

# AUTHOR'S GUIDE TO PREPARING 'RESEARCH HIGHLIGHTS' FOR CACM USING L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> AND B<sub>I</sub>B<sub>T</sub>E<sub>X</sub>

## Overview of this Document

### 1. Getting Started

- 1.1 Summary of CACM *Research Highlights* Format
- 1.2 Using the CACM L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> Document Class and B<sub>I</sub>B<sub>T</sub>E<sub>X</sub> Style Files
- 1.3 Beginning your L<sup>A</sup>T<sub>E</sub>X Source File

### 2. The Structure of the Article

- 2.1 Some Housekeeping Details
- 2.2 The Title and Author Information
- 2.3 The Body of the Article
- 2.4 Acknowledgements
- 2.5 The Bibliography
- 2.6 A Final Bit of Formatting?

## OVERVIEW OF THIS DOCUMENT

This document explains how to use L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> and B<sub>I</sub>B<sub>T</sub>E<sub>X</sub> with the document class/style file (**research4cacm.cls**) provided by ACM to create a paper suitable for submission to *Research Highlights* in CACM. Section 1 gives a summary of the CACM *Research Highlights* format and a general look at the use of the ACM L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> document class and B<sub>I</sub>B<sub>T</sub>E<sub>X</sub> style files. Section 2 discusses, in fairly thorough detail, the structure of the L<sup>A</sup>T<sub>E</sub>X file for your *Research Highlights* article and, in much more general terms, the structure of a B<sub>I</sub>B<sub>T</sub>E<sub>X</sub> file.

### NOTE:

The reason for the existence of this *Research Highlights* style is to allow authors, who have published an article in a conference proceedings, a chance to disseminate their work to a broader audience.

For detailed instructions on using L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub>, refer to the *L<sup>A</sup>T<sub>E</sub>X User's Guide and Reference Manual*, Second Edition, by Leslie Lamport.

## 1. GETTING STARTED

### 1.1 Summary of CACM Research Highlights (Format)

Articles cited to be published in the *Research Highlights* section of CACM will provide readers with a collection of outstanding research articles, selected from the broad spectrum of computing-research conferences. Submissions for this section are first nominated by Editorial Board Members or Approved Nominating Organizations, and are then subject to final selection by the Editorial Board. Authors are then invited to submit their article, *after they have rewritten and expanded the scope of their articles* as appropriate for the broad readership of *Communications*. It is important to note that publication in *Communications*, a

---

computing-technology and science magazine, does **not** conflict with publication in archival journals. Articles in archival journals are typically expanded versions of conference publications, while *Communications* aims at publishing somewhat shorter and higher-level versions of these articles.

Submissions must address topics of relevance and professional value to a very broad-based readership. It is best to remember that most readers are not experts in the author's particular discipline, but expect to get a broad perspective on computing practice and research.

We'll begin by summarizing some formatting guidelines for *CACM Research Highlights*.

**PAGE SIZE AND LAYOUT:** All material on each page should fit within a rectangle of 18.3 cm / 23.5 cm (7.3" / 9.25"), centered on the page, beginning 2.54 cm (1") from the top of the page and ending with 2.54 cm (1") from the bottom. The right and left margins should be 1.9 cm (.75"). The text should be in two 8.45 cm (3.33") columns with a .83 cm (.33") gutter.

All body text is set in two columns. For CACM, the two columns on the last page do **not** necessarily have to be of equal length. Remember, your text will be 'flowed' into CACM, thus page-endings will differ from your original.

**NORMAL OR BODY TEXT:** The body text is set in 9-point Times Roman (cmr). Use sans serif or nonproportional fonts only for special purposes, such as distinguishing source code text. Right margins should be justified, not ragged. **This *Research Highlights* style uses the indenting of paragraphs, to visually distinguish between successive paragraphs, instead of the de facto style which uses a full line space.**

**TITLE AND AUTHOR INFORMATION:** The title (Helvetica or Arial 18-point bold), authors' names (Helvetica or Arial 12point), author addresses, affiliations and phone number (Helvetica or Arial 10-point) and email address (Helvetica 12 point) run across the full width of the page. There is no restriction on the number of author names (and information blocks) that may appear in the byline. These should be aligned at the top of the first page. Editorial staff will fashion the byline even further and place email addresses and affiliation information towards the back of the finalized article.

**REFERENCES AND CITATIONS:** Footnotes should be Times New Roman 9-point. The format of references is a numbered list at the end of the article, sorted alphabetically by surname and referenced by numbers in brackets e.g. [1]. The bibstyle is 'abbrv'.

References should be published materials accessible to the public. Internal technical reports may be cited only if they are easily accessible (i.e. you can give the address to obtain the report within your citation) and may be obtained by any reader. Proprietary information may not be cited. Private communications should be acknowledged, not referenced (e.g. "[Robertson, personal communication]").

---

**PAGE NUMBERING, HEADERS AND FOOTERS:** Do not include headers or footers in your submission. Page numbers etc. are *not* output by the **research4cacm.cls** file.

**HIERARCHICAL SECTION HEADINGS:** The heading of a section should be in Times New Roman 12 point bold in all-capitals flush left. Sections and subsequent subsections should be numbered and flush left.

The heading of subsections should be in Times New Roman 12 point bold with only the initial letters capitalized. (Note: For subsections and subsubsections, a word like *the* or *a* is not capitalized unless it is the first word of the header.)

The heading for subsubsections (or lower) should be in Times New Roman 11-point italic with initial letters capitalized.

