# Clamping Systems from MAPAL

With the perfect connection  
for optimum results

In the progressive area of cutting operations on components, precision tools from MAPAL provide a guarantee of maximum economy. Their efficiency lies in innovative systems, modern cutting materials and the highest accuracy in tool production. In addition the tools are specifically matched for the most part to the application to provide the best possible solution with minimum compromise, even for complex tasks.

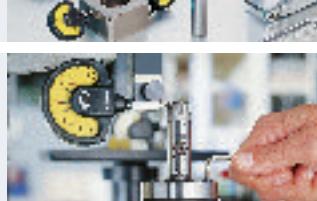

When using the tools, connection to the machine spindle, and therefore the clamping technique, often plays a role which is undervalued. When fine machining components extremely good results can be achieved with maximum concentricity. However the effect when boring or milling is also very significant and lower, radial variations can have a positive direct effect on tool life.

MAPAL's programme of clamping systems offers the perfect solution for every application and a connection which provides the tool with the concentricity and repeatable accuracy it requires in use.

From expanding chucks to thermal expanding chucks, from polygon chucks and mechanical chucks for cylindrical shanks to adaptors and flanges with the MAPAL KS clamping cartridge, MAPAL's competence in clamping covers a wide variety of systems.

# From spindle to blade

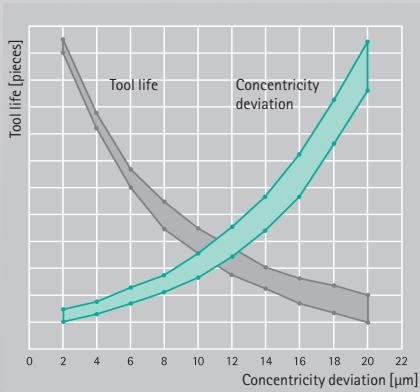

A perfect connection between tool and machine is the basis for an optimum machining result. This means that the clamping device is just as vital as the tool itself. The required concentricity and repeatable accuracy in a machining operation is affected quite decisively by the precision and rigidity of the clamping device used.

## MAPAL clamping systems

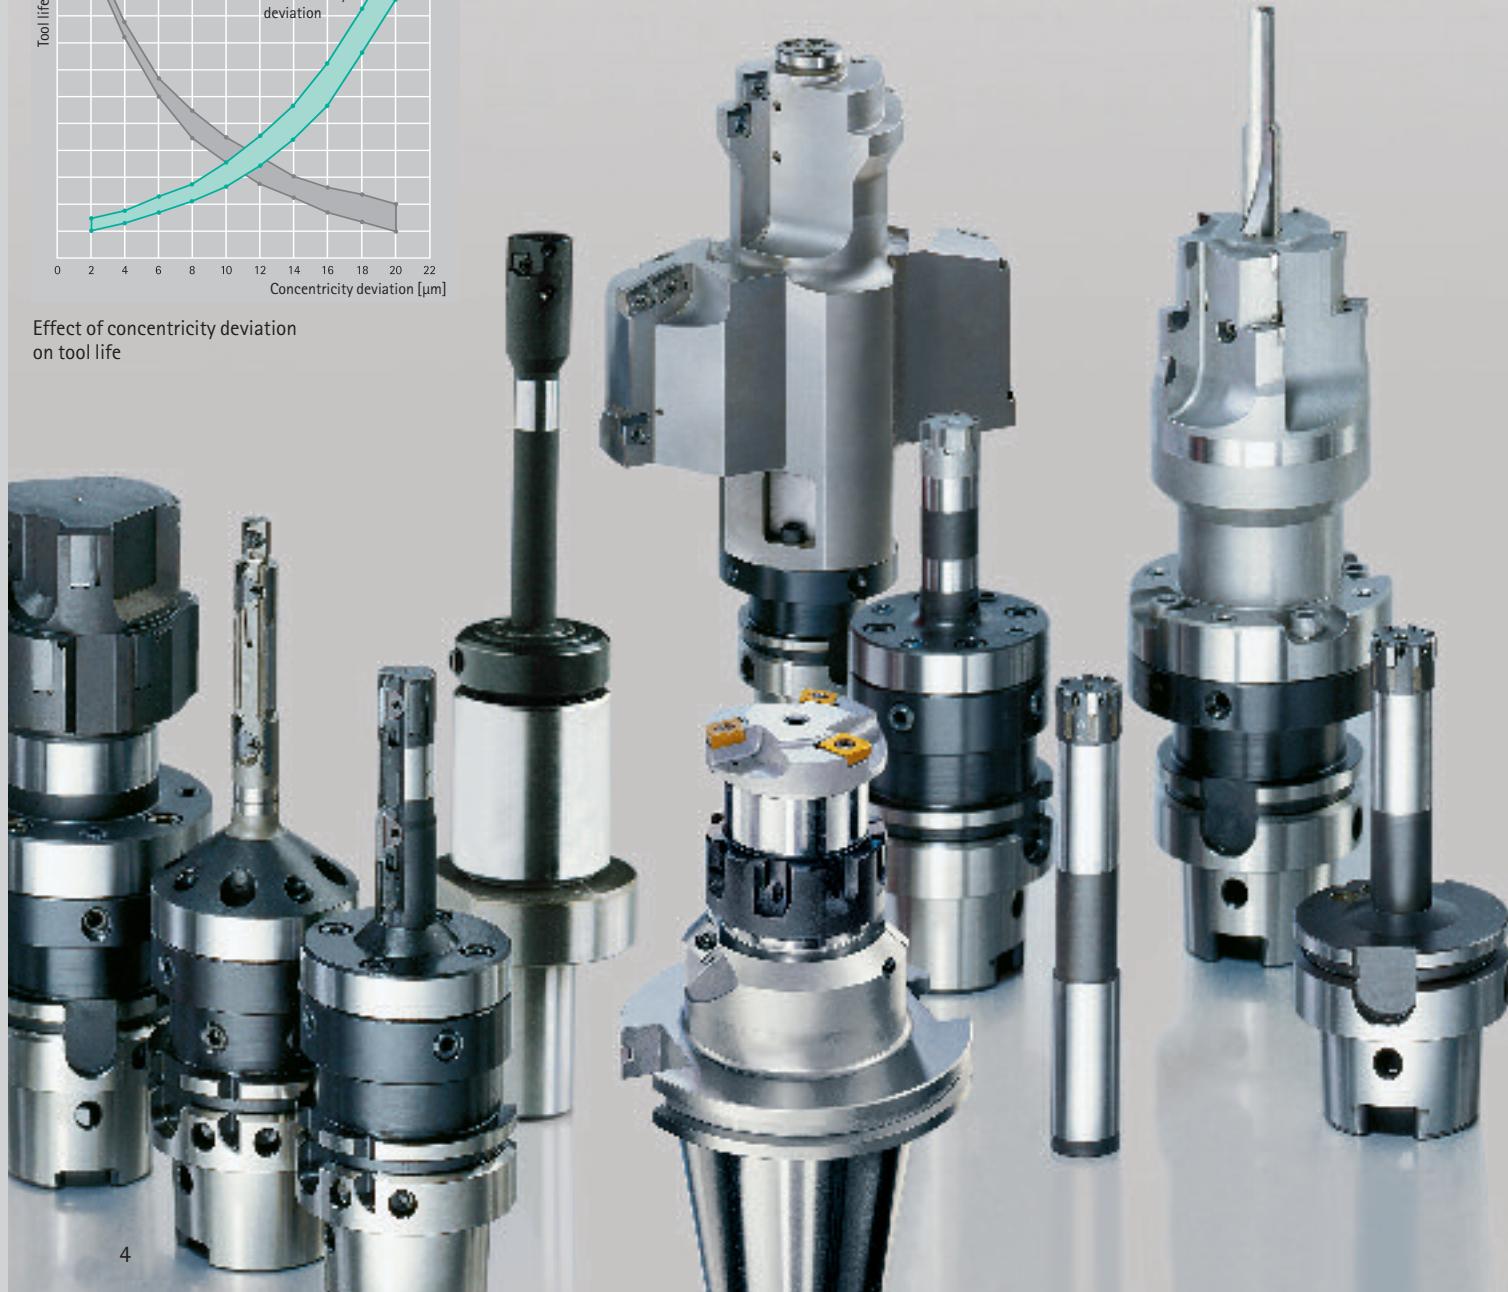

Simplicity, precision and speed together with flexibility, security and economics – those are the demands placed on systems in modern production technology. Based on this knowledge, MAPAL developed its own, highly accurate connections and also participated in promoting and advancing the development of the HSK system. Since then the standardised HSK hol-

low taper shank connection has become widespread and has been successful against other connection systems.

Maximum concentricity and repeatable accuracy by using the short taper, together with high rigidity from the face connection, provide the right prerequisites to allow the efficiency of modern precision tools to be fully revealed.

Effect of concentricity deviation on tool life

The HFS® Head Fitting System developed by MAPAL is the extension of the HSK system into the smaller diameter ranges. With the same design features – short taper and face connection – the HFS® is ideally suited for replaceable head systems and modular tools.

With the HSK and HFS® replaceable head systems, concentricity and angular errors, which are caused by other components in the overall system or occur because of wear, cannot be compensated for. With longer tools in particular it is often impossible to achieve the quality levels required. The modular connection developed by MAPAL has proved itself an excellent method for these cases over many years. Using

adjusting screws incorporated into the connection system both concentricity and angular errors can be corrected extremely well

#### MAPAL HSK clamping system

MAPAL offers a complete system of HSK clamping devices for use on machining centres, special machines and transfer units, right through to modern turning centres. The programme of HSK precision chucks is rounded off by a wide range of extensions and reducing elements plus adaptors and flange adaptors. This opens up numerous possibilities for modular tool systems and for adapting to individual machine types.

One important component of the MAPAL HSK clamping system is the KS clamping cartridges. The manual clamping mechanism provides maximum draw-in and clamping forces which can be reliably achieved as a result of their simple, robust construction. Within the KS clamping system programme two special clamping cartridges have also been standardised; these are suitable for use with minimal lubrication or for maximum coolant pressures.

# The KS clamping cartridge

## At the heart of MAPAL HSK clamping devices

MAPAL took an active part in HSK clamping technology right from the start and supplies an extensive and universal programme of HSK clamping devices for manual and automatic tool clamping.

While the standardised, hollow taper shank and face connection in the HSK clamping system are responsible for maximum accuracy and rigidity, high bending and torque resistance are also determined by the clamping system.

High clamping forces do not just guarantee the absorption of high cutting forces but also allow stable static and dynamic behaviour to be maintained

when lower cutting forces are applied in precision machining, even where there are large tool overhangs. The required surface quality and tolerances can then be economically produced.

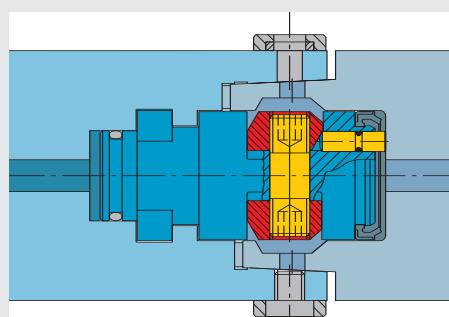

At the heart of the MAPAL HSK clamping devices – and a guarantee for optimum transfer of the cutting forces – is the KS clamping cartridge. This is used on spindles and basic holders, directly or with an adaptor flange.

In addition to the standard version, MAPAL has also included clamping cartridges for applications with minimal lubrication and for high pressure use (see pages 8–9).

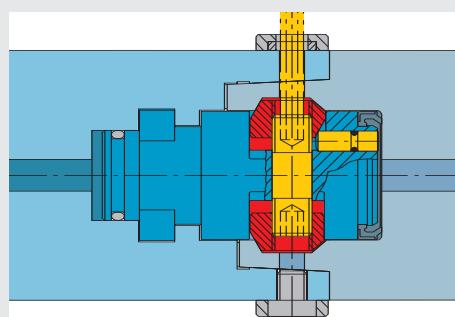

### Fitting and function

The KS clamping cartridge is held by means of a bayonet fitting and secured with a heavy-duty holding pin. When clamping is being carried out the two clamping jaws are moved radially outwards using a clockwise screw. The jaws then lie against the 30° clamping shoulder on the hollow shank and produce axial and radial clamping forces.

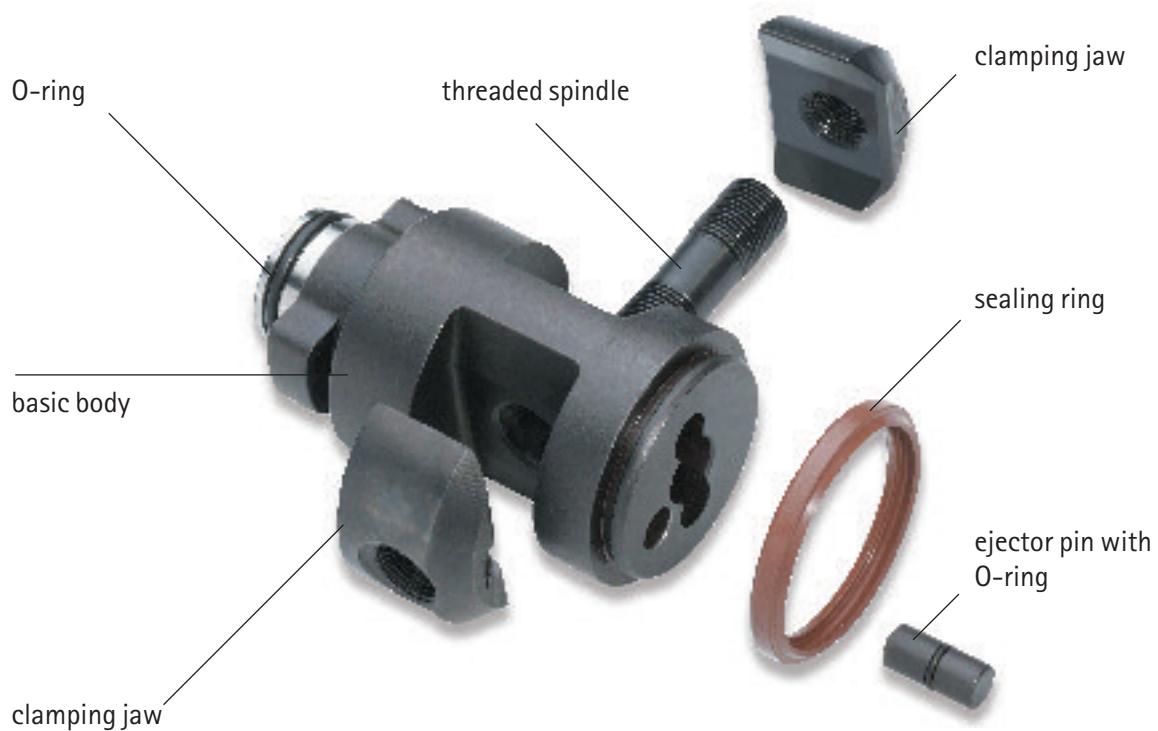

To release the tool an ejector pin is activated which pushes the tool out of the connection.

Released

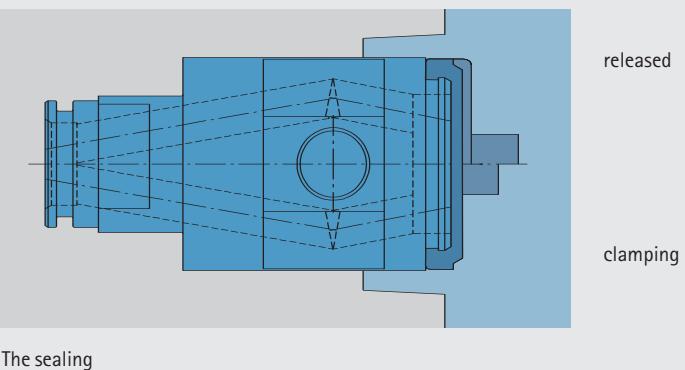

Clamped

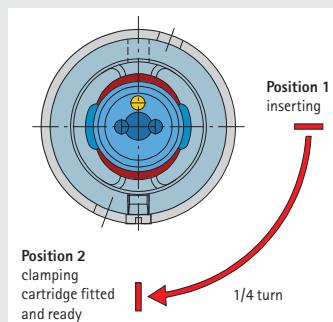

### The principal features of the KS clamping cartridge:

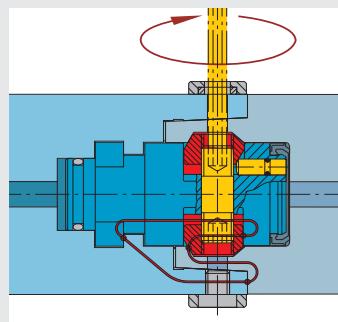

- simple design with very few individual parts
- rigid construction with optimum flow of force from the bayonet over the body of the cartridge to the clamping jaws; this helps transfer high clamping forces
- Four surface clamping for maximum clamping force and concentricity
- Safe seal – even for maximum clamping force – due to seal on face side
- Clamping cartridge if fitted with an easy bayonet fitting instead of screw fit with a high torque
- 100% torque transfer because of ideal surface contact on the milled drive elements
- User-friendly operation from side
- "Totally fool-proof" – not possible to assemble wrongly, from fitting the cartridge right up to changing the tool.

The sealing

Easy to fit

Optimum flow of force

# The KS clamping cartridge for applications using minimal lubrication (MLC)

MAPAL is a pioneer in the development of precision tools and the clamping technology this involves for dry machining and machining with minimal lubrication. In addition to the specific removal of chips, a standardised MLC system is at the centre of the system which guarantees unobstructed throughput of the air and oil mixture from the spindle onto the tool blade.

When designing clamping devices for operations using minimal lubrication, central throughput of the lubricant aerosol through the machine spindle, adaptor and tool wherever possible is of decisive importance. Any precipitation of the aerosol along the way must be avoided. With conventional HSK clamping cartridges this was only possible until now if the clamping was applied behind the hollow taper shank. However, this extended the length of the spindle's overhang.

Taking these specific conditions into account, MAPAL offers a standardised

clamping unit for use with minimal lubrication. Great significance is given to the special KS clamping cartridge for applications using minimal lubrication (MLC). With the MAPAL system the aerosol is passed through centrally and without hindrance and the clamping applied in the bore provided for in the standard.

## Technical details

The MLC clamping unit from MAPAL consists of the KS clamping cartridge for minimal lubrication applications and an adaptor tube through which the aerosol is passed onto the tool. To allow all the customer's requirements to be met, MAPAL offers three different connection methods on the machine for the adaptor tube:

### • Adaptor tube with spigot connection

The aerosol is passed from the spindle onto the clamping device outside the clamping cartridge. The adaptor tube protrudes beyond the cartridge.

**• Adaptor tube with bore connection**  
The aerosol is passed through the cartridge. The adaptor on the spindle side goes into the cartridge.

### • Plugs

For use with KS clamping cartridges for applications with minimal lubrication if these are used without adaptor tubes. The aerosol is passed through a plastic hose from the mixing unit directly onto the tool.

## Principal features of MAPAL KS clamping cartridge for applications with minimal lubrication (MLC):

- Aerosol supplied centrally
- Direct clamping applied in the bore provided for in the standard
- Easy changeover to MLC: compatible with conventional KS clamping cartridges
- Can be used for single or double supply lines

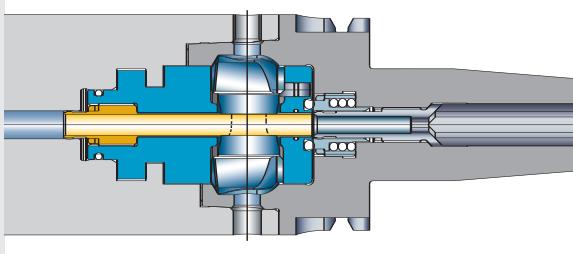

# for high pressure applications

The MAPAL clamping cartridge programme is rounded off with the high pressure clamping cartridges which are designed for pressures of up to 150 bar.

