and military temperature ranges. For the commercial temperature range (0° to +75°C) specify N82S2708, and for the military temperature range (-55°C to +125°C) specify S82S2708.

APPLICATIONS

- **Prototyping/volume production**
- **Sequential controllers**
- **Microprogramming**
- **Hardwired algorithms**
- **Control store**
- **Random logic**
- **Code conversion**

FEATURES

- **Address access time:**
  N82S2708: 70ns max
  S82S2708: 90ns max
- **Power dissipation: 85μW/bit typ**
- **Input loading:**
  N82S2708: -100μA max
  S82S2708: -150μA max
- **Chip enable input**
- **On-chip address decoding**
- **No separate fusing pins**
- **Unprogrammed outputs are low level**
- **Pin for pin replacement for 2708 EROM**
- **Fully TTL compatible**

F_L	Fusing attempts per link				2	cycle

NOTES

1. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
2. V_S is the sensing threshold of the PROM output voltage for a programmed bit. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
3. Care should be taken to insure the 17 ± 1V output voltage is maintained during the entire fusing cycle.
4. Programming duty cycle is 50% after continuous programming at 100% duty cycle.
5. This is an updated method of programming and does not obsolete any programming systems presently being used.

PROGRAMMING PROCEDURE

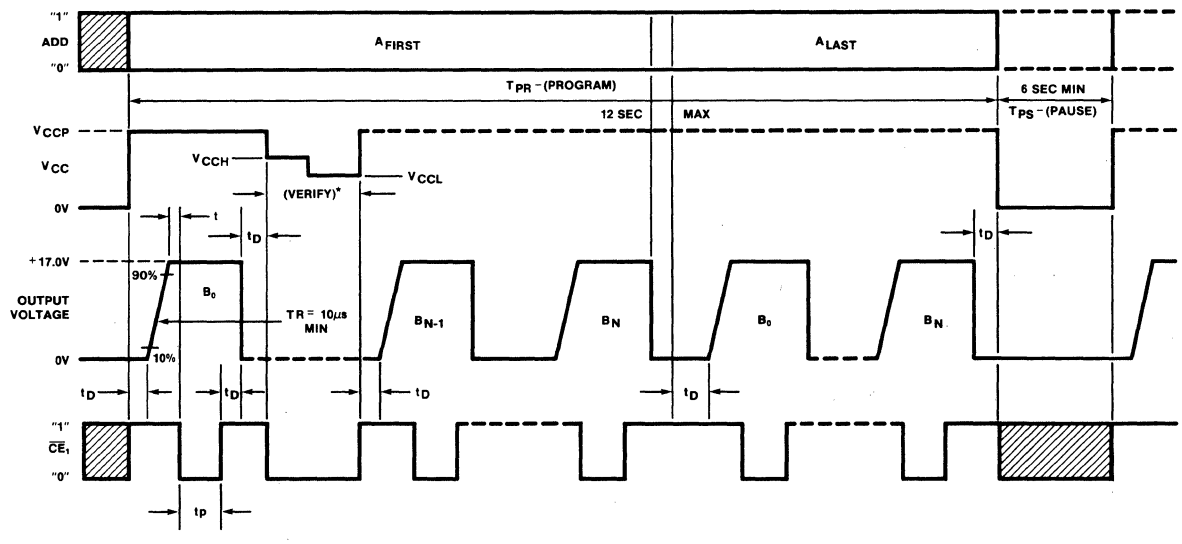
1. Terminate all device outputs with a 10kΩ resistor to V_{CC}. Apply $\overline{CE}_1$ = High, CE_2 = High and CE_3 = High.
2. Select the Address to be programmed, and raise V_{CC} to V_{CCP} = 8.75 ± .25V.
3. After 10μs delay, apply V_{OUT} = +17 ± 1V to the output to be programmed. Progam one output at the time.
4. After 10μs delay, pulse the $\overline{CE}_1$ input to logic low for 0.3 to 0.5ms.
5. After 10μs delay, remove +17V from the programmed output.
6. To verify programming, after 10μs delay, lower V_{CC} to V_{CCH} = +5.5 ± .2V, and apply a logic low level to the $\overline{CE}_1$ input. The programmed output should remain in the high state. Again, lower V_{CC} to V_{CCL} = +4.5 ± .2V, and verify that the programmed output remains in the high state.
7. Raise V_{CC} to V_{CCP} = 8.75 ± .25V, and repeat steps 3 through 6 to program other bits at the same address.
8. After 10μs delay, repeat steps 2 through 7 to program all other address locations.

TYPICAL PROGRAMMING SEQUENCE



*Programming verification at both high and low V_{CC} margins is optional. For convenience, verification can also be executed at the operating V_{CC} limits specified in the dc characteristics.

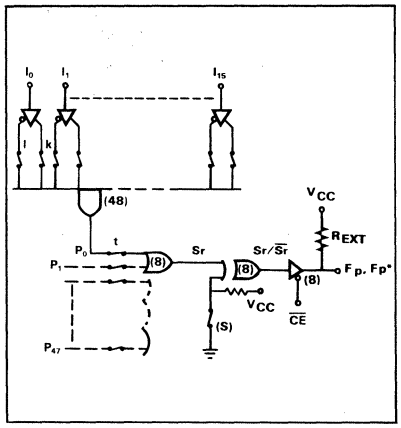
DESCRIPTION

The 82S100 (tri-state outputs) and the 82S101 (open collector outputs) are Bipolar Programmable Logic Arrays, containing 48 product terms (AND terms), and 8 sum terms (OR terms). Each OR term controls an output function which can be programmed either true active-high (Fp), or true active-low ($F\dot{p}$). The true state of each output function is activated by any logical combination of 16-input variables, or their complements, up to 48 terms. Both devices are field programmable, which means that custom patterns are immediately available by following the fusing procedure outlined in this data sheet.

The 82S100 and 82S101 are fully TTL compatible, and include chip-enable control for expansion of input variables, and output inhibit. They feature either open collector or tri-state outputs for ease of expansion of product terms and application in bus-organized systems.

Both devices are available in commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S100/101,I or N, and for the military temperature range (-55°C to +125°C) specify S82S100/101,I.

FPLA EQUIVALENT LOGIC PATH



LOGIC FUNCTION

Typical Product Term:
$P_0 = I_0 \bullet I_1 \bullet \overline{I_2} \bullet I_5 \bullet \overline{I_{13}}$

Typical Output Functions:
$F_0 = (\overline{CE}) + (P_0 + P_1 + P_2)$ @ S = Closed
$F_0^* = (\overline{CE}) + (\overline{P_0} \bullet \overline{P_1} \bullet \overline{P_2})$ @ S = Open

NOTE

For each of the 8 outputs, either the function Fp (active-high) or $F\dot{p}$ (active low) is available, but not both. The required function polarity is programmed via link (S).

APPLICATIONS

- **CRT display systems**
- **Random logic**
- **Code conversion**
- **Peripheral controllers**
- **Function generators**
- **Look-up and decision tables**
- **Microprogramming**
- **Address mapping**
- **Character generators**
- **Sequential controllers**
- **Data security encoders**
- **Fault detectors**
- **Frequency synthesizers**

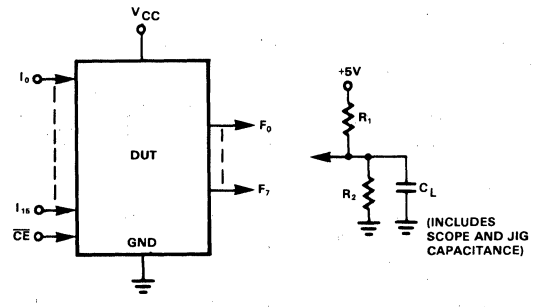
NOTES on following page.

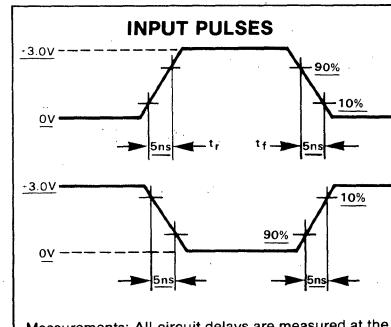
NOTES

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device of these or any other condition above those indicated in the operation of the device specifications is not implied.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. All voltage values are with respect to network ground terminal.
4. Test one at the time.
5. Measured with V_{IL} applied to $\overline{CE}$ and a logic high stored.
6. Measured with a programmed logic condition for which the output test is at a low logic level. Output sink current is applied thru a resistor to V_{CC}.
7. Measured with: V_{IH} applied to $\overline{CE}$.
8. Duration of short circuit should not exceed 1 second.
9. I_{CC} is measured with the chip enable input grounded, all other inputs at 4.5V and the outputs open.

TEST LOAD CIRCUIT

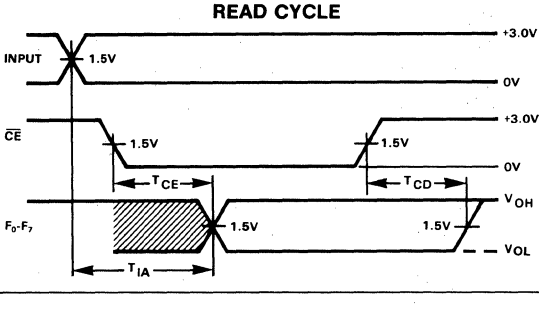


VOLTAGE WAVEFORM



Measurements: All circuit delays are measured at the +1.5V level of inputs and outputs.

TIMING DIAGRAM



TIMING DEFINITIONS

T_{CE} Delay between beginning of Chip Enable low (with Address valid) and when Data Output becomes valid.

T_{CD} Delay between when Chip Enable becomes high and Data Output is in off state (Hi-Z or high).

T_{IA} Delay between beginning of valid Input (with Chip Enable low) and when Data Output becomes valid.

VIRGIN DEVICE

The 82S100/101 are shipped in an unprogrammed state, characterized by:

1. All internal Ni-Cr links are intact.
2. Each product term (P-term) contains both true and complement values of every input variable I_m (P-terms always logically "false").
3. The "OR" Matrix contains all 48-P-terms.
4. The polarity of each output is set to active high (Fp function).
5. All outputs are at a low logic level.

RECOMMENDED PROGRAMMING PROCEDURE

To program each of 8 Boolean logic functions of 16 true or complement variables, including up to 48 P-terms, follow the Program/Verify procedures for the "AND" matrix, "OR" matrix, and output polarity outlined below. To maximize recovery from programming errors, leave all links in unused device areas intact.

SET-UP

Terminate all device outputs with a 10K resistor to +5V. Set GND (pin 14) to 0V.

Output Polarity

PROGRAM ACTIVE LOW ($\overline{F_P}$ FUNCTION)

Program output polarity before programming "AND" matrix and "OR" matrix. Program 1 output at the time. (S) links of unused outputs are not required to be fused.

1. Set FE (pin 1) to V_{FEL}.
2. Set V_{CC} (pin 28) to V_{CCL}.
3. Set $\overline{CE}$ (pin 19), and I_0 through I_{15} to V_{IH}.
4. Apply V_{OPH} to the appropriate output, and remove after a period t_p.
5. Repeat step 4 to program other outputs.

VERIFY OUTPUT POLARITY

1. Set FE (pin 1) to V_{FEL}; set V_{CC} (pin 28) to V_{CCS}.
2. Enable the chip by setting $\overline{CE}$ (pin 19) to V_{IL}.
3. Address a non-existent P-term by applying V_{IH} to all inputs I_0 through I_{15}.
4. Verify output polarity by sensing the logic state of outputs F_0 through F_7. All outputs at a high logic level are programmed active low (F_p function), while all outputs at a low logic level are programmed active high (F_p function).
5. Return V_{CC} to V_{CCP} or V_{CCL}.

"AND" Matrix

PROGRAM INPUT VARIABLE

Program one input at the time and one P-term at the time. All input variable links of unused P-terms are not required to be fused. However, unused input variables must be programmed as Don't Care for all programmed P-terms.

1. Set FE (pin 1) to V_{FEL}, and V_{CC} (pin 28) to V_{CCP}.
2. Disable all device outputs by setting $\overline{CE}$ (pin 19) to V_{IH}.
3. Disable all input variables by applying V_{IX} to inputs I_0 through I_{15}.
4. Address the P-term to be programmed (No. 0 through 47) by forcing the corresponding binary code on outputs F_0 through F_5 with F_0 as LSB. Use standard TTL logic levels V_{OHF} and V_{OLF}.

5a. If the P-term contains neither I_0 nor $\overline{I_0}$ (input is a Don't Care), fuse both I_0 and $\overline{I_0}$ links by executing both steps 5b and 5c, before continuing with step 7.

5b. If the P-term contains I_0, set to fuse the $\overline{I_0}$ link by lowering the input voltage at I_0 from V_{IX} to V_{IH}. Execute step 6.

5c. If the P-term contains $\overline{I_0}$, set to fuse the I_0 link by lowering the input voltage at I_0 from V_{IX} to V_{IL}. Execute step 6.

6a. After t_D delay, raise FE (pin 1) from V_{FEL} to V_{FEH}.

6b. After t_D delay, pulse the $\overline{CE}$ input from V_{IH} to V_{IX} for a period t_p.

6c. After t_D delay, return FE input to V_{FEL}.

7. Disable programmed input by returning I_0 to V_{IX}.
8. Repeat steps 5 through 7 for all other input variables.
9. Repeat steps 4 through 8 for all other P-terms.
10. Remove V_{IX} from all input variables.

VERIFY INPUT VARIABLE

1. Set FE (pin 1) to V_{FEL}; set V_{CC} (pin 28) to V_{CCP}.
2. Enable F_7 output by setting $\overline{CE}$ to V_{IX}.
3. Disable all input variables by applying V_{IX} to inputs I_0 through I_{15}.
4. Address the P-term to be verified (No. 0 through 47) by forcing the corresponding binary code on outputs F_0 through F_5.
5. Interrogate input variable I_0 as follows:
   A. Lower the input voltage at I_0 from V_{IX} to V_{IH}, and sense the logic state of output F_7.
   B. Lower the input voltage at I_0 from V_{IH} to V_{IL}, and sense the logic state output F_7.

The state of I_0 contained in the P-term is determined in accordance with the following truth table:

I_0	F_7	INPUT VARIABLE STATE CONTAINED IN P-TERM
0 1	1 0	$\overline{I_0}$
0 1	0 1	I_0
0 1	1 1	Don't Care
0 1	0 0	(I_0), $(\overline{I_0})$

Note that 2 tests are required to uniquely determine the state of the input variable contained in the P-term.

6. Disable verified input by returning I_0 to V_{IX}.
7. Repeat steps 5 and 6 for all other input variables.
8. Repeat steps 4 through 7 for all other P-terms.
9. Remove V_{IX} from all input variables.

"OR" MATRIX

PROGRAM PRODUCT TERM

Program one output at the time for one P-term at the time. All P_n links in the "OR" matrix corresponding to unused outputs and unused P-terms are not required to be fused.

1. Set FE (pin 1) to V_{FEL}.
2. Disable the chip by setting $\overline{CE}$ (pin 19) to V_{IH}.
3. After t_D delay, set V_{CC} (pin 28) to V_{CCS}, and inputs I_6 through I_{15} to V_{IH}, V_{IL}, or V_{IX}.
4. Address the P-term to be programmed (No. 0 through 47) by applying the corresponding binary code to input variables I_0 through I_5, with I_0 as LSB.

5a. If the P-term is contained in output function F_0 ($F_0 = 1$ or $F_0^* = 0$), got to step 6, (fusing cycle not required).

5b. If the P-term is **not** contained in output function F_0 ($F_0 = 0$ or $F_0^* = 1$), set to fuse the P_n link by forcing output F_0 to V_{OPF}.

6a. After t_D delay, raise FE (pin 1) from V_{FEL} to V_{FEH}.

6b. After t_D delay, pulse the $\overline{CE}$ input from V_{IH} to V_{IX} for a period t_p.

6c. After t_D delay, return FE input to V_{FEL}.

6d. After t_D delay, remove V_{OPF} from output F_0.

7. Repeat steps 5 and 6 for all other output functions.
8. Repeat steps 4 through 7 for all other P-terms.
9. Remove V_{CCS} from V_{CC}.

VERIFY PRODUCT TERM

1. Set FE (pin 1) to V_{FEL}.
2. Disable the chip by setting $\overline{CE}$ (pin 19) to V_{IH}.
3. After t_D delay, set V_{CC} (pin 28) to V_{CCS}, and inputs I_0 through I_{15} to V_{IH}, V_{IL}, or V_{IX}.
4. Address the P-term to be verified (No. 0 through 47) by applying the corresponding binary code to input variables I_0 through I_5.
5. After t_D delay, enable the chip by setting $\overline{CE}$ (pin 19) to V_{IL}.
6. To determine the status of the P_n link in the "OR" matrix for each output function F_p or F_p^*, sense the state of outputs F_0 through F_7. The status of the link is given by the following truth table:

OUTPUT		P-TERM LINK
Active High (F_p)	Active Low (F_p^*)	
0 1	1 0	**Fused** **Present**

7. Repeat steps 4 through 6 for all other P-terms.
8. Remove V_{CCS} from V_{CC}.

F_L	Fusing attempts per link				2	cycle
V_S	Verify threshold[4]		1.4	1.5	1.6	V

NOTES

1. These are specifications which a Programming System must satisy in order to be qualified by Signetics.
2. Bypass V_{CC} to GND with a 0.01µf capacitor to reduce voltage spikes.
3. Care should be taken to ensure that the voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
4. V_S is the sensing threshold of the FPLA output voltage for a programmed link. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.
5. These are new limits resulting from device improvements, and which supersede, but do not obsolete the performance requirements of previously manufactured programming equipment.

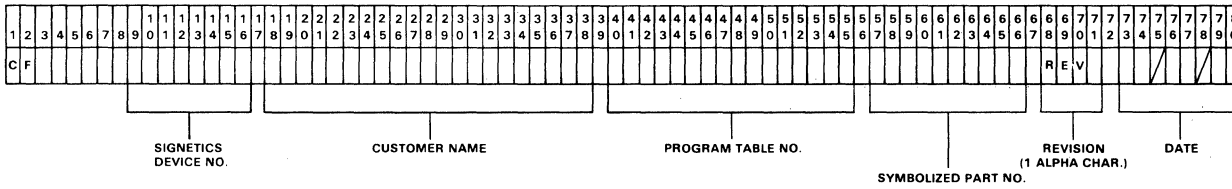
* Input and Output fields of unused P-terms can be left blank. Unused inputs and outputs are FPLA terminals left floating.

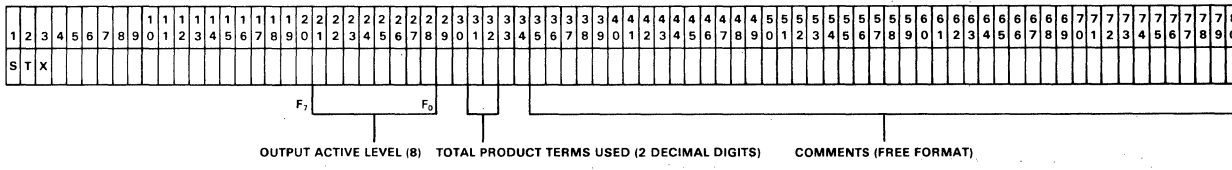
PUNCHED CARD CODING FORMAT

The FPLA Program Table can be supplied directly to Signetics in punched card form, using standard 80-column IBM cards. For each FPLA Program Table, the customer should prepare in input card deck in accordance with the following format. Product Term cards 3 through 50 can be in any order. Not all 48 Product Terms need to be present. Unused Product Terms require no entry cards, and will be skipped during the actual programming sequence:

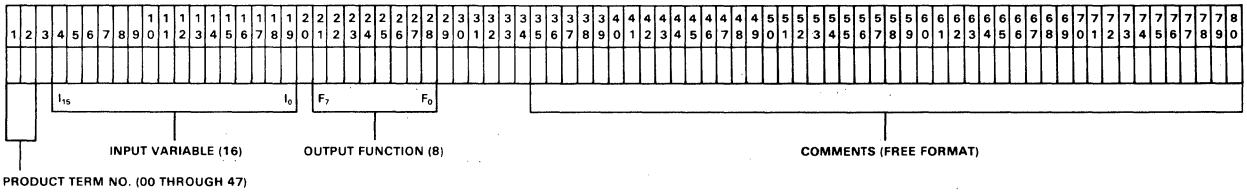
CARD NO.1—Free format within designated fields.



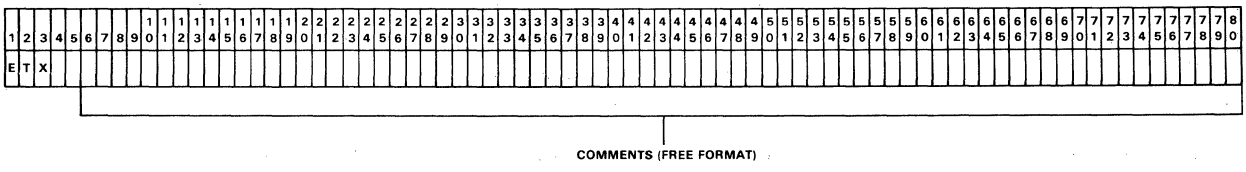
CARD NO. 2—



CARD NO. 3 through NO. 50



CARD NO. 51



Output Active Level entries are determined in accordance with the following table:

OUTPUT ACTIVE LEVEL	
Active high H	**Active low** L

NOTES
1. Polarity programmed once only.
2. Enter (H) for all unused outputs.

Input Variable entries are determined in accordance with the following table:

INPUT VARIABLE		
Im H	$\overline{\text{Im}}$ L	Don't care — (dash)

NOTE
Enter (—) for unused inputs of used P-terms.

Output Function entries are determined in accordance with the following table:

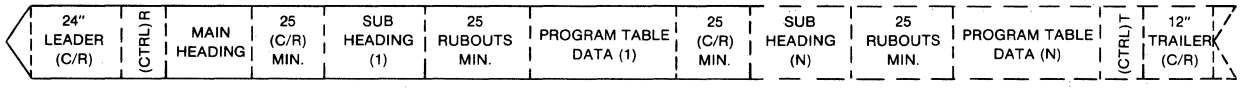
OUTPUT FUNCTION	
Product term present in FP A	Product term *not* present in FP • (period)

NOTES
1. Entries independent of output polarity.
2. Enter (A) for unused outputs of used P-terms.

TWX TAPE CODING FORMAT

The FPLA Program Table can be sent to Signetics in ASCII code format via airmail using any type of 8-level tape (paper, mylar, fanfold, etc.), or via TWX: just dial (910) 339-9283, tell the operator to turn the paper puncher on, and acknowledge. At the end of transmission instruct the operator to send tape to Signetics Order Entry.

A number of Program Tables can be sequentially assembled on a continuous tape as follows, however limit tape length to a roll of 1.75 inch inside diameter, and 4.25 inch outside diameter:



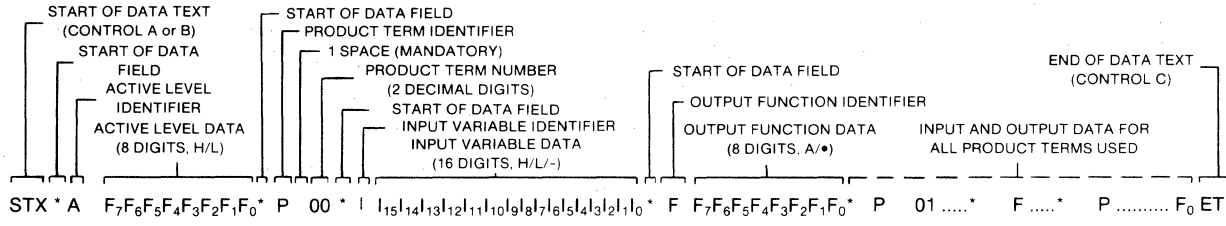
A. The MAIN HEADING at the beginning of tape includes the following information, with each entry preceded by a ($) character, whether used or not:

1. Customer Name _____
2. Customer TWX No. _____
3. Date _____
4. Purchase Order No. _____
5. Number of Program Tables _____
6. Total Number of Parts _____

B. Each SUB HEADING should contain specific information pertinent to each Program Table as follows, with each entry preceded by a ($) character, whether used or not:

1. Signetics Device No. _____
2. Program Table No. _____
3. Revision _____
4. Date _____
5. Customer Symbolized Part No. _____
6. Number of Parts _____

C. Program Table data blocks are initiated with an STX character, and terminated with an ETX character. The body of the data consists of Output Active Level, Product Term, and Output Function information separated by appropriate identifiers in accordance with the following format:



Entries for the 3 Data Fields are determined in accordance with the following Table:

INPUT VARIABLE		
I_m H	$\overline{I_m}$ L	Don't care — (dash)

NOTE

Enter (—) for unused inputs of used P-terms.

OUTPUT FUNCTION	
Product term present in Fp A	Product term not present in Fp • (period)

NOTES

1. Entries independent of output polarity.
2. Enter (A) for unused outputs of used P-terms.

OUTPUT ACTIVE LEVEL	
Active high H	**Active low** L

NOTES

1. Polarity programmed once only.
2. Enter (H) for all unused outputs.

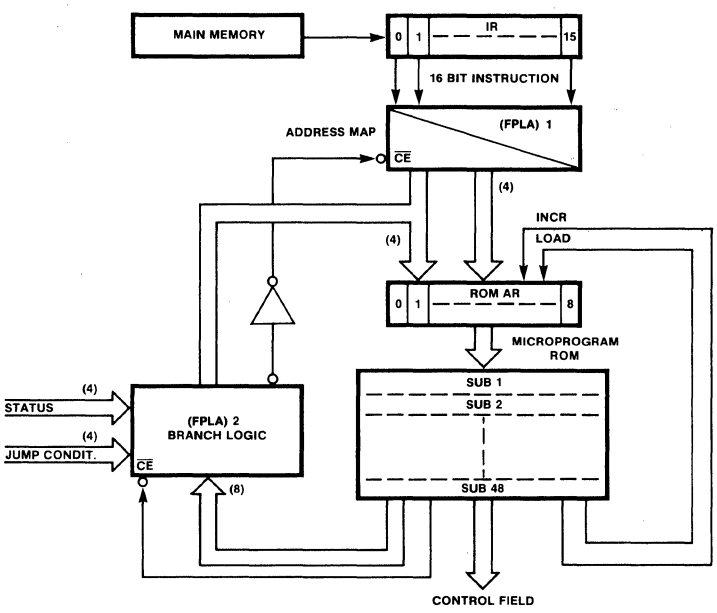
Although the Product Term data are shown entered in sequence, this is not necessary. It is possible to input only one Product Term, if desired. Unused Product Terms require no entry. ETX signalling end of Program Table may occur with less than the maximum number of Product Terms entered.

NOTES

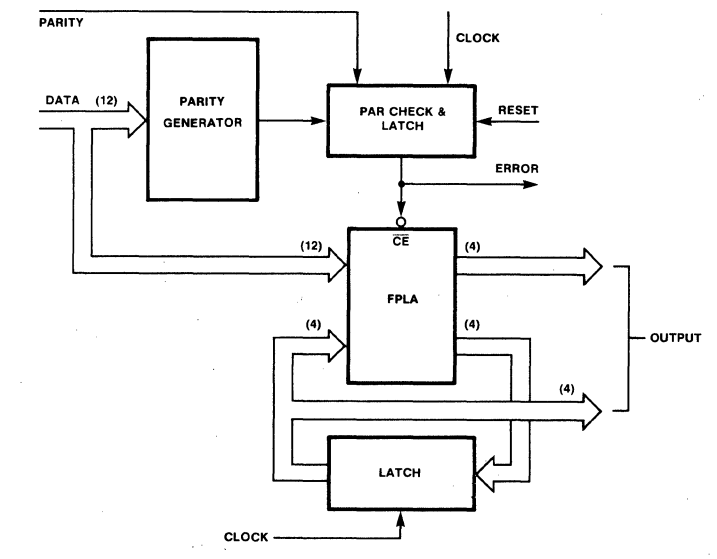
1. Corrections to any entry can be made by backspace and rubout. However, limit consecutive rubouts to less than 25.
2. P-Terms can be re-entered any number of times. The last entry for a particular P-Term will be interpreted as valid data.
3. Any P-Term can be deleted entirely by inserting the character (E) immediately following the P-Term number to be deleted, i.e., *P 25E deletes P-Term 25.
4. To facilitate an orderly Teletype print out, carriage returns, line feeds, spaces, rubouts etc. may be interspersed between data groups, but only preceding an asterisk (*).
5. Comments are allowed between data fields, provided that an asterisk (*) is not used in any Heading or Comment entry.

TYPICAL APPLICATIONS

SUBROUTINE ADDRESS MAP



SEQUENTIAL CONTROLLER



DESCRIPTION

The 82S200 (tri-state outputs) and the 82S201 (open collector outputs) are Bipolar Programmable Logic Arrays, containing 48 product terms (AND terms), and 8 sum terms (OR tems). Each OR term controls an output function which can be programmed either true active-high (F_P), or true active-low (F_P*). The true state of each output function is activated by any logical combination of 16-input variables, or their complements, up to 48 terms. Both devices are mask programmable by supplying to Signetics Program Table data in one of the formats specified in this data sheet.

The 82S200 and 82S201 are fully TTL compatible, and include chip enable control for expansion of input variables, and output inhibit. They feature either open collector or tri-state outputs for ease of expansion of product terms and application in bus-organized systems.

Both devices are available in commercial and military temperature ranges. For the commercial temperature range (0°C to +75°C) specify N82S200/201, I or N, and for the military temperature range (-55°C to +125°C) specify S82S200/201, I.