## 1.2 Using the ACM L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> Document Class and B<sup>I</sup>B<sup>T</sup>E<sup>X</sup> Style Files

Now that you know more about the *Research Highlights* CACM format, you can rest assured that you won't have to fuss very much with the niceties of it. By using L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> and B<sup>I</sup>B<sup>T</sup>E<sup>X</sup> with the *Research Highlights* CACM document class and bibliographic style files, and creating .tex and .bib files that use the appropriate commands, virtually all of the nitty-gritty of the format detailed above is handled properly for you.

The balance of this document will focus on using L<sup>A</sup>T<sub>E</sub>X<sub>2</sub><sub>ε</sub> and B<sup>I</sup>B<sup>T</sup>E<sup>X</sup> with the *Research Highlights* CACM document class and bibliographic style files to produce your article. In general, it assumes you are familiar with L<sup>A</sup>T<sub>E</sub>X and B<sup>I</sup>B<sup>T</sup>E<sup>X</sup> on your site. [For those who are not: L<sup>A</sup>T<sub>E</sub>X is available for a variety of computer systems. While all versions are essentially the same — an input file created on one should produce identical output on any other (font issues notwithstanding) but how you actually run L<sup>A</sup>T<sub>E</sub>X may vary from system to system.]

**OBTAINING THE DOCUMENT CLASS AND BIBLIOGRAPHIC STYLE FILES.** You can receive instructions on how to obtain the document class file (**research4cacm.cls**) and related information (including this document) by visiting ACM's home page at

- <http://www.acm.org/Publications/cacm/guidelines/RHTemplate.html>

You will probably want to put the **research4cacm.cls** file in your L<sup>A</sup>T<sub>E</sub>X *local style directory* so that L<sup>A</sup>T<sub>E</sub>X can find it at run time.

As said, the document class file contains the commands which define the various *structural* parts of the document to format a CACM *Research Highlights* paper. Since such articles are derived from (ACM) Conference Proceedings, the similarity between the styles is far from co-incidental. ACM wants you to focus on adjusting the *content* – to edit the article so that it can be understood by a wider audience – instead of spending time changing LaTeX commands to suit a new style.

---

**NOTE:** Remember, when you are *morphing* your article, from a Proceedings paper to one suitable for publication in the magazine, you are NOT trying to produce camera-ready copy!

Once you have the document class file and are ready to begin writing/editing your article, write, revise, and prepare your article for submission as you usually do with L<sup>A</sup>T<sub>E</sub>X, using information from:

- *Author's Guide to Preparing 'Research Highlights' for CACM Using L<sup>A</sup>T<sub>E</sub>X2<sub>ε</sub> and B<sup>I</sup>B<sup>T</sup>E<sup>X</sup>* (this document)
- *L<sup>A</sup>T<sub>E</sub>X User's Guide and Reference Manual* [Second Edition] (Leslie Lamport)

Remember, you should use only the *structural* commands in the **research4cacm.cls** file, but you may use any of the *typographical* commands – such as accented or non-English characters and the mathematical characters and structures – from L<sup>A</sup>T<sub>E</sub>X.

### 1.3 Beginning Your L<sup>A</sup>T<sub>E</sub>X Source File

It is not necessary, but it is sensible and highly recommended, to begin your document with several comment lines showing the file name, your name, a brief revision history, and any other pertinent comments about the file. Each line of a comment in a L<sup>A</sup>T<sub>E</sub>X document begins with a %; comments in the source document do not appear in the output.

#### EXAMPLE

```
% research4cacm.tex
% Preparation of my Proceedings Conference Paper to one more
% suitable for publishing in CACM.
% Author: John Doe
% Revisions: 20 March 2008
```

The very first (non-commented) lines in your file must be

```
\documentclass{research4cacm}
\begin{document}
```

This tells L<sup>A</sup>T<sub>E</sub>X to add the *Research Highlights* CACM style file's structural commands to the suite of typographic commands already available, and to begin working in the ACM **document** environment.

The very last (non-commented) line in your file must be

```
\end{document}
```

All the rest of your L<sup>A</sup>T<sub>E</sub>X document is “bracketed”, as it were, by these commands.

A word to the novice: if you have some previous experience with L<sup>A</sup>T<sub>E</sub>X, you will probably find it very helpful and instructive to obtain the source files of the sample document;

---

**research-highlights.tex**, **research4cacm.cls**, **bibs4cacm.bib** along with the three pieces of artwork; **rosette.ps**, **fly.eps** and **flies.eps**), and compile them with L<sup>A</sup>T<sub>E</sub>X and B<sup>I</sup>B<sub>T</sub>E<sub>X</sub>, and then compare the source with your output.

A word to the expert: If you have routinely used L<sup>A</sup>T<sub>E</sub>X or T<sub>E</sub>X for a long time, you may be tempted to write your own improvements to the structural definitions in the **research4cacm.cls** file, or to use other commands to streamline typesetting. *Please refrain from doing this!* Remember your final submission file will be **edited and recompiled** by a vendor using un-hacked .tex, .sty and .cls files. The vendor's versions will, therefore, **not** contain any author-specific tweaks, hacks or local enhancements. Problems will arise if your source file expects them to. Also, please be very careful when using `\def` in your source file as you may, inadvertently, redefine a reserved L<sup>A</sup>T<sub>E</sub>X or T<sub>E</sub>X keyword.

## 2. THE STRUCTURE OF THE ARTICLE

You can think of your article as having this general structure: the Title and Author Information (including title and author information along with any footnotes on title, subtitle and authors); the Body of the Article (including text, citations, figures, tables and equations); Acknowledgements and Bibliography.

