# Monitoring the Cisco UCS Manager

The **Cisco Unified Computing System** (UCS) is a data center computing solution composed of computing hardware, virtualization software, switching fabric, and management software. The idea behind the system is to reduce total cost of ownership and improve scalability by integrating the different components into a cohesive platform that can be managed as a single unit. Just-In-Time deployment of resources and 1:N redundancy are also possible with a system of this type.

Figure 1 depicts the architecture of Cisco UCS.

## Monitoring the Cisco UCS Manager

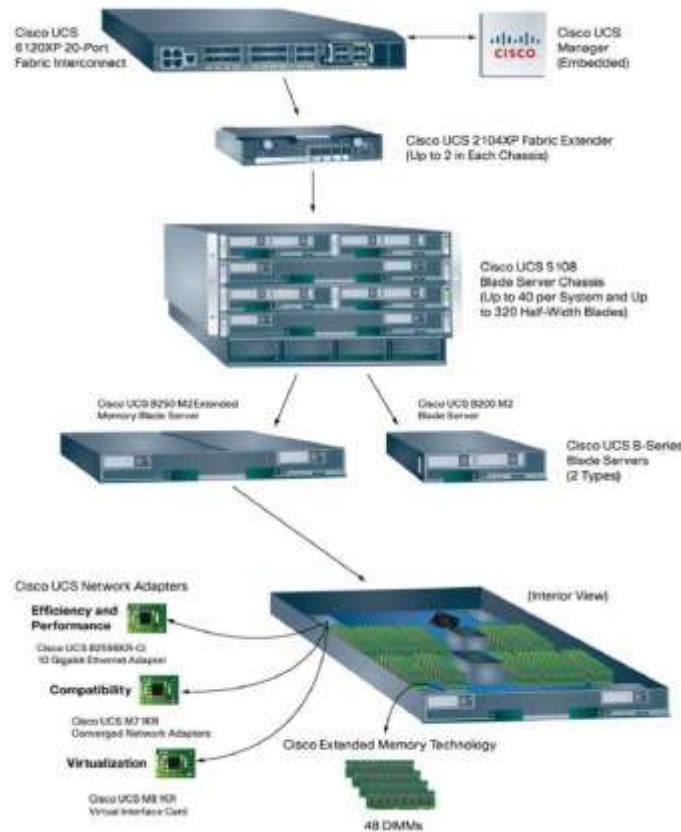

Figure 1: The architecture of the Cisco UCS

The computing component of the UCS is available in two versions; the B-Series (a modular package consisting of a powered chassis and full or half slot blade servers), and the C-series rackmount servers (that can be used with or without UCS, or mixed with blade UCS systems). Both form factors utilize the same standard components seen throughout the industry, including Intel Nehalem processors and DIMM memory. The servers are distinctive for supporting Converged Network Adapters (CNAs), Port Virtualization, and in some models the Catalina chipset (ASICs that expand the number of memory sockets than can be connected to a single memory bus).

Besides the blade servers and chassis, the other core components of the Cisco UCS are as follows:

- **UCS manager:** Cisco UCS Manager implements policy-based management of the server and network resources. Network, storage, and server administrators all create service profiles, allowing the manager to configure the servers, adapters, and fabric extenders and appropriate isolation, quality of service (QoS), and uplink connectivity. It also provides APIs for integration with existing data center systems management tools. An XML interface allows the system to be monitored or configured by upper-level systems management tools.
- **UCS fabric interconnect:** Networking and management for attached blades and chassis with 10 GigE and FCoE. All attached blades are part of a single management domain. Deployed in redundant pairs, the 20-port and the 40-port offer centralized management with Cisco UCS Manager software and virtual machine optimized services with the support for VN-Link.
- **Cisco Fabric Manager:** manages storage networking across all Cisco SAN and unified fabrics with control of FC and FCoE. Offers unified discovery of all Cisco Data Center 3.0 devices as well as task automation and reporting. Enables IT to optimize for the quality-of-service (QoS) levels, performance monitoring, federated reporting, troubleshooting tools, discovery and configuration automation.

## Monitoring the Cisco UCS Manager

- **Fabric extenders:** connect the fabric to the blade server enclosure, with 10 Gigabit Ethernet connections and simplifying diagnostics, cabling, and management. The fabric extender is similar to a distributed line card and also manages the chassis environment (the power supply, fans and blades) so separate chassis management modules are not required. Each UCS chassis can support up to two fabric extenders for redundancy.

The health of the Cisco UCS platform hence largely relies on how the blade chassis, the blade servers, the fabric interconnects and extenders are functioning. This implies that issues in the availability / operability of one/more of these components, or the unexpected power/thermal/voltage failures they may encounter can degrade the overall performance of the Cisco UCS. In order to avoid this, the health and operational efficiency of the integral components of the platform should be continuously monitored, and issues proactively reported.

eG Enterprise provides a 100%, web-based *Cisco UCS Manager* monitoring model that periodically monitors the Cisco UCS manager, discovers the chassis, I/O modules, blades, and fabric interconnects managed by the UCS manager, and determines the current status of each of these components.

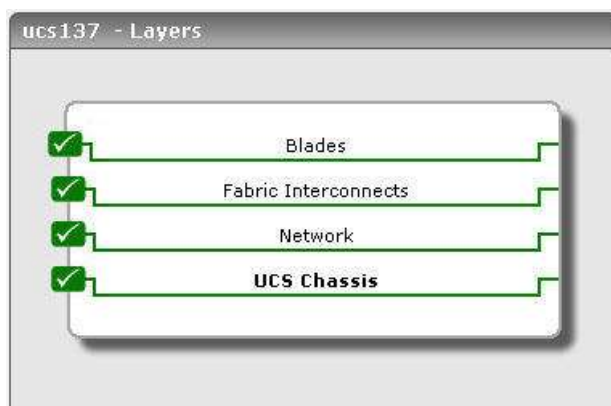

Figure 2: Layer model of the Cisco UCS Manager

Each layer of Figure 2 is mapped to a series of tests that instantly capture current/potential abnormalities in the state and functioning of the core components managed by the Cisco UCS manager, and alerts administrators to the same. With the help of the metrics collected by these tests, administrators can find quick and accurate answers for the following queries:

- Are all I/O modules (i.e., fabric extenders) operating normally? Is any I/O module in a degraded/powered-off/inoperable state currently? If so, which one is it?
- Is any I/O module experiencing any critical performance issues now?
- How is the power/voltage/thermal states of the I/O modules?
- Is any I/O module missing?
- Is the temperature of all I/O modules normal? Is any I/O module experiencing abnormal temperatures?
- Is any fan inoperable? In which chassis, does this fan exist?
- Does any fan operate at abnormal speeds?
- Is any fan experiencing any performance failures?
- Have non-recoverable problems occurred in the power/thermal /voltage states of any fan?
- How is the overall health of the chassis? Is any chassis in an inoperable state currently?

## Monitoring the Cisco UCS Manager

- Is any chassis license-insufficient?
- Are the power/thermal/voltage states of all chassis normal?
- Is any chassis receiving / transmitting more power than it can handle?
- Which fan module is currently in an inoperable state?
- Which fan module is behaving abnormally?
- Are all backplane ports healthy?
- Have any operational/performance issues been detected in any of the PSUs in the chassis?
- Which PSU is receiving voltage over 210 volts and emitting voltage over 12 volts?
- Are the fabric interconnects operating normally?
- Do the fabric interconnects have enough CPU and memory resources at their disposal? Is any fabric interconnect experiencing a CPU/memory contention?
- Are the PSUs of the fabric interconnects operating normally?
- Is the power/voltage input and output of the PSUs within acceptable limits?
- Have any uplink ethernet ports failed?
- Which uplink ethernet port is seeing very high traffic?
- Are the fans of all fabric interconnects operating normally?
- Is any uplink fibre channel port in an abnormal state?
- Are there any disabled uplink fibre channel ports?
- Is any fibre channel port seeing very high traffic?
- Is any fibre channel port experiencing too many errors in transmission?
- Are the blade servers in a chassis healthy?
- Is any blade server unavailable?
- Is the power state/slot state of the blade servers OK?
- Are the blade servers utilizing memory optimally? If any blade server over-utilizing the memory?
- Is the motherboard of any blade server consuming power/current excessively?
- Is the temperature of the motherboard normal? If not, then which side of the motherboard is experiencing abnormal temperatures - the front or the rear?
- Is the temperature of any memory array of any blade server very high?

The sections that follow will discuss each layer of Figure 2 of this document.

### 1.1 UCS Chassis Layer

The Cisco UCS server chassis and its components are part of the Cisco Unified Computing System.

The Cisco UCS server chassis system consists of the following components:

- Cisco UCS server chassis

## **Monitoring the Cisco UCS Manager**

- Cisco UCS blade servers—up to eight half-width or four full-width blade servers, each containing two CPUs and holding up to two hard drives
- Cisco UCS I/O Module—up to two I/O modules, each providing four ports of 10-Gb Ethernet, Cisco Data Center Ethernet, and Fibre Channel over Ethernet (FCoE) connection to the fabric interconnect
- A number of SFP+ choices from copper to fiber
- Power supplies—up to four 2500 Watt hot-swappable power supplies
- Power Distribution Unit
- Fan modules—eight hot-swappable fan modules

As a problem in the chassis system can affect the overall performance of the Cisco UCS platform, you need to shield the chassis and its integral components from permanent physical or operational damage. To achieve this, you need proactive updates of probable threats to the health of the chassis system; these updates will enable you to initiate corrective measures before it is too late. The tests mapped to this layer provide you with such problem updates.

With the help of these tests, you can keep an eye on the status of each chassis managed by the Cisco UCS manager and also its core components such as the fabric extenders, fan modules, power supplies, etc., and quickly detect abnormalities.