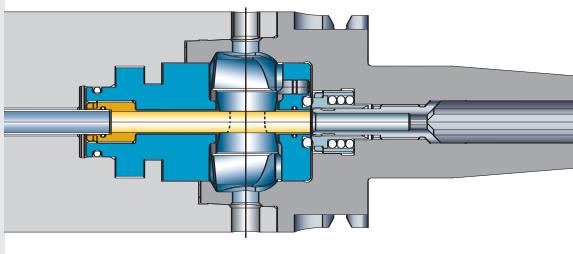

**Connection options on machine for KS clamping cartridge for use with minimal lubrication:**

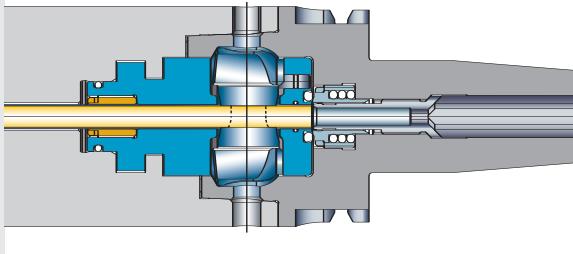

Adaptor tube with spigot connection

Adaptor tube with bore connection

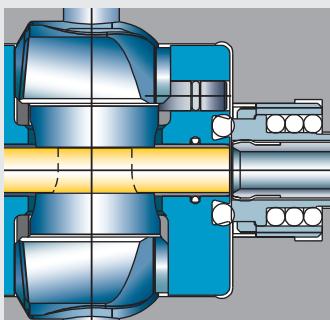

Plugs and plastic supply hose through device

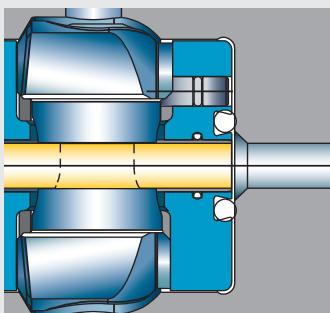

**Internal seal for optimum sealing with manual and automatic clamping devices:**

The MAPAL KS clamping cartridge also has an important detail on the face side for MLC applications: the sealing ring on the face side is incorporated into the cartridge. With this MAPAL ensures that the clamping cartridge is equally suited for clamping HSK-A and HSK-C tools.

Seal for HSK-A tools

Seal for HSK-C tools

# MAPAL HFS® – Head Fitting System

The brilliantly simple connection  
for simply brilliant tool concepts

The rapid establishment of the HSK clamping system worldwide has provided a technological leap forward in the precision tool industry in issues of stability and concentricity. For tool head connections, however, there are still a large number of different connection systems.

With the HFS® Head Fitting System MAPAL has now brought a connection for tool heads onto the market which adapts elements of the HSK clamping system to the particular needs of replaceable heads.

## The principal features of the HFS connection are:

- Taper
- Face connection
- Positive drive
- Coolant supply onto the blade

HFS® guarantees high precision and performance with which changeover accuracy and concentricity of less than 3 µm can be reliably achieved in production, setting new standards in economy, user comfort and quality of machining results.

Tools with HFS connections are no weaker or less accurate than a monolith tool. On the contrary, a tool with HFS® is to some extent superior to a monolith tool since tools with HFS® have a higher rigidity than monolith tools because of the extraordinary precision of this type of connection. Despite this the tool head is also produced as a standard part and can therefore be manufactured in comparatively large quantities and with maximum precision.

For modern production set-ups the outstanding effect of consistency in performance, including tool life, is achieved to the best possible level with HFS®.

## Universal combination options

The design of the MAPAL HFS® offers the best possible conditions for the tool to be tailored precisely to specific requirements. This means that the whole tool can be made up of combinations of various materials such as steel or carbide. In designing combination tools the precise concentricity can also be fully utilised and various cutting systems joined together – for example a brazed tool with a basic holder for inserts.

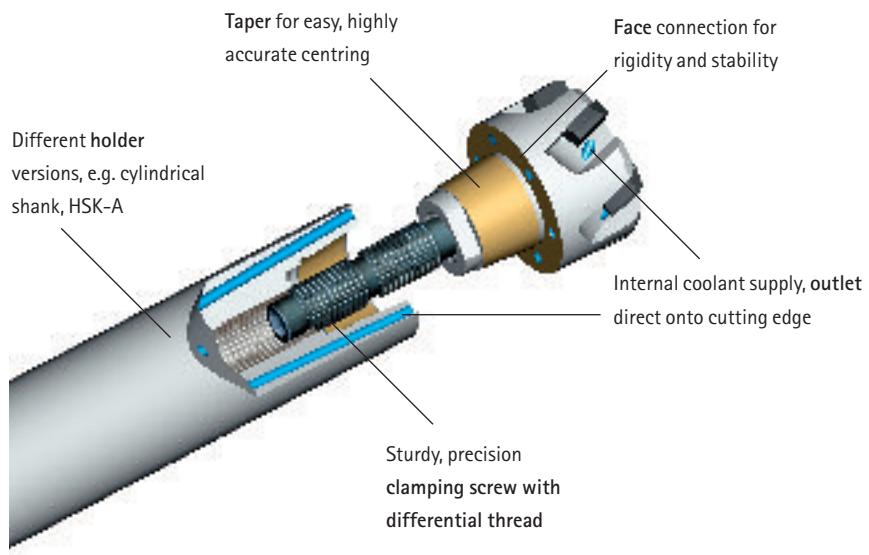

For tools with large jumps between diameters, HFS® allows the components of the tool to be produced separately on suitable production equipment and using the best possible clamping set-up for each one.

## A brief summary of the advantages:

- Changeover accuracy and concentricity of less than 3 µm
- Simple, high precision centring with taper
- High rigidity and stability with optimised vibration damping properties
- Long tool life and excellent machining results as a result of vibration damping on material

- Extremely compact, rotationally symmetrical design; suitable for high spindle speeds
- Simple, direct coolant supply through the connection directly onto the blade, making it particularly suitable for use with minimal lubrication (MLC)
- Modular design allows maximum universal use
- Easy handling when changing the tool head using clockwise/anti-clockwise screw and eccentric pins

## MAPAL HFS axial clamping system

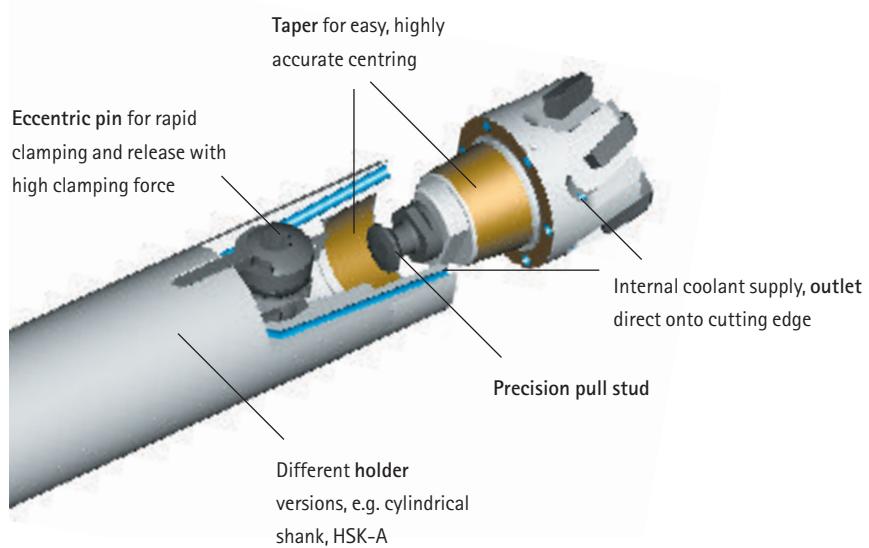

### MAPAL HFS replaceable head holders available with two different clamping systems:

For holders with **axial clamping** the system is applied from the rear through the shank and away from the machine. The tool head is drawn in with a sturdy differential screw, radially aligned to high precision and held in the exact position. Releasing the tool head is also automatic and simple by turning in the reverse direction.

A further significant development in the holder system is **radial clamping**, which provides clear advantages in tool change times and the amount of handling without any change in precision. The radial clamping system consists of an eccentric pin in the holder and a pull stud fitted on the head. The replaceable head is clamped or released by a quarter turn of the eccentric pin. Changing the heads can be carried out quickly, easily and on the machine.

## MAPAL HFS radial clamping system:

Head change fast, easy and basically on the machine:

# HSK

## The standardised hollow taper shank

Since the development and standardisation of the HSK system, the spread and use of this connection has been extremely rapid. The HSK offers high precision and rigidity, is very sturdy and simple in both construction and manufacture. This has meant that the connection methods previously used have been increasingly pushed out of high performance production systems. In addition to these technical advantages, easy access across the industry to this independently standardised connection has also contributed to the successful spread of the HSK.

Several versions of the HSK have been standardised, each of them suitable for specific requirements. Whether on machining centres with automatic tool change systems or on special machines and transfer lines with manual tool clamping, the HSK has become successfully established for rotating tools.

### HSK on turning machines and turning/milling centres

The developing of turning machines into modern turning and milling centres for the complete machining of parts has also opened up new areas of use for the HSK system. The standard for HSK-T was specially developed and adapted for use with stationary tools on turning machines. Compared to other HSK versions the play on the drive elements is limited, so that there is minimum effect on the cutting edge position.

MAPAL also offers new manual clamping systems for use on turning machines. The new HSK clamping units are designed so that extremely high clamping forces can be safely used. At the same time good central access allows elements to be passed on for additional functions on the tool. For example motor-driven tools can also be used on the turret with manual clamping.

HSK-A/C to DIN 29893-1 + DIN 69063-1	Adaptor	
HSK-T (standard in draft) to ISO / CD 12164-3 + ISO / CD 12164-4 and ICTM standard	12.2 12.3 12.4 12.5 12.6	

By using HSK clamping systems on turning machines and on rotating turrets, unproductive ancillary times can be dramatically reduced and an enormous potential for rationalisation identified. The extraordinarily high accuracy in changing the HSK connection allows 'sister' tools to be used which have been preset at the setting station, measured and the used directly on the turret. This means there is no need for samples to be produced or adjustments to be made.

Detailed information can be found in our special catalogue "MAPAL Clamping Systems for Turning Machines and Turning and Milling Centres".

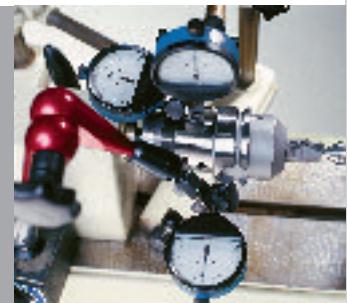

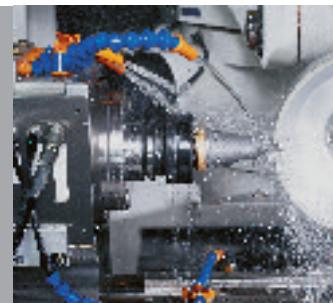

# Competence in Design and Production

## Key factors for innovative tools

The basic prerequisite for efficient precision tools is competent design with significant knowledge and experience at the latest technical level. However, conversion into production must also be to the same high level. Only in this way will tools emerge of the highest quality and precision.

Recognition of this also applies for tool holders, adaptors and clamping devices and in particular for modular design, complex special tools. At MAPAL modern methods and machines, together with highly qualified personnel, are used along the whole production chain – from design to production. And this is what guarantees maximum precision.

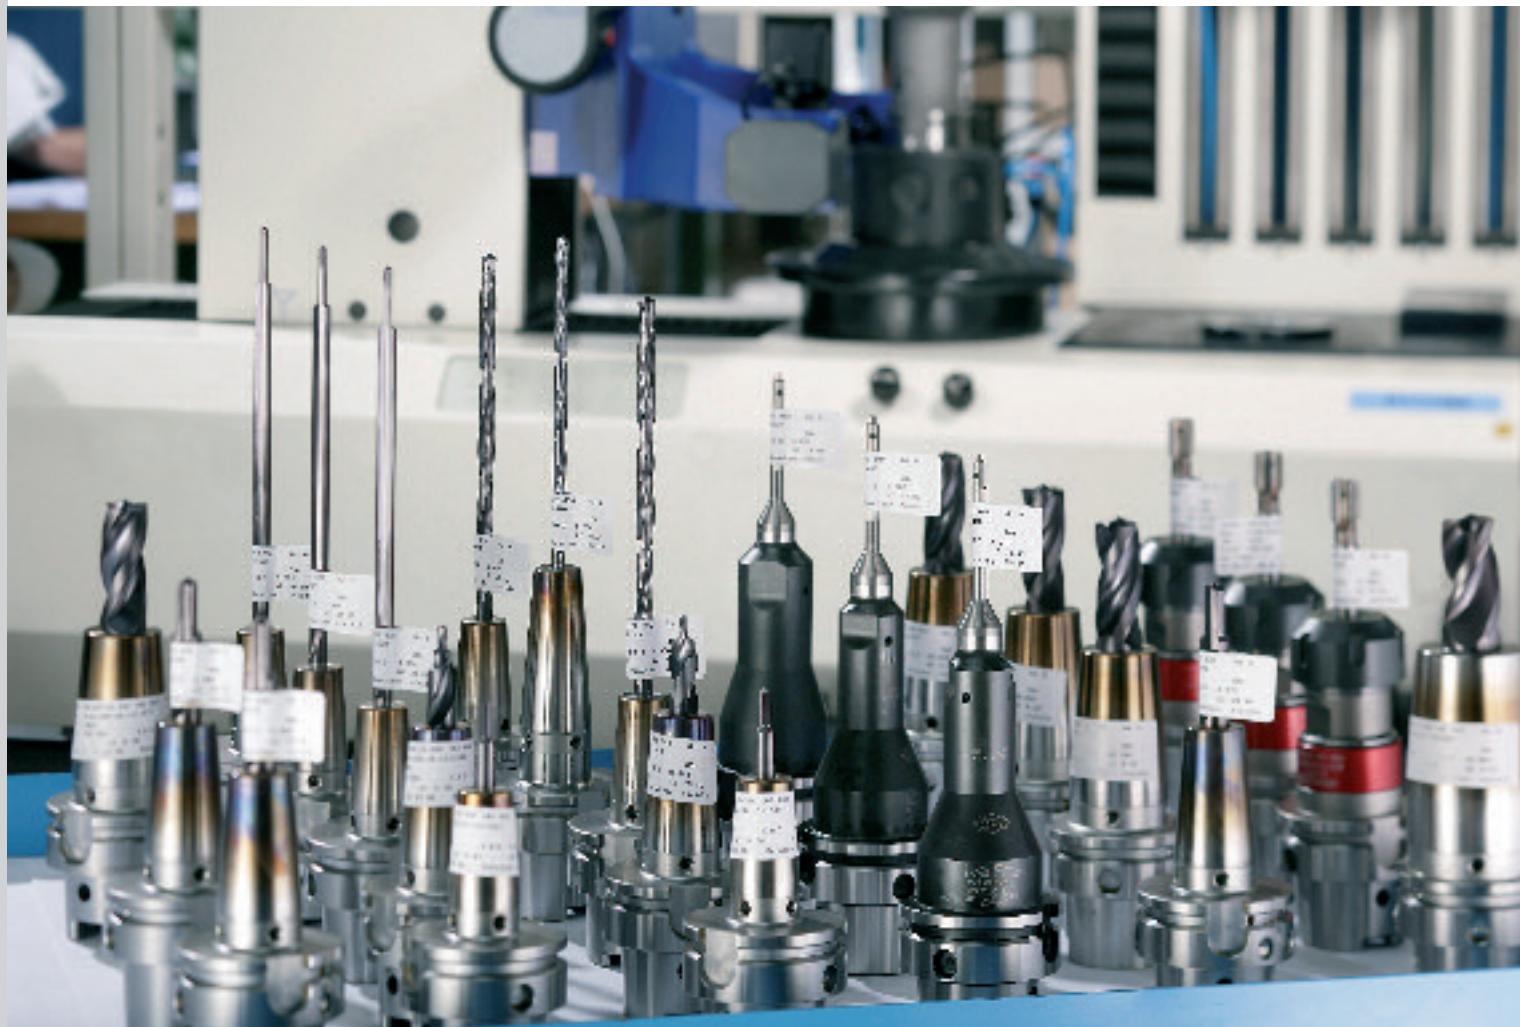

# Tools ready for use

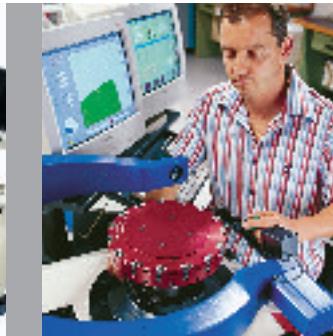

## Complete service for projects

Within overall projects MAPAL has specialised for some time in project managing and designing the complete tool system which is needed to machine parts which are ready to assemble. The range of tools within projects of this kind extends from simple boring tools and milling cutters to complex special tools. The appropriate tool holders, clamping devices and adaptors are also included in the project management work.

When planning the production processes and the design for the tools, particular value is placed by MAPAL specialists on the optimum machining results and times.

This comprehensive approach brings significant advantages for the customer bringing process costs and not tool costs to the fore.

A further decisive factor for the function of precision tools is their correct assembly and setting. It is only in this way that trouble-free function and performance can be guaranteed. All assembly and adjustment work within the overall project is carried out by MAPAL and the customer is then supplied with the tools ready to use. The equipment used is the very latest tech-

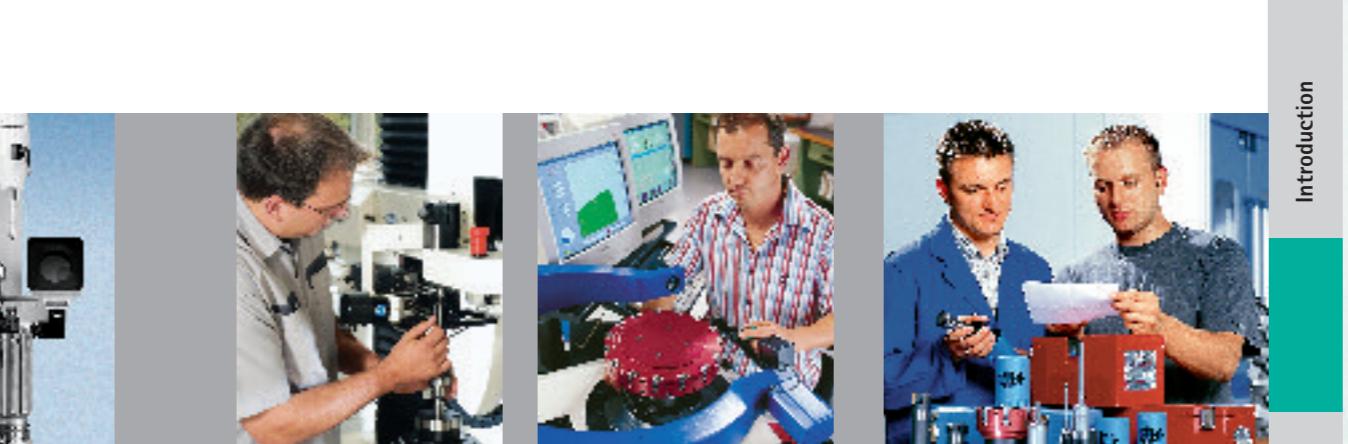

nology and all current machines and clamping systems are available. Qualified personnel carry out the work and document the data. Each step is fully comprehensible and transparent.

The MAPAL KS clamping cartridges have proved extremely successful with manual tool clamping for HSK shanks for some time. Their compact, simple and reliable construction guarantees maximum clamping and draw-in forces are applied. The clamping cartridges are available in all HSK sizes and also in versions which are modified for special applications.

# MAPAL Competence – Clamping Systems

## Programme summary and selection table

Their compact, simple and reliable construction guarantees maximum clamping and draw-in forces are applied. The clamping cartridges are available in all HSK sizes and also in versions which are modified for special applications.

## Clamping devices with flange module

MAPAL clamping devices with flange module are recommended for machining conditions under which concentricity and angular errors on the machine spindle have to be corrected. These are adjusted radially with alignment elements and then produce extremely high accuracies.