The Title and Author Information is rather rigid in its internal organization, requiring specific elements in a specific order. The organization of the Body of the Article is determined to a great extent by the type of information you are communicating in your article. The Acknowledgements section is optional, but is included only if required, likewise, its content and internal organization are entirely up to you. The Bibliography section is produced 'automatically' by the **abbrv.bst** (bibstyle file) utilizing B<sup>I</sup>B<sub>T</sub>E<sub>X</sub>, from the 'cites' you insert in your article and, of course, from the (database-like) contents of your **.bib** file.

Each of these general parts of the document is dealt with in detail below.

### 2.1 Some Housekeeping Details

There are a few details that must be attended to during the *morphing* of any Conference Proceeding article to one suitable for publication in CACM. In addition, there are some formatting tweaks specific to the final, published, version. Such final formatting tweaks, are really the purview of the editor for CACM, and are not, strictly speaking, the author's responsibility. (But they are mentioned here for completeness.)

#### 2.1.1 Conference Information

The `\conferenceinfo{ }{ }` command, normally seen in a Conference Proceedings submission *should be commented out*.

*EXAMPLE*

```
%\conferenceinfo{STOC}{'97 El Paso, Texas USA}
```

---

### 2.1.3 Copyright Date

The `\CopyrightYear{}` command, normally seen in a Conference Proceedings submission *should be commented out*.

EXAMPLE

```
%\CopyrightYear{1999}
```

### 2.1.4 Copyright Data

The `\crdata{}` command, takes a single argument: the fourteen digit number that comprises the copyright data. This appears in the copyright notice at the bottom of the first page of each article. This information defaults to 0001-0782/08/0X00 if not specified. The `\crdata{}` command allows the default to be overridden, if need be.

EXAMPLE

```
\crdata{0001-0782/08/0200}
```

## 2.2 Title and Author Information

As noted above, the internal organization of the title and author is rather rigid. The following outline shows the basic organization of the front matter; an explanation of each element is given in subsections 2.2.1 through 2.2.4. Unless noted as OPTIONAL, each element below is required, and required in the order indicated. (This same outline is repeated, with the actual L<sup>A</sup>T<sub>E</sub>X command or environment in lieu of the description for each element given below, in section 2.2.4 of this document.)

- **Title**

footnote about title (OPTIONAL)

- **Subtitle (OPTIONAL)**

footnote(s) about subtitle (OPTIONAL)

- **Author or authors' information**

includes names, affiliations, addresses and e-mail addresses

footnote(s) about author(s) (OPTIONAL)

### 2.2.1 Title of the Paper

The `\title{}` command takes one argument: the title of your article. You may insert `\\` (line breaks) to indicate desirable line breaks for the title; if you do not insert line breaks, L<sup>A</sup>T<sub>E</sub>X may insert them in ways that you find unaesthetic.

You should enter the title in mixed upper and lower case. You may indicate emphasis with the `\ttit` command, and you may of course enter any required special characters with the appropriate L<sup>A</sup>T<sub>E</sub>X command. If you need to enter math mode characters, use `\huge` size for the best match of math characters to title characters.

---

### EXAMPLE

```
\title{On {\huge$\mathrm{ACC}^0[p^k]$} Proofs}
```

If you need to include any information about the title in a note at the bottom of the page, use the `\titlenote{}` command. The text of the note is the argument of the `\titlenote{}` command; ‘numbering’ (actually, symbols are used to indicate order in the title notes) is done automatically. The `\titlenote{}` command and its argument should be contained within the argument of the `\title{}` command.

### EXAMPLE

```
\title{A Novel Application for B$\acute{\mbox{e}}zier Curves}  
OR  
\title{On Sorting Strings in External Memory\titlenote{Paper  
presented at the STOC '97 in El Paso.}}
```

You may have up to five occurrences of the `\titlenote{}` command throughout the title and author information block.

### 2.2.2 Subtitle of the Paper

The `\subtitle{}` command takes one argument: a subtitle of your paper. Most often, this is the remark that a paper is an “Extended Abstract”, but you may use it for any text that should be centered in a smaller type size below the title and before the author information block.

You should enter the subtitle in mixed upper and lower case. You may indicate emphasis with the `\subttlit` command or emboldening with `\subttlbf`, and you may of course enter any required special characters with the appropriate L<sup>A</sup>T<sub>E</sub>X command.

If you need to include any information about the subtitle in a note at the bottom of the page, use the `\titlenote{}` command. The text of the note is the argument of the `\titlenote{}` command; numbering is done automatically. The `\titlenote{}` command and its argument should be contained within the argument of the `\subtitle{}` command. (The `\subtitle{}` command is optional.)

### EXAMPLE

```
\subtitle{[Extended Abstract]\titlenote{The full paper will appear  
in the Journal of Theoretical Practice.}}
```

### 2.2.3 Author or Authors

The style calls for ‘alignment’ of the names and affiliations, of the authors’, beneath the article title. There is no restriction on the number of authors that can appear beneath the title.

---

To help L<sup>A</sup>T<sub>E</sub>X to handle this formatting, use the command `\numberofauthors{}`, which takes the single argument, none other than the total number of authors.

Now, how to handle all those author names... The `\author{}` command takes one argument, but it may be a long and complex one: the names of all authors who wish to appear beneath the article title, along with their affiliations and addresses and email addresses, and any footnotes that must go with an individual's name. Let's go through the details of this block of author information.

