MELF (Metal Electodes Face-Bonding) Components

Warning

If MELF components are forcibly removed from the printed circuit board with pincers or pliers, the circuit board pattern is likely to peel away. Always remove MELF components according to the procedure described on the next page. Replace MELF components with the lead type components.

MELF components are soldered directly to the surface of the printed circuit board.

MELF resistors and capacitors have the same dimensions and are distinguished by their background colors: light brown for resistors, and pink or light green for capacitors.

The MELF resistor color coding is the same as for conventional resistors, and MELF capacitor color coding is the same as for tube-type ceramic capacitors. Note, however, that all MELF resistors are rated at ¼W and ±5%.

Components larger than resistors and without a color code are cross conductors, which are used instead of jumper wires.

1. Structure

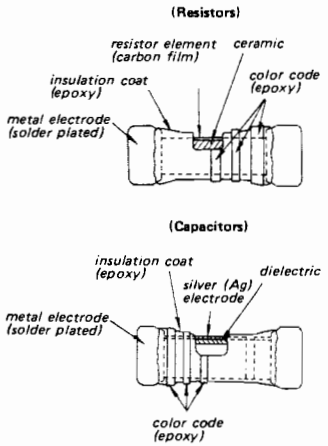

Fig. 1

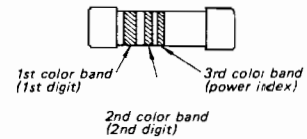
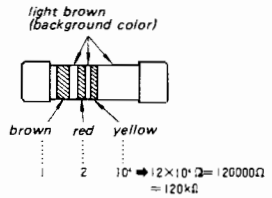
2. Color Code Reading



(Example of Resistor)



(Example of Capacitor)

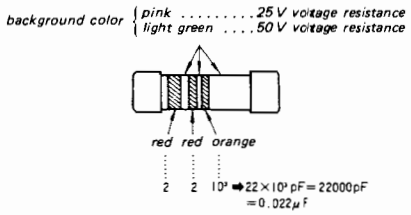


Fig. 2

3. How to Remove MELF Components and Mount Replacements

Use a soldering iron of at least 40W with an iron tip 4 mm in diameter and file the tip down to the angle shown in the diagram.

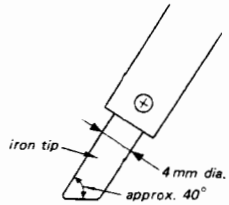

Fig. 3

1. Bring the flat surface of the soldering iron in equal contact with both soldered ends of the component.
2. The solder should melt in about 4 seconds. (The solder will melt more readily if a small amount of solder is attached to the iron tip and the iron tip is placed against the component.)
3. Once the solder has melted, tap the component aside with the tip of the soldering iron, and remove it from the board.

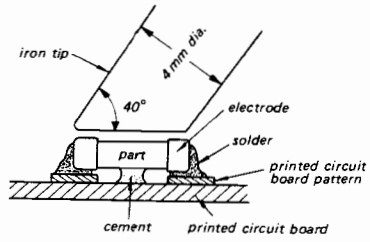

Fig. 4

4. Use lead type resistors or capacitors to replace the MELF components.
These replacements may be mounted either with short leads (see Fig. 5), or by covering a lead with tubing (see Fig. 6).

CAUTION ON POWER SUPPLY

There are two ways of power supply in FH-7MKII. One is by AC-78II using AC power supply, the other is by DC power unit EBP-78MKII (optional accessory). Each of them has different signal path and B+ bus mutually.

- **THE CASE BY AC-78II USING AC POWER SUPPLY**
  There are five B+ buses from AC-78II, +DC (AC power supply), +VccH, −VccH, +Vcc and −Vcc. +DC (AC power supply) is supplied to ST-78II, TA-78II and TC-78II, or also +VccH, −VccH, +Vcc and −Vcc are supplied to TA-78II only. These four B+ buses to TA-78II are for IC103 (L-CH) and IC104 (R-CH) as the power amplifier in TA-78II. Signals from each set are amplified at IC103, 104 and drive the speakers.

- **THE CASE BY EBP-78MKII (optional accessory)**
  B+ bus from EBP-78MKII is only +DC (DC power supply), and this B+ bus is supplied to ST-78II, TA-78II and TC-78II (or TC-78CII).
  According to one B+ bus by +DC (DC power supply), power is not supplied to IC103, 104 as the power amplifier in TA-78II, so there is no amplification at TA-78II. Therefore, there is IC101 as a amplifier in EBP-78MKII. Signals are amplified there, and drive the speakers.
  See page 7 – 10 on connection and signal path of the each case by AC-78II, EBP-78MKII.

SAFETY CHECK-OUT (US Model)

After correcting the original service problem, perform the following safety check before releasing the set to the customer:
Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microampers). Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2 V AC range are suitable. (See Fig. A)

Cassette deck section
- The cassette deck can use the metal tapes, providing wider dynamic range and extended frequency response.
- Auto-reverse function enables you to repeat playback of both sides of the cassette, once or continuously.
- Automatic Music Sensor (AMS) allows easy playback of the selection being played and easy skipping to the next selection.
- The automatic recording control system sets the recording level automatically.
- The record muting function allows you to eliminate material you do not want to record, such as commercials, and to make a blank space between selections.
- The Dolby NR (noise reduction) system reduces tape hiss and assures high quality recording and playback. (AEP, UK, E model)
- The C-type Dolby NR (noise reduction) system reduces tape noise twice as effectively as the conventional B-type Dolby NR system and assures high quality recording and playback. (US, Canadian model)

AC power supply section
- Permits headphones to be connected. Their volume is adjustable.
- This section supplies power to the tuner, amplifier and cassette deck.

Speaker section
- A two way speaker system with an APM (Accurate Pistonic Motion) woofer provides clear sound.