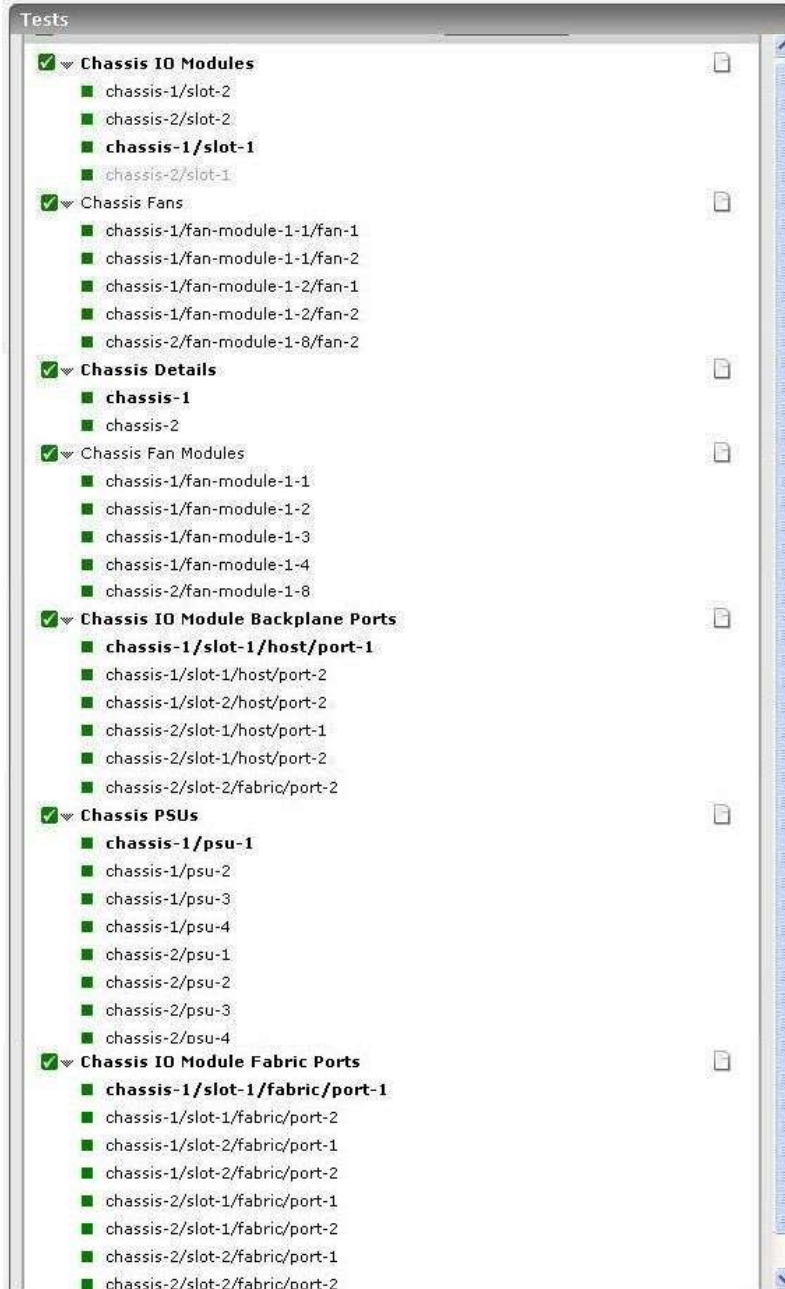

Figure 3: The tests mapped to the UCS Chassis layer

### 1.1.1 Chassis IO Modules Test

The Cisco UCS chassis contains I/O Modules or Fabric Extenders that allow the blade servers in the chassis to communicate with Cisco UCS Fabric Interconnects. The chassis supports up to two I/O Modules, each with four I/O ports.

The Cisco UCS Fabric Extenders bring the unified fabric into the blade server enclosure, providing 10 Gigabit Ethernet connections between blade servers and the fabric interconnect, simplifying diagnostics, cabling, and management.

## Monitoring the Cisco UCS Manager

The Cisco UCS Fabric Extenders extend the I/O fabric between the Cisco UCS Fabric Interconnects and the Cisco Blade Server Chassis, enabling a lossless and deterministic Fibre Channel over Ethernet (FCoE) fabric to connect all blades and chassis together. Since the fabric extender is similar to a distributed line card, it does not do any switching and is managed as an extension of the fabric interconnects. This approach removes switching from the chassis, reducing overall infrastructure complexity and enabling the Cisco Unified Computing System to scale to many chassis without multiplying the number of switches needed, reducing TCO and allowing all chassis to be managed as a single, highly available management domain.

The Cisco UCS Fabric Extenders also manages the chassis environment (the power supply and fans as well as the blades) in conjunction with the Fabric Interconnects. Therefore, separate chassis management modules are not required.

Cisco UCS Fabric Extenders fit into the back of the Cisco UCS Chassis. Each Cisco UCS Chassis can support up to two Fabric Extenders, enabling increased capacity as well as redundancy.

This test monitors the overall health of each of the I/O Modules present in every chassis managed by the Cisco UCS manager, and in the process, promptly alerts you to abnormalities in the power, thermal, voltage states of the modules and sudden spikes in the ambient/ASIC temperature of the modules. This way, defective I/O modules come to light.

<b>Purpose</b>	Monitors the overall health of each of the I/O Modules present in every chassis of managed by the Cisco UCS manager, and in the process, promptly alerts you to abnormalities in the power, thermal, voltage states of the modules, or a sudden increase in the ambient/ASIC temperature of the modules
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>1. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>2. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>3. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>4. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>5. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>6. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>7. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>		
<p><b>Outputs of the test</b></p>	<p>One set of results for each I/O module in each chassis managed by the Cisco UCS manager being monitored</p>

sFigure 4: The detailed diagnosis of the Configuration state measure of the Chassis I/O Modules Test

### 1.1.2 Chassis Fans Test

A Cisco Blade Server Chassis contains the following components:

- Cisco UCS Fabric Extenders—Up to two fabric extenders (FEX), each FEX provides four ports of 10-Gigabit Ethernet, Cisco Data Center Ethernet, and Fibre Channel over Ethernet (FCoE)
- SFP+ transceiver choices that include copper and fiber optic
- Power supply units—Up to four 2500 W hot-swappable power supply units
- Fan modules—Eight hot-swappable fan modules
- Cisco UCS Blade Servers —Up to eight half-wide blade servers or four full-width blade servers, each holding RAID capable hard drives

This test monitors the overall health of each fan present in each chassis managed by the Cisco UCS manager, and proactively alerts users to the following:

- Fans that are in an abnormal operational state;
- Fans that are in a critical performance/thermal/voltage state;

## Monitoring the Cisco UCS Manager

- Fans in a degraded/errored power state;
- Fans operating at abnormal speeds.

<b>Purpose</b>	Monitors the overall health of each fan module present in each chassis managed by the Cisco UCS manager, and proactively alerts users to the following: <ul style="list-style-type: none"><li>➤ Fans that are in an abnormal operational state;</li><li>➤ Fans that are in a critical performance/thermal/voltage state;</li><li>➤ Fans in a degraded/errored power state;</li><li>➤ Fans operating at abnormal speeds.</li></ul>
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

	<p><b>Speed:</b> Indicates the speed which this fan operates currently.</p>	RPM	Ideally, the speed of the fans must be within normal limits.																				

The detailed diagnosis of the *Overall status* measure reveals the Time, ID, PID, Module, Revision, Serial Number, Tray and Vendor attributes for each fan in each chassis.

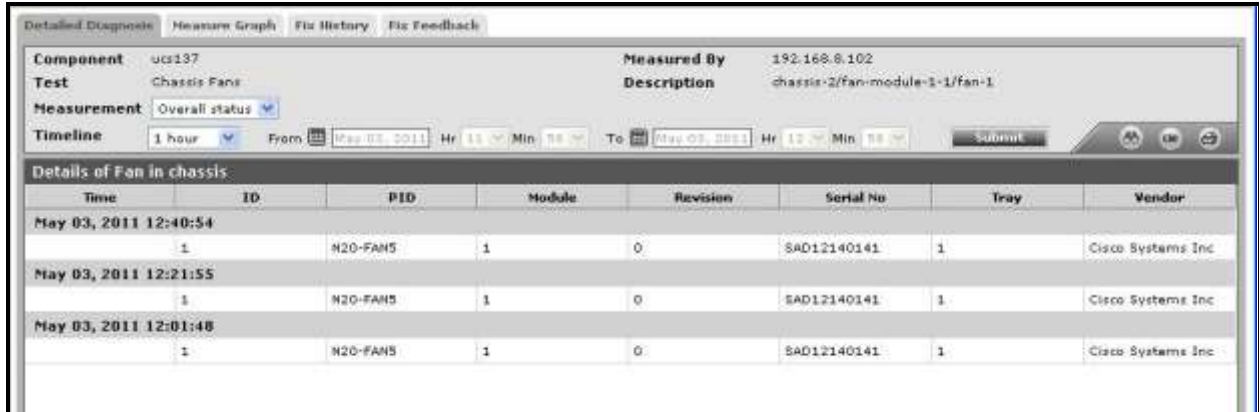

Figure 5: The detailed diagnosis of the Overall status measure of the Chassis Fans test

### 1.1.3 Chassis Details Test

The Cisco UCS 5100 Series Blade Server Chassis is a scalable and flexible blade server chassis for data centers. The chassis can house up to eight half-width Cisco UCS B-Series Blade Servers and can accommodate both half- and full-width blade form factors. Four single-phase, hot-swappable power supplies are accessible from the front of the chassis. These power supplies are 92 percent efficient and can be configured to support nonredundant, N+1 redundant, and grid-redundant configurations. The rear of the chassis contains eight hot-swappable fans, four power connectors (one per power supply), and two I/O bays for Cisco UCS 2104XP I/O modules. A passive midplane provides up to 20 Gbps of I/O bandwidth per server slot and up to 40 Gbps of I/O bandwidth for two slots.