Start each of the author's name and affiliation with the `\alignauthor` command, which takes no argument, but handles some calculations to align and center the author information properly. If there is a footnote for an author, you must use the `\titlenote{}` command, with the text of the footnote as its argument. End each line of the author information with `\\` to ensure proper line breaks.

Next, use the command `\affaddr{}` which takes as its argument a line of affiliation or address to ensure the proper formatting of the address and affiliation for each author. Finally, use `\email{}` with the argument of an email address to properly format that nugget of author information.

#### EXAMPLES

*A single author:*

```
\numberofauthors{1}
\author{
\alignauthor Ben Trovato\titlenote{ A note from Dr.~Trovato.}\\
    \affaddr{Institute for Clarity in Documentation}\\
    \affaddr{1932 Wallamaloo Lane}\\
    \affaddr{Wallamaloo, New Zealand}\\
    \email{trovato@corporation.com}
}
```

*Two authors:*

```
\numberofauthors{2}
\author{
\alignauthor Ben Trovato\titlenote{ A note from Dr.~Trovato. }\\
    \affaddr{Institute for Clarity in Documentation}\\
    \affaddr{1932 Wallamaloo Lane}\\
    \affaddr{Wallamaloo, New Zealand}\\
    \email{trovato@corporation.com}
\alignauthor Lars Th{\o}rv{"a}ld\titlenote{A note from Lars.}\\
    \affaddr{The Th{\o}rv{"a}ld Group}\\
    \affaddr{1 Th{\o}rv{"a}ld Circle}\\
    \affaddr{Hekla, Iceland}\\
    \email{larst@affiliation.org} }
```

---

*Six authors:*

```
\numberofauthors{6}
\author{
% 1st. author
\alignauthor
Ben Trovato\titlenote{A note from Dr.~Trovato.}\
    \affaddr{Institute for Clarity in Documentation}\
    \affaddr{1932 Wallamaloo Lane}\
    \affaddr{Wallamaloo, New Zealand}\
    \email{trovato@corporation.com}
% 2nd. author
\alignauthor
G.K.M. Tobin\titlenote{A note from G. Tobin.}\
    \affaddr{Institute for Clarity in Documentation}\
    \affaddr{P.O. Box 1212}\
    \affaddr{Dublin, Ohio 43017-6221}\
    \email{webmaster@marysville-ohio.com}
% 3rd. author
\alignauthor Lars Th{\o}rv{"a}ld\titlenote{A note from Lars.}\
    \affaddr{The Th{\o}rv{"a}ld Group}\
    \affaddr{1 Th{\o}rv{"a}ld Circle}\
    \affaddr{Hekla, Iceland}\
    \email{larst@affiliation.org}
\and % use '\and' if you need 'another row' of author names
% 4th. author
\alignauthor Lawrence P. Leipuner\
    \affaddr{Brookhaven Laboratories}\
    \affaddr{Brookhaven National Lab}\
    \affaddr{P.O. Box 5000}\
    \email{lleipuner@researchlabs.org}
% 5th. author
\alignauthor Sean Fogarty\
    \affaddr{NASA Ames Research Center}\
    \affaddr{Moffett Field}\
    \affaddr{California 94035}\
    \email{fogartys@amesres.org}
% 6th. author
\alignauthor Charles Palmer\
    \affaddr{Palmer Research Laboratories}\
    \affaddr{8600 Datapoint Drive}\
    \affaddr{San Antonio, Texas 78229}\
    \email{cpalmer@prl.com}
}
```

If you need more than two rows, use the `\and` command ‘in between’ each row.

**NOTE:** If you have used the `\additionalauthors{}` feature, in your Conference article, *you need to comment this out* and, instead, move ALL authors to the byline. In this way,

---

ALL, authors get ‘equal billing’. Do not worry if the first page appears as though it is ‘full of authors’ because, during the editing stage, author affiliations, emails, etc. will be moved to the back of the article, when published in CACM.

#### EXAMPLES

```
\numberofauthors{5}
```

.

[\author{...} 3 of the 5 would normally go here, so as to appear beneath the title, in a Conference article. But, for a CACM article, ALL authors get equal billing so ALL 5 should appear in the byline.]

.

```
%\additionalauthors{Additional authors: John Smith (The Th{\o}rvald  
%Group, email: {\texttt{jsmith@affiliation.org}}) and Julius  
%P.~Kumquat (The Kumquat Consortium, email:  
%{\texttt{jpkumquat@consortium.net}}).}  
% Memo to self: put all these authors into the byline ALSO!
```

Be certain to note that there is only one occurrence of `\author` in each document; you do *not* have multiple occurrences of `\author` surrounding each author and affiliation. You should insert `\\` (line breaks) between a name and each line of affiliation and/or address, and you may insert one for a desirable break if either line is too long to fit on a single line.

You should enter the author’s/authors’ names and affiliation in mixed upper and lower case. You may use any of L<sup>A</sup>T<sub>E</sub>X’s accented characters as required in an author or organization name. You may put a tie accent (the tilde with no backslash) between an initial and a subsequent part of the name to improve spacing.

### 2.3 The Body of the Article

The body of your paper, just like for a Conference, will start out with an abstract.

**NOTE:** For CACM, the categories, subject descriptors and general terms *are to be commented out*.

Beyond that, there are very few requirements: the text of the body of the article is organized as you see fit to best communicate your ideas. Type style changes and accents and symbols from languages other than English may be necessary for clarity and precision. Moreover, the body of the article may contain equations and other mathematical structures, as well as figures and tables. The body of the article will also include citations to works referenced in the bibliography.