APPLICATIONS

- **CRT display systems**
- **Random logic**
- **Code conversion**
- **Peripheral controllers**
- **Function generators**
- **Look-up and decision tables**
- **Microprogramming**
- **Address mapping**
- **Character generators**
- **Sequential controllers**
- **Data security encoders**
- **Fault detectors**
- **Frequency synthesizers**

NOTES

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device of these or any other condition above those indicated in the operation of the device specifications is not implied.
2. All typical values are at $V_{CC} = 5V$, $T_A = 25°C$.
3. All voltage values are with respect to network ground terminal.
4. Test one at the time.
5. Measured with V_{IL} applied to $\overline{CE}$ and a logic high stored.
6. Measured with a programmed logic condition for which the output test is at a low logic level. Output sink current is applied thru a resistor to V_{CC}.
7. Measured with: V_{IH} applied to $\overline{CE}$.
8. Duration of short circuit should not exceed 1 second.
9. I_{CC} is measured with the chip enable input grounded, all other inputs at 4.5V and the outputs open.

TEST LOAD CIRCUIT

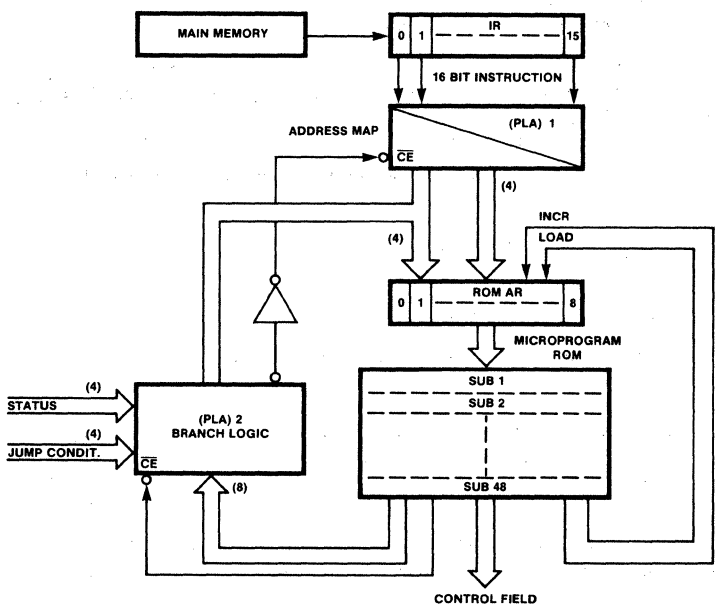
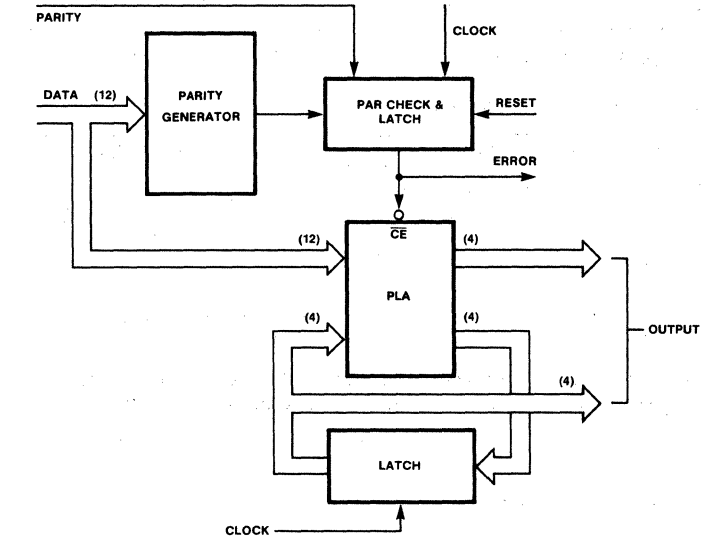
TYPICAL APPLICATIONS

SUBROUTINE ADDRESS MAP



SEQUENTIAL CONTROLLER



DESCRIPTION

The 82S102 and 82S103 are Bipolar programmable AND/NAND gate arrays, containing 9 gates sharing 16 common inputs. On-chip input buffers enable the user to individually program for each gate either the True (I_m), Complement ($\overline{I_m}$), or Don't Care (X) logic state of each input. In addition, the polarity of each gate output is individually programmable to implement either AND or NAND logic functions.

Alternately, if desired, OR/NOR logic functions can also be realized by programming for each gate the complement of its input variables, and output (DeMorgan theorem).

Both devices are field-programmable, which means that custom patterns are immediately available by following the fusing procedure outlined in this data sheet.

The 82S102 and 82S103 include chip-enable control for output strobing and inhibit. They feature either open collector or tri-state outputs for ease of expansion of input variables and application in bus-organized systems.

Both devices are available in the commercial and military temperature ranges. For the commercial range (0°C to +75°C) specify N82S102/103, I or N, and for the military range (−55°C to +125°C) specify S82S102/103, I.

FEATURES

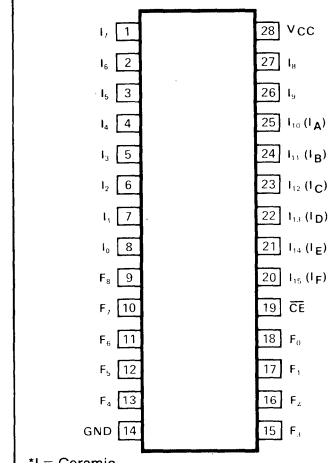
- **Field programmable (Ni-Cr link)**
- **16 input variables**
- **9 output functions**
- **Chip enable input**
- **I/O propagation delay:**
  N82S102/103: 30ns max
  S82S102/103: 50ns max
- **Power dissipation: 600mW typ**
- **Input loading:**
  N82S102/103: −100μA max
  S82S102/103: −150μA max
- **Output options:**
  82S102: Open collector
  82S103: Tri-state
- **Output disable function:**
  82S102: Hi
  82S103: Hi-Z
- **Fully TTL compatible**

APPLICATIONS

- **Random logic**
- **Address decoders**
- **Code detectors**
- **Peripheral selectors**
- **Fault monitors**
- **Machine state decoders**

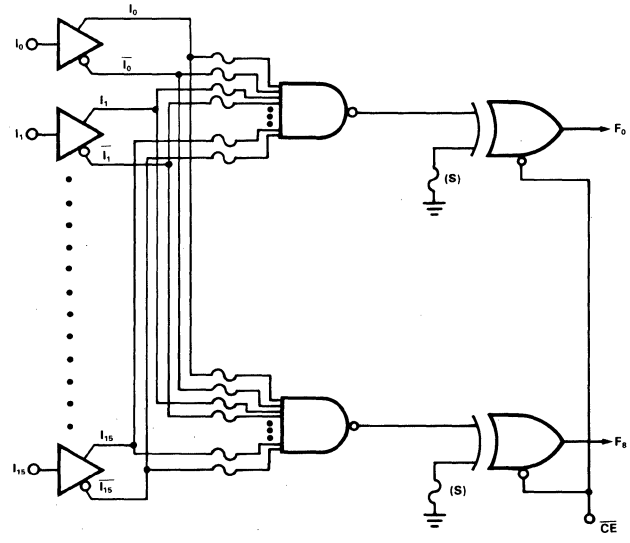
PIN CONFIGURATION

I,N PACKAGE*



*I = Ceramic
N = Plastic

LOGIC DIAGRAM



For each of the 9 outputs, either the function Fp (active high) or Fp (active low) is available, but not both. The required function polarity is user programmable via fuse (S).

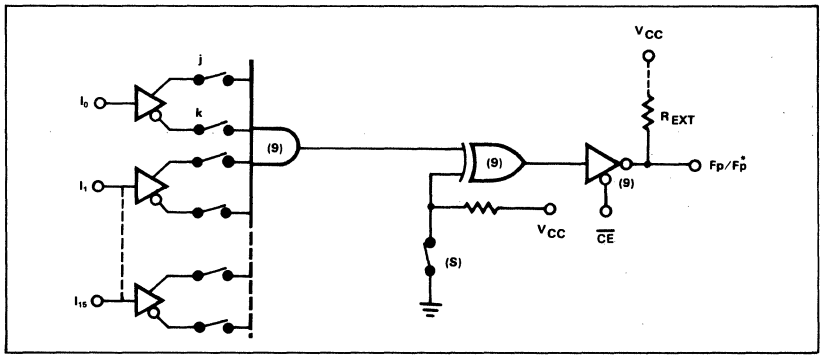
	Output voltage		Vdc
V_{OH}	High (82S102)	+5.5	
V_O	Off-state (82S103)	+5.5	
I_{IN}	Input current	±30	mA
I_{OUT}	Output current	+100	mA
	Temperature range		°C
T_A	Operating		
	N82S102/103	0 to +75	
	S82S102/103	-55 to +125	
T_{STG}	Storage	-65 to +150	

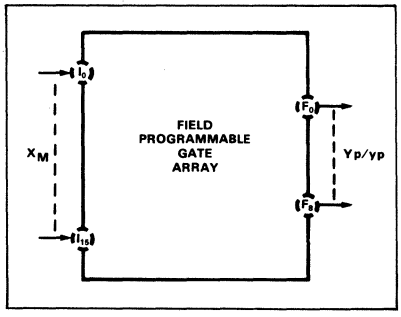
EQUIVALENT LOGIC PATH



The Field Programmable Gate Array consists of 9 gates with individually programmable inputs and outputs.

The inputs to each gate can be programmed either True (I_m), Complement ($\overline{I_m}$), or Don't Care via corresponding links (j) and (k). The outputs of each gate can be programmed active-high (F_p) or active-low (F_p^*) via corresponding links (S). Thus, each gate provides either of 2 output logic functions in terms of *external* input logic variables X_m as defined below (positive logic):

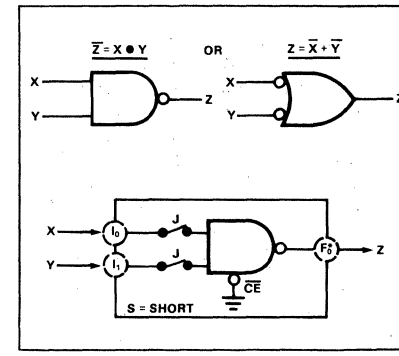
At S = Open:
$F_p = \overline{CE} + (X_0 \bullet X_1 \bullet X_2 \bullet \ldots . Xm) = Yp$
At S = Closed:
$F_p^* = \overline{CE} + (\overline{X}_0 + \overline{X}_1 + \overline{X}_2 + \ldots . X_m) = yp$
m = 0, 1, 2, ... 15
p = 0, 1, 2, ... 8
and where $X_m = I_m, \overline{I_m}$, Don't Care, as assigned by programming polarity of inputs I_0- I_{15}.

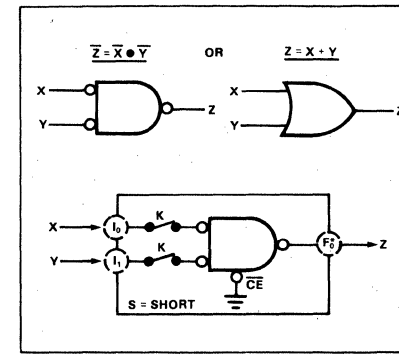


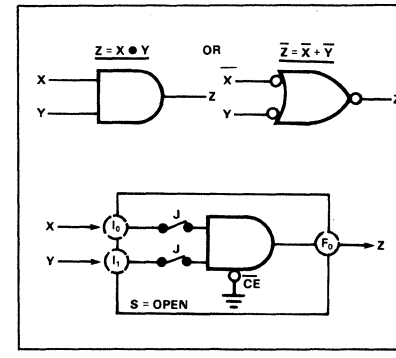
When $\overline{CE}$ = low, all gates are enabled, and $F_p^* = \overline{F}_p$ giving $y_p = \overline{Y}_p$.

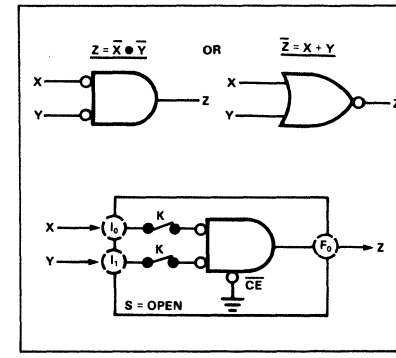
PROGRAMMABLE LOGIC FUNCTIONS

All internal links of virgin FPGAs are intact. Therefore, as shown in the Equivalent Logic Path, all symbolic switches are initially closed. Selective programming (opening) of links (J), (K), and (S) enables the user to assign input and output polarities to each gate for implementing NAND, NOR, AND, OR logic functions without changing the routing of input and output wires. This is shown in the following diagrams for a typical gate in terms of 2 input variables, which can be readily extended up to 16.









DC ELECTRICAL CHARACTERISTICS

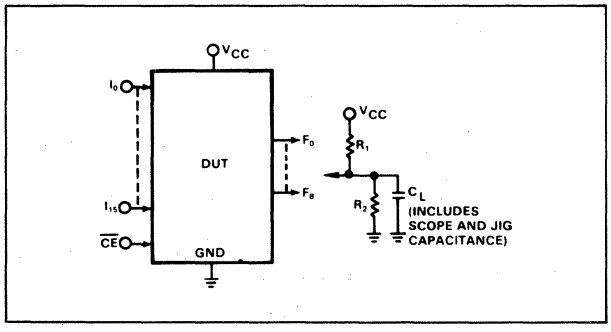
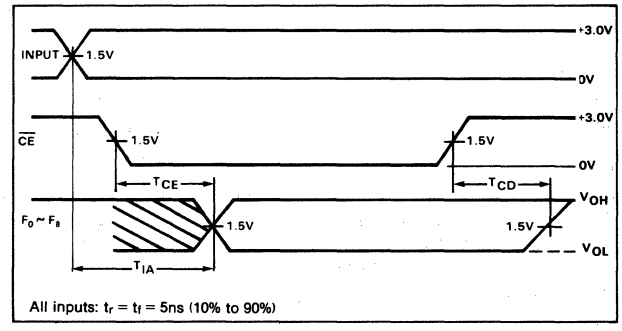
NOTES

1. All voltage values are with respect to network ground terminal.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. Test each output one at a time.
4. Measured with a programmed logic condition for which the output under test is at a low logic level. Output sink current is supplied through a resistor to V_{CC}.
5. Measured with V_{IL} applied to $\overline{CE}$ and a logic high at the output.
6. Measured with V_{IH} applied to $\overline{CE}$.
7. Duration of short circuit should not exceed 1 second.
8. I_{CC} is measured with the chip enable input grounded, all other inputs at 4.5V and the outputs open.

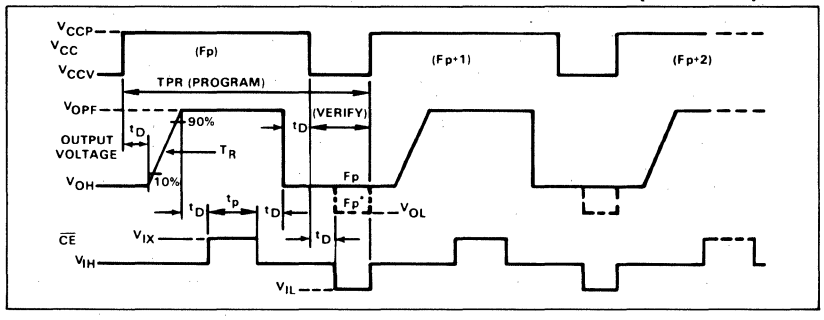
TEST LOAD CIRCUIT



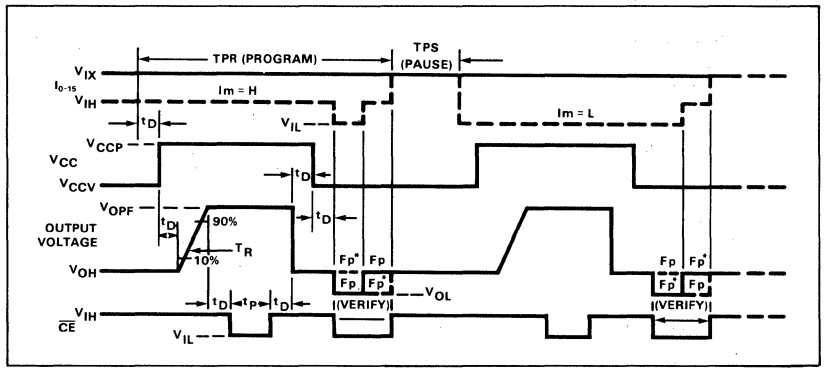
VOLTAGE WAVEFORM



OUTPUT POLARITY PROGRAM-VERIFY SEQUENCE (TYPICAL)



INPUT MATRIX PROGRAM-VERIFY SEQUENCE (TYPICAL)



VIRGIN DEVICE

The 82S102/103 are shipped in an unprogrammed state, characterized by:

1. All internal Ni-Cr links are intact.
2. Each gate contains both true and complement values of every input variable I_m (logic Null state).
3. The polarity of each output is set to active low (F_p^* function).
4. All outputs are at a high logic level.

RECOMMENDED PROGRAMMING PROCEDURE

To program each of 9 Boolean logic functions of 16 True, Complement, or Don't Care input variables follow the program/verify procedures for the Input Matrix and Output Polarity outlined below. To maximize recovery from programming errors, leave all links of unused gates intact.

SET-UP

Terminate all device outputs with a 10KΩ resistor to +5V.

Output Polarity

PROGRAM ACTIVE HIGH (Fp FUNCTION)

Program output polarity before programming inputs (for convenience). Program one output at a time. (S) links of unused outputs are not required to be fused.

1. Set GND (pin 14) to 0V, and V_{CC} (pin 28) to V_{CCV}.
2. Disable all device outputs by setting $\overline{CE}$ (pin 19) to V_{IH}.
3. Disable all input variables by applying V_{IX} to inputs I_0 through I_{15}.

A. Raise V_{CC} (pin 28) from V_{CCV} to V_{CCP}.
B. After t_D delay, force output to be programmed to V_{OPF}.
C. After t_D delay, pulse the $\overline{CE}$ input from V_{IH} to V_{IX} for a period t_p.
D. After t_D delay, remove V_{OPF} voltage source from output being programmed.
E. After t_D delay, return V_{CC} (pin 28) to V_{CCV}, and verify.
F. Repeat steps A through E for any other output.

VERIFY OUTPUT POLARITY

1. Set GND (pin 14) to 0V, and V_{CC} (pin 28) to V_{CCV}.
2. Disable all input variables by applying V_{IX} to inputs I_0 through I_{15}.

A. After t_D delay, set the $\overline{CE}$ input to V_{IL}.
B. Verify output polarity by sensing the logic state of outputs F_0 through F_8. All outputs at a low logic level are programmed active low (F_p^* function), while all outputs at a high logic level are programmed active high (F_p function).

Input Matrix

PROGRAM INPUT VARIABLE

Program one input at a time for one gate at a time. Input variable links of unused gates are not required to be fused. However, unused input variables must be programmed at Don't Care for all used gates.

1. Set GND (pin 14) to 0V, and V_{CC} (pin 28) to V_{CCV}.
2. Disable all device outputs by setting $\overline{CE}$ (pin 19) to V_{IH}.
3. Disable all input variables by applying V_{IX} to inputs I_0 through I_{15}.

A-1. If a gate contains nether I_0 nor $\overline{I_0}$ (input is a Don't Care), fuse both j and k links by executing both steps A-2 and A-3, before continuing with step C.
A-2. If a gate contains I_0, set to fuse the k link by lowering the input voltage at I_0 from V_{IX} to V_{IH}. Execute step B.
A-3. If a gate contains $\overline{I_0}$, set to fuse the j link by lowering the input voltage at I_0 from V_{IX} to V_{IL}. Execute step B.
B-1. After t_D delay, raise V_{CC} from V_{CCV} to V_{CCP}.
B-2. After t_D delay, force output of gate to be programmed to V_{OPF}.
B-3. After t_D delay, pulse the $\overline{CE}$ input from V_{IH} to V_{IL} for a period t_p.
B-4. After t_D delay, remove V_{OPF} voltage source from output of gate being programmed.
B-5. After t_D delay, return V_{CC} (pin 28) to V_{CCV}, and verify.
C. Disable programmed input by returning I_0 to V_{IX}.
D. Repeat steps A through C for all other input variables.
E. Repeat steps A through D for all other gates to be programmed.
F. Remove V_{IX} from all input variables.

VERIFY INPUT VARIABLE

Unambiguous verification of the logic state programmed for the inputs of each gate requires prior knowledge of its programmed output polarity. Therefore, the output polarity verify procedure must precede input variable verify.

1. Set GND (pin 14) to 0V, and V_{CC} (pin 28) to V_{CCV}.
2. Enable all outputs by setting $\overline{CE}$ (pin 19) to V_{IL}.
3. Disable all input variables by applying V_{IX} to inputs I_0 through I_{15}.

A. Interrogate input variable I_0 as follows:
Lower the input voltage to I_0 from V_{IX} to V_{IL}, and sense the logic state of outputs F_{0-8}.

Raise the input voltage to I_0 from V_{IL} to V_{IH} and sense the logic state of outputs F_{0-8}.

The state of I_0 contained in each gate is determined in accordance with the given truth table. Note that 2 tests are required to uniquely determine the state of the input variable contained in each gate.

B. Disable verified input by returning I_0 to V_{IX}.

C. Repeat steps A and B for all other input variables.

D. Remove V_{IX} from all input variables.

TRUTH TABLE FOR INPUT VERIFICATION

I_0	Fp	$F\dot{p}$	INPUT VARIABLE STATE	LINK FUSED
0	1	0	$\overline{I_0}$	j

F_L	Fusing attempts per link				2	cycle
V_S	Verify threshold[4]		1.4	1.5	1.6	V

NOTES

1. These are specifications which a Programming System must satisfy in order to be qualified by Signetics.
2. Bypass V_{CC} to GND with a 0.01μF capacitor to reduce voltage spikes.
3. Care should be taken to ensure that the voltage is maintained during the entire fusing cycle. The recommended supply is a constant current source clamped at the specified voltage limit.
4. V_S is the sensing threshold of a gate output voltage for a programmed link. It normally constitutes the reference voltage applied to a comparator circuit to verify a successful fusing attempt.

PROGRAMMING

In a virgin device all Ni-Cr links are intact. The initial programmed state of each gate is shown in the Typical Gate illustration.

To program inputs and outputs of each gate for implementing the desired logic function, fuse Ni-Cr links as indicated in the fuse link diagrams.

MOS MEMORY DATA SPECIFICATIONS

2501-I,N

DESCRIPTION

The 2501 employs enhancement mode p-channel MOS devices integrated on a single monolithic chip.

Low cost silicone DIP packaging is implemented and reliability is assured by the use of Signetics unique silicon gate MOS process technology. Unlike the standard metal gate MOS process, the silicon material over the gate oxide passivates the MOS transistors, and the deposited dielectric material over the silicon gate-oxide-substrate structure provides an ion barrier. In addition, Signetics' proprietary surface passivation and silicone packaging techniques result in an MOS circuit with inherent high reliability and demonstrating superior moisture resistance, mechanical shock and ionic contamination barriers.

The use of Signetics' unique silicon gate low threshold process allows the design and production of higher performance MOS circuits and provides higher functional density on a chip than other MOS technologies.

All inputs of the 2501 can be driven directly by standard bipolar integrated circuits (TTL, DTL, etc.). The data output buffers are capable of sinking a minimum of 1.6mA which is sufficient to drive one standard TTL load.

The maximum power dissipation of 1.6mW/bit is required only during read or write. For standby operation, 150μW/bit is obtained by removing V_D and reducing V_{DD} to -4.0V. Removal of V_D alone will cut power dissipation by a factor of 1.5.

The outputs of the 2501 are effectively open circuited when the device is not selected (logic high on chip select). This feature allows OR-tying for memory expansion.

FEATURES

- **Fully decoded addresses**
- **Access time: 1.0μs guaranteed**
- **Power dissipation: 1.6mW/bit max**
- **Standby power dissipation: 150μW/bit**
- **DTL and TTL compatible**
- **Chip select and output wired-OR capability**
- **Standard 16-pin DIP**
- **P-MOS silicon gate technology**
- **Completely static**
- **Requires no clocking**

APPLICATIONS

- **Small buffer stores**
- **Small core memory replacement**
- **Bipolar compatible data storage**

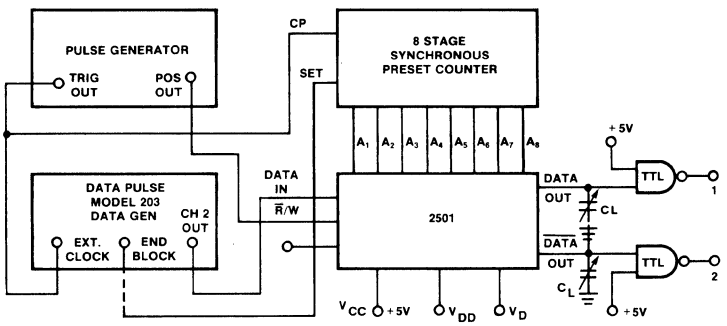
NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.
2. V_{CC} tolerance is ±5%. Any variation in actual V_{CC} will be tracked directly by V_{IL}, V_{IH} and V_{OH} which are stated for a V_{CC} of exactly 5V.
3. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 100°C/W junction to ambient for the I package or 150°C/W for the N package.
4. All inputs are protected against static charge.
5. Parameters are valid over operating temperature range unless specified.
6. All voltage measurements are referenced to ground.
7. Manufacturer reserves the right to make design and process changes and improvements.
8. Typical values are at +25°C and typical supply voltages.
9. Special device are available for operation at V_{DD} = -7V, V_D = -10V. Contact your Signetics Representative for details.

TEST LOAD CIRCUIT

SPEED MEASUREMENT



NOTES

A. Each clock time is split into a Read followed by a Write. Read and Write times can be varied by adjustment of the delay and width controls of the pulse generator.
B. Data generator produces a 256-bit block of data, 32 bits repeated 8 times. PCM mode used so data can be changed in 32 bits of the 2501 from one cycle to the next.
C. All inputs to the 2501 are standard TTL outputs with V_{CC} = 5V ± 5%.
D. Access time is measured between A1 (least significant address input) and points 1 and 2.

25L01-I,N

DESCRIPTION

The 25L01 employs enhancement mode p-channel MOS devices integrated on a single monolithic chip.

Low cost silicone DIP packaging is implemented and reliability is assured by the use of Signetics' unique silicon gate MOS process technology. Unlike the standard metal gate MOS process the silicon material over the gate oxide passivates the MOS transistors, and the deposited dielectric material over the silicon gate-oxide substrate structure provides an ion barrier. In addition, Signetics' proprietary surface passivation and silicone packaging techniques result in an MOS circuit with inherent high reliability and demonstrating superior moisture resistance, mechanical shock and ionic contamination barriers.

All inputs of the 25L01 can be driven directly by standard bipolar integrated circuits (TTL, DTL, etc.). The data output buffers are capable of sinking a minimum of 1.6mA, sufficient to drive one standard TTL load.

The maximum power dissipation of 1.7mW/bit is required only during read or write. For standby operation 100μW/bit is obtained by removing V_D and reducing V_{DD} to -8.0V. Removal of V_D alone wll cut power dissipation by a factor of almost 3.

The outputs of the 25L01 are effectively open circuited when the device is not selected (logic high on chip select). This feature allows OR-tying for memory expansion.

FEATURES

- **Fully decoded addresses**
- **Access time: 1.0μs guaranteed**
- **Power dissipation: 1.7mW/bit max**
- **Standby power dissipation: 100μW/bit**
- **DTL and TTL compatible**
- **Chip select and output wired-OR capability**
- **Standard 16-pin DIP**
- **P-MOS silicon gate technology**
- **Fully static**
- **Requires no clocking**
- **Optimized with +5 and -12V supplies**

APPLICATIONS

- **Small buffer stores**
- **Small core memory replacement**
- **Bipolar compatible data storage**

2101-F,N • 2101-1-F,N • 2101-2-F,N

DESCRIPTION

The 2101 series is high performance, low power static read/write RAM's.

The 2101 series is fabricated with n-channel silicon gate technology which allows the design of high performance easy to use MOS circuits and provides a high functional density on a given monolithic chip.

FEATURES

- **Fully static**
- **No refresh operations, sense amps or clocks required**
- **All inputs and outputs are TTL compatible**
- **One 5V power supply required**

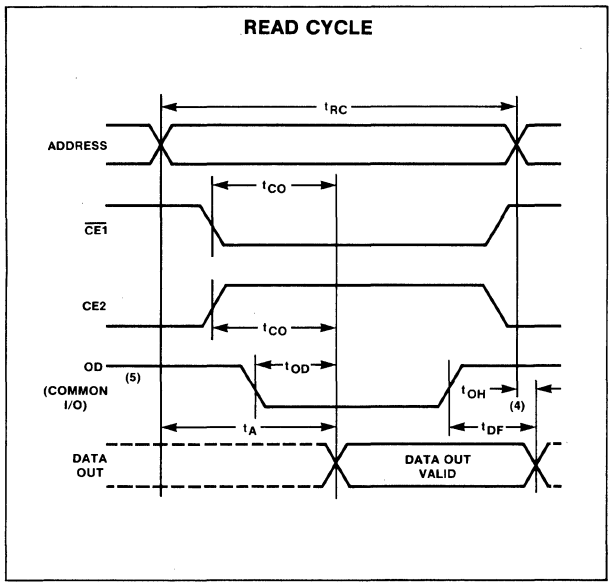
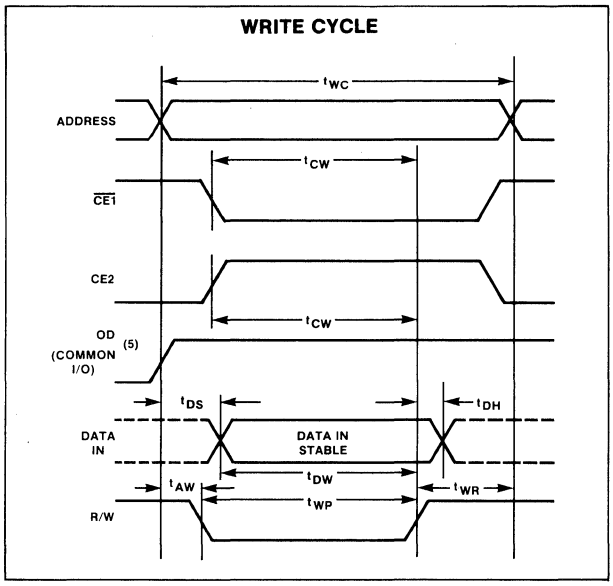
NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values are for T_A = 25°C and typical supply voltage.
3. This parameter is periodically sampled and is not 100% tested.
4. t_{DF} is with respect to the trailing edge of $\overline{CE}_1$, CE_2 or OD, whichever occurs first.
5. CD should be tied low for separate I/O operation.