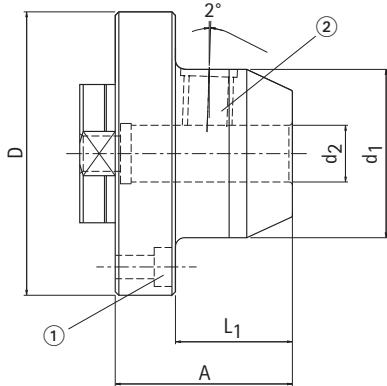

The use of adaptors and flanges which can be aligned allows the high changeover accuracies provided by the HSK system to be transferred to spindles and ISO holders. In addition interchangeable adaptors can be easily replaced if damage or wear occurs. At the heart of these flanges and adaptors are the MAPAL KS clamping cartridges, which allow maximum load. The milled key blocks allow maximum torque transfer.

The adaptor flanges in the MN5520 and MN5523 series are combined with ISO basic holders and even allow high run-out accuracy for machines using ISO adaptors.

Dimensions in mm.

Use:

For clamping tools with smooth cylindrical shanks to DIN 6535 (Form HA) up to ø 32 mm and with recesses to DIN 1835 (Form B, E) and DIN 6535 (Form HB, HE) directly and without adaptor sleeve in the clamping diameter. The clamping diameter is designed for a tool tolerance h6 with d<sub>2</sub> = 12 mm to d<sub>2</sub> = 32 mm.

Supply includes:

Supplied complete with length adjustment screw, clamping screw, cylindrical screw (for holding chuck) and alignment screw (thrust pad and threaded pin)

Design:

Maximum tool life and quality production results when used for smooth cylindrical shanks to DIN 1835 Form A and DIN 6535 Form HA.

With an overhang length of

2,5 x D (max. 50 mm), concentricity of 0,003 mm.

Can be precisely set in radial run-out by using threaded pins (for alignment) on the machine spindle and on HSK or ISO adaptor.

Can be precisely set in face run-out using alignment screws (thrust pad and threaded pin) in the expanding chuck.

When using cylindrical shanks with angled clamping surface (Form E and Form HE), this may affect accuracy.

Note:

Chuck with axial tool length adjustment:

Coolant supply through central hole.

For adaptor sleeves see page 171.

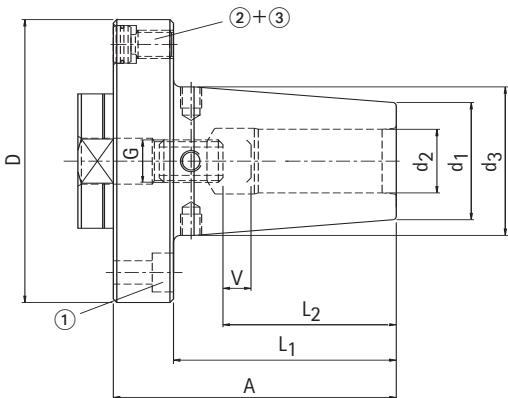

(when using adaptor sleeves, this may effect accuracy).

Length adjustment screws and clamping screws can be supplied on request.

Design:

Can be precisely set in radial run-out by using threaded pins (for alignment) on the machine spindle and on HSK or SK adaptors.

Can be precisely set in face run-out using alignment screws (thrust pad and threaded pin) in the expanding chuck.

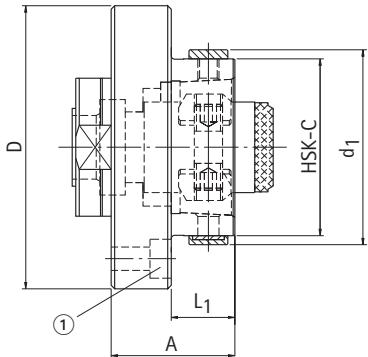

The clamping diameter is designed for a shank tolerance h6.

## Toolholders with HSK-A

Toolholders with shanks and gripper elements under DIN 69893, Form HSK-A, are suitable for both manual and automatic changing. They can be used not only directly on machining centres but also combined with manual routines. The uniform nature of HSK gives the HSK clamping devices a universal character.

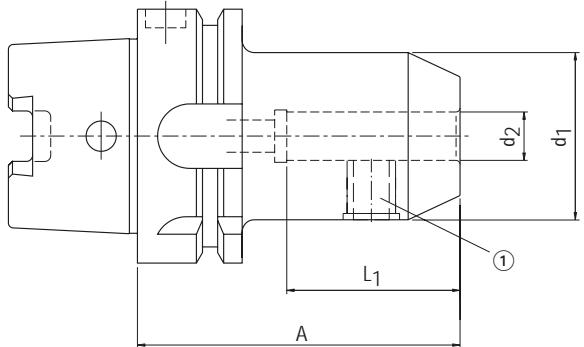

The HSK programme of toolholders allows all the clamping elements to be selected which are needed to fully equip machining centres.

By combining the HSK-A toolholders with extensions and reducers in form HSK-C, numerous types of modular types can be put together as required.

25	M18x2x20	10004141
32	M20x2x20	10004129

Dimensions in mm.

Use:

For holding milling tools and drills with cylindrical shank and lateral clamping face to DIN 1835 Form B and to DIN 6535 Form HB.

Supply includes:

With clamping screw fitted; coolant tube not included.

Design:

Permissible concentricity deviation of hollow taper shank to clamping diameter  $d_2 = 0.003$  mm

The bore tolerance is much reduced compared to DIN 1835 ( $d_2^{H4}$ ) to produce extremely high accurate machining results.

Note:

From clamping diameter  $d_2 = 25$  mm 2 clamping screws are provided.

For coolant tube details see page 148.

For notes on preventing mix-ups and on fine balancing see technical notes.

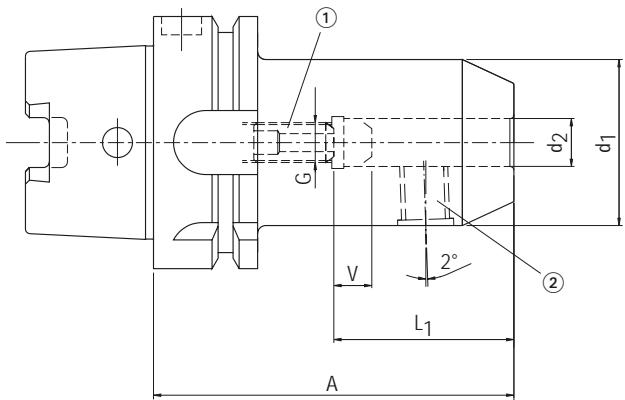

For retro-fitting clamping devices with data carriers see page 179.

25	M18x2x20	10004141
32	M20x2x20	10004129

Dimensions in mm.

Use:

For holding milling tools and drills with cylindrical shank and angled clamping face ( $2^\circ$ ) to DIN 1835 Form E and to DIN 6535 Form HE.

Supply includes:

With clamping screw and length adjustment screw fitted; coolant tube not included.

Design:

Permissible concentricity deviation of hollow taper shank to clamping diameter  $d_2 = 0.003$  mm.

The bore tolerance is much reduced compared to DIN 1835 ( $d_2^{H4}$ ) to produce extremely high accurate machining results.

Note:

From clamping diameter  $d_2 = 25$  mm 2 clamping screws are provided.

For coolant tube details see page 148.

For notes on preventing mix-ups and on fine balancing see technical notes.

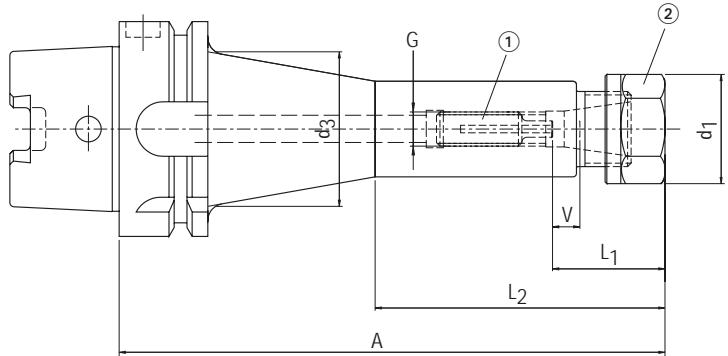

For retro-fitting clamping devices with data carriers see page 179.

Dimensions in mm.

Recommendations for use:

For holding brazed fine and rough boring tools.

Design:

Permissible concentricity deviation for hollow taper shank to clamping diameter  $d_2 = 0.003$  mm.

The bore tolerance is designed for H4. For best concentricity results four alignment screws are also applied to the clamping bore.

Supply includes:

Clamping, balancing, alignment and length adjustment screws; coolant tube not included.

Note:

The length adjustment screw has a through hole for coolant.

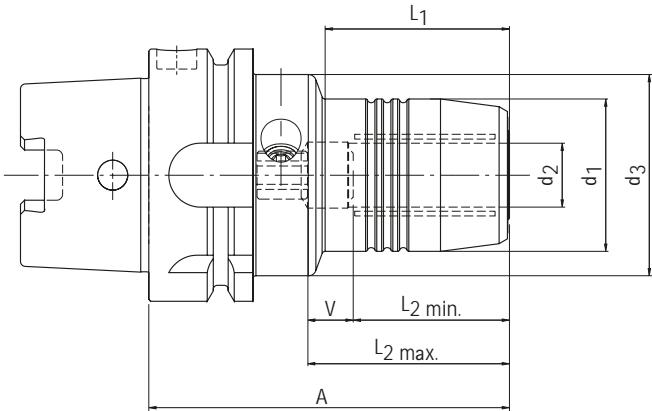

For coolant tube see page 148.

For notes on preventing mix-ups and on fine balancing see technical notes.

For retro-fitting clamping devices with data carriers see page 179.

Dimensions in mm:

Use:

For clamping tools with smooth cylindrical shanks to DIN 6535 (Form HA) up to  $\varnothing 32$  mm and with recesses to DIN 1835 (Form B, E) and DIN 6535 (Form HB, HE) directly and without adaptor sleeve in the clamping diameter.

The clamping diameter is designed for a tool tolerance of h6 with  $d_2 = 6$  mm to  $d_2 = 32$  mm.

Supply includes:

Supplied complete with length adjustment screw; coolant tube not included.

Design:

Maximum tool life and quality production results when used for smooth cylindrical shanks to DIN 1835 Form A and DIN 6535 HA. With an overhang length of  $2.5 \times D$  (max. 50 mm), concentricity of 0.003 mm.

When using cylindrical shanks with angled clamping surface (Form E and Form HE), this may affect accuracy.

Note:

Chuck with radial tool length adjustment: Coolant supply through central hole.

For adaptor sleeves to reduce clamping diameter see page 171.

(Using adaptor sleeves, this may adversely effect accuracy).

For coolant tube see page 148.

Set for length adjustment available on request.

For notes on preventing mix-ups and on fine balancing see technical notes.

For retro-fitting clamping devices with data carriers see page 179.

Dimensions in mm.

Design:

Permissible concentricity deviation for hollow taper shank to clamping diameter  $d_2 = 0.003$  mm.

The clamping diameter is designed for a shank tolerance H6.

Supply includes:

Length adjustment screw with through hole. Fine balancing screw and coolant tube not included.

Note:

For coolant tube see page 148.

For tool extensions see page 172.

Length adjustment screw and fine balancing screw available on request.

For notes on preventing mix-ups and on fine balancing see technical notes.

For retro-fitting clamping devices with data carriers see page 179.

Dimensions in mm.

Use:

For safe, fast clamping of tap drills.

To compensate for any differences in pitch which occur between the synchronous spindle and the tap drill.

Supply includes:

Supplied complete with clamping nut for internal coolant supply and hexagonal key.

Does not include collet, washer and coolant tube.

Design:

With internal coolant supply.

Note:

Other versions available on request.

For tapping collets and washers to suit internal coolant supply see pages 168-170.

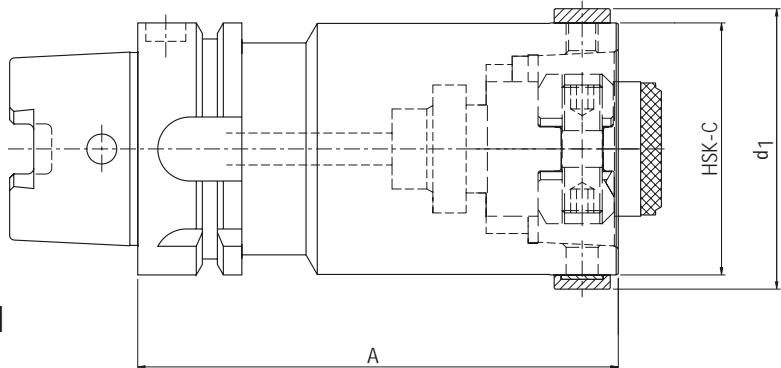

For coolant tube see page 148.

For hexagonal keys see page 153.

For notes on preventing mix-ups and on fine balancing see technical notes.

For retro-fitting clamping devices with data carriers see page 179.

100	127	200	171	MN5598-10-K	MN5598-510-K

Dimensions in mm.

Version 1:

Rough turned and milled.

In the HSK area, grinding allowance from HSK 32 to HSK 80 = 0.2 mm, from HSK 100 upwards = 0.3 mm on the taper and 0.15 mm on the face.

Unhardened and unground.

Blank front section unhardened and unground for further processing.

Version 2:

Taper including collar hardened and finish ground.

Blank front section unhardened and unground for further processing.

Important note regarding Version 2:

Excessive cutting and any application of heat on finished blanks can lead to unacceptable distortion on the HSK shank.

Claims against warranty can therefore only be made on blanks which have not been processed.

Supply:

Does not include coolant tube.

Note:

If extensive cutting is carried out on the blank front section we recommend Version 1 be used and the HSK be finish ground as the final operation.

Further sizes available on request.

For coolant tube see page 148.

Material:

42CrMo54

## Toolholders with HSK-C

The toolholder programme for hollow shanks in the HSK-C form offers wide-ranging opportunities for use in batch production on special machines to universal application as a modular clamping system,

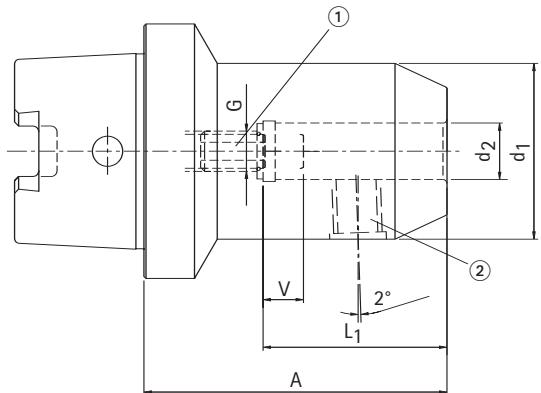

The KS clamping cartridge using with extensions and reducing elements (reducers) allows optimum transfer of bending and torque moments. The high quality of MAPAL toolholders produces results of the highest accuracy.

The high repeatable and changeover accuracy with the HSK connection also produces high quality results in production, even when using combination tools with several connecting elements.

25	M18x2x20	10004141
32	M20x2x20	10004129

Dimensions in mm.

Use:

For holding milling tools and drills with cylindrical shank and angled clamping face ( $2^\circ$ ) to DIN 1835 Form E and DIN 6535 Form HE.

Supply includes:

Clamping screw and cylindrical screw fitted (to hold chuck).

Design:

Permissible concentricity deviation for hollow taper shank to clamping diameter  $d_2 = 0.003$  mm. The bore tolerance is much reduced compared to DIN 1835 ( $d_2^{H4}$ ) to produce extremely high accurate machining results.

Note:

From clamping diameter  $d_2 = 25$  mm two clamping screws are provided.

The length adjustment screws have through holes for coolant.

For notes on preventing mix-ups and on fine balancing see technical notes.

40 - 100	LS1023-01	LS1023-02	LS1023-03	ERC-16	10007862

Dimensions in mm.

Supply includes:

Supplied complete with clamping nut for internal coolant (HI-Q/ERC); washer, length adjustment screw and clamping jaws not included.

Design:

Permissible concentricity deviation for hollow taper shank to internal taper 0.003 mm.

Note:

Chucks have a through hole with internal thread for the length adjustment screw.

For suitable collets see pages 164-167.

For assembly keys see page 153.

For washers see pages 169-170.

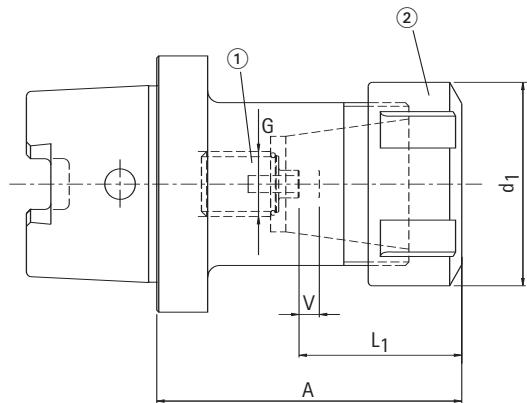

For notes on preventing mix-ups and on fine balancing see technical notes.

Dimensions in mm.

Use:

For clamping tools with smooth cylindrical shanks to DIN 6535 (Form HA) up to Ø 32 mm and with recesses to DIN 1835 (Form B, E) and DIN 6535 (Form HB, HE) directly and without adaptor sleeve in the clamping diameter.

The clamping diameter is designed for a tool tolerance h6 with d<sub>2</sub> = 6 mm to d<sub>2</sub> = 32 mm.

Supply:

Supplied complete with length adjustment screw.

Design:

Maximum tool life and quality production results when used for smooth cylindrical shanks to DIN 1835 Form A and DIN 6535 Form HA.

With an overhang length of 2.5 x D (max. 50 mm), concentricity of 0.003 mm. When using cylindrical shanks with angled clamping surface (Form E and Form HE), this may adversely affect accuracy.

Note:

Chuck with axial tool length adjustment.

Coolant supply via central through hole.

For adaptor sleeves to reduce clamping diameter see page 171.

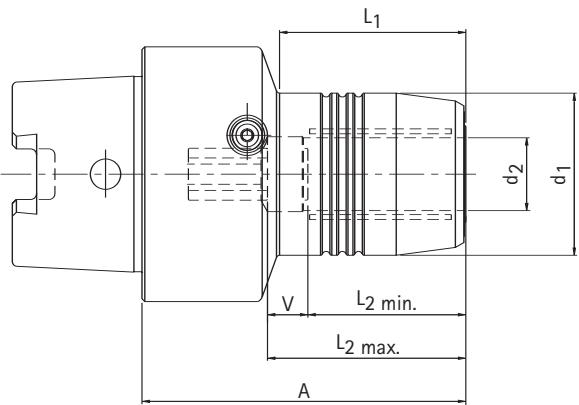

(Using adaptor sleeves, this may effect accuracy).

Length adjustment screw available on request.

For notes on preventing mix-ups and on fine balancing see technical notes.

Dimensions in mm.

Supply includes:

Holder with pull studs, hexagonal key and open-end wrench for pull studs.  
Recommendation:

To allow replaceable heads to be changed quickly with the radial clamping system, at least 1 additional pull stud should be ordered.

Note:

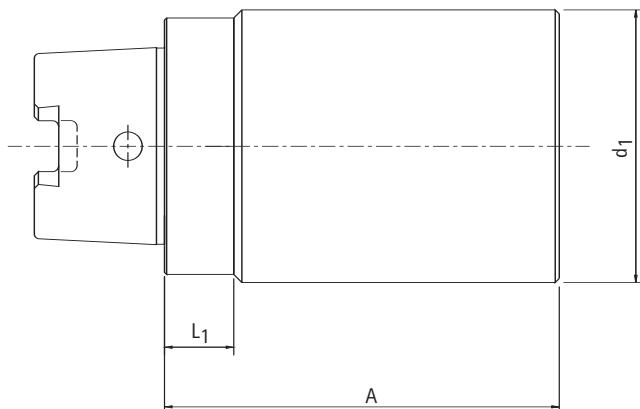

For accessories and spares see page 162.

For suitable torque wrench and hexagonal key see pages 150-152.

100	127	200	16	MN5578-10-K	MN5578-510-K

Dimensions in mm.

Version 1:

Rough turned and milled.

In the HSK area, grinding allowance from HSK 32 to HSK 80 = 0.2 mm, from HSK 100 upwards = 0.3 mm on the taper and 0.15 mm on the face.

Unhardened and unground.

Blank front section unhardened and unground for further processing.