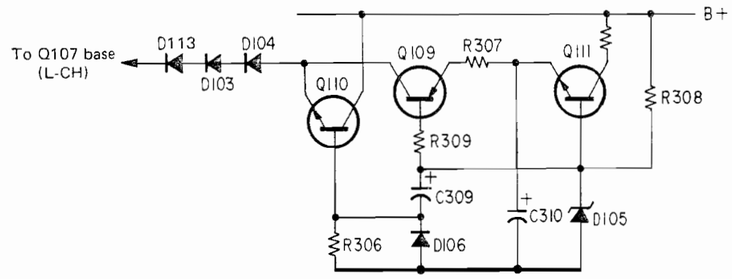
1. CIRCUIT DESCRIPTION

MUTING CIRCUIT

Q107 is a muting transistor.
It mutes output when the power switch is turned on and off or power voltage is much decreased.
When the power switch is ON:
Current flows on R308, C309 and R306, when the power switch is turned on.
Q110 is on until C309 finishes charging.
Q107 mutes output while Q110 is on.
When the power switch is off.
When Q109 base voltage is 0.6V lower than that of the emitter, Q109 is on.
Voltage charged to C310 is discharged through R307.
Then, Q107 turns on.

Power voltage fluctuation.

D105 is an 11V zener diode. Therefore, Q111 base voltage is 11V.
At this time, Q111 emitter voltage is 10.4V.
When power voltage decreases, and Q109 base voltage becomes 0.6V lower than that of the emitter, Q109 turns on.
Then Q107 mutes output.
When power voltage increased a little, Q110 turns ON.
Then Q107 turns ON and mutes output.



Graphic EQ circuit

Fig. 1 shows a part of graphic EQ circuit redrawn for easy comprehension.
Graphic EQ circuit consists of C1, 2, R1, 2, Q1.
The output level of frequency band decreases when S1 is set to side ① , because certain frequency band of output signal passes through EQ circuit to the ground.
The output level of frequency band increases when S1 is set to side ② , because NF circuit is connected to the EQ circuit causing certain frequency band to pass through the EQ circuit to the ground.
The frequency band of this EQ circuit can be changed by changing the value of a capacitor.

NOTE:

- The mechanical parts with no reference number in the exploded views are not supplied.
- Items marked " ♦ " are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.
- If there are two or more same circuitsin a set such as a stereophonic machine, only typical circuit parts may be indicated and capacitors and resistors in other same circuits may be omitted.

CAPACITORS:
MF:μF, PF:μμF.

RESISTORS
- All resistors are in ohms.
- F : nonflammable

COILS
- MMH : mH, UH : μH

SEMICONDUCTORS
In each case, U : μ, for example:
UA···: μA···, UPA···: μPA···, UPC···: μPC,

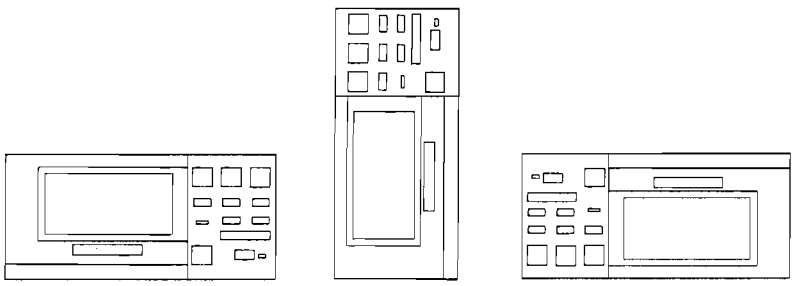
NOTES ON REPAIR

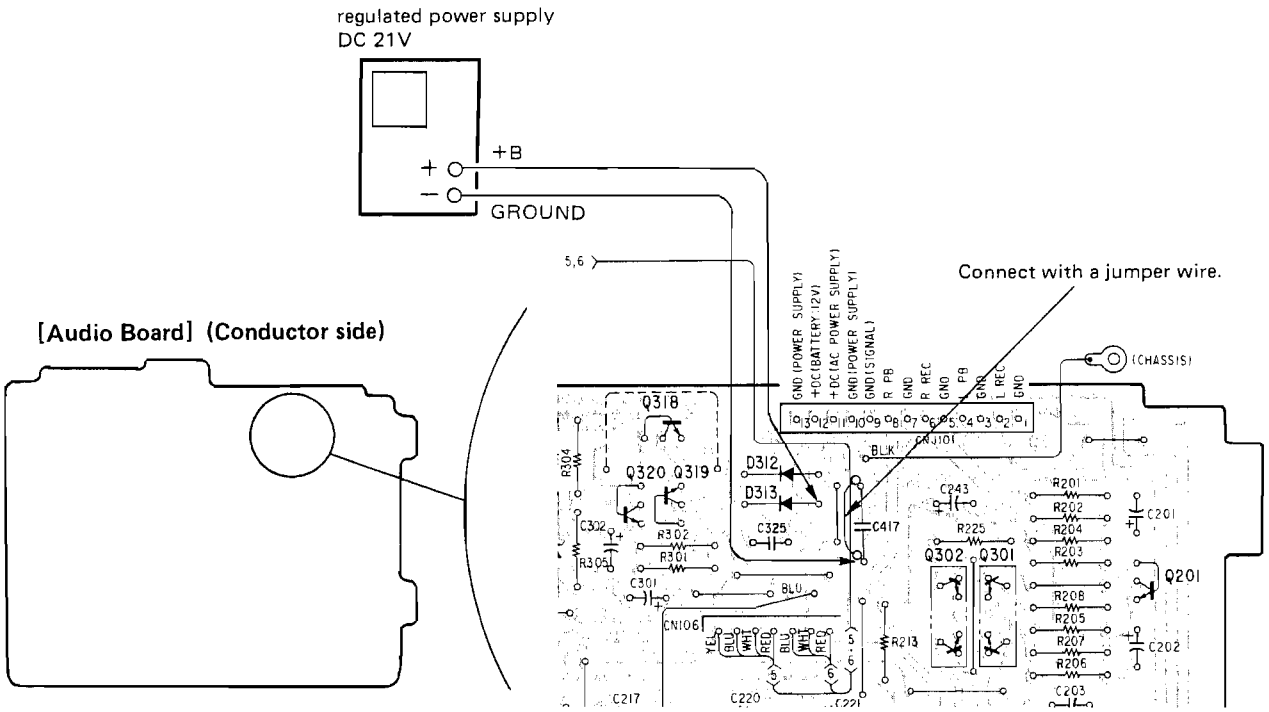
When the mech deck is operated with the set in an upside-down position, misoperation may result. For repair while operating the mech deck, perform with the set in its normal position or standing on its side.



