In the interests of user-safety (Required by safety regulations in some countries) the set should be restored to its original condition and only parts identical to those specified should be used.

CONTENTS

Parts marked with " ⚠ " are important for maintaining the safety of the set. Be sure to replace these parts with specified ones for maintaining the safety and performance of the set.

SHARP CORPORATION

SAFETY PRECAUTION

IMPORTANT SERVICE SAFETY PRECAUTION

■ **Service work should be performed only by qualified service technicians who are thoroughly familiar with all safety checks and the** servicing guidelines which follow:

■ WARNING

1. For continued safety, no modification of any circuit should be attempted.
2. Disconnect AC power before servicing.

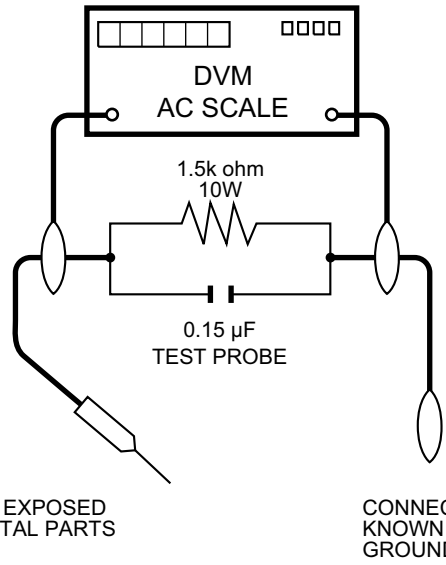
CAUTION:
FOR CONTINUED PROTECTION AGAINST A RISK OF FIRE REPLACE ONLY WITH SAME TYPE FUSE.
F7000 (6.3A/250V)

■ BEFORE RETURNING THE RECEIVER (Fire & Shock Hazard)

Before returning the receiver to the user, perform the following safety checks:

3. Inspect all lead dress to make certain that leads are not pinched, and check that hardware is not lodged between the chassis and other metal parts in the receiver.
4. Inspect all protective devices such as non-metallic control knobs, insulation materials, cabinet backs, adjustment and compartment covers or shields, isolation resistor-capacitor networks, mechanical insulators, etc.
5. To be sure that no shock hazard exists, check for leakage current in the following manner.

- Plug the AC cord directly into a 220~240 volt AC outlet.
- Using two clip leads, connect a 1.5k ohm, 10 watt resistor paralleled by a 0.15μF capacitor in series with all exposed metal cabinet parts and a known earth ground, such as electrical conduit or electrical ground connected to an earth ground.
- Use an AC voltmeter having with 5000 ohm per volt, or higher, sensitivity or measure the AC voltage drop across the resistor.
- Connect the resistor connection to all exposed metal parts having a return to the chassis (antenna, metal cabinet, screw heads, knobs and control shafts, escutcheon, etc.) and measure the AC voltage drop across the resistor.
  All checks must be repeated with the AC cord plug connection reversed. (If necessary, a nonpolarized adaptor plug must be used only for the purpose of completing these checks.)
  Any reading of 1.05 V peak (this corresponds to 0.7 mA peak AC.) or more is excessive and indicates a potential shock hazard which must be corrected before returning the monitor to the owner.



SAFETY NOTICE

Many electrical and mechanical parts in LCD color television have special safety-related characteristics.

These characteristics are often not evident from visual inspection, nor can protection afforded by them be necessarily increased by using replacement components rated for higher voltage, wattage, etc.

Replacement parts which have these special safety characteristics are identified in this manual; electrical components having such features are identified by "⚠" and shaded areas in the Replacement Parts List and Schematic Diagrams.

For continued protection, replacement parts must be identical to those used in the original circuit.

The use of a substitute replacement parts which do not have the same safety characteristics as the factory recommended replacement parts shown in this service manual, may create shock, fire or other hazards.

Precautions for using lead-free solder

■Employing lead-free solder

- “PWBs” of this model employs lead-free solder. The LF symbol indicates lead-free solder, and is attached on the PWBs and service manuals. The alphabetical character following LF shows the type of lead-free solder.

  Example:

Indicates lead-free solder of tin, silver and copper.

Indicates lead-free solder of tin, silver and copper.

■Using lead-free wire solder

- When fixing the PWB soldered with the lead-free solder, apply lead-free wire solder. Repairing with conventional lead wire solder may cause damage or accident due to cracks.

  As the melting point of lead-free solder (Sn-Ag-Cu) is higher than the lead wire solder by 40 °C, we recommend you to use a dedicated soldering bit, if you are not familiar with how to obtain lead-free wire solder or soldering bit, contact our service station or service branch in your area.

■Soldering

- As the melting point of lead-free solder (Sn-Ag-Cu) is about 220 °C which is higher than the conventional lead solder by 40 °C, and as it has poor solder wettability, you may be apt to keep the soldering bit in contact with the PWB for extended period of time. However, Since the land may be peeled off or the maximum heat-resistance temperature of parts may be exceeded, remove the bit from the PWB as soon as you confirm the steady soldering condition.

  Lead-free solder contains more tin, and the end of the soldering bit may be easily corroded. Make sure to turn on and off the power of the bit as required.

  If a different type of solder stays on the tip of the soldering bit, it is alloyed with lead-free solder. Clean the bit after every use of it.

  When the tip of the soldering bit is blackened during use, file it with steel wool or fine sandpaper.

- Be careful when replacing parts with polarity indication on the PWB silk.

Preparation

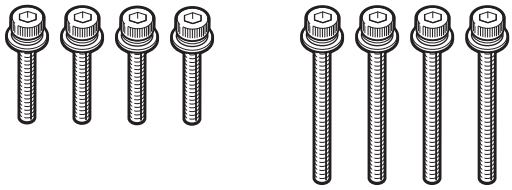
Attaching the stand unit

- Before attaching (or detaching) the stand, unplug the AC cord from the AC INPUT terminal.
- Before performing work spread cushioning over the base area to lay the TV on. This will prevent it from being damaged.

