# 1 Getting Started – Quick Guide to Access Contactless Cards

This document is intended as a guide for software developers who want to integrate contactless memory or CPU cards using OMNIKEY CardMan 5x21 smart card readers.

This chapter describes how to install the drivers necessary to operate the CardMan 5x21 in a Windows based environment. Please note that other operating systems such as Linux are also supported by the CardMan 5x21.

## 1.1 Driver Installation

The OMNIKEY CardMan 5x21 driver is mandatory for all systems that require support for contactless smart cards.

CardMan 5x21 is a CCID compliant device. This means that the contact interface can be operated without an OMNIKEY proprietary driver installed. However, for contactless cards, the OMNIKEY proprietary CardMan 5x21 driver is necessary.

The following steps describe how to install the CardMan 5x21 driver:

**1.** First, go to <u>www.omnikey.com</u>. Then, select the support/download section and download the latest CardMan 5x21 driver installation package for Windows.

**2.** Run the installation package and follow the instructions on the screen. The installation package will extract all the necessary driver files to your hard drive. Please note the location to which the files were copied. Please note that at this time you have only extracted, not installed the driver files.

3. Connect the reader to a USB Port of your computer.

4. The "Found New Hardware Wizard" will appear. To continue driver installation, click "Next".

Note: On Windows XP systems, the Microsoft Windows CCID Class driver may be activated without showing the "Found New Hardware Wizard". If this is the case, the Microsoft PC/SC driver` must be replaced manually with the OMNIKEY proprietary PC/SC driver. This can be done using the Device Manager.

5. In the next dialogue, choose "Search for a suitable driver for my device (recommended)" and click "Next".

Title:	CardMan 5x21-CL Reader De	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	5 of 67	Printed:	18.09.07 08:17

6. Now, choose "Specify a Location" and click "Next".

Found New Hardware Wizard
Locate Driver Files Where do you want Windows to search for driver files?
Search for driver files for the following hardware device:
Smart Card Reader USB
The wizard searches for suitable drivers in its driver database on your computer and in any of the following optional search locations that you specify. To start the search, click Next. If you are searching on a floppy disk or CD-RDM drive, insert the floor disk v CD before clicking Next.
Optional search locations: Floppy disk drives D-RDM drives
Specify a location     Microsoft Windows Update
< Back Next > Cancel

**7.** Press "**Browse**" and go to the location where you previously installed the driver package. To continue press "**OK**".

8. If the driver was found in this location press "Next" to continue.

ound New Hardware Wizard
Driver Files Search Results The vicard has finished searching for driver files for your hardware device.
The wizard found a driver for the following device:
GardMan 5121
Windows found a driver for this device. To install the driver Windows found, click Next.
c: \temp\cardman5121 pcsc driver v1.1.0.22\comuDvdm.in/
< <u>Back</u> Cancel

**9.** If the driver is a test driver (a BETA driver that is not digitally signed), the following dialogue will appear. It can be accepted by clicking "**Yes**".

Title:	CardMan 5x21-CL Rea	ader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	6 of 67	Printed:	18.09.07 08:17

**10.** The following message should appear and the green LED on the CardMan 5x21 reader should light up.

pgrade Device Driver Wizar	d
	Completing the Upgrade Device Driver Wizard
	Windows has finished installing the software for this device.
	To close this wizard, click Finish.
	< Back. Finish Cencel

If the installation was successful, the green LED on the reader will light up and the reader will be listed in the diagnostic tool as "CardMan 5x21". Now your reader is ready for use and you can do a quick smart card system check using the OMNIKEY Diagnostic Tool described in the chapter entitled "Diagnostic Tool".

## 1.1.1 Reader Name for Contact/Contactless Slot

OMNIKEY CardMan 5x21 is a "dual slot" reader. This means that from the application and smart card resource manager point of view there are two readers available, each represented by its respective reader name. "OMNIKEY CardMan 5x21 n" identifies the contact slot and "CardMan 5x21-**CL** n" stands for the contactless slot. The "n" represents a slot number 0, 1…, etc. This allows card tracking though contact and air interface, respectively.

## 1.2 Diagnostic Tool

The OMNIKEY Diagnostic tool is a great tool for a quick test of the smart card system. It lists all available OMNIKEY readers, driver files with version information, firmware version information, and also allows the configuration of the RFID/air interface.

'Diagnostic Tool' can be started from the **Control Panel**.

Title:	CardMan 5x21-CL Reader	Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	7 of 67	Printed:	18.09.07 08:17

## 1.2.1 Driver Version Detection

The **General** Tab shows if the 'Resource Manager' is running. Select this tab to find out more about version and manufacturer data of smart card system services, DLLs, and drivers.

🗮 Diagnostic Tool for Card	Man			×

			1
Installed APIs			
FileName	Version	API Name	1
scardsyn.dll	1.1.1.1	Synchronous API	

Diagnostic Tool, API Tab

#### 1.2.3 Card and Reader Detection

The OMNIKEY Diagnostic tool creates a separate tab for each available OMNIKEY reader interface. The tabs indicate their respective reader names - the same names you will be using within the PC/SC framework.

Title:	CardMan 5x21-CL Reader De	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	8 of 67	Printed:	18.09.07 08:17

For a quick connectivity test of your contactless card, select the "OMNIKEY CardMan 5x21-CL 0" tab and place a contactless card on the reader. As soon as the card is detected, the **Status** field will switch from "no smart card inserted" to "smart card inserted" and the **ATR** field will display the card's ATR. Please refer to the chapter about ATR for further information on how the Answer to Reset (ATR) is generated for contactless smart cards.

The Diagnostic Tool has an internal flat database that allows a quick lookup of the ATR. If it is a known card, a description will be displayed in the **Smart Card Name** field. For contactless cards the card's unique ID (UID) will be displayed in the **Smart Card Name** field and in the **Protocol** field T=CL will be displayed.

## 1.2.4 Card Type Detection and RFID Settings

CardMan 5x21-CL supports multiple 13.56MHz contactless standards and protocols, including but not limited to, ISO14443A, ISO14443B, ISO15694, iCLASS, I-CODE. As there is no physical card switch, the only way to get information about a card in the field is by trial and error in a predefined search order. The built-in anti-collision mechanisms ensure that, once a card is detected, it is the only card the reader interface is connected with.

The OMNIKEY Diagnostic tool has an RFID Settings tab that allows configuration of the card types the reader should look for and their respective search order. However, the RFID Settings tab must first be enabled by right-clicking on the title bar of the Diagnostic Tool window and then choosing **View->RFID settings** from the drop-down menu.

	<b>E Diagn</b> General	×	C Tool for Corr Verschieben Schließen	dMap Alt+F4	121 0]

Search type and order ICLAS15693 ICODE1 ISD14443A ISD14443A ISD14443B STM14443B STM14443B		Available cards	Reset

Diagnostic Tool, RFID settings Tab

The left window pane contains a list of all active card types. The right window pane contains a list of all available card types that are supported by the reader but are not included in the card search. Card types from the left window pane can be moved to the right window pane, and vice versa, using the search order in the active list can be changed.

The setting has to be activated using the **Apply** button. The **Reset** button discards any unsaved changes.

Note: The search order is forward-looking to improve system performance. This means that the last successfully detected card type automatically moves to the top of the search order, regardless of its position within the order set on the RFID settings tab.

Title:	CardMan 5x21-CL Reader	Developer's	Guide	Version:	1.13

## 1.2.5 Air Interface Baud Rate Configuration

For ISO 14443 type cards the air interface transmission speed can be 106 kbps, 212 kbps, 424 kbps, or 848 kbps. By default, the contactless interface is set to 424 kbps. It can be changed to a different value through the RFID settings tab of the Diagnostic Tool.

# 2 PC/SC 2.0

With the OMNIKEY CardMan 5x21 PC/SC driver, ISO14443A/B or ISO15693 compliant contactless cards can be accessed through the same framework as ISO7816 compliant contact cards. This makes card integration a snap for any developer who is already familiar with PC/SC. Even valuable PC/SC resource manager functions, such as card tracking, are available for contactless card integration.

The Microsoft Developer Network (MSDN) Library contains valuable information and a complete documentation of the SCard API within the MSDN Platform SDK: "Security" section.

Contactless CPU cards can be accessed directly via PC/SC. For storage cards other than Mifare cards, an additional library - the OMNIKEY synchronous API - is necessary. Whether using direct PC/SC access or the OMNIKEY synchronous API, only a small set of functions is required to write your first "hello card" program.

	Card can be integrated via						
	PC/SC 2.0 compliant APDU's	OMNIKEY Synchronous API					
Mifare	YES	YES					
ICLASS	NO	YES					
LRI64	YES	NO					

#### 2.1 How to Access Contactless Cards via PC/SC

The following steps provide a guideline to create your first contactless smart card application using industry standard. PC/SC compliant API function calls. The function definitions provided below are taken verbatim from the MSDN Library [MSDNLIB]. For additional descriptions of these and other PC/SC functions provided by the Microsoft Windows PC/SC smart card components, please refer directly to the MSDNLIB. The following functions are defined in the Microsoft Platform SDK (Security section).

#### 1. Establish Context

This step will initialize the PC/SC API and allocate all resources necessary for a smart card session. The SCardEstablishContext function establishes the resource manager context (the scope) within which database operations are performed.