## Monitoring the Cisco UCS Manager

Figure 6: A Cisco UCS Blade Server Chassis

A Cisco UCS can support multiple chassis, each with two fabric extenders for redundancy.

By running periodic health checks on each chassis managed by a Cisco UCS manager, you can promptly identify the following:

- The chassis that is currently in an abnormal operational state;
- The insufficiently licensed chassis;
- Empty/missing chassis;
- The chassis that is experiencing serious power failures;
- The chassis with fans that are in a critical thermal state;
- The chassis that is handling unusually high input and output power.

<b>Purpose</b>	<p>Runs periodic health checks on each chassis supported by a Cisco UCS to promptly identify the following:</p> <ul style="list-style-type: none"><li>➤ The chassis that is currently in an abnormal operational state;</li><li>➤ The insufficiently licensed chassis;</li><li>➤ Empty/missing chassis;</li><li>➤ The chassis that is experiencing serious power failures;</li><li>➤ The chassis with fans that are in a critical thermal state;</li></ul>
----------------	--

## Monitoring the Cisco UCS Manager

	➤ The chassis that is handling unusually high input and output power		
<b>Target of the test</b>	A Cisco UCS manager		
<b>Agent deploying the test</b>	A remote agent		
<b>Configurable parameters for the test</b>	<ol style="list-style-type: none"> <li><b>TESTPERIOD</b> – How often should the test be executed</li> <li><b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li><b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li><b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li><b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li><b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li><b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li><b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

## Monitoring the Cisco UCS Manager

	<b>Input power:</b> Indicates the current input power of this chassis.	Watts	An abnormally high or low power may cause serious damage to the hardware components of the chassis. Therefore, the value of this measure should be low.
	<b>Output power:</b> Indicates the current output power of this chassis.	Watts	Ideally, the value of this measure should be low.

The detailed diagnosis of the *Administrative state* measure provides the Time, ID, PID, Module, Revision, Serial Number, Tray and Vendor attributes for each chassis.

Time	ID	PID	Revision	Serial No	Vendor
May 03, 2011 12:43:42	1	N20-C6508	0	1	Cisco Systems Inc
May 03, 2011 12:23:14	1	N20-C6508	0	1	Cisco Systems Inc
May 03, 2011 12:01:46	1	N20-C6508	0	1	Cisco Systems Inc

Figure 7: The detailed diagnosis of the Administrative state measure of the Chassis Details test

### 1.1.4 Chassis Fan Modules Test

The Cisco UCS Blade server chassis contains eight hot-swappable fan modules. These fan modules ensure that the internals of the chassis always receive adequate air flow and the temperature within the chassis is maintained at acceptable levels at all times. Snags in the functioning of the fan module can hence hamper air flow, which in turn may have disastrous effects on the health of the other chassis components.

By periodically monitoring the availability, overall health, operational state, and the exhaust temperature of fan module, you can promptly detect abnormalities in the operations of the module and initiate speedy remedial measures. This test does just that.

<b>Purpose</b>	Periodically monitors the availability, overall health, operational state, and the exhaust temperature of each fan module, and promptly detects abnormalities in the operations of the module, so that remedial measures can be swiftly initiated
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>		
<p><b>Outputs of the test</b></p>	<p>One set of results for each fan module available in each chassis managed by the Cisco UCS manager being monitored</p>

	<p><b>Exhaust temperature:</b></p> <p>Indicates the current exhaust temperature of the fans present in this fan module in this chassis.</p>		<p>Ideally, the value of this measure should be low, as an abnormal temperature can cause damage to the fans in a module.</p>																				

The detailed diagnosis of the *Overall status* measure provides the Time, ID, PID, Module, Revision, Serial Number, Tray and Vendor attributes for the fan module.

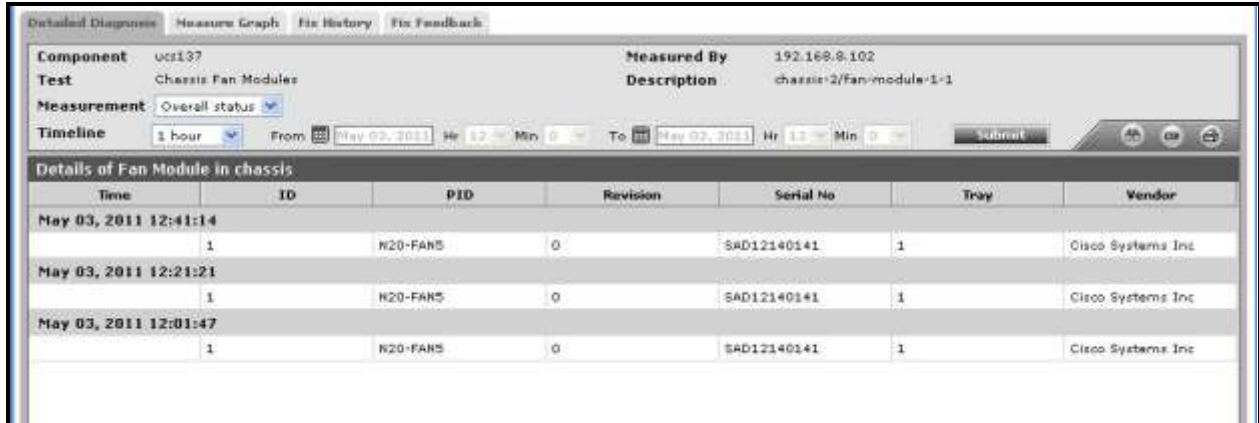

Figure 8: The detailed diagnosis of the Overall status measure of the Chassis Fan Modules test

### 1.1.5 Chassis IO Module Backplane Ports Test

The Cisco UCS chassis supports eight blade slots, and each blade has two Intel Xeon "Nehalem" processors and up to 96GB of RAM. The chassis also has two SAS drive slots and a RAID controller, plus a connection to the backplane. The chassis is responsible for providing support infrastructure to blades via the backplane connection.

A **backplane** is a circuit board (usually a printed circuit board) that connects several connectors in parallel to each other, so that each pin of each connector is linked to the same relative pin of all the other connectors forming a computer bus. It is used as a backbone to connect several printed circuit boards together to make up a complete computer system.

In Cisco UCS, all network traffic flows over FCoE directly from the chassis backplane to an FI (Fabric Interconnect) device.

To make sure that the blades in the chassis receive prompt and uninterrupted networking services, you need to frequently check whether the backplane ports of the chassis are available and operational. The **Chassis IO Module Backplane Ports** test makes this verification possible. At pre-configured intervals, this test monitors the health of each of the backplane ports in every I/O module of a chassis, and reports whether they are operational or not. Backplane ports experiencing errors, hardware failures, or software failures can thus be identified quickly and accurately.

<b>Purpose</b>	Monitors the health of each of the backplane ports in every I/O module of a chassis, and reports whether they are operational or not
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

## Monitoring the Cisco UCS Manager

<b>Configurable parameters for the test</b>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.</li> </ol> <p>In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</p>

### 1.1.6 Chassis PSUs Test

A Cisco UCS Blade Server Chassis can be provided with upto four 2500 Watt hot-swappable power supplies.

As issues in the power supply units can adversely impact the performance of the blades in a chassis, administrators need to promptly detect power-related issues and rectify them before any irreparable damage is done. This test aids in the timely detection of the following anomalies related to PSUs:

- Abnormalities in the overall PSU health;
- Operational deficiencies;
- Critical performance setbacks;
- Unrecoverable power/thermal/voltage failures;
- Disturbing rise in temperature;
- Input/output voltage, current, and power that exceeds permissible limits.

## Monitoring the Cisco UCS Manager

<b>Purpose</b>	Aids in the timely detection of the following anomalies related to PSUs: <ul style="list-style-type: none"><li>➤ Abnormalities in the overall PSU health;</li><li>➤ Operational deficiencies;</li><li>➤ Critical performance setbacks;</li><li>➤ Unrecoverable power/thermal/voltage failures;</li><li>➤ Disturbing rise in temperature;</li><li>➤ Input/output voltage, current, and power that exceeds permissible limits.</li></ul>
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>		
<p><b>Outputs of the test</b></p>	<p>One set of results for each PSU in each chassis managed by the Cisco UCS manager being monitored</p>

## Monitoring the Cisco UCS Manager

	<b>Internal temperature:</b> Indicates the current internal temperature of this PSU in this chassis.	Celcius	A high temperature is a cause for concern, as it may cause severe damage to the PSUs, which in turn may degrade the performance of the blade server chassis.
	<b>Input210v:</b> Indicates the current input voltage of this PSU in this chassis.	Volts	Any value higher than 210 volts could indicate a problem condition that may require further investigation.
	<b>Output12v:</b> Indicates the current output voltage of this PSU in this chassis.	Volts	Any value higher than 12 volts could indicate a problem condition that may require further investigation.
	<b>Output3v3:</b> Indicates the current output voltage of this PSU in this chassis.	Volts	Any value higher than 3.3 volts could indicate a problem condition that may require further investigation.
	<b>Output current:</b> Indicates the output current of this PSU in this chassis.	Amps	Ideally, the value of this measure should be low. A sudden/consistent increase in this value could warrant an investigation.
	<b>Output power:</b> Indicates the output power of this PSU in this chassis.	Watts	Ideally, the value of this measure should be low. A sudden/consistent increase in this value could warrant an investigation.