TIMING DIAGRAMS





2111-I,N • 2111-1-I,N • 2111-2-I,N

DESCRIPTION

The 2111 series is a high-performance, low-power static read/write RAM.

The 2111 series is fabricated with n-channel silicon gate technology which allows the design of high performance easy to use MOS circuits and provides a high functional density on a given monolithic chip.

FEATURES

- **Fully static**
- **Requires no refresh operations, sense amps or clocks**
- **Completely TTL compatible**
- **Only one 5V power supply required**

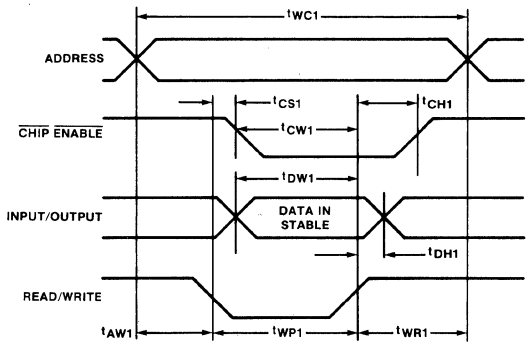
NOTES on following page.

NOTES

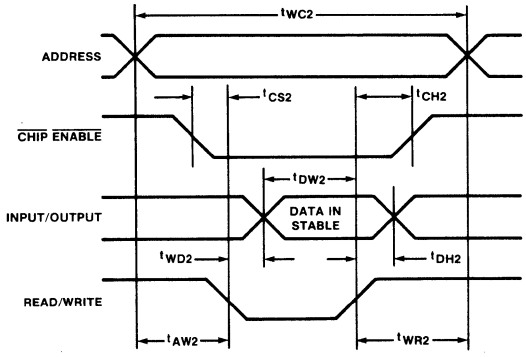
1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values are for $T_A = 25°C$ and typical supply voltage.
3. This parameter is periodically sampled and is not 100% tested.
4. Output is enabled and t_{CO} commences only with both CE low and WE high.
5. Output is disabled and t_{DF} combined from either the rising edge of CE or the falling edge of WE.
6. Minimum t_{WP} is valid when CE has been high at least t_{DF} before WE goes low. Oherwise $t_{WP(min)} = t_{DW(min)} + t_{DF(max)}$.
7. When WE goes high at the end of the write cycle, it will be possible to turn on the output buffers if CE is still low. The data out will be the same as the data just written and so will not conflict with input data that may still be on the I/O bus.

VOLTAGE WAVEFORMS

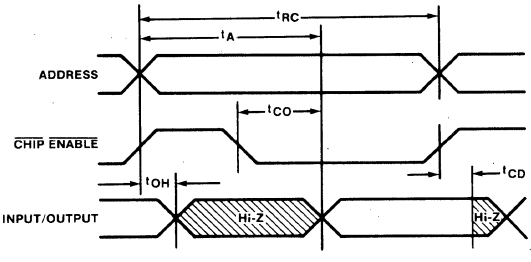
WRITE CYCLE #1



WRITE CYCLE #2



READ CYCLE



2606-F,I,N • 2606-1-F,I,N

DESCRIPTION

The 2606 is fabricated with n-channel silicon gate MOS technology and achieves an access time of less than 750ns.

FEATURES

- **Fully decoded**
- **No clocks required**
- **All interface signals, including power supply directly TTL compatible**

NOTES on following page.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values are for T_A = 25° C and typical supply voltage.
3. This parameter is periodically sampled and is not 100% tested.
4. Input levels swing between 0.65V and 2.2V.
5. Input signal transition times are 20ns.
6. Timing reference level is 1.5V.
7. Bus load is 100pF, 1 TTL tri-state output.
8. R/$\overline{W}$ must be high and CE must be low in order for output buffers to turn on.
9. Maximum t_{DH} governed by potential conflict with data out during next cycle.
10. The output buffers will turn off within the specified time after write mode is selected.
11. Write setup required to prevent data overlap. For write cycle B the R/$\overline{W}$ line will typically change with the addresses.

2102-F,I,N • 2102-1-F,I,N • 2102-2-F,I,N

DESCRIPTION

The 2102, 2102-1 and 2102-2 are static random access read/write memories fabricated with low threshold n-channel silicon gate technology.

FEATURES

- **Fully static**
- **Require no clocks**
- **Completely DTL/TTL compatible**
- **Single 5V power supply**
- **Three-state output for OR-tie capability**

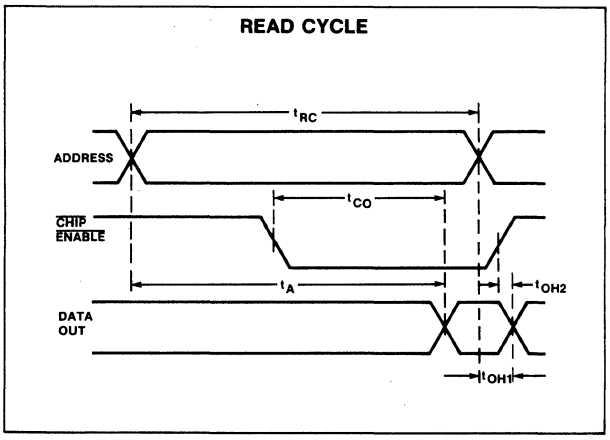
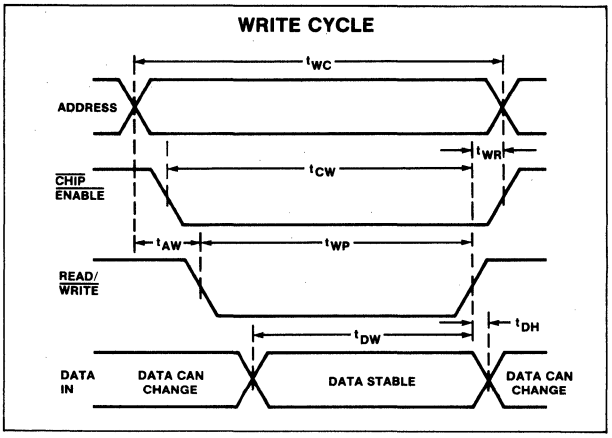
NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device of these or any other condition above those indicated in the operation of the device of these or any other condition above those indicated in the operation sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 150°C/W junction to ambient ("B" package).
3. All inputs protected against static charge.
4. Parameter valid over operating temperature range unless otherwise specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Typical values are at +25°C and typical supply voltages.

TIMING DIAGRAMS





DESCRIPTION

The 2102A is a high speed static random access memory element using n-channel MOS devices integrated on a monolithic array. It uses fully dc stable (static) circuitry and therefore requires no clocks or refreshing to operate. The data is read out nondestructively and has the same polarity as the input data.

The 2102A is designed for memory applications where high performance, low cost, large bit storage, and simple interfacing are important design objectives. A low standby power version (2102AL) is also available, and has all the same operating characteristics of the 2102A with the added feature of 35mW maximum power dissipation in standby and 174mW in operations.

A separate chip enable ($\overline{CE}$) lead allows easy selction of an individual package when outputs are OR-tied.

The 2102A is fabricated with n-channel silicon gate technology, which allows the design and production of high performance, easy-to-use MOS circuits and provides a higher functional density on a monolithic chip than either conventional MOS technology or p-channel silicon gate technology.

FEATURES

- **Single 5V supply voltage**
- **Fully TTL compatible**
- **Standby power mode (2102AL)**
- **Tri-state output**
- **OR-tie capability**
- **All inputs protected against static charge**
- **Low cost packaging**

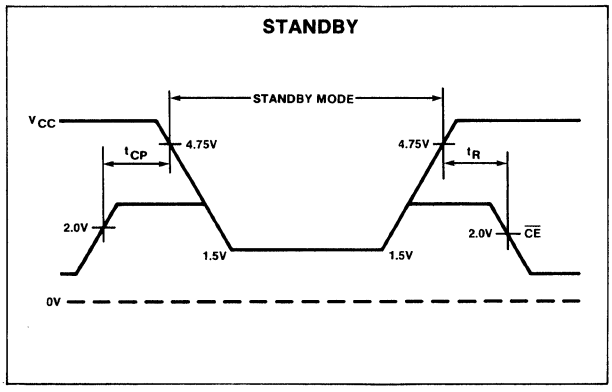
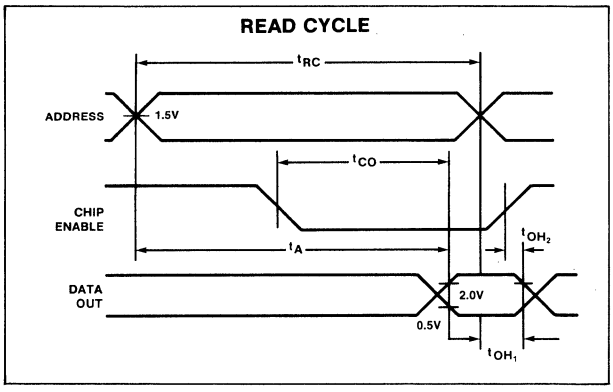
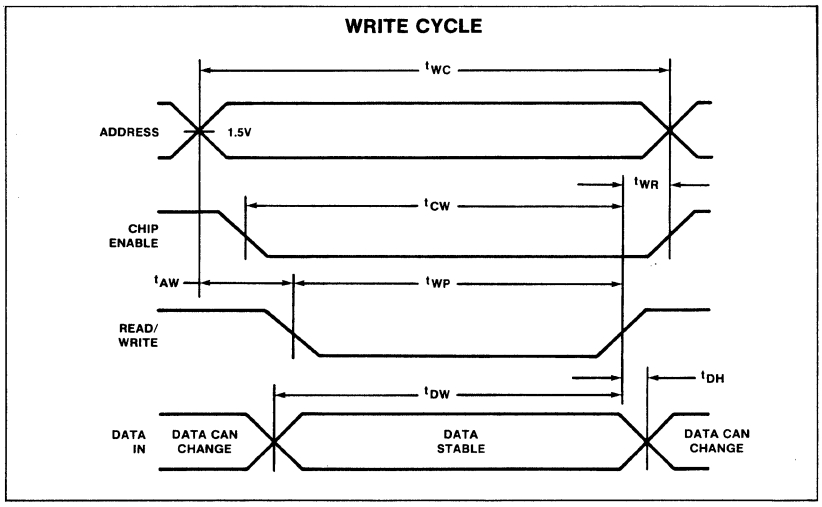
NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values are for T_A = 25°C and typical supply voltage.
3. The maximum I_{CC} value is 55mA for the 2102A and 2102A-4, and 33mA for the 2102AL and 2102AL-4.
4. This parameter is periodically sampled and is not 100% tested.
5. Typical values are for T_A = 25°C.
6. Consider the test conditions as shown: if the standby voltage (V_{PD}) is between 5.25V (V_{CC} max) and 2.0V, then $\overline{CE}$ must be held at 2.0V min (V_{IH}). If the standby voltage is less than 2.0V but greater than 1.5V (V_{PD} min), then $\overline{CE}$ and standby voltage must be at least the same value or, if they are different, $\overline{CE}$ must be the more positive of the 2.
7. $t_R = t_{RC}$ (read cycle time).

VOLTAGE WAVEFORMS







21F02-F,I,N • 21F02-2 - F,I,N • 21F02-4 - F,I,N

DESCRIPTION

The 21F02 is a high speed static random access memory element using n-channel MOS devices integrated on a monolithic array. It uses fully dc stable (static) circuitry and therefore requires no clocks or refreshing to operate. The data is read out nondestructively and has the same polarity as the input data.

The 21F02 is designed for memory applications where high performance, low cost, large bit storage, and simple interfacing are important design objectives. A separate chip enable (CE) lead allows easy selection of an individual package when outputs are OR-tied.

The Signetics 21F02 is fabricated with n-channel silicon gate technology. This technology allows the design and production of high performance easy to use MOS circuits and provides a higher functional density on a monolithic chip than either conventional MOS technology or p-channel silicon gate technology.

FEATURES

- **Fully TTL compatible**
- **Single 5V supply**

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device of these or any other condition above those indicated in the operation sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 150°C/W junction to ambient (B package).
3. Typical values are at +25°C and typical supply voltages.
4. All inputs protected against static charge.
5. Parameter valid over operating temperature range unless otherwise specified.
6. All voltage measurements are referenced to ground.
7. Manufacturer reserves the right to make design and process changes and improvements.

21L02-F,I,N • 21L02-1-F,I,N • 21L02-2-F,I,N • 21L02-3-F,I,N

DESCRIPTION

The 21L02, 21L02-1, 21L02-2, and 21L02-3 are low power static random access read/write memories fabricated with low threshold n-channel silicon gate technology.

FEATURES

- **Fully static**
- **Requires no clocks**
- **Completely DTL/TTL compatible**
- **Single 5V power supply**
- **Three-state output for OR-tie capability**

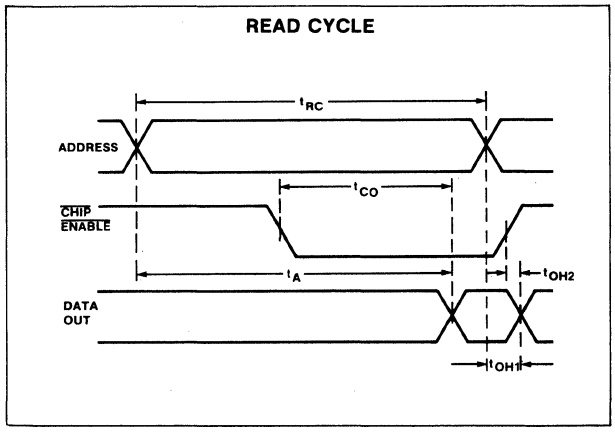
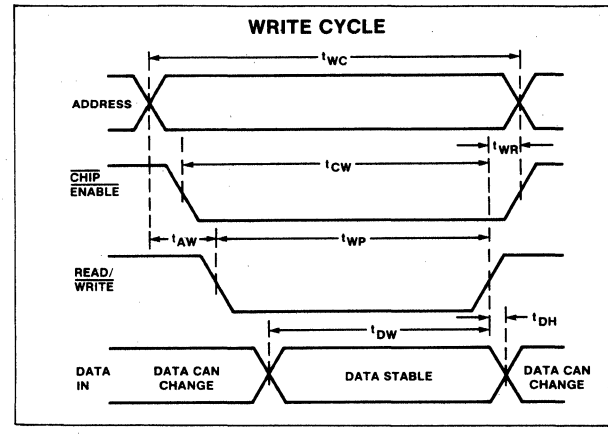
TIMING DIAGRAMS





OBJECTIVE SPECIFICATION

2115/2115L-F,I,N • 2125/2125L-F,I,N

DESCRIPTION

The 2115 and 2125 family are read/write RAMs which are designed for buffer control storage and high performance main memory applications.

These devices offer the advantages of high performance, low power dissipation, and system cost savings, making them ideal where cost is a prime factor. N-channel technology allows the design and production of high speed MOS RAMs which are compatible to the performance of Bipolar RAMs.

FEATURES

- **Power dissipation: 0.2mW/bit typ (2115L, 2125L)**
- **Output options:**
  2115: Uncommitted collector*
  2125: Three-state
- **Non-inverting data output**
- **Dual-in-line package**
- **N-channel MOS silicon gate technology**
- **Fully pin compatible to 93415 (2115) and 93425 (2125)**
- **Fully compatible with TTL logic families including inputs, output and single 5V supply**

* The 2115 is an MOS device and the output is actually an uncommitted drain.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The operating ambient temperature ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute and a 2 minute warm-up. Typical thermal resistance values of the package at maximum temperature are:
   θ_{JA} (@ 400fpm air flow) = 45°C/W
   θ_{JA} (still air) = 60°C/W
   θ_{JC} = 25°C/W.
3. Duration of short circuit current should not exceed 1sec.

DESCRIPTION

The 1103 is designed for main memory applications where high performance, low cost and large bit storage are important design objectives. It is a random access memory element using enhancement mode p-channel MOS devices integrated on a monolithic array. It is fully decoded, permitting the use of an 18-pin dual in-line package. The dynamic circuitry dissipates significant power only during precharge. Information stored in the memory is non-destructively read. Refreshing of all 1024 bits is accomplished in 32 read cycles and is required every 2ms. A separate cenable (chip enable) lead allows easy selection of an individual package when outputs are OR-tied. Use Signetics 8T25 sense amp, and 3207 clock driver.

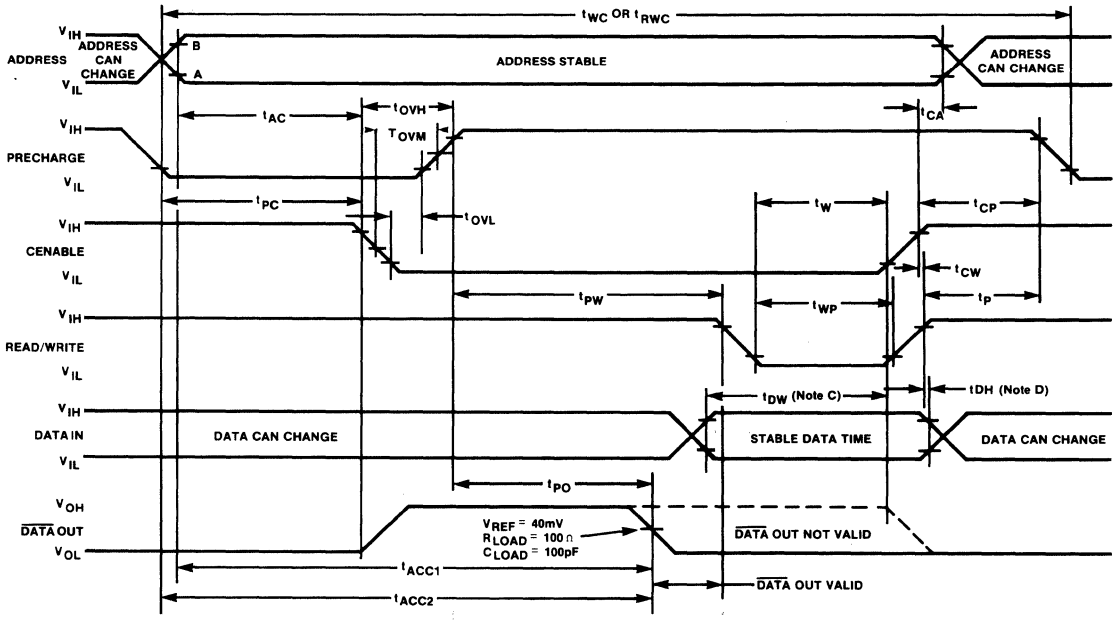
NOTES

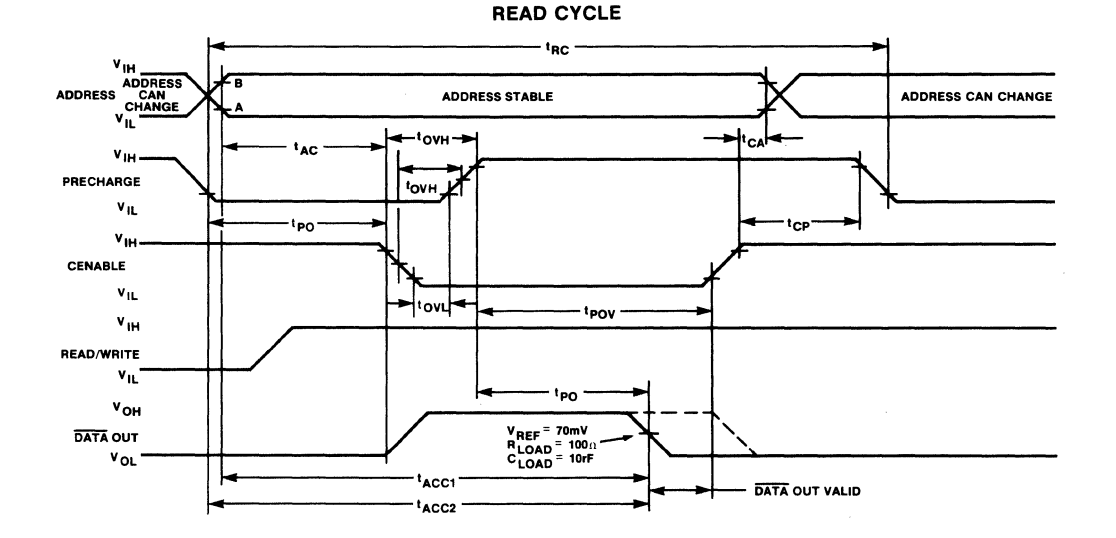
1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The V_{SS} current drain is equal to $(I_{DD} + I_{OH})$ or $(I_{DD} + I_{OL})$.
3. $(V_{BB} - V_{SS})$ supply should be applied at or before V_{SS}.
4. The maximum values for V_{IL} and the minimum values for V_{IH} are linearly related to temperature between 0°C and 70°C. Thus any value in between 0°C and 70°C can be calculated by using a straight-line relationship.
5. The maximum values for V_{IL} (for precharge, cenable and read/write) may be increased to V_{SS} - 14.2 at 0°C and V_{SS} - 14.5 at 70°C (same values as those specified for the address and data-in lines) with a 40ns degradation (worst case) in t_{AC}, t_{PC}, t_{RC}, t_{WC}, t_{RWC}, t_{ACC1} and t_{ACC2}.
6. This value of load resistance is used for measurement purposes. In applications the resistance may range from 100Ω to 1kΩ.
7. The output current when reading a low output is the leakage current of the 1103 plus external noise coupled into the output line from the clocks. V_{OL} equals I_{OL} across the load resistor.
8. See Supply Current vs Temperature for guaranteed current at the temperature extremes. These values are taken from a single pulse measurement.
9. This parameter is periodically sampled and is not 100% tested.
10. This parameter is periodically sampled and is not 100% tested. It is measured at worst case operating conditions. Capacitance measurements for plastic package only.
11. These times will degrade by 40ns (worst case) if the maximum values for V_{IL} (for precharge, cenable and read/write inputs) go to V_{SS} - 14.2V at 0°C and V_{SS} - 14.5V at 70°C.

TIMING DIAGRAMS

WRITE CYCLE OF READ/WRITE CYCLE



READ CYCLE



NOTES

A. V_{DD} + 2V
B. V_{SS} - 2V
t_T is defined as the transitions between these two points.
C. t_{DW} is referenced to point 1 of the rising edge of cenable of read/write whichever occurs first.
D. t_{DH} is referenced to point 2 of the rising edge of cenable or read/write whichever occurs first.

2660-F,I,N • 2660-1 - F,I,N • 2660-2 - F,I,N • 2660-3 - F,I,N

DESCRIPTION

The 2660 is fabricated with n-channel silicon gate technology for high performance and high functional density, and uses a single transistor dynamic storage cell and dynamic circuitry to achieve high speed and low power dissipation.

The unique design of the 2660 allows it to be packaged in the industry standard 16-pin in-line package, which provides the highest system bit densities and is compatible with widely available automated handling equipment.

The use of the 16-pin package is made possible by multiplexing the 12 address bits (required to address 1 of 4096 bits) into the 2660 on 6 address input pins. The two 6-bit address words are latched into the device by the 2 TTL clocks, Row Address Strobe (RAS) and Column Address Strobe (CAS). Non-critical clock timing requirements allow use of the multiplexing technique while maintaining high performance.

The single transistor dynamic storage cell provides high speed along with low power dissipation. The memory cell requires refreshing for data retention, and this is most easily accomplished by performing a read cycle at each of the 64 row addresses every 2ms.

FEATURES

- **Standard 16-pin DIP**
- **All inputs including clocks TTL compatible**
- **On chip latches for address, chip select and data in**
- **Tri-state TTL compatible output**
- **Output data is latched and valid into next cycle**
- **Read and write cycle time:**
  - **2660: 375ns**
  - **2660-1: 425ns**
  - **2660-2: 500ns**
  - **2660-3: 375ns**
- **Access time:**
  - **2660: 250ns**
  - **2660-1: 300ns**
  - **2660-2: 350ns**
  - **2660-3: 250ns**
- **Low power:**
  - **Operating: <380mW**
  - **Standby: <24mW**
- **RAS only refresh (no dummy cycles required)**
- **Page mode addressing: 2660-3**
- **±10% power supply margins: 2660-3**
- **TRPW = $\overline{RAS}$ pulse width of 32μs: 2660-3**

NOTES on following page.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. V_{DD} = 12 ± 10% for the 2660-3.
3. Input voltages greater than TTL levels (0 to 5V) require device operation at reduced speed.
4. All device pins at 0V except V_{BB} at -5V and pin under test which is at +10V.
5. Output disabled by chip select input.
6. Current is proportional to clock speed with maximum current measured at fastest cycle rate.
7. Depends upon output loading. The V_{CC} supply is connected to the output buffer only.
8. Assumes t_T = 5ns.
9. For minimum cycle, t_{RCL} has a maximum value of 110ns.
10. Implies $|t_{CRL}| \leq 40ns$ only for minimum cycle time; otherwise $|t_{CRL}| \gg 40ns$ is legal for other than minimum cycle time.
11. Assumes $t_{RCL} + t_T > t_{RCL}$ (max). If not, the access time is controlled by t_{RAC}.
12. Assumes that $t_{RCL} + t_T < t_{RCL}$ (max). If $t_{RCL} + t_T > t_{RCL}$ (max), then t_{RC} and t_{RAC} will be longer by the amount $t_{RCL} + t_T$ exceeds t_{RCL} (max).
13. Rise and fall times measured between V_{IH} and V_{IL}.
14. The minimum cycle time is achieved by compensating for RAS rise and fall times with t_{CRL}. The minimum cycle time is then constrained by t_{RCL} (max) + t_{CPW} + t_{RP}.
15. These parameters are referenced to the CAS leading edge in random write cycle operation and to the Write leading edge in read-write or read-modify-write cycle.
16. Write command hold time is important only when performing normal random write cycles. During read-write or read-modify-write cycles, the write command pulse width is the limiting parameter.
17. All voltages reference to V_{SS}.
18. Output voltage will swing from V_{SS} to V_{CC} independent of differential between V_{SS} and V_{CC}.