LONG SCardEstablishContext( IN DWORD dwScope, IN LPCVOID pvReserved1, IN LPCVOID pvReserved2, OUT LPSCARDCONTEXT phContext);

#### 2. Get Status Change

Next, check the status of the reader for card insertion, removal, or availability of the reader. SCardGetStatusChange. This function blocks execution until the current availability of the cards in a specific set of readers changes. The caller supplies a list of readers to be monitored and the maximum amount of time (in milliseconds) that it is willing to wait for an action to occur on one of the listed readers.

LONG SCardGetStatusChange( IN SCARDCONTEXT hContext,

IN DWORD dwTimeout,

IN OUT LPSCARD READERSTATE rgReaderStates,

IN DWORD cReaders);

Title:	CardMan 5x21-CL Reader Developer's Guide			Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	12 of 67	Printed:	18.09.07 08:17

#### 3. List Readers

Then, get a list of all PC/SC readers using the SCardListReaders function. Look for "OMNIKEY CardMan 5x21-CL 0" in the returned list. If multiple CardMan 5x21 readers are connected to your system, they will be enumerated. Examples: "OMNIKEY CardMan 5x21-CL 1", "OMNIKEY CardMan 5x21-CL 2".

Always make sure to analyze the complete string. CardMan 5x21 also has a contact interface. Look for the "-CL" in the reader mane to make sure that you are really referring to the contactless interface in the following calls.

LONG SCardListReaders( IN SCARDCONTEXT hContext, IN LPCTSTR mszGroups, OUT LPTSTR mszReaders, IN OUT LPDWORD pcchReaders);

#### 4. Connect

Now, you can connect to the card. The SCardConnect function establishes a connection (using a specific resource manager context) between the calling application and a smart card contained by a specific reader. If no card exists in the specified reader, an error is returned.

LONG SCardConnect( IN SCARDCONTEXT hContext, IN LPCTSTR szReader, IN DWORD dwShareMode, IN DWORD dwPreferredProtocols, OUT LPSCARDHANDLE phCard, OUT LPDWORD pdwActiveProtocol);

Note: For iCLASS cards use T=0 protocol (mandatory).

#### 5. Exchange Data and Commands with the Card

Next, exchange command and data via APDUs. The SCardTransmit function sends a service request to the smart card, and expects to receive data back from the card.

LONG SCardTransmit( IN SCARDHANDLE hCard, IN LPCSCARD\_I0\_REQUEST pioSendPci, IN LPCBYTE pbSendBuffer, IN DWORD cbSendLength, IN OUT LPSCARD\_I0\_REQUEST pioRecvPci, OUT LPBYTE pbRecvBuffer, IN OUT LPDWORD pcbRecvLength);

Note: For storage cards that are not supported by PC/SC 2.0, you need to call an OMNIKEY proprietary API function such as **SCardCLICCTransmit** instead. This function exposes additional functionality of the CardMan 5x21-CL reader that is not yet defined in PC/SC standards. Other than that, you are still using the standard PC/SC framework to track cards, list readers, etc. Even the smart card handle is the same.

#### 6. Disconnect

It is not absolutely necessary to disconnect the card after the completion of all transactions, but it is recommended. The SCardDisconnect function terminates a connection previously opened between the calling application and a smart card in the target reader.

LONG SCardDisconnect( IN SCARDHANDLE hCard, IN DWORD dwDisposition);

#### 7. Release

This step ensures that all system resources are being released. The SCardReleaseContext function closes an established resource manager context, freeing any resources allocated under that context.

LONG SCardReleaseContext( IN SCARDCONTEXT hContext);

Title:	CardMan 5x21-CL Reader Developer's Guide				1.13
Created/Modified:	28.08.07 20:01	Page:	13 of 67	Printed:	18.09.07 08:17

## 2.2 ATR Generation

Unlike contact cards, contactless cards don't generate an ATR. They generate an Answer to Select (ATS) instead. To make contactless cards available within the PC/SC framework, CardMan 5x21 generates a PC/SC compliant ATR according to PC/SC v2.01 "Interoperability Specification for ICCs and Personal Computer Systems" [PCSC 2.01].

The documents can be downloaded from the PC/SC Workgroup at the following web address: <a href="http://www.pcscworkgroup.com/specifications/specdownload.php">http://www.pcscworkgroup.com/specifications/specdownload.php</a>

## 2.2.1 CPU Cards

Contactless smart cards (cards with a CPU) expose their ATS or information bytes via ATR mapping according to PCSC 2.01, Part 3: Requirements for PC-Connected Interface Devices, 3.1.3.2.3.1, Table 3.5.

## 2.2.2 Storage Cards

The ATR of storage cards (i.e. cards without a CPU) is composed as described in PCSC 2.01, Part 3: Requirements for PC-Connected Interface Devices, 3.1.3.2.3.1, Table 3.6. In order to allow the host application to identify a storage and card type properly, its standard and card name is mapped according to the Part 3 Supplemental Document of PCSC 2.01.

Note: The Registered Application Provider Identifier (RID) returned by the CardMan 5x21 for storage cards (cards without a CPU) is A0 00 00 06 0A, indicating a PC/SC compliant ATR generation.

Title:	CardMan 5x21-CL Reader Developer's Guide				1.13
Created/Modified:	28.08.07 20:01	Page:	14 of 67	Printed:	18.09.07 08:17

# 3 Accessing Asynchronous Cards

Asynchronous cards are cards with CPU or memory cards that are accessible via standard PC/SC using Microsoft's library "winscard.dll". This type of cards supports at least one of the asynchronous protocols T=0 or T=1. The Microsoft Platform SDK contains PC/SC sample code for Visual C/C++ and Visual Basic.

No additional libraries or third-party software components are necessary to integrate contactless CPU cards.

Title:	CardMan 5x21-CL Reader Developer's Guide			Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	15 of 67	Printed:	18.09.07 08:17

## 3.1 DESFire Card

According to [DESFIRE], DESFire cards can be accessed via ISO7816-4 compliant framed APDU commands (ISO7816-4 framing).

## 3.1.1 Example: Write Card Data via ISO 7816-4 Framed APDU

#### **Command Syntax**

CLA	INS	P1	P2	Lc	File No.	Offset	Length	Data	Le
'90'	'3D'	'00'	'00'	ʻxx'	ʻxx'	ʻxxxxxi	ʻxxxxxi	'xx' 'xx'	'00'

Lc = 7+ DataLength; Le=0 (no other values accepted)

#### **Response Syntax**

Response Data	SW1	SW2
empty	ʻxx'	ʻxx'

#### **Status Codes**

SW1	SW2	Description					
'90'	'00'	success					
'91'	'xx	error (refer to DESFire data sheet)					

## 3.1.2 Example: Read Card Data via ISO 7816-4 Framed APDU

#### **Command Syntax**

CLA	INS	P1	P2	Lc	File No.	Offset	Length	Data	Le
ʻ90'	'3D'	'00'	ʻ00'	'07'	ʻxx'	ʻxxxxxi	'LLLL'	empty	'00'

Le=0 (no other values accepted)

#### **Response Syntax**

Response Data	SW1	SW2
ʻxx' ʻxx' (ʻLLLLLL' bytes)	ʻxx'	ʻxx'

#### **Status Codes**

SW1	SW2	Description					
'90'	'00'	success					
'91'	'xx	error (refer to DESFire data sheet)					

Title:	CardMan 5x21-CL Reader Developer's Guide				1.13
Created/Modified:	28.08.07 20:01	Page:	16 of 67	Printed:	18.09.07 08:17

# 4 Accessing Synchronous Cards (Storage Cards)

OMNIKEY provides two ways to integrate contactless storage cards. They can either be accessed through OMNIKEY's proprietary synchronous API library, or, for cards such as Mifare cards, directly via PC/SC 2.0 compliant function calls. Storage cards that are not supported directly through PC/SC 2.0 compliant APDU exchanges, can only be accessed via OMNIKEY proprietary synchronous API.

The synchronous API for Windows systems resides in a DLL named "scardsyn.dll". It can be downloaded from OMNIKEY's website. The download also contains sample code for Mifare and iCLASS cards. For further information about this API, refer to the help file "cmsync.hlp" available in the c:\omnikey\hlp folder after installation of the synchronous API with default settings.

The OMNIKEY Synchronous API is typically used whenever a card has not yet found its way into the PC/SC 2.0 standard. Currently, only Mifare cards can be integrated via PC/SC 2.0 compliant APDU.

	Card can be integrated via					
	PC/SC 2.0 compliant APDUs	OMNIKEY Synchronous API				
Mifare	Yes	Yes				
iCLASS	No	Yes				

No special drivers are required for a PC/SC 2.0 compliant card integration on Windows or Linux. OMNIKEY's latest drivers provide seamless cross-platform support allowing industry standard-compliant contactless card integration.

## 4.1 Mifare Card

CardMan 5x21 supports Mifare 1K, Mifare 4K and Mifare Ultra Light cards.

The following functions are supported via PC/SC:

GetUID				
LoadKey				
Authenticate	Implemented according to IPCSC 2.011			
Verify				
Update Binary				
Read Binary				
Increment	OMNIKEY proprietary extension of PC/SC			
Decrement	OMNIKEY proprietary extension of PC/SC			
Mifare Emulation Mode	OMNIKEY proprietary extension of PC/SC CM_IOCTL_SET_RFID_CONTROL_FLAGS			

Please refer to the [PCSC 2.01] and [MIFARE] for documentation of PC/SC 2.0 compliant Mifare card access. The following section only describes usage of functions that are not already documented in [PCSC 2.01]. They are part of an OMNIKEY proprietary extension of PC/SC.

