## The Johnson Electric Group is one of the world's largest providers of motion actuators for automotive and industrial applications

Over the years, we have shipped billions of motors to more than thirty countries in over one hundred different motor applications. Johnson Electric has an annual production capacity of one billion motors.

to meet all of our commitments and to support our customers' success. Product reliability and assurance of supply are our commitment.

At the heart of Johnson Electric's success is our commitment to make our customers successful. Our customers include many of the world's leading industrial, consumer and automotive companies. We begin by understanding our customers' business needs, and the product application requirements of the end user of our customers' products. Then we design and deliver innovative motion solutions that help our customers to differentiate their products in the marketplace. Our goal is to be instrumental in the successful launch of our customers' products in their respective marketplaces.

### Our Brand Promise

#### Johnson Electric is the most reliable partner

Johnson Electric is responsive and flexible; and has the financial stability and organizational integrity

### Johnson Electric delivers competitive advantage

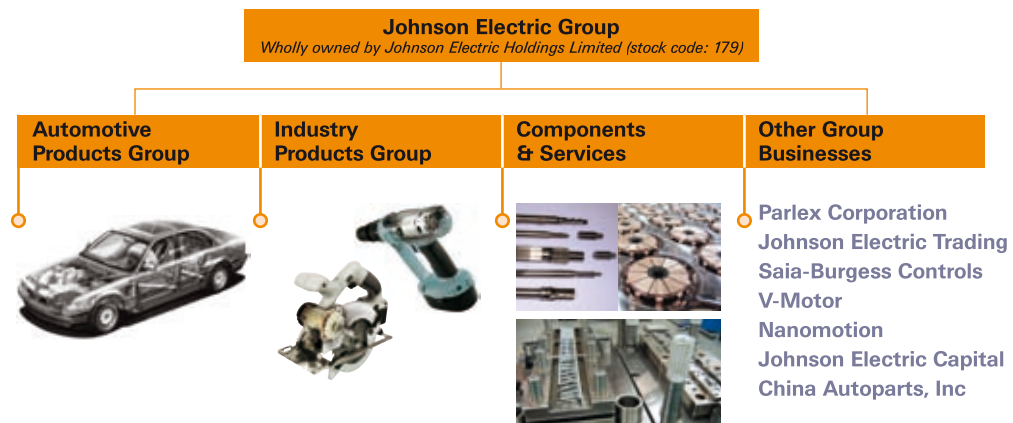

Johnson Electric delivers differentiation and innovation through its motion products – subsystems comprising of Stepper Motors, DC Motors, AC Motors, Piezo-electric Motors, Switches, Solenoids, Flexi Circuits, Motion Control, Precision Plastics and Precision Gears.

Our business growth hinges with leading "branded" goods producers to deliver differentiation and innovation through our motion products. The core platform for delivering these solutions is a highly developed production base and focused customer support teams throughout the world. This combines scale advantages in production and procurement with skilled and dedicated motion application experts.

## HOW WE ARE ORGANIZED

**Johnson Electric Holdings Limited is the parent company of the Johnson Electric Group and has been listed on the Stock Exchange of Hong Kong since 1984. The Group structure consists of a number of operating divisions and business units focused on their particular customer application or product segment**

**The Group's motion systems, motors and switches businesses are managed through two primary operating divisions: Automotive Products Group and Industry Products Group.**

The Automotive Products Group, which consists of Johnson Electric's Automotive Motors Group and the Automotive Division of Saia-Burgess Electronics, is focused on providing customized motion solutions for major automotive application segments that include powertrain, body and chassis.

The Industry Products Group is comprised of business units that provide motion products and solutions for various commercial and industrial application sectors, including home appliances, power tools, business equipment, personal care products, medical equipment and healthcare, building automation and security, audio-visual and other industrial products.