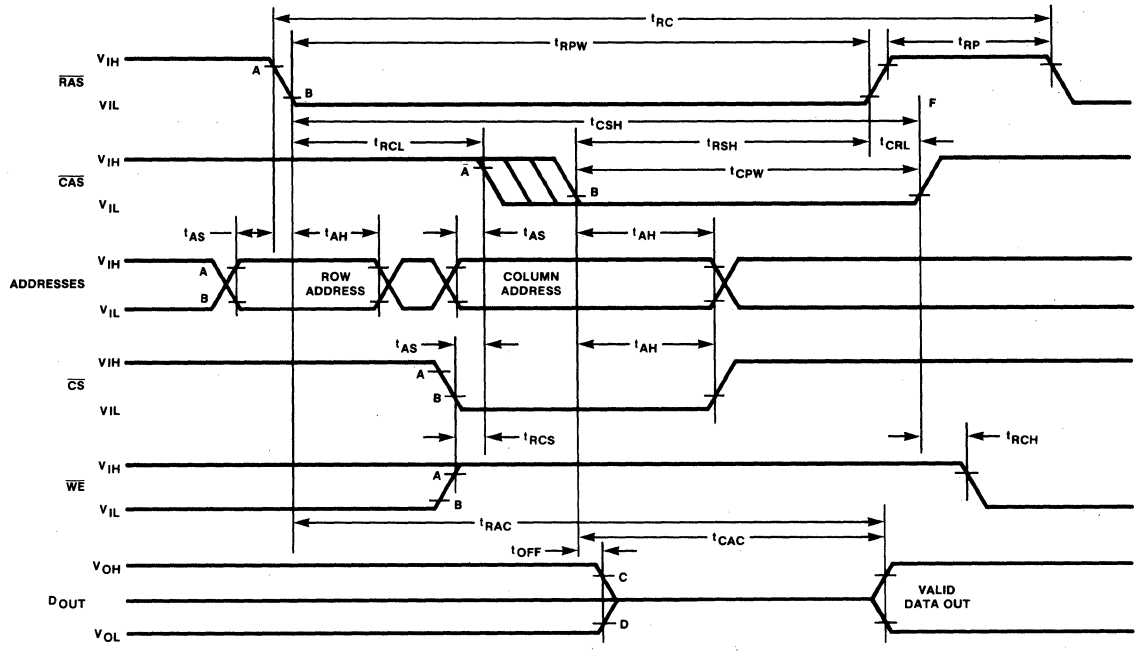
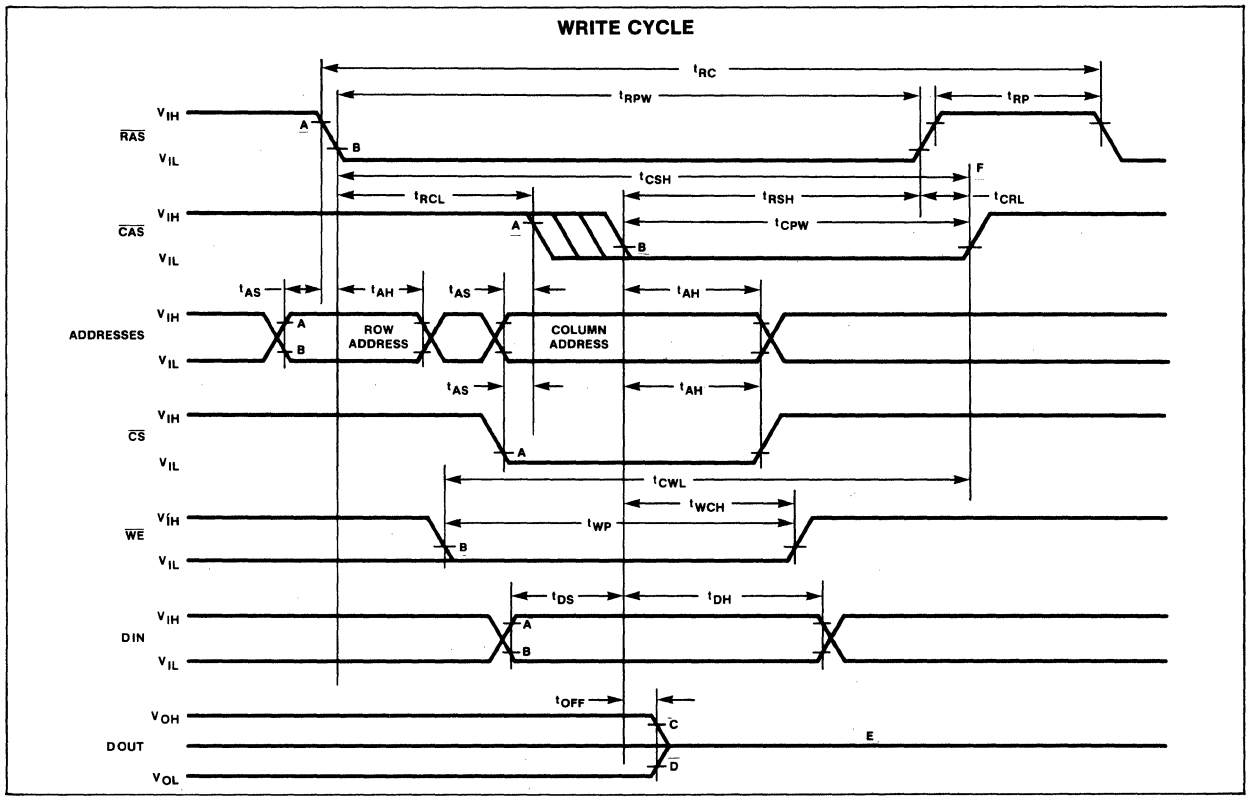
READ CYCLE

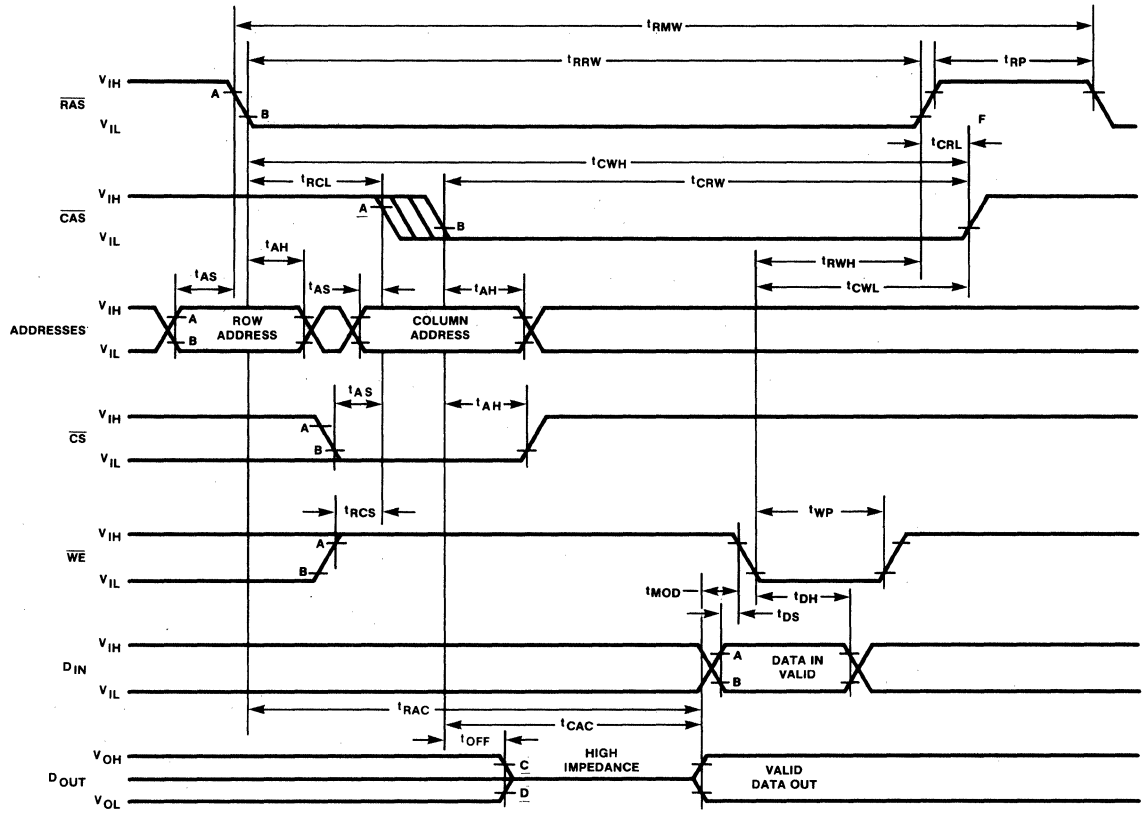


TIMING DIAGRAMS (Cont'd)



TIMING DIAGRAMS (Cont'd)

READ MODIFY WRITE CYCLE



NOTES

A,B. V_{IHMIN} and V_{ILMAX} are reference levels for measuring timing of input signals.

C,D. V_{OHMIN} and V_{OLMAX} are reference levels for measuring timing of D_{OUT} with 100pf load.

E. If $\overline{WE}$ goes low while $\overline{CAS}$ is low, D_{OUT} could go either V_{OL} or V_{OH} after t_{CAC}. D_{OUT} will be in open circuit state (write cycle waveforms), if $\overline{WE}$ goes Low before $\overline{CAS}$ goes low. In a read-modify-write cycle D_{OUT} is data read and does not change during modify-write portion of the cycle.

F. For minimum cycle timing, t_{CRL} must be 0 to 40ns for the 2660 and 2660-3; 0 to 50ns for the 2660-1 and 2660-2.

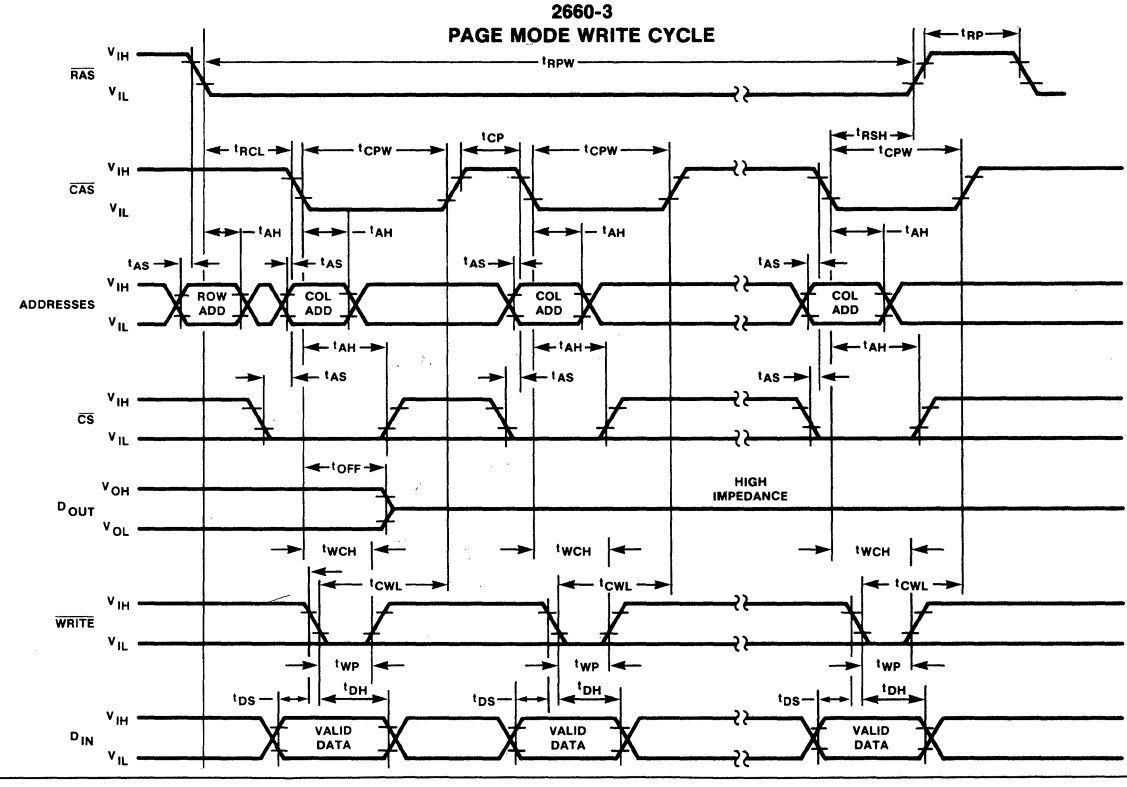
PAGE MODE WRITE CYCLE



2680-F,I,N • 2680-1-F,I,N • 2680-2-F,I,N

DESCRIPTION

The 2680 incorporates the latest memory design features and can be used in a wide variety of applications, from those which require very high speed to ones where low cost and large bit capacity are the prime criteria.

The 2680 must be refreshed every 2ms. This can be accomplished by performing a read cycle at each of the 64 row addresses (A_0-A_5). The chip select input can be either high or low for refresh.

The 2680 has been designed with minimum production costs as a prime criterion. It is fabricated using n-channel silicon gate MOS technology, which is an ideal choice for high density integrated circuits. The 2680 uses a single transistor cell to minimize the device area. The single device cell, along with unique design features in the on-chip peripheral circuits, yields a high performance and low cost memory device.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values are for T_A = 25°C and typical power supply voltages.
3. The I_{DD} and I_{CC} currents flow to V_{SS}. The I_{BB} current is the sum of all leakage currents.
4. During CE on V_{CC} supply current is dependent on output loading V_{CC} is connected to output buffer only.
5. Capacitance measured with Boonton Meter or effective capacitance calculated from the equation with the current equal to a constant 20mA.
6. If $\overline{WE}$ is low before CE goes high then D_{IN} must be valid when CE goes high.
7. The only requirement for the sequence of applying voltage to the device is that V_{DD}, V_{CC}, and V_{SS} should never be .3V more negative than V_{BB}.

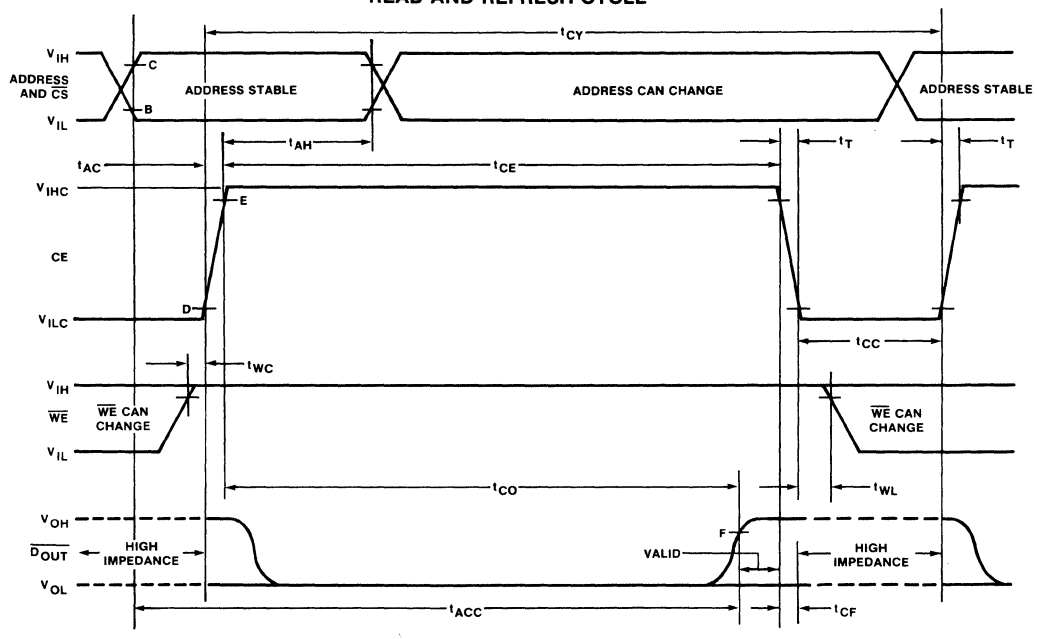
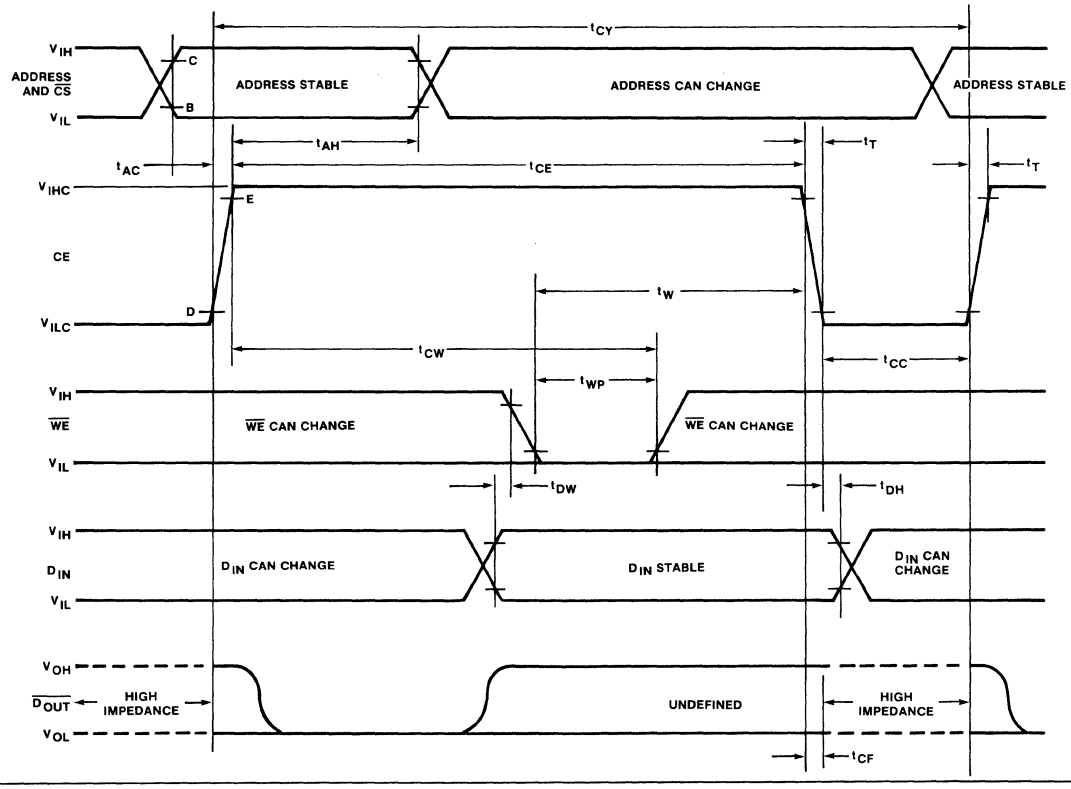
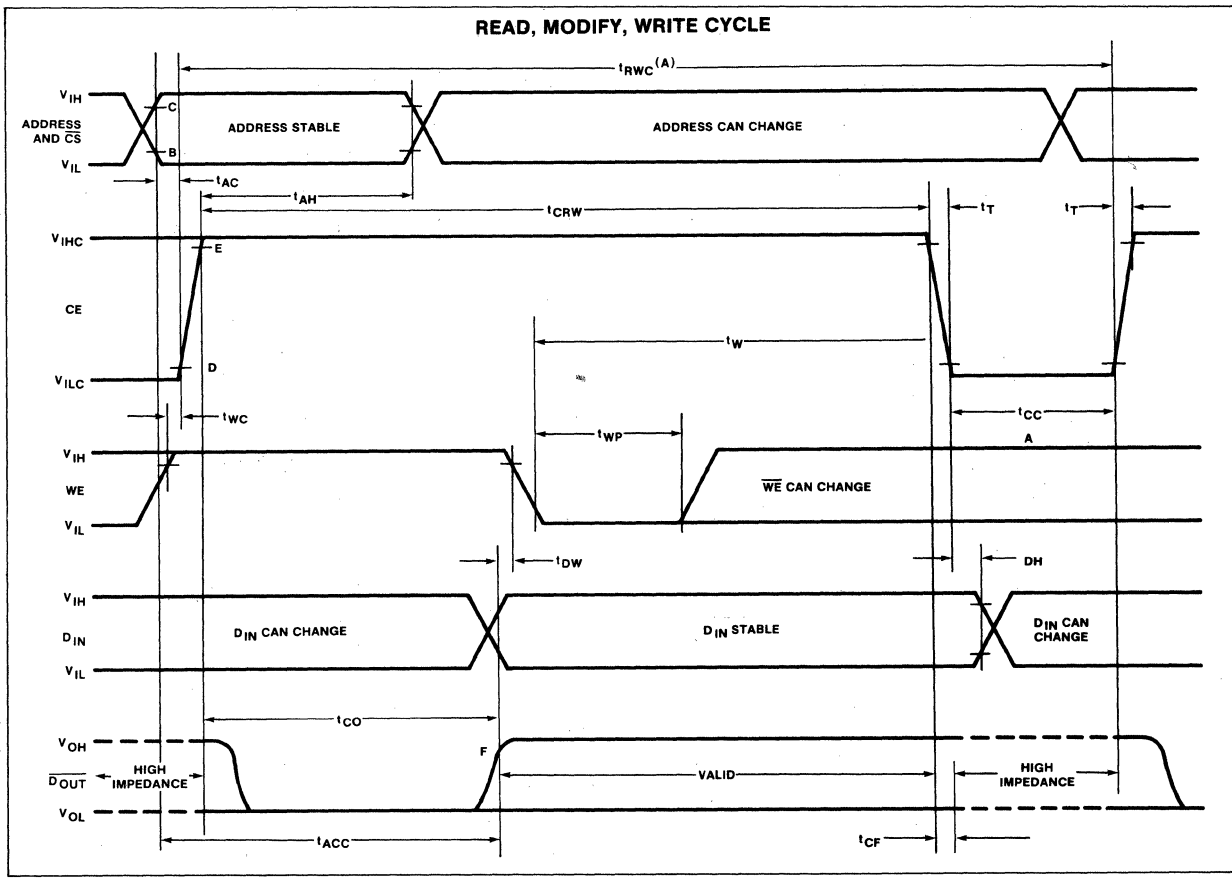
READ AND REFRESH CYCLE[A]



WRITE CYCLE



TIMING DIAGRAMS (Cont'd)



NOTES

A. For Refresh cycle row and column addresses must be stable before t_{AC} and remain stable for entire t_{AH} period.
B V_{IL} max is the reference level for measuring timing of the addresses, $\overline{CS}$, $\overline{WE}$, and D_{IN}.
C. V_{IH} min is the reference level for measuring timing of the addresses, $\overline{CS}$, $\overline{WE}$, and D_{IN}.
D. V_{SS} +2.0V is the reference level for measuring timing of CE.
E. V_{DD} -2V is the reference level for measuring timing of CE.
F. V_{SS} +2.4V is the reference level for measuring the timing of D_{OUT}.

2530-I,N

DESCRIPTION

The 2530 has a read input which controls the entry of data from the ROM into output latches. Three-state outputs allow OR-tying for implementing larger memories. Two mask programmable output enables control the 8 output devices without affecting address circuitry.

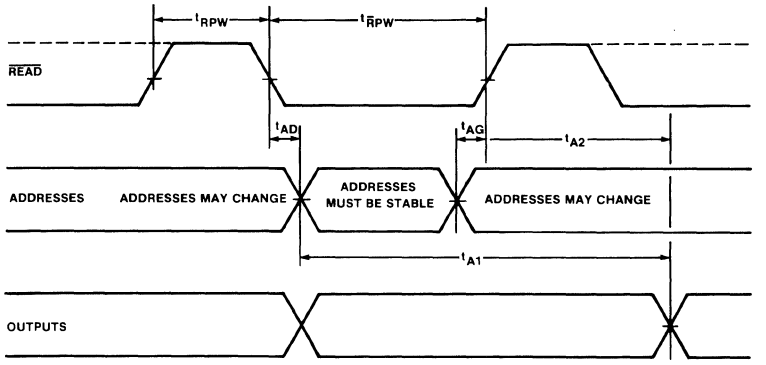
t_{A2}[13]		Output	End of read pulse		200	250	
t_{OE}		Output	Output enable		100	250	

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on +150°C maximum junction temperature and a thermal resistance of 110°C/W junction to ambient.
3. All inputs are protected against static charge.
4. Parameters are valid over operating temperature range unless specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Typical values are at +25°C and typical supply voltages.
8. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to 70°C. Actual input requirements with respect to V_{CC} are V_{IH} = V_{CC} -1.85V and V_{IL} = V_{CC} -4.15V.
9. Outputs open, t_{RPW} = 250ns, $t_{\overline{R}PW}$ = 500ns.
10. During $t_{\overline{R}PW1}$ addresses are decoded and sent to the memory matrix and the stored memory data is moved to the data inputs of the output RS latches. This data is clocked into the output latches at the end (rising edge) of the $\overline{\text{read}}$ pulse. After t_{A2} data appears at the output terminals.
11. During t_{RPW1} data is clocked into the output latches and the address decoders are precharged in preparation for the next cycle.
12. Addresses must be stable within 50ns after the $\overline{\text{read}}$ line falls and must remain stable until at least 50ns before the $\overline{\text{read}}$ line goes high.
13. t_A = 0°C to +70°C.

TIMING DIAGRAM



All times measured from 50% points, for all input waveforms $t_r = t_f = 10ns$.

OBJECTIVE SPECIFICATION 2609-F,I,N

DESCRIPTION

The 2609 is a mask-programmable 8192-bit row select character generator. It contains 128 characters in a 7X9 matrix, and has the capability of shifting certain characters that normally extend below the baseline, such as j, y, g, p and q. Circuitry is supplied internally to effectively lower the whole matrix for this type of character, a feature previously requiring external circuitry.

A 7-bit address code is used to select 1 of the 128 available characters. Each character is defined as a specific combination of logic "1"s and "0"s stored in a 7X9 matrix. When a specific 4-bit binary row select code is applied, a word of 7 parallel bits appears at the output. The rows can be sequentially selected, providing a 9-word sequence of 7 parallel bits per word for each character selected by the address inputs. As the row select inputs are sequentially addressed, the devices will automatically place the 7X9 character in 1 of 2 pre-programmed positions on the 16-row matrix, with the positions defined by the 4 row select inputs.

Complete TTL compatibility is provided, as well as direct interfacing with other NMOS devices, and with CMOS when using a +5V power supply. Maximum access time is 500ns; however, if a device is programmed without shifted characters, the access time is reduced.

FEATURES

- **Static operation—no clocks**
- **Access time: 500ns max**
- **Single 5V power supply**
- **TTL compatible inputs and outputs**
- **Power dissipation: 525mW**
- **N-channel silicon gate technology**
- **Standard 24-pin package**
- **All inputs are capacitive and do not sink or source current**

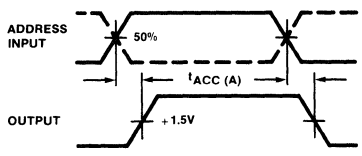
$t_{ACC(RS)}$		Output	Row select		300	500	
P_D	Power dissipation				400	525	mW

NOTES

1. No pullup resistors are required.
2. Capacitances are periodically sampled rather than 100% tested.
3. This is advance information and specifications are subject to change without notice.

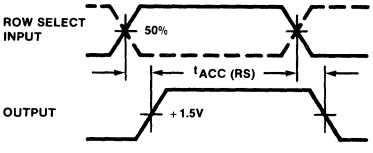
TIMING DIAGRAMS

ADDRESS ACCESS



Address inputs are set in a dc state

ROW SELECT ACCESS



Row select inputs are set in a dc state

MEMORY OPERATION USING POSITIVE LOGIC

(Most positive level = 1, most negative level = 0)

Address

To select 1 of the 128 characters, apply the appropriate binary code to the address inputs (A1-A7).

Row Select

To select 1 of the rows of the addressed character to appear at the 7 output lines, apply the appropriate binary code to the row select inputs (RS1-RS4).

Shifted Characters

These devices have the capability of displaying characters that descend below the bottom line (such as lower case letters j, y, g, p and q). Internal circuitry effectively drops the whole matrix for this type of character. Any character can be programmed to occupy either of the 2 positions in a 7X16 matrix.

Output

For these devices, an output dot is defined as a logic "1" level, and an output blank is defined as a logic "0" level.

MEMORY TIMING DEFINITIONS

$t_{ACC(A)}$ Address Access Time:
The time delay between a change in the address inputs and a corresponding change at the output lines with all other inputs held stable, and with the recommended load.

$t_{ACC(RS)}$ Row Select Access Time:
The time delay between a change in the row select inputs and the appearance of valid information at the output lines, with all other inputs held stable.

DISPLAY FORMAT

Figure 1 shows the relationship between the logic levels at the row select inputs and the character row at the outputs. The 2609 allows the user to locate the basic 7X9 font anywhere in 7X16 array. In addition, a shift-

ed font can be placed anywhere in the same 7X16 array. For example, the basic CN6571 font is established in rows R14-R6. All other rows are automatically blanked. The shifted font is established in rows R11-R3. Thus, while any one character is contained in a 7X9 array, the CN6571 requires a 7X12 array on the CRT screen to contain both normal and descending characters. Other uses of the shift option may require as much as the full 7X16 array, or as little as the basic 7X9 array.

The 2609 can be programmed to be scanned either from bottom to top or from top to bottom. This is achieved through the option of assigning row numbers in ascending or descending count, as long as both the basic font and the shifted font are the same. For example, an up counter will scan the CN6571 from bottom to top.

CUSTOM PROGRAMMING FOR 2609

By programming of a single photomask, the customer may specify the content of this memory. Encoding of the photomask is done with the aid of a computer. Use of the computer provides a quick and efficient way to implement a custom bit pattern, while reducing the cost of implementation.

Information on the general options of the 2609 should be submitted on an Organizational Data Form.

Programming of the memory content should be transmitted to Signetics as completed data encoding sheets. The Data Encoding Sheet Format illustration details the requirements for proper completion of the data encoding sheets.

Three examples are shown to indicate proper character encoding. The following rules apply:

1. Enter the character number in the space provided above each dot matrix. Address 0000000 is used for character number 1, with other character numbers following in the normal binary progression.
2. Indicate the rows to be used in the space provided to the left of each dot matrix. Note that characters may be positioned in either of two 7X9 locations on a 7X16 matrix; however, only 2 positions are allowed per mask option. The character for a given address may occupy only 1 of these positions
3. Column zero is added to the dot matrix on the format sheet for use in indicating shifted characters. If a character is to be shifted, a dot should be entered into the first row of the first (zero) column (see the third example, j).
4. The desired character should be entered in the matrix, using only columns B1-B7.

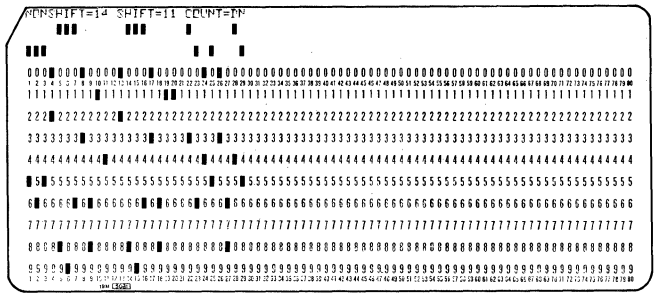
CHARACTER SET UP CARD



CHARACTER SET UP CARD

Card #6

Columns	
1	Type in —, NONSHIFT =
10 & 11	Enter decimal number that corresponds to TOP row of the nonshifted characters
13-18	Type in —, SHIFT =
19 & 20	Enter decimal number that corresponds to TOP row of shifted characters
22-27	Type in —, COUNT =
28 & 29	These columns are used to identify the direction of the numerical count for the subsequent row numbers. When "DN" is punched this adds -1 to the number of top row of character to get the second row; third row is -2; etc.
30-78	Leave blank
79 & 80	Enter truth table number

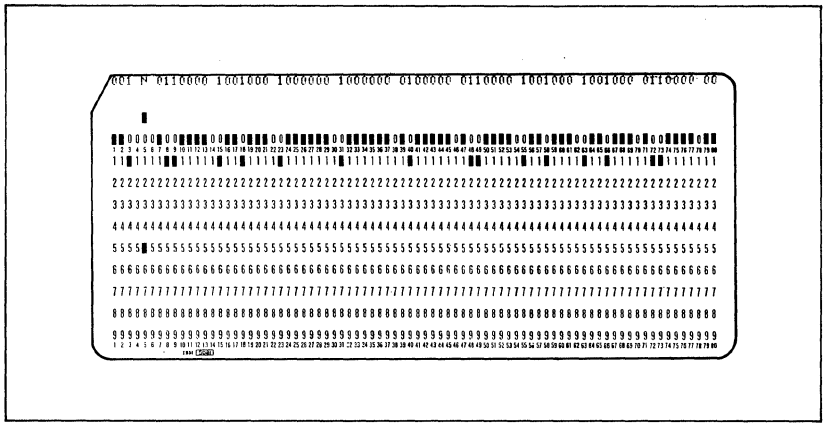
CHARACTER CARDS

This format identifies characters by numerical sequence beginning with 001 (the first character of the set) and ending with 128 (the last character of the set). Address 0000000 is used for character #1, with other characters following in normal binary progression with A_1 the LSB and A_7 the MSB.