Version 2:

Taper including collar hardened and finish ground.

Blank front section unhardened and unground for further processing.

Important note regarding Version 2:

Excessive cutting and any application of heat on finished blanks can lead to unacceptable distortion on the HSK shank.

Claims against warranty can therefore only be made on blanks which have not been processed.

Note:

If extensive cutting is carried out on the blank front section we recommend Version 1 be used and the HSK be finish ground as the final operation.

Further sizes available on request.

Material:

42CrMo54

## Toolholders with steep taper (ISO) to DIN 69871

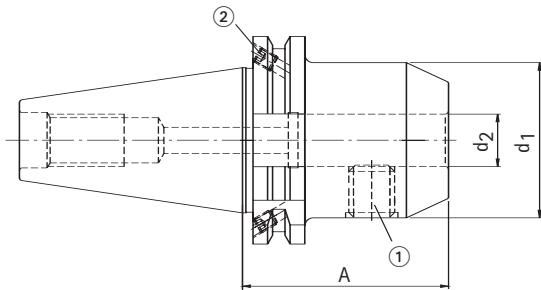

MAPAL has a wide range of products in the area of steep taper (ISO) toolholders and adaptors to DIN 69871.

In addition to all the current versions, there are also steep taper adaptors which, when combined with MN5520 or MN5523 adaptor flanges, ensure greater concentricity.

Dimensions in mm.

Use:

For holding milling tools and drills with cylindrical shank and lateral clamping face to DIN 1835 Form B and DIN 6535 Form HB.

Supply includes:

Clamping screw fitted; pull studs not included.

Bores for coolant supply Form B are stopped with threaded pins when delivered.

Design:

Permissible concentricity deviation for taper to clamping diameter  $d_2 = 0.003$  mm.

The bore tolerance is much reduced compared to DIN 1835 ( $d_2^{H4}$ ) to produce machining results of the highest accuracy.

Note:

From clamping diameter  $d_2 = 25$  mm two clamping screws are provided.  
For pull studs see page 163.

45	2	M5x6	10036759
50	2	M6x8	10036770

Dimensions in mm.

Use:

For holding milling tools and drills with cylindrical shank and angled clamping face ( $2^\circ$ ) to DIN 1835 Form E.

Supply includes:

Clamping screw and length adjustment screw ; pull studs not included.

Bores for coolant supply Form B are stopped with threaded pins when delivered.

Design:

Permissible concentricity deviation for taper to clamping diameter  $d_2 = 0.003$  mm.

The bore tolerance is much reduced compared to DIN 1835 ( $d^{H5}$ ) to produce machining results of the highest accuracy.

Note:

From clamping diameter  $d_2 = 40$  mm two clamping screws are provided.  
The length adjustment screws have a through hole for coolant.

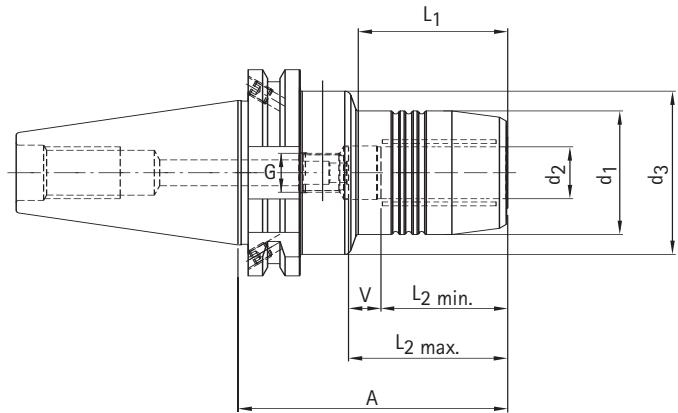

For pull studs see page 163.

Dimensions in mm.

Use:

For clamping tools with smooth cylindrical shanks to DIN 6535 (Form HA) up to Ø 32 mm and with recesses to DIN 1835 (Form B, E) and DIN 6535 (Form HB, HE) directly and without adaptor sleeve in the clamping diameter.

The clamping diameter is designed for a tool tolerance of h6 with d<sub>2</sub> = 6 mm to d<sub>2</sub> = 32 mm.

Supply includes:

Supplied complete with length adjustment screw; pull studs not included.  
Bores for coolant supply Form B are stopped with threaded pins when delivered.

Design:

Maximum tool life and quality production results when used for smooth cylindrical shanks to DIN 1835 Form A and DIN 6535 Form HA.

With an overhang length of 2.5 x D (max. 50 mm), concentricity of 0.003 mm. When using cylindrical shanks with angled clamping surface (Form E and Form HE), this may affect accuracy.

Note:

Chuck with axial tool length adjustment.

Coolant supply via central through hole.

For adaptor sleeves to reduce clamping diameter see page 171.  
(Using adaptor sleeves, this may effect accuracy).

For pull studs see page 163.

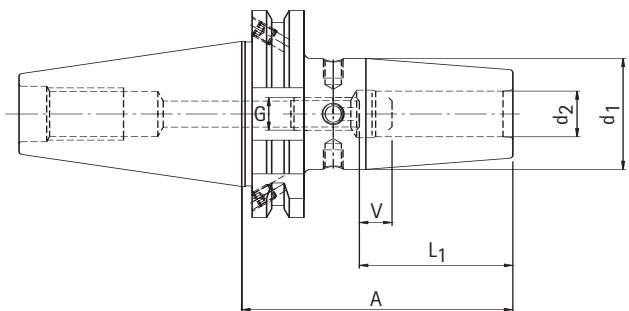

Length adjustment screw available on request.

Dimensions in mm.

Use:

For use on machine spindle for holding HSK tools.

Supply includes:

Supplied complete with clamping cartridge and stop ring; pull studs not included.

Design:

Permissible concentricity of steep taper to HSK internal taper 0.003 mm.

Note:

For clamping cartridges see pages 142-143.

For stop rings see page 145.

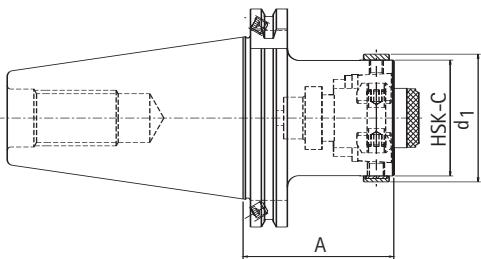

For pull studs see page 163.

On request the extensions can be supplied with KS clamping cartridge for use with minimal lubrication. For this an M is added to the order number, e.g. MN5510-18-KM.

50	20	42	44,5	90	34	41	51	M16x1	10	4,0	MN1167-04	10023449

Dimensions in mm.

Use:

For clamping tools with smooth cylindrical shanks to DIN 6535 (Form HA) up to Ø 32 mm and with recesses to DIN 1835 (Form B, E) and DIN 6535 (Form HB, HE) directly and without adaptor sleeve in the clamping diameter.

The clamping diameter is designed for a tool tolerance of h6 with d<sub>2</sub> = 6 mm to d<sub>2</sub> = 32 mm.

Supply includes:

Supplied complete with length adjustment screw; pull studs not included.

Bores for coolant supply stopped off with threaded pins when delivered.

Design:

Maximum tool life and quality production results when used for smooth cylindrical shanks to DIN 1835 Form A and DIN 6535 Form HA.

With an overhang length of 2.5 x D (max. 50 mm), concentricity of 0.003 mm. When using cylindrical shanks with angled clamping surface (Form E and Form HE), this may adversely affect accuracy.

Note:

Chuck with axial tool length adjustment.

Coolant supply via central through hole.

For adaptor sleeves to reduce clamping diameter see page 171.

(Using adaptor sleeves, this may affect accuracy).

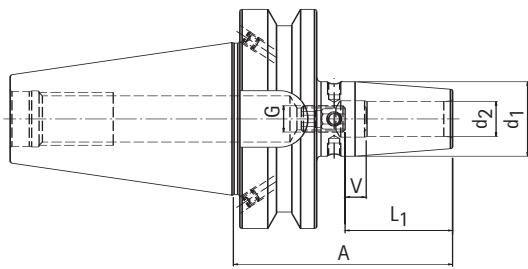

For pull studs see page 163.

Length adjustment screw available on request.

Dimensions in mm.

Supply includes:

Length adjustment screw with through hole already in place.

Fine balancing screw and coolant hose not included.

Bores for coolant supply stopped off when delivered.

Design:

Permissible concentricity deviation for hollow taper shank to clamping diameter  $d_2 = 0.003$  mm.

The clamping diameter is designed for a shank tolerance H6.

Note:

For tool extensions see page 172.

For pull studs see page 163.

Length adjustment screw and fine balancing screw available on request.

### Spares

For module diameter D	Quantity required	① Threaded pin Order No.
60-80	4	K2865-24
100-140	4	K2865-34

Dimensions in mm.

Use:

For use on machine spindle for holding KS adaptor flange, thermal expanding chuck, hydraulic chuck, chuck for cylindrical shanks or tools with modular shank to MN 5000-30 or MN 5000-34.

Supply includes:

Supplied complete with threaded pins for adjusting concentricity; pull studs not included.

Design:

Because of the threaded pins concentricity of an adaptor or tool which has been fitted can be precisely adjusted to the steep taper.

Note:

For suitable KS adaptor flanges MN 5520 and MN 5523, see pages 28 and 29.

For suitable thermal expanding chucks see page 27.

For suitable hydraulic chucks see page 26.

For suitable chucks for cylindrical shanks see pages 24-25.

For pull studs see page 163.

Balance:

G 6.3 at 3,000 min<sup>-1</sup>

CAT

# Toolholders with cylindrical shank

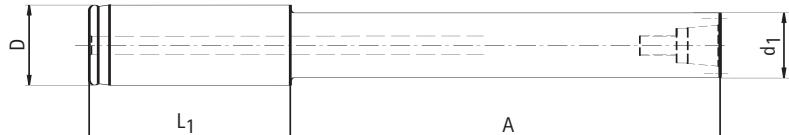

The programme of MAPAL HFS holders for clamping tool heads is completed by holders with cylindrical shanks in Form A.

Softsynchro tapping chucks with location shank to DIN 1835 Form B+E can also be found in this chapter.

# HFS Holders with axial clamping system

Location shank to MN623

Cylindrical shank

Dimensions in mm.

Use:

For safe, fast clamping of tap drills.

To compensate for any differences in pitch which occur between the synchronous spindle and the tap drill.

Supply includes:

Supplied complete with clamping nut for internal coolant supply and hexagonal key.

Does not include collet and washer.

Design:

With internal coolant supply.

Note:

Other versions available on request.

For tapping collets and washers to suit internal coolant supply see pages 168-170.

For hexagonal keys see page 153.

## Notes

Cylindrical shank

# Floating holders

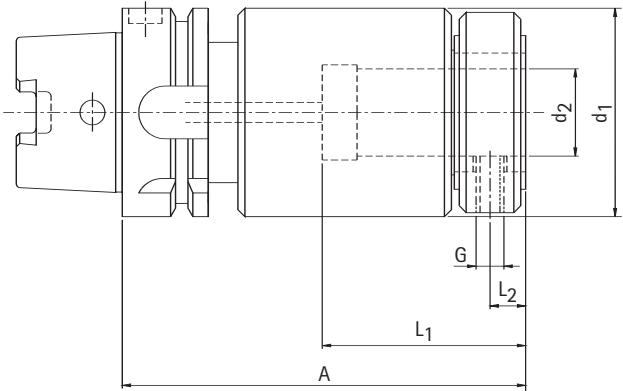

The MAPAL "Wellach System" floating holders have been specially designed for high speed reaming. These compensate for axial and angular displacement and in doing so guarantee optimum machining results with high cutting speeds and long tool life.

To produce higher machining values and even better results, the floating holders can be combined with MAPAL self-adjusting floating holders which will reduce the pendulum movement required by the floating holder and therefore minimise radial play.

For assembly keys see page 153.

# Accessories and Spares

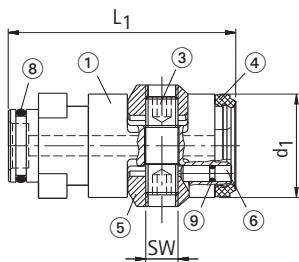

The broad programme of accessories and spares represents a practical extension to the actual programme of clamping systems and offers spares and additional parts, plus support items, for both tools and on the spindles which make their use easy, safe and reliable.

For the final user and also for the machine or spindle manufacturer valuable ancillary items can be supplied, such as spanners and collets for assembly, cleaning items, gauges and measuring equipment. In addition add-on parts are also available which the users can use to replace or complete the systems or for their own constructions.

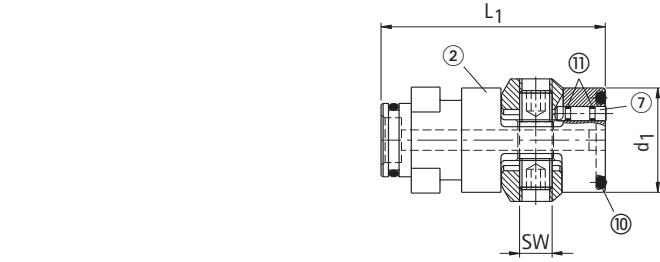

# KS Clamping cartridges

**Standard version**

80	41,6	75	6	525	KS80-09-D
100	52,6	94	8	1.031	KS100-10-D

**Use:**

For mounting on machine spindles and adaptors, for manual clamping of HSK tools.

**Note:**

If individual tools are damaged, the clamping cartridges can be replaced on request as a repair replacement.

**Use:**

Suitable for coolant pressures up to 150 bar.

**Note:**

If individual tools are damaged, the clamping cartridges can be replaced on request as a repair replacement.

Use:

For closing tapped bore in HSK tool holders if no coolant tube is being used.

Design:

Not balanced.

Note:

For closing fast rotating HSK holders, HSK balancing gauges (see page 157) are recommended.

Use:

For closing spindle holders without fitting tool.

Version:

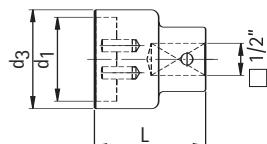

Not balanced, with central coolant hole.

Note:

For closing fast rotating HSK holders, HSK balancing gauges (see page 157) are recommended.

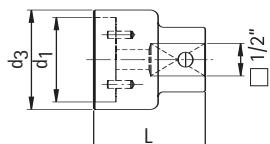

Dimensions in mm.

80	260	130	160		MN5224-09
100	260	130	160		MN5224-10

**Version 1:**

The tool holders are clamped on the collar vertically and horizontally. This means all taper forms with the same collar diameter can be clamped on one block.

The torque is transferred by the frictional resistance.

Supply includes:

Basic body with fitted horizontal and vertical adaptor sleeve, incl. control key.

Note:

Version 1 can be used for all HSK forms in the nominal size.

Dimensions in mm.

**Version 2:**

Vertically the tool holder is simply inserted and held by its own weight.

Horizontally the tool is held by means of the swivelling disc.

The torque is transferred by means of the drive element at the taper end.

Supply includes:

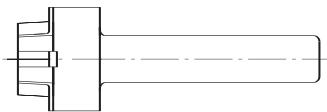

The basic body with horizontal and vertical adaptor sleeve fitted.

Note:

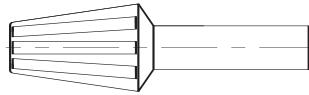

Version 2 can only be used for HSK Forms A and C for the relevant nominal size.

100	MN5281-10-K	10081083

Dimensions in mm.

Use:

For testing the principal function dimensions in a process.

1.  $d_2$  large taper  $\phi$  (direct measurement)

2.  $d_k$  small taper  $\phi$  (direct measurement)

3.  $L_5$  clamping shoulder distance  $30^\circ$

4.  $L_6$  base of bore

concentricity:  $d_2, d_3, L_5$  by rotating the workpiece in the measuring fixture.

5.  $d_{11}, f_3$  gripper groove.

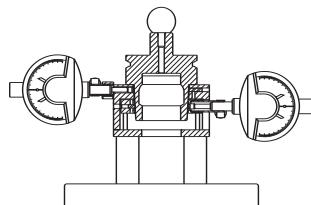

Supply includes:

Gauges with measuring head incl. 6 dial indicators.

Note:

The gauge is modular in design and as a result can be supplied on request in various versions and combinations.

# Gauges for HSK shanks

**Gauge for taper diameter  $d_2$  and measuring point diameter  $d_k$**

Nominal size HSK	Ref. code	Order No.
32	MN5280-05-K	10081088

63	MN5280-08-K	10081091
80	MN5280-09-K	10081092
100	MN5280-10-K	10081093

**Gauge for 30° clamping angle**

Nominal size HSK	Order No.
32	MN5212-05-K
40	MN5212-06-K
50	MN5212-07-K
63	MN5212-08-K
80	MN5212-09-K
100	MN5212-10-K

**Use:**

For direct comparative measurement between calibrated taper plug gauge and HSK external taper. Using the taper measuring rings set to the taper plug gauge, the deviation in the shank to the nominal taper diameter  $d_2$  and measuring point diameter  $d_k$  can be read off on the dial indicators.

**Supply includes:**

Measuring device mounted on a board in wooden case with 2 precision dial indicators for  $d_2$  and  $d_k$ ; includes master gauge in wooden case.

**Use:**

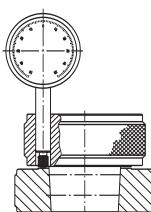

For direct comparative measurement between calibrated setting gauge and HSK external taper. Using the measuring gauge calibrated with the setting gauge, the deviation of the shank from the clamping point distance  $L_6$  can be read off on the dial indicator.

**Supply includes:**

Setting gauge and gauge with dial indicator as a set in a wooden case.

100	MN5214-10-K

Display unit	MN5214-00
Pipe 1 m	MN5214-01
Pipe 2 m	MN5214-02

### Use:

For direct comparative measurement between calibrated taper gauge ring and tool spindle or tool holders. Using the taper measuring rings set to the taper plug gauge, the deviation in the internal taper of the spindle can be read off on the dial indicators.

### Supply includes:

Taper gauge and plug gauge with dial indicator as a set in a wooden case.

### Use:

For direct measurement of the HSK internal taper on the tool spindles and tool holders. With the nozzle-type plug gauge calibrated with the setting rings, the deviation of the internal taper from the nominal taper diameter  $d_1$  and measuring point diameter  $d_3$  can be read off on the scale on the measuring column. To extend the measuring range, the nozzle plug gauge is fitted with a dial indicator (0.01 mm) which allows dimension checking to be carried out even while the internal taper is being rough machined.

### Supply includes:

2 taper gauge rings and nozzle plug gauge with dial indicator as a set in a wooden case.

Display unit and pipe must be ordered separately.

### Design:

Non-contact measurement with measuring nozzle. High measurement accuracy and repeatability of measurement results of 0.001 mm.

### Technical details for pneumatic, electronic display unit:

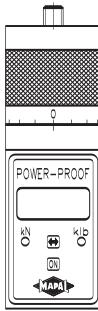

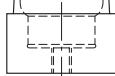

Measuring range: 30 µm

Scale increment: 1 µm

Operating pressure: 4 – 10 bar

Scale length: 200 mm

100	MN5223-10-K		
Basic unit	MN5223-00		

**Use:**

For measuring clamping forces on tool spindles with HSK and ISO connection. By changing various adaptors the measuring device can be selected for the following spindle sizes:  
 HSK-A32/B40 to HSK-A125/B160  
 ISO 30 to ISO 50 (to DIN/ISO and ANSI).

**Design:**

Compact design, i.e. load measuring device completely incorporated into basic unit.

Not affected by mains power supply due to 9V block battery.

Display in Newtons and pounds, with maximum value storage.

Load measurement also possible in tool and spindle tolerance range.

Device switches off automatically when not in use.

**Note:**

Other adaptors available on request.

**Technical details:**

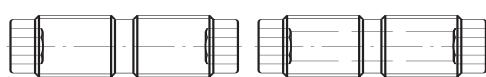

Measuring range: 10 - 75 kN

Measuring system: DMS recorder

Accuracy: <1% of maximum value

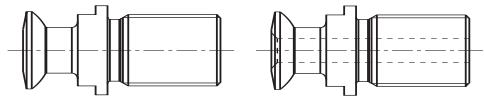

Weight: approx. 3 kg.