Supporting these two operating divisions is the Group's Components & Services function which produces metal and plastic parts, tooling and production equipment for motor and motion related products. Johnson Electric is a highly vertically integrated business that manufactures an exceptionally wide range of components that form the basis for its final assembled end products. We make magnets, bearings, shafts, housings, laminations, commutators and die cast parts. We also build tools, assembly fixtures, plastic molds as well as armature winding and other production machines.

In addition to motion systems and motors, the Group also consists of a number of complementary manufacturing businesses and other subsidiary companies. These include an innovative provider of flexible printed circuits and interconnect solutions; a successful niche player in the programmable controls industry; and a rapidly growing specialty metals and trading services company.

# Looking for a specialized switching solution?

---

## Look no further.

In addition to the wide range of standard products shown in this catalog, we will be happy to work with you to meet your switching needs. If your application requires more than a standard product solution, please consider us early in your design process. Our product development team will be happy to discuss your specification, whether you need a special switch design or a complete value-added assembly. We specialize in developing switches for demanding industrial environments.

The images shown give some examples of our capabilities.

# Burgess is the leading global brand for industrial switches

**Burgess designs have defined industry standards. If you need a specific solution for your switching needs, call us to set your own standard.**

A pioneer of snap-action technology, the Burgess brand stands for innovative, robust solutions for industrial switch requirements.

## Wide range

Snap-action switches have to fulfill a wide variety of functions. The standard Burgess range ensures there will be a switch for your needs, with one of the broadest product portfolios around. From ultra-miniature to metal-housed basic types, we are sure to have the type appropriate to your application, whether it is signal or power switching, high or low force actuation.

## Environmental protection

The sealed switch is a Burgess speciality. In demanding environments – wet, humid or dusty – even the most sensitive signal can be switched reliably with IP67 rated products. Our robust metal-housed switches offer impact resistance outside whilst switching with precision inside.

## Uncompromising reliability

With many UL, CSA and ENEC approvals, the performance of Burgess products is globally recognized. For safety-related applications, such as machine maintenance systems, positive-action mechanisms ensure a physical break in the circuit.

## Precision actuation

Snap-action switches offer high levels of repeat accuracy and switch virtually independently of actuation speed and force. This is the mechanism of choice for pressure sensing, timing and position indicating applications.

## Minimum size

Our F5 range demonstrates our capability to switch relatively high current from a small size envelope – 5A 250 VAC from a switch less than 15 mm long.

## Typical Burgess switch applications

- Circuit breakers
- Special purpose vehicles
- Vending machines

# Switches in General Industry

Switches can be found in a wide variety of applications:

## Burgess switches for special purpose vehicles

Switches used in special purpose vehicle applications must have:

- high levels of environmental protection
- the ability to handle high DC inrush currents
- reliability throughout the life of the product

## Burgess switches for circuit breakers

Circuit breaker applications demand:

- dependability and reliability
- a high degree of shock resistance in the mechanism
- the ability to carry high currents and voltages

## Burgess switches for vending machines

Switches used in vending machines must:

- work reliably, time after time
- have appropriate environmental protection to resist dust and moisture

# Switches for locking mechanisms

Switches are found in numerous applications that require a locking device. Whether it is a medical application, an office automation application or a door lock, switches provide an effective, cost-efficient locking mechanism.

## Security Applications

- Hotel room door lock
- Hotel safe lock
- Prison door lock
- Fire safety door opening lock
- Garage door safety lock

## Office Automation

- Disk drive door lock
- Personal computer chassis lock
- Docking station lock
- Locks to hold peripherals in place
- Tape library index lock

## Medical

- Sterilizer lock
- Centrifuge lock
- Blood analysis machine lock

## Industrial

- Overhead door lock
- Fire safety door lock
- Commercial laundry locks

# Table of typical applications & Burgess switch types

In addition to the products shown in the Product Catalog pages, the Product Mapping table below shows a wide range of switch types for a selection of applications. Also, a switch may be customized to fulfill your specific requirements, please feel free to contact us.