Title:	CardMan 5x21-CL Reader De	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	17 of 67	Printed:	18.09.07 08:17

# 4.1.1 Mifare Increment (Card Command)

This command will increment the value of a block, if the card and block support this functionality: **Command Syntax** 

CLA	'FF'
INS	'D4'
P1	MSB of block address
P2	LSB of block address
LC	1
Data Field	One byte value indicating block increment
Le	empty

## **Response Syntax**

Data Field		Empty
SW1	SW2	status word as described below
'90'	'00'	Success
'65'	'81'	memory failure (unsuccessful increment)
'69'	'81'	incompatible command
'69'	'82'	security status not satisfied
'69'	'86'	command not allowed
'6A'	'81'	function not supported
'6A'	'82'	invalid block address

Title:	CardMan 5x21-CL	Reader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	18 of 67	Printed:	18.09.07 08:17

## 4.1.2 Mifare Decrement (Card Command)

This command will decrement the value of a block, if the card and block support this functionality:

## **Command Syntax**

-	
CLA	'FF'
INS	'D8'
P1	MSB of block address
P2	LSB of block address
LC	1
Data Field	one byte value indicating block decrement
Le	Empty

## **Response Syntax**

Data Field		Empty
SW1	SW2	status word as described below
'90'	'00'	Success
'65'	'81'	memory failure (unsuccessful decrement)
'69'	'81'	incompatible command
'69'	'82'	security status not satisfied
'69'	'86'	command not allowed
'6A'	'81'	function not supported
'6A'	'82'	invalid block address

Title:	CardMan 5x21-CL F	Reader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	19 of 67	Printed:	18.09.07 08:17

## 4.1.3 Mifare Emulation Mode

By default, the CardMan 5x21 driver exposes standard Mifare storage cards through a PC/SC 2.01 compliant interface. This driver-level Mifare emulation mode makes standard Mifare cards available via standard APDUs even though the card itself does not support any asynchronous protocols supported directly by native PC/SC components.

For dual-interface cards things work a little different. Their CPU supports communication via ISO14443A part 4 (T=CL) allowing on-card Mifare emulation rather than host-side Mifare emulation. This means that CardMan 5x21's default mode (i.e. host-side Mifare emulation) must be disabled to support the on-card Mifare emulation of such dial-interface card.

There are two ways to switch between host-side and card-side Mifare emulation: via registry keys or via IO controls using the PC/SC function ScardControl() as described in Appendix <u>A2.8 Mifare</u> <u>Emulation Mode (OMNIKEY Proprietary API)</u>.

The following registry keys let you switch between OMNIKEY Mifare emulation mode (default) and oncard Mifare emulation.

HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\CardMan\RFID

ControlFlags=0x00000004	OMNIKEY's host-side Mifare emulation ON
	default
ControlFlags=0x00000000	OMNIKEY's host-side Mifare emulation OFF
	T=CL, for on-card Mifare emulation

Notes:

- The CardMan 5x21 driver needs to be (re)started after changing the registry keys (disconnect and reconnect the reader).

#### 4.1.4 Mifare Application Directory (MAD)

To access the Mifare Application Directory (MAD), two commands are necessary – Authenticate and Read. The following steps describe how a MAD can be retrieved from a Mifare card:

- 1. Authenticate block 3 with the Public key 'A0A1A2A3A4A5' and authentication mode A.
- 2. Read Block 3.
- 3. Read Block 2.
- 4. Read Block 1.

Title:	CardMan 5x21-CL Reader I	Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	20 of 67	Printed:	18.09.07 08:17

## 4.2 iCLASS Card

HID iCLASS cards can only be accessed through OMNIKEY's proprietary "scardsyn" API. This synchronous API contains a function that is dedicated to accessing contactless cards using the standard PC/SC card handle.

OMNIKEY CardMan 5x21-CL exposes all iClass functions necessary to access any of the application areas on an iClass card. Two modes of communication between the card and the application are supported:

- Standard mode communication
- Secured mode communication (OMNIKEY proprietary mode)

Note: OMNIKEY CardMan 5x21 does not allow **WRITE access to the HID application** (1st application on page 0). For **READ access to the HID application**, secured communication (available for firmware version 5.00 and greater) is mandatory.

## 4.2.1 Card Access via SCardCLICCTransmit

SCardCLICCTransmit is the OMNIKEY proprietary function to access HID iCLASS cards via the OMNIKEY synchronous API. It supports both, standard and secure communication modes and is defined as follows:

```
OKERR ENTRY SCardCLICCTransmit (
```

IN	SCARDHANDLE		ulHandleCard,	
IN	PUCHAR		pucSendData,	
IN	ULONG		ulSendDataBufLen,	
IN	OUT	PUCHAR	pucReceivedData,	
IN	OUT	PULONG	pulReceivedDataBufLen	);

Parameter	Description
ulHandleCard	handle to the card, provided from the PC/SC "smart card resource manager" after connecting to the card with SCardConnect
pucSendData	buffer for data sent to the reader/card, typically a command APDU
ulSendDataBufLen	length of the data to be sent
pucReceivedData	buffer for data received from reader/card, typically data and status
pulReceivedDataBufLen	before the call: length (in bytes) of the receive buffer after the call: number of bytes actually received

Title:	CardMan 5x21-CL Reader D	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	21 of 67	Printed:	18.09.07 08:17

#### **Command Syntax**

CLA	INS	P1	P2	Lc	Input Data or Datagram***	Le
'8x'	ʻxx'	ʻxx'	ʻxx'	ʻxx'	ʻxx' ʻxx' (Lc bytes)	ʻxx'

#### **Response Syntax**

Response Data or Datagram	SW1	SW2
'xx' 'xx' (Le or max bytes)	ʻxx'	ʻxx'

## **Status Codes**

SW1	SW2	Description
'90'	'00'	success
'64'	'00'	card execution error
'67'	'00'	wrong length
'68'	'00'	invalid class (CLA) byte
'69'	'82'	security status not satisfied. This can include wrong data structure, wrong keys, incorrect padding.
'6A'	'81'	invalid instruction (INS) byte
'6B'	'00'	wrong parameter P1 or P2

The error codes defined in the table above are valid for all the commands. Command specific error codes are documented with their respective command documentation.

Note: Error code '6982' "security status not satisfied", received during any secured communication, blocks any further commands and requires that the card be removed and re-inserted to reactivate communication with the card.

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	22 of 67	Printed:	18.09.07 08:17
		9			

## 4.3 ST LRI64 Support (PC/SC 2.0 add-on)

ST Microelectronics' LRI64 is a memory tag IC with 64-bit Unique ID (UID) and WORM user area. The following table lists PC/SC 2.01 compliant functions that are available for LRI64 based storage cards.

Get UID	
Update Binary	implemented according to [PCSC 2.01]
Read Binary	

This ISO15693 compliant IC is not accessible with standard standard driver settings. It requires the following registry key setting:

#### [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\CardMan\RFID]

#### "ControlFlags"=dword:0000010

Please refer to the [PCSC 2.01] and [LRI64] for documentation of PC/SC 2.0 compliant LRI64 card access. The following section only describes usage of functions that are not already documented in [PCSC 2.01].

## 4.3.1 Update Binary

UpdateBinary requires block numbers within the WORM memory area (Write-Once Read-Many).

Examples:

Write '121314' to block '0D' (decimal 12): Command APDU: 'FFD6000D03121314' Response APDU : '9000'

#### Attempt to write '101112 to block '0A' (10 decimal):

Command APDU: 'FFD6000A03101112' Response APDU: '6282'

For blocks 10 and 11 this works out fine, however, because we previously wrote to block 12, the card responds with '6282' "End of file reached before writing Lc bytes". After the first write access to block 12 only read operations are supported.

#### The following APDU attempts to write to block 7:

Command APDU: 'FFD6000701FF' Response APDU : '6581'

The card responds with '6581' "Memory failure (unsuccessful writing)" because this is a UID byte - write access to the UID area is always locked.

#### 4.3.2 Read Binary

The ReadBinary command is available for all blocks of the LRI64 chip.

Examples:

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	23 of 67	Printed:	18.09.07 08:17

#### Reading all 15 blocks from 0 to 14

Command APDU: 'FFB0000000' Response APDE : 'xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000'

## Attempt to read 16 blocks

Command APDU: 'FFB0000010' Response APDE: 'xxxxxxxxxxxxxxxxxxxxxxxxxx2282'

The response is '6282' or "End of file reached before reading expected number of bytes". Even though the warning '6282' is returned, all bytes from block 0 up to block 14 are read correctly.

#### Read blocks 10 and 11 (2 bytes)

Command APDU: 'FFB0000A02' Response APDE : 'xxxx9000'

#### Attempt to read an invalid block number:

Command APDU:	'FFB0000F01'
Response APDE :	'6A82'

The response is the error code '6A82' because block number 15 does not exists.

Title:	CardMan 5x21-CL Re	ader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	24 of 67	Printed:	18.09.07 08:17

# 5 CardMan 5x21-CL Keys

OMNIKEY CardMan 5x21-CL has a set of built-in cryptographic keys, some of which are implemented in volatile memory others in non-volatile memory.