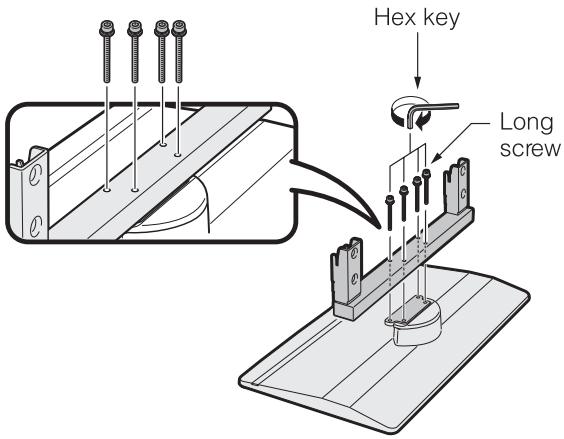
CAUTION

- **Attach the stand in the correct direction.**
- **Be sure to follow the instructions. Incorrect installation of the stand may result in the TV falling over.**

1 Confirm that there are 8 screws (4 short screws and 4 long screws) with the stand unit.

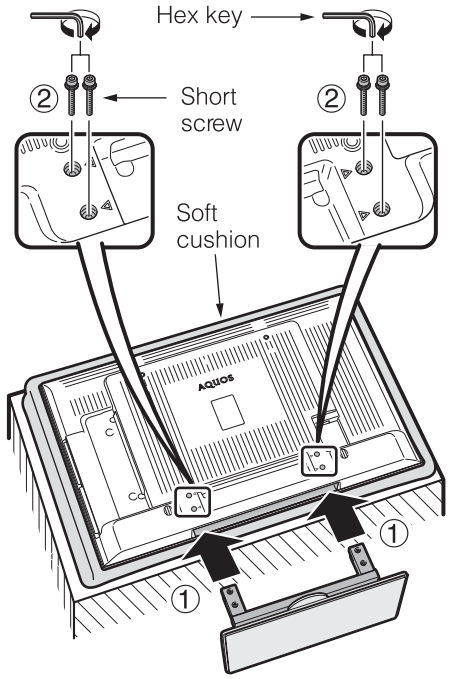


2 Attach the supporting post for the stand unit onto the base using the 4 long screws with the hex key (supplied) as shown.



3 ① Insert the stand into the openings on the bottom of the TV. (Hold the stand so it will not drop from the edge of the base area.)

② Insert and tighten the 4 short screws into the 4 holes on the rear of the TV.



NOTE

- To detach the speaker unit, perform the steps in reverse order.

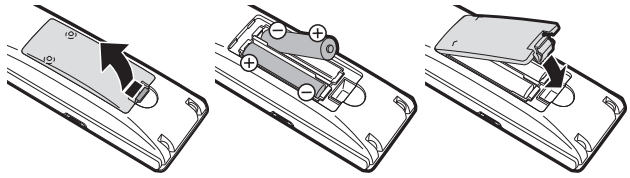
Inserting the batteries

Before using the TV for the first time, insert two “AAA” size batteries (supplied). When the batteries become depleted and the remote control unit fails to operate, replace the batteries with new “AAA” size batteries.

1 Open the battery cover.

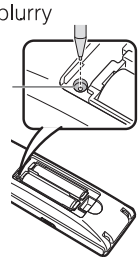
2 Insert two supplied “AAA” alkaline size batteries.
- Place batteries with their terminals corresponding to the (+) and (−) indications in the battery compartment.

3 Close the battery cover.



CAUTION

Improper use of batteries can result in chemical leakage or explosion. Be sure to follow the instructions below.
- Do not mix batteries of different types. Different types of batteries have different characteristics.
- Do not mix old and new batteries. Mixing old and new batteries can shorten the life of new batteries or cause chemical leakage in old batteries.
- Remove batteries as soon as they have worn out. Chemicals that leak from batteries can cause a rash. If you find any chemical leakage, wipe thoroughly with a cloth.
- When replacing the batteries, use alkaline batteries instead of manganese ones.
- Do not overuse the light-up function of the **LIGHT** button, doing so may shorten the battery life. Replace the batteries when the light on the LCD window or the light-up function becomes weak or when the window becomes blurry
- Do not continue to use the remote control unit with the batteries running low. This may result in error message or malfunction. Should this happen replace the batteries and leave it unused for a while. Otherwise, you may open the rear battery cover and press the **RESET** button. When you press the **RESET** button, your Universal remote control settings will be deleted.
- The remote control unit has a internal memory of external devices. In order not to lose the data, replace the batteries quickly. If the manufacturer code is initialised and lost, you can input the manufacturer code again.
- The batteries supplied with this product may have a shorter life expectancy due to storage conditions.
- If you will not be using the remote control unit for an extended period of time, remove the batteries from it.

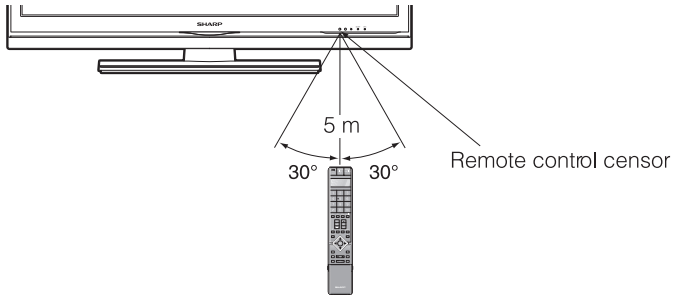


Note on disposing batteries:

The batteries provided contain no harmful materials such as cadmium, lead or mercury.
Regulations concerning used batteries stipulate that batteries may no longer be thrown out with the household rubbish. Deposit any used batteries free of charge into the designated collection containers set up at commercial businesses.

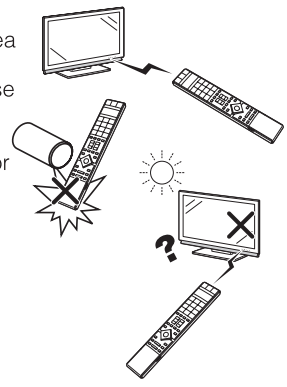
Using the remote control unit

Use the remote control unit by pointing it towards the remote control sensor. Objects between the remote control unit and sensor may prevent proper operation.



Cautions regarding the remote control unit

- Do not expose the remote control unit to shock.
  In addition, do not expose the remote control unit to liquids, and do not place in an area with high humidity
- Do not install or place the remote control unit under direct sunlight. The heat may cause deformation of the unit.
- The remote control unit may not work properly if the remote control sensor of the TV is under direct sunlight or strong lighting. In such case, change the angle of the lighting or TV, or operate the remote control unit closer to the remote control sensor.