The detailed diagnosis of the *Overall status* measure provides the Time, ID, PID, Revision, Serial Number and Vendor attributes for the PSU.

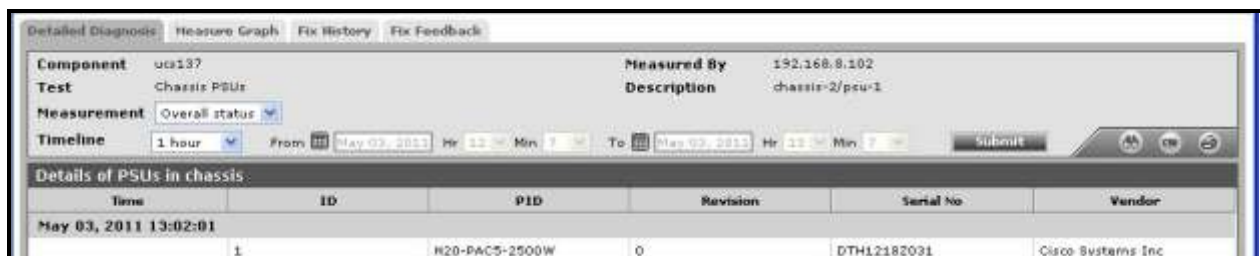

Figure 9: The detailed diagnosis of the Overall status measure of the Chassis PSUs test

### 1.1.7 Chassis IO Module Fabric PortsTest

A typical Cisco UCS system supports upto two I/O modules, each configured with four ports of 10-Gb Ethernet, Cisco Data Center Ethernet, and Fibre Channel over Ethernet (FCoE) connection to the fabric interconnect. Since the I/O module acts as a bridge between the UCS blades and the fabric interconnect, all ethernet connections to the fabric interconnect will get suspended if one/more ports are rendered unavailable or non-operational for a brief period. It is hence imperative that the administrators be promptly alerted when the I/O module ports start behaving abnormally so that, remedial measures can be initiated instantaneously to avoid a prolonged port outage. This test monitors the overall health and availability of each of the ports in every I/O module, and sends out proactive alerts to potential performance anomalies.

<b>Purpose</b>	Monitors the overall health and availability of each of the ports in every I/O module, and sends out proactive alerts to potential performance anomalies
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

## 1.2 The Network Layer

Determine the availability of the Cisco UCS manager the network, and quickly isolate latencies while establishing a network connection with the Cisco UCS manager, using the tests mapped to this layer.

Figure 11: The tests mapped to the Network layer

Since the **Network** test mapped to this layer has already been dealt with in the *Monitoring Unix and Windows Servers* document, let us proceed to take a look at the **Fabric Interconnects** layer in this test.

## 1.3 The Fabric Interconnects Layer

A core part of the Cisco Unified Computing System, the Cisco UCS Fabric Interconnects provide both network connectivity and management capabilities to all attached blades and chassis. The Cisco UCS Fabric Interconnects offers line-rate, low-latency, lossless 10 Gigabit Ethernet and Fibre Channel over Ethernet (FCoE) functions.

The interconnects provide the management and communication backbone for the Cisco UCS Blades and UCS Blade Server Chassis. All chassis, and therefore all blades, attached to the interconnects become part of a single, highly available management domain. In addition, by supporting unified fabric, the Cisco UCS Fabric Interconnects provides both the LAN and SAN connectivity for all blades within its domain.

Typically deployed in redundant pairs, fabric Interconnects provide uniform access to both networks and storage, eliminating the barriers to deploying a fully virtualized environment.

This layer monitors the fabric interconnects and their critical hardware components such as the PSUs, the uplink and FC ports, and fans, and proactively alerts administrators to potential hardware failures and operational issues experienced by the fabric interconnects; this way, the layer ensures the continuous availability of the interconnects, and thus eliminates any disruption in communication for the blades and the blade server chassis.

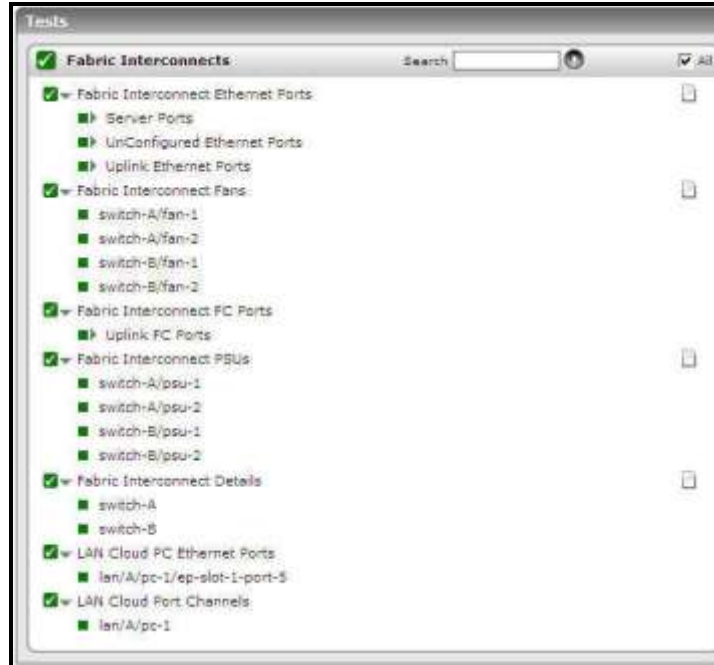

Figure 12: The tests mapped to the Fabric Interconnects layer

### 1.3.1 Fabric Interconnect PSUs Test

The Cisco UCS Fabric Interconnects is provided with two front end slots to support Power Supply Units. The failure of a power supply unit, if not addressed promptly, can cause short to prolonged breaks in the availability of the interconnects. Moreover, a sudden yet steep rise in the power/voltage/current handled by a PSU may not only injure that PSU, but also cause damage to the associated fabric interconnect. To avoid such adversities, the PSUs supported by each fabric interconnect should be periodically monitored.

This test monitors the overall health of each PSU supported by every fabric interconnect and promptly reports abnormalities such as operational issues experienced by the PSUs, critical PSU failures, serious errors in the power/thermal/voltage state of each PSU, and inexplicable surges in the input power/voltage/current of a PSU.

<b>Purpose</b>	Monitors the overall health of each PSU supported by every fabric interconnect and promptly reports abnormalities such as operational issues experienced by the PSUs, critical PSU failures, serious errors in the power/thermal/voltage state of each PSU, and inexplicable surges in the input power/voltage/current of a PSU
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

The detailed diagnosis of the *Overall status* measure provides the Time, ID, PID, Revision, Serial Number and Vendor attributes of the fabric interconnect PSU.

Figure 13: The detailed diagnosis of the Overall status measure of the Fabric Interconnect PSUs test

### 1.3.2 Fabric Interconnect Ethernet Ports Test

The Cisco UCS fabric interconnect includes the following key Ethernet port types:

- **Server Ports** - Server ports handle data traffic between the fabric interconnect and the adapter cards on the servers. You can only configure server ports on the fixed port module. Expansion modules do not include server ports.
- **Uplink Ethernet Ports** - Uplink Ethernet ports handle ethernet traffic between the UCS fabric interconnect and the next layer of the network. All network-bound Ethernet traffic is pinned to one of these ports. You can configure uplink Ethernet ports on either the fixed module or an expansion module.
- **Appliance Ports** - The Appliance port is intended for connecting Ethernet-based storage arrays (such as those serving iSCSI or NFS services) directly to the Fabric Interconnect. By adding this Appliance port type, you can ensure that any port configured as an Appliance Port will not be selected to receive broadcast/multicast traffic from the Ethernet fabric, as well as providing the ability to configure VLAN support on the port independently of the other Uplink ports.
- **FCoE Storage Ports** - The FCoE Storage Port type provides similar functionality as the Appliance Port type, while extending FCoE protocol support beyond the Fabric Interconnect. Note that this is not intended for an FCoE connection to another FCF (FCoE Forwarder). Only direct connection of FCoE storage devices (such as those produced by NetApp and EMC) are supported. When an Ethernet port is configured as an FCoE Storage Port, traffic is expected to arrive without a VLAN tag. The Ethernet headers will be stripped away and a VSAN tag will be added to the FC frame.

In addition, the fabric interconnect supports **Monitoring Ethernet Ports**, and Ethernet ports that have not yet been configured to perform any function and are hence still **UnConfigured Ethernet Ports**.

This test enables you to run frequent health checks on these ports so that, you can quickly identify non-operational, overloaded, or slow ports. Whenever ethernet traffic slows down, you can use this

## Monitoring the Cisco UCS Manager

information to figure out which ethernet port is responsible for it. Moreover, in times of heavy traffic, this information will enable you to decide whether additional ports need to be configured using the expansion module for handling the load.