Columns	
1-3	Enter decimal character number
4	Leave blank
5	Enter character position: S for shifted, N for nonshifted
6	Leave blank
7-13	Enter contents of the top row of character beginning with the least significant bit (B_1) and ending with the most significant bit (B_7)[A,B]
14	Leave blank
15-21	Enter contents of second row of character (LSB to MSB)
22	Leave blank
23-29	Enter third row
30	Leave blank
31-77	Continue until contents of all 9 rows have been entered
78	Leave blank
79 & 80	Enter truth table number

OBJECTIVE SPECIFICATION 2609-F,I,N

CHARACTER CARD



NOTES

A. An entered dot corresponds to a high voltage output
B. A complete card deck consists of 5 header cards, 1 set up card and 128 character cards

2607-F,I,N

FEATURES

- Static operation—no clocks
- Access time: 450ns max
- Single 5V power supply
- TTL compatible inputs and outputs
- Power dissipation: 525mW
- Tri-state outputs
- Mask programmable chip select for easy word expansion
- N-channel silicon gate technology
- Standard 24-pin package
- Designed for system applications requiring high performance, large bit storage and simple interfacing
- 2 chip selects ($\overline{CS}1$, negative true; $CS2/\overline{CS}2$, either negative true or positive true at mask level)
- Pin for pin compatible with Intel 2708 electrically programmed erasable ROM and Intel 2308/8308 ROM, except only requiring +5V supply
- All inputs capacitive and do not sink or source current

PIN DESIGNATION

PIN NO.	FUNCTION
A_0-A_9	Address inputs
O_1-O_8	Data outputs
CS_1, CS_2	Chip select inputs

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values for T_A = 25°C and typical supply voltages.

INPUT FORMAT

A. For a N words X 8-bit organization only, cards 2 and the following cards should be punched as shown. Each card specifies the 8-bit output of 8 words.

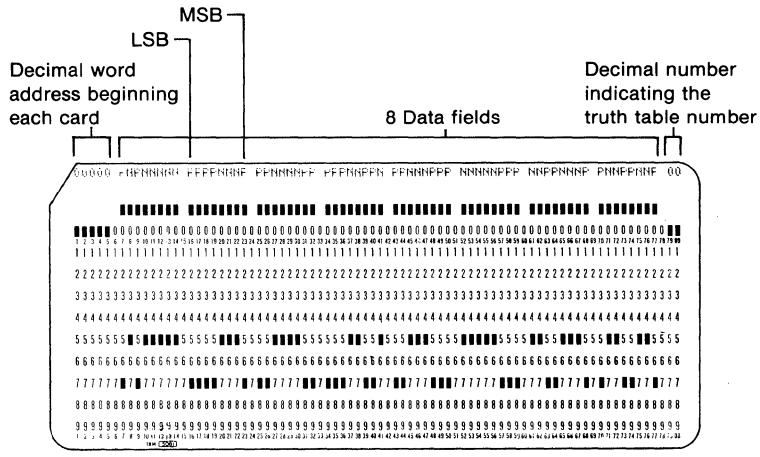
B. Paper Tape Format
The paper tapes which should be used are the:

1. 1" wide paper tape using 7 or 8-bit ASCII code, such as a model 33 ASR teletype produces:

The format requirements are as follows:

1. All word fields are to be punched in consecutive order, starting with word field 0 (all addresses low). There must be exactly N word fields for the NX8 organization.
2. Each word field must begin with the start character B and end with the stop character F. There must be exactly 8 or 4 data characters between the B and F for the NX8 organization.

   NO OTHER CHARACTERS, SUCH AS RUBOUTS, ARE ALLOWED ANYWHERE IN A WORLD FIELD. If in preparing a tape, an error is made, the entire word field, including the B and F must be rubbed out. Within the word field, a P results in a high level output, and an N results in a low level output.
3. Preceding the first word field and following the last word field, there must be a leader/trailer length of at least 25 characters. This should consist of rubout punches (letter key for Telex tapes).
4. Between word fields, comments not containing B's or F's may be inserted. Carriage return and line feed characters should be inserted (as a "comment") just before each word field (or at least between every 4 word fields). When these carriage returns, etc. are inserted, the tape may be easily listed on the teletype for purposes of error checking. The customer may also find it helpful to insert the word number (as a comment) at least every 4 word fields.
5. Included in the tape before the leader should be the customer's complete Telex or TWX number and if more than one pattern is being transmitted, the ROM pattern number.
6. MSB and LSB are the most and least significant bit of the device outputs. Refer to the data sheet for the pin numbers.



COLUMN	DATA
1-5	Punch the 5 digit decimal equivalent of the binary coded location which begins each card. The address is right justified, i.e., 00000, 00008, 00016, etc.
6	Blank

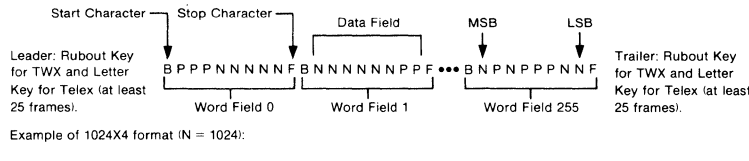
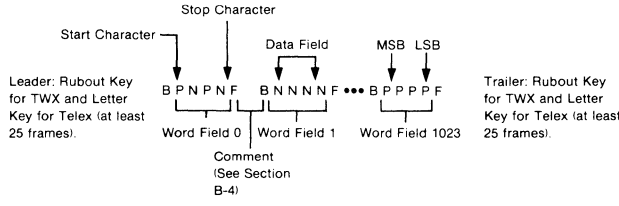
69	Blank
70-77	Data field
78	Blank
79-80	Punch same 2 digit decimal number as in title card.

EXAMPLE OF 256X8 FORMAT (N = 256)



Example of 1024X4 format (N = 1024):



2608-F,I,N • 2608-1-F,I,N

FEATURES

- Static operation—no clocks
- Access time:
  - 2608: 550ns
  - 2608-1: 450ns
- Single 5V power supply and ground power connections
- TTL compatible inputs and outputs
- Power dissipation: 400mW max
- Tri-state outputs
- 4 mask programmable chip selects for easy word expansion
- Low threshold n-channel silicon gate technology which allows ease of use with low voltage logic families such as transistor-transistor logic
- Standard 24-pin package
- Fully decoded

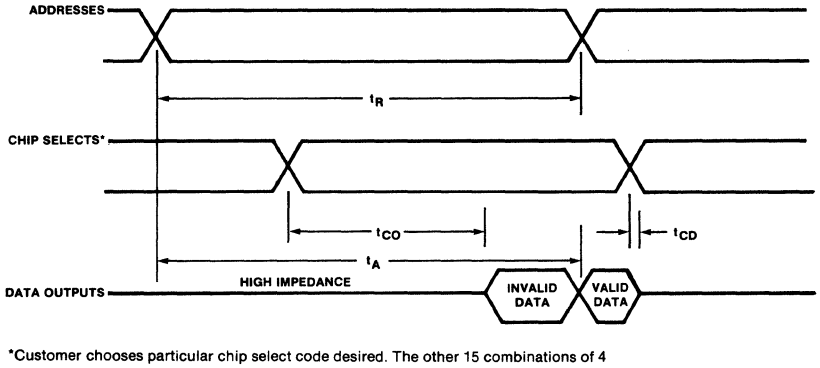
NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operation sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 50° C/W junction to ambient.
3. This product includes circuitry specifically designed for the protection of its internal devices from the damaging effects of excessive static charge. Nonetheless, it is suggested that conventional precautions be taken to avoid applying any voltages larger than the rated maxima.
4. Parameter valid over operating temperature range unless otherwise specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process improvements.
7. Typical values are at +25°C, typical supply voltages, and typical processing parameters.
8. Input levels swing between 0.65V and 2.2V.
9. Input signal transition times are 20ns.
10. Timing reference level is 1.5V.
11. Output load is one standard TTL load plus 130pF.

TIMING DIAGRAM



*Customer chooses particular chip select code desired. The other 15 combinations of 4 chip select inputs disable the outputs.

PIN DESCRIPTION

Addresses

These 10 TTL-compatible inputs are decoded on-chip to select one of 1024 8-bit bytes. Since the 2608 utilizes static logic throughout, a change in addresses results in a change in data as long as the chip is selected. Access time is measured from the point where the last address input became stable. Cycle time and access time are equal in a static ROM design.

Chip Selects

There are 4 TTL-compatible chip select inputs for the 2608. Only 1 combination of these 4 signals enables the chip. The other 15 disable the chip. The particular enabling combination is chosen by the customer and specified on the first punched card of the customer card deck. A positive logic convention is assumed.

Data Outputs

The 8 data outputs are push-pull buffers capable of driving one standard TTL load plus a 130pF load capacitance. These outputs are placed in the high impedance state when any one of the disabling combinations of the chip select inputs is present.

CODING FORMAT

Coding data for the 2608 may be sent to Signetics via punched cards or via a written truth table. Cards are preferred since errors are essentially eliminated.

On receipt of a card deck, Signetics will translate the card deck to a truth table using the Signetics Computer Aided Design (CAD) facility. The truth table will then be sent to the customer for final approval. On receipt of final approval, Signetics will produce masks and proceed with manufacturing.

DATA CARDS

Columns

12—75	Hexadecimal data coding
77—78	Card number (starting 01)
79—80	Total number of cards (32)

Column 12 on the first card contains the hexadecimal equivalent of bits D7 thru D4 of byte 0, while column 13 contains the hexadecimal equivalent of bits D3 thru D0. Columns 14 and 15 contain byte 1, columns 16 and 17 byte 2, and so on.

The first card contains the first 32 bytes. Columns 12 and 13 on the second card will contain byte 32 (the 33rd byte). A total of 32 cards will contain 1024 bytes of 8 bit.

2580-I,N

DESCRIPTION

The 2580 has a Read input which controls the entry of data from the ROM into output latches. Three-state outputs allow OR-tying for implementing larger memories. The outputs are enabled by a programmable 4-bit select code applied to 4 binary chip select terminals.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 110°C/W junction to ambient.
3. All inputs are protected against static charge.
4. Parameters are valid over operating temperature range unless specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Typical values are at +25°C and typical supply voltages.
8. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to 70°C. Actual input requirements with respect to V_{CC} are V_{IH} = V_{CC} -1.85 and V_{IL} = V_{CC} -4.15V.
9. Outputs open, t_{RPW} = 500ns, $t_{\overline{RPW}}$ = 500ns.
10. During t_{RPW} addresses are decoded and sent to the memory matrix, and the stored memory data is moved to the data inputs of the output RS latches. This data is clocked into the output latches at the end (falling edge) of the read pulse. After t_{A2}, data appears at the output terminals.
11. During $t_{\overline{RPW}}$ data is clocked into the output latches and the address decoders are precharged in preparation for the next cycle.
12. Addresses must be stable within 50ns after the read line rises and must remain stable until the read line falls.

TIMING DIAGRAM

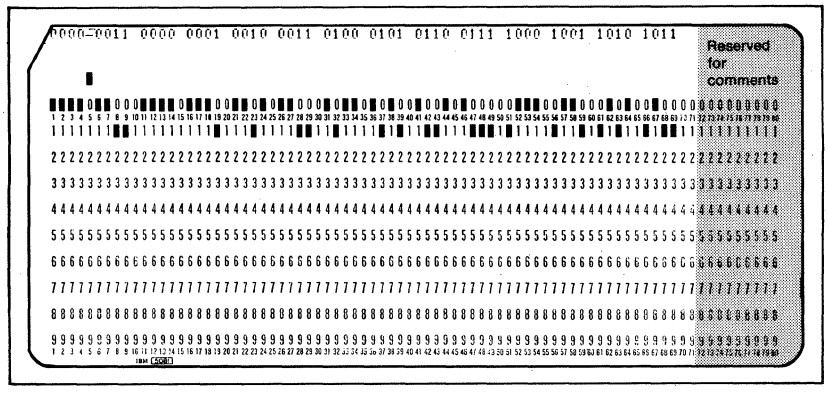
EXAMPLE



CODING FORMAT

Coding data for the 2580 may be sent to Signetics via punched cards or via a written truth table. Cards are preferred since errors are essentially eliminated.

On receipt of a card deck, Signetics will translate the card deck to a truth table using the Signetics Computer Aided Design (CAD) facility. The truth table will then be sent to the customer requesting engineer for final approval. On receipt of final approval, Signetics will cut the rubylith mask and proceed with manufacture.

DATA CARD FORMAT

Columns	
1-4	Decimal equivalent of first data word location Example: 0124 Note: Leading zeros must be used for addresses from 0000 to 0999
5	Dash (—) to separate numbers
6-9	Address of last word on card
10	Blank
11-14	First data word (O_4, O_3, O_2, O_1)
15	Blank
16-19	Second data word
Etc. thru 71	
72-80	Reserved for comments (these columns are ignored by the computer)

Up to twelve (12) data words can be coded on one card. Less than 12 may be used as long as the first and last addresses are given in columns 1-9.

DESCRIPTION

The 2600 outputs appear and remain in a steady state condition until a new address is read. The 16,384 bits are organized as 2048 addresses with 8 output lines. Full address decoding is performed on chip. The 2600's size enhances its usage in any high density, fixed memory application such as logic function generation or microprogramming. Programming of the device is accomplished via the use of one custom mask during device fabrication.

FEATURES

- **Completely static**
- **Utilizes MOS n-channel si-gate technology**
- **Clocked or unclocked operation**
- **Access time: 300/550ns max**
- **Single +5V power supply**
- **2 output enable controls allow:**
  Wire OR'D three-state outputs for expanded memories
  2048X8 or 4096X4 organization
- **All inputs and outputs directly TTL compatible**
- **Pin compatible with EA4600 and EA4900**

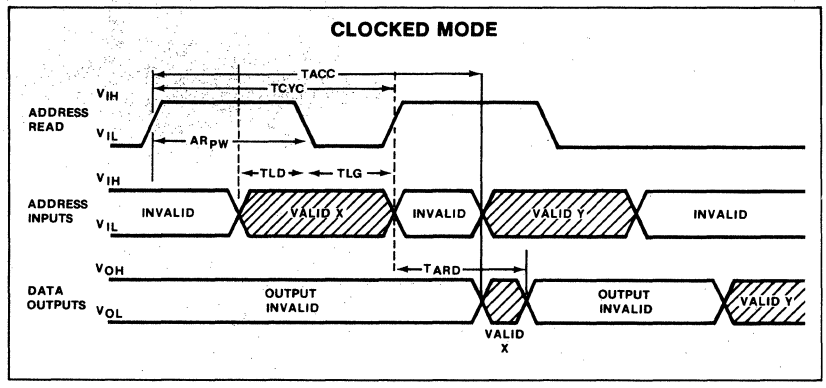
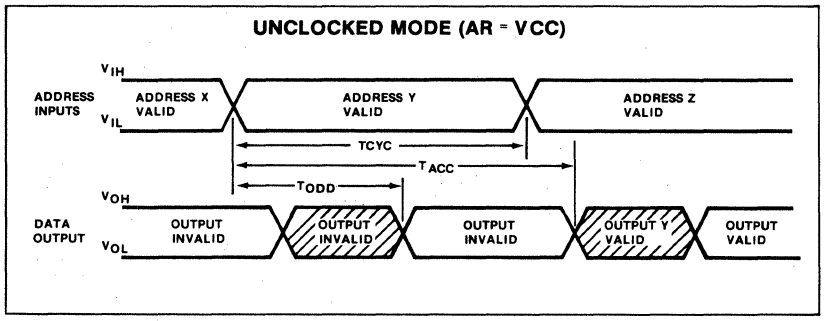
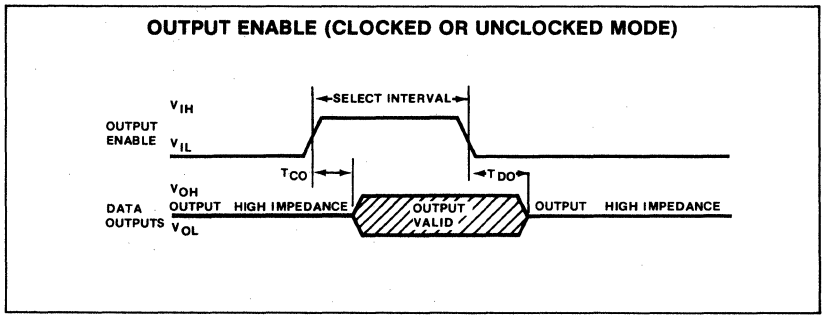
NOTES

1. Stresses more severe than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and operation of the device at any condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. All voltages are referenced to V_{SS}. Positive current flows into the referenced pin.
3. Output load = 50pF plus 1 standard TTL input.

TIMING DIAGRAMS







DEFINITIONS

Clocked Mode

1. T_{CYC}, Cycle Time is the time between successive address read pulses.
2. T_{LD}, Address Lead Time is the minimum time required for the address to be valid prior to the falling edge of the AR pulse.
3. T_{LG}, Address Lag Time is the minimum amount of the time required for the address to remain valid after the falling edge of the AR pulse.
4. T_{ARD}, Address Read to Output Disturb Delay is the minimum time between the AR pulse and the first output transition when a new address is present.

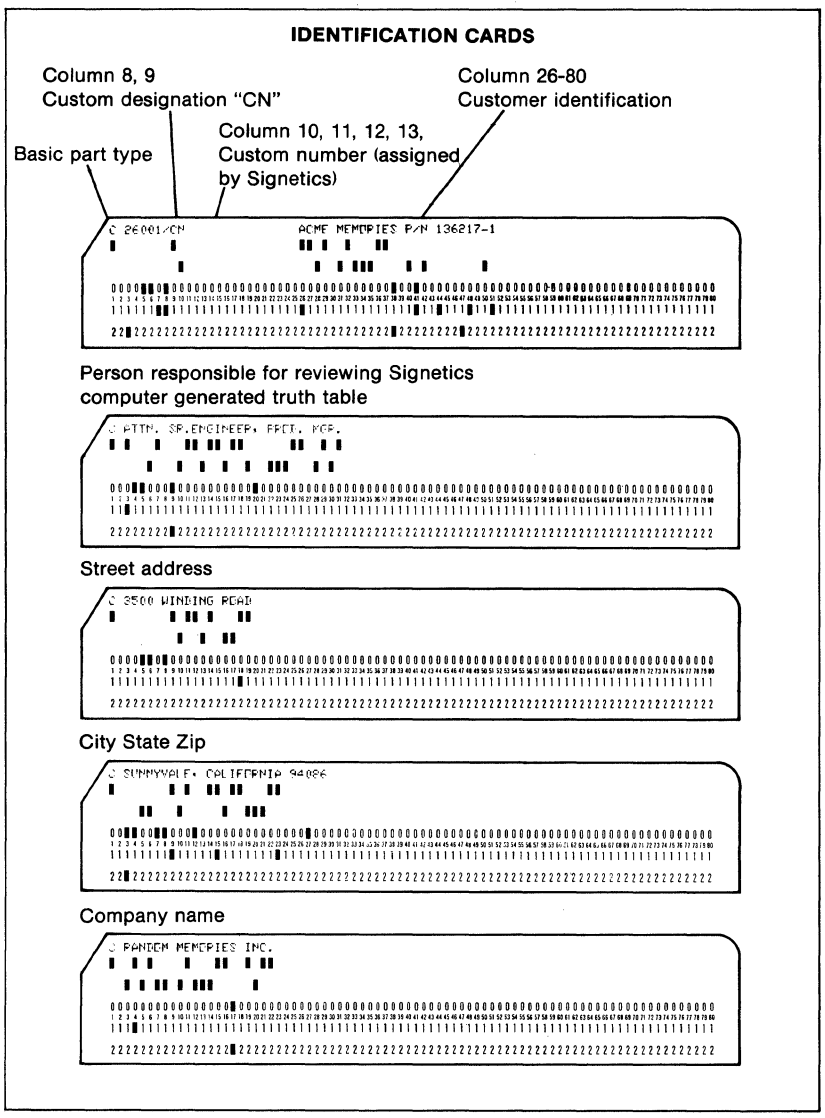
Unclocked Mode

1. T_{CYC}, Cycle Time is the time between application of successive addresses.
2. T_{ACC}, Address to Output Delay Time is the maximum time between a new valid address and the corresponding valid output.
3. T_{ODD}, Output Disturb Delay is the minimum time between the address change and the first output transition.

Output Enable

1. T_{CO}, Output Enable to Output ON Delay Time is the minimum time required for the output, in high impedance state, to become valid after rising edge of the output enable pulse.
2. T_{DO}, Output Enable to Output ON Delay Time is the minimum time required for the output to become high impedance after the falling edge of the output enable pulse.

CARD FORMAT



CUSTOM PATTERN PROGRAMMING INSTRUCTIONS

For the very large MOS ROM now produced by Signetics, a computer aided technique utilizing punched computer cards is employed. This technique requires that the customer supply Signetics with a deck of standard 80 column computer cards describing the data to be stored in the ROM array.

The required punching format is described below. All addresses must be included with their outputs defined. That is, no assumptions are made regarding the bit configuration of undefined outputs. Therefore the customer must submit cards defining the entire ROM contents, even though part or portions of the ROM may be unused (zeros).

Data Card Format for Custom ROMs

Each card is to be punched as follows. Note that for the Signetics 2600, a 3-digit octal number is used for representing the 8 ROM outputs.

Column	
1-4	Punch a 4-digit octal number representing the input address for the first of the 16 output words appearing on this card. (This is the initial address)
5-7	Punch a 3-digit octal number representing the outputs for the initial input address.
8-10	Punch a 3-digit octal number representing the outputs for the initial input address +1.
11-13	Punch a 3-digit octal number representing the outputs for the initial input address +2.
50-52	Punch a 3-digit octal number representing the outputs for the initial input address +15.
69-80	The unique number assigned to this ROM pattern by Signetics must be punched in this field enclosed by blank spaces. This number can be obtained by contacting your local Signetics salesman, representative, or the marketing department at the factory directly.

Each card, therefore, carries (in octal) the initial input address for the 16 output words contained on that card, the 16 output words themselves (in octal) and the unique ROM number. The card must be provided for all possible sequential address locations (in blocks of 16). A 2048 word ROM, therefore, requires 128 cards, with all 16 output words defined on each card.

GENERAL

The Signetics 2600-1 is a high speed 16K MOS ROM that utilizes the n-channel silicon gate technology. The maximum access and cycle time is 300ns. The memory is organized in a 2048X8 configuration at the outputs, however, two separate output enable signals allow the memory to also operate as a 4096X4 organization, where required.

The TTL compatibility of all inputs and outputs including the power requirements of only a single +5V supply, coupled with Signetics' process and design, results in a denser, more economical and more reliable part at the system level, where it counts.

Figure 1 illustrates the 2600-1 block diagram, while Figure 2 illustrates the pin configuration.

The 2600-1 is pin compatible to the EA 4600, but outperforms it by nearly a 2:1 margin in access/cycle times. The Signetics 2600-1 also offers many other advantages over EA's part which will be discussed in the following paragraphs.

2600-1 BLOCK DIAGRAM

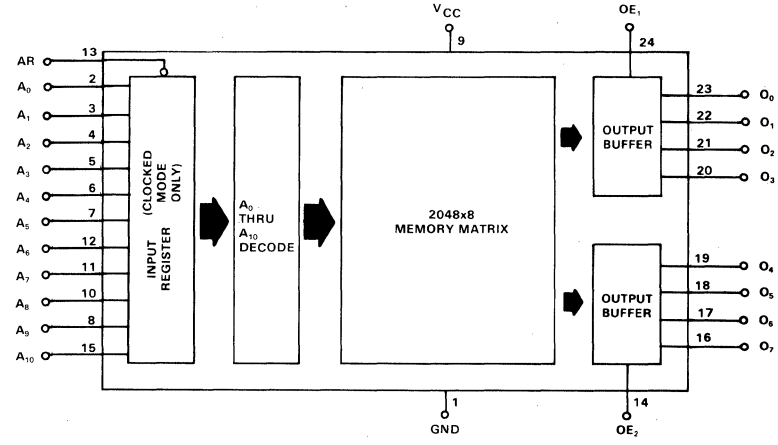


Figure 1

TECHNOLOGY ADVANTAGE

The 2600-1 is fabricated using the MOS n-channel silicon gate process in favor of metal gate to produce a smaller die size and a more reliable part. The Signetics proprietary version of the n-channel was developed to achieve the speed goal of 300ns access as the major speed distribution under worst case temperature, supply voltage and input/output voltage levels. Figure 3 is an illustration of the Signetics manufacturing process advantages.

PERFORMANCE ADVANTAGE

The Signetics 2600-1 is specified at 300ns maximum access/cycle compared with competition's 550ns access/500ns cycle. This means a 45 percent improvement in performance over the EA 4600 equivalent device, at the same maximum power consumption. What this means to the system designer is this:

1. More system timing margins for system currently designed to the EA 4600 ROM. Eliminates critical timing problems and "soft" errors due to worst case data settling times, crosstalk, and coincident timings where several timing pulse edges often line up during the access time to latch the data at the earliest possible time in order to meet system timings.
2. Upgrade current systems using the EA 4600 with the 2600-1 where the ROM is the gating item for performance. The instruction fetch time, for example, can be sped up by 45 percent for program store applications.
3. Anticipate future requirements for faster ROMs. Microprocessors, for example, are going to single +5V supply and becoming progressively faster. A ROM which covers this spectrum means fewer changes at the system level which ultimately translates into valuable development and design time savings and less dollars spent on qualification, documentation, design, etc.

2600-1 PIN CONFIGURATION

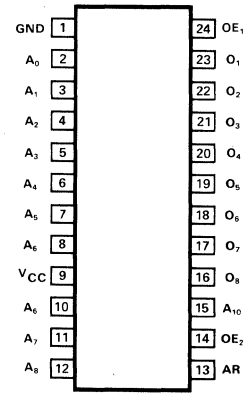

Figure 2

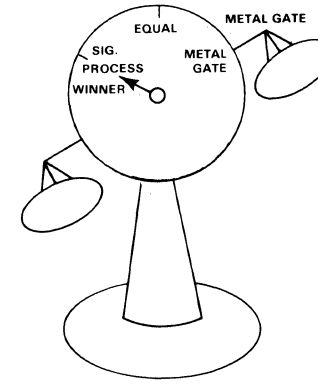
N-CHANNEL SILICON GATE TECHNOLOGY



ADVANTAGES

Smaller Die
Higher Yield
Lower Production Cost/Die
Better Reliability
Gate Oxide Protection
Self Aligning Gates
Lower Internal Capacitance

Figure 3

SPECIFICATION ADVANTAGE

Power Supply Requirements

The Signetics 2600-1, like the EA 4600, operates from a single +5V supply and both

specify the supply current I_{CC} = 115mA maximum. The big difference is the speed/power ratio. Table 1 shows this difference.

Normalized, this ratio becomes 1 for the Signetics 2600-1 and 1.8 for the EA 4600. The 2600-1 is, therefore, nearly two times more efficient with the same maximum power consumption of 603mW (115mA X 5.25V). To the system designer this means:

1. No change in power supply ratings is required when replacing or upgrading systems currently using EA 4600's with Signetics 2600-1's, although the most performance improvement is almost double that over EA's part.
2. Cost savings in implementing noise suppression techniques (additional bypass capacitors, bigger ground/power PC traces, and bus bars) where multiple ROM chips are employed for a given speed of operation.