Appendix

Troubleshooting

Problem	Possible Solution
• No power.	• Check if you pressed **TV** ⏻ | on the remote control unit. If the indicator on the TV lights upred, press **TV** ⏻ |. • Is the AC cord disconnected? • Check if you pressed ⏻ on the TV.
• Unit cannot be operated.	• External influences such as lightning, static electricity, etc., may cause improper operation. In this case, operate the unit after first turning the power off, or unplugging the AC cord and re-plugging it in after 1 or 2 minutes.
• Remote control unit does not operate.	• Is the **FUNCTION** button set correctly? Set it to the TV setting position. • Are batteries inserted with polarity (+, −) aligned? • Are batteries worn out? (Replace with new batteries.) • Are you using it under strong or fluorescent lighting? • Is a fluorescent light illuminated onto the remote control sensor?
• Picture is cut off.	• Is the image position correct? • Are screen mode adjustments (WIDE MODE) such as picture size made correctly?
• Strange colour, light colour or dark, or colour misalignment.	• Adjust the pictue tone. • Is the room too bright? The picture may look dark in a room that is too bright. • Check the colour system setting.
• Power is suddenly tuned off.	• The unit's internal temperature has increased. Remove any objects blocking the vent or clean. • Is the sleep timer set? Select "Off" from the "Sleep Timer" menu. • Is "No signal off" activated?
• No picture.	• Are connections to external equipment correct? • Is the input signal type selected correctly after connection? • Is the correct input source selected? • Is a non-compatible signal being input? • Is the picture adjustment correct? • Is the antenna connected properly? • Is "On" selected in "Audio Only"?
• No sound.	• Is the volume too low? • Make sure that headphones are not connected. • Check if you pressed 🔇 on the remote control unit.
• The TV sometimes makes a cracking sound.	• This is not a malfunction. This happens when the cabinet slightly expands and contracts according to change in temperature. This does not affect the TV's performance.

Cautions regarding use in high and low temperature environments

- When the unit is used in a low temperature space (e.g. room, office), the picture may leave trails or appear slightly delayed. This is not a malfunction, and the unit will recover when the temperature returns to normal.
- Do not leave the unit in a hot or cold location. Also, do not leave the unit in a location exposed to direct sunlight or near a heater, as this may cause the cabinet to deform and the LCD panel to malfunction.
  Storage temperature: +5°C to +35°C.

IMPORTANT NOTE ON RESETTING THE PIN

We suggest that you remove the following instruction from the operation manual to prevent children from reading it. As this operation manual is multilingual, we also suggest the same with each language. Keep it in a safe space for future reference.

Troubleshooting

Problem	Possible Solution
• No power.	• Check if you pressed ⏻	on the remote control unit. If the indicator on the TV lights up red, press ⏻ |. • Is the AC cord disconnected? • Check if you pressed ⏻ on the TV.
• Unit cannot be operated.	• External influences such as lightning, static electricity, etc., may cause improper operation. In this case, operate the unit after first turning the power off, or unplugging the AC cord and re-plugging it in after 1 or 2 minutes.
• Remote control unit does not operate.	• Are batteries inserted with polarity (+, −) aligned? • Are batteries worn out? (Replace with new batteries.) • Are you using it under strong or fluorescent lighting? • Is a fluorescent light illuminated onto the remote control sensor?
• Picture is cut off.	• Is the image position correct? • Are screen mode adjustments (WIDE MODE) such as picture size made correctly?
• Strange colour, light colour, or dark, or colour misalignment.	• Adjust the picture tone. • Is the room too bright? The picture may look dark in a room that is too bright. • Check the colour system setting.
• Power is suddenly tuned off.	• The unit's internal temperature has increased. Remove any objects blocking the vent or clean. • Is the sleep timer set? Select “Off” from the “Sleep Timer” menu. • Is “No signal off” activated?
• No picture.	• Are connections to external equipment correct? • Is the input signal type selected correctly after connection? • Is the correct input source selected? • Is a non-compatible signal being input? • Is the picture adjustment correct? • Is the antenna connected properly? • Is “On” selected in “Audio Only”?
• No sound.	• Is the volume too low? • Make sure that headphones are not connected. • Check if you pressed 🔇 on the remote control unit.
• The TV sometimes makes a cracking sound.	• This is not a malfunction. This happens when the cabinet slightly expands and contracts according to change in temperature. This does not affect the TV's performance.

Cautions regarding use in high and low temperature environments

- When the unit is used in a low temperature space (e.g. room, office), the picture may leave trails or appear slightly delayed. This is not a malfunction, and the unit will recover when the temperature returns to normal.
- Do not leave the unit in a hot or cold location. Also, do not leave the unit in a location exposed to direct sunlight or near a heater, as this may cause the cabinet to deform and the LCD panel to malfunction.
  Storage temperature: +5°C to +35°C.

CHAPTER 3. ADJUSTMENT PROCEDURE

[1] ADJUSTMENT PROCEDURE

1. Adjustment method after PWB and/or IC replacement due to repair

The unit is set to the optimum at the time of shipment from the factory. If any value should become improper or any adjustment is necessary due to the part replacement, make an adjustment according to the following procedure.

1. Procure the following units in order to replace the main unit, IC3301, IC8101, IC3501, IC3502, IC8301, IC8302, IC8303, or IC8304.

   MAIN UNIT: DUNTKE186FM01 (LC-42/46/52XL2E)
   DUNTKE186FM02 (LC-46/52XL20E)

NOTE: [Caution when replacing ICs in the main unit (IC1501/IC1502/IC1503/IC2002) or the mini av unit (IC802)]

The above ICs are EEPROMs storing the EDID data of HDMI and the monitor microcomputer. Before replacing the relevant part, procure the following parts in which the data have been rewritten.

IC2002	RH-IXB986WJN8Q	Monitor microcomputer
IC802	RH-IXC284WJQZS	HDMI_EXT4
IC1501	RH-IXC285WJQZS	HDMI_EXT5
IC1502	RH-IXC286WJQZS	HDMI_EXT6
IC1503	RH-IXC287WJQZS	RGB (PC)_EXT7

2. After replacing the LCD panel or LCD control PWB, check PANEL_SIZE in the following procedure.
   1) Enter the process adjustment mode.
   2) Use the cursor keys ∧ / ∨ and P ∧ / ∨ of R/C to select the item [PANEL_SIZE] on the page 33/33.
   3) Verify that the panel size is displayed.
   4) If the size doesn't match, select the values of the panel size with the Vol ∧ / ∨ keys.
   5) After selection in Step 4), press the OK key, and it is completed with OK displayed.
3. After replacing the LCD panel or LCD control PWB, adjust the VCOM in the following procedure.
   1) Enter the process adjustment mode.
   2) Use the cursor keys ∧ / ∨ and P ∧ / ∨ of R/C to select the item [VCOM ADJ] on the page 10/33.
   3) Press the OK key to verify that the adjustment pattern is displayed.
   4) Use the +/- keys of VOL of L/C to adjust the flicker in the center of the screen to minimum.
   5) When the optimal state is achieved in Step 4, press the OK key to turn the pattern to OFF.
4. After replacing LCD panel or LCD control PWB, perform the up/down brightness difference adjustment in the following procedure. (Note: It is applicable to LC-42/46/52XL2E only.)
   1) Enter the process adjustment mode.
   2) Use the cursor keys ∧ / ∨ and P ∧ / ∨ of R/C to select the item [LCD_LUMA_ADJ] on the page 10/33.
   3) Press the OK key to verify that the adjustment pattern (all gray) is displayed.
   4) Use the VOL +/- keys of R/C to adjust the upper/lower brightness difference in the center of the screen to minimum.
   5) When the optimal state is achieved in Step 4, press the OK key to turn the pattern to OFF.