# Terminology: Snap-action switches

## ADDITIONAL TECHNICAL INFORMATION

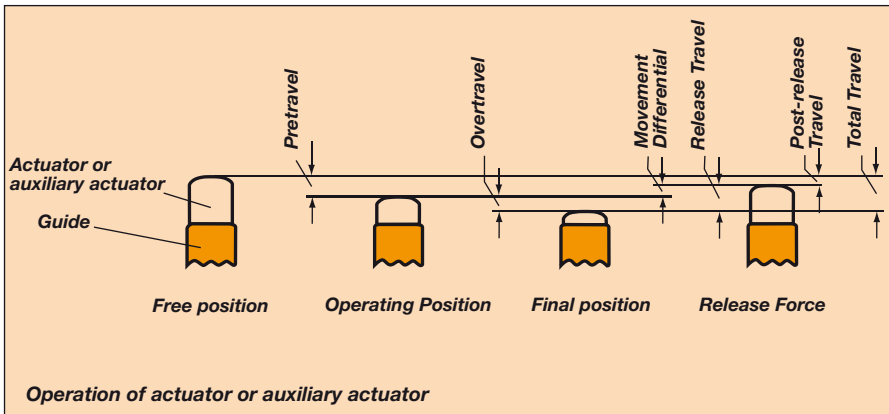

### Contact Resistance

The contact resistance is the electrical resistance measured at the terminals of the switch when the contacts are closed. The resistance specifications refer to unwired switches in new condition.