## 5.1 Key Numbering Scheme

Cryptographic keys are referenced by a unique key number between 0x00 and 0xFE. Each key number refers to a key of pre-defined length for a specific card type. For cards such as Mifare and iCLASS, multiple key numbers are reserved.

The OMNIKEY key number is used to determine key usage, key length, and to map the reader key to the third party card key.

Examples:

CardMan Key number '0A' refers to the 6 byte Mifare key 10, K<sub>MIF10</sub>

CardMan Key number '24' refers to the 8 byte iCLASS Default key for application 1 on page 1

Refer to [MIFARE] and [ICLASS] for detailed documentation of these third-party keys and contact your card manufacturer in case you need information about any key values.

Key Number	Key Name	Key Length	Кеу Туре	Memory Type
	6-byte (Mifare) key	S		
'00' to '1F'	$K_{\text{MIF0}}$ (Mifare Key 0) to $K_{\text{MIF31}}$ (Mifare Key 31)	6 bytes	Card Key	Non- volatile memory
	8-byte (iClass) key	S		
'20'	K <sub>IAMC</sub> (Any Inside Application Master key)	8 bytes	Card Key	Non- volatile memory
'21'	$K_{MDC}$ HID Master Key ( $K_{MD0}$ , Kd for application 1 of page 0 on Book 0 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'22'	RFU (previously used for HID Master Key $K_{MDO}$ )	8 bytes	Card Key	Non- volatile memory
'23'	$K_{\text{MC0}}$ (Default Master Key for application 2 of page 0 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'24'	$K_{MD1}$ (Default Master Key for application 1 of page 1 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'25'	$K_{MC1}$ (Default Master Key for application 2 of page 1 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'26'	$K_{MD2}$ (Default Master Key for application 1 of page 2 of iCLASS card)	8 bytes	Card Key	Non- volatile memory

## **Keys Numbers and Key Names**

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	25 of 67	Printed:	18.09.07 08:17

'27'	$K_{MC2}$ (Default Master Key for application 2 of page 2 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'28'	$K_{MD3}$ (Default Master Key for application 1 of page 3 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'29'	$K_{\text{MC3}}$ (Default Master Key for application 2 of page 3 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
ʻ2A'	$K_{\text{MD4}}$ (Default Master Key for application 1 of page 4 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'2B'	$K_{MC4}$ (Default Master Key for application 2) of page 4 of iCLASS card	8 bytes	Card Key	Non- volatile memory
'2C'	$K_{MD5}$ (Default Master Key for application 1 of page 5 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'2D'	$K_{\text{MC5}}$ (Default Master Key for application 2 of page 5 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'2E'	$K_{MD6}$ (Default Master Key for application 1 of page 6 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'2F'	$K_{MC6}$ (Default Master Key for application 2 of page 6 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'30'	K <sub>MD7</sub> (Default Master Key for application 1 of page 7 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'31'	K <sub>MC7</sub> (Default Master Key for application 2 of page 7 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'32'	K <sub>MTD</sub> (Master Transport Key for application 1 of iCLASS card, key stored at chip production)	8 bytes	Card Key	Non volatile memory
'33'	K <sub>MTC</sub> (Master Transport Key for application 1 of iCLASS card, key stored at chip production))	8 bytes	Card Key	Non- volatile memory
'34'	K <sub>MD0B1</sub> (Default Master Key for application 1 of page 0 on Book 1 of iCLASS card)	8 bytes	Card Key	Non- volatile memory
'35''7f'	RFU			
	16-byte keys			
'80'	K <sub>CUR</sub> (Custom read key)	16 bytes	Reader Key	Non- volatile memory
'81'	K <sub>CUW</sub> (Custom write Key)	16 bytes	Reader Key	Non- volatile memory

Title:	CardMan 5x21-CL Rea	der Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	26 of 67	Printed:	18.09.07 08:17

'82'	K <sub>ENC</sub> (Card data encryption key)	16 bytes	Card Key	Non- volatile memory				
	24- byte keys							
'B0''CF'	RFU							
	32-byte keys							
'D0''DF'	RFU							
	0xF0 to 0xFF are volatile keys							
0xF0	K <sub>VAK</sub> (volatile application key)	8 bytes	Card Key	Volatile memory				
'F1''FF'	RFU							

Note: CardMan 5x21 firmware version 5.00 is the first to support all keys listed above. Readers with firmware version 1.03 and 1.04 only support key numbers 0x20 and 0xF0.

Key number 0x21 to Key number 0x31 (except 0x22) are the default keys for iCLASS cards. Key number 0x32 and 0x33 are the default transport keys for Inside cards.

Keys 0x21 and 0x22 are stored in the reader. The remaining non-volatile keys 0x23 to 0x33 are stored in the registry.

Key 0x21 can't be updated. Updates of key 0x22 are RFU and currently not supported.

## 5.2 Key Container and Key Slots

The CardMan 5x21-CL key container is organized in fixed-length key slots. These key slots allow easy usage of cryptographic keys. It is thus not necessary that the host application knows anything about the physical storage location. Keys can be loaded into a key container just by referring to a key slot and a key number. Key access and usage are managed by the reader firmware. For security purposes, keys can only be used and updated, but they can never be read. As an additional security measure, keys are diversified with two 16-byte secret keys before being committed to a key container.

Key slot properties are available for advanced users. This feature is designed to ensure proper use of a single key in case there are more keys than key slots.

Key Slot (KS) Number	KS Length	Default Stored Key Name	Default Stored Key Number	Remarks
<b>'00'</b>	12	K <sub>MIFO</sub>	'00'	No key slot information is
	12			available for these key slots. Retrieving information will return
'1F'	12	K <sub>MIF31</sub>	'1F'	SW1SWŽ "6300".
<b>'20'</b>	16	K <sub>CUR</sub>	'80'	Key slot information is available.
'21'	16	K <sub>cuw</sub>	'81'

'38'	08	K <sub>MD0B1</sub>	'34'	

# 5.3 Key Update Rules

The following table lists update rules for keys being used by the reader system. Key updates relate to keys residing in the OMNIKEY reader. Those keys are used for authentication of the reader to the card or to encrypt data written to the card.

Key Name	Key Number	Key Update Rule	Description
К <sub>МІF0</sub> to К <sub>МІF31</sub>	'00' to '1F'	Always	6-byte Mifare keys can be loaded/updated by using the <b>SCardCLWriteMifareKeyToReader</b> function of synchronous API. A key sent to reader may be plain or 3-DES encrypted with the $K_{CUR}$ or $K_{CUW}$
KIAMC	'20'	Standard Mode: - Always Secured Mode: - Read session - Write session	8-byte iCLASS key to authenticate any iCLASS application. The default value for this key is the Inside contactless card transport key Kd0 (authenticates to application 1 on page 0).

Title:	CardMan 5x21-CL F	Reader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	28 of 67	Printed:	18.09.07 08:17

K <sub>MDC</sub>	'21'	Never	Authenticates the reader to the HID application of an iCLASS card for read access. This authentication requires secure mode operation. Write access to the HID application is not allowed.
K <sub>MDO</sub>	'22'	Never	RFU
K <sub>CUR</sub>	'80'	Secured mode: - read session - write session	Authenticates the reader to establish a secured session. Grants the application read access. This key can also be used to encrypt the Mifare key in <b>SCardCLWriteMifareKeyToReader function</b> .
K <sub>cuw</sub>	'81'	Secured mode: - read session	Authenticates the reader to establish a secured session. Grants the application read-only access. This key can also be used to encrypt the Mifare key in <b>SCardCLWriteMifareKeyToReader function</b> .
K <sub>enc</sub>	'82'	Secured mode: - read session - write session	Encrypts data written to the card or decrypts data read from the card. Requires read/update INS bits to be set accordingly. If INS bits are set for DES, the first 8 bytes of $\mathbf{K}_{\text{ENC}}$ are used. For 3-DES operations, all 16 bytes are used.
К <sub>VAK</sub>	'F0'	Standard Mode: - Always Secured Mode: - Read session - Write session	Authenticates any application on the iCLASS card. The sequence is as follows: Load $K_{VAK}$ with the 8-byte value, Authenticate with $K_{VAK}$ Load $K_{VAK}$ with new 8-byte value, Authenticate with $K_{VAK}$
K <sub>MC0</sub> to K <sub>MC7</sub> K <sub>MD1</sub> to K <sub>MD7,</sub> and K <sub>MD0B1</sub>	'23' to '31' and '34'	Never	iCLASS default keys for free memory zones. May be used to authenticate to any non-HID application on an iCLASS card. This allows quick evaluation of iCLASS cards without knowledge of the default keys.
K <sub>MTD</sub> . K <sub>MTC,</sub>	'32' '33'	Never	iCLASS transport keys set by the card manufacturer.

Title:	CardMan 5x21-CL Re	eader Developer's	Guide	Version:	1.13

# 6 Standard Communication with iCLASS Card

Standard communication means that there is no authentication of the host application (i.e. Windows program) to the CardMan 5x21-CL. Unless the card itself has a built-in mechanisms for confidential communication, the channel between host and reader is unprotected, exposing the connecting USB cable to eavesdropping.