NOTE: LCD LUMA UD ** ←The value at the ** part is changed.

LCD LUMA DOWN 0 (Note that the value is changed if the P ∧ / ∨ keys are pressed in Step 4 above.)

2. Entering and exiting the adjustment process mode

1. Press the “POWER” key on the set of running TV set to force off the power.
2. While holding down the “VOL (-)” and “INPUT” keys on the set at once, plug in the AC power cord to turn on the power.

   The letter “K” appears on the screen.
3. Next, hold down the “VOL (-)” and “P (V)” keys on the set at once.

   Multiple lines of character string appearing on the screen indicate that the set is now in the adjustment Process mode. If you fail to enter the adjustment process mode (the display is the same as normal startup), retry the procedure. (Another procedure)
4. Press the “MENU” key on the main unit to display OSD.
5. Move the cursor to SERVICE (OSD) using the cursor keys on the remote control.

   Then press the “MENU” key on the remote control to enter the service mode (adjustment process mode).
6. To exit the adjustment process mode after the adjustment is done, unplug the AC power cord to force off the power. (When the power is turned off with the remote controller, once unplug the AC power cord and plug it in again. In this case, wait 10 seconds or so before plugging.)

CAUTION: Use due care in handling the information described here lest the users should know how to enter the adjustment process mode. If the settings are tampered with in this mode, unrecoverable system damage may result.

3. Remote controller key operation and description of display in adjustment process mode.

   Storage of EEP adjustment value

3. EEP RECOVER (Page 33/33)

   Retrieval of EEP adjustment value from storage area.

7. Lamp error detection

1. Function

   This LCD color TV set incorporates a lamp error detection feature that automatically turns off the power for safety under abnormal lamp or lamp circuit conditions. If by any chance anything is wrong with the lamp or lamp circuit or if the lamp error detection feature is activated for some reason, the following will result.

   1) The power is interrupted in about 6 seconds after it is turned on.

      (The power LED on the front of the TV set turns red from green and keeps blinking in red: ON for 250 ms and OFF for 1 sec.).

   2) If the above phenomenon 1) occurs 5 times consecutively, it becomes impossible to turn on the power. (The power LED remained red).

2. Measures

   1) Checking with lamp error detection OFF

      Enter the adjustment process mode, referring to 1. Entering and exiting the adjustment process mode.

      If there is a problem with the lamp or lamp circuit, the lamp will go out. (The power LED is green.)

      Then, you can check the operation to see if the lamp and lamp circuit are in trouble.

   2) Resetting the lamp error count

      After the lamp and lamp circuit are found out of trouble, reset the lamp error count. If a lamp error is detected five consecutive times, the power cannot be turned on. Using the cursor (UP/DOWN) key, move to the cursor to [LAMP ERROR RESET], Line 8 on adjustment process mode service page 2/33. With the cursor (LEFT/RIGHT) keys, select the [LAMP ERROR RESET] value. Finally press the cursor (OK) eys to reset the value to “0”.

   The thing that the HDMI-CEC circuit operates is confirmed.

12. Initialization to factory settings

CAUTION: When the factory settings have been made, all user setting data, including the channel settings, are initialized.
(The adjustments done in the adjustment process mode are not initialized.) Keep this in mind when initializing these settings.

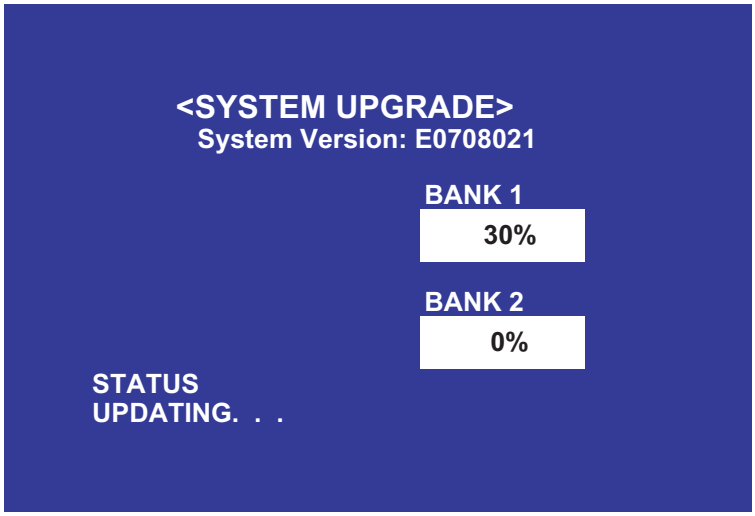
	Adjustment item	Adjustment conditions	Adjustment procedure
1	Factory settings	ends by turning off the MAIN POWER key. (See to below caution)	[Factory setting with adjustment process mode] • Enter the adjustment process mode. • Move the cursor to [INDUSTRY INIT] on page 2/33. • Use the R/C key to select a region from [EUROPE/RUSSIA/SWEDEN] and press the [OK] key. • “EXECUTING” display appears. • After a while, “SUCCESS” display appears, the setting is completed. When succeeding: Background color (green) When failing: Background color (red)
			The following items are initialized in the factory setting. 1) User settings 2) Channel data (e.g. broadcast frequencies) 3) Maker option setting 4) Password data

After adjustments, exit the adjustment process mode.
To exit the adjustment process mode, turn off the MAIN power key.
When the power is turned off with the remote control, unplug the AC power cord and plug it back in.