Signetics 2600-1	$\frac{300ns}{115mA}$ = 2.6 = 1 normalized
EA 4600	$\frac{550ns}{115mA}$ = 4.78 = 1.8 normalized

Table 1 COMPARISON OF POWER SUPPLY REQUIREMENTS

	PARAMETER	SIGNETICS 2600-1	EA 4600	COMMENTS
AR_{PW}	Address read pulse width	100ns min.	300ns min.	Signetics 2600-1 is twice the speed.
T_{CYC}	Cycle time	300ns min.	500ns min.	Signetics 2600-1 is twice the speed.
T_{ACC}	Address to output delay	300ns max.	550ns max.	Signetics 2600-1 is 250ns faster.
T_{LD}	Address lead time	50ns min.	100ns min.	Signetics 2600-1 has 100ns margin over EA 4600.
T_{LG}	Address lag time	100ns min.	150ns min.	Signetics 2600-1 has 100ns margin over EA 4600.
T_{ARD}	Address read to output disturb	0ns min.	75ns min.	No timing skews

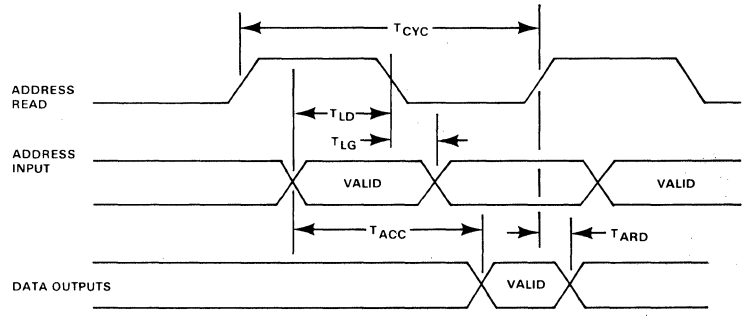
Table 2 CLOCKED MODE TIMING COMPARISON

Timing Requirements

The 2600-1 is capable of operation in the fully static unclocked mode or the clocked mode. The difference is that in clocked mode, the input address to the ROM is latched internally, controlled by the Address Read (AR) input signal, thereby holding the output data valid until the AR signal allows the next address to be propagated. If it is desired that the output data changes with the input addresses, the Address Read signal is not used and is tied to V_{CC}. It is also possible to operate in the clocked mode during other times by controlling the AR input signal.

1. *Clocked Mode*
   In the clocked mode of operation, the Address Read (AR) input signal controls the input address latches similar to a clock controlling a D-latch where the contents of this set of latches (the address) selects the corresponding eight bits of data which become out 0 through out 7. As long as AR is held high, the input addresses are allowed to propagate through the latches. If the addresses change, the address latches will reflect this change and the selection of the corresponding data bits begins. However, when AR is brought to the low level, the addresses are latched to the state of the address lines prior to the negative transition of AR. There are minimum set-up and hold time requirements indicated by TLD (address lead time) and TLG (address lag time). They are the minimum times the address must be valid before and after the falling edge of the AR signal. The 2600-1 requires TLD of 50ns and TLG of 100ns compared to EA's 100ns and 150ns, respectively. This means that for the address to be latched (thereby the output data is effectively latched) it need only be present in a given cycle for 150ns compared to EA's requirement of 250ns. This frees up the address bus for an extra 100ns where other operations may take advantage of the bus. A timing diagram for the clocked mode is shown in Figure 4, while Table 2 is a competitive comparison.

CLOCKED MODE TIMING



DEFINITIONS

1. T_{CYC} Cycle Time—The time between successive address read pulses.
2. T_{LD} Address Lead Time—The minimum time required for the address to be valid prior to the falling edge of the AR pulse.
3. T_{LG} Address Lag Time—The minimum amount of the time required for address to remain valid after the falling edge of the AR pulse.
4. T_{ARD} Address Read to Output Disturb Delay—The minimum time between the AR pulse and the first output transition when a new address is present.

Figure 4

The clocked mode is useful when cycle time is greater than the minimum cycle where, for example, in common bussed lines it is desirable to free the bus up as quickly as possible so that it may be used to initiate another device between memory accesses. Using the ROM in the clocked mode therefore eliminates the need for a set of input address latches.

2. *Unclocked Mode*
   The 2600-1 is fully static allowing it to be operated in the unclocked mode. That is, the output data always reflects the stored data at the address location of the input address delayed by the access time when the address is valid for the minimum specified time. The AR input is held high when it is desired to operate in the unclocked mode.

   The Signetics 2600-1 output will become valid 300ns from address valid. There is no timing skew between the minimum cycle and the maximum access times. Figure 5 shows the unclocked mode timing diagram and Table 3 presents a competitive comparison.

Output Flexibility

The 2600-1 is configured as a 2048X8 bits memory, however because there are separate output enable control signals for the lower and upper 4 bits of data out, the corresponding output lines may be OR-tied to achieve a 4096X4-bit organization. The output enable signals (OE_1 and OE_2) are then used as A_{11} and $\overline{A}_{11}$. Figure 6 illustrates the 4096X4 organization.

For applications that require the 8 bits of output data to be multiplexed onto a 4-bit bus, the Output Enable signal (OE_1 and OE_2) must be timed serially so as not to garble the output data. Figure 7 illustrates the 2048X8 organization.

Figure 8 shows the turn-on and turn-off timing diagrams. The turn-on and the turn-off delay times dictate the minimum time required to strobe data onto the bus.

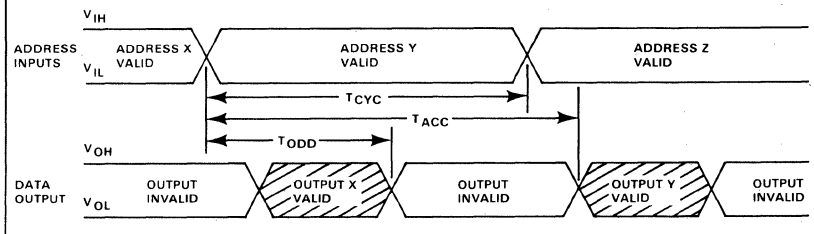
It is desirable to have as quick a response as possible in order to minimize these overhead delays.

The 2600-1 has 550ns (TCO + 2 TDO) of overhead while the EA 4600 has 100ns of overhead. The bus is in an indeterminable state during this time period and cannot be used to transmit information.

	PARAMETER	SIGNETICS 2600-1	EA 4600	COMMENTS
T_{ACC}	Address to output delay	300ns max.	500ns max.	Signetics 2600-1 is 200ns faster.
T_{CYC}	Cycle time	300ns min.	500ns min.	Signetics 2600-1 is twice the speed.
T_{ODD}	Output disturb delay	0ns min.	75ns min.	

Table 3 UNCLOCKED MODE TIMING COMPARISON

UNCLOCKED MODE TIMING DIAGRAM (AR TIED TO V_{CC})



DEFINITIONS

1. T_{CYC} Cycle Time—The time between application of successive addresses.
2. T_{ACC} Address to Output Delay Time—The maximum time between a new valid address and the corresponding valid output.
3. T_{ODD} Output Disturb Delay—The minimum time between the address change and the first output transition.

PARAMETER	SIGNETICS 2600-1	EA 4600	COMMENTS
Technology	N-channel, silicon gate	N-channel, metal	Smaller, more reliable die with Signetics process
Performance Access	300ns	550ns	Signetics 2600-1 is nearly two times faster than EA's 4600.
Cycle	300ns	500ns	
Power Supply	+5V	+5V	Both are fully TTL compatible
Power Consumption	603mW max.	603mW max.	Signetics' 2600-1 has the same power consumption with twice the performance.
Output Delay			
TCO	150ns max.	300ns max.	Signetic's 2600-1 has less overhead time.
TDO	200ns max.	400ns max.	Faster throughout for OR-tied multiple 8-bit output

Table 4 SIGNETICS 2600-1 VERSUS EA 4600—SUMMARY

DESCRIPTION

The Signetics 2616 is a 16,384-bit static MOS read-only memory organized as 2048 words by 8 bits. This ROM is designed for memory applications where high performance, large bit storage, and simple interfacing are important design objectives.

The inputs and outputs are fully TTL compatible. This device operates with a single 5V power supply. The three chip select inputs are programmable. Any combination of active high or low level chip select inputs can be defined by the designer and the desired chip select logic level is fixed during the masking process. These three programmable chip select inputs, as well as OR-tie compatibility on the outputs, facilitates easy memory expansion.

The 2616 read-only memory is fabricated with n-channel silicon gate technology. This technology provides the designer with high performance, easy-to-use MOS circuits. Only a single 5V power supply is needed and all devices are directly TTL compatible.

FEATURES

- **Single 5V power supply**
- **Guaranteed 350/450ns access time**
- **Directly TTL compatible—all inputs and outputs**
- **Three programmable chip select inputs for easy memory expansion or no connection option**
- **Three-state output—OR-tie capability**
- **Fully decoded—on chip address decode**
- **Inputs protected—all inputs have protection against static charge**

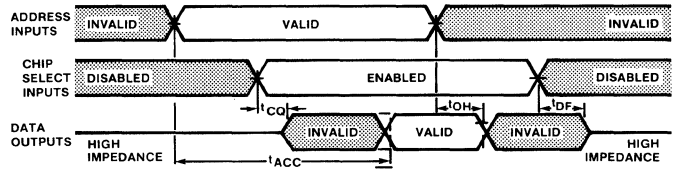
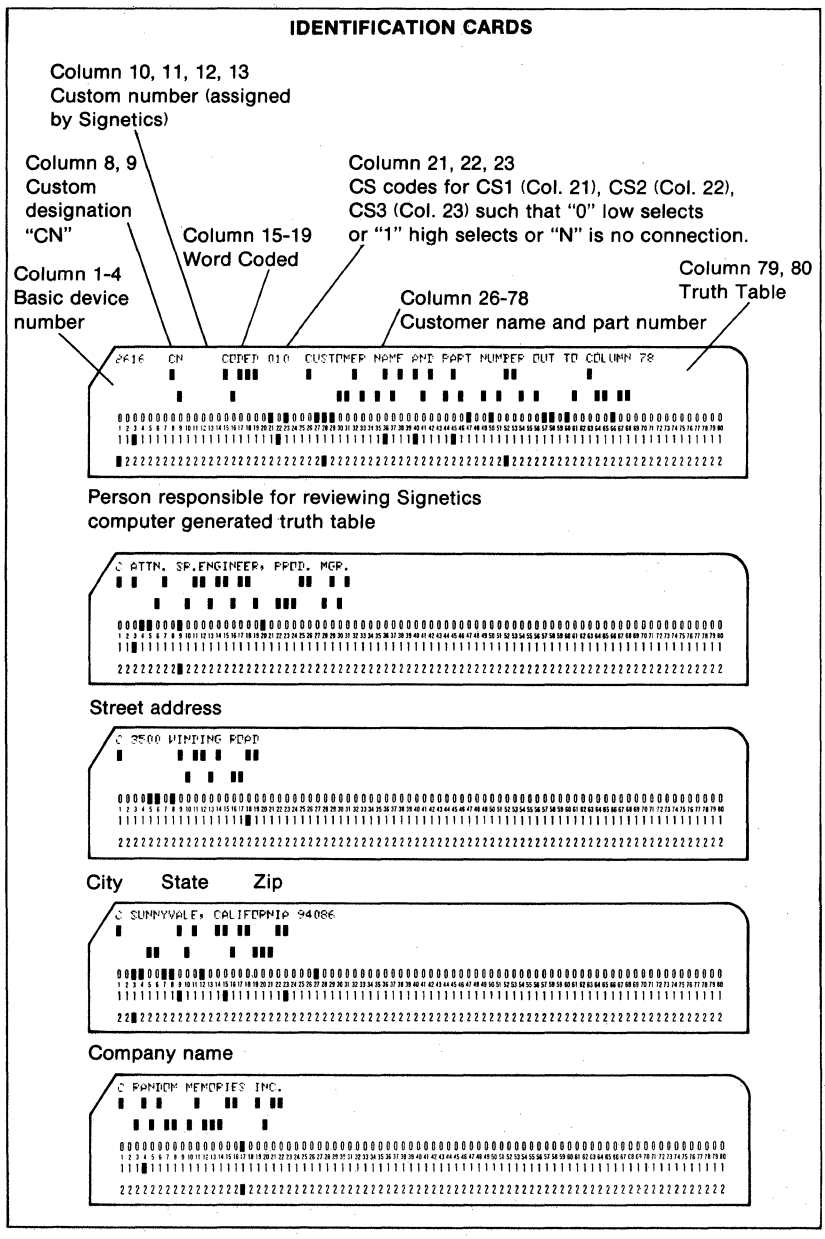
NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Input levels that swing more negative than -0.5V will be clamped and may cause damage to the device.
3. This parameter is periodically sampled and is not 100% tested.

TIMING DIAGRAM



CARD FORMAT



PROGRAMMING INSTRUCTIONS

2616

All Signetics Read Only Memories utilize computer aided techniques to manufacture and test custom bit patterns. The custom bit pattern is supplied on standard 80 column computer cards in the format described below.

All address and related output patterns must be completely defined. Each deck of cards defining a specific ROM bit pattern consists of:

A. Title card
B. Comment cards
C. Data cards

For the user's convenience the data cards consisting of address and bit patterns can be specified in any one of three formats:

1. The hexadecimal format, where each data card carries (in hexadecimal) the initial input address for the 32 output words contained on that card, the 32 output words themselves (in hexadecimal) and the ROM truth table number. An N word ROM, therefore, requires n/32 cards, with all 32 output words defined on each card.
2. The octal format, where each data card carries (in octal) the initial input address for the 16 output words contained on that card, the 16 output words themselves (in octal) and the ROM truth table number. An N word ROM, therefore, requires N/16 cards, with all 16 output words defined on each card.
3. The binary format, where each data card carries (in decimal) the initial input address for the 8 output words contained on that card, the 8 output words themselves (in binary) and the ROM truth table number. An N word ROM, therefore, requires N/8 cards, with all 8 output words defined on each card.

Positive logic is used on all input cards; a logic "1" is the most positive voltage level and a logic "0" is the most negative level.

Title Card

COLUMN	INFORMATION
1-4	Signetics Part Number, that is, 2600, 2616, 2620, etc.
7-13	Leave blank _____ Pattern Number to be assigned by Signetics.
15-19	Punch the letters "CODED"
21	CS1/$\overline{CS1}$/NC Chip Select Logic Level (If low selects chip, punch "0"; if high selects chip, punch "1"; if no connection, punch "N".)

PROGRAMMING INSTRUCTIONS

t_{CE}		Output	Chip enable			150		

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated on a +150°C maximum junction temperature and a thermal resistance of 110°C/W junction to ambient.
3. All inputs are protected against static charge.
4. Parameters are valid over operating temperature range unless specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Typical values at +25°C and typical supply voltages.
8. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to +70°C. Actual input requirements with respect to V_{CC} are $V_{IH} = V_{CC}$ -1.85V and $V_{IL} = V_{CC}$ -4.15V.

EXAMPLE 'S'

CHARACTER ADDRESS

	COLUMN ADDRESS					
	A_4	A_5	A_6	A_7	A_8	A_9
ASCII CHARACTER	1	1	0	0	1	0

ORGANIZATION AS CHARACTER GENERATOR

A 6-bit binary address (A_4-A_9) selects 1-of-64 matrix characters arranged 5 dots horizontally and 8 dots vertically. A 3-bit binary address code (A_1-A_3) selects 1 of 8 rows. Five outputs display a complete row of the character matrix (see Row Address Character Format). The devices may also be used in pairs to provide 9X7 and 10X8 vertical scan formats.

ORGANIZATION AS ROM

For a straight 512X5 ROM, the 5 outputs will display any one of 512 5-bit stored words corresponding to a 9-bit address applied to A_1-A_9.

CUSTOM DEVICES

For unique custom memory patterns, this form should be used to transmit coding instructions. The nomenclature for a custom device will consist of the basic product type followed by a unique CM number assigned by Signetics, i.e, 2513N/CM2141.

- Programming with punched cards:
  For maximum accuracy and minimum cost and turn-around time, the truth table should be transmitted to Signetics in the form of punched cards according to the format indicated on the following pages.

VERIFICATION

Upon receipt of either punched card or written truth table information, Signetics will prepare a computer tabulation of the instructions and return to the address indicated. If errors are detected, they should be transmitted to Signetics as quickly as possible.

LOGIC CONVENTION

Logic "1"s or blackened squares in the truth table will result in high output from the indicated output terminal, i.e., 3.2V minimum. Similarly, a "1" address input level is interpreted as 3.2V minimum.

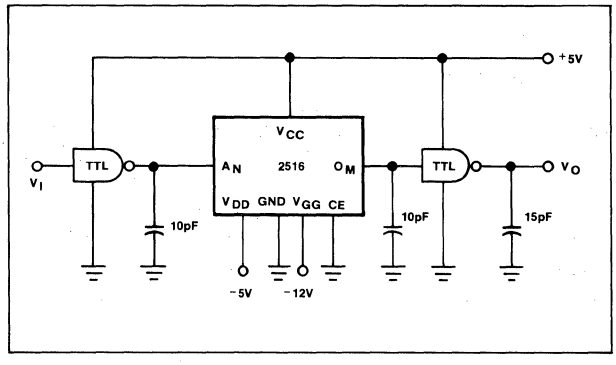
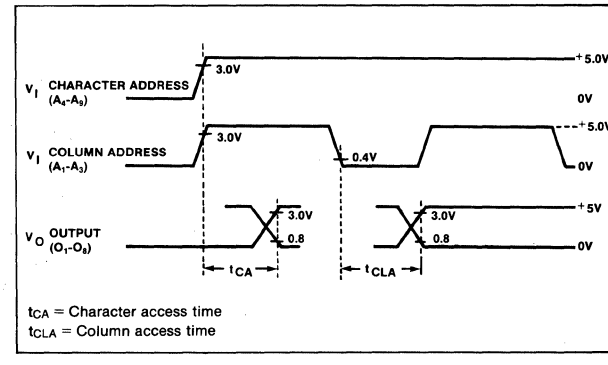
7. Typical values are at +25°C and typical supply voltages.
8. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to +70°C. Actual input requirements with respect to V_{CC} are V_{IH} = V_{CC} -1.85V and V_{IL} = V_{CC} -4.15V.
9. V_{CC} tolerance is ±5%. Any variation in actual V_{CC} will be tracked directly by V_{IL}, V_{IH} and V_{OH}, which are stated for a V_{CC} of exactly 5V.

TEST LOAD CIRCUIT

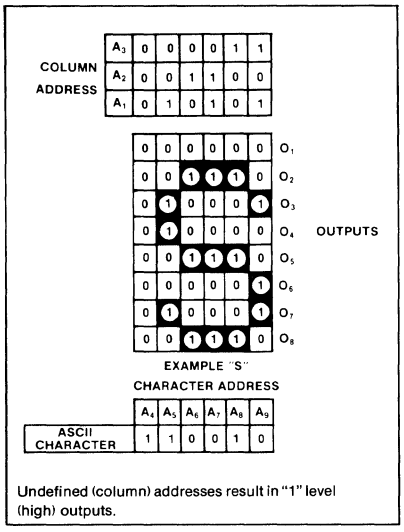


TIMING DIAGRAM



t_{CA} = Character access time
t_{CLA} = Column access time

CHARACTER FORMAT



Undefined (column) addresses result in "1" level (high) outputs.

APPLICATIONS DATA

Output Interfacing Notes

The tri-state outputs on this device exhibit 3 states:

1. "1" = Low impedance to +5V
2. "0" = Low impedance to -5V
3. Off = High impedance, 10m

The off state is controlled by the chip enable control input.

Custom ROM Organizations

The 2516 is a static ROM with a total 64X6X8-bit capacity. This allows a standard 5X7 font to be encoded in the ROM, e.g., the 2516/CM2150 ASCII font standard product. A custom coding configuration may make use of the full 6X8 dot matrix if desired.

ORGANIZATION AS CHARACTER GENERATOR

A 6-bit binary address (A_4-A_9) selects 1-of-64 matrix characters arranged 6 dots horizontally and 8 dots vertically. A 3-bit binary address code (A_1-A_3) selects 1 of 6 columns. Eight outputs display a complete column of the character matrix.

STANDARD PATTERN

A standard ASCII Character Font is available for the 2516. This device (2516N/CM2150) may be used for ASCII character generation or for device evaluation.

CUSTOM DEVICES

For unique custom memory patterns, the following formats should be used to transmit coding instructions. The nomenclature for each custom device will consist of the basic product type followed by a unique CM number assigned by Signetics, i.e., 2516N/CM2151.

- Programming with punched cards:
  For maximum accuracy and minimum cost and turn-around time, the truth table should be transmitted to Signetics in the form of punched cards according to the format indicated on the following pages.
- Programming with written truth table:
  When punched data cards cannot be supplied, the truth table may be transmitted in written form using the attached blank truth table.

VERIFICATION

Upon receipt of either punched card or written truth table information, Signetics will prepare a computer tabulation of the instructions and return to the address indicated. If errors are detected, they should be transmitted to Signetics as quickly as possible.

LOGIC CONVENTION

Logic "1"s of blackened squares in the truth table will result in high output from the indicated output terminal, i.e., +3.6V minimum. Similarly, a "1" address input level is interpreted as +3.2V minimum.

Undefined addresses result in "1" level outputs.

2526-I,N

DESCRIPTION

The 2526 high speed ROM may be organized as 64X9X9 for use as a character generator, or as a 512X9 ROM for general purpose use. A read input controls the entry of data from the ROM into output latches. Three-state outputs allow OR-tying for implementing large memories. Output enable controls the 9 output devices without affecting address circuitry.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 110°C/W junction to ambient.
3. All inputs are protected against static charge.
4. Parameters are valid over operating temperature range unless specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Typical values are at +25°C and typical supply voltages.
8. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to 70°C. Actual input requirements with respect to V_{CC} are V_{IH} = V_{CC} - 1.85V and V_{IL} = V_{CC} - 4.15V.
9. Outputs open, t_{RPW} = 250ns, $t_{\overline{R}PW}$ = 500ns.
10. During t_{RPW1} addresses are decoded and sent to the memory matrix and the stored memory data is moved to the data inputs of the output RS latches. This data is clocked into the output latches at the end (rising edge) of the $\overline{\text{read}}$ pulse. After t_{A2}, data appears at the output terminals.
11. During t_{RPW1} data is clocked into the output latches and the address decoders are precharged in preparation for the next cycle.
12. Addresses must be stable within 50ns after the $\overline{\text{read}}$ line falls and must remain stable until at least 50ns before the $\overline{\text{read}}$ line goes high.
13. t_A = 0°C to +70°C.

1702A-I

DESCRIPTION

The 1702A is ideally suited for uses where fast turn-around and pattern experimentation are important. The device undergoes complete programming and functional testing on each bit position prior to shipment, thus insuring 100% programmability.[1]

The 1702A is packaged in a 24-pin dual in-line package with a UV transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written into the device.

The 1702A is fabricated with silicon gate technology. This low threshold technology allows the design and production of high performance MOS circuits and provides a higher functional density on a monolithic chip than conventional MOS technologies.

FEATURES

- **Fast programming for all 2048 bits: 2 minutes**
- **All 2048 bits guaranteed programmable**
- **100% factory tested**
- **Fully decoded**
- **Static MOS: No clocks required**
- **Inputs and outputs DTL and TTL compatible**
- **Tri-state output: OR-tie capability**
- **Simple memory expansion**
- **Chip select input lead**

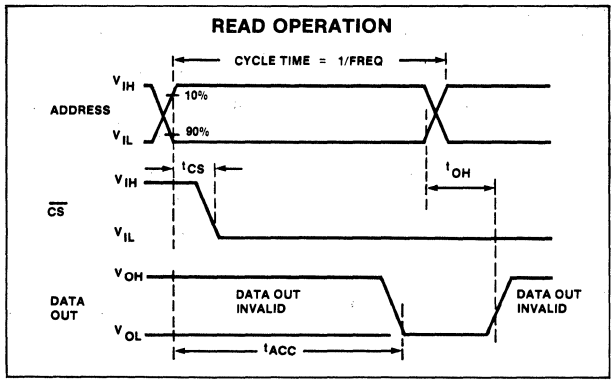
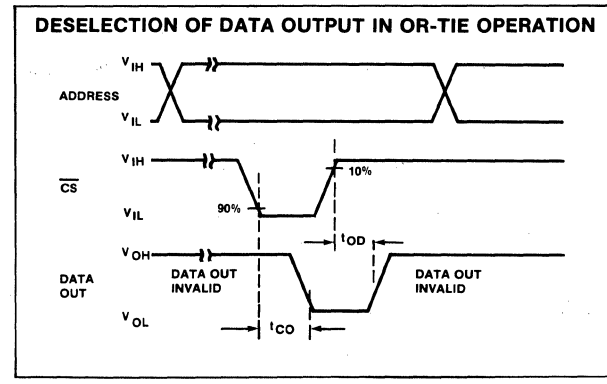
t_{CS}		Output	Chip select			100	ns
t_{CO}		Output	$\overline{CS}$			900	ns
t_{OD}	Output deselect					300	ns

NOTES

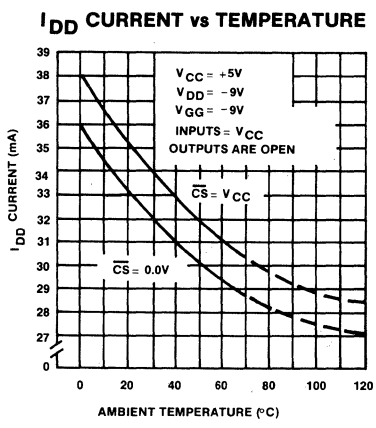
1. Signetics liability shall be limited to replacing any unit which fails to program as desired.
2. The external lead connections to the 1702A differ depending on whether the device is being programmed or used in read mode. In the programming mode, the data inputs 1-8 are pins 4-11 respectively.
3. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
4. Typical values are T_A = 25°C and at typical supply voltages.
5. This parameter is perdiodically sampled and is not 100° tested.

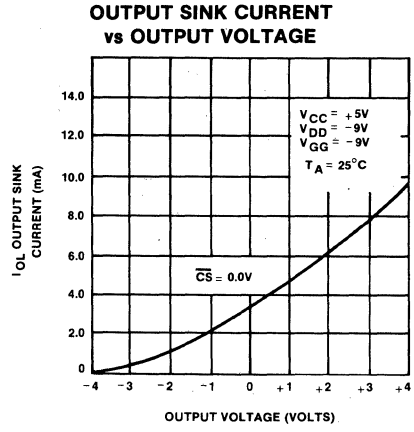
TIMING DIAGRAMS

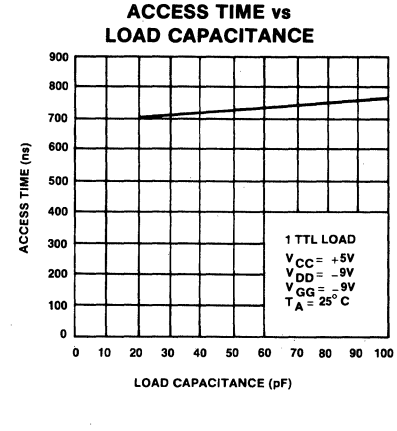


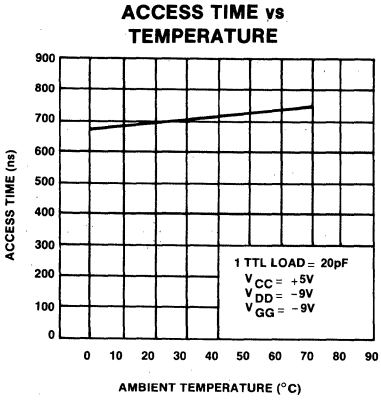


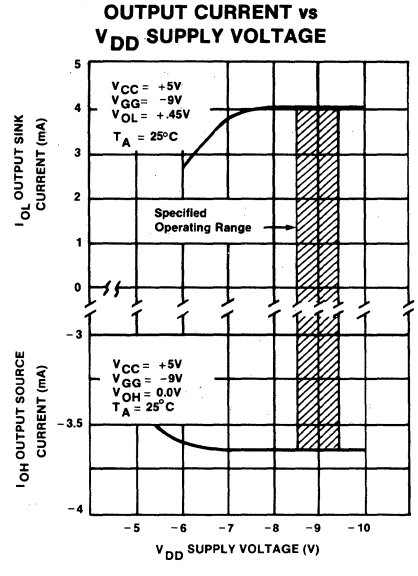
TYPICAL PERFORMANCE CHARACTERISTICS

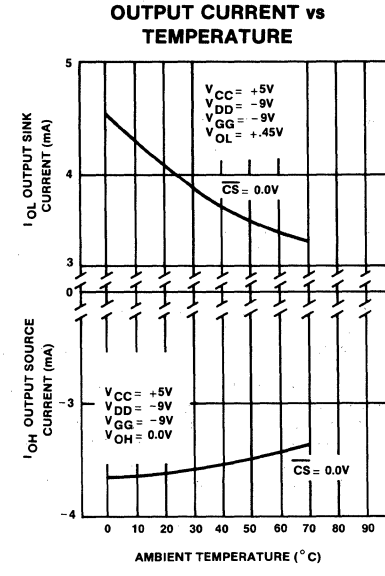












DC AND OPERATING PROGRAMMING CHARACTERISTICS

T_A = 25°C, V_{CC} = 0V, V_{BB} = +12V ± 10%, $\overline{CS}$ = 0V unless otherwise specified.