good good wrong

[To apply B+ voltage in repair]

The power supply voltage of this unit is fed from AC-78II via TA-78II.
There are two ground lines for signal and power supply circuits, which are not connected in this unit.
When this unit alone operates, connect the two ground lines with a jumper wire and a regulated power supply as illustrated.
After repairing, remove the jumper wire connected.



- Refer to the service manual of TC-78 for the circuit description and the mechanical operation.
  (They are identical to those of TC-78.)

PRECAUTION

1. Clean the following parts with a denatured-alcohol-moistened swab:

record/playback head	pinch roller
erase head	rubber belts
capstan	idlers

2. Demagnetize the record/playback head with a head demagnetizer.
3. Do not use a magnetized screwdriver for the adjustments.
4. After the adjustments, apply suitable locking compound to the parts adjusted.
5. The adjustments should be performed with the rated power supply voltage (dc 2.5V) unless otherwise noted.

Torque Measurement

Torque	Torque meter	Meter reading
FWD	CQ-102C	28 – 60 g·cm (0.39 – 0.83 oz·inch)
FWD Back tension	CQ-102C	2 – 8 g·cm (0.03 – 0.1 oz·inch)

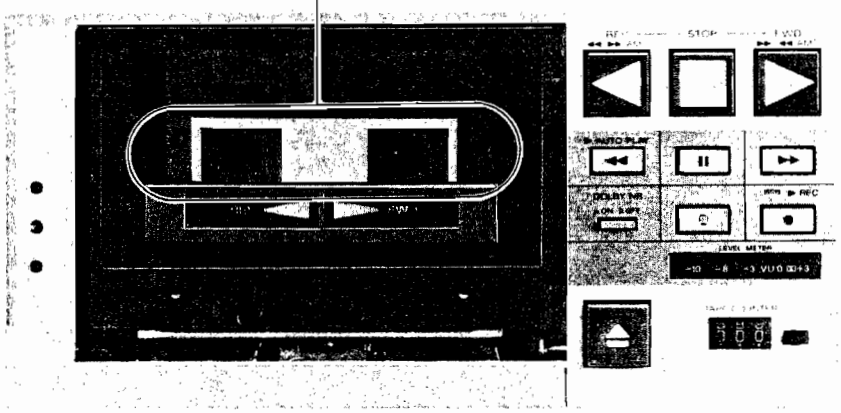
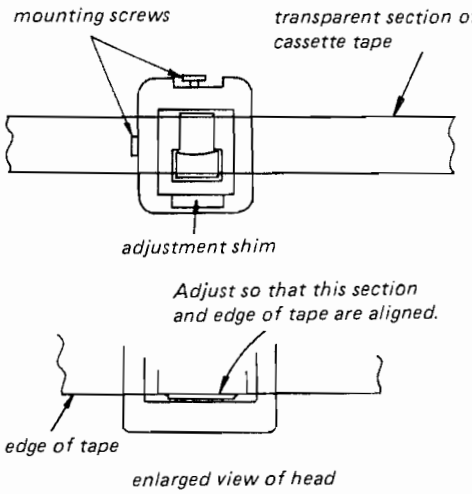
FF, REW	CQ-201B	80 – 165 g·cm (1.1 – 2.28 oz·inch)



Head Height Adjustment

The following adjustments should be made when the record/playback head is replaced.

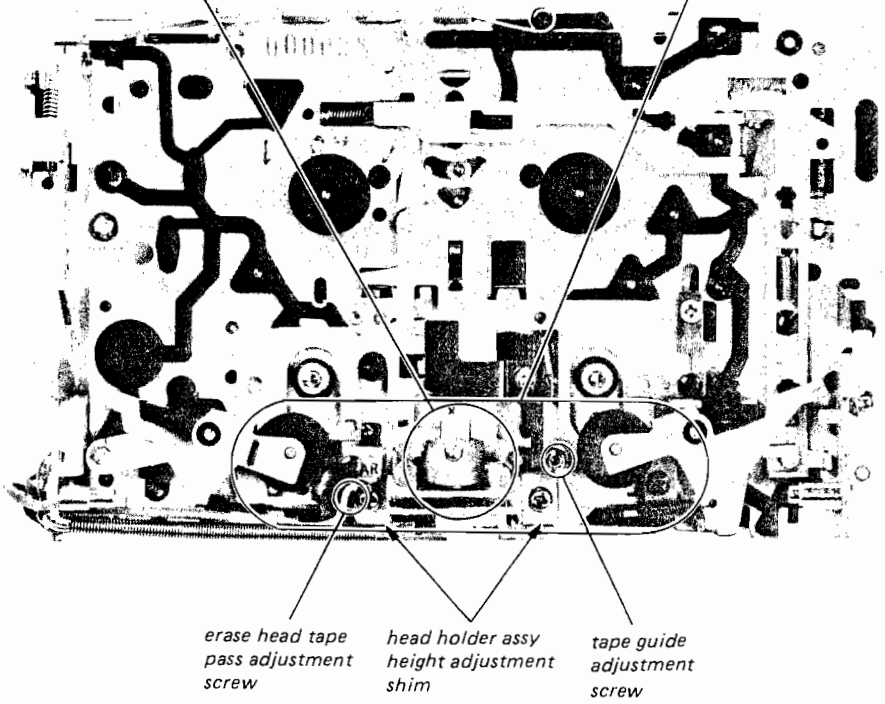
1. The head should be made after removing the head pad of the mirror cassette tape.
2. Using the leader section of the mirror cassette tape, adjustments are made by changing the adjusting shim so that the core and the edge of the tape become as shown in the illustration below when the tape is moved across the head.