13. Upgrading the software

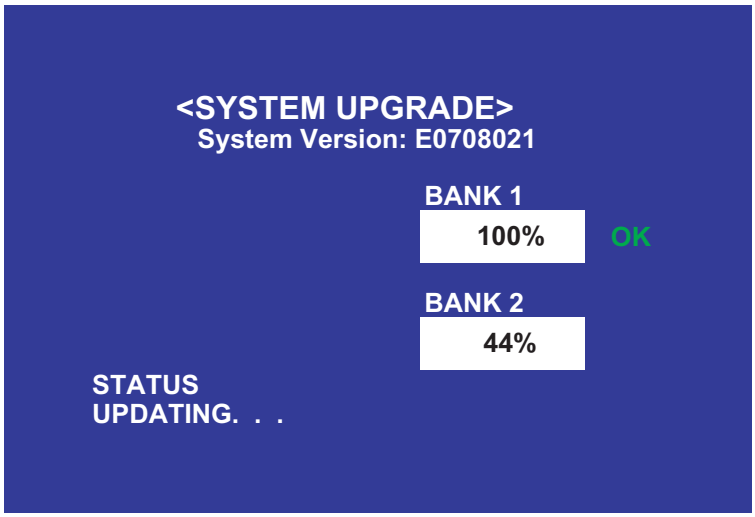
1. Turn off the AC power (Unplug the AC power cord).
2. Insert the upgrading USB flash memory for upgrade into the service slot.
3. While holding down the power button, plug in the AC power cord of the main unit to turn on the power.
4. Upgrade begins automatically.

   After the set starts, the upgrade screen like the figure below is displayed.

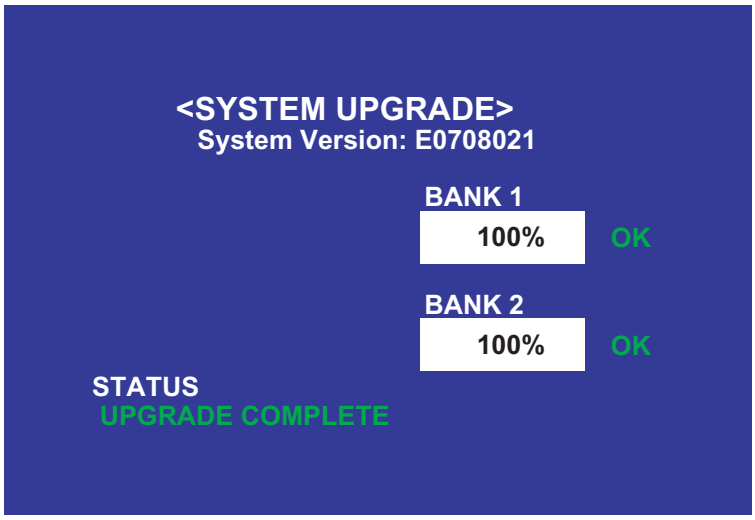


5. If any of the procedures fails, the following upgrade failure screen shows up. For the failing procedure, the “NG” marking turns red.

NOTE: In such case, try to upgrade the software again. If it still fails, the hardware may be in trouble.



6. When all the procedures are complete, the following upgrade success screen shows up. The new software version can be confirmed on screen. The version number appears when each item has been successfully upgraded. Finally the main version number appears on screen.



7. Turn off the AC power (Unplug the AC power cord). Take out the upgrading USB flash memory.
8. Now the software has been upgraded.

NOTE: Then get the set started and call the process adjustment screen 1/33 to check the main software version.

CAUTION

1) Do not take out and put in the USB flash memory during formatting.
2) It takes about one minute to the rewriting completion.
   Please confirm the upgrade status on the screen becomes 100%.

Configuration			
54	I2CADDR/TPWR	I/O	I2C Slave Address input/Transmit Power Sense output pin. When RESET# is low, this pin is used as an input to latch the I2C sub-address. The level on this pin is latched when the RESET# pin transitions from low to high. When RESET# is high, this pin is used as the TPWR output, indicating that the Rx-port has 5V present.
24	I2CSEL/INT#	I/O	I2C Selection input/ Interrupt output pin. The Sil9181 has two modes of operation: Local I2C control and Standalone. The mode is determined by the level of the I2CSEL/INT pin at the rising edge of RESET#. A high indicates I2C mode, and a low indicates Standalone mode. In Local I2C mode, all functions are controlled and observed with I2C registers using the pins LSCL/EPSEL1 and LSDA/EPSEL0 as the local I2C bus. In Standalone mode, the external pins LSCL/ EPSEL1 and LSDA/ EPSEL0 are use to determine whether the Sil9181 is in Normal mode or Standby mode. After reset, this pin becomes the Interrupt output. This is an open-drain output and requires an external pull-up.
50	RSVDL	—	Reserved for use by Silicon Image and must be tied low.
Control Pins			
11	RESET#	I	Reset Pin (Active LOW). Certain configuration inputs are latched when RESET# transitions from low to high.
13	LSCL/EPSEL1	I	Local I2C Clock / External Port Select 1. When I2CSEL is high, this becomes the Local I2C bus clock pin, LSCL. When I2CSEL is low, this becomes the external port select pin, EPSEL1. True open drain, so does not pull to ground if power not applied. An external pull-up is required.
12	LSDA/EPSEL0	I/O	Local I2C Data / External Port Select 0. When I2CSEL is high, this becomes the Local I2C bus data pin, LSDA. When I2CSEL is low, this becomes the external port select pin, EPSEL0. True open drain, so does not pull to ground if power not applied. An external pull-up is required.
CEC Pins			
41	CEC_A	I/O	HDMI compliant CEC I/O used to interface to CEC devices. CEC electrically compliant signal. This pin connects to the CEC signal of all HDMI connectors in the system. As an input, the pad acts as a LVTTL Schmitt triggered input and is 5V tolerant. As an output, the pad acts as an NMOS driver with resistive pull-up. This pin has an internal pull-up resistor.
40	CEC_D	I/O	CEC interface to local system. True open-drain. An external pull-up is required. This pin typically connects to the local CPU.
Differential Signal Data Pins