## 6.1 APDU Structure for Standard Communication

iCLASS cards are supported via ISO7816 compliant APDU exchange. Command and response APDUs are exchanged through the OMNIKEY proprietary API function SCardCLICCTransmit residing in the OMNIKEY synchronous API.

#### Command APDU (via pucSendData)

CLA	INS	P1	P2	Lc	Data in	Le
'80'	ʻxx'	ʻxx'	ʻxx'	'xx'	'xx' 'xx'	ʻxx'

#### Response APDU (via pucReceivedData)

Data out	SW2	SW1
'xx' 'xx'	ʻxx'	ʻxx'

## 6.2 Commands Available in Standard Communication Mode

Card commands are referred to by their respective instruction (INS) byte as part of a command APDU sent by SCardCLICCTransmit. The following table lists all INS values supported by the OMNIKEY CardMan 5x21-CL reader in standard communication mode.

Title:	CardMan 5x21-CL R	eader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	30 of 67	Printed:	18.09.07 08:17

Instruction (INS)	Description	Command Type
'82'	Load Key	reader command
'C4'	GetKeySlotInfo	reader command
ʻA6'	Select Page	card command
'88'	Authenticate	card command
'B0'	Read	card command
'D6'	Update	card command

#### List of Supported INS bytes (APDU Commend Set)

## 6.2.1 Select Page (Card Command)

iCLASS comes with various card configurations. Every iCLASS card has at least one page (page 0). Cards such as the iCLASS 2x8KS, provide additional pages 1 to 7. In addition to pages, iCLASS cards also have books. To select a certain memory block on an iCLASS card, you need to know its book number, page number, and block number.

It is necessary to select the appropriate page and book before any authentication to an iCLASS card application for read/write access can be performed. In the context of iCLASS cards, an application area and memory area are synonymous.

Currently, only cards with more than 16 kbit of total memory capacity have an additional book. The following section describes parameters of the Select Page command.

CLA	'80'
INS	ʻA6'
P1	'00': Select the only page of iCLASS 2KS or single page of 16KS '01': Select page of multi-page iCLASS 16KS (8x2KS) or 32KS
P2	Specifies whether data is requested from the card '00': no data requested '04': request for 8-byte card serial number '08': request for 8-byte configuration block data '0C': request for 8-byte application issuer data
LC	for P1='00': standard mode: empty; secured mode: '00' for P1='01': '01'
Data Field	for P1='00': empty for P1='01': book number and page number according to format below
Le	for P2='00': empty for P2>'00': '00' or '08'

#### **Command Syntax**

#### **Data Field Format for Page Number & Book Selection**

b7	b6	b5	b4	b3	b2	b1	b0
0	0	0	Book number 0: for 1 <sup>st</sup> book 1: for 2 <sup>nd</sup> book on iCLASS 32KS	0	Pa	ge number	0-7

Examples for Page Selection:

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	31 of 67	Printed:	18.09.07 08:17

Data Field	Description
'03'	select page 3 of an iCLASS 8x2KS card
'03'	select page 3 of book 0 of an iCLASS 32KS (book 0: 8x2KS) card
'13'	select page 3 of book 1 of an iCLASS 32KS (book 1: 8x2KS) card
'10'	select book 1 (16KS) of an iCLASS 32KS
'00'	select book 0 (16KS) of an iCLASS 32KS

## **Response Syntax**

Data Field		empty or 8 byte card response, in case of a previous request for such data
SW1	SW2	status word as described below
'90'	'00'	Success
'62'	'83'	requested page number does not exist
'6C'	ʻxx'	wrong length Le. xx returns the number of data available

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

Note: If the application resides on page 0 of an 8x2KS iCLASS card or on the single page of an iCLASS 16KS or iCLASS 2KS card, the Select Page command is not necessary. It can still be helpful to call Select Page anyway, in case you need to retrieve the card serial number, configuration block, or application issuer data.

Title:	CardMan 5x21-CL	Reader Developer's	Guide	Version:	1.13
Created/Modified	28.08.07 20:01	Page:	32 of 67	Printed:	18.09.07 08:17

## 6.2.2 Load Key

Load Key command loads an iCLASS card key and stores it in reader memory, thus preparing the reader for subsequent card authentication commands. CardMan 5x21 can only store one such key at a time.

#### **Command Syntax**

CLA	'80': standard mode operation '84': secured mode operation
INS	'82'
P1	'xx' specifies key location according to byte format below
P2	'xx' key number (see Key Numbering Scheme)
LC	ʻ08'
Data Field	8 byte key
Le	Empty

## P1 - Format for Key Location

b7	b6	b5	b4	b3	b2	b1	b0	Description
х								0: card key 1: reader key
	х							0: plain transmission 1: secured transmission (not available)
		х						0: key loaded in volatile memory 1: key loaded in non-volatile memory.
			х					0: RFU (non-zero value returns error)
				0	0	0	0	b0b3 must be set to 0

Note: A key in volatile memory only needs to be loaded once during any given card session. Unless you need to authenticate to any additional application with a different key, you can use the stored key throughout the session for more than just one authentication.

Title:	CardMan 5x21-CL F	Reader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	33 of 67	Printed:	18.09.07 08:17

## **Response Syntax**

Data Field		empty
SW1	SW2	status word as described below
'90'	'00'	success
'63'	'00'	no further information given (warning)
'63'	'81'	loading/updating is not allowed
'63'	'82'	card key not supported
'63'	'83'	reader key not supported
'63'	'84'	plaintext transmission not supported
'63'	'85'	secured transmission not supported
'63'	'86'	volatile memory is not available
'63'	'87'	non-volatile memory is not available
'63'	'88'	key number not valid
'63'	'89'	key length is not correct

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

Title: CardMan 5x21-CL Reader Developer's Guide	Version: 1.13
Created/Modified: 28.08.07 20:01 Page: 34 of 67	Printed: 18.09.07 08:17

## 6.2.3 GetKeySlotInfo (Reader Command)

The GetKeySlotInfo reader command provides access to key slot status information.

OMNIKEY CardMan 5x21-CL provides a set of predefined key slots in the key container. Key slots can easily be loaded with keys by referring to the key number (i.e. key reference) rather than loading the actual 8 byte key by value. The slot for key storage is automatically determined by the reader system.

#### **Command Syntax**

CLA	'80': standard mode operation '84': secured mode operation
INS	'C4'
P1	'00'
P2	'xx' key slot number (see chapter 5.2 Key Container and Key Slots)
LC	standard mode: empty; secured mode: '00'
Data Field	8 byte key
Le	'00' or '02'

#### **Response Syntax**

Data F	ield	2 byte key information see "Key Information" and "Key Access Option" below	
SW1 SW2		status word as described below	
'90'	'00'	success	
'63'	'00'	no further information given (warning)	
'63'	'01'	key slot does not contain valid key or empty key slot	
'62'	'83'	requested key slot does not exist	
'6C'	ʻxx'	more data available than requested; xx returns available data size	

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

#### Key Information (contained in Data Field)

b15	b14	B13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

#### Key Access Option (contained in b9,b8 of Data Field)

b9	B8	Key Access Option			
0	0 key can be loaded for any plaintext and secured transmission.				
0	1	key can only be loaded in OMNIKEY proprietary secured mode			
1	0	key can never be loaded			
1	1	RFU			

Title:	CardMan 5x21-CL R	eader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	35 of 67	Printed:	18.09.07 08:17

## 6.2.4 Authenticate (Card Command)

The Authenticate command authenticates the reader system to the card application of the selected page. For iCLASS authentication, this command requires previous page selection.

## **Command Syntax**

CLA	'80': standard mode operation '84': secured mode operation
INS	'88'
P1	<ul> <li>'xx' key type:</li> <li>'00': Inside Contactless or iCLASS debit key Kd (i.e. application 1)</li> <li>'01': Inside Contactless or iCLASS credit key Kc (i.e. application 2)</li> <li>'60': Mifare Key A</li> <li>'61': Mifare Key B</li> <li>'FF': key type unknown or not necessary</li> <li>all other values: RFU</li> </ul>
P2	'xx' key number (see chapter 5.1-Key Numbering Scheme )
LC	length of address iCLASS: standard mode: empty; secured mode: '00' other cards: '01' or '02' (max 2 address bytes supported)
Data Field	iCLASS: empty other cards: one or two byte address
Le	empty

#### **Response Syntax**

Data Field		empty	
SW1 SW2		status word as described below	
'90'	)' '00' success		
'63'	'00'	no further information given (warning)	
'69'	'83' authentication cannot be done		
'69'	'84'	reference key not useable	
'69'	'88'	key number not valid	

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

Title:	CardMan 5x21-CL Reader I	)eveloper's	Guide	Version:	1.13
Created/Modified.	28.08.07 20:01	Page:	36 of 67	Printed:	18.09.07 08:17

## 6.2.5 Read (Card Command)

The Read command reads a data block from the given block address. For the iCLASS card, only eight bytes can be read at a time. For further information about available blocks refer to [HID\_ICLASS]. This command requires previous page selection and, depending on the iCLASS card configuration, authentication to the iCLASS application.