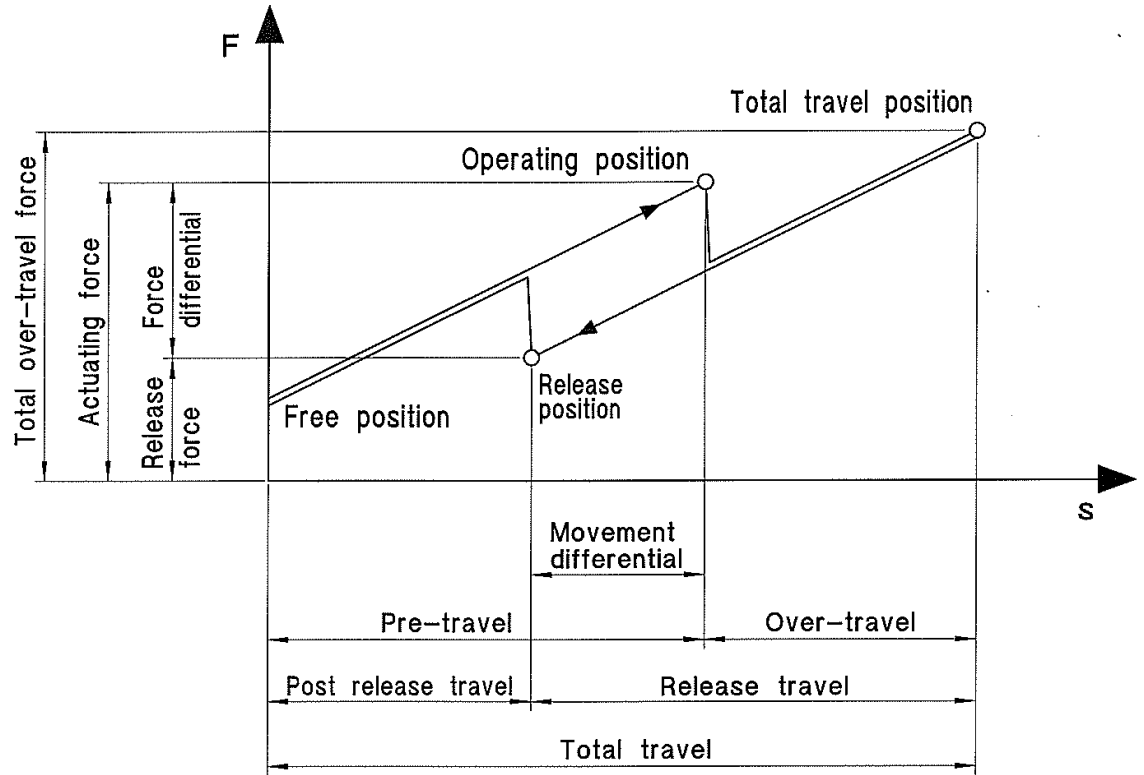

### Positions – forces – movements

Free position	Position of the actuator, without any influence from an external force.
Operating position	Position of the actuator when contact changeover takes place.
Total travel position	Position of the actuator at the end of the allowed travel.
Release position	Position of the actuator when the switch mechanism resets.
Actuating force	The force required to move the actuator from the free position to the operating position.
Release force	The value to which the applied force must be reduced to allow the mechanism to reset after operation.
Force differential	Difference between actuating force and release force.
Pre-travel	Movement of the switch actuator between free and operating position.
Over-travel	Movement of the switch actuator beyond the operating position.
Total travel	The sum of pre-travel and over-travel.
Movement differential	Distance between operating position and release position.
Release travel	Movement of the switch actuator between release and total travel position.
Post release travel	Movement of the switch actuator between release and free position.

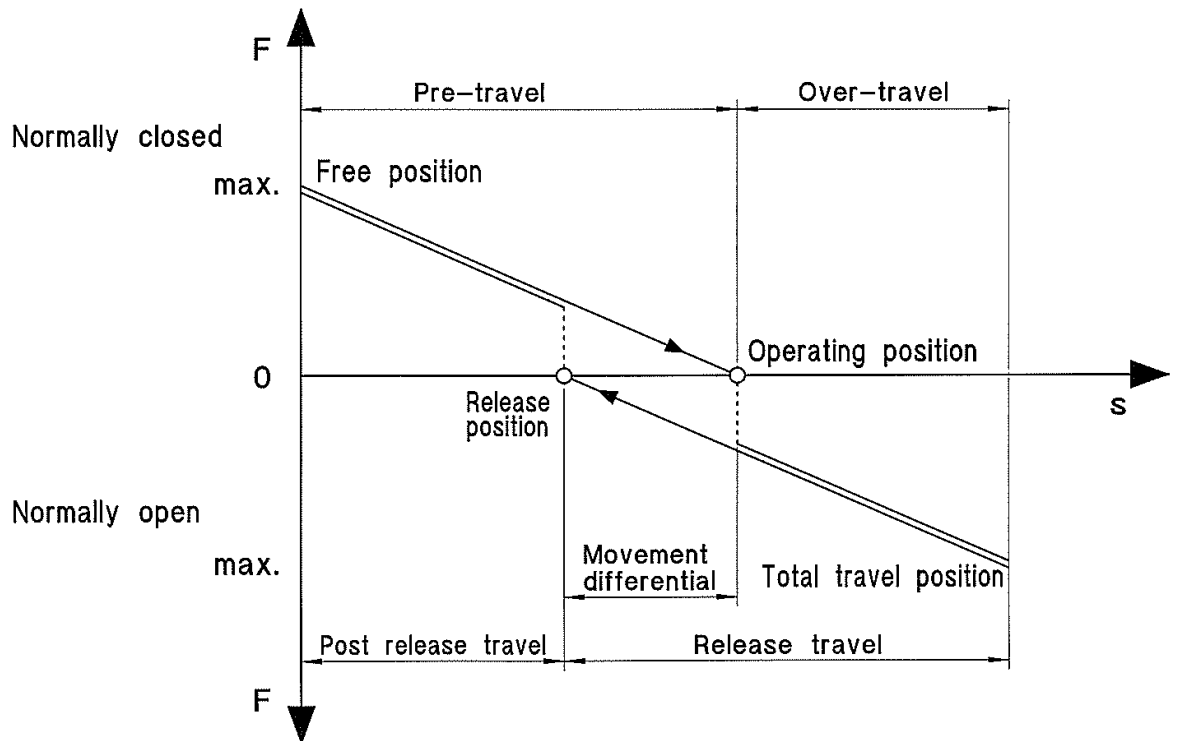

### Contact force – movement – diagram

## Actuating force – movement – diagram

## Contact force – movement – diagram

## Switch Technology

**Clearance Distance**—the distance in air between current carrying parts of opposite polarity or between any current carrying part and an earthed-(grounded) metal plate to which the switch is attached.