Each of these different aspects of the body of your article will be considered in turn below.

---

### 2.3.1 Abstract

The abstract of the article is put in the **abstract** environment. Place the control sequence `\begin{abstract}` at the front of the abstract and `\end{abstract}` at the end. Multiple paragraphs may be separated by a blank line.

### 2.3.2 Categories and Subject Descriptions

For CACM, the Categories and Subject Descriptions *are to be commented out*.

#### EXAMPLES

*Note: both are from the same document:*

```
%\category{D.2}{Software}{Software Engineering}
%\category{D.2.8}{Software Engineering}{Metrics}[complexity
%measures, performance measures]
```

### 2.3.3 General Terms

For CACM, the General Terms *are to be commented out*.

#### EXAMPLE

```
%\terms{Languages, Performance}
```

### 2.3.4 Keywords

For CACM, Keywords *are to be commented out*.

#### EXAMPLE

```
%\keywords{Discrete event modeling, encapsulation, event-driven
%simulation, modularity, parallel discrete event simulation, process
%interaction}
```

### 2.3.5 Type Styles and “Special” Characters

As you probably know, L<sup>A</sup>T<sub>E</sub>X has the ability to change type styles and to use accents and symbols from other languages. Remember, that the type style changes that occur in distinguishing *structural* parts of the document are handled by the **research4cacm.cls** commands. For instance, the larger, bolder type of the title is provided automatically by making the text the *argument* to the `\title` command. Nevertheless, you will likely need occasionally to denote non-structural text as *italicized* (use the `\textit` command), as **emboldened** (use the `\textbf` command) or as *typewriter* style (use `\texttt` command). Please take care with the position of the curly brackets when changing typefaces; all text you wish to be in the “changed” typeface must be contained within the curly brackets.

An aside for users of earlier versions of L<sup>A</sup>T<sub>E</sub>X or plain old T<sub>E</sub>X: The way that font style changes are done has changed, viz. the `\textit` command italicizes only its argument; thus,

```
\textit{Italicize this!} But not this.
```

will result in

*Italicize this!* But not this.

---

However, those used to the old “toggle” style change command might be surprised that `\textit Italicize this! \textrm But not this.` will result in:

*Italicize this!* But not this.

Because, in the absence of brackets delineating the argument, only the first letter of the following text has the style change applied.

Another change is that style change commands can be combined to produce a variety of styles within the current font family. So, for instance,

`\textit{Italicize this, and \textbf{boldly}!}`

produces

*Italicize this, and **boldly!***

while

**Make all your style changes \textbf{boldly} and with conviction.**

Results in

Make all your style changes **boldly** and with conviction.

In short, the result of `\textbf`, or any other text style command, is dependent upon the font context (i.e., the current style of text) in which it is applied.

Note also that the old “toggle” commands `\it`, `\tt`, and so on still work; but do upgrade to the newer commands to keep your documents as clean and consistent as possible.

Finally, note that none of the style commands discussed above (or any of the other `\textnn` commands) can be used in math mode. See section 2.3.7 below for a discussion of changing font style in math mode.

#### EXAMPLES

`. . .since we would have to be in \textit{both} of \textit{B} and {\textit{C}}. . .`

`We extend \textbf{superstate} and \textbf{overlap} to sets . . .`

`. . .type \texttt{help@acm.org} in the . . .`

You may also require accented characters or foreign language characters. These commands allow you to handle very small pieces of foreign text in an English document. Note that Greek letters used in mathematics are handled in a slightly different way from these commands (see section 2.3.7). Refer to the *L<sup>A</sup>T<sub>E</sub>X User’s Guide & Reference Manual* for a complete list of the commands available.

Remember that the commands for accented and foreign characters can be used in any section of your document where needed, not just in the body of the article.

---

### 2.3.6 Headings within Text

The text of your article probably has a hierarchical organization of major sections and various smaller sections. The `research4cacm.cls` file has commands available to assist you in delineating this structure, by providing different type conventions for each level of heading and providing automatic numbering where desired.

The command `\section` is the highest hierarchical section heading. It takes a single argument: the text of the heading for that section. The heading should be entered in mixed upper and lower case, and no heading number should be given. L<sup>A</sup>T<sub>E</sub>X will add the appropriate heading number of form *digit.*, cause a line break to occur after the heading, and set the heading in the appropriate type style. Although sections are generally numbered in ACM journals, `\section*` may be used in lieu of `\section` to produce an *unnumbered* section-level heading. Since a special typeface is stipulated in the .cls file for the section headings, use the command `\secit` to indicate italicized text in the section heading.

The command `\subsection` is the next, or second highest, hierarchical section heading. It takes a single argument, the text of the heading for that subsection. The heading should be entered in mixed upper and lower case, and no heading number should be given. L<sup>A</sup>T<sub>E</sub>X will add the appropriate heading number of form *digit.digit.*, cause a line break to occur after the heading and set the heading in the appropriate type style. Although subsections are generally numbered in ACM journals, `\subsection*` may be used in lieu of `\subsection` to produce an *unnumbered* subsection-level heading. Since a special typeface is stipulated in the .cls file for the subsection headings, use the command `\subsecit` to indicate emphasized text in the subsection heading.

The command `\subsubsection` is the third highest hierarchical section heading. It takes a single argument, the text of the heading for that sub-subsection. The heading should be entered in mixed upper and lower case, and no heading number should be given. L<sup>A</sup>T<sub>E</sub>X will add the appropriate heading number of form *digit.digit.digit.* and set the heading in the appropriate type style. The command `\subsubsection*` may be used in lieu of `\subsubsection` to produce an *unnumbered* subsection-level heading.