Tape Path Adjustment

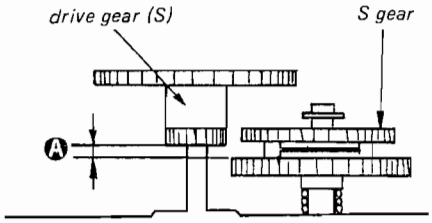
When assembling the erase head and head holder, and when replacing the tape guide (L), be sure to perform the following adjustments.

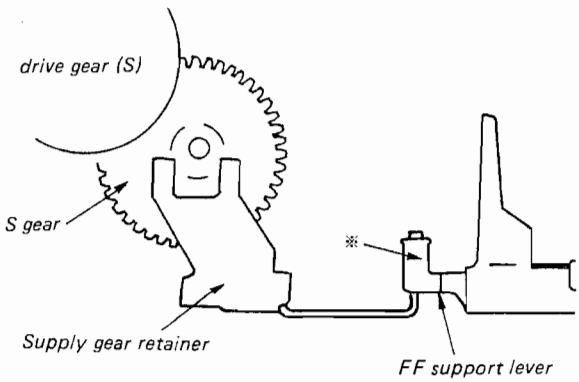
1. Using a mirror cassette, adjust each of the adjustment screws until there is not tape curling.
2. Perform adjustments by changing the height adjustment shim of the head holder assembly and the height adjustment shim of the record/playback head, so that the core of the record/playback head is positioned correctly for both FWD and REV.

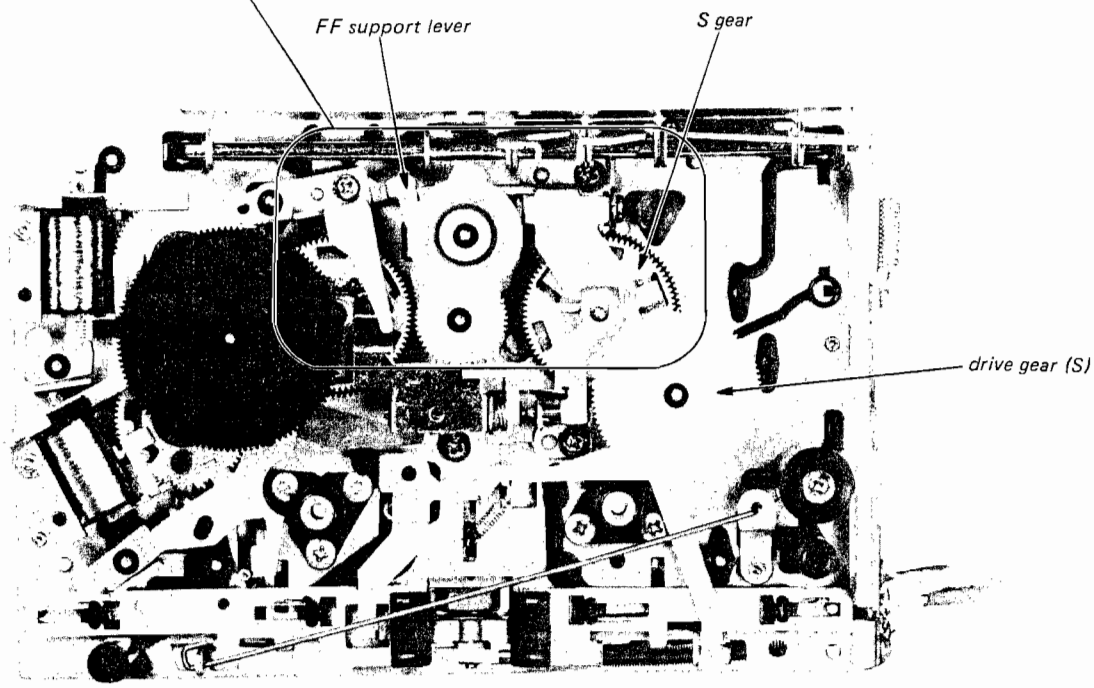


Supply Gear Retainer Position Adjustment

1. With the deck in the REV mode.
2. Bend the FF supplementary lever at the place indicated by the asterik (※) to make adjustments so that the dimension of Ⓐ is 1mm, ±0.5mm.