#### **Command Syntax**

CLA	'80': standard mode operation '84': secured mode operation
INS	'B0'
P1	MSB of block number
P2	LSB of block number
LC	standard mode: empty; secured mode: '00'
Data Field	empty
Le	'00' or '08' '20': if supported by card, up to 32 bytes can be returned

#### **Response Syntax**

Data Field		<ul><li>8 byte block returned from the card (iCLASS)</li><li>32 bytes returned if card supports it</li></ul>
SW1	SW2	status word as described below
'90'	'00'	success
'62'	'81'	part of returned data may be corrupted
'62'	'82'	end of file reached before reading all requested bytes
'69'	'81'	command incompatible
'69'	'86'	command not allowed
'6A'	'81'	function not supported
'6A'	'82'	file not found or addressed block or byte does not exist
'6C'	ʻxx'	more data available than requested; xx returns available data size, typically '08'

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

Note: Reading blocks without valid authentication or trying to read data without read permission, will set all returned data to 'FF'.

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	37 of 67	Printed:	18.09.07 08:17

## 6.2.6 Update (Card Command)

The Update command writes a data block to a given block address. For the iCLASS card, only eight bytes can be written at a time. For further information about available blocks refer to [HID\_ICLASS]. This command requires previous page selection and, depending on the iCLASS card configuration, authentication to the iCLASS application.

## **Command Syntax**

CLA	'80': standard mode operation '84': secured mode operation
INS	'D6'
P1	MSB of block number
P2	LSB of block number
LC	'08' (iCLASS only allows 8 bytes per call)
Data Field	8 bytes to be written to card
Le	empty

#### **Response Syntax**

Data F	Field	empty
SW1	SW2	status word as described below
'90'	'00'	success
'62'	'82'	end of file reached before writing all Lc bytes
'65'	'81'	memory failure (unsuccessful writing).
'69'	'81'	command incompatible
'69'	'86'	command not allowed
'6A'	'81'	function not supported
'6A'	'82'	file not found or addressed block or byte does not exist

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

Note: Trying to update without authenticating to the corresponding application will return '6400' "Card Execution Error".

Title:	CardMan 5x21-CL Reader	Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	38 of 67	Printed:	18.09.07 08:17

Title:	CardMan 5x21-CL F	Reader Developer's	Guide	Version:	1.13

# 7 Secured Communication with the iCLASS Card

For a desktop smart card reader, such as the OMNIKEY CardMan 5x21-CL, security mainly evolves from the following scenarios:

- Authenticity between the host application and the reader
- Confidentiality of data transmitted via USB cable
- Integrity of transmitted data
- Authenticity between the reader and the card
- Confidentiality and integrity of the RF transmission
- Confidentiality of data stored in cards

OMNIKEY CardMan 5x21-CL reader provides an end-to-end security scheme to fulfill the security requirements listed above.

Note: Secured mode communication requires reader firmware version 5.00 or greater.

## 7.1 Multi-Step Approach to a Secure Card Reader System

## 7.1.1 Authenticity Between Host and Reader

Authenticity between host and reader is enforced with a mutual authentication scheme that requires a 16-byte transport key (Kcur or Kcuw) and a proprietary algorithm. Sessions can only be initiated upon successful completion of this one-step mutual authentication process.

Note: This feature prevents unauthorized reader usage. Additional information about this process is available to under an NDA.

## 7.1.2 Confidentiality of USB Data Exchange

CardMan 5x21-CL has a built-in mechanism that protects against eavesdropping and replay attacks on USB traffic. The data transmitted through a USB cable is triple DES encrypted with the Session Key (Ks). This key is generated during the mutual authentication process. It is unique for every session. Therefore, traffic recorded in one session cannot be replayed in another session.

## 7.1.3 Integrity of Transmitted Data

Data transmitted between host and reader is digitally signed with an eight-byte Message Authentication Code (MAC) which is appended to the data. This is done to detect any inconsistencies that may occur due to erroneous or modified data.

## 7.1.4 Authenticity Between Reader and Card

iCLASS cards allow authentication of the reader system to the card. This is done by proving knowledge of a shared secret, the iCLASS card application key  $K_{IAMC}$  or  $K_{MDC}$ . Applications that are protected

Title:	CardMan 5x21-CL Reader D	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	40 of 67	Printed:	18.09.07 08:17

with such a key require successful reader authentication before read/write access to card data can be granted.

## 7.1.5 Integrity of the Radio Frequency (RF) Transmission

Data integrity of an RF transmission with an iCLASS card is enforced with a two-byte checksum (based on CRC algorithm).

## 7.1.6 Confidentiality of the RF Transmission

The CardMan 5x21-CL supports an important feature to guarantee confidentiality: it encrypts data before writing data to the card and decrypts data read from the card. Confidentiality in this context means that data can be securely transmitted between the card and the reader without an eavesdropper being able to read the data in plaintext.

## 7.1.7 Authentication of the Host for Read/Write Session

CardMan 5x21-CL contains two keys  $K_{CUR}$  and  $K_{CUW}$  that are used to control access to read and write functions respectively. Initiating a reader session with  $K_{CUR}$  makes it a read-only session thus blocking functions that write to the card. Starting a session with  $K_{CUW}$  enables the reader for both read and write access.

Note: This is part of a host-to-reader authentication mechanism, not to be confused with reader-to-card authentication enforced by the card itself.

#### 7.1.8 Protection Against Known Attacks

Replay Attacks:

The data header contains a datagram that is different with every APDU exchange. The reader ensures that no frame is repeated.

Plain Text Attack:

For some critical commands, there is a built-in delay to prevent a plain text attack. If there is any error in the data header or signature, the session is immediately terminated. One can commence communication only again after starting a new session.

OMNIKEY welcomes comments and suggestions regarding any additional features that might be implemented to prevent specific attacks to the card system.

Title:	CardMan 5x21-CL Reader D	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	41 of 67	Printed:	18.09.07 08:17

## 7.2 APDU Structure for Secured Communication

CardMan 5x21-CL provides a unique mechanism to secure the communication channel using OMNIKEY's proprietary cryptographic envelope which protects the transmitted data from eavesdroppers.

Secured communication requires additional steps to prepare data before sending it to the reader system and after receiving data from the reader. The underlying triple DES algorithm requires a block size that is a multiple of 8. Therefore, the datagram has a built-in padding scheme. Authenticity of the plaintext is enforced with an 8 byte signature.

Command Syntax

CLA	INS	P1	P2	Lc	Input Datagram (sent to the reader)	Le
'84'	ʻxx'	ʻxx'	ʻxx'	ʻxx'	'xx xx"	ʻxx'

Input Datagram (sent to the reader)

	Data Header (DH)	Size of INS related data Lc <sub>INS</sub>	INS related data (INSData)	Padding Bytes (PB)	Signature
3-DES{K <sub>s,</sub> (	ʻxxxxxxxi	ʻxx'	'xx xx'	'80 00'	'xx xx' )}
	4 bytes	1 byte	Lc <sub>INS</sub> bytes	P bytes	8 bytes

P = number of padding bytes to satisfy  $(4+1+Lc_{INS}+P)$  is multiple of 8.

**Response Syntax** 

Output Datagram ( <i>received</i> from the reader)	SW2	SW1
'xx xx'	ʻxx'	ʻxx'

Output Datagram (received from the reader)

	Data Header (DH)	Size of Card Response LcR	Card Response	Padding Bytes (PB)	Signature
3-DES{K <sub>s,</sub> (	ʻxxxxxxxi	'xx'	ʻxx xx'	'80 00'	'xx xx' )}
	4 bytes	1 byte	n bytes	P bytes	8 bytes

P = number of padding bytes to satisfy (4+1+ Lc<sub>INS</sub>+P) is multiple of 8.

Note: If no valid session key Ks is available due to a previous error during the 'Start Session' command, all datagram bytes are set to '00'. Therefore the host would receive '00 ... 00' || SW1 || SW2 as response from the reader.

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	42 of 67	Printed:	18.09.07 08:17

## 7.2.1 Data Header (DH)

Data Header

Byte 0	Byte 1	Byte 2	Byte 3
Host data he	ader (HDH)	Reader data l	neader (RDH)

When the host system sends a Host Data Header (HDH) to the reader, the reader must acknowledge the HDH in its response by returning the 1's complement of the original HDH. This allows the host to check whether it receives data originating from the correct data header.

When the reader sends a Reader Data Header (RDH) to the host, the host must acknowledge the RDH in its next request by sending the 1's complement of the preceding RDH. This allows the reader to check whether the data sent by the host follows a previous reader response.

#### 7.2.2 Signature Generation

The CardMan 5x21-CL signature generation is based on an 8-byte Message Authentication Code (MAC). The MAC value is calculated by taking the last 8 bytes of a DES CBC encypted data block consisting of DH, LcINSData, INSData, and padding bytes. Kcur or Kcuw are used as signing keys.

The following steps describe how padding is applied to create a data block that can be signed using a DES CBC operation:

- Append '80' to the right of the data block.
- If the resulting data block length is a multiple of eight, no further padding is required.
- Do zero ('00') padding until the data block size reaches a multiple of eight.

#### 7.2.3 Session Key Generation

The session key Ks is derived from an 8-byte random number and the MAC transmitted to the reader during Start Session. For the Start Session command, LcINSData equals 8 (length of the random number) and INSData contains the 8-byte random number.

All secured communication calls following a successful session key negotiation are 3DES encrypted with Ks.