<b>Purpose</b>	Enables you to run frequent health checks on different types of ethernet ports so that, you can quickly identify non-operational, overloaded, or slow ports
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>SHOW OVERALL STATUS</b> - By default, regardless of the <i>Administrative state</i> of an Ethernet port, this test reports the <i>Overall status</i> of that port. In other words, by default, this test reports the <i>Overall status</i> measure for an Ethernet port, even if the <i>Administrative state</i> of that port is <i>Disabled</i>. This is because, the <b>SHOW OVERALL STATUS</b> flag is set to <b>Yes</b> by default. If this flag is set to <b>No</b> instead, then this test will report the <i>Overall status</i> of only those Ethernet ports that are currently in an <i>Enabled Administrative state</i>.</li> <li>9. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>		
<p><b>Outputs of the test</b></p>	<p>One set of results for each ethernet port managed by the Cisco UCS manager being monitored</p>

	<p><b>Broadcast packets received:</b> Indicates the number of broadcast packets received by this uplink ethernet port during the last measurement period .</p>	Number	<p>In computer networking, broadcasting refers to transmitting a packet that will be received by every device on the network. Broadcasting can be performed as a high level operation in a program, for example broadcasting Message Passing Interface, or it may be a low level networking operation, for example broadcasting on Ethernet.</p> <p>Comparing the value of these measures across all the uplink ethernet ports will point you to that port which is handling the maximum broadcast traffic.</p>												
	<p><b>Broadcast packets transmitted:</b> Indicates the number of broadcast packets transmitted by this uplink ethernet port during the last measurement period.</p>	Number													

	<p><b>Jumbo packets received:</b></p> <p>Indicates the number of jumbo packets received by this uplink ethernet port during the last measurement period.</p>	<p>Number</p>	<p>In computer networking, jumbo frames are Ethernet frames with more than 1500 bytes of payload. Conventionally, jumbo frames can carry up to 9000 bytes of payload, but variations may exist.</p> <p>In the event of a network slowdown, you can compare the value of these measures across all the uplink ethernet ports to quickly isolate the port that is overloaded with jumbo packets.</p>
	<p><b>Jumbo packets transmitted:</b></p> <p>Indicates the number of jumbo packets transmitted by this uplink ethernet port during the last measurement period.</p>	<p>Number</p>	
	<p><b>Multicast packets received:</b></p> <p>Indicates the number of multipcast packets received by this uplink ethernet port during the last measurement period.</p>	<p>Number</p>	<p>In computer networking, multicast is the delivery of a message or information to a group of destination computers simultaneously in a single transmission from the source creating copies automatically in other network elements, such as routers, only when the topology of the network requires it.</p> <p>In the event of a network slowdown, you can compare the value of these measures across all the uplink ethernet ports to quickly isolate the port that is overloaded with multicast packets.</p>
	<p><b>Multicast packets transmitted:</b></p> <p>Indicates the number of multipcast packets sent by this uplink ethernet port during the last measurement period.</p>	<p>Number</p>	
	<p><b>Data received:</b></p> <p>Indicates the amount of data received by this uplink ethernet port during the last measurement period.</p>	<p>MB</p>	<p>Compare the value of these measures across all ethernet ports to determine which port is handling the maximum data traffic.</p>

	<p><b>Data transmitted:</b></p> <p>Indicates the amount of data transmitted by this uplink ethernet port during the last measurement period.</p>	MB	
	<p><b>Packets received:</b></p> <p>Indicates the number of packets received by this uplink ethernet port during the last measurement period.</p>	Number	Compare the value of these measures across all ethernet ports to determine which port is handling the maximum packet traffic.
	<p><b>Packets transmitted:</b></p> <p>Indicates the number of packets transmitted by this uplink ethernet port during the last measurement period.</p>	Number	
	<p><b>Unicast packets received:</b></p> <p>Indicates the number of unicast packets received by this uplink ethernet port during the last measurement period.</p>	Number	<p>Unicast is the term used to describe communication where a piece of information is sent from one point to another point. In this case there is just one sender, and one receiver.</p> <p>Compare the value of these measures across all ethernet ports to determine which port is handling the maximum unicast packet traffic.</p>
	<p><b>Unicast packets transmitted:</b></p> <p>Indicates the number of unicast packets transmitted by this uplink ethernet port during the last measurement period.</p>	Number	

The detailed diagnosis of the *Overall status* measure provides the Time, ID, Slot ID, Port Type, Role Type, Transport Type, Network Type, MAC and Mode attributes for the ethernet ports.

## Monitoring the Cisco UCS Manager

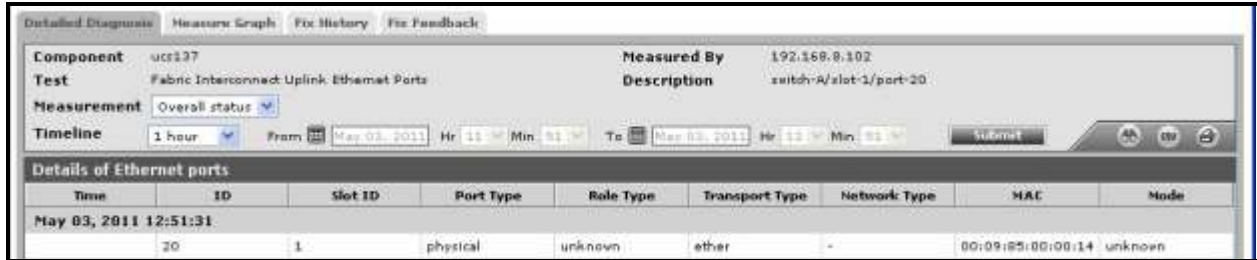

Figure 14: The detailed diagnosis of the Overall status measure of the Fabric Interconnect Uplink Ethernet Ports test

### 1.3.3 Fabric Interconnect Fans Test

The Cisco UCS Fabric Interconnects comprise of two slots on the front of the chassis for fan modules. Each fan module houses six fans. The combination of six fans for each module and two modules provides the chassis with 12 fans. Use this test to closely monitor the availability, overall health, and performance of each of these fans and report anomalies so that, you can promptly initiate measures to ensure that adequate air flow is available in the fabric interconnects.

<b>Purpose</b>	Closely monitors the availability, overall health, and performance of each of the fans in the fabric interconnects and reports anomalies
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

The detailed diagnosis of the *Overall status* measure provides the Time, ID, PID, Module, Revision, Serial Number, Tray and Vendor attributes for each fan in the fabric interconnect.

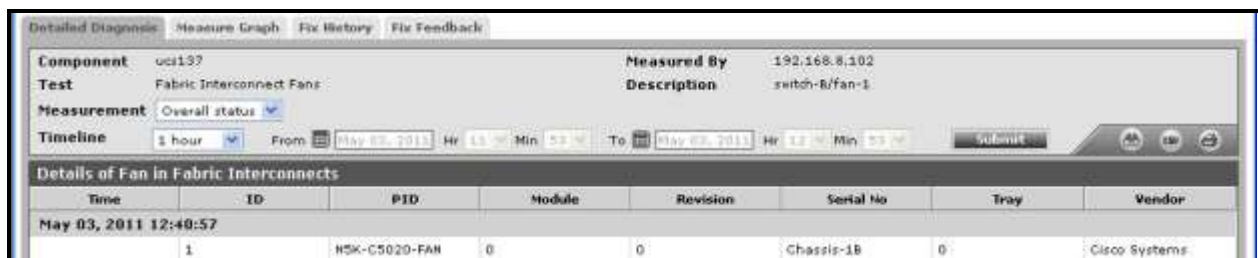

Figure 15: The detailed diagnosis of the Overall status measure of the Fabric Interconnect Fans test

### 1.3.4 Fabric Interconnect FC Ports Test

The Cisco UCS fabric interconnect includes the following key Fibre Channel (FC) port types:

- **Uplink FC Ports** : Uplink Fibre Channel ports handle FCoE traffic between the fabric interconnect and the next layer of the network. All network-bound FCoE traffic is pinned to one of these ports. If one/more of these ports are not operable or a traffic congestion occurs on any of these ports, then, significant latencies can be noticed in the FCoE communication between the corresponding interconnect and the network. To avoid this, you need to constantly observe the operational status, overall health, and the traffic flowing to and from each of the FC ports on every fabric interconnect, spot abnormalities quickly, and fix them before it is too late. This test enables you to do just that.
- **Storage FC Ports** : The Storage FC Port type allows for the direct attachment of a FC storage device to one of the native FC ports on the Fabric Interconnect expansion modules. Like the FCoE Storage Port type, the FC frames arriving on these ports are expected to be un-tagged – so no connection to an MDS FC switch, etc. Each Storage FC Port is assigned a VSAN number to keep the traffic separated within the UCS Unified Fabric. When used in this way, the Fabric Interconnect is not providing any FC zoning configuration capabilities – all devices within a particular VSAN will be allowed, at least at the FC switching layer (FC2), to communicate with each other.

In addition, the fabric interconnect supports **Monitoring FC Ports**, and FC ports that have not yet been configured to perform any function and are hence still **UnConfigured FC Ports**.

The test runs frequent health checks on each of the FC ports in every fabric interconnect, and turns the spotlight on overloaded ports, non-operational ports, and ports that are operating at a slow pace.

<b>Purpose</b>	Runs frequent health checks on each of the FC ports in every fabric interconnect, and turns the spotlight on overloaded ports, non-operational ports, and ports that are operating at a slow pace
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>SHOW OVERALL STATUS</b> - By default, regardless of the <i>Administrative state</i> of an FC Port, this test reports the <i>Overall status</i> of that port. In other words, by default, this test reports the <i>Overall status</i> measure for an FC port, even if the <i>Administrative state</i> of that port is <i>Disabled</i>. This is because, the <b>SHOW OVERALL STATUS</b> flag is set to <b>Yes</b> by default. If this flag is set to <b>No</b> instead, then this test will report the <i>Overall status</i> of only those FC ports that are currently in an <i>Enabled Administrative state</i>.</li> <li>9. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>		
<p><b>Outputs of the test</b></p>	<p>One set of results for each FC port in every fabric interconnect managed by the Cisco UCS manager being monitored</p>

	<p><b>Negotiated speed:</b> Indicates the current operating speed of this FC port in this fabric interconnect.</p>		<p>The values reported by this measure and their corresponding numeric equivalents are described in the table below:</p> <table border="1" data-bbox="919 306 1360 499"> <thead> <tr> <th>Numeric Value</th> <th>Measure Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Indeterminate</td> </tr> <tr> <td>1</td> <td>1Gbps</td> </tr> <tr> <td>2</td> <td>10Gbps</td> </tr> </tbody> </table> <p><b>Note:</b> By default, this measure reports the above-mentioned <b>Measure Values</b> while indicating the operational speed of an FC port. However, in the graph of this measure, the speed will be represented using the corresponding numeric equivalents only.</p>	Numeric Value	Measure Value	0	Indeterminate	1	1Gbps	2	10Gbps
Numeric Value	Measure Value										
0	Indeterminate										
1	1Gbps										
2	10Gbps										
	<p><b>Data received:</b> Indicates the amount of data received by this FC port during the last measurement period.</p>	MB	Compare the value of these measures across all FC ports to determine which port is handling the maximum data traffic.								
	<p><b>Data transmitted:</b> Indicates the amount of data sent by this FC port during the last measurement period.</p>	MB									
	<p><b>Packets received:</b> Indicates the number of packets received by this FC port during the last measurement period.</p>	Number	Compare the value of these measures across all FC ports to determine which port is handling the maximum packet traffic.								