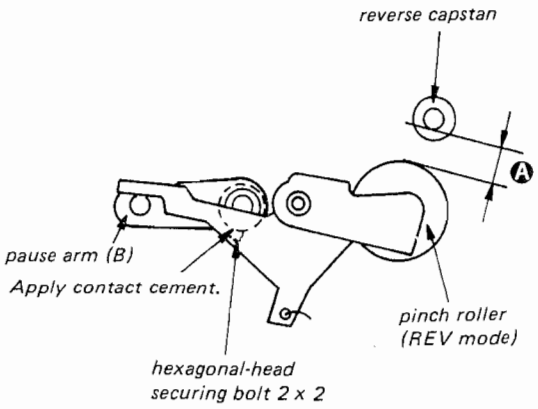


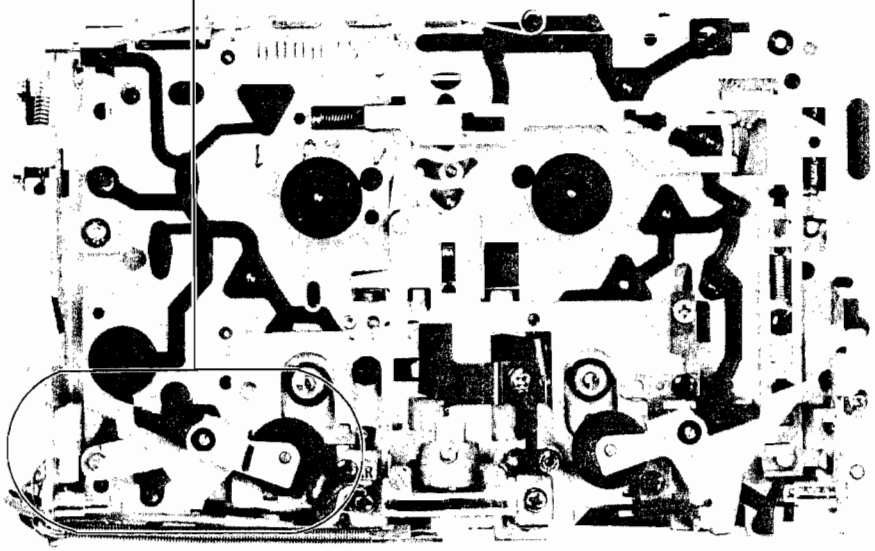




Pause Arm Position Adjustment

1. With the deck in the REV mode.
2. Loosen the hexagonal head securing bolts and adjust the position of the pause arm B so that the dimension of Ⓐ below becomes 0.5mm – 1.0mm.
3. After the adjustment, lock the screws with contact cement.

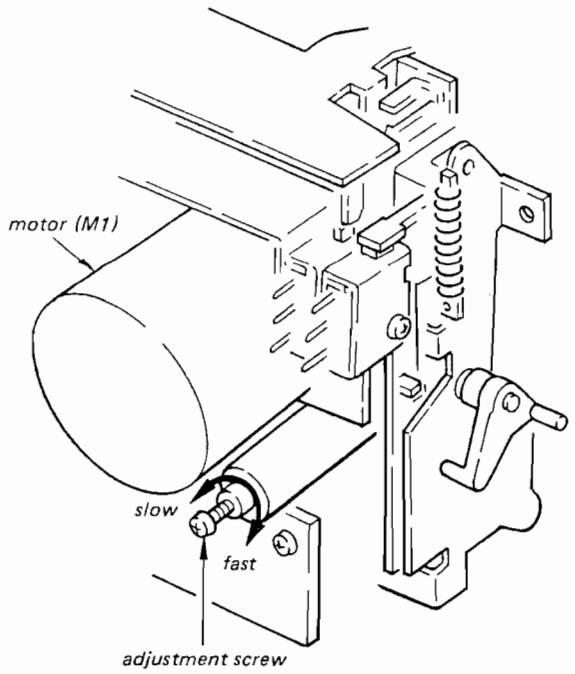




Cassette Holder Opening/Closing Speed Adjustment

1. Insert a CHF-90 or equivalent tape (in terms of weight).
2. Adjust the adjustment screw so that the time required for the cassette holder is 0.4 – 1.0 seconds when the EJECT button is depressed.

Adjustment Location:



3-2. ELECTRICAL ADJUSTMENTS

Note: The adjustment should be performed in the order given in this service manual. (Playback section may be adjusted earlier than record section.)
The adjustments should be performed for both L-CH and R-CH.

NOTE:

- The mechanical parts with no reference number in the exploded views are not supplied.
- Items marked " ♦ " are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.
- If there are two or more same circuitsin a set such as a stereophonic machine, only typical circuit parts may be indicated and capacitors and resistors in other same circuits may be omitted.

CAPACITORS:

MF:μF, PF:μμF.