Title: CardMan 5x21-CL Reader Developer's Guide			Version:	1.13	
Created/Modified:	28.08.07 20:01	Page:	43 of 67	Printed:	18.09.07 08:17

## 7.2.4 Example: Proprietary Datagram Exchange between Host and Reader

Figure: Proprietary data structure scenario

Note: This is a read-only session because  $K_{CUR}$  was used in the start session command. If  $K_{CUW}$  were used to start the session, both read and write operations would be allowed. The HID application is always read-only.

Title:	CardMan 5x21-CL Reader Developer's Guide		Version:	1.13	
Created/Modified:	28.08.07 20:01	Page:	44 of 67	Printed:	18.09.07 08:17

## 7.3 Instructions (INS) for Secured Communication

Card commands are referred to by their respective instruction (INS) byte as part of a command APDU sent by SCardCLICCTransmit. CardMan 5x21-CL with firmware version 5.00 or greater supports the following secured mode instructions:

Instruction (INS)	Description	Command Type
'C4'	GetKeySlotInfo	reader command
'72'	Manage Session	reader command
'82'	Load Key	reader command
'A6'	Select Page	card command
'88'	Authenticate	card command
'B0'	Read	card command
'D6'	Update	card command
'24'	Update Card Key	card command

#### List of INS bytes for Secured Communication

In the following sections the command structure is described. LcINS and INSData are part of the OMNIKEY proprietary structure.

#### Notes

1- Secured mode' and 'Standard Mode' use different formatting of P1, bit 7 and bit 6 of the Read/Update commands (INS 0xB0 and 0xD6 respectively). The two LSBits of P1 are used to control the encryption of data read or updated.

2- Lc must always be transmitted in secured mode.

Title:	CardMan 5x21-CL Reader	Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	45 of 67	Printed:	18.09.07 08:17

## 7.3.1 Manage Session (Reader Command)

The Manage Session command is used to either start a session or end a session.

#### **Command Syntax**

-		
CLA	'84'	
INS	'72'	
P1	'00': start session '01': end session other values: RFU	
P2	P1 = '00' (start session)	P1 = '01' (end session)
	'00': start read only session '01': start read/write session	'00'
Lc	'08': challenge size	,00,
Data Field	8-byte random number (challenge)	empty
Le	empty	

#### **Response Syntax**

Data	Field empty	
SW1	SW2	status word as described below
'90'	'00'	success

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

Note: A session will be automatically ended if the card is removed.

## 7.3.2 Select Page (Card Command)

Except for the CLA byte '84', the syntax for Select Page in secured mode is identical to the command described in 6.2.1-Select Page (Card Command).

## 7.3.3 Load Key (Reader Command)

Except for the CLA byte '84', the syntax for Load Key in secured mode is identical to the Load Command described in 6.2.2-Load Key.

#### 7.3.4 Authenticate (Card Command)

Except for the CLA byte '84', the syntax for Authenticate in secured mode is identical to the command described in 6.2.4-Authenticate (Card Command).

Title:	CardMan 5x21-CL Read	er Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	46 of 67	Printed:	18.09.07 08:17

## 7.3.5 Read (Card Command)

Except for the CLA byte '84', and the additional formatting rules for P1 described below, the syntax for the Read command in secured mode is identical to the command described in 6.2.5-Read (Card Command).

#### P1 Formatting for Secured Mode

b7	b6	b5 – b0	Description
0	0		Plain
0	1		DES Encryption
1	0	DIUCK INT. IVISD	Triple DES Encryption
1	1		RFU

Data needs to be decrypted with the  $K_{ENC}$  to get the plaintext data.

## 7.3.6 Update (Card Command)

Except for the CLA byte '84', and additional formatting of P1 described below, the syntax for the Update command in secured mode is identical with the command described in 6.2.6-Update (Card Command).

#### P1 Formatting for Secured Mode

b7	b6	b5 – b0	Description
0	0		Plain
0	1	Plook Nr. MSP	DES Encryption
1	0	DIUCK INT. IVISD	Triple DES Encryption
1	1		RFU

Data is encrypted with  $K_{ENC}$  before storing it on the card.

#### 7.3.7 GetKeySlotInfo (Reader Command)

Except for the CLA byte '84', the syntax for 7.3.7 GetKeySlotInfo in secured mode is identical to the command described in 6.2.3-GetKeySlotInfo (Reader Command).

#### 7.3.8 Update Card Key

The Update Card Key command is used to change KC or KD.

#### **Command Syntax**

CLA	'84'
INS	'24'
P1	'00': New key for KD (application 1) '01': New key for KC (application 2) other values: RFU
P2	Key number where new key is stored.
Lc	'00': empty

Title:	CardMan 5x21-CL Reader De	veloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	47 of 67	Printed:	18.09.07 08:17

Data Field	empty
Le	empty

#### **Response Syntax**

Data	Field	empty					
SW1	W1         SW2         status word as described below						
'90'	'00'	Success					
'65'	'81'	Memory failure (unsuccessful writing)					
'69'	'81' '86'	Command incompatible Command not allowed					
'6A'	'81'	Function not supported					

Please refer to 4.2.1-Card Access via SCardCLICCTransmit for additional status words common to all iCLASS access functions.

The sequences for using UpdateCardKey command are as follows:

- 1. If the desired change of the key is not in page 0, the page has to be selected by a 'Select Page' command
- 2. Load transport/old key by 'Load Key' command
- 3. Authenticate the card with the old key (key number as used for 'Load Key'in step 2)
- 4. Load new key by 'Load Key' command
- 5. Now send Update CardKey command with specific P2 (New Key number as loaded in step 4)

**Note:** You can only update KD (application 1) after authentication with KD, and you can only update KC (application 2) after authentication with KC.

Note: Do not write directly to address 3,4 where KC and KD are stored, this will destroy the keys.

# Appendix A Application Programming

## A1 Sample Project

The following C++ sample project is part of the synchronous API which can be downloaded from our website at <u>www.omnikey.com</u>

If you choose the default installation settings, sample code can be found in: c:\omnikey\samples\contactlessdemovc.

Sample code for Visual Basic is also available and can be found in c:\omnikey\samples\contactlessdemovb.

The sample uses the OMNIKEY synchronous API and demonstrates how to select a reader, connect to a card, and access either a Mifare or an iCLASS card.

Note: Mifare cards can also be integrated via non-proprietary, PC/SC 2.0 compliant function calls.

## A1.1 Overview

Connect CG RFID to P MNIKEY Car MNIKEY Car	ted Readers C/SC Reader RF dMan 5x21 0 dMan 5x21-CL 0	Write Mifare Key Key To Reader 00	y Nr. Tr. O	er Related Funct otion En. Secured 80	ion Key Nr.	Key (AOA1)

Title:	CardMan 5x21-CL Reader De	eveloper's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	53 of 67	Printed:	18.09.07 08:17

#### Figure 1: Screenshot of Sample Program

In the list box in the top-left corner of the window you can select the reader from a drop down list that contains all readers available to the smart card resource manager. When a card is inserted, the **ATR**, **UID** and **Card Name** is displayed. The functions in the **Reader Related functions** group box can be used with or without a card in the RF field.

Functions available in the **Mifare Functions using Sync API** group can only be used when a Mifare card is in the field. The **ISO 7816/iCLASS/PCSC 2.01** group allows APDU exchange with a CPU card (asynchronous card) in the field.

Each processed command produces output in the output log on the bottom of the window. This log can be cleared with the **Refresh Output Screen** button. The return status of the last function executed is shown in the group box **Last Operation Status**.

The Exit button closes the application.

## A1.2 Reader Related Functions

Reader related functions don't require a card in the field.

To store a MIFare key, do the following:

- Define a key number to determine the location where the key will be stored.
- Select either plain or secured as the mode of transmission of the key. For secured transmissions, use transmission key number 0x80 or 0x81.
- Enter the key in hex string format to the text field **Mifare Key**. For plain transmissions enter a 6 byte, 12 hex digit value (no spaces). For secured transmission enter an 8 byte value.
- Click on the Write Mifare Key to Reader button to load the key to reader memory.

## A1.3 Mifare Card Related Functions Using Synchronous API

Before using any of the **Mifare Card Related functions** authentication to the card is required. (Mifare UltraLight does not need authentication).

To authenticate to a block of the card do the following:

- In the field Block Nr, enter the block number of the block you want to authenticate to.
- In the Access Option box choose whether a key number or a plain key will be supplied.
- In the Authentication Mode box choose Mode A or Mode B.
- Press the **Authenticate** button.

Upon successful authentication, you can read and write data blocks and use the increment and decrement functions.

## A1.4 PC/SC 2.01

Enter an APDU according to PC/SC 2.01 to access storage cards such as Mifare cards directly without using the OMNIKEY proprietary synchronous API.

#### A1.5 ISO 7816 - APDU

Enter an APDU for your CPU (asynchronous) card and send the APDU the same way you would an ISO7816 contact card.

Title:	CardMan 5x21-CL Reader Developer's Guide			Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	54 of 67	Printed:	18.09.07 08:17

## A1.6 iCLASS Standard Mode

Present an iCLASS card to the reader RF field, and send APDUs directly to the card according to the *chapter 6-Standard Communication with iCLASS Card.* This will give you an easy-to-use way of experimenting with the available functions.

Title:	CardMan 5x21-CL F	Reader Developer's	Guide	Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	55 of 67	Printed:	18.09.07 08:17

## A2 Code Snippets

This section lists some coding samples for a PC/SC 2.01 compliant implementation.