**Creepage Distance** – the path along the surface of insulating material between current carrying parts of opposite polarity or between any current carrying part and an earthed (grounded) metal plate to which the switch is attached.

**Insulation Resistance** – resistance as measured between the normally closed terminals, or between all terminals connected together and a metal plate to which the switch is mounted. In dry conditions the value would be expected to be greater than 5M $\Omega$ .

**Single Throw** – a switch which provided an ON-OFF or OFF-ON function but does not change over from one conductor to another. Such switches are usually referred to as being «normally-closed only» or «normally-open only».

**Switching Cycle** – one complete switching operating from free position into overtravel and back through release position to free position.

**Switch Resistance** – a total resistance offered by a switch in a circuit, as measured from terminal through mating contacts, to terminal.

**Transit Time** – the time taken by the moving contact in a snap-action mechanism to move from one stable position to another.

## Electrical Ratings

Electrical ratings given in the catalog are ratings according to UL1054, CSA22.55 or IEC61058-1.

Where these are not available, a general rating is given based upon in-house laboratory testing.

The ratings tables should be considered as safe working maximums for most applications. However, switch performance is influenced by a variety of factors, including:

- Frequency of operation
- Type of load
- Amount of travel used
- Temperature
- Humidity

Please do not hesitate to contact Burgess about your specific application.

## Approvals

CSA mark. Switch meets CSA's safety standards

UL Recognized Component Mark for Canada and the United States

ENEC Mark. Switch fulfills European EN standards. The two digit number indicates which certification body has issued the ENEC Certificate

CQC Approval (China) is available for certain switches

## Switch Life

a. **Electrical Life** – the electrical life data contained in this catalog is based on laboratory controlled tests. In practice, frequency and speed of operation, type of load, suppression, actuator travel used, ambient humidity and temperature and other environmental conditions can have a major effect on switch life.

Individual assessments for specific applications are possible and can be undertaken by Burgess on request.

Please ask Burgess if you would like an assessment for your specific application.

b. **Mechanical Life** – the figures quoted relate to the number of switching cycles made without an electrical load.

## Switch Drawings

All drawings in this catalog are third angle projection.

All dimensions in this catalog are nominal, except where specifically shown.

---

## Application Technology

### Shock and Vibration

If switches are likely to be subjected to shock or vibration, select models with the highest available actuating force.

Burgess switches feature low mass mechanisms which are inherently resistant to shock and vibration.

If possible, the switches should be mounted so that the line of acceleration is at right angles to the travel of the plunger. The maximum available overtravel should be used.

### Direct Current

Direct current (DC) ratings where shown should not be exceeded if destructive arcing and contact welding are to be avoided.

Some form of arc suppression is recommended when switches are used in DC circuits containing inductive devices wired in series with the switch and the supply.

### Lamp Loads

Because of the very high inrush currents associated with incandescent lamps, applications should be subject to individual assessment.

### Capacitive Loads (including fluorescent lamps)

These can generate very high peak currents which can cause contact welding. Applications should be subject to individual assessment.

### Inductive Loads

The general ratings tables included in this catalog provide data for switches used to control inductive circuits at a power factor of 0.5 (EN 0.6; UL 0,7 means HP-Rating 0,5).

## Contact Materials

Silver and silver alloys are the primary contact materials used in Burgess switches.

The ratings tables shown refer to switches with silver/silver alloy contacts.