**Monitoring the Cisco UCS Manager**

	<p><b>Packets transmitted:</b></p> <p>Indicates the number of packets transmitted by this FC port during the last measurement period.</p>	Number	
	<p><b>Crc received:</b></p> <p>Indicates the number of Cyclic Redundancy Check (CRC) errors that occurred during data trafficking in this FC port, during the last measurement period.</p>	Errors	<p>CRC or Cyclic Redundancy Check is a process that helps in identifying any errors that might occur during the data transmission process. Data is usually transmitted in small blocks, and a CRC value is assigned to each block and transmitted along with it. This CRC value is verified at the destination to ensure that it matches the CRC value transmitted from the source. A CRC error occurs when the two values (source and destination) do not match and the test fails. The main benefit of CRC is that it helps you ensure that data you have received or downloaded is not damaged or corrupt.</p> <p>By comparing the value of this measure across all FC ports, you can accurately identify most error-prone FC port.</p>

	<p><b>Error received:</b> Indicates the total number of errors received by this FC port during the last measurement period.</p>	Errors	
	<p><b>Error transmitted:</b> Indicates the total number of errors transmitted by this FC port during the last measurement period.</p>	Errors	
	<p><b>Discard error received:</b> Indicates the total amount of data that was discarded during reception of data by this FC port since the last measurement period.</p>	MB	
	<p><b>Discard error transmitted:</b> Indicates the total amount of data that was discarded during data transmission through this FC port since the last measurement period.</p>	MB	
	<p><b>Too long error received:</b> Indicates the total number of errors that occurred when data of a large size was received by this FC port during the last measurement period.</p>	Errors	<p>Ideally, the value of this measure should be low. A high value is indicative of many errors during data reception. To identify the most error-prone port, compare the value of this measure across FC ports.</p>

	<p><b>Too short error received:</b> Indicates the total number of errors that occurred due to truncated or corrupt data received by this FC port during the last measurement period.</p>	Errors	Ideally, the value of this measure should be low. A high value is indicative of many errors during data transmission. To identify the most error-prone port, compare the value of this measure across FC ports.
	<p><b>Signal losses:</b> Indicates the signal losses that occurred on this FC port during data transmission and reception in the last measurement period.</p>	Errors	Ideally, the value of this measure should be 0.
	<p><b>Synchronize losses:</b> Indicates the losses that occurred due to synchronization of this FC port with other components during the last measurement period.</p>	Errors	Ideally, the value of this measure should be 0.
	<p><b>Link failures:</b> Indicates the link failures that occurred between this FC port blade server chassis during the last measurement period.</p>	Errors	Ideally, the value of this measure should be 0.

The detailed diagnosis of the *Overall status* measure provides the Time, ID, Slot ID, Port Type, Network Type, Transport Type, WWPN and Mode attributes for each FC port.

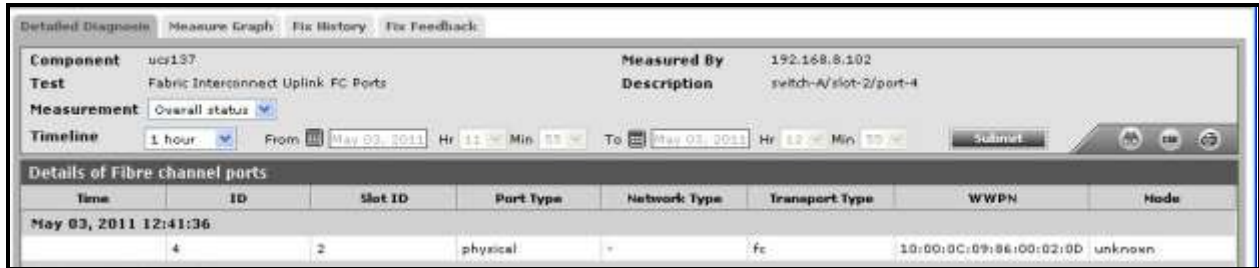

Figure 16: The detailed diagnosis of the Fabric Interconnect Uplink FC Ports test

### 1.3.5 Fabric Interconnect Details Test

Since fabric interconnects provide both network connectivity and management capabilities for the Cisco UCS system, an inoperable or resource-intensive fabric interconnect can shake the communication backbone for the blade servers and the blade server chassis of the system. Likewise, real and potential threats to the health of the interconnect hardware (eg., PSUs, mainboards, fans) can also result in significant latencies in network traffic flow over the interconnects. With the help of this test, you can keep track of the operational status and resource usage of the fabric interconnects, and also be alerted to sudden spikes in the temperature of the PSUs, mainboards, and fans supported by each interconnect.

<b>Purpose</b>	With the help of this test, you can keep track of the operational status and resource usage of the fabric interconnects, and also be alerted to sudden spikes in the temperature of the PSUs, mainboards, and fans supported by each interconnect
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

	<p><b>PSU control inlet1:</b></p> <p>Indicates the temperature of power supply unit 1 of this fabric interconnect.</p>	Celcius	A low value is desired for this measure.

	<p><b>PSU inlet2: control</b></p> <p>Indicates the temperature of power supply unit 2 of this fabric interconnect.</p>	<p>Celcius</p>	<p>A low value is desired for this measure.</p>
--	--	----------------	---

The detailed diagnosis of the *Overall status* measure provides the Time, Name, PID, Revision, Serial Number and Vendor attributes of each fabric interconnect.

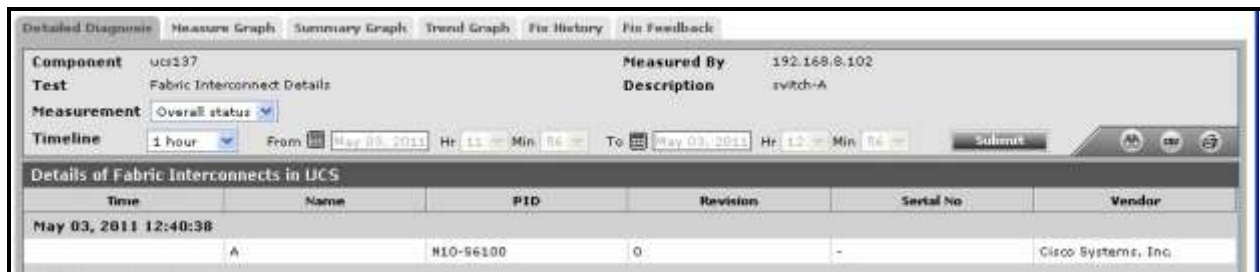

Figure 17: The detailed diagnosis of the Overall status measure of the Fabric Interconnect Details test

### 1.3.6 LAN Cloud Port Channels Test

You can aggregate a number of uplink ethernet ports by configuring them as a port channel, so traffic will forward between your upstream LAN switch and Cisco UCS fabric interconnect over the aggregate port channel ports as a single aggregated link.

This test auto-discovers the port channels configured on each Fabric Interconnect and reports the overall health, operational speed, and VLAN status of each port channel. With the help of this test, problematic and slow port channels can be identified.

<p><b>Purpose</b></p>	<p>Auto-discovers the port channels configured on each Fabric Interconnect and reports the overall health, operational speed, and VLAN status of each port channel. With the help of this test, problematic and slow port channels can be identified</p>
<p><b>Target of the test</b></p>	<p>A Cisco UCS manager</p>
<p><b>Agent deploying the test</b></p>	<p>A remote agent</p>

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option. The detailed diagnosis of the *Overall status* measure provides the complete details of a port channel, such as, the ID of the port channel, the ID of the Fabric Interconnect for which it is configured, the Type, the Port type, the flow control policy, the transport, and the name.

Figure 18: The detailed diagnosis of the Overall status measure of the LAN Cloud Port Channels Test

### 1.3.7 LAN Cloud PC Ethernet Ports

You can aggregate a number of uplink ethernet ports by configuring them as a port channel, so traffic will forward between your upstream LAN switch and Cisco UCS fabric interconnect over the aggregate port channel ports as a single aggregated link.

This test auto-discovers the Ethernet ports aggregated in each port channel on every Fabric Interconnect and reports the overall health, operational speed, and VLAN status of each Ethernet port. With the help of this test, problematic and slow ports can be identified.

<b>Purpose</b>	Auto-discovers the Ethernet ports aggregated in each port channel on every Fabric Interconnect and reports the overall health, operational speed, and VLAN status of each Ethernet port. With the help of this test, problematic and slow ports can be identified
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>

The detailed diagnosis of the *Overall status* measure provides the complete details of a port, such as, the ID of the port, the slot ID, the Fabric Interconnect for which the port has been configured, the Type, the Port type, the flow control policy, the transport, and the port, locale, and name.