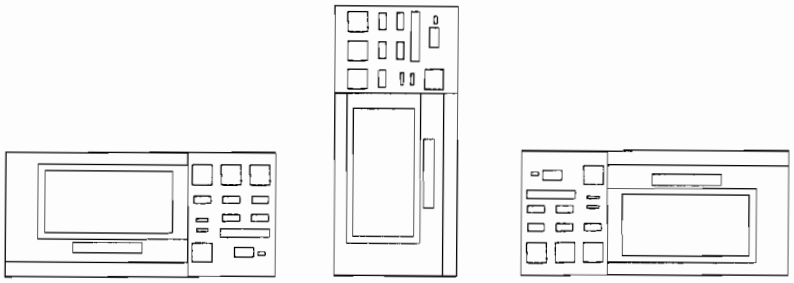
NOTES ON REPAIR

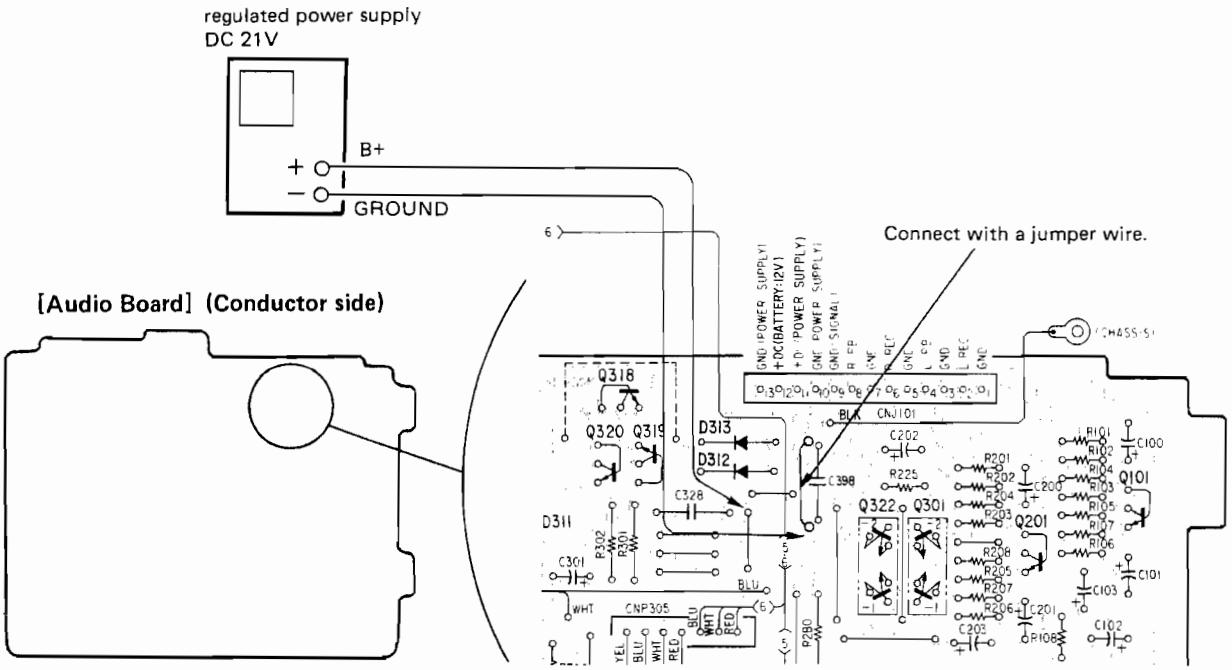
When the mechanism is operated with the set in an upside-down position, misoperation may result. For repair while operating the mechanism, perform with the set in its normal position or standing on its side.



good good wrong

[To apply B+ voltage in repair]

The power supply voltage of this unit is fed from AC-78II via TA-78II.
There are two ground lines for signal and power supply circuits, which are not connected in this unit. When this unit alone operates, connect the two ground lines with a jumper wire and a regulated power supply as illustrated.
After repairing, remove the jumper wire connected.



- Refer to the service manual of TC-78 for the circuit description and the mechanical operation.
  (They are identical to those of TC-78.)

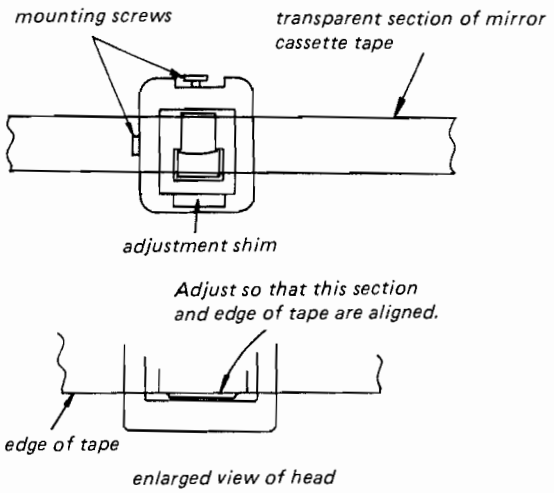
Head Height Adjustment

The following adjustments should be made when the record/playback head is replaced.

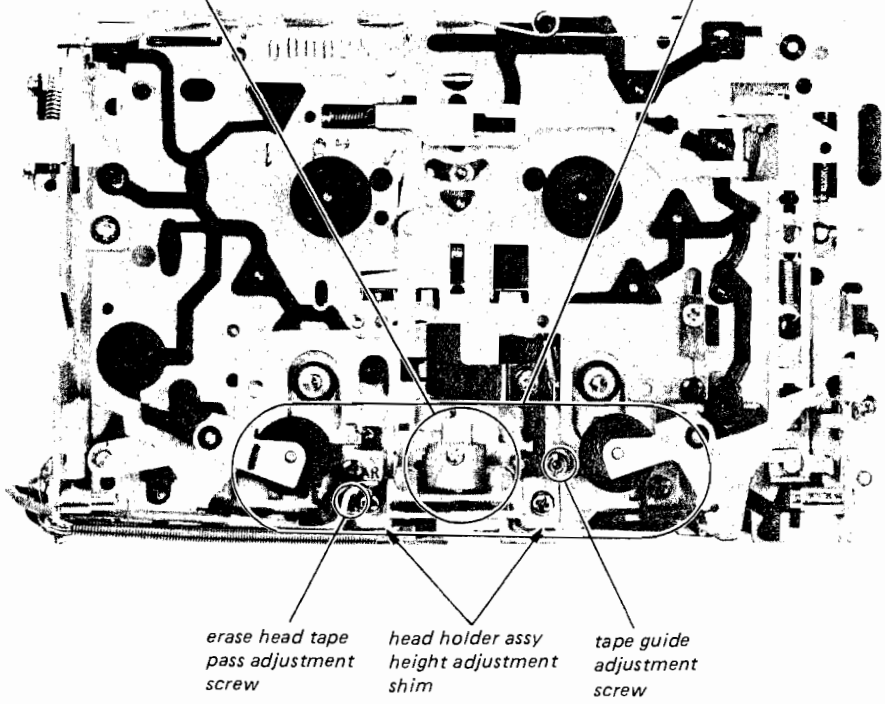
1. The head should be made after removing the head pad of the mirror cassette tape.
2. Using the leader section of the mirror cassette tape, adjustments are made by changing the adjusting shim so that the core and the edge of the tape become as shown in the illustration below when the tape is moved across the head.



Tape Path Adjustment

When assembling the erase head and head holder, and when replacing the tape guide (L), be sure to perform the following adjustments.

1. Using a mirror cassette, adjust each of the adjustment screws until there is not tape curling.
2. Perform adjustments by changing the height adjustment shim of the head holder assembly and the height adjustment shim of the record/playback head, so that the core of the record/playback head is positioned correctly for both FWD and REV.



SECTION 3
ADJUSTMENTS

3-1. MECHANICAL ADJUSTMENTS

PRECAUTION

1. Clean the following parts with a denatured-alcohol-moistened swab:

record/playback head	pinch roller
erase head	rubber belts
capstan	idlers

2. Demagnetize the record/playback head with a head demagnetizer.
3. Do not use a magnetized screwdriver for the adjustments.
4. After the adjustments, apply suitable locking compound to the parts adjusted.
5. The adjustments should be performed with the rated power supply voltage (dc 2.5V) unless otherwise noted.