1-16	ER-25			3-26	ER-40	26-25	SG4008-26

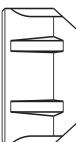

Note:

Never clamp shanks excessively!

E.g. never press a shank 12,2 mm in diameter into a collet 12-11 mm in diameter. Use the next largest collet (in this example 13-12 mm ø).

Dimensions in mm.

## Clamping nut for internal coolant supply

### Clamping nut for internal coolant supply

Clamping range	Nominal size	Order No.
0,5-10	ERC-16	10007862
1-13	ERC-20	10008009
1-16	ERC-25	10014123
2-20	ERC-32	10007923
3-26	ERC-40	10008010

#### Use:

For use with coolant pressure up to 150 bar.

#### Design:

The Hi-QERC clamping nut is the version for use with internal coolant supply. When combined with DS/ER sealing discs this allows collets previously used to also be used for tools with internal coolant.

Dimensions in mm.

Use:

Primarily in high speed machining where very high accuracy in concentricity is required. The tool life is increased at the same time.

Design:

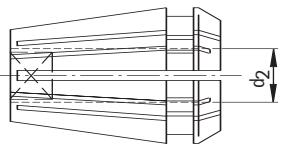

The ultra-precision collets combine the advantages of ISO-15488 A+B on a single collet. This has a clamping range like the standard collet to ISO 15488 Form B. In addition the high concentricity for this collet is as for ISO 15488 Form A.

Note:

Never clamp shanks excessively!

E.g. never press a shank 12.2 mm in diameter into a collet 12-12.2 mm in diameter. Use the next largest collet (in this example 12.5-11.5 mm ø).

Dimensions in mm.

Design:

Suitable of tap drills to DIN, ISO and JIS standards.

Note:

Never clamp shanks excessively!

E.g. never press a shank 9.2 mm in diameter into a collet 9.0 mm in diameter.  
Use the next largest collet (in this example 10.0 mm ø).

Dimensions in mm.

Use:

To reduce clamping diameter for cylindrical shanks Form HA, HB, HE to DIN 6535.

Design:

Clamping diameter  $d_2$  designed for shank tolerance h6.

Without peripheral cooling system: collar closed, coolant seal up to max. of 80 bar.

Note:

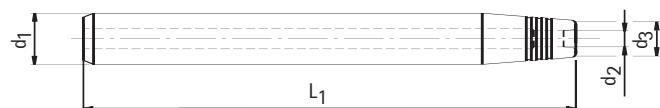

Coolant seal and max. torque only achieved at maximum clamping depth.

Sleeve extraction device MN5420-99 for adaptor sleeve:

Order No. 10060834.

Adaptor sleeve with peripheral cooling system available on request.

16	20	29		50,5	47,5	2	10	0,10	MN5422-38	10060833

Dimensions in mm.

Use:

To reduce clamping diameter for cylindrical shanks Form HA, HB, HE to DIN 6535.

Design:

Clamping diameter  $d_2 = 20$  mm with rubber seal.

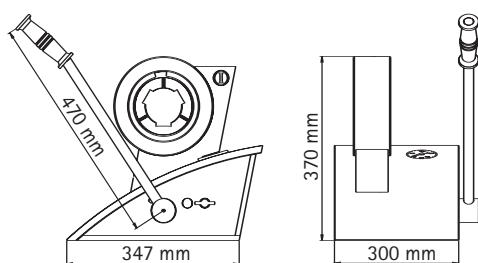

Coolant seal up to max. of 80 bar.

With peripheral cooling system: collar slotted, not sealed against coolant.

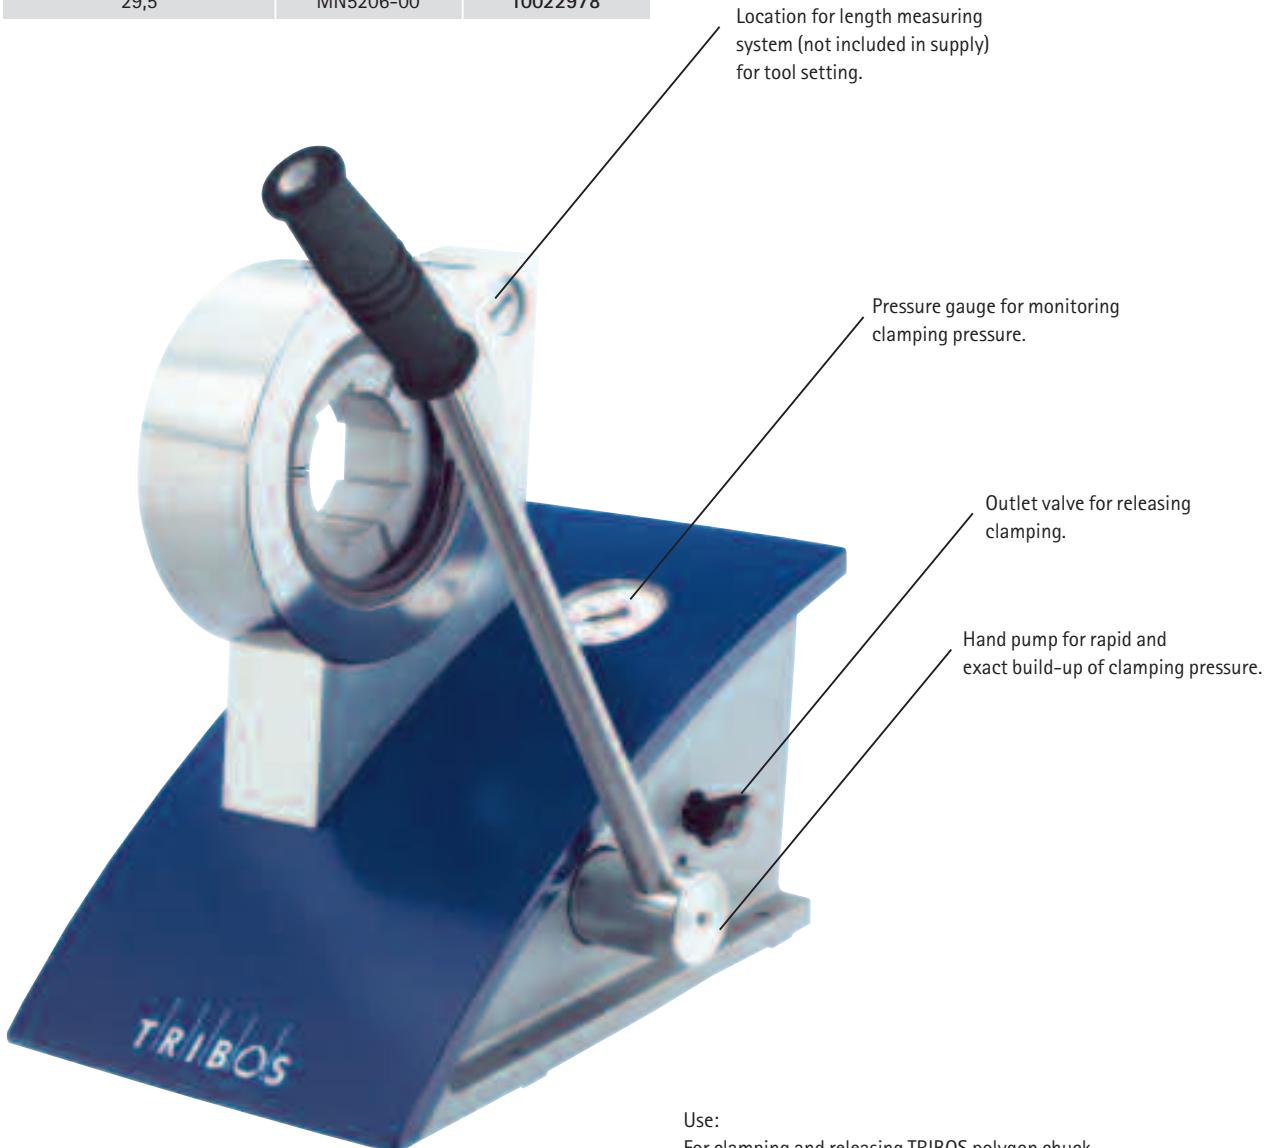

Note:

Sleeve draw-in device MN5420-99 for adaptor sleeve: Order No. 10060834.

## Clamping fixture for TRIBOS polygon chucks

Weight kg	Ref. code	Order No.
29,5	MN5206-00	10022978

Location for length measuring system (not included in supply) for tool setting.

Pressure gauge for monitoring clamping pressure.

Outlet valve for releasing clamping.

Hand pump for rapid and exact build-up of clamping pressure.

### Use:

For clamping and releasing TRIBOS polygon chuck.

### Supply:

Clamping fixture; reducing inserts not included.

### Design:

Hydraulic clamping fixture with hand pump for fast build-up of clamping pressure.

No external power source (electricity, air, etc.) required.

### Note:

For reducing inserts see pages 176-177.

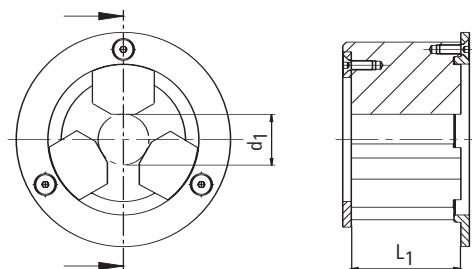

Storage magazine for reducing inserts available on request.

Length measurement system for tool pre-setting available on request.

Best clamping results with cylindrical shanks Form HA with shank tolerance h6.

25	9,5	M10x20-45H	10003956	3050005	10080863

Note:

The spares depend on the clamping diameter  $d_2$  and the position of the threaded pin. Please see the table on the relevant page for the appropriate dimension (in this case  $L_x$ ).

## Balluft tag

Ref. code	Dimensions		Order No.
	d <sub>1</sub>	L <sub>1</sub>	
BIS C-122-04/L	10	4,5	10004178

Dimensions in mm.

Use:

For fitting on tool holders/chucks with HSK-A adaptor to DIN 69893.

Design:

Housing material:	Compressed epoxy resin
Storage capacity:	511 Bytes
Suitable for write/read head:	BIS C-300 / 302 / 305 / 306 / 325
Max. write/read distance:	2.5 mm
Fitting:	on collar
Working temperature:	0 to +70°C
Storage temperature:	-20 to +85°C
Security to IEC 60529:	IP 67
Programming cycles:	500 000 (up to 70 °C)

Note:

The bar code carrier can be written on as often as necessary.

The bar code carrier does not require batteries for power supply.

The power and data required by the bar code carrier are linked inductively from the write/read head.

Data transfer security is safeguarded by means of a plausibility check.

On request the tool holders/chucks can be supplied with a stick-on bar code carrier.

An example of the order number for this is: MN5100-08-KC.

# Technical information, setting and handling notes

In the following pages you will find technical notes and background information on the MAPAL clamping technology.

In addition to the HSK-A and HSK-C standards and the various ISO versions, the mounting dimensions for the flange module are also listed. Important technical notes are also provided on the individual clamping systems and clamping methods covered in the catalogue.

The main features of the KS Clamping cartridge include details of clamping force and transferable bending moment. In addition torque transmission, concentricity and repeatable accuracies plus spindle speed limits for the HSK connection are described.

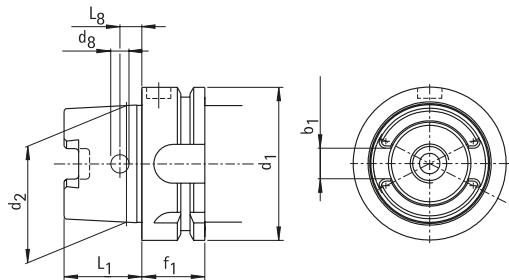

Subject to definition, calculation, effect and limits of balancing, we will also provide information to you the security system to prevent the hollow taper shanks being confused, which stops operating errors when changing tools and is supplied by MAPAL as an option.

Finally we provide you with helpful tips for use in practice with setting and handling notes for fitting and assembling the KS Clamping cartridge and for fitting and alignment of KS adaptor flanges and MAPAL module connections.

## Clamping systems and clamping methods

### The hydraulic method

When clamping with the hydraulic method constant pressure is built up by means of a tensioning screw and a pressure plunger within a closed chamber system. This pressure is transferred to the tool through the built-in expanding sleeve.

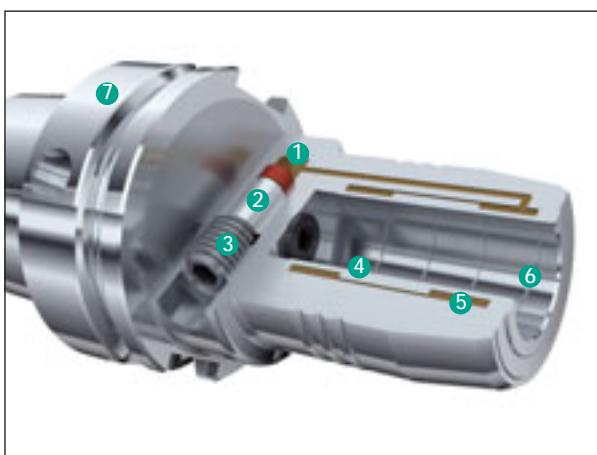

#### Advantages and use by the customer:

- Longer tool life because of maximum concentricity and repeatable accuracy ( $< 0.003 \text{ mm}$ ); this means the cutting edge is evenly applied.
- Improved surface quality on the workpiece; less microscopic fracturing on the tool cutting edge because of excellent vibration damping in the hydraulic system.
- High torque transfer because of diversion of oil, grease and lubricant residue into the groove. This keeps the clamping surface substantially dry.
- Flexible clamping range by using slotted adaptor sleeve with coolant seal (concentricity accuracy of sleeve  $< 0.002 \text{ mm}$ ).
- Exact radial or axial length adjustment.
- Suitable for minimal lubrication.

#### System advantages:

- Easy to use and extremely rapid handling:  
Using a hexagonal key the tool can be clamped concentrically in seconds. No peripheral equipment is needed for clamping and releasing. No additional investment and maintenance costs for external components.
- Closed clamping system:  
No maintenance work and additional costs caused by contamination.
- Extremely high clamping safety:  
No reduction in clamping forces at high spindle speeds.
- Fine balancing:  
All hydraulic chucks are finely balanced as standard for use on HSC machines.

#### 1. Elements of expanding clamping systems

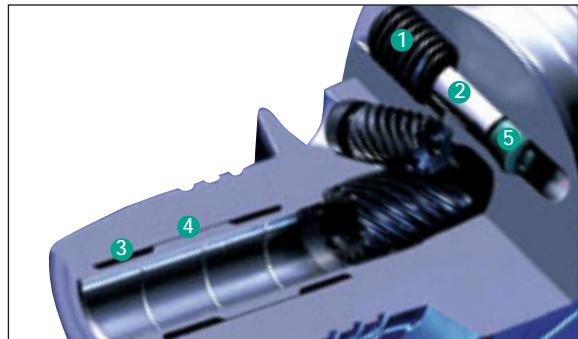

- 1 **Sealing element:** see page loss in the clamping bore prevented by lip seal.
- 2 **Pressure plunger:** presses the hydraulic medium into the chamber system.
- 3 **Tensioning screw:** to activate the piston, can be clamped without using torque wrench.
- 4 **Expanding sleeve:** clamps the tool shank concentricity by applying the pressure evenly.
- 5 **Chamber system:** produced through the connection of the expanding sleeve and basic body. Has a damping effect on the tool because of the hydraulic medium and therefore reduces wear.
- 6 **Groove:** Oil, grease and lubricant residue is diverted into the groove because of the high clamping pressure. The clamping surfaces remain substantially dry and this ensures torque transmission.
- 7 **Basic body:** MAPAL expanding chucks can be supplied for all current machine connections (HSK-A, HSK-C, ISO, BT and flange module).

# Clamping systems and clamping methods

## The hydraulic method

### 2. Function principle

- 1 The tensioning screw is turned as far as the stop with a hexagonal key.
- 2 The pressure plunger presses the hydraulic medium into the expansion chamber and produces an increase in pressure.
- 3 expansion chamber and produces an increase in pressure.
- 4 The thin walled expansion sleeve pushes evenly against the tool shank. This clamping process first causes the tool shank to be centred and then produces a full, positive clamping effect.
- 5 The special sealing element ensures an absolute seal and a long tool life.

### 3. Torque transmission

Please refer to the table for individual torque transmission.

The torques shown apply for shank lengths to DIN 6535 and DIN 1835.

#### a Torque transmission with direct clamping, oiled shank, clamping diameter $d_2 = 6 - 32$ mm

$d_2$ [mm]	6	8	10	12	14	16	18	20	25	32
for shank h6 [Nm]	16	23	45	90	110	185	240	330	400	650

#### b Torque transmission measured with adaptor sleeve, oiled shank

Clamping diameter expanding chuck  $d_2 = 32$  mm

$d_2$ [mm]	6	8	10	12	14	16	18	20	25
for shank h6 Minimum/Maximum [Nm]	36 / 55	46 / 75	82 / 140	120 / 190	140 / 220	200 / 350	260 / 450	280 / 500	400 / 650

Clamping diameter expanding chuck  $d_2 = 20$  mm

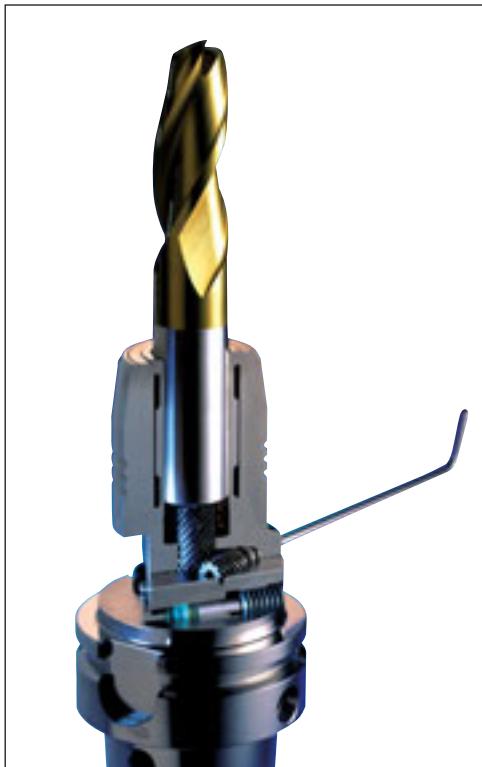

$d_2$ [mm]	3	4	5	6	7	8	9	10	11	12
for shank h6 Minimum/Maximum [Nm]	6 / 10	10 / 15	16 / 25	28 / 50	45 / 68	50 / 80	70 / 100	80 / 120	100 / 150	115 / 175
$d_2$ [mm]	13	14	15	16	17					
for shank h6 Minimum/Maximum [Nm]	125 / 180	130 / 190	140 / 200	170 / 240	200 / 250					

Clamping diameter expanding chuck  $d_2 = 12$  mm

$d_2$ [mm]	3	4	5	6	8
for shank h6 Minimum/Maximum [Nm]	4 / 5	5 / 10	7 / 15	12 / 26	15 / 32

## The hydraulic method

### 4. Radial tool length adjustment

In the area of clamping devices with HSK adaptors, MAPAL also supplies hydraulic chucks with radial tool length adjustment. Using this setting method concentricity accuracy is also guaranteed of < 0.003 mm.