The command `\paragraph` is the lowest hierarchical section heading. It takes a single argument, the text of the heading for that portion of the article (paragraph is a bit of a misnomer, as more than one paragraph of text can occur below a `\paragraph` heading). The heading should be entered in mixed upper and lower case, and no heading number should be given. L<sup>A</sup>T<sub>E</sub>X will add the appropriate heading number of form *digit.digit.digit.digit.* and set the heading in the appropriate type style. The command `\paragraph*` may be used in lieu of `\paragraph` to produce an unnumbered subsection-level heading.

By the way, there is no visual distinction between the output of the command `\subsubsection*` and that of `\paragraph*`; only the numbered versions are distinguishable. The reader may decide whether that is a hint or a caveat.

### 2.3.7 Mathematical and Logical Structures

The `research4cacm.cls` file already provides you with environments for math expressions and provides you with a means to add additional logical constructs.

The `equation` environment renders mathematical expressions within it in “display math style” (i.e. vertical space occurs before and after the equation(s), and it is/they are centered horizontally) and automatically adds the appropriate equation number in parentheses right justified and vertically centered.

```

EXAMPLE
\begin{equation}
    y = x^2 + x + 1
\end{equation}

```

The `displaymath` environment renders mathematical expressions within it in “display math style” (as described above) but does not number the equation.

```

EXAMPLE
\begin{displaymath}
    y = x^2 + x + 1
\end{displaymath}

```

The `math` environment renders mathematical expressions within it in inline (i.e., no vertical space between text and equation) math style. Surrounding dollar signs are a common and useful shortcut for the math environment.

```

EXAMPLE
We find that \begin{math} y = x^2 + x + 1\end{math} is. . .

```

---

We find that  $y=x^2 + x + 1$  is. . .

Users of earlier versions of L<sup>A</sup>T<sub>E</sub>X will want to note the new rules in L<sup>A</sup>T<sub>E</sub>X<sub>2<sub>ε</sub></sub> for changing fonts within math mode, such as `\mathit` (change to italic in math), `\mathrm` (change to roman in math) and `\mathbf` (change to bold in math). These commands change the style only of letters, numbers and uppercase Greek letters; nothing else is affected.

The rules for all the complexities of math expressions that may be expressed within such environments are far beyond the scope of this document. Please refer to the *L<sup>A</sup>T<sub>E</sub>X User's Guide & Reference Manual* for a complete list of mathematical structures and symbols.

In addition to the actual “math mode” environments, wherein math symbols and structures are the norm and text is the exception, you may also want environments in which the content is primarily textual, but which contain logical constructs, such as algorithms, answers, assertions and axioms (and that’s just the A’s!).

One group of such constructs has the form of a theorem, i.e. the name of the construct appears in small caps, its appropriate number is appended, and the text is set in italics. For each of these, use the command `\newtheorem` once, before the first use of the construct. The command `\newtheorem` takes two arguments, the first the lowercase name of the environment, and the second the capitalized tagline to appear before each occurrence of the construct.

*EXAMPLE*

```
\newtheorem{axiom}{Axiom}
\begin{axiom}Every nonempty set of real numbers that has an upper
bound has a {\it least} upper bound.\end{axiom}
```

Note that the `\newtheorem` command occurs *only once* for each different logical construct you specify. Also remember that text is assumed as the contents of any of the environments created with the `\newtheorem` command; if you use a mathematical expression, you must stipulate the math environment you want.

Other logical constructs that have the same appearance, for which you will want to add an appropriate `\newtheorem` command when they occur in your document, are:

Algorithm	Corollary	Proposition
Assertion	Criterion	Reduction
Axiom	Hypothesis	Sublemma
Conjecture	Lemma	Theorem

Another group of such constructs has the form of a definition or convention (among others), i.e., the name of the construct appears in italics, its appropriate number is appended, and the text is set in Roman. For each of these, use the command `\newdef` once, before the first use of the construct. The command `\newdef` takes two arguments, the first the lowercase name of the environment, and the second the capitalized tagline to appear before each occurrence of the construct.

---

**Please note:** the first argument is the non-displayed name of the environment; you can name your environment anything you want, of course, but it makes most sense to simply call the environment by the same word that will appear in the tagline (the second argument).

EXAMPLE

```
\newdef{answer}{Answer}
\begin{answer}
\begin{displaymath}
{\bf a \cdot b} = (2)(1) + (1)(1) + (1)(-3) = 2+1-3=0
\end{displaymath}
Since the dot product is 0, the two vectors must be perpendicular.
The angle between them is  $\frac{1}{2}\pi$  radians.\end{answer}
% later in document, answer to another problem
\begin{answer}42\end{answer}
```

Note that the `\newdef` command occurs *only once* for each different logical construct you specify. Also remember that text is assumed as the contents of any of the environments created with the `\newdef` command; if you use a mathematical expression, you must stipulate the math environment you want.

Other logical constructs that have the same appearance, for which you will want to add an appropriate `\newdef` command when they occur in your document, are:

Answer	Convention	Problem
Application	Definition	Property
Affirmation	Discussion	Subcase
Assumption	Example	Step
Case	Exercise	Technique
Claim	Fact	Type
Comment	Notation	Question
Conclusion	Note	Remark
Condition	Observation	

One other environment is already provided by `research4cacm.cls`. The `proof` environment precedes the text entered with the tagline `Proof` in the appropriate typestyle, is not numbered and concludes the text with an open square dingbat.