Torque Measurement

Torque	Torque meter	Meter reading
FWD	CQ-102C	28 – 60 g·cm (0.39 – 0.83 oz·inch)
FWD Back tension	CQ-102C	2 – 8 g·cm (0.03 – 0.1 oz·inch)
REV	CQ-102R	28 – 60 g.cm (0.39 – 0.83 oz·inch)

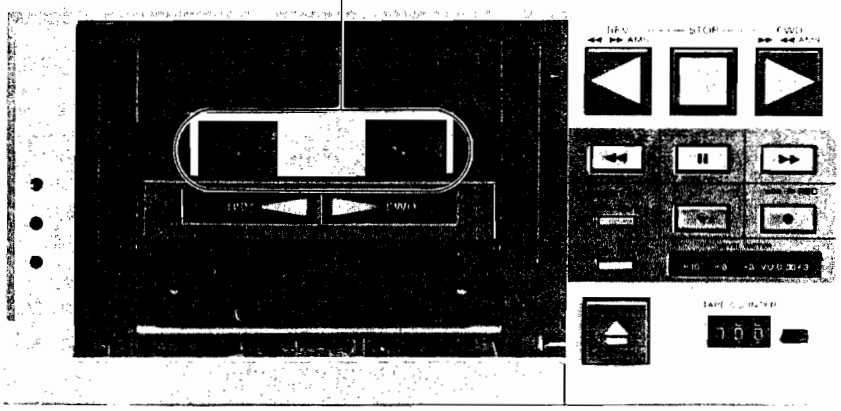
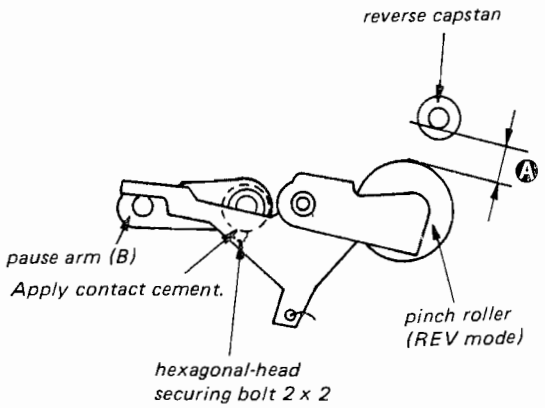
FF, REW	CQ-201B	80 – 165 g·cm (1.1 – 2.28 oz·inch)

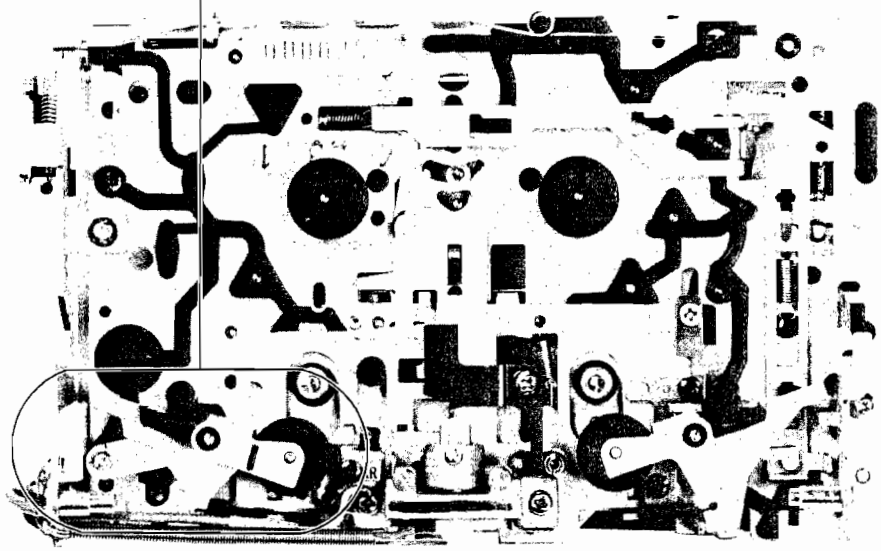


Pause Arm Position Adjustment

1. With the deck in the REV mode.
2. Loosen the hexagonal head securing bolts and adjust the position of the pause arm B so that the dimension of Ⓐ below becomes 0.5mm – 1.0mm.

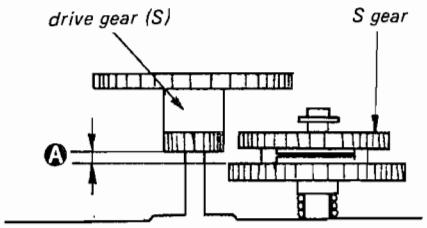


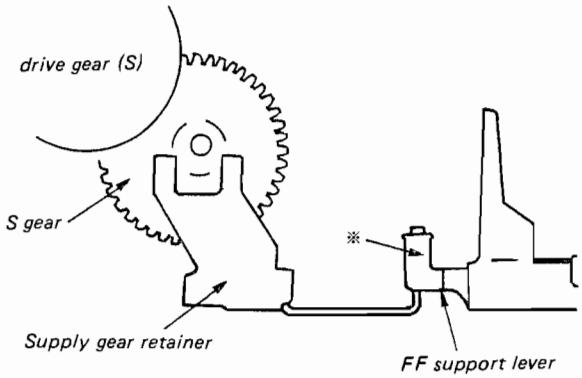
3. After the adjustment, lock the screws with contact cement.