PARAMETER		TEST CONDITIONS	LIMITS			UNIT
			Min	Typ	Max	
	Input voltage					V
V_{IHP}	High			0.3

I_{LI2P}	Program and V_{GG}	V_{IN} = -48V		10		
I_{BB}	V_{BB} supply[1]		10	100		
I_{DDP}	Peak I_{DD} supply[2]	$V_{DD} = V_{prog}$ = -48V, V_{GG} = -35V	200	300		

AC PROGRAMMING CHARACTERISTICS

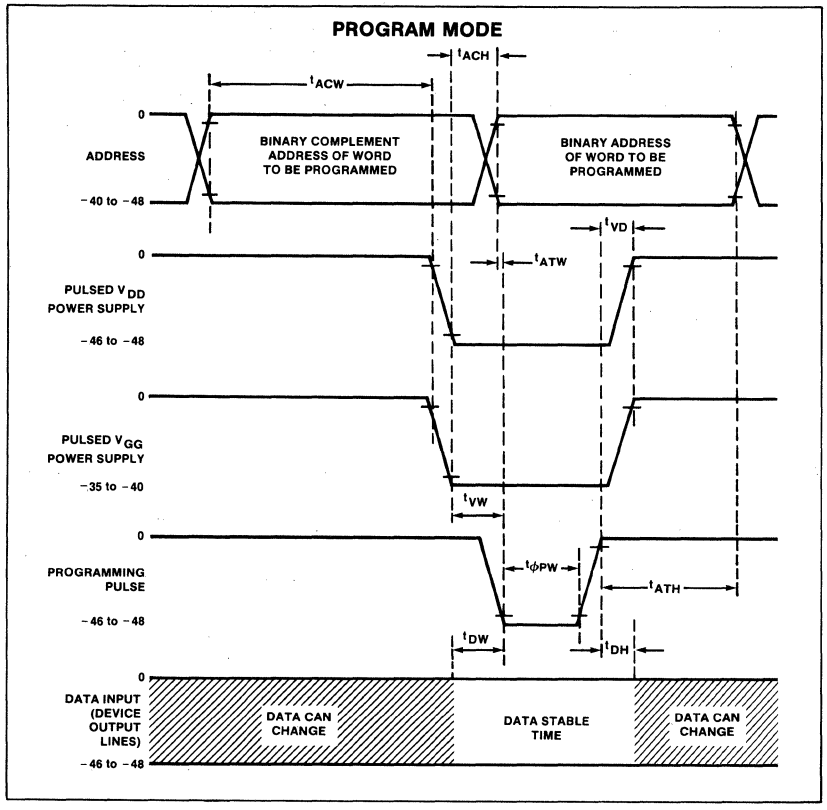
T_A = 25°C, V_{CC} = 0V, V_{BB} = +12V ± 10%, $\overline{CS}$ = 0V, unless otherwise specified, Input rise and fall times = < 1μs unless otherwise specified.

PARAMETER		TO	FROM	TEST CONDITIONS	LIMITS			UNIT
					Min	Typ	Max	
	Duty cycle (V_{DD}, V_{GG})						20	%
$t_{\phi PW}$	Program pulse width			$V_{DD} = V_{prog}$ = -48V, V_{GG} = -35V			3	ms
	Setup and hold time							μs
t_{DW}	Setup time	Programming pulse	Data		25			
t_{DH}	Hold time	Data	Programming pulse		10			
t_{VW}	Setup time	Programming pulse	Pulsed power supply		100			
t_{VD}	Hold time	Pulsed power supply	Programming pulse		10		100	
t_{ACW}	Setup time[3]	Pulsed V_{DD} power supply	Address		25			
t_{ACH}	Hold time[3]	Address	Pulsed V_{DD} power supply		25			
t_{ATW}	Setup time	Programming pulse	Address		10			
t_{ATH}	Hold time	Address	Programming pulse		10			

NOTES

1. The V_{BB} supply must be limited to 100mA current to prevent damage to the device.
2. I_{DDP} flows only during V_{DD}, V_{GG} on time. I_{DDP} should not be allowed to exceed 300mA for greater than 100μs. Average power supply current I_{DDP} is typically 40mA at 20% duty cycle.
3. All 8 address bits must be in the complement state when pulsed V_{DD} and V_{GG} move to their negative levels. The addresses (0-255) must be programmed as shown in the timing diagram.

TIMING DIAGRAM



OPERATION IN PROGRAM MODE

Initially, all 2048 bits of the ROM are in the low state. Information is introduced by selectively programming high's in the proper bit locations.

Word Address selection is done by the same decoding circuitry used in the Read mode (see dc Electrical Characteristics table). All 8 address bits must be in the binary complement state when pulsed V_{DD} and V_{GG} move to their negative levels. The addresses must be held in their binary complement state of a minimum of 25μs after V_{DD} and V_{GG} have moved to the negative levels. The addresses must then make the transition to their true state a minimum of 10μs before the program pulse is applied.

The 8 output terminals are used as data inputs to determine the information pattern in the 8 bits of each word. A low data input level (-48V) will then program a "1" and a high data input level (ground) will leave a "0" (see dc and Operating Programming Characteristics table). All 8 bits of one word are programmed simultaneously by setting the desired bit information patterns on the data input terminals.

During the progamming, V_{GG}, V_{DD} and the program pulse are pulsed signals. We recommend the P+4P smart programming routine where P = the number of programming pulses for data to read true; P max = 256; and 4P = the number of over programming pulses applied.

ERASING PROCEDURE

The 1702A may be erased by exposure to high intensity short-wave ultraviolet light at a wavelength of 2537A°. The recommended integrated dose (i.e., UV intensity x exposure time) is 6W-sec/cm^2. Examples of ultraviolet sources which can erase the 1702A in 10 to 20 minutes are the Model UVS-54 and Model S-52 short-wave ultraviolet lamps manufactured by Ultra-Violet Products, Inc., 5114 Walnut Grove Avenue, San Gabriel, Ca. The lamps should be used without short-wave filters, and the 1702A to be erased should be placed about one inch away from the lamp tubes.

4096-BIT ERASABLE AND ELECTRICALLY REPROGRAMMABLE MOS ROM (512X8) 2704
8192-BIT ERASABLE AND ELECTRICALLY REPROGRAMMABLE MOS ROM (1024X8) 2708

DESCRIPTION

The 2708/2704 are high speed Erasable and Electrically Reprogrammable ROMs (EPROM) ideally suited where fast turn around and pattern experimentation are important requirements.

The 2708/2704 are packaged in a 24 pin dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written into the device.

A pin for pin mask programmed ROM, the Signetics 2607, is available for large volume production runs of systems initially using the 2708.

The 2708/2704 is fabricated with the time proven n-channel silicon gate technology.

FEATURES

- **Organization:**
  2708: 1024X8
  2704: 512X8
- **Fast programming-100 sec. typ for all 8K bits**
- **Low power during programming**
- **Access time: 450ns**
- **Standard power supplies 12V, ±5V**
- **Static—no clocks required**
- **Inputs and outputs TTL compatible during both read and program modes**
- **Three-state output—OR-tie capability**

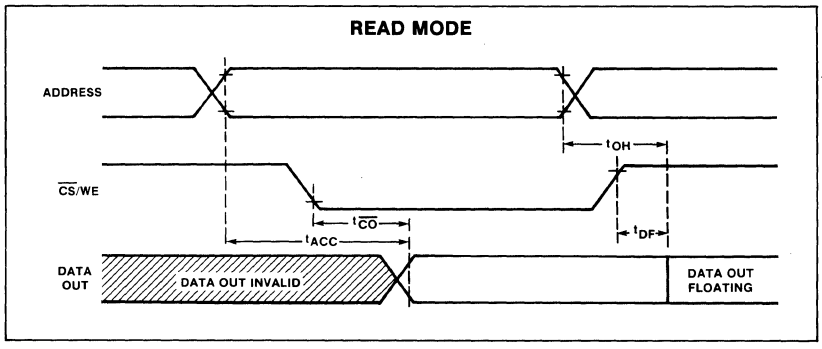
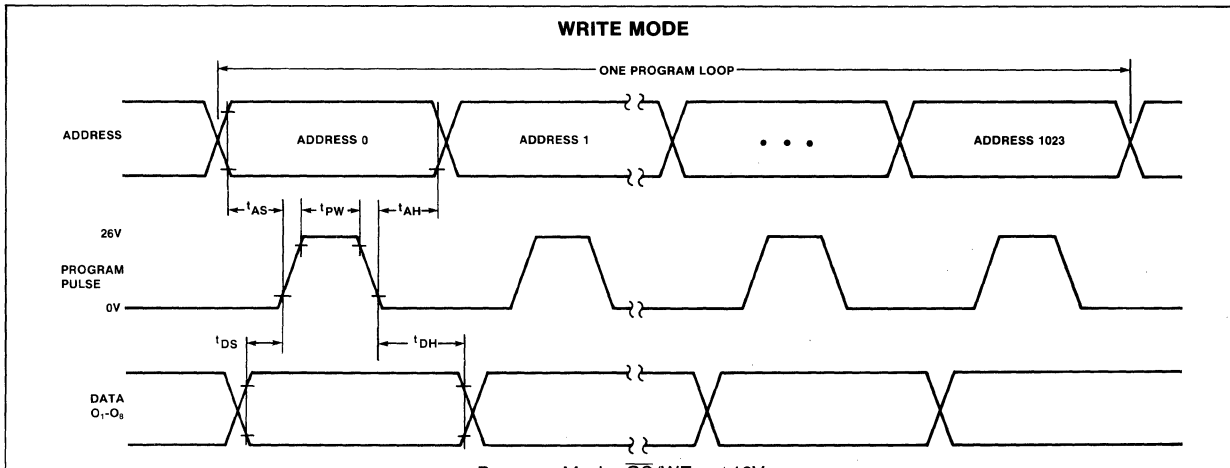
t_{OH}	Hold time	Output	Address	0			ns

NOTES

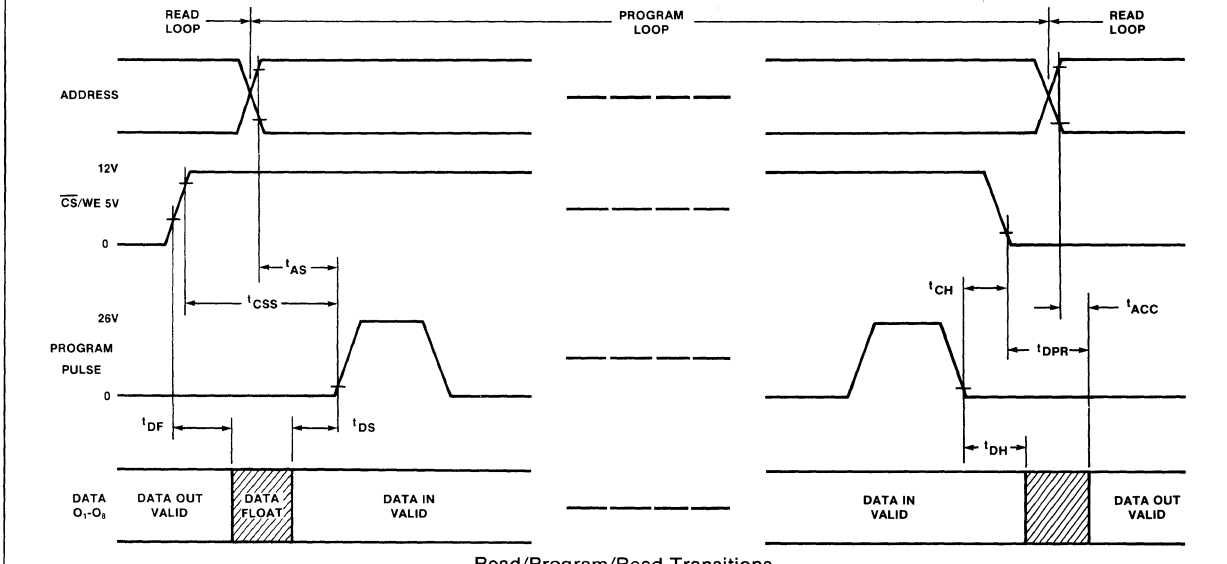
1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Typical values are for T_A = 25°C and typical supply voltages.
3. This parameter is periodically sampled and not 100% tested.
4. The program input (pin 18) may be tied to V_{SS} during the read mode.
5. Signetics reserves the right to make changes in specification at any time and without notice. The information furnished by Signetics in this publication is believed to be accurate and reliable. However, no responsibility is assumed by Signetics for its use; nor any infringements of patents or other rights of third parties resulting from its use. No license is granted under any patents or patent rights of Signetics.

TIMING DIAGRAMS





Program Mode: $\overline{CS}$/WE = +12V



Read/Program/Read Transitions

Logic levels and timing reference levels same as in the Read Mode unless noted otherwise.

PROGRAMMING SPECIFICATIONS $T_A = 25°C$

	PARAMETER	LIMITS Min	LIMITS Typ	LIMITS Max	UNIT
	Setup and hold time				μs

t_{DF}	Chip deselect to output float delay	0		120	ns
t_{DPR}	Program to read delay			10	μs
t_{PW}	Program pulse width	.1		1.0	ms
t_{PR}	Program pulse rise time	.5		2.0	μs
t_{PF}	Program pulse fall time	.5		2.0	μA
I_P	Programming current		10	20	mA
V_P	Program pulse amplitude	25		27	V

PROGRAMMING PROCEDURE

At shipment and after each erasure, all bits of the 2708/2704 are in the logic high state (output high). The device is put into the program mode by raising the $\overline{CS}$/WE input (pin 20) to +12V. While in the program mode, data to be stored is presented on lines O_1-O_8, forming an 8-bit word. Word addresses are selected in the same manner as in the Read mode. After each address and data word is set up, one program pulse (V_P) is applied to the program input (pin 18). Refer to the Program Mode timing diagram. A program loop is defined as one pass through all device addresses. The number of loops (N) required is dependent upon the program pulse width (t_{PW}) according to $N^* t_{PW} \geq 100ms$.

Program and read loops may be alternated as shown in the Read/Program/Read Transitions timing diagram.

ERASING PROCEDURE

The 2708/2704 may be erased by exposure to high intensity short-wave ultraviolet light at a wavelength of $2537A_2°$. The recommended integrated dose (i.e., UV intensity x exposure time) is 10W-sec/cm². Examples of ultraviolet sources which can erase the 2708/2704 in 30 to 60 minutes are the Model UVS-54 and Model S-52 short-wave ultraviolet lamps manufactured by Ultra-Violet Products, Inc., 5114 Walnut Grove Avenue, San Gabriel, California. The lamps should be used without short-wave filters, and the 2708/2704 to be erased should be placed about 1 inch away from the lamp tubes. Both Cervue and UV glass lids are available.

2518-N • 2519-N

DESCRIPTION

The 2518 32-bit and the 2519 40-bit recirculating static shift registers consist of enhancement mode p-channel silicon gate MOS devices intergrated on a single monolithic chip. Internal recirculation logic plus TTL/DTL level clock signals are provided for maximum interfacing ease.

TRUTH TABLE

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a 150°C maximum junction temperature and a thermal resistance of 125°C C/W, junction to ambient.
3. All inputs are protected against static charge.
4. Parameters are valid over operating temperature range unless specified.
5. All voltage measurements are referenced to ground.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Typical values are at +25°C and typical supply voltages.
8. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to +70°C. Actual input requirements with respect to V_{CC} are V_{IH} = V_{CC} -1.85V and V_{IL} = V_{CC} - 4.15V.
9. V_{OL} is dependent on R_L and input characteristics of driven gate.
10. Input rise and fall times = 10ns. Output load is 1 TTL gate.
11. For static operation, clock must be stopped in TTL high state in order to retain data (see clock pulse width specification).

TIMING DIAGRAM

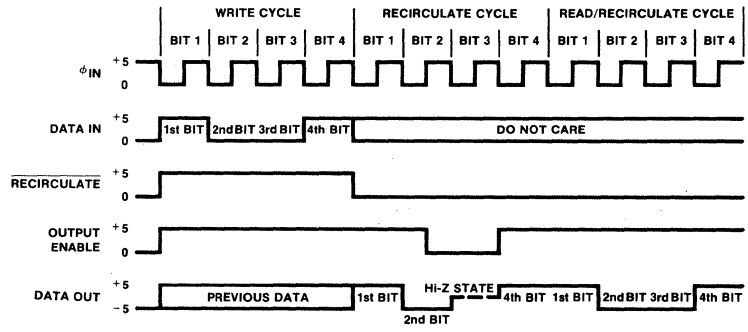
$t_R = t_F < 10ns$ for all inputs

TYPICAL APPLICATION

EXAMPLE FOR 4-BIT SHIFT REGISTER



NOTES

A. Write Cycle: The positive going edge of the recirculate control is coincident with the negative-going clock edge. The output enable control may be either high or low. If it is high, previous data will be read, and the 1st bit will be read after the fourth rising clock edge.

B. Recirculate Cycle: Data Recirculates while the recirculate control is low. Output enable may be either high or low. If it is low, the output is in the high impedance state.

C. Read/Recirculate Cycle: Data is read out while the output enable is high. Data is also recirculated as long as the recirculate control is low.

DESCRIPTION

The 2532 static shift register consists of enhancement mode p-channel silicon gate MOS devices integrated on a single monolithic chip. Each of the four 80-bit registers is provided with an independent input, push-pull output and recirculation control. The single phase clock is common to all 4 registers. All inputs and outputs including the clock interface directly with TTL or DTL circuits without external components.

Data is entered when the clock is at a logic high. Data is shifted when the clock goes low. When the recirculate control is at a logic high, data recirculates and is continuously available at the output, data input is inhibited. When the recirculate control is at a logic low, data is entered.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.
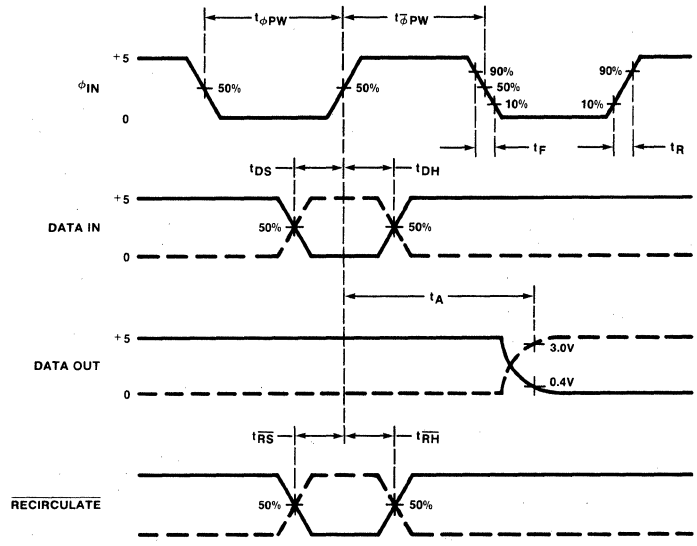
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 150°C/W junction to ambient.
3. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to +70°C. Actual input requirements with respect to V_{CC} are V_{IH} = V_{CC} − 1.85V and V_{IL} = V_{CC} − 4.15V.
4. All inputs are protected against static charge.
5. Parameters are valid over operating temperature range unless specified.
6. All voltage measurements are referenced to ground.
7. Manufacturer reserving the right to make design and process changes and improvements.
8. Typical values are at +25°C and typical supply voltages.

TIMING DIAGRAM



NOTES

A. $t_R = t_F < 10ns$ for all inputs.
B. For static operation, clock must be stopped in TTL high state in order to retain data (see clock pulse width specification).

DUAL 240-BIT STATIC SHIFT REGISTER (240X2) 2527
DUAL 250-BIT STATIC SHIFT REGISTER (250X2) 2528
DUAL 256-BIT STATIC SHIFT REGISTER (256X2) 2529

2527-N • 2528-N • 2529-N

DESCRIPTION

The 2527 240-bit, 2528 250-bit, and the 2529 256-bit recirculating static shift registers consist of enhancement mode p-channel silicon gate MOS devices integrated on a single monolithic chip.

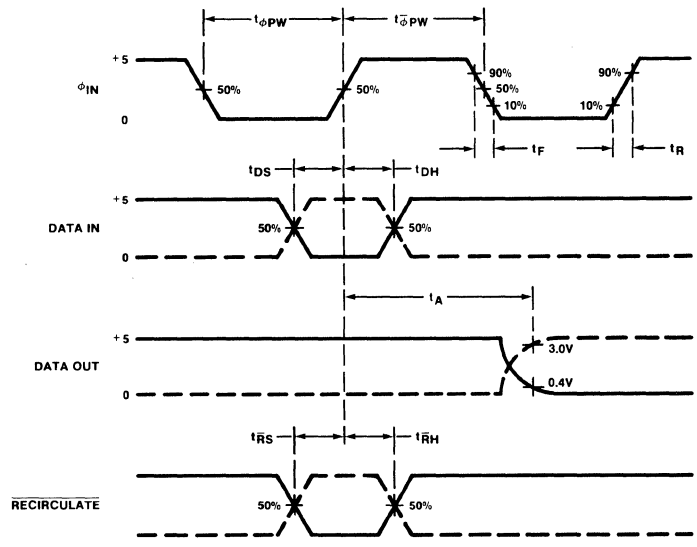
8. Typical values are at +25°C and typical supply voltages.

TIMING DIAGRAM



NOTES

A. $t_R = t_F < 10$ns for all inputs.
B. For static operation, the input clock must be stopped in the TTL high state in order to retain data (see clock pulse width specification).

2533-N

DESCRIPTION

The 2533 static shift register consists of enhancement mode p-channel silicon gate MOS devices integrated on a single monolithic chip.

The 1024-bit register is equipped with 2 data inputs together with a stream select control to facilitate external recirculation.

The single phase clock input, data input, data output, and stream select control will interface directly with TTL/DTL circuits without external components.

Data is entered when the clock is at a logic high. Data is shifted when the clock goes low.

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 150°C/W (T package) or 175°C/W (V package).
3. All inputs are protected against static charge.
4. V_{CC} tolerance is ±5%. Any variation in actual V_{CC} will be tracked directly by V_{IL}. V_{IH} and V_{OH} which are stated for a V_{CC} of exactly 5 volts.
5. Parameters are valid over operating temperature range unless otherwise specified.
6. All voltage meuurements are referenced to ground.
7. Manufacturer reserves the right to make design and process changes and improvements.
8. Typical values are at +25°C and typical supply voltages.
9. Logic Convention: Data Lines - Positive; Clocks -Negative.
10. V_{OL} (for this bare drain device) is a function only of the driven gate characteristics together with the external pull-down resistor. (R_{PD}).

	Setup and hold time							ns
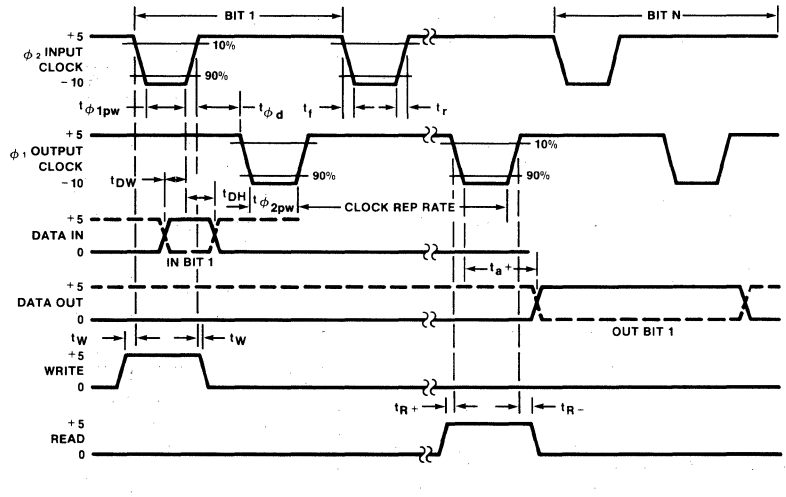
t_{DW}	Setup time	Clock	Data in		70			
t_{DH}	Hold time	Data in	Clock		20			
t_{A+}	Delay time	Data out	Clock				100	ns
t_{R-},t_{W-}	Clock to read or write timing				0			ns
t_{R-},t_{W+}	Clock to read or write timing				0			ns

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 150°C/W junction to ambient.
3. Guaranteed input levels are stated for worst case conditions including a ±5% variation in V_{CC} and a temperature variation of 0°C to +70°C. Actual input requirements with respect to V_{CC} are $V_{IH} = V_{CC} - 1.85V$ and $V_{IL} = V_{CC} - 4.15V$.
4. V_{OL} is a function of the input characteristics of the driven TTL/DTL gate I_{OI} and V_{CLAMP} and the value of the pull-down resistor (R_L).
5. See Minimum Operating Frequency graph for low limits on data rep. rate.
6. All inputs are protected against static charge.
7. All voltage measurements are referenced to ground.
8. Manufacturer reserving the right to make design and process changes and improvements.
9. Typical values are at +25°C and typical supply voltages.
10. Parameters are valid over operating temperature range unless otherwise specified.

TIMING DIAGRAM



NOTES

A. N = 512 for 2524, N = 1024 for 2525.
B. Note that the read input is AND'ed with $\overline{\phi_1}$; therefore this function is not valid until ϕ_1 occurs.

2502-N • 2503-TA,N • 2504-TA,N

DESCRIPTION

These 2500 Series 1024-bit multiplexed dynamic shift registers consist of enhancement mode p-channel MOS devices integrated on a single monolithic chip. Due to on-chip multiplexing, the data rate is twice the clock rate.

t_{DO}	Data in overlap	10			ns
t_{A+},t_{A-}	Data out			90	ns

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other condition above those indicated in the operational sections of this specification is not implied.
2. For operating at elevated temperatures the device must be derated based on a +150°C maximum junction temperature and a thermal resistance of 150°C/W (TA and V package) or 125°C/W (B package).
3. All inputs are protected against static charge.
4. V_{CC} tolerance is ±5%. Any variation in actual V_{CC} will be tracked directly by V_{IL}, V_{IH} and V_{OH} which are stated for a V_{CC} of exactly 5 volts.
5. Parameters are valid over operating temperature range unless specified.
6. All voltage measurements are referenced to ground.
7. Manufacturer reserving the right to make design and process changes and improvements.
8. Typical values are at +25°C and typical supply voltages.

MILITARY

The Signetics Mil 38510/883 Program is organized to provide a broad selection of processing options, structured around the most commonly requested customer flows. The program is designed to provide our customers:

- Standard processing flows to help minimize the need for custom specs.
- Cost savings realized by using standard processing flows in lieu of custom flows.
- Better delivery lead times by minimizing spec negotiation time, plus allows customers to buy product off-the-shelf or in various stages of production rather than waiting for devices started specifically to custom specs.

The following explains the different processing options available to you. Special device marking clearly distinguishes the type of screening performed. Refer to Tables 1 and 2.

Table 2 MILITARY PACKAGE AVAILABILITY

JAN QUALIFIED (JB)

JAN Qualified product is designed to give you the optimum in quality and reliability. The JAN processing level is offered as the result of the government's product standardization programs, and is monitored by the Defense Electronic Supply Center (DESC), through the use of industry-wide procedures and specifications.

JAN Qualified products are manufactured, processed and tested in a government certified facility to Mil-M 38510, and appropriate device slash sheet specifications. Design documentation, lot sampling plans, electrical test data and qualification data for each specific part type has been approved by the Defense Electronic Supply Center (DESC) and products appear on the DESC Qualified Products List (QPL-38510).

Group B testing, per Mil-Std-883 Method 5005, is performed on each six weeks of production on each slash sheet for each package type. Group C, per Mil-Std-883 Method 5005, is performed every ninety days for each microcircuit group. Group D testing, per Mil-Std-883 Method 5005, is performed every six months for each package type.

In addition to the common specs used throughout the industry for processing and testing, JAN Qualified products also possess a requirement for a standard marking used throughout the IC industry.

JAN PROCESSING (JBX)

This option is extremely useful when the reliability and screening of a JAN device is required, however, Signetics is not listed on the QPL for the product needed. Processing is performed to Mil-Std-883 Method 5004, and product is 100% electrically tested to the appropriate JAN slash sheet.

Group B, C and D data for JAN processed and the other military processing levels which follow, consist of Group B, C and D testing performed per Mil-Std-883 Method 5005, in accordance with the Signetics Military Data Program.

JAN REL (RBX)

Processing to this option is ideal when no JAN slash sheets are released on devices required. Product is processed to Mil-Std-883 Method 5004, and is 100% electrically tested to industry data sheets.

/883B (RB)

This is a lower priced version of the JAN Rel option described above. Processing is identical with the only exceptions being the dc electrical testing over the temperature range and ac electrical testing at room temperature are performed as a part of Group A instead of 100%.

MIL TEMP/883C (S/RC)

If you need a Military temp. range device, but do not require all the high reliability screening performed in the other processing options, our Mil-Temp. product is ideal. Mil-Temp. parts are the standard full Mil-Temperature range product guaranteed to a 1% AQL to the Signetics data sheet parameters.

MILITARY GENERIC DATA

Signetics has a new program for those customers who require quality conformance data on their products. This program allows our customers to obtain reliability information without the necessity of running Groups B, C and D inspections for their particular purchase order. It provides for the customer something that has not been readily available before in the semiconductor industry in that all Military Generic Data is controlled and audited by both Government Inspection in the case of JAN data and Signetics Quality Assurance.

Signetics Military Generic Data is compiled by the Military Products Division based on data from 1) JAN quality conformance lots, and 2) Data generated by quality conformance lots run for other reliability programs. Refer to Table 3.

A Military Generic family is defined as consisting of die function and package type families.

Military Generic Data

- Allows our customers to qualify Signetics products based on existing quality conformance data performed at Signetics.
- Allows our customers to reduce costs and improve deliveries.
- Provides assurance that all Signetics die function families and packages meet Mil-M-38510 and customer reliability requirements.
- Provides an attributes summary to the customer backed by lot identity and traceability.

QUALIFIED SUB-GROUPS	QUALIFIES	OPTION 1	OPTION 2
A	Electrical Test	See NOTE 1	See NOTE 1
B	Package—Same package construction and lead finish.	Data selected from devices manufactured within 6 weeks of the manufacturing period on the same production line through final seal.	Data selected from devices manufactured within 24 weeks of manufacturing period.
C	Die/Process—Devices representing the same process families.	Data selected from representative devices from the same microcircuit group and sealed within 12 weeks of the manufacturing period.	Data selected from the representative devices from the same microcircuit group and sealed within 48 weeks of the manufacturing period.
D	Package—Same package construction and lead finish.	Data selected from the devices representing the same package construction and lead finish manufactured within the 24 weeks of manufacturing period. If specific data not available, Option 2 will be supplied.	Data selected from the devices representing the same package construction and lead finish manufactured within the 52 weeks of manufacturing period.