Gold contacts should be specified when switches are to be used in low voltage control or logic circuits, especially when long periods of inactivity are expected or when atmospheres with a high sulphur content may be encountered.

Gold contacts are generally available in two forms; gold plated silver alloy contacts, which can also be used at higher currents or gold alloy cross-point

contacts, which are only suitable for switching low currents.

### Gold

Gold plated contacts are recommended for switches to be used in low voltage control or logic circuits, especially when long periods of inactivity are envisaged. Gold flash, a thinner deposit, is applied to certain switch terminals to ensure good solderability even after prolonged storage.

The selection of the appropriate contact material will depend on a number of factors:

- current and voltage
- resistive or inductive load
- inrush current peak
- frequency of switching operations
- atmospheric conditions
- required switching reliability

### Pure silver contacts (standard)

Burgess Snap-Action Switches are normally equipped with pure silver contacts (Ag999). These are suitable for most applications and have satisfactory electrical and thermal properties.

### Gold-plated contacts

Gold-plated contacts (4 µm) are used for low currents of a few mA and voltages below about 20 V (for DC and AC) and for sulphurous atmospheres. They are unsuitable for higher breaking capacities.

### Silver-cadmium oxide contacts

Silver-cadmium oxide (AgCdO 90/10) contacts should be used where high inrush current peaks (30 A or more) are switched on as they tend to weld less at high current loads. They can resist peaks of 80 A or more for several ms provided that they are used with a Burgess Snap-Action Switch with high operating and contact force (80 cN in the free position and total-travel position).

At high breaking capacities, switches fitted with such contacts have about 50% longer life expectancy than those fitted with pure silver contacts. Normally, silver-cadmium oxide contacts are not suitable for voltages under 50 V.

Please ask Burgess if you would like an assessment for your specific application.

---

## Switch Actuation

### Direct Operation

Actuating plungers should be operated in the direction of their axis. Where this is not possible the use of actuating levers is recommended. For direct actuation the attack angle should not exceed 30°.

*Actuation by sliding cams.*

### Actuating Levers

Various lever types are available for use with Burgess switches. They are generally stainless steel. If roller or cam-follower levers are approached in the reverse direction, care must be taken to ensure that the angle of approach is small enough not to jam the lever.

### Actuation by Cams

Cam-follower levers are particularly well suited for use with plastic actuating cams. Abrupt actuation or release of switch actuators shortens the life of the switches. For this reason cam should preferably provide a continuous movement. Ideally they should be of cycloidal form.

*Long roller lever with continuous actuation*

## Environmental Protection

### Protection Classifications

The protection classes of Burgess switches are in accordance with IEC 529 and are covered by just four codes.

#### IP40

Adequate protection against solids such as probing fingers and small wires >1mm. Liquids however can gain access and, unless externally protected, the switches should be mounted in dry or well-sheltered positions.

#### IP5K4

Good protection against solid foreign bodies, including dust and water splashing against the enclosure from any direction.

Switches may be used out of doors if sheltered from the worst of the elements or on factory machines subjected to normal washing down procedures.

#### IP65

Complete protection against solids, including dust, and against low pressure jets of water from all directions.

#### IP6K7

Complete protection against solids including dust and against immersion in water at a specific pressure for a specified time.

We reserve this code for switches which are factory sealed and tested. Switches should not be immersed in any liquid.

\* International IK code indicates protection against mechanical impact regarding to EN 50102.

### Working Temperatures

For details of the working temperatures applicable to individual types, refer to the appropriate specification sheet. Special versions suitable for temperatures outside these ranges may be possible. Please contact us for information.

All quoted temperatures assume stable operation. They do not imply an ability to withstand excessive cycling within the range.