EXAMPLE

```
\begin{proof} If  $x$  is in the range of  $f$ , then  $f$  must take on
the value  $x$  at some number. Since  $f$  is one-to-one, there can be
only one such number. We call it  $g(x)$ . \end{proof}
```

---

### 2.3.8 Citations

Citations to articles or books listed in the Bibliography section of your article will occur throughout the text of your article. You should create a **.bib** source file and use BIBTEX to automatically produce this bibliography; you simply need to insert the command `\cite` in the proper location in the text of the body of the article. The command `\cite` has a single argument, the key for the item cited. The key is a short reference you invent to uniquely identify each work; typically the key is the first author's surname and a word from the title, separated by a colon. This unique identifying key is included with each item in the **.bib** file for your article.

A citation may reference more than one work.

#### EXAMPLE

```
..with the second edition of \textit{Fundamentals of Interactive  
Computer Graphics}, by Foley et al. \cite{foley:fundamentals}
```

```
Other systems use a spreadsheet model for accessing attributes of  
objects \cite{myers:graphical,wilde:spreadsheet}
```

```
These examples are from an article in \textit{ACM Transactions on  
Information Systems} \cite{pausch:lessons}
```

More information on how the identifier key must tie in to the **.bib** file, and on the **.bib** file itself, can be found below in Section 2.6.

### 2.3.9 Tables

The **research4cacm.cls** file already provides you with environments for proper placement and formatting of tables with captions in your document. Because tables cannot be split across pages, and because half-empty pages are undesirable, the **table** and **table\*** environment allows tabular information to “float” to a convenient location, such as the start of the following page.

To include a table that is no wider than a single column of text, use the **table** environment. The commands `\begin{table}` and `\end{table}` should surround all material comprising the table, including the table caption. This should be followed by the command `\centering` (which takes no argument) to center the tabular information horizontally on the page. Then, use the command `\caption` with a single argument, the text of the caption, to correctly number and caption your table. Next, you must use the **tabular** environment to control the formatting of the actual contents of the table; use the commands `\begin{tabular}` and `\end{tabular}`.

To include a table that is wider than a single column of text, up to the total page width, use the **table\*** environment. The commands `\begin{table*}` and `\end{table*}` should surround all material comprising the table, including the table caption. This should be

---

followed by the command `\centering` (which takes no argument) to center the tabular information horizontally on the page. Then, use the command `\caption` with a single argument, the text of the caption, to correctly number and caption your table. Next, you must use the **tabular** environment to control the formatting of the actual contents of the table; use the commands `\begin{tabular}` and `\end{tabular}`.

The niceties of formatting tabular material in rows and columns are beyond the scope of this document; you can find all the details in the *L<sup>A</sup>T<sub>E</sub>X User Guide*. Note that mathematical symbols, non-English language symbols and/or changes in typestyle are permitted in the **table** and **tabular** environments; use the normal commands or environments.

#### EXAMPLES

```
% Single-column table
\begin{table}
\centering
\caption{Frequency of Special Characters}
\begin{tabular}{|c|c|l|} \hline
Non-English or Math Characters&Frequency&Comments\\ \hline
\O & 1 in 1,000& Useful for Swedish names\\ \hline
 $\pi$  & 1 in 5& Very common in math\\ \hline
$ & 4 in 5 & Used in business\\ \hline
 $\Psi^2_1$  & 1 in 40,000& Unexplained usage\\ \hline
\end{tabular}
\end{table}

% Full page width table
\begin{table*}
\centering
\caption{Some Typical Commands}
\begin{tabular}{|c|c|l|} \hline
Command&A Number&Comments\\ \hline
\texttt{\char'134}alignauthor & 100 & Author alignment\\ \hline
\texttt{\char'134}numberofauthors & 200 & Author enumeration\\ \hline
\texttt{\char'134}table & 300 & For tables\\ \hline
\texttt{\char'134}table* & 400 & For wider tables\\ \hline
\end{tabular}
\end{table*}
% end the environment with {table*}, not {table}!
```

You may use the **table**, **table\*** and **tabular** environments anywhere in the body of the article or the appendices, for every occurrence of table information. Place the **table** or **table\*** environment and its contents just past the point where it is first mentioned; remember, this location will change to accommodate desirable page breaks.

---

### 2.3.10 Figures

The `research4cacm.cls` file already provides you with environments for proper placement of figures with captions in your document. Because figures cannot be split across pages, and because half-empty pages are undesirable, the `figure` and `figure*` environments allows graphics to “float” to a convenient location, such as the start of the following page.

To include a figure that is no wider than a single column of text, use the `figure` environment. The commands `\begin{figure}` and `\end{figure}` should surround the figure, including the figure caption. The `\begin{figure}` command should be followed by the command `\centering` (which takes no argument) to center the graphic horizontally on the page.

To include a figure that is wider than a single column of text, up to the total page width, use the `figure*` environment. The commands `\begin{figure*}` and `\end{figure*}` should surround the figure, including the figure caption. The `\begin{figure*}` command should be followed by the command `\centering` (which takes no argument) to center the graphic horizontally on the page.

**Encapsulated PostScript** – Use the command `\epsfig` to reference an `.eps` figure in the body of the article in order to preview or print it with L<sup>A</sup>T<sub>E</sub>X (assuming you have the proper driver).

The command `\epsfig` takes a single argument composed of one or more parameters (more on that, in a moment) separated by commas. The first (and only required) parameter is `file=filename`, the name of the graphics file including the `.eps` suffix. If the graphic is the proper size for your document, nothing additional is needed; but if you wish to resize the graphic, add the parameters `height=graphicheight` and `width=graphicwidth`.