77	TSDA	I/O	Master DDC Data (Open drain output.) to HDMI receiver. I2C transactions required for HDCP operation are performed over this I2C bus.
Configuration Pins			
79	I2CADDR/TPWR	I/O	I2C Slave Address input / Transmit Power Sense output pin. When RESET# is low, this pin is used as an input to latch the I2C sub-address. The level on this pin is latched when the RESET# pin transitions from low to high. When RESET# is high, this pin is used as the TPWR output, indicating that the selected Rx-port has 5V present. When none of the Rx ports are selected, this signal is low.
35	I2CSEL/INT#	I/O	I2C Selection input / Interrupt output pin. When RESET# is low, this pin is used as an input to latch the External Port Detection signal. The level on this pin is latched when the RESET# pin transitions from low to high. When this pin is low during reset, the external pins EPSEL1/LSCL and EPSEL0/LSDA are used to select the Rx-port as EPSEL[1:0]. When this pin is high during reset, the internal local I2C register is used to select the Rx-port.
75	RSVDL	I	Reserved for use by Silicon Image and must be tied low.
Control Pins			
13	RESET#	I	Reset Pin (Active LOW). Certain configuration inputs are latched when RESET# transitions from low to high.
15	LSCL/EPSEL1	I	Local I2C Clock / External Port Select 1. When I2CSEL is high, this becomes the Local I2C bus clock pin, LSCL. When I2CSEL is low, this becomes the external port select pin, EPSEL1. True open drain, so does not pull to ground if power not applied. An external pull-up is required.
14	LSDA/EPSEL0	I/O	Local I2C Data / External Port Select 0. When I2CSEL is high, this becomes the Local I2C bus data pin, LSDA. When I2CSEL is low, this becomes the external port select pin, EPSEL0. True open drain, so does not pull to ground if power not applied. An external pull-up is required.
CEC Pins			
54	CEC_A	I/O	HDMI compliant CEC I/O used to interface to CEC devices. CEC electrically compliant signal. This pin connects to the CEC signal of all HDMI connectors in the system. As an input, the pad acts as a LVTTL Schmitt triggered input and is 5V tolerant. As an output, the pad acts as an NMOS driver with resistive pull-up. This pin has an internal pull-up resistor.
53	CEC_D	I/O	CEC interface to local system. True open-drain. An external pull-up is required. This pin typically connects to the local CPU.

2.14. IC7801 (9NK2510067610)

2.14.1 Pin Connections and short description

Pin No.	Pin Name	I/O	Pin Function
1	INV	I	Inverting input of the error amplifier. The information on the output voltage of the PFC preregulator is fed into the pin through a resistor divider.
2	COMP	O	Output of the error amplifier. A compensation network is placed between this pin and INV (pin #1) to achieve stability of the voltage control loop and ensure high power factor and low THD.
3	MULT	I	Main input to the multiplier. This pin is connected to the rectified mains voltage via a resistor divider and provides the sinusoidal reference to the current loop.
4	CS	I	Input to the PWM comparator. The current flowing in the MOSFET is sensed through a resistor, the resulting voltage is applied to this pin and compared with an internal sinusoidal-shaped reference, generated by the multiplier, to determine MOSFET's turn-off.
5	ZCD	I	Boost inductor's demagnetization sensing input for transition-mode operation. A negative-going edge triggers MOSFET's turn-on.
6	GND	—	Ground. Current return for both the signal part of the IC and the gate driver.
7	GD	O	Gate driver output. The totem pole output stage is able to drive power MOSFET's and IGBT's with a peak current of 600 mA source and 800 mA sink. The high-level voltage of this pin is clamped at about 12V to avoid excessive gate voltages in case the pin is supplied with a high Vcc.
8	VCC	—	Supply Voltage of both the signal part of the IC and the gate driver. The supply voltage upper limit is extended to 22V min. to provide more headroom for supply voltage changes.

2.15. IC7905 (9NK2510293234)

2.15.1 Pin Connections and short description

Pin No.	Pin Name	Pin Function
5	DRAIN (D) Pin:	Power MOSFET drain connection. Provides internal operating current for both start-up and steady-state operation.
1	BYPASS (BP) Pin:	Connection point for a 0.1 μF external bypass capacitor for the internally generated 5.8 V supply.
4	ENABLE/UNDER-VOLTAGE (EN/UV) Pin:	This pin has dual functions: enable input and line under-voltage sense. During normal operation, switching of the power MOSFET is controlled by this pin. MOSFET switching is terminated when a current greater than 240 μA is drawn from this pin. This pin also senses line under-voltage conditions through an external resistor connected to the DC line voltage. If there is no external resistor connected to this pin, TinySwitch-II detects its absence and disables the line undervoltage function.
2,3	SOURCE (S) Pin:	Control circuit common, internally connected to output MOSFET source.

2.17. IC8301-4 (RH-iXC154WJQZQ)

2.17.1 Pin Connections and short description

Pin No.	Pin Name	I/O	Pin Function
53, 52	CK, $\overline{CK}$	I	Clock: CK and $\overline{CK}$ are differential clock inputs. CMD, ADD inputs are sampled on the crossing of the positive edge of CK and negative edge of $\overline{CK}$. Output (read) data is referenced to the crossings of CK and $\overline{CK}$ (both directions of crossing).
41	CKE	I	Clock Enable: CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is synchronous for power down entry and exit, and for self refresh entry. CKE is asynchronous for self refresh exit. CKE must be maintained high throughout read and write accesses. Input buffers, excluding $\overline{CK}$, and CKE are disabled during powerdown. Input buffers, excluding CKE, are disabled during self refresh.
51	$\overline{CS}$	I	Chip Select: All commands are masked when CS is registered HIGH. CS provides for external bank selection on systems with multiple banks. $\overline{CS}$ is considered part of the command code.
19	ODT	I	On Die Termination: ODT (registered HIGH) enables termination resistance internal to the gDDR2 SDRAM. When enabled, ODT is only applied to each DQ, UDQS/$\overline{UDQS}$, LDQS/$\overline{LDQS}$, UDM, and LDM signal for x16 configurations. The ODT pin will be ignored if the Extended Mode Register (EMRS) is programmed to disable ODT.
77, 76, 70	$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	I	Command Inputs: RAS, CAS and WE (along with CS) define the command being entered.
66, 62	(L) UDM	I	Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
42, 71	BA0 - BA1	I	Bank Address Inputs: BA0 and BA1 define to which bank an Active, Read, Write or Precharge command is being applied. BA0 also determines if the mode register or extended mode register is to be accessed during a MRS or EMRS cycle.
50, 72, 75, 44, 49, 73, 74, 45, 48, 46, 43, 47, 13	A0 - A12	I	Address Inputs: Provided the row address for Active commands and the column address and Auto Precharge bit for Read/Write commands to select one location out of the memory array in the respective bank. A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA0, BA1. The address inputs also provide the op-code during Mode Register Set commands.
	DQ	I/O	Data Input/ Output: Bi-directional data bus.
81, 57, 61, 29	LDQS, ($\overline{LDQS}$) UDQS, ($\overline{UDQS}$)	I/O	Data Strobe: output with read data, input with write data. Edge-aligned with read data, centered in write data. LDQS corresponds to the data on DQ0-DQ7; UDQS corresponds to the data on DQ8-DQ15. The data strobes LDQS and UDQS may be used in single ended mode or paired with optional complementary signals LDQSand UDQS to provide differential pair signaling to the system during both reads and writes. An EMRS (1) control bit enables or disables all complementary data strobe signals.
10, 14, 15, 16, 32, 36,	NC/RFU	—	No Connect: No internal electrical connection is present.