## Health & Safety

Burgess has ensured, so far as it is reasonably practicable, that their products are as described in this catalog or in other current company publications, or as specified on Burgess

installation drawings. They have been so designed and constructed as to be safe and without risk to health when installed by suitably qualified personnel in accordance with relevant legislation, codes of practice, regulations (including IEE Wiring Regulations), the installation recommendations offered by the company and the accepted rules of the art. Their usage should be confined within the ratings limitations and parameters of application indicated in this catalog and elsewhere.

Please contact us should you need additional information or guidance.

## Service Recommendations

### Maintenance

Burgess switches are not user-maintainable but they should be kept in a reasonably clean, paint-free condition, especially in the actuator area. Regular checks should be made on mounting security and on the actuating medium to switch actuator relationship.

Lubrication or the use of aqueous or chemical cleaning fluids is not recommended.

## Installation Recommendations

The following notes are intended merely to stress the most important and general aspects of good switch installation procedure and to provide some helpful additional information. Safety Consideration

Installation should only be carried out by competent personnel.

### Switch Positioning and Operation

Pre-loading of the switch actuator must be avoided. The actuating medium must be able to operate the switch through the operating position into overtravel and then to retract far enough to allow the switch to regain its free position.

Burgess recommends that the actuating medium should drive the switch into at least 50% of the available overtravel.

All ratings tables shown in this catalog are based on the use of all the available overtravel.

### Mounting

Side mounting switches should be mounted on smooth, firm, flat surfaces using the recommended screw size. Avoid over tightening the screws. For added security, they should be locked using epoxy resin. Do not attempt to enlarge switch mounting holes and avoid over stressing the switch. Use insulating material between the switch and metallic plates to increase clearance on switches with open terminals.

### Connections

When soldering, overheating of the switch insulation must be avoided. In certain circumstances, it may be advisable to use a heat shunt. For optimum mechanical strength, the conductor should be wrapped round the tip of the terminal taking care to avoid loose strands of wire.

The soldering iron tip should be applied to the end of the terminal while simultaneously applying solder. Remove the iron as soon as the solder has wetted the conductor and terminal end. A soldering iron tip temperature of 350°C (260°C/5 seconds for PCB Terminals) applied for a maximum of 2-3 seconds should be adequate.

For lead-free solder, is usually needed an iron tip temperature 15% higher.

## Installation Recommendations (EN 61058-1)

Mounting Holes and Screw sizes				Mounting Screw Torque	
Normal hole Diameter (mm)	Diameter (in)	Metric	Unified Thread	For guidance when using	
		Screw	Screw	mild steel screws:

## Specifications

Housing	Glass fibre reinforced nylon
Plunger	Nylon
Mechanism	Snap-action, coil spring mechanism with stainless steel spring
Functions	Single pole change-over
Contacts	Gold plate on silver
Terminals	PCB - copper, gold-flashed
Temperature range °C	-40°C to +85°C
Mechanical life	10 <sup>6</sup> cycles minimum (impact-free actuation)
Protection	IP40 (enclosure)
Mounting	Side mount PCB with locating pin on housing
Actuators	Plain plunger, straight lever

# 4BR

## 4BR

- Characteristics
- choice of IP54 or IP67 sealed versions
  - precise movements and exceptional repeat accuracy
  - robust metal housing
  - flying lead version available
  - long overtravel

Rating 250 VAC, 15 A max.

Dimensions (mm) 53,1 × 20,6 × 29,2

Actuator ■ plunger

Approvals UL, CSA

## Preferred Range

# Positive-action Switches

Locknut mounting

Dimensions

# BVM3

## BVM3F

- Characteristics
- positive-action (forced break) contacts
  - > 3 mm contact gap at full travel
  - internationally recognized V3 housing
  - faston terminals

Rating 250 VAC, 10 A

Dimensions (mm) 28 × 16 × 10.5

- Actuator
- plunger
  - plain lever
  - roller lever

Approvals UL, CSA and ENEC

## Preferred Range

Ordering Reference	Actuating Force (N) (ozf)		Sealing	Terminal	Circuit	Actuator	Contacts	Electrical rating