#### EXAMPLES

```
\begin{figure}
\centering
\epsfig{file=fly.eps}
\caption{A sample black and white graphic (.eps format).}
\end{figure}
```

```
\begin{figure}
\centering
\epsfig{file=fly.eps, height=1in, width=1in}
\caption{A sample black and white graphic (.eps format) that has
been resized with the \texttt{\epsfig} command.}
\end{figure}
```

```
\begin{figure*}
\centering
\epsfig{file=flies.eps}
\caption{A sample black and white graphic (.eps format) that needs
to span two columns of text.}
```

---

```
\end{figure*}
% and don't forget to end the environment with {figure*}, not %
{figure}!
```

**PostScript** – Use the command `\psfig` to reference a **.ps** figure in the body of the article in order to preview or print it with L<sup>A</sup>T<sub>E</sub>X (assuming you have the proper driver).

The command `\psfig` works just like `\epsfig`: it takes a single argument composed of one or more parameters separated by commas. The first (and only required) parameter is `file=filename`, the name of the graphics file including the **.ps** suffix. If the graphic is the proper size for your document, nothing additional is needed; but if you wish to resize the graphic, add the parameters `height=graphicheight` and `width=graphicwidth`.

*EXAMPLE*

```
\begin{figure}
\centering
\psfig{file=rosette.ps, height=1in, width=1in}
\caption{A sample black and white graphic (.ps format) that has been
resized with the \texttt{psfig} command.}
\end{figure}
```

Finally, use the command `\caption` with a single argument, the text of the caption, to correctly number and caption your figure.

You may use the **figure** environment anywhere in the body of the article or the appendices, for every occurrence of figures. Place the **figure** or **figure\*** environment and its contents just past the point where it is first mentioned; remember, this location will change to accommodate desirable page breaks. We have also experienced success including PDF files as figures/images, so feel free to use PDFs!

## 2.4 Acknowledgements

The Acknowledgements section of your document is optional; it is used, as the name suggests, to acknowledge contributions of individuals or organizations to the document or the research it discusses. This section should immediately follow the end of the body of your document. Use the command `\section{Acknowledgements}` to start the text of your acknowledgements. A new paragraph can be indicated by a blank line in the input file.

*EXAMPLE*

```
\section{Acknowledgements}
We would like to thank Ben Trovato, for his many helpful comments,
and his insightful perusal of our first draft.
```

We also want to thank the many referees of the previous versions of this paper for their extremely useful suggestions.

---

## 2.5 Additional Authors

This may appear in your Conference Proceedings paper before the Bibliography, however, for CACM, all authors get equal billing so this section is now inapplicable. You need to insert ALL authors into the byline and comment out the `\additionalauthors` in your `.tex` file. The ‘number’ of authors, appearing in the byline, is unrestricted.

EXAMPLE

```
%\additionalauthors
% Memo to self: Move ALL authors to the byline
```

## 2.6 Bibliography

You should use the BIBTEX facility to produce the bibliography for your article. If you do, you must write a bibliography input (**.bib**) file, which must be run through LATEX and BIBTEX to create a bibliography output (**.bbl**) file. *You should remember to supply the .bbl file, along with all your other files, when your article is ready for submission.*

You need only two commands in your LaTeX file to produce the bibliography: `\bibliographystyle` and `\bibliography`.

The command `\bibliographystyle` takes a single argument, the name of the bibliography style (**abbrv**) file which you should use to properly format your citations and the bibliography, in this case, the abbreviated style. The command `\bibliographystyle` should immediately follow the end of the body of the article or any acknowledgements or appendices. The command `\bibliography` should immediately follow the command `\bibliographystyle`. The command `\bibliography` takes a single argument, the name of the bibliography database file (the **.bib** file) for your article.

EXAMPLE

```
\bibliographystyle{abbrv}
\bibliography{bibs4cacm}
\end{document}
% Memo to self: Remember to supply the .bbl file when submitting
```

The **.bib** file is separate from the **.tex** file, and consists of entries for each item cited in your article. These entries must be arranged alphabetically according to author's or editor's names, or publishing organizations for items to which no names can be attached. The complete rules for the construction of a proper 'bib' file are beyond the scope of this document, but may be found in the *LATEX User's Guide & Reference Manual*.

You will also need to consult your Local Guide for complete details on running BibTEX. The main point to remember is that you must run:

```
latex yourarticle[.tex]
bibtex yourarticle[.aux]
latex yourarticle[.tex]
latex yourarticle[.tex]
```

---

in order to completely resolve all references and produce a proper **.bbl** file.

#### EXAMPLES OF BIB FILE ITEMS

*These items correspond to citations in Section 3.3.3. Note identifier key.*

```
@BOOK{foley:fundamentals,  
  AUTHOR = "Foley, J. and ",  
  TITLE = "Computer Graphics: Principles and Practice ",

## 2.7 Appendices

The Appendix/Appendices section of your document is optional in a Conference article but wholly inappropriate for CACM. You need to suitably edit your article so that it is shorter and appeals to a wider audience.

## 2.8 A Final Bit of Formatting?

Once you have your paper written, try **not** to spend time formatting it. The article will undergo editing and will be ‘flowed’ into CACM. Thus, time spent adjusting widows/orphans, page-breaks, etc. etc. will be for naught. Again, we emphasize that you focus on adjusting the content and let CACM be the ‘publisher’.

Your file should, for all practical purposes, now be ready for submission!