Figure 19: The detailed diagnosis of the Overall Status measure of the LAN Cloud PC Ethernet Ports test

## 1.4 The Blades Layer

The Cisco UCS B-Series Blade Servers are crucial building blocks of the Cisco Unified Computing System, delivering scalable and flexible computing for a datacenter.

The Cisco UCS B-Series Blade Servers are based on industry-standard server technologies and provide:

- Up to two Intel Xeon Series 5500 multicore processors
- Two optional front-accessible, hot-swappable SAS hard drives
- Support for up to two dual-port mezzanine card connections for up to 40 Gbps of redundant I/O throughput
- Industry-standard double-data-rate 3 (DDR3) memory
- Remote management through an integrated service processor that also executes policies established in Cisco UCS Manager software
- Local keyboard, video, and mouse (KVM) access through a front console port on each server
- Out-of-band access by remote KVM, Secure Shell (SSH) Protocol, and virtual media (vMedia) as well as Intelligent Platform Management Interface (IPMI)

Since these blade servers are the heart of the Cisco UCS system, even a brief non-availability or non-operability of these servers, or sporadic hardware-related issues they encounter, will have an adverse impact on the overall performance of the Cisco UCS system. Using the tests mapped to this layer, administrators can closely observe the changes in the status of the blade servers, and promptly detect deviations, so that the problems can be resolved before they affect the Cisco UCS system as a whole.

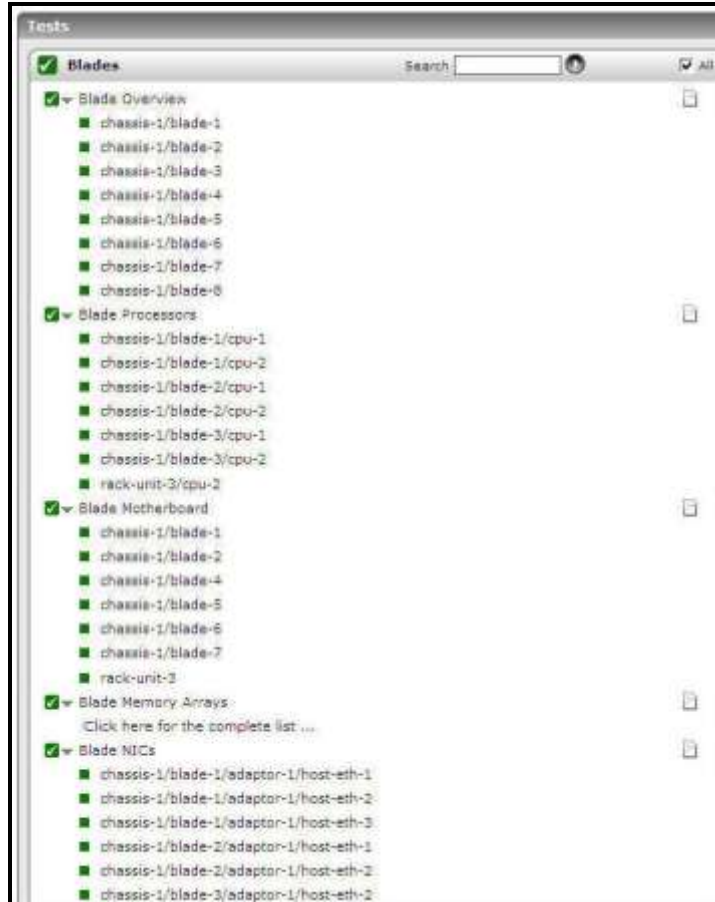

Figure 20: The tests mapped to the Blades layer

### 1.4.1 Blade Overview Test

Blade servers are the core components of the Cisco UCS system. Unavailable/inoperable blade servers can hence bring the entire system to a standstill. Using this test, you can continuously monitor the overall health, operability, and availability of each blade server in each chassis managed by the Cisco UCS manager, and be alerted to anomalies as soon as they occur, so that you can take the required corrective actions before your mission-critical services begin to suffer. In addition, the test also captures critical power and thermal failures experienced by the blade servers, and takes stock of the hardware (such as processors, cores, NICs, etc.) supporting the operations of the blade server.

<b>Purpose</b>	Continuously monitors the overall health, operability, and availability of each blade server in each chassis managed by the Cisco UCS manager, and alerts administrators to anomalies as soon as they occur, so that the required corrective actions can be taken before mission-critical services begin to suffer
<b>Target of the test</b>	A Cisco UCS manager

		<p><b>Note:</b></p> <p>By default, this measure reports the above-mentioned states while indicating the overall status of a blade server. However, in the graph of this measure, states will be represented using their corresponding numeric equivalents only.</p> <p>The detailed diagnosis of this measure provides the Time, Slot ID, chassis ID, PID, Revision, Serial Number, Vendor, Name, UUID, Service Profile and Original UUID attributes for this blade server.</p>						
	<p><b>Administrative state:</b></p> <p>Indicates the current administrative state of this blade server loaded in this chassis.</p>	<p>This measure reports either <i>In-service</i> or <i>Out-of-service</i> as the administrative state of the blade servers. The numeric equivalents corresponding to these states are shown in the table below:</p> <table border="1" data-bbox="932 835 1360 982"> <thead> <tr> <th>Numeric Value</th> <th>State</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>In-service</td> </tr> <tr> <td>2</td> <td>Out-of-service</td> </tr> </tbody> </table> <p><b>Note:</b></p> <p>By default, this measure reports the above-mentioned states while indicating the administrative state of a blade server. However, in the graph of this measure, states will be represented using their corresponding numeric equivalents only.</p>	Numeric Value	State	1	In-service	2	Out-of-service
Numeric Value	State							
1	In-service							
2	Out-of-service							

	<p><b>Association state:</b></p> <p>Indicates the current associative state of this blade server loaded in this chassis i.e., indicates whether the blade server is associated with the service profile that is preconfigured in the Cisco UCS Manager.</p>		<p>A service profile represents a logical view of a single blade server, without needing to know exactly which blade you are talking about. The profile object contains the server personality (identity and network information). The profile can then be associated with a single blade at a time.</p> <p>Cisco UCS Manager uses service profiles to provision the blade servers and their I/O properties. The Cisco Unified Computing System has a form factor-neutral architecture, allowing administrators to centrally manage Cisco UCS blade servers or rack-mount servers, or incorporate both within a single management domain.</p> <p>Service profiles are created by server, network, and storage administrators and are stored in the Cisco UCS Fabric Interconnects. Infrastructure policies needed to deploy applications, such as power and cooling, security, identity, hardware health, and Ethernet and storage networking, are encapsulated in the service profile. The policies coordinate and automate element management at every layer of the hardware stack, including RAID levels, BIOS settings, firmware revisions and settings, adapter identities and settings, VLAN and VSAN network settings, network quality of service (QoS), and data center connectivity. Cisco UCS Manager provides granular Cisco Unified Computing System visibility for higher-level management tools from BMC, CA, HP, IBM, and others, providing exceptional alignment of infrastructure management with OS and application requirements.</p> <p>This measure reports the associative state of the blade servers and their numeric equivalents as shown in the table:</p> <table border="1" data-bbox="979 1602 1325 1841"> <thead> <tr> <th>Numeric Value</th> <th>State</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Associated</td> </tr> <tr> <td>2</td> <td>Removing</td> </tr> <tr> <td>3</td> <td>Failed</td> </tr> </tbody> </table>	Numeric Value	State	0	None	1	Associated	2	Removing	3	Failed

**Monitoring the Cisco UCS Manager**

	<p><b>Effective memory:</b> Indicates the amount of memory that can be effectively used by this blade server present in this chassis.</p>	MB	Ideally, the value of this measure should be high.
	<p><b>Total memory:</b> Indicates the total memory available in this blade server present in this chassis.</p>	MB	
	<p><b>Number of processors:</b> Indicates the number of Central Processor Units available in this blade server loaded in this chassis.</p>	Number	
	<p><b>Number of cores:</b> Indicates the total number of cores available on all the CPS that are installed in this blade server in this chassis.</p>	Number	
	<p><b>Number of cores enabled:</b> Indicates the number of core processors that are enabled in this blade server in this chassis.</p>	Number	
	<p><b>Number of threads:</b> Indicates the number of processes that can run simultaneously on this blade server in this chassis.</p>	Number	This measure should be equal to either the number of cores or twice the number of cores if the operating system supports hyperthreading.

	<p><b>Number of adapters:</b> Indicates the number of adapters available in this blade server in this chassis.</p>	Number	
	<p><b>Number of NICs:</b> Indicates the number of physical ethernet network interface cards (NICs) available in this blade server in this chassis.</p>	Number	
	<p><b>Number of HBAs:</b> Indicates the number of physical host bus adapters (HBAs) available in the blade servers.</p>	Number	

## 1.4.2 Blade Processors Test

The Cisco UCS B-Series Blade Servers support up to two Intel Xeon Series 5500 multicore processors. If the temperature of a processor suddenly soars or a high voltage of current unexpectedly flows through a processor, it can damage one/more internal components of the processor, thereby suspending not only the processor's operations, but also that of the blade server depending on it. It is hence imperative to keep tabs of the temperature and current changes experienced by each of the processors of a blade server. Using this test, you can periodically check the temperature and input current of each of the processors supported by a blade server, and promptly detect abnormalities (if any).