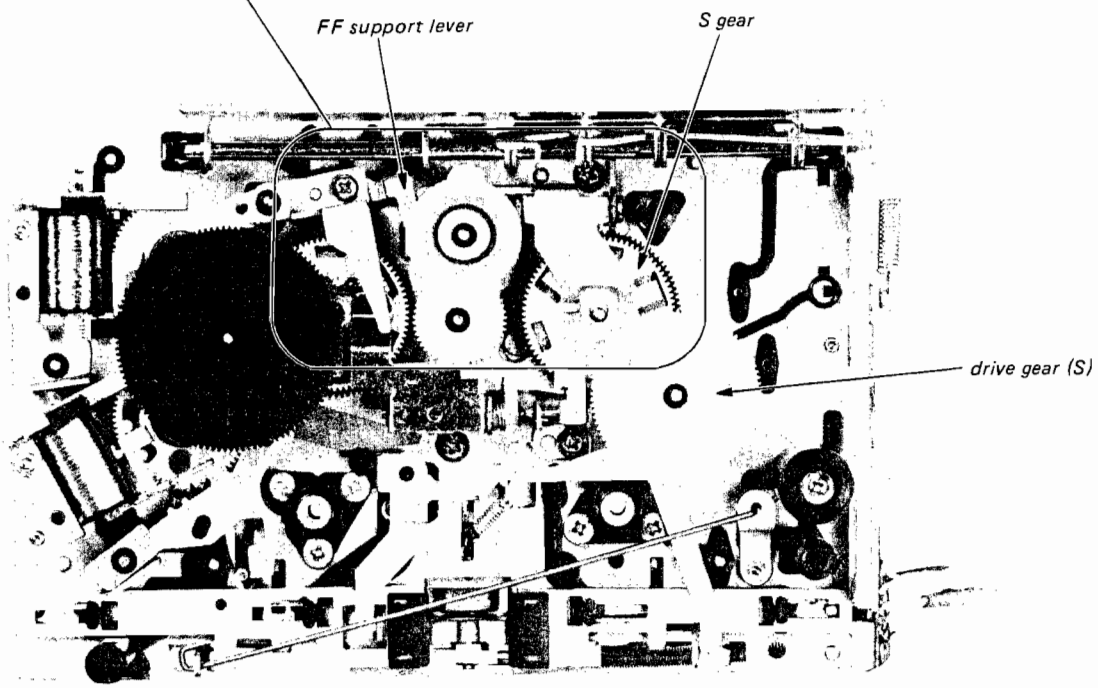


Supply Gear Retainer Position Adjustment

1. With the deck in the REV mode.
2. Bend the FF supplementary lever at the place indicated by the asterisk (※) to make adjustments so that the dimension of Ⓐ is 1mm, ±0.5mm.







3-2. ELECTRICAL ADJUSTMENT

Note: The adjustment should be performed in the order given in this service manual. (Playback section may be adjusted earlier than record section.)
The adjustments should be performed for both L-CH and R-CH.

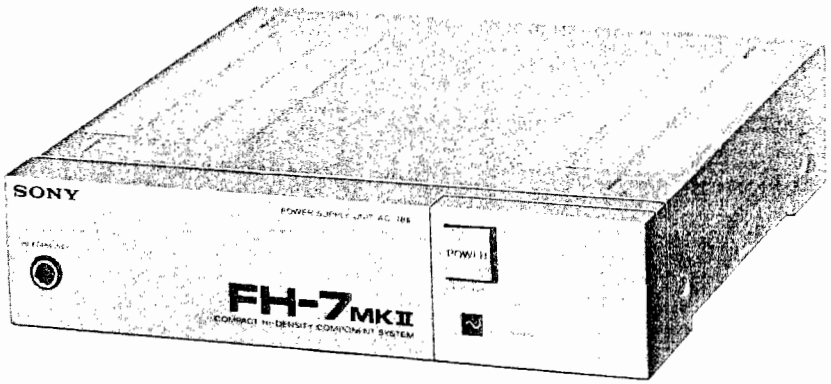
POWER SUPPLY UNIT
[AC-78II]



Note: AC-78II is a power supply unit in FH-7 MKII.

CIRCUIT DESCRIPTION

Shift Circuit

In the case of a conventional amp, high voltage is required to obtain large output, and even during small output, high voltage continues to be supplied.
The heat produced from the amplifier is proportional to the voltage applied.
However, all the unneeded voltage changes into heat. It is disadvantageous for a low-output amplifier such as this unit.
The shift circuit on this model is employed to limit the high voltage supplied during small output to the minimum necessary, and control heat.

Shift Circuit Operation

The output signals from both channels of the TA-78II power amplifier enter D101 – 104, and are separated into plus and minus output by this circuit.

The detected output signal enters IC101, where it is compared with the level set at IC101 and the TA-78II output signal detected from D101 – 104.

During small output (approx. 5W), IC101 output goes low. At this time shift drive (Q101 – 104) all go off, and no bias is applied to Q105, Q106, which also go off, so +Vcc (AEP, UK, E MODEL: +19V, US, Canadian MODEL: +22.7V) and –Vcc (AEP, UK, E MODEL: –19V, US, Canadian MODEL: –22.7V) pass through D107, D108 respectively and are supplied to the power amplifier.
During large output (approx. 28W), IC101 output goes high. At this time shift drive (Q101 – 104) all go on, as do Q105, Q106.
±Vcc passes through Q105, Q106, becomes +Vcc (approx. +24.5V) and –Vcc (AEP, UK, E MODEL: approx. –24V, US, Canadian MODEL: approx. –24.5V) and is supplied to the power amplifier. +Vcc (AEP, UK, E MODEL: +19V, US, Canadian MODEL: +22.7V) and –Vcc (AEP, UK, E MODEL. –19V, US, Canadian MODEL: –22.7V) are cut by D107, D108 being reverse biased.

Notes on Repair

On this model's shift circuit, ±Vcc voltage changes according to the increase and decrease of the TA-78II output signal.

This indicates that the shift circuits operating properly. To check shift circuit operation, refer to the chart below.