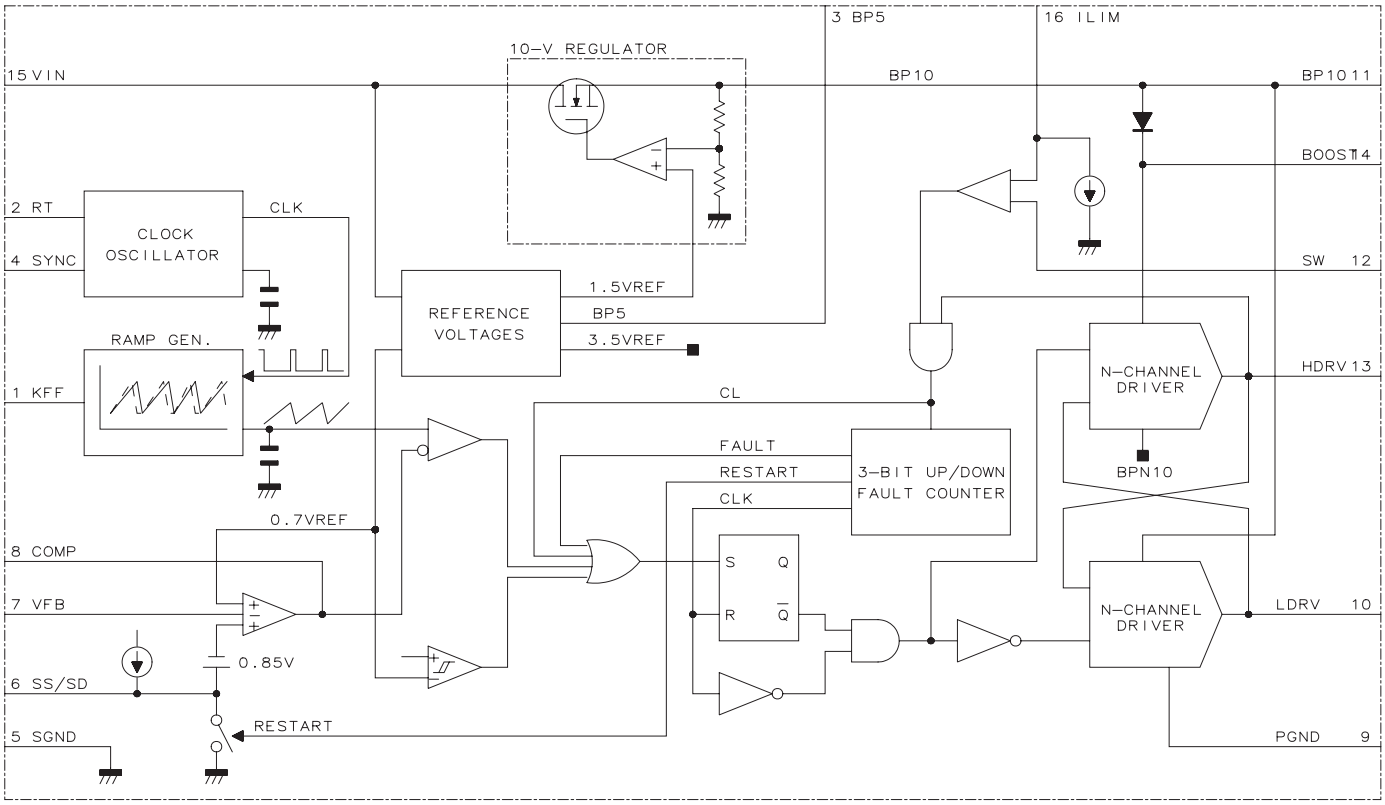
2.21.1 Block Diagram

TPS40055

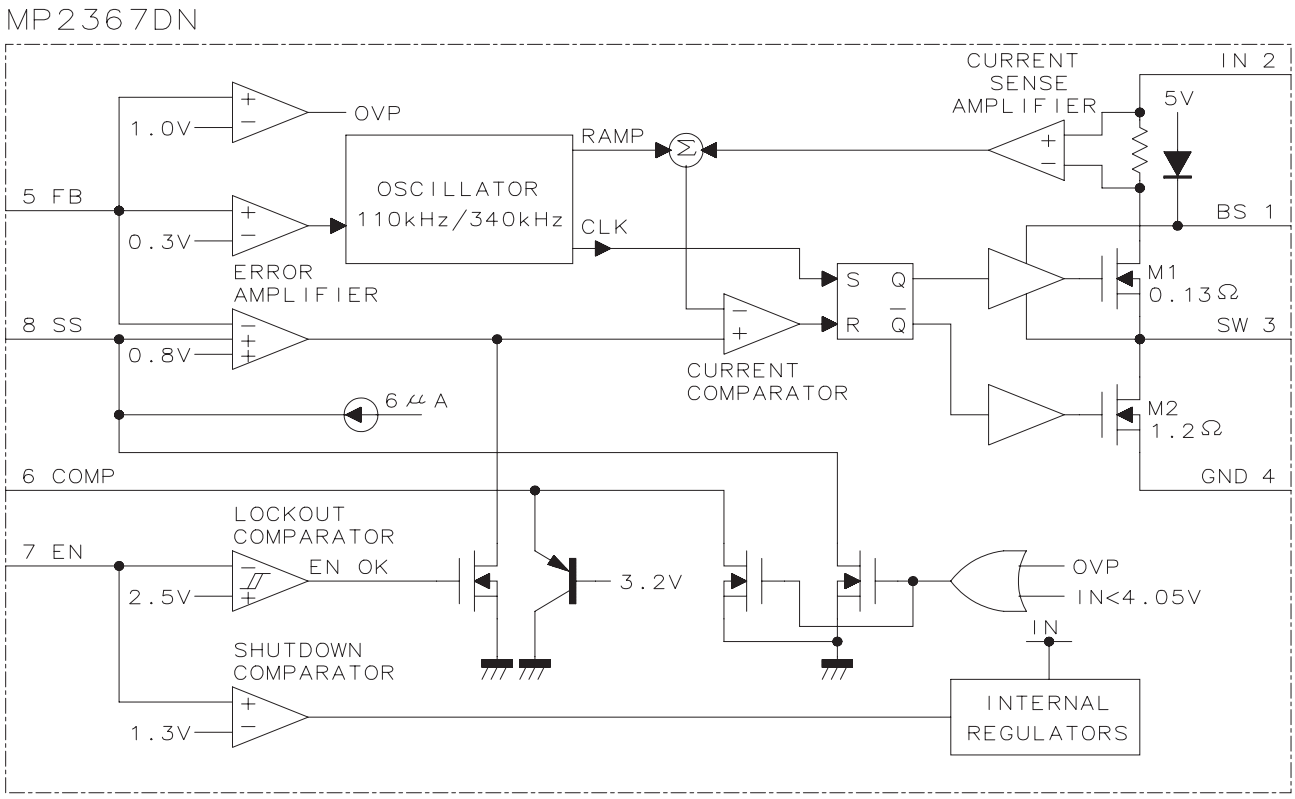


2.21.2 Pin Connections and short description

Pin No.	Pin Name	I/O	Pin Function
14	BOOST	O	Gate drive voltage for the high side N-channel MOSFET. The BOOST voltage is 9 V greater than the input voltage. A 0.1-μF ceramic capacitor should be connected from this pin to the drain of the lower MOSFET.
3	BP5	O	5-V reference. This pin should be bypassed to ground with a 0.1-μF ceramic capacitor. This pin may be used with an external DC load of 1 mA or less.
11	BP10	O	10-V reference used for gate drive of the N-channel synchronous rectifier. This pin should be bypassed by a 1-μf ceramic capacitor. This pin may be used with an external DC load of 1 mA or less.
8	COMP	O	Output of the error amplifier, input to the PWM comparator. A feedback network is connected from this pin to the VFB pin to compensate the overall loop. The comp pin is internally clamped above the peak of the ramp to improve large signal transient response.
13	HDRV	O	Floating gate drive for the high-side N-channel MOSFET. This pin switches from BOOST (MOSFET on) to SW (MOSFET off).
16	ILIM	I	Current limit pin, used to set the overcurrent threshold. An internal current sink from this pin to ground sets a voltage drop across an external resistor connected from this pin to VCC. The voltage on this pin is compared to the voltage drop (VIN-SW) across the high side MOSFET during conduction.
1	KFF	I	A resistor is connected from this pin to VIN to program the amount of voltage feed-forward. The current fed into this pin is internally divided and used to control the slope of the PWM ramp.
10	LDRV	O	Gate drive for the N-channel synchronous rectifier. This pin switches from BP10 (MOSFET on) to ground (MOSFET off).
9	PGND	—	Power ground reference for the device. There should be a low-impedance path from this pin to the source (s) of the lower MOSFET (s).
2	RT	I	A resistor is connected from this pin to ground to set the internal oscillator and switching frequency.
5	SGND	—	Signal ground reference for the device.
6	SS/SD	I	Soft-start programming pin. A capacitor connected from this pin to ground programs the soft-start time. The capacitor is charged with an internal current source of 2.3 μA. The resulting voltage ramp on the SS pin is used as a second non-inverting input to the error amplifier. The output voltage begins to rise when VSS/SD is approximately 0.85 V. The output continues to rise and reaches regulation when VSS/SD is approximately 1.55 V. The controller is considered shut down when VSS/SD is 125 mV or less. All internal circuitry is inactive. The internal circuitry is enabled when VSS/SD is 210 mV or greater. When VSS/SD is less than approximately 0.85 V, the outputs cease switching and the output voltage (VOUT) decays while the internal circuitry remains active.