#### Advantages of radial length adjustment

- high precision length adjustment ( $\mu$ ) by means of adjustment gearing
- no change in position of tool caused by own weight or by axial pressure because of self-locking adjusting screw
- 10 mm adjustment path for all clamping diameters with front and rear stop for adjusting screw
- not affected by dirt
- robust mechanical elements
- coolant seal for up to 100 bar
- no radial change in set screw
- user friendly and reliable in production

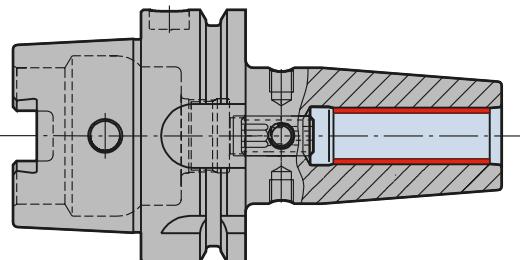

#### Radial length adjustment components:

- 1 Radial length adjustment activated
- 2 Ventilation
- 3 Clamping applied
- 4 Set screw

# Clamping systems and clamping methods

## The thermal expansion method

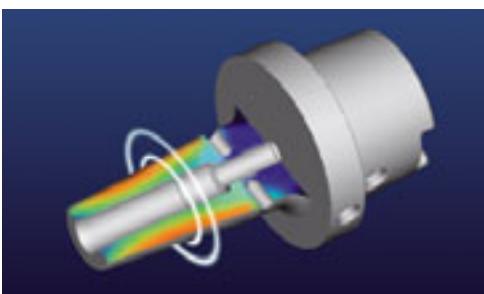

The thermal expansion method uses thermal influences to clamp the tool. An induction coil warms the thermal expanding chuck, the chuck expands and the cold tool shank can be inserted. The thermal expanding chuck is then cooled again, contracts and forms an extremely homogenous unit with the tool.

### Advantages and use by customer:

- High flexibility: numerous options for combining thermal expanding chucks and extensions.
- Wide range of applications: high torque transfer and radial rigidity.
- Long tool life: no changes in geometry or structure when heat is applied.
- No maintenance costs: closed system so no contamination.
- High dimensional stability in the workpiece: durable concentricity and repeatable accuracy of < 0.003 mm in the location bore.
- Long tool life and good surface quality: fine balanced as standard.

### Function principle

#### 1. Warming the chuck

The chuck is warmed precisely at the clamping point using the latest induction technology. The clamping diameter expands. An induction coil produces eddy currents which act directly on the chuck and heat precisely at the point where the tool shank is located.

#### 2. Insert the tool shank

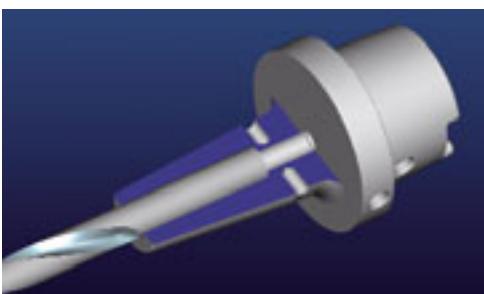

The cold tool shank is inserted into the warmed chuck.

#### 3. Cooling

The thermally expanded chuck is cooled, the clamping diameter contracts to its original size and clamps the tool. An efficient unit with water-cooled cooling elements produces rapid cooling within 30 seconds. This means that the taper and the data chip are not warmed. Adaptors which can be incorporated in the cooling unit allow extensions and also non-standard thermal expanding chucks to be cooled.

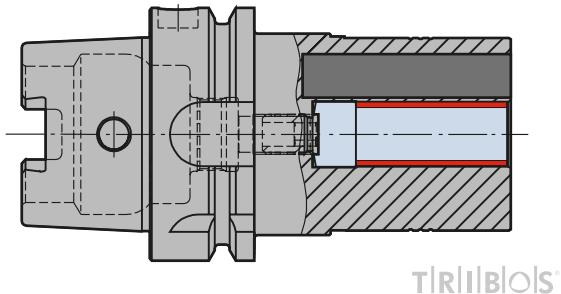

#### The result:

With the inductive warming system tool change can be carried out within seconds. The shrink-fit chuck, the tool extension where applicable, and tool shank form an homogeneous unit. Carbide and HSS tools can be perfectly clamped. The tool sits in the tool holder with perfect fit and held with maximum clamping force.

# Clamping systems and clamping methods

## The polygon clamping method

With the polygon clamping method the tool shank is shrunk into a polygon which has been "deformed" by using a hydraulic clamping device. The TRIBOS® polygon chucks are produced in a narrow design as TRIBOS-S and a more heavy-duty version as TRIBOS-R. The TRIBOS-S chucks are intended for fine and light machining and for areas of the workpiece which are difficult to reach. TRIBOS-R is for heavy duty, difficult machining operations requiring very high precision.

### Advantages and use to the customer:

- Long tool life and production reliability: durable concentricity and repeatable accuracy of < 0.003 mm.
- Short machine stoppage times, fast and easy handling: tool change within 20 seconds.
- Flexible and cost-saving: use of adaptor sleeves (concentricity accuracy < 0.002 mm) allows clamping of several clamping diameters.
- Maximum spindle speeds possible: absolutely rotationally symmetrical construction with basic imbalance of < 4 gmm. Fine balanced as standard for use on HSC machines.
- Durable: no material stress caused by thermal expansion and cooling.
- Totally maintenance free: system has no movable parts and is therefore not mechanically sensitive.
- No material restrictions: clamps carbide and HSS, for shanks with or without clamping flat.
- Flexible location for clamping device: no external power source required.
- Precise axial length adjustment: no axial movements during the clamping process.
- Write/read chips for tool identification system can be used.

# Clamping systems and clamping methods

## The polygon clamping method

### 1. Function principle

TRIBOS-S

#### 1. Special geometry

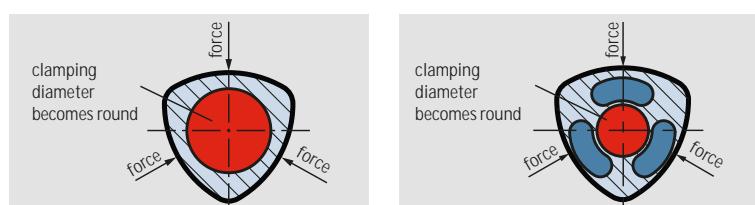

When released, the clamping diameter of the TRIBOS polygon chuck is similar to that of a polygon.

TRIBOS-R

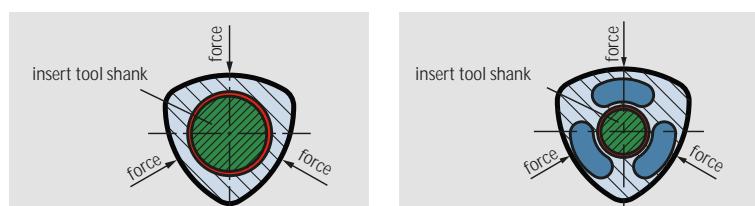

#### 2. Apply pressure

Using the hydraulic clamping device, an exact amount of pressure to the polygon chuck is applied at three points using the clamping display on a pressure gauge. This turns the clamping diameter into a circle.

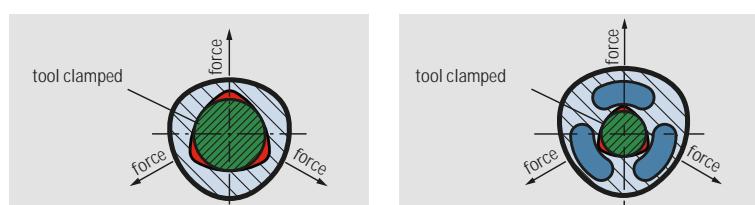

#### 3. Insert tool shank

The tool shank of the cutting tool is now inserted into the clamping diameter.

#### 4. Clamp tool

The clamping device is released and the force acting on the polygon chuck released completely. The clamping diameter returns to its original form and the tool shank is clamped. The clamping process is then complete.

### 2. TRIBOS-S

TRIBOS-S chucks are for fine and light machining. Because of its narrow design, TRIBOS-S is designed for machining workpiece areas which are difficult to reach and where conventional clamping systems cannot be used. The slim design and low weight also gives the advantage that TRIBOS-S can also be used at high spindle speeds and with high feed rates.

# Clamping systems and clamping methods

## The polygon clamping method

### 3. TRIBOS-R

For heavy-duty machining to maximum precision the external diameter on TRIBOS-R is reinforced to increase rigidity. To dampen vibrations a special chamber system, filled with vibration-damping, copper alloy inserts, is incorporated which produces better surface finish and longer tool life.

The high rigidity of TRIBOS-R allows the high radial forces to be absorbed which occur in heavy duty cutting. A long tool life and quiet machining process are achieved because of the filling in the hollow chamber with Duroplast around the clamping diameter. TRIBOS-R collets can also be used for high settings and high cutting volumes because of its stability.

### 4. Use of adaptor sleeves

By using adaptor sleeves different clamping diameters can be clamped with just one tool holder, thus producing cost savings. The radial rigidity is increased and significantly higher clamping forces can be achieved. When connecting to TRIBOS extensions, numerous combination options are possible.

### 5. Tool extensions (concentricity < 0.003 mm)

The TRIBOS programme also includes tool extensions with which the polygon clamping method can be combined with an extremely wide variety of chucks. The tool extensions are of particular advantage in machining situations where chucks with projecting tool restrictions cannot be used.

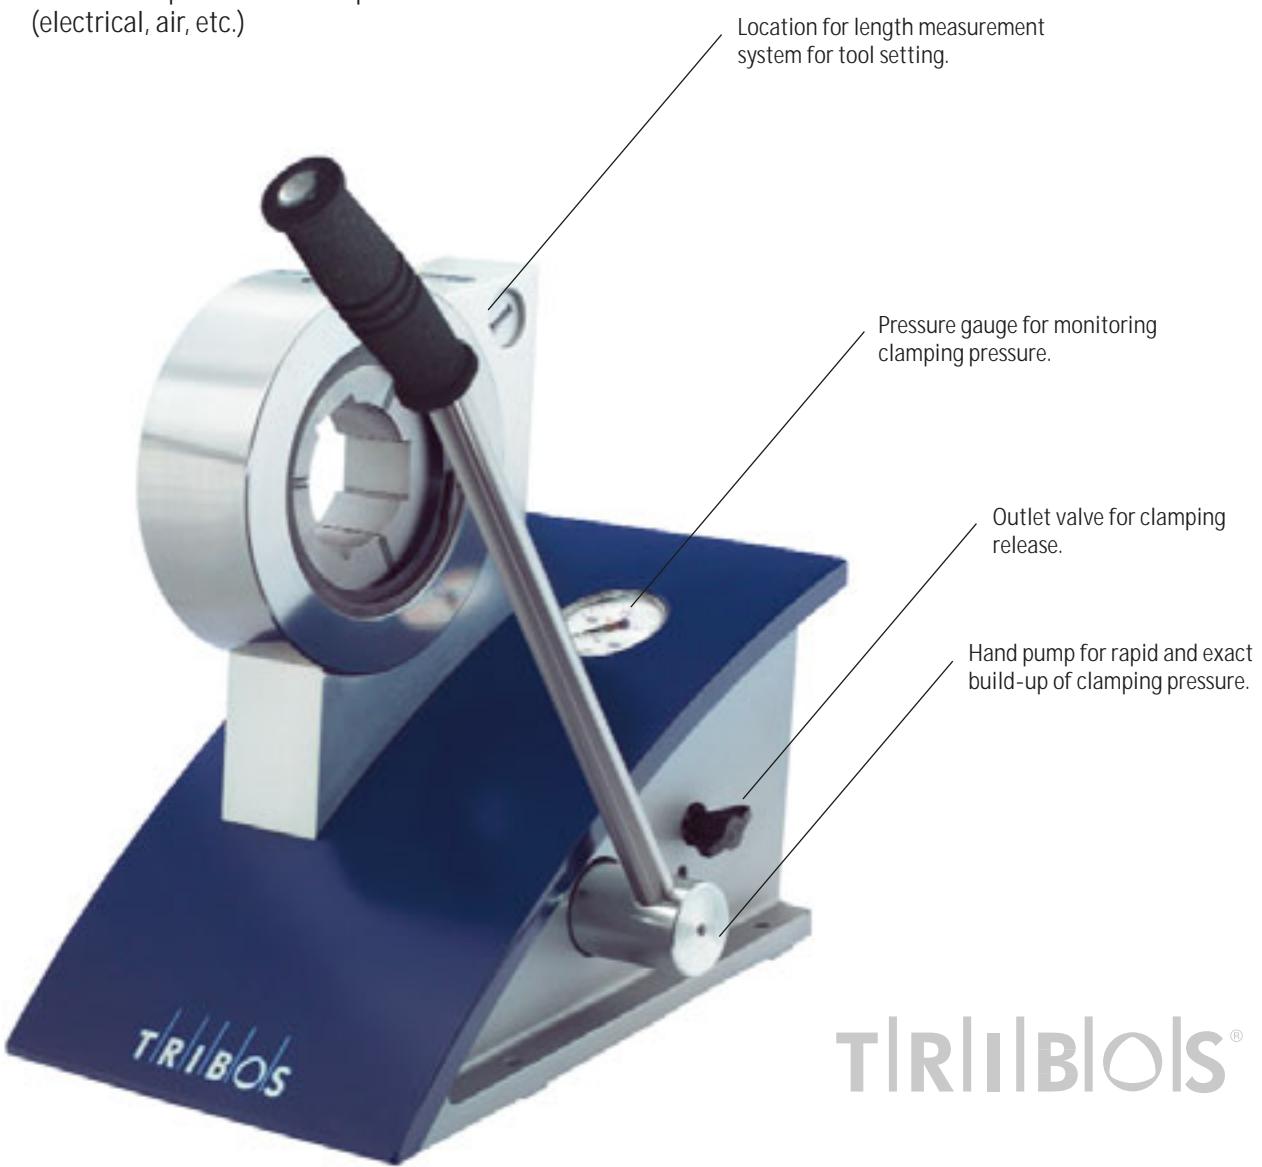

# Clamping systems and clamping methods

## The polygon clamping method

### 6. TRIBOS clamping fixture

#### Design:

- Hydraulic clamping fixture
- Hand pump for build-up of clamping pressure
- No external power source required  
(electrical, air, etc.)

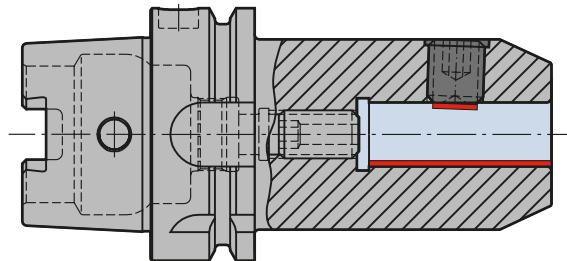

Procedure for clamping and releasing TRIBOS polygon chuck in the clamping fixture:

1. Read off clamping pressure required from the polygon chuck (see label).
2. Insert polygon chuck with the necessary reduction insert into the clamping fixture.
3. Close the outlet valve on the clamping fixture.
4. Using the hand lever produce the required clamping pressure, checking the display on the pressure gauge.
5. Insert or remove tool.

# Clamping systems and clamping methods

## The mechanical chuck method

The low cost version in the world of tool clamping is to use mechanical chucks. These chucks are characterised by their sturdy design and simplicity.

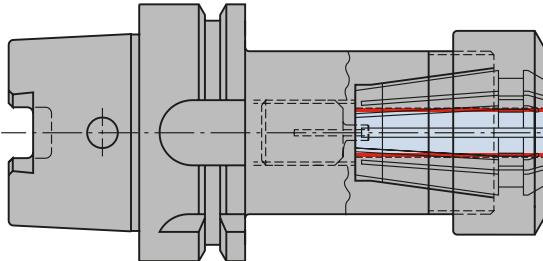

1. Cylindrical holders to DIN 69882-4/-5

MAPAL includes both clamping devices with lateral clamping surfaces and with angled clamping surfaces in their programme. However, because of the effect of clamping force on one side, shortcomings in concentricity have to be accepted.

For HSK-A adaptors chucks with alignment facilities are also available. This version allows for greater demand for concentricity. Using four alignment screws at the clamping bore, concentricity of up to 0.003 mm can be achieved. Chucks with alignment are particularly suitable for brazed fine boring and roughing tools.

In the steep taper area it is advisable to clamp MAPAL NC reamers with angled clamping surfaces using a precision adaptor. These special clamping devices are supplied for steep taper chucks to DIN, BT and ASME standards. These are restricted to 0.003 mm in order to reliably achieve the quality requirements set for MAPAL reaming tools in production.

2. Collet holders to DIN 69882-6

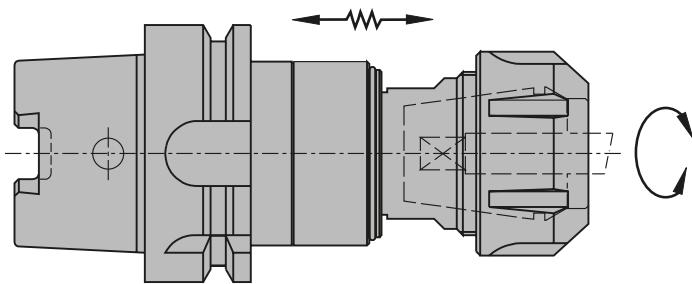

The flexible version of the mechanical chuck is the solution which uses collets. By using appropriate collets, a holder can hold tools with cylindrical shanks within a whole clamping diameter range (e.g. clamping range 2 - 20 mm with a single clamping device). For this a collet covers an area of 1 mm in the diameter.

The variability of the collet holders has the disadvantage, however, that, in the context of concentricity, the collet holder has shortcomings when it comes to maximum possible spindle speed and maximum torque transmission.

In addition to conventional collet holders MAPAL also offers chucks with clamping nuts for internal coolant supply. When used with the ER sealing discs, these Hi-Q/ERC clamping nuts also allow previously used collets to be used for tools with internal coolant supply.

## Clamping systems and clamping methods

### The mechanical chuck method

### 3. Softsynchro® tapping chucks

The synchronisation of the spindle's rotary movement and feed axis allows threads to be produced with tools without length adjustment. In practice, however, synchronisation errors cannot be entirely avoided. The reasons for this are the machine's dynamics and the interplay between spindle and linear drives. Tolerances on the tapping tool also play a role. When using rigid tools these synchronisation errors produce high axial forces and as a result shorter tool life and threads and teeth which are not clean and cannot be gauged.

Collet holders of the Softsynchro® type act as an attenuating element between synchronous spindle and tapping tool and allow the synchronous spindle to be used in the best possible way. This produces optimum tool life and surface qualities.

The MAPAL programme includes Softsynchro® tapping chucks with HSK-A adaptors and with cylindrical shank to DIN 1835 B + E.

#### Advantages and use by the customer:

- Adjustment of differences in pitch between synchronous spindle and tapping tool
- High concentricity
- Firm clamping by means of collets with square holder
- No special shanks required on tool
- High production reliability when producing threads synchronously.

# Clamping systems and clamping methods

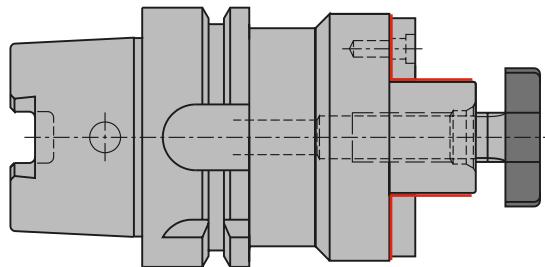

## The mechanical chuck method

3. Softsynchro® tapping chucks

Design features of Softsynchro® tapping chucks:

- In two parts (chuck shank / tool holder):  
easy to dismantle, easy maintenance
- Axial force adjustment and torque separate:  
hardly any effect
- Pre-stressed damping element in plastic:  
no effect on tool cutting edge from upward axial movement. Axial movement only when pre-stressed level has been exceeded.
- Lengthways movement guided by ball-bearings:  
little friction caused by rolling, very good response.
- Suitable for up to 50 bar internal coolant:  
no effect of axial force from coolant pressure so no lengthways movement.

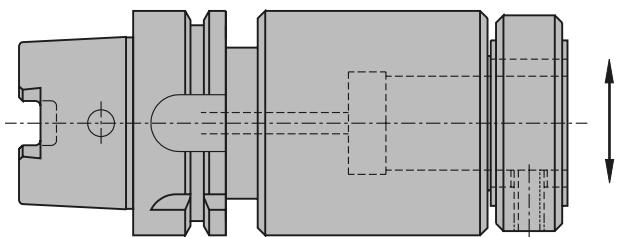

4. Milling cutter arbors to DIN 69882-3

A tried and tested clamping system for holding cutter heads, shell end face milling cutters and single angle shell end mills.

# Clamping systems and clamping methods

## MAPAL floating holders

### Simple design, problem-free function

Reamers are used to improve the dimensional accuracy and surface quality of a bore. Because of their design they are supported in the bore by guides. This applies both for multiple bladed reamers and for tools which use the single blade principle.