<b>Purpose</b>	Periodically checks the temperature and input current of each of the processors supported by a blade server, and promptly detect abnormalities (if any)
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<p><b>Configurable parameters for the test</b></p>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>9. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.</li> </ol> <p>In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</p>		
<p><b>Outputs of the test</b></p>	<p>One set of results for each processor supported by every blade server in each chassis being monitored</p>		
<p><b>Measurements made by the test</b></p>	<p><b>Measurement</b></p>	<p><b>Measurement Unit</b></p>	<p><b>Interpretation</b></p>
	<p><b>CPU temperature:</b> Indicates the current temperature of this processor.</p>	<p>Celcius</p>	<p>A low value is ideal for this measure. A sudden and significant increase in this value could be a cause for concern.</p>
	<p><b>Input current:</b> Indicates the input current received by this processor.</p>	<p>Amps</p>	<p>Ideally, the value of this measure should be low. A sudden, yet significant increase in this value could inflict injury on the internal components of the processor.</p>

### 1.4.3 Blade Motherboard Test

Issues in the motherboard can have an adverse impact on the performance levels delivered by a blade server. This test monitors the health of the motherboard of each blade server loaded in each chassis managed by a Cisco UCS manager, and reveals the following:

- Is the motherboard consuming power excessively?
- Are the current and voltage inputs received by the motherboard in excess of its capacity?
- Are the temperatures in the front and rear panels of the motherboard normal?

## Monitoring the Cisco UCS Manager

- If the temperature of the rear panel is very high, then which rear panel is contributing to this abnormality - the left or the right rear panel?

<b>Purpose</b>	Monitors the health of the motherboard of each blade server loaded in a chassis		
<b>Target of the test</b>	A Cisco UCS manager		
<b>Agent deploying the test</b>	A remote agent		
<b>Configurable parameters for the test</b>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.</li> </ol> <p>In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</p>		
<b>Outputs of the test</b>	One set of results for each blade server loaded in each chassis managed by the Cisco UCS manager being monitored		
<b>Measurements made by the test</b>	<b>Measurement</b>	<b>Measurement Unit</b>	<b>Interpretation</b>
	<b>Consumed power:</b> Indicates the total power consumed by the motherboard of this blade server.	Watts	An unusually high value could be a cause for concern.
	<b>Input current:</b> Indicates the input current received by the motherboard of this blade server.	Amps	Ideally, the value of this measure should be low. A sudden, yet significant increase in this value could inflict injury on the motherboard.

	<b>Input voltage:</b> Indicates the input voltage received by the motherboard of this blade server.	Volts	Ideally, the value of this measure should be low. A sudden, yet significant increase in this value could inflict injury on the motherboard.
	<b>Front temperature:</b> Indicates the temperature of the front panel of the motherboard of this blade server.	Celcius	A very high temperature indicates that the motherboard is overheated.
	<b>Rear temperature:</b> Indicates the temperature of the rear panel of the motherboard of this blade server.	Celcius	A very high temperature indicates that the motherboard is overheated.
	<b>Rear temperature right:</b> Indicates the temperature of the right rear panel of the motherboard of this blade server.	Celcius	A very high temperature indicates that the motherboard is overheated.
	<b>Rear temperature left:</b> Indicates the temperature of the left rear panel of the motherboard of this blade server.	Celcius	A very high temperature indicates that the motherboard is overheated.

### 1.4.4 Blade Memory Arrays Test

This test monitors the temperature of each of the memory arrays of the blade servers loaded in a chassis, and reports any abnormal increase in temperature.

<b>Purpose</b>	Monitors the temperature of each of the memory arrays of the blade servers loaded in a chassis, and reports any abnormal increase in temperature
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent

<b>Configurable parameters for the test</b>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.</li> </ol> <p>In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</p>		
<b>Outputs of the test</b>	One set of results for each memory array of every blade server loaded in each chassis managed by the Cisco UCS manager being monitored		
<b>Measurements made by the test</b>	<b>Measurement</b>	<b>Measurement Unit</b>	<b>Interpretation</b>
	<b>Array temperature:</b>  Indicates the current temperature of the memory array present in this blade server.	Celcius	A very high temperature could indicate that the memory array is overheated.

### 1.4.5 Blade NICs Test

This test auto-discovers the NICs (Network Interface Cards) supported by the UCS Blade servers, monitors the overall health, operational state, and load on each NIC, and promptly notifies administrators when an NIC suddenly switches to an abnormal state, becomes overloaded, or encounters errors while sending/receiving data over the network. This way, you can easily isolate problematic, over-used, and error-prone NICs.

<b>Purpose</b>	Auto-discovers the NICs (Network Interface Cards) supported by the UCS Blade servers, monitors the overall health, operational state, and load on each NIC, and promptly notifies administrators when a NIC suddenly switches to an abnormal state, becomes overloaded, or encounters errors while sending/receiving data over the network
<b>Target of the test</b>	A Cisco UCS manager
<b>Agent deploying the test</b>	A remote agent
<b>Configurable parameters for the test</b>	<ol style="list-style-type: none"> <li>1. <b>TESTPERIOD</b> – How often should the test be executed</li> <li>2. <b>HOST</b> – The IP address of the host for which the test is being configured.</li> <li>3. <b>PORT</b> – The port at which the specified <b>HOST</b> listens. By default, this is NULL.</li> <li>4. <b>UCS USER</b> and <b>UCS PASSWORD</b> – Provide the credentials of a user with at least <i>read-only</i> privileges to the target Cisco UCS manager.</li> <li>5. <b>CONFIRM PASSWORD</b>- Confirm the password by retyping it here.</li> <li>6. <b>SSL</b> - By default, the Cisco UCS manager is SSL-enabled. Accordingly, the <b>SSL</b> flag is set to <b>Yes</b> by default.</li> <li>7. <b>WEB PORT</b>- By default, in most virtualized environments, Cisco UCS manager listens on port 80 (if not SSL-enabled) or on port 443 (if SSL-enabled) only. This implies that while monitoring Cisco UCS manager, the eG agent, by default, connects to port 80 or 443, depending upon the SSL-enabled status of Cisco UCS manager - i.e., if Cisco UCS manager is not SSL-enabled (i.e., if the <b>SSL</b> flag above is set to <b>No</b>), then the eG agent connects to Cisco UCS manager using port 80 by default, and if Cisco UCS manager is SSL-enabled (i.e., if the <b>SSL</b> flag is set to <b>Yes</b>), then the agent-Cisco UCS manager communication occurs via port 443 by default. Accordingly, the <b>WEBPORT</b> parameter is set to <i>default</i> by default.  In some environments however, the default ports 80 or 443 might not apply. In such a case, against the <b>WEBPORT</b> parameter, you can specify the exact port at which the Cisco UCS manager in your environment listens, so that the eG agent communicates with that port for collecting metrics from the Cisco UCS manager.</li> <li>8. <b>DETAILED DIAGNOSIS</b> - To make diagnosis more efficient and accurate, the eG Enterprise suite embeds an optional detailed diagnostic capability. With this capability, the eG agents can be configured to run detailed, more elaborate tests as and when specific problems are detected. To enable the detailed diagnosis capability of this test for a particular server, choose the <b>On</b> option. To disable the capability, click on the <b>Off</b> option.  The option to selectively enable/disable the detailed diagnosis capability will be available only if the following conditions are fulfilled: <ul style="list-style-type: none"> <li>➤ The eG manager license should allow the detailed diagnosis capability</li> <li>➤ Both the normal and abnormal frequencies configured for the detailed diagnosis measures should not be 0.</li> </ul> </li> </ol>
<b>Outputs of the test</b>	One set of results for each NIC supported by every blade server loaded in each chassis managed by the Cisco UCS manager being monitored

	<p><b>Data received:</b> Indicates the amount of data received by this NIC during the last measurement period.</p>	MB	<p>These measures are good indicators of the load banded by an NIC. By comparing the value of each measure across NICs, you can quickly identify which NIC is experiencing heavy data traffic and when - while receiving data? or while transmitting data?</p>																								
	<p><b>Data transmitted:</b> Indicates the amount of data transmitted by this NIC during the last measurement period.</p>	MB																									

	<p><b>Packets received:</b></p> <p>Indicates the number of packets received by this NIC during the last measurement period.</p>	Packets	<p>These measures are good indicators of the load banded by an NIC. By comparing the value of each measure across NICs, you can quickly identify which NIC is experiencing heavy data traffic and when - while receiving data? or while transmitting data?</p>
	<p><b>Packets transmitted</b></p> <p>Indicates the number of packets sent by this NIC during the last measurement period.</p>	Packets	
	<p><b>Dropped packets received:</b></p> <p>Indicates the number of dropped packets received by this NIC during the last measurement period.</p>	Packets	
	<p><b>Dropped packets transmitted:</b></p> <p>Indicates the number of dropped packets transmitted by this NIC during the last measurement period.</p>	Packets	
	<p><b>Errors received:</b></p> <p>Indicates the errors encountered by this NIC while receiving data during the last measurement period.</p>	Errors	<p>Ideally, the value of both these measures should be 0. A non-zero value indicates that one/more errors have occurred on an NIC. If these measure values increase with time, you may want to compare the value of each of these measures across NICs to quickly zero-in on the error-prone NICs and understand when the maximum number of errors occurred on those NICs - while transmitting data? or while receiving it?</p>

## Monitoring the Cisco UCS Manager

	<b>Errors transmitted:</b> Indicates the errors encountered by this NIC while transmitting data during the last measurement period.	Errors	
--	--	--------	--

## Conclusion

This document has described in detail the monitoring paradigm used and the measurement capabilities of the eG Enterprise suite of products with respect to **Cisco UCS Manager**. For details of how to administer and use the eG Enterprise suite of products, refer to the user manuals.

We will be adding new measurement capabilities into the future versions of the eG Enterprise suite. If you can identify new capabilities that you would like us to incorporate in the eG Enterprise suite of products, please contact [support@eginnovations.com](mailto:support@eginnovations.com). We look forward to your support and cooperation. Any feedback regarding this manual or any other aspects of the eG Enterprise suite can be forwarded to [feedback@eginnovations.com](mailto:feedback@eginnovations.com).