12	SW	I	This pin is connected to the switched node of the converter and used for overcurrent sensing.
4	SYNC	I	Syncronization input for the device. This pin can be used to synchronize the oscillator to an external master frequency. If synchronization is not used, connect this pin to SGND.
7	VFB	I	Inverting input to the error amplifier. In normal operation the voltage on this pin is equal to the internal reference voltage, 0.7 V.
15	VIN	I	Supply voltage for the device.

2.22. IC9602 (VHiMP2367DN-1Y)

2.22.1 Block Diagram



2.22.2 Pin Connections and short description

Pin No.	Pin Name	I/O	Pin Function
1	BS	I	High-Side Gate Drive Boost Input. BS supplies the drive for the high-side N-Channel MOSFET switch. Connect a 0.01μF or greater capacitor from SW to BS to power the high side switch.
2	IN	I	Power Input. IN supplies the power to the IC, as well as the step-down converter switches.
3	SW		Drive IN with a 4.45V to 28V power source. Bypass IN to GND with a suitably large capacitor to eliminate noise on the input to the IC.
4	GND		Ground.
5	FB		Feedback Input. FB senses the output voltage to regulate that voltage. Drive FB with a resistive voltage divider from the output voltage. The feedback reference voltage is 0.8V.
6	COMP		Compensation Node. COMP is used to compensate the regulation control loop. Connect a series RC network from COMP to GND to compensate the regulation control loop. In same cases, an additional capacitor from COMP to GND is required.
7	EN		Enable Input. EN is a digital input that turns the regulator on or off. Drive EN high to turn on the regulator, drive it low to turn it off.
8	SS		Soft-start Control Input. SS controls the soft-start period. Connect a capacitor from SS to GND to set the soft-start period.

CHAPTER 8. SCHEMATIC DIAGRAM

[1] DESCRIPTION OF SCHEMATIC DIAGRAM

VOLTAGE MEASUREMENT CONDITION:

1. The voltages at test points are measured on exclusive AC adaptor and the stable supply voltage of AC 230V.
   Signals are fed by a colour bar signal generator for servicing purpose and the above voltages are measured with a 20k ohm/V tester.

INDICATION OF RESISTOR & CAPACITOR:

RESISTOR

1. The unit of resistance "Ω" is omitted.
   (K=kΩ=1000 Ω, M=MΩ).
2. All resistors are ± 5%, unless otherwise noted.
   (K= ± 10%, F= ± 1%, D= ± 0.5%)
3. All resistors are 1/16W, unless otherwise noted.

CAPACITOR

1. All capacitors are μF, unless otherwise noted.
   (P=pF=μμF).
2. All capacitors are 50V, unless otherwise noted.

CAUTION:
This circuit diagram is original one, therefore there may be a slight difference from yours.

SAFETY NOTES:
1. DISCONNECT THE AC PLUG FROM THE AC OUTLET BEFORE REPLACING PARTS.
2. SEMICONDUCTOR HEAT SINKS SHOULD BE REGARDED AS POTENTIAL SHOCK HAZARDS WHEN THE CHASSIS IS OPERATING.

IMPORTANT SAFETY NOTICE:
PARTS MARKED WITH " ⚠ " ( ) ARE IMPORTANT FOR MAINTAINING THE SAFETY OF THE SET. BE SURE TO REPLACE THESE PARTS WITH SPECIFIED ONES FOR MAINTAINING THE SAFETY AND PERFORMANCE OF THE SET.