The coordination of the rough bore with the tool axis is a prerequisite for both tool designs to perform without problems. In many cases this condition is not met. As a result, when machining with several clamping set-ups and frequently with a single tool change, for example, a cycle and positioning error will occur and cause an offset between tool and workpiece.

The MAPAL "Wellach System" floating holder programme has been designed for optimum use of high speed reamers and allows for this axis and angle displacement.

### Advantages and use by the customer:

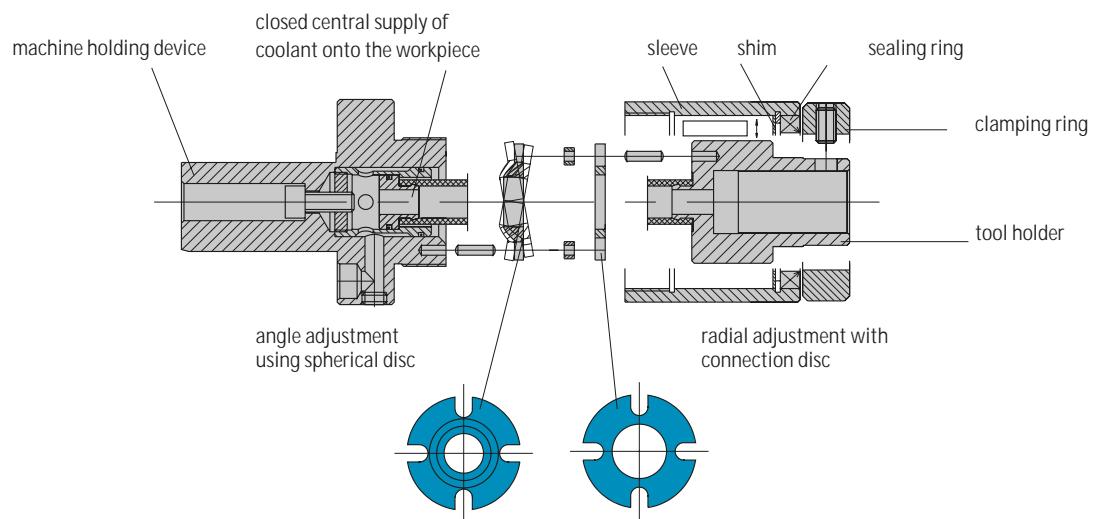

- Long tool life, even at high feed rates, because of trouble-free operation
- Consistent results for batch production
- Less scrap and reworking
- Less space for multi-spindle use because of slim design and small head diameter
- An advantage at high spindle speeds
- No parts subject to wear so no cost-intensive stock of spares required.

# Clamping systems and clamping methods

## MAPAL floating holders

### 1. Design elements

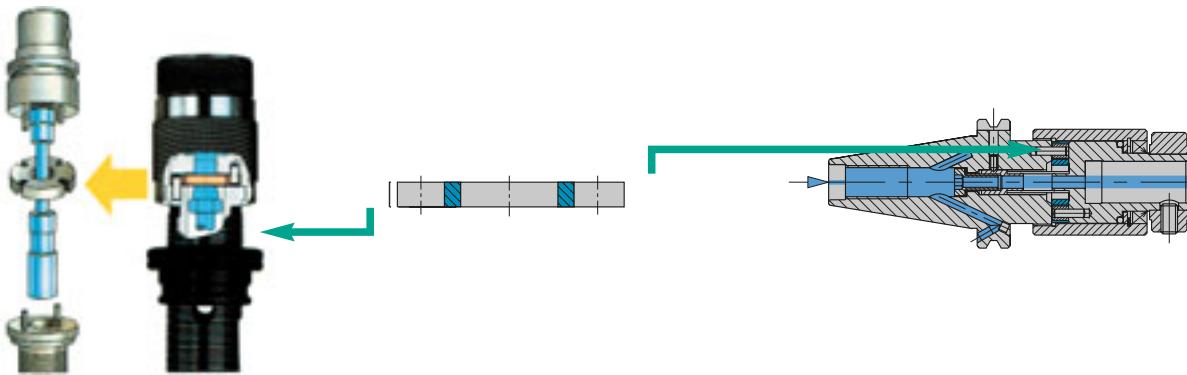

- Sliding surface connection: smooth sliding surfaces transfer the axial feed forces with low pressure on surface.
- Reliable function: even at the feed rates which are normal today and with the high forces these cause.
- Problem-free radial and angular movement of tool holder with long lasting high accuracy.
- Radial and angular adjustment ensured by play incorporated in the design.
- The design advantage of the surface connection is particularly great compared to conventional contact at a specific point.
- Closed, central coolant system (water, oil, air) supplied to the workpiece by means of a flexible, sealed unit which is connected with the holding device and the tool holder.

### 2. Offset adjustment methods

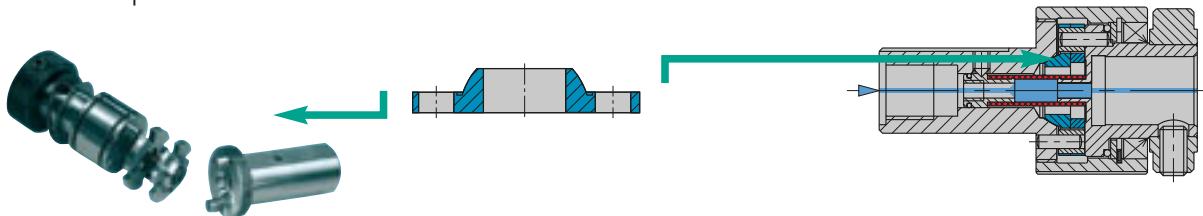

Two different types of floating holders vary in the methods used for offset adjustment:

Type PR has a **sliding surface contact**, with which the axial feed forces are transferred with low surface pressure being applied.

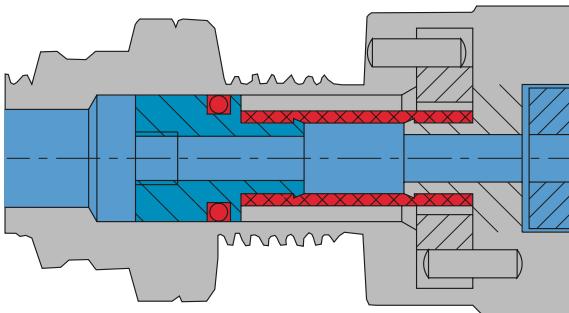

# Clamping systems and clamping methods MAPAL floating holders

Type PA has a second movement plane with which the angular offset is compensated for with a spherical disc and tapered "dish".

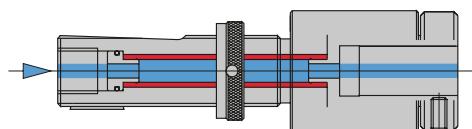

## 3. Coolant supply

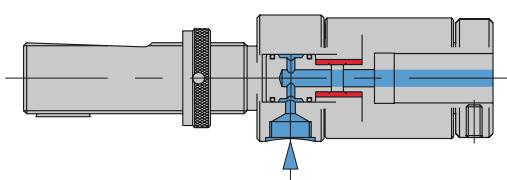

MAPAL floating holders are characterised by a closed central coolant supply (water, air, oil) onto the work-piece using a flexible, sealed unit which is connected with the machine holding device and the tool holder.

The following three connection versions are available

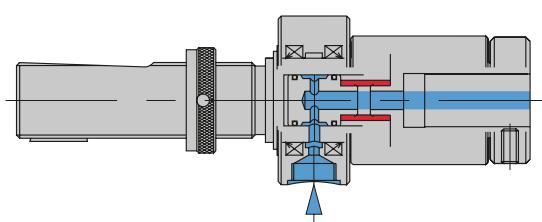

### 1. Supply at end of floating holder

Maximum possible coolant pressure 50 bar. Ref. code KZ.

### 2. Supply through lateral hole

Maximum possible coolant pressure 50 bar. Ref. code KZB.

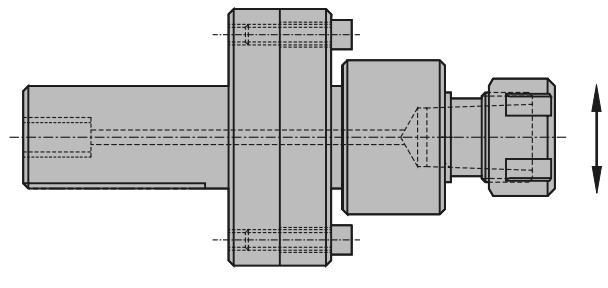

### 3. Supply through rotating ring

Maximum possible coolant pressure 30 bar. Ref. code KZD.

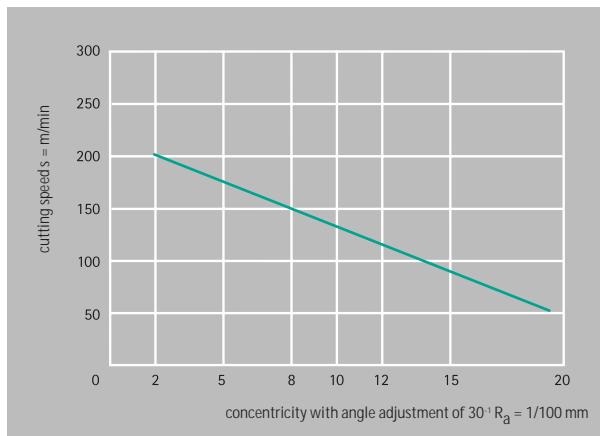

# Clamping systems and clamping methods

## MAPAL floating holders

### Self-adjusting floating holders

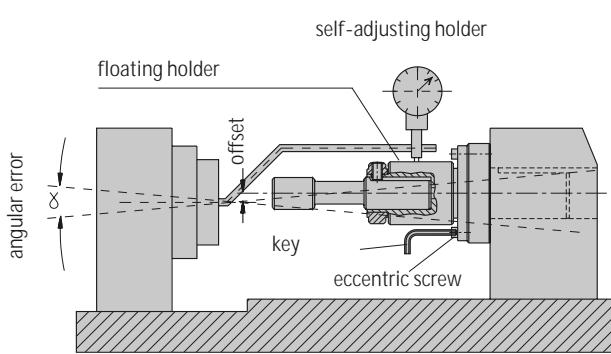

In order to achieve higher machining values and even better machining results, the floating holder can be combined with the MAPAL self-adjusting floating holder. The self-adjusting floating holder reduces the pendulum movement of the floating holder and the radial play is then minimised. The efficiency of the system can be seen from the higher spindle speeds and cutting speeds which extend right up to the HSC range.

Effect of radial play on cutting speed

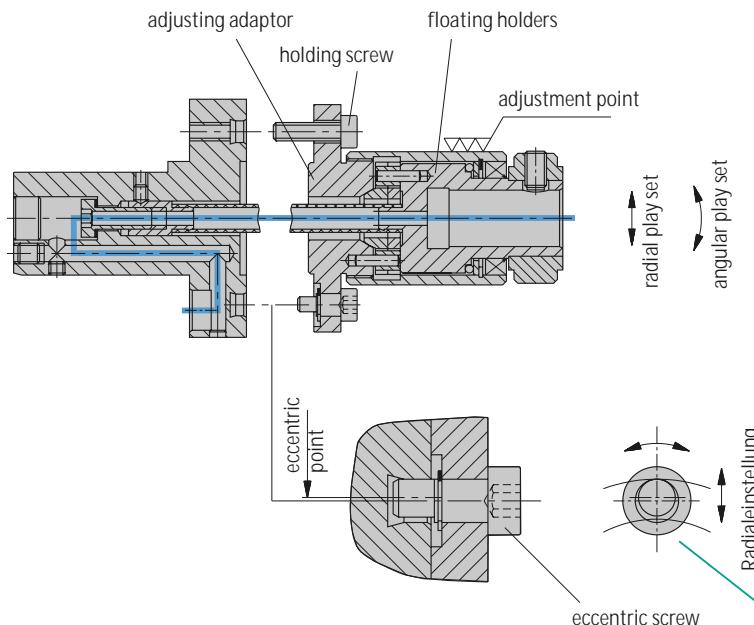

#### 1. Structural diagram of self-adjusting floating holder

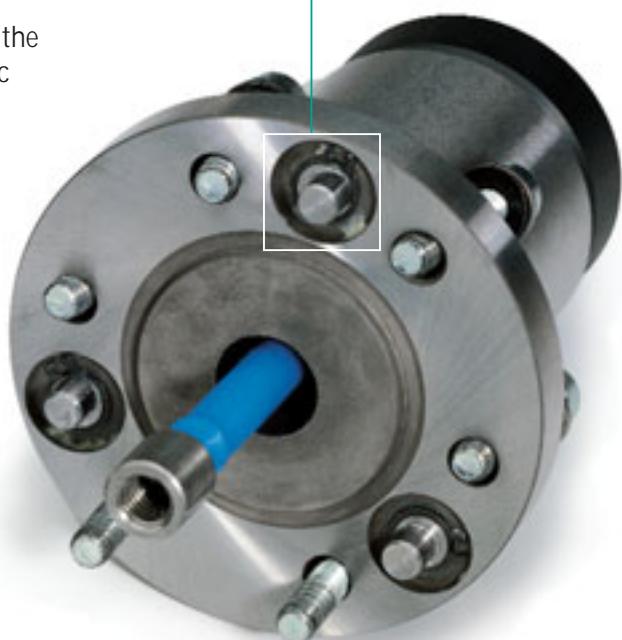

The combination of floating holder and self-adjusting holder also saves long machine stoppage times: instead of having to set up the whole machine, the spindle error can be set easily and directly on the self-adjusting floating holder using easily accessible eccentric screws. The new self-adjusting floating holder is especially suited for use on turning machines (adjusting slide guideways) and multi-spindle machines (adjusting tool holders). In general the MAPAL self-adjusting floating holders can be used wherever manual adjustment of an axial error is needed.

Clamping systems and clamping methods  
MAPAL floating holders  
Self-adjusting floating holders

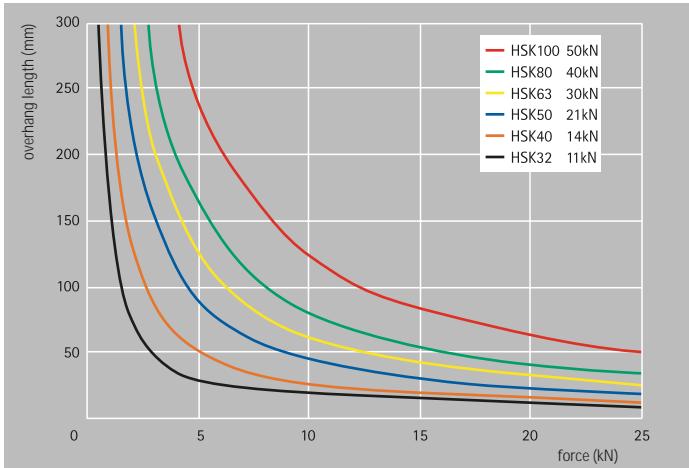

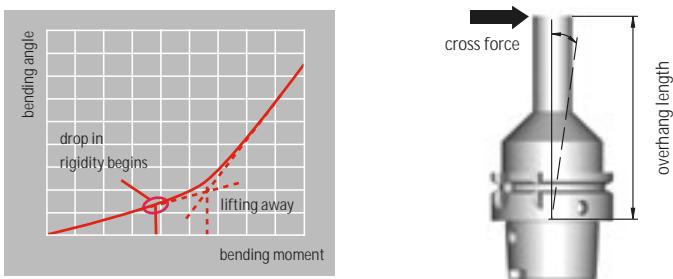

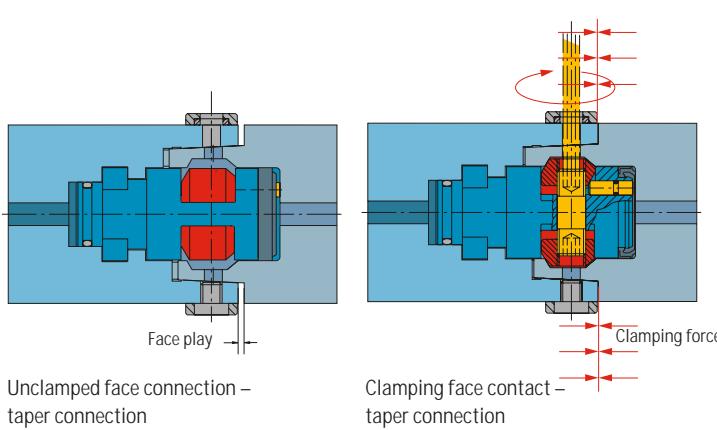

2. Function

The holders are supplied set to. If the radial play is not sufficient, loosen the holding screw and align the floating holder on the machine using the eccentric screws.

# Main features of the KS Clamping cartridge

Permissible bending load for HSK connection when using KS cartridge

Nominal size HSK	32	40	50	63	80	100
Clamping diameter $d_2$	mm	24	30	38	48	60
Shank diameter (DIN 69893)	kN	4.5	6.8	11	18	29
Clamping force (MAPAL KS)	kN	11	14	21	30	40
Clamping moment	Nm	6	7	15	20	30
Lifting moment $M_{lift}$	Nm	150	260	460	625	1.005

Clamping force and lifting moment

## Clamping force and acceptable bending moments

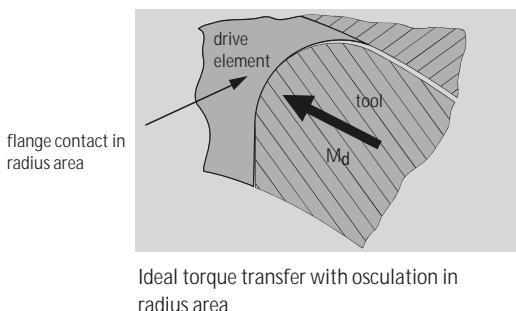

The pre-stressed HSK connection draws its efficiency from a high clamping force effected on the face connection with force effected simultaneously on the taper shank. The tolerances for the HSK shank and holder lead to excessive forces. The excessive proportion of the clamping force is applied to the face connection and, together with the face connection diameter, this is responsible for absorbing high bending moments.

Because of the compact design of the clamping mechanism the MAPAL KS clamping system allows higher clamping forces than are recommended under the standard. This produces an extremely high load capacity from the bending moments and a high rigidity in the connection.

In practical use this means the absorption of higher cutting forces even with large overhangs plus better tool life and therefore maximum productivity. Depending on external stresses, the lower DIN clamping forces may also be sufficient.

The values shown in the diagram and the table are the result of extensive trials in research and in practice and provide an orientation for the user. Depending on the application in question, loads beyond this are also possible.

# Main features of the HSK connection

50	30.000
63	24.000
80	20.000
100	16.000

Guideline values for spindle speed limits for HSK connections

## Transferable torque

HSK connections transfer both positive and form locking torques. The high clamping force of the MAPAL KS clamping system leads to high friction forces on taper and face and as a result to correspondingly high friction moments.

The form locking torque transfer is characterised by compact drive elements in the holders whose radii osculate exactly and thus allow maximum transferable values.

For tools in 16MnCr5 / 1.7131, the form locking torque transfer allows an extremely high maximum torque ( $M_{d,max}$ ). When using higher quality materials, such as 1.6582 or 1.2343, these values rise dramatically.

## Concentricity and repeatable accuracy

The accuracy of the HSK connection is the predominant feature of this standardised connection system. When used with the easy-to-operate KS clamping system, changeover and repeatable accuracies in the high precision range are possible which open up new perspectives for improving quality.

The repeatable accuracy of the HSK connection is  $\leq 1 \mu\text{m}$  axially and  $\leq 3 \mu\text{m}$  radially.

## Spindle speed limits

The spindle speed limit for the HSK connection is defined by a number of factors. This means that the length of the supporting location taper, the excess between the taper shank and the taper holder, and also the clamping system used, have considerable effect.

For applications at high spindle speeds the spindle speed limit needs to be determined according to conditions. The values shown alongside can be taken as rough guidelines.