#### A2.1 Getting the Card UID (PC/SC 2.01)

The following function retrieves the Unique card ID (UID) of the card currently connected via air interface. You can use the UID as the card serial number. It is available for every ISO 14443 A/B or ISO 15693 compliant card and does not matter whether it is a CPU or storage card. This makes GetUID the ideal candidate for Hello Card type applications. If you don't have access to application keys, the UID may serve as a valuable identifier that allows card lookup on a backend database.

```
BOOLEAN GetUID(UCHAR *UID, int &sizeofUID)
```

```
ucByteSend[0] = 0xFF;//CLA
ucByteSend[1] = 0xCA; //INS
ucByteSend[2] = 0x00;//P1
ucByteSend[3] = 0x00;//P2
ucByteSend[4] = 0x00;//Le
ulnByteSend = 5;
printf("\nRetrieving the UID.....");
SCard_Status = SCardTransmit(hCard,SCARD_PCI_T1,ucByteSend,ulnByteSend,NULL,
                             ucByteReceive, &dwRecvLength);
if (SCard_Status != SCARD_S_SUCCESS)
  printf("\nProblem in SCardTransmit, Erro rcode = 0x%04X",SCard_Status);
  return FALSE;
if(ucByteReceive[dwRecvLength-2] != 0x90 || ucByteReceive[dwRecvLength-1] != 0x00)
ł
  printf("\nWrong return code: %02X%02X",
          ucByteReceive[dwRecvLength-2],ucByteReceive[dwRecvLength-1]);
  return FALSE;
sizeofUID = dwRecvLength-2;
memcpy(UID,ucByteReceive,sizeofUID);
return TRUE;
```

#### A2.2 Loading a Mifare Key (PC/SC 2.01)

The following code-snippet loads a Mifare key to the reader. The key is stored in non-volatile memory. Once loaded, it remains available throughout the reader session.

```
BOOLEAN LoadKey(UCHAR ucKeyNr, UCHAR *ucKey, UCHAR ucKeyLength)
```

```
ucByteSend[0] = 0xFF;
                            //CLA
ucByteSend[1] = 0x82;
                            //INS
ucByteSend[2] = 0x20;
                            //P1 card key, plain transmission, non-volatile memory
ucByteSend[3] = ucKeyNr;
                            //P2 key number for mifare could be 0x00 to 0x31)
ucByteSend[4] = ucKeyLength;//Lc
memcpy(ucByteSend+5,ucKey, ucKeyLength );
ulnByteSend = 5+ucKeyLength;
printf("\nLoading Key to the reader.....");
SCard_Status = SCardTransmit(hCard,SCARD_PCI_T1,ucByteSend,ulnByteSend,NULL,
                            ucByteReceive, &dwRecvLength);
if (SCard_Status != SCARD_S_SUCCESS)
  printf("\nProblem in SCardTransmit, Erro rcode = 0x%04X",SCard_Status);
  return FALSE;
if(ucByteReceive[dwRecvLength-2] != 0x90 || ucByteReceive[dwRecvLength-1] != 0x00)
  printf("\nWrong return code: %02X%02X",
  ucByteReceive[dwRecvLength -2],ucByteReceive[dwRecvLength-1]);
  return FALSE;
```

Title:	CardMan 5x21-CL Reader Developer's Guide			Version:	1.13
Created/Modified:	28.08.07 20:01	Page:	56 of 67	Printed:	18.09.07 08:17

```
}
return TRUE;
}
```

## A2.3 Mifare 1K/4K Authenticate (PC/SC 2.01)

The following code snippet demonstrates how to authenticate to a Mifare card:

BOOLEAN Authenticate(UCHAR BlockNr, UCHAR ucKeyNr, UCHAR ucKeyType)

```
ł
 ucByteSend[0] = 0xFF;
                             // CLA
 ucByteSend[1] = 0x88;
                            // INS
 ucByteSend[2] = 0x00;
                            // P1, Mifare Block Number MSB, for mifare it is always 0x00
 ucByteSend[3] = BlockNr;
                            // Mifare Block Number LSB
 ucByteSend[4] = ucKeyType; // P3
 ucByteSend[5] = ucKeyNr;
 ulnByteSend = 6;
 printf("\nAuthenticating .....");

## A2.9 iCLASS Select Page (OMNIKEY Proprietary API)

The following code-snippet selects page 0x01 of a 8x2KS iCLASS card and returns the card serial number:

```
//Select page 0x02 of a 8x2KS iCLASS card
UCHAR ucDataSend[7] = {0};
ULONG ulNoOfDataSend = 7;
UCHAR ucReceivedData[64] = {0};
ULONG ulNoOfDataReceived = 64;
ucDataSend [0] = 0 \times 80 //CLA, standard mode
ucDataSend [1]
                 = 0xA6 / / INS
ucDataSend [2]
                 = 0x01 //P1
ucDataSend [3]
                 = 0x04 //P2, return card serial number
ucDataSend [4] = 0x01 //Lc
ucDataSend [5] = 0x01 //Page number
ucDataSend [6] = 0x08 //Le
SCard_Status = SCardCLICCTransmit(hCard,ucDataSend,ulNoOfDataSend,
                                     ucReceivedData,&ulNoOfDataReceived);
if (SCard_Status! = SCARD_S_SUCCESS)
{
  printf("Error in SCardCLICCTransmit, with error code %8X", SCard_Status);
  exit(-1);
}
```

Title:	CardMan 5x21-CL Reader	Developer's	Guide	Version:	1.13

# Appendix B Accessing iCLASS Memory

In the following diagrams the free zones of two typical iCLASS memory layouts is shown:

## B1.1 Memory Layout

a) Memory layout of an iCLASS 2KS, iCLASS 16KS or page 0 of an iCLASS 8x2KS card:

Block Number	Block Description (block size eight bytes)
'00'	card serial number
'01'	configuration block
'02'	e-Purse
'03'	Kd (so-called debit key, key for application 1)
'04'	Kc (so-called credit key, key for Application 2)
'05'	application issuer area
'06'	
	HID application
'12'	
'13'	
'1F'(2KS)	The zones in ICLASS ZNS, ICLASS TONS OF Page 0 OF ICLASS 6X2NS
'FF'(16KS)	

#### b) Memory layout of an iCLASS 8x2KS on pages 1 to 7:

Block	Size: 8 bytes
'00'	card serial number
'01'	configuration block
'02'	e-Purse
'03'	Kd (so-called debit key, key for application 1)
'04'	Kc (so-called credit key, key for Application 2)
'05'	application issuer area
'06'	
	application 1 (free zones in iCLASS 8x2KS other than page 0)
ʻxx'	
'xx'+1	
	application 2 (free zones in iCLASS 8x2KS other than page 0)
'1F'	

Title:	CardMan 5x21-CL Reader De	eveloper's	Guide	Version:	'00'
Created/Modified:	28.08.07 20:01	Page:	61 of 67	Printed:	18.09.07 08:17

## B1.2 Assigning Space to iCLASS Application 2

By default, iCLASS cards have the application limit set to the last byte of its respective memory area. This means that the complete memory area is reserved for application 1 and the size of application 2 is set to zero. The application limit can be set to a different block number to support an additional application. To do this, the page's configuration block must be overwritten as follows:

- 1. Select the page you want to configure.
- 2. Authenticate with Kd of the selected page.
- 3. Read 8 bytes from block 0x01 the configuration block.
- 4. Replace the first byte with the block number 'xx' of the new application limit.
- 5. Leave the remaining bytes of the configuration block unchanged and write all 8 bytes back to the configuration block 0x01.
- 6. Remove the card.

# B1.3 Read/Write Memory of iCLASS 2KS, 16KS or page 0 of iCLASS 8x2KS card

- 1. Insert card.
- 2. Connect to card.
- 3. For secured mode: Start Session.
- 4. Authenticate with  $K_{MC0}$ , (P1 = 0x01, P2 = 0x23). If the key is not an iCLASS default key, the new key has to be loaded as  $K_{IAMC}$  or  $K_{VAK}$ , and in the authenticate command the key number of  $K_{IAMC}$  or  $K_{VAK}$  must be used.
- 5. Read/write any block (block number 0x13 to 0x1F for 2KS and 0xFF for 16KS).
- 6. For secured mode: End Session.
- 7. Disconnect from card.
- 8. Remove card.

## B1.4 Read/Write Memory of iCLASS 8x2KS Card on Pages 1 to 7

- 1. Insert card.
- 2. Connect to card.
- 3. For secured mode: Start Session.
- 4. Select page N (N = 1 to 7).
- 5. Authenticate with  $K_{MDN} / K_{MCN}$  (P1 = 0x00 for  $K_{MDN}$ , or 0x01 for  $K_{MCN}$ , P2 =  $K_{MDN}$ , /  $K_{MCN}$  (refer to chapter 5.1Key Numbering Scheme).
- 6. If the key is other than iCLASS default key, the new key has to be loaded as  $K_{IAMC}$  or  $K_{VAK}$ , and in the authenticate command the key number of  $K_{IAMC}$  or  $K_{VAK}$  must be used.

Created/Modified:	28.08.07 20:01	Page:	62 of 67	Printed:	18.09.07 08:17

- 7. Read/write any block (block number 0x13 to 0x1F for 2KS and 0xFF for 16KS).
- 8. For secured mode: End Session.
- 9. Disconnect card.
- 10. Remove card.