NOTE
1. Group A is performed on each lot or sublot of Signetics devices.

PACKAGES

INTRODUCTION

The following information applies to all packages unless otherwise specified on individual package outline drawings.

General

1. Dimensions shown are metric units (millimeters), except those in parentheses which are English units (inches).
2. Lead spacing shall be measured within this zone.
   a. Shoulder and lead tip dimensions are to centerline of leads.
3. Tolerances non-cumulative
4. Thermal resistance values are determined by utilizing the linear temperature dependence of the forward voltage drop across the substrate diode in a digital device to monitor the junction temperature rise during known power application across VCC and ground. The values are based upon 120 mils square die for plastic packages and a 90 mils square die in the smallest available cavity for hermetic packages. All units were solder mounted to P.C. boards, with standard stand-off, for measurement.

Plastic Only

5. Lead material: Alloy 42 or equivalent, solder dipped.
6. Body material: Plastic
7. Round hole in top corner denotes lead No. 1.
8. Body dimensions do not include molding flash.

Hermetic Only

9. Lead material
   a. Alloy 52—gold plated, or solder dipped.
   b. ASTM alloy F-15 (KOVAR) or equivalent—gold plated, tin plated, or solder dipped.
   c. ASTM alloy F-30 (Alloy 42) or equivalent—tin plated.
   d. ASTM alloy F-15 (KOVAR) or equivalent—gold plated.
   e. ASTM alloy F-15 (KOVAR) or equivalent—tin plated.
10. Body Material
   a. 1010 Steel—nickel plated or tin plate over nickel.
   b. Eyelet, ASTM alloy F-15 or equivalent—gold or tin plated.
   c. Eyelet, ASTM alloy F-15 or equivalent—gold or tin plated, glass body.
   d. Ceramic with glass seal at leads.
   e. BeO ceramic with glass seal at leads.
   f. Ceramic with ASTM alloy F-15 or equivalent.
11. Lid Material
   a. 1010 steel, nickel plated, or tin-plate over nickel, weld seal.
   b. Nickel or tin plated nickel, weld seal.
   c. Ceramic, glass seal.
   d. ASTM alloy F-15 or equivalent, gold plated.
   e. BeO Ceramic with glass seal.
   f. Translucent $A1_2O_3$, glass seal.

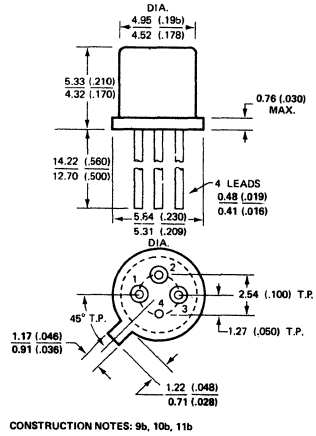
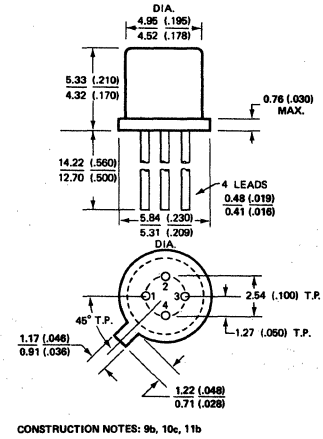
CONSTRUCTION NOTES: 9b, 10b, 11b

DC Package



CONSTRUCTION NOTES: 9b, 10b, 11b

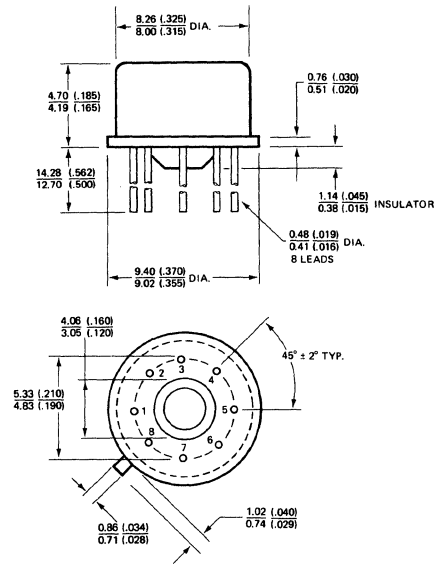
DE Package



CONSTRUCTION NOTES: 9b, 10c, 11b

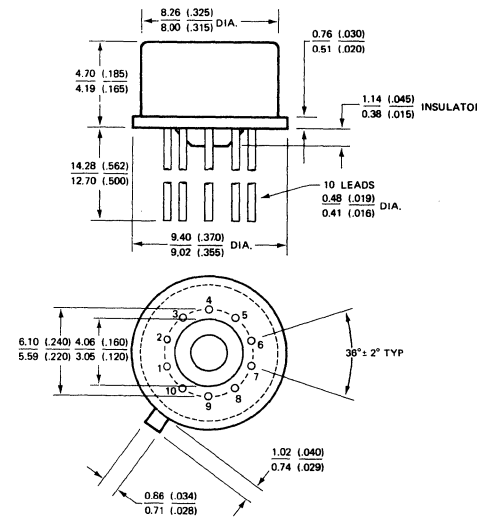
HERMETIC: Metal Headers (cont'd.)

T Package



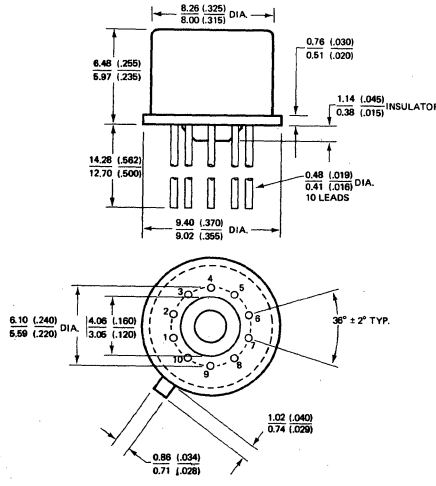
CONSTRUCTION NOTES: 9b, 10c, 11b

K Package



CONSTRUCTION NOTES: 9b, 10c, 11b

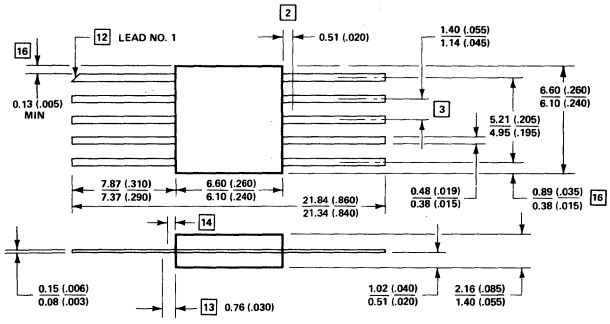
L Package



CONSTRUCTION NOTES: 9b, 10c, 11b

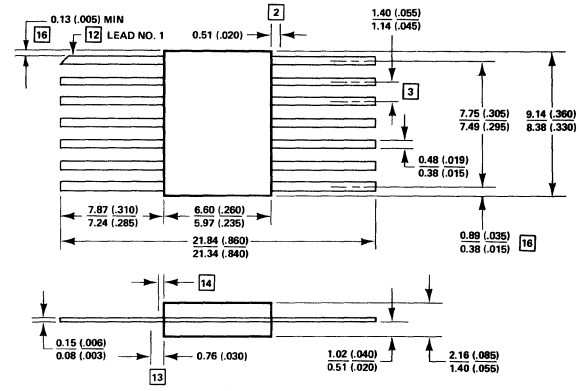
HERMETIC: Flat Packs

WF Package



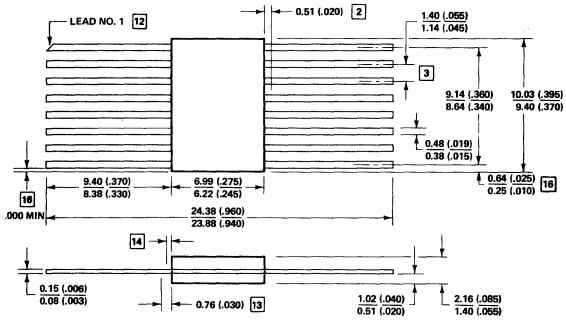
CONSTRUCTION NOTES: 9c, 10d, 11c

WH Package



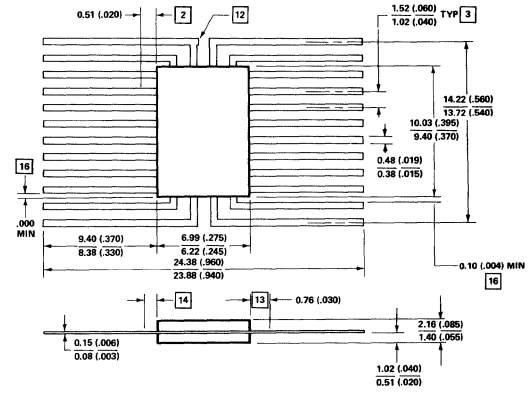
CONSTRUCTION NOTES: 9c, 10d, 11c

WJ Package



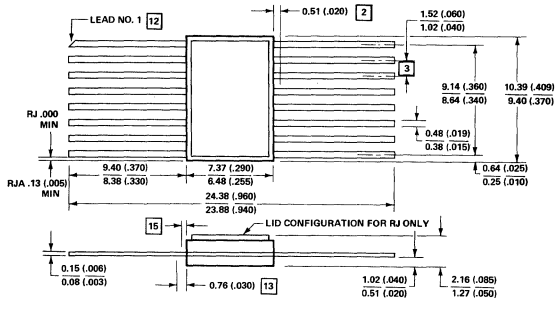
CONSTRUCTION NOTES: 9c, 10d, 11c

WN Package



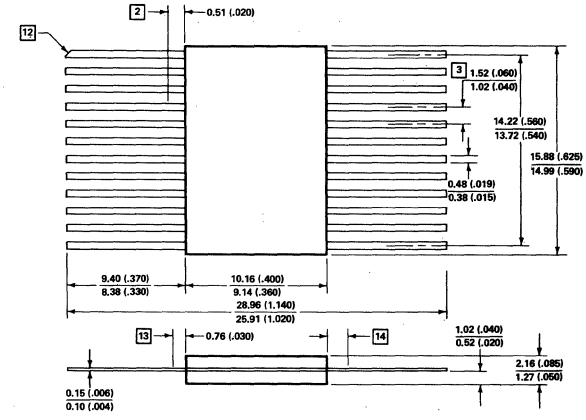
CONSTRUCTION NOTES: 9c, 10d, 11c

RJ and RJA Package



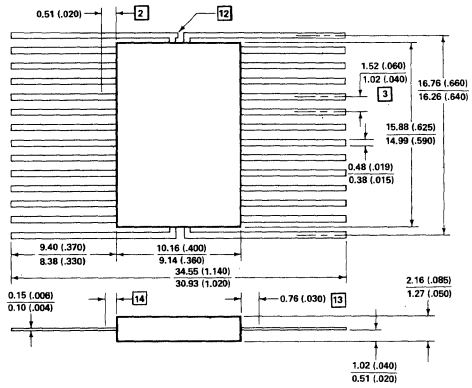
RJA CONSTRUCTION NOTES: 9c, 10e, 11e
RJ CONSTRUCTION NOTES: 9d, 10e, 11d

RNA Package



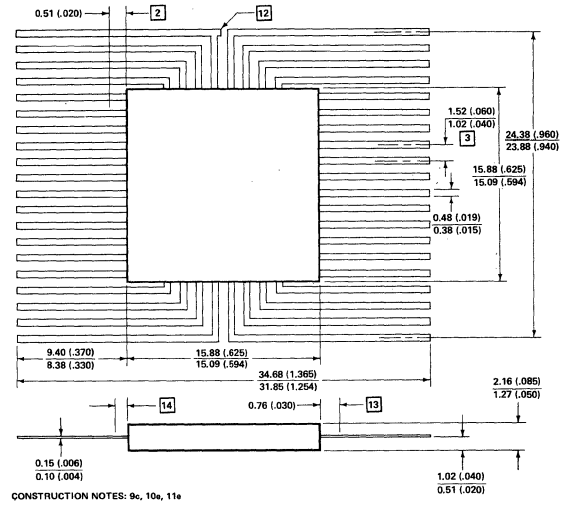
HERMETIC: Flat Packs (cont'd.)

RQA Package



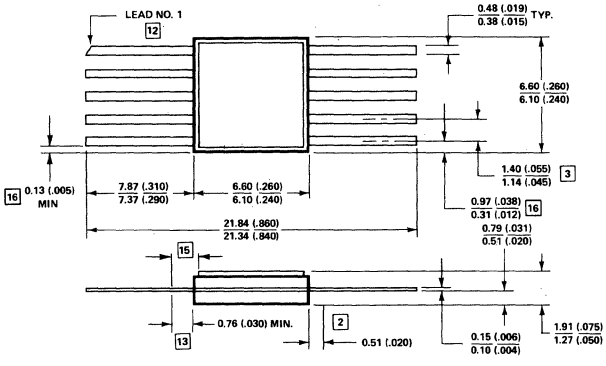
CONSTRUCTION NOTES: 9c, 10e, 11e

RWA Package



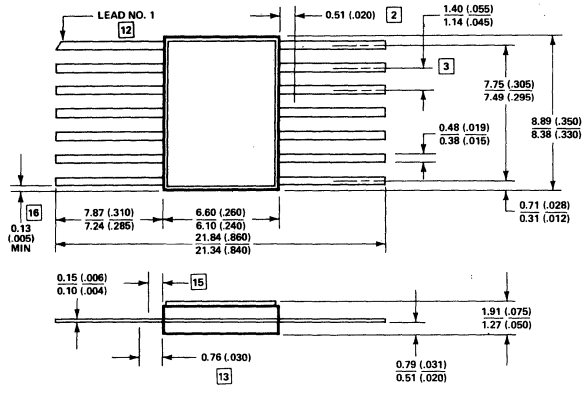
CONSTRUCTION NOTES: 9c, 10e, 11e

QF Package



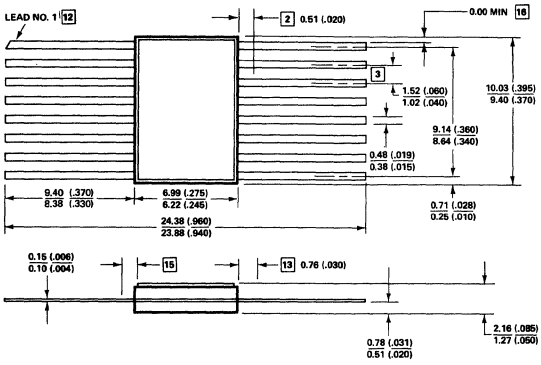
CONSTRUCTION NOTES: 9d, 10d, 11c

QH Package



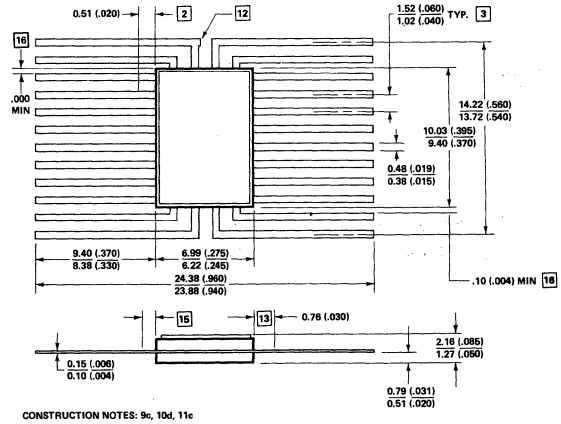
CONSTRUCTION NOTES: 9d, 10d, 11c

QJ Package



CONSTRUCTION NOTES: 9d, 10d, 11c

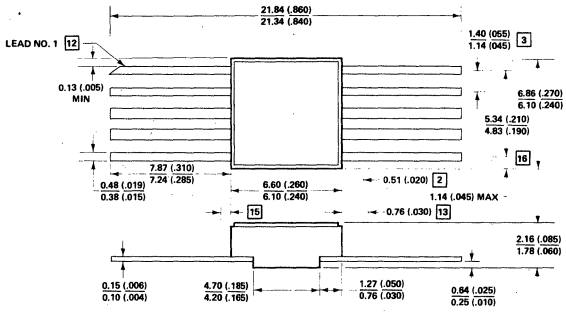
QN Package



CONSTRUCTION NOTES: 9c, 10d, 11c

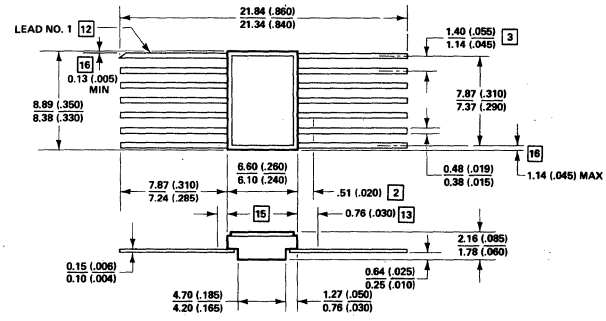
HERMETIC: Flat Packs (cont'd.)

QFA Package



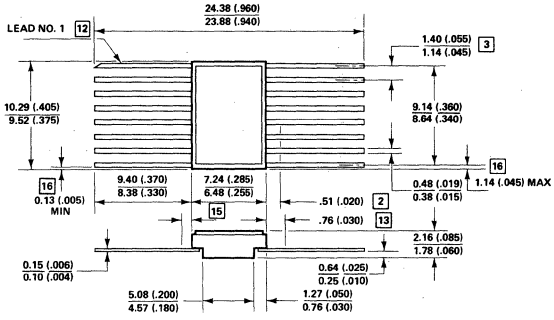
CONSTRUCTION NOTES: 9d, 10f, 11c

QHA Package



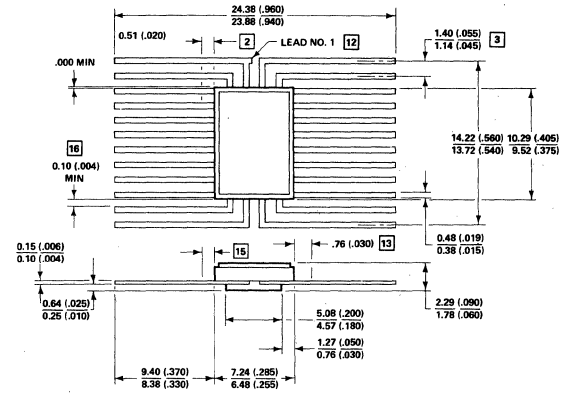
CONSTRUCTION NOTES: 9d, 10f, 11c

QJA Package



CONSTRUCTION NOTES: 9d, 10f, 11c

QNA Package



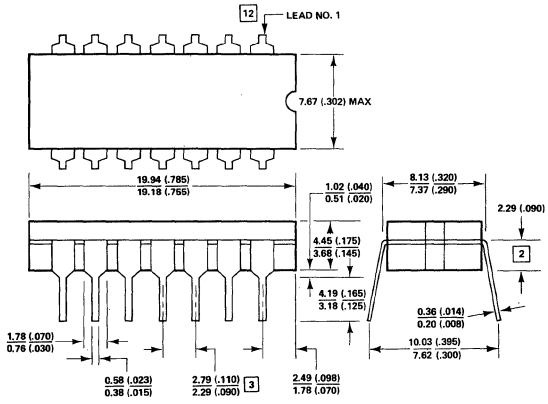
CONSTRUCTION NOTES: 9d, 10f, 11c

RKA Package

Package not yet available
Scheduled for 1977 release

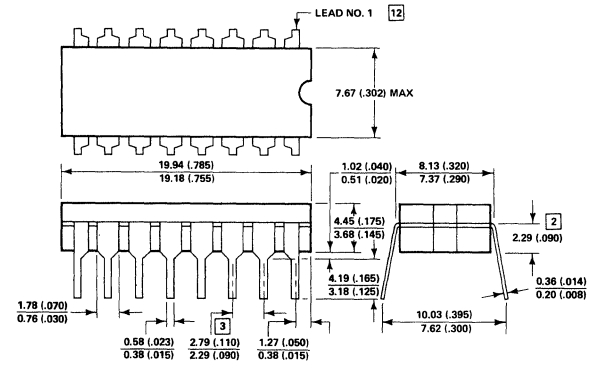
HERMETIC: Cerdip

FH Package



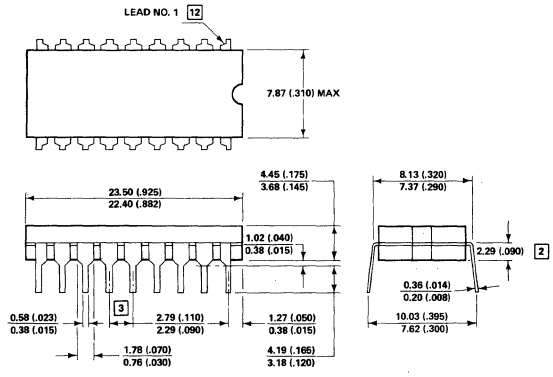
CONSTRUCTION NOTES: 9c, 10d, 11c

FJ Package



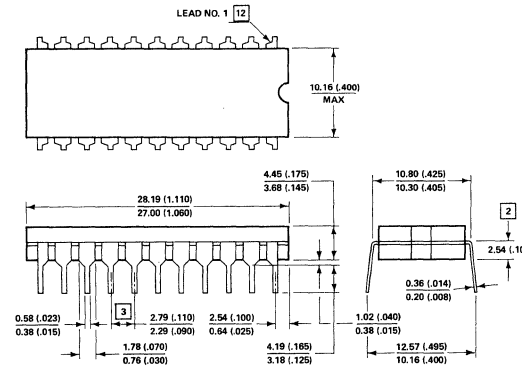
CONSTRUCTION NOTES: 9c, 10d, 11c

FK Package



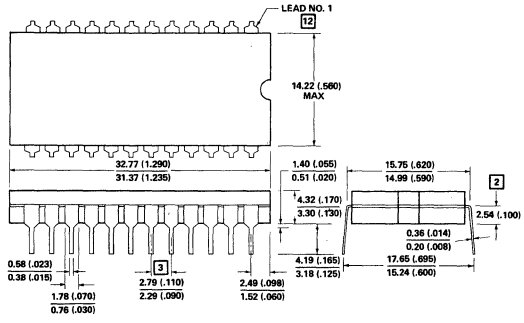
CONSTRUCTION NOTES: 9c, 10d, 11c

FM Package



CONSTRUCTION NOTES: 9c, 10d, 11c

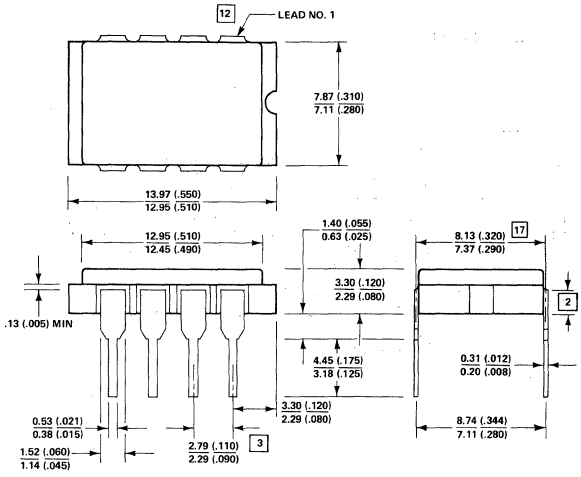
FN Package



CONSTRUCTION NOTES: 9c, 10d, 11c

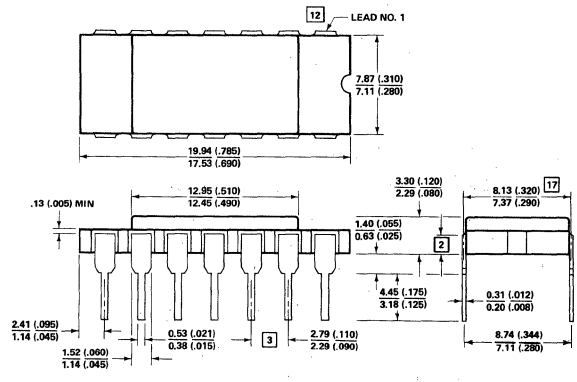
HERMETIC: Laminated Ceramic, Side Brazed Lead

IEA Package



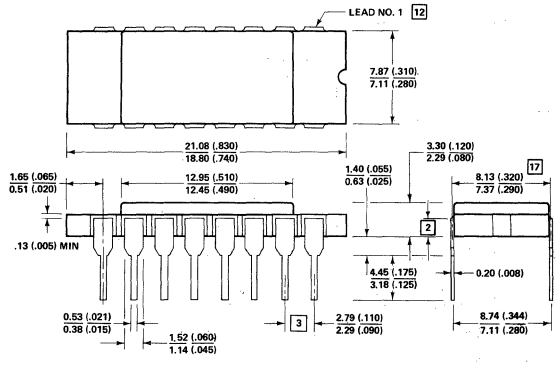
CONSTRUCTION NOTES: 9e, 10f, 11c

IHA Package



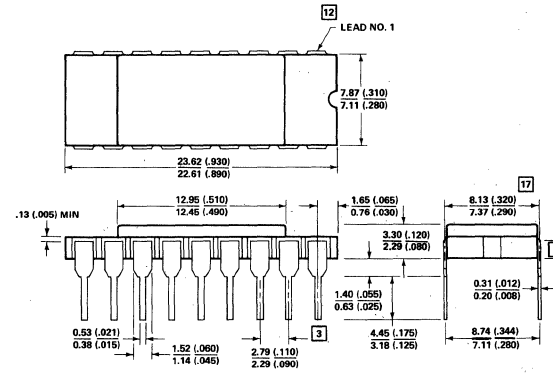
CONSTRUCTION NOTES: 9e, 10f, 11c

IJA Package



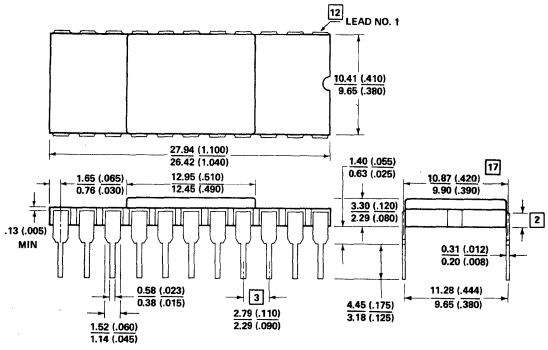
CONSTRUCTION NOTES: 9e, 10f, 11c

IKA Package



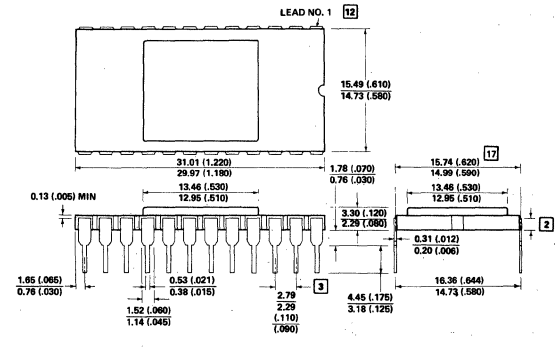
CONSTRUCTION NOTES: 9e, 10f, 11c

IMA Package



CONSTRUCTION NOTES: 9e, 10f, 11c

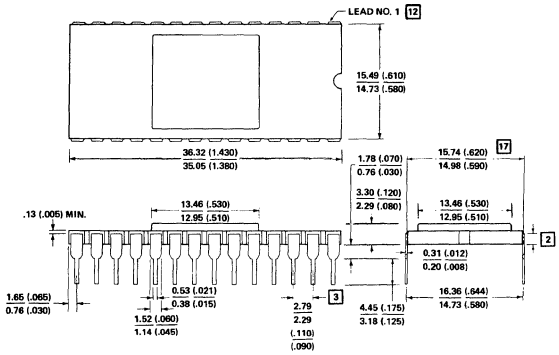
INC Package and IND Package



CONSTRUCTION NOTES: 9e, 10f, 11c, 11f (IND)

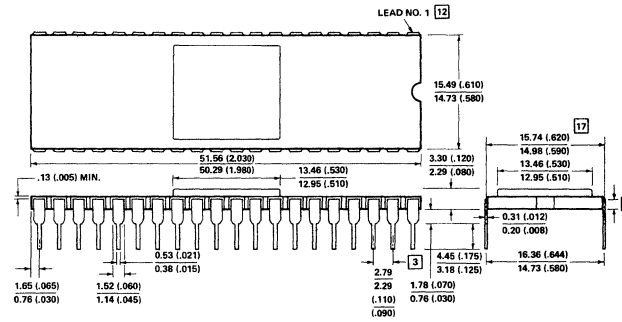
HERMETIC: Laminated Ceramic, Side Brazed Lead (cont'd.)

IQA Package



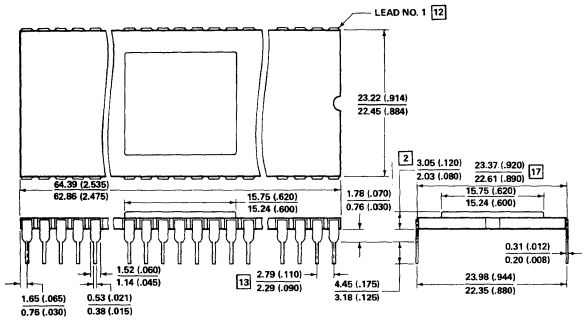
CONSTRUCTION NOTES: 9e, 10f, 11c

IWA Package



CONSTRUCTION NOTES: 9e, 10f, 11c

IZA Package



CONSTRUCTION NOTES: 9e, 10f, 11c