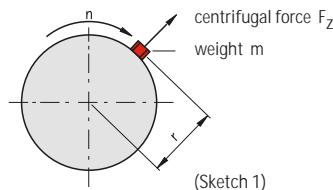

# Definition, calculation, effect and limits of balancing

## 1. Imbalance and calculation of imbalance

Imbalance  $U$  is a measurement which defines what weight  $m$  is located on a specific radius  $r$  to the axis of rotation (see sketch 1). This has the "unmanageability" unit gmm and is calculated with formula A:

$$U = m \cdot r$$

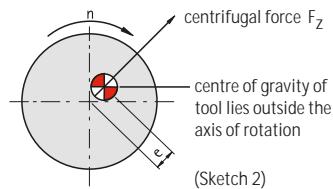

(Formula A)

With a rotating cutting tool, the imbalance is normally referred to this weight  $m_{WZ}$  and is calculated with an eccentric distortion  $e$  from its centre of gravity to the axis of rotation:

$$U = m_{WZ} \cdot e$$

(Formula B)

This imbalance is calculated on a balancing device and the weight to be balanced under Formula A automatically adjusted to the radius  $r$  on which the material compensation is carried out so that the tool will meet the customer requirement.

The permissible distance  $e_{zul}$  is produced from the balancing quality value  $G$  and the required spindle speed  $n$  using Formula C:

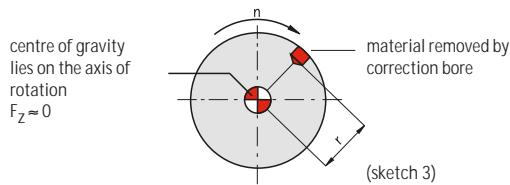

$$e_{zul} = G \cdot \frac{60}{2 \cdot \pi \cdot n}$$

and is a good basis on which to estimate how difficult balancing will be and whether a request for balancing can be effectively carried out.

The permissible residual imbalance  $m_R$  from this is produced from

$$m_R = m_{WZ} \cdot \frac{e_{zul}}{r}$$

As an example, using Formula C for a toolholder with a required balance of  $G$  6.3 and a spindle speed  $n$  of  $10,000 \text{ min}^{-1}$ , the permissible distance  $e_{zul} = 6 \mu\text{m}$ . For a correction radius  $r = 16 \text{ mm}$ , with a tool weight of  $m_{WZ} = 1 \text{ kg}$ , using Formula D the permissible residual imbalance weight  $m_R$  is then 380 kg.

The imbalance with the rotating spindle produces a centrifugal force  $F_z$  which, if the imbalance is too great, can have a negative effect on the machining process and/or the life of the spindle bearing.

The centrifugal force  $F_z$  develops linearly with the imbalance and quadratically with spindle speed  $n$  using Formula E:

$$F_z = U \cdot \omega^2 = U \cdot (2 \cdot \pi \cdot n)^2$$

(Formula E)

To avoid these centrifugal forces, compensating bores and surfaces are normally produced on tool holders and tools, as a result of which the centre of gravity is shifted in the direction of the axis of rotation and the centrifugal force reduced accordingly (see sketch 3)

The balancing quality  $G$  is calculated from

$$G = e \cdot \omega = \frac{U}{m} \cdot \frac{2 \cdot \pi \cdot n}{60}$$

(Formula F)

## 2. Balancing limits

The purpose of balancing a tool holder (with tool) must be to ensure sufficient balance for the application in question. This always means a compromise between the technical feasibility and the technical and economic practicalities.

In general a requirement to balance is both unrealistic and also unfeasible if the permissible distance  $e_{zul}$  which this produces is less than the radial clamping accuracy for the tool holder used.

For the hollow taper shank (HSK), as the currently most accurate connection, this limit is  $e_{min} \geq 2 \mu\text{m}$ . With this value, using Formula B for a tool holder with a clamped tool (total weight 1,340 g), this produces a possible, and not influential, imbalance of 2.68 gmm and, using Formula F at a spindle speed of, for example,  $30,000 \text{ min}^{-1}$ , the best possible balance of  $G$  6.3.

The same clamping accuracies/inaccuracies which occur with use on the machine tool spindle also apply of course to the balancing device, and as a result a lower residual imbalance and a better balancing quality cannot be reproduced.

The measuring accuracy of balancing devices as used in the tool industry must be taken into account when considering these limits. With a display sensitivity of 0.5 gmm for a high quality balancing device this means a further measuring uncertainty because of the shift in centre of gravity of 0.5  $\mu\text{m}$  and with regard to the balancing quality of  $\Delta G$  at  $30,000 \text{ min}^{-1}$  (tool weight 1,340 g).

### 3. Balancing chucks for cylindrical shanks Form HB and HE

In these chucks standard tools such as drills and milling cutters are used which, because of their clamping surface(s), have an integral imbalance. If the tool holders for these tools are then balanced without taking this imbalance into account, the overall imbalance of the tool is transferred to the unit produced by the tool holder + tool when assembled.

For this reason, to balance the tool holder correctly either a shank must be clamped on or the imbalance in question 'contained' on the screw side. The material for the tool to be held (usually HSS or carbide) is therefore of great significance because of the density specific to this.

If the tool material is either not known or varies, these tool holders can be balanced as a 'fictitious' material whose theoretical density of 11.2 g/mm<sup>3</sup> lies exactly between that of steel (7.8 mm<sup>3</sup>) and carbide (14.6 g/mm). This means the possible deviation for the user from the free choice of tool material normally required is only half as great as if the balancing were to be either for steel or carbide.

With regard to the general balance limits which are generally to be applied for such tool holders, the clamping accuracy of the cylindrical shank in the location bore also needs to be taken into account.

#### Example

Tool 25 mm ø / 370g

DIN tolerances: bore H5 produces ø tolerance

0/+9 µm

shank h6 produces ø tolerance

0/-13 µm

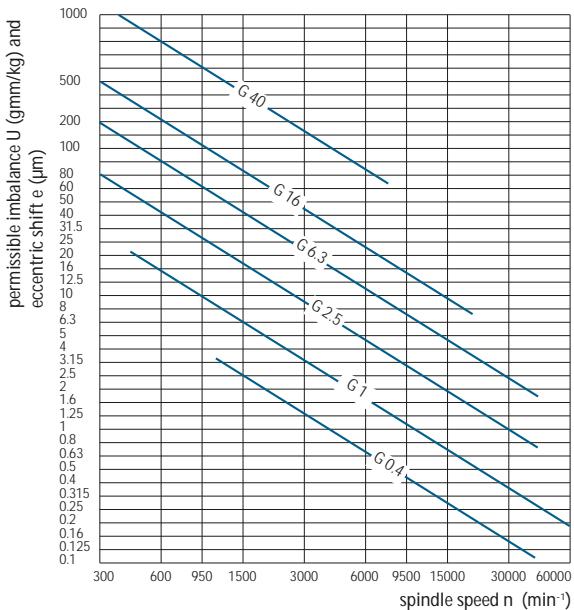

⇒ maximum radial offset 11 µm

For the whole tool being observed (tool holder + tool = 1.340 g), using Formula F for a spindle speed of 8,000 min<sup>-1</sup>, a possible drop in the balance quality is produced of Δ G 2.5. The clamping accuracy for the HSK hollow taper shank produces a further uncertainty of Δ G 1.68.

The overall result in the case of these tool holders can only be that requirements below G 6.3 are hardly practicable.

In certain cases it may be necessary to balance tool holder and tool together. Clear limits can only be defined, however, by taking the type of tool, overhang length and machine/spindle design into consideration.

The diagram show below (to DIN/ISO 1940-1) shows, for balance values G on a balancing weight of 1 kg, the permissible standardised residual imbalance U and the permissible radial shift in the centre of gravity e in relation to the spindle speed n.

### 4. Formula symbols, units and formula

Symbols	Units	Formula	Description
e	µm	$e = \frac{U}{m_{WZ}}$	eccentric shift
e <sub>zul</sub>	µm	$e_{zul} = G \cdot \frac{60}{2 \cdot \pi \cdot n}$	permissible distance
F <sub>Z</sub>	N	$F_Z = U \cdot \omega^2$	centrifugal force
G	mm/s	$G = e \cdot \omega$	balancing quality
m	g		weight
m <sub>R</sub>	g	$m_R = m_{WZ} \cdot \frac{e_{zul}}{r}$	permissible residual imbalance weight
m <sub>WZ</sub>	g		tool weight
n	min <sup>-1</sup>		spindle speed
r	mm		radius
U	gmm	$U = m \cdot r = m_{WZ} \cdot e$	imbalance

### 5. Fine balancing

MAPAL chucks are balanced as standard with at least G 6.3 at 3,000 min<sup>-1</sup>. On request specific clamping devices can also be fine balanced (see relevant notes on table pages)

For this the order numbers have an "F" added.

Example:

Chuck for cylindrical shanks with lateral clamping surface, location shank HSK-A 63, clamping diameter 12 mm.

Order No. with standard balancing G 6.3 at 3,000 min:  
MN5083-08-K

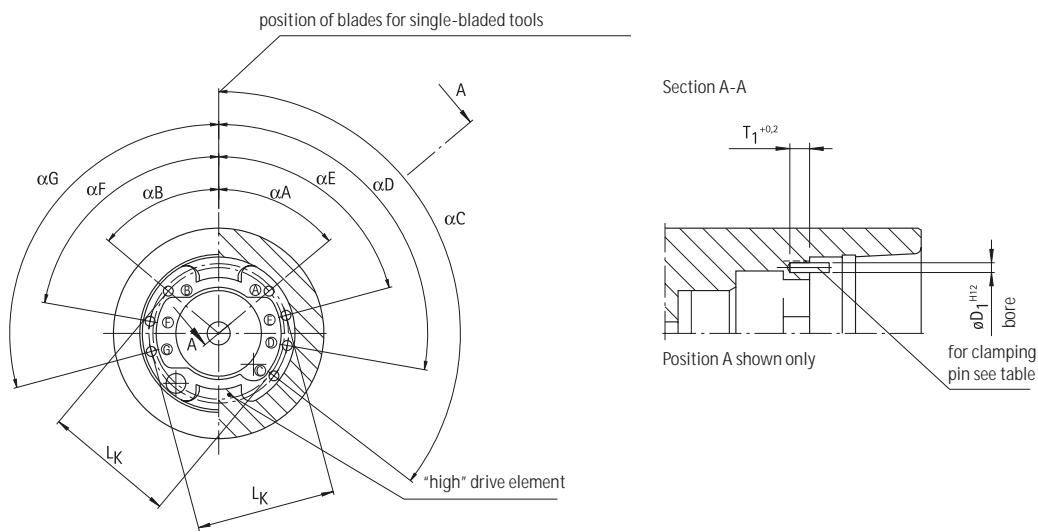

Order No. in fine balanced version:  
MN5083-08-KF

# Security system for identifying hollow taper shanks

On special machines multi-spindle boring heads are frequently used. A large number of spindles are often kept in a very tight space. To prevent operator error when changing tools, the DIN 69894 security system has been developed for hollow taper

shanks. With this a tool is clearly allocated to a specific spindle by means of additional pins in the tool spindles and slots at the end of the HSK shank.

## Security system for tool spindles:

Position HSK	(A) α A	(B) α B	(C) α C	(D) α D	(E) α E	(F) α F	(G) α G	D <sub>1</sub>	T <sub>1</sub>	L <sub>K</sub>	Clamping pin

= Recommended

All MAPAL clamping devices and HSK adaptors can be supplied with this security system.

For this the letter "V" is added to the order number. In addition the position is clearly indicated by the appropriate letter.

Order examples:

Hydraulic chuck with security system on the adaptor side in position B for nominal size MN5165-08-KF:

MN5165-08-KFV-B

Collet chucks with security system on the adaptor side in position A and position C for nominal size MN5140-07-K:

MN5140-07-KV-AC

Setting and handling notes  
**KS Clamping cartridges**

**1. Direct mounting of KS Clamping cartridge on the spindle, chuck or adaptor**

**a) Using an assembly key**

1. Insert clamping cartridge into the spindle or into the adaptor.

2. Place box spanner on the clamping cartridge.

3. Rotate in clockwise direction until the nose of the cartridge engages on the clamping pin.

**b) Using KS wrench**

1. Open jaws on wrench by pressing the round button and insert the clamping cartridge.

2. Insert the clamping cartridge into the spindle or adaptor and rotate the wrench clockwise until the nose of the cartridge engages on the clamping pin.

3. With the cartridge is engaged there must be play between the cartridge and pin.

# Setting and handling notes KS Clamping cartridges

## 2. Fitting the KS Clamping cartridge

1. Clamping jaw seating on basic body, clamping angle on jaws and threaded spindle are lightly greased. Recommended grease: METAFLUX anti-friction metal paste.

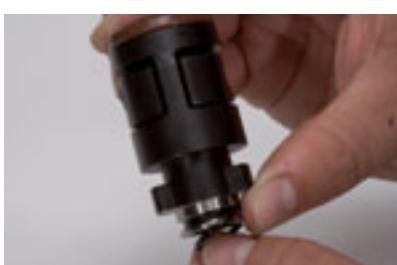

2. Screw threaded spindle into the clamping jaw with the ejector angle by approx. one turn.

5. By turning the threaded spindle with a key both jaws are moved inwards.

6. Check the threaded spindle's seating – this must be exactly central between the jaws.

7. Press on sealing ring with soft sealing lip forwards on the face side.

8. Pull on O-ring.

9. Insert pressure pin into bore.

# Setting and handling notes

## KS Clamping cartridges

### 3. Starting torques for clockwise/anti-clockwise screw on KS Clamping cartridge for clamping tool

HSK size	32	40	50	63	80	100
Max. starting torque [Nm]	6	7	15	20	30	50
Key width	3	3	4	5	6	8

### 4. Notes on using the KS clamping system

In using spindles or adaptors which are fitted with a clamping cartridge and are being used without a tool, a cap should be used in every case. This will protect the system and the user and prevent contamination.

When using tools with low radial stress, e.g. in drilling and reaming operations, it is acceptable to fall below the maximum starting torque by approx. 25 %.

### 5. Maintenance and care

With every tool change the taper should be cleaned using a taper cleaner.

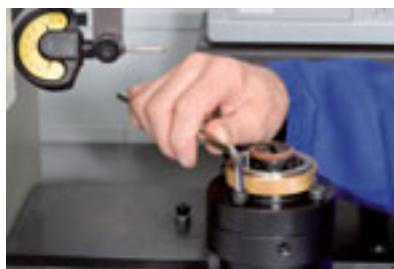

The Clamping cartridge should be greased again after comparatively long use. The mount of time between applications depends on the frequency of the tool change, the type of operation and the coolant. However, re-greasing should be carried out at least once every six months.

Setting and handling notes  
**KS adaptor flanges**

1. Fitting and aligning the KS adaptor flange with radial alignment

1. Clean taper and faces of adaptor flange and adaptors.

2. Insert adaptor flange. Tighten holding screw to 50 % of the specified starting torque (see table on page 214).

3. Clean taper and face of test arbor or tool.

4. Insert test arbor or tool and secure with gripper screw.

5. Bring the dial indicator into position on the concentricity check point.

With MAPAL tools alignment can also take place on the HSK collar.

Locate the highest measurement point and bring dial indicator to zero.

# Setting and handling notes

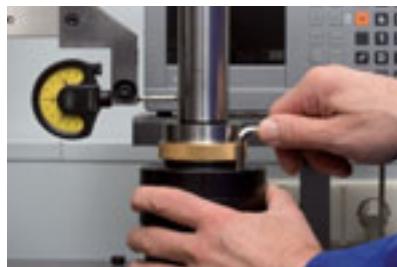

## KS adaptor flanges

6. Roughly align adaptor flange (approx. 0.01 mm). Release the adjusting screw each time this is activated.

7. Set concentricity with adjusting screw. Also release the adjusting screw each time this is activated. Repeat the process until the concentricity error is < 3 µm.

8. Tighten gripper screw over cross and apply starting torque (see table). After the full starting torque has been reached, check radial alignment again and adjust if necessary. Apply adjusting screw lightly.

Radial alignment can also be carried out with measuring probes. For this the probes are positioned on the adaptor flange taper.

### Withdrawal torques

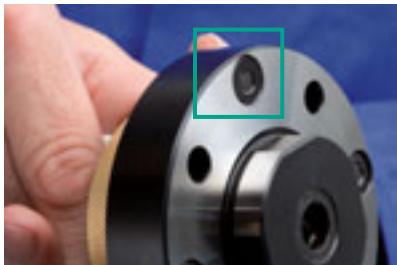

Nominal size	Module diameter	Gripper screw	Starting torque
HSK 32	60	DIN 912 – M5x16 – 12.9	8,7 Nm
HSK 40	70	DIN 912 – M6x20 – 12.9	15 Nm
HSK 50	80	DIN 912 – M6x20 – 12.9	15 Nm
HSK 63	100	DIN 912 – M8x25 – 12.9	36 Nm
HSK 80	117	DIN 912 – M8x25 – 12.9	36 Nm
HSK 100	140	DIN 912 – M10x30 – 12.9	72 Nm

As a basis for the maximum starting torques for cylindrical screws to DIN 912, the general DIN standard for rigidity class 10.9 applies.

MAPAL only uses cylindrical screws to DIN 912 with rigidity class **12.9**.

# Setting and handling notes KS adaptor flanges

## 2. Fitting and aligning KS adaptor flanges and MAPAL modular adaptors with radial and angular alignment

1. Clean faces of adaptor flange and adaptor (see page 213). In doing so check that the face of the alignment screw does not protrude beyond the face of the adaptor flange.

2. Insert adaptor flange. Position gripper screw.

3. Clean taper and face of test arbor or tool extremely carefully. Insert test arbor or tool.

4. Bring the dial indicator into position at the concentricity check point. With MAPAL tools alignment can also take place on the HSK collar. Locate the highest measurement point and bring dial indicator to zero.

For procedure see page 214.

5. For angular alignment the dial indicator is positioned at the uppermost checking point or approx. 100 mm from the connection. Carry out angular alignment using the alignment screws. Do **not** loosen the alignment screws after this has been done.

6. After the angular alignment has been set to  $< 3 \mu\text{m}$ , check the radial alignment at the concentricity checkpoint on the collar again and adjust if necessary. If the radial alignment needs to be adjusted, the angular alignment should be checked again afterwards.

# A Review of MAPAL's Competence

## Reaming and Fine Boring

From the wide range of single and twin-bladed reamers with guide pads, together with fine boring tools with guide pads and WP or HX blades, to the HPR high performance reamers combined with the MAPAL HFS® head fitting system for exact concentricity and accurate changeover – to give you a general view of our complete knowledge and experience in precision machining bores.

## PCD Tools

For pre-machining and finish machining, MAPAL also offers an extensive programme of precision tools with fixed PCD (polycrystalline diamond) blades. This includes precision gun boring tools plus circular and end milling tools. The programme of face milling heads from the PowerMill and EcoMill series is characterised by simple, sturdy design and rapid, accurate blade setting.

## ISO Tools

This aspect of MAPAL competence is made up of special tools with ISO elements for gun boring and milling. This includes precision ground blades in the widest variety of cutting materials and coatings. The use of MAPAL's tried and tested adjustment system ensures that the blades are accurately matched to the task. MAPAL offers particular knowledge and experience in tangential technology.

## Generating Slide Tools

Generating slide tools offer a high potential for rationalisation and optimisation on special machines and machining centres. In addition to the conventional facing heads, MAPAL also supplies EAT and LAT performance-enhanced actuating systems for generating slide tools. MAPAL TOOLTRONIC® tools with their extraordinary range of functions are the latest development.

## Drilling

Yet another area is the product programme for drilling. MAPAL offers the right tool concept for every task, whether for machining aluminium, steel or cast iron, hard machining or dry machining or for use in HSC areas. Specially developed coatings and PCD blades complete the broad-based drilling programme.

## Clamping

MAPAL's modern clamping systems, in conjunction with MAPAL's tried and tested reaming and fine boring tools, guarantee maximum productivity and economy. Whether HSK, ISO or HFS®, these high-precision connections and interfaces provide the concentricity and changeover accuracy essential to modern production.

## Customer Services

Project planning, maintenance, management and optimisation – the complete CTS® service package from MAPAL will accompany you from process design to permanent process optimisation and will ensure optimum and cost-saving use of your tools with the best possible
