## Table of Contents

	Page
Subnet Breakdown (Binary to decimal)	1
Subnet Breakdown (Binary to Hexadecimal)	2
Equations	3
Header Offset Shortcuts	4
OSI vs. TCP/IP	5
TCP vs. UDP	6
IPv4 Header (RFC 791)	7
Transmission Control Protocol - TCP Header (RFC 793)	9
User Datagram Protocol - UDP Header (RFC 768)	10
Internet Control Message Protocol - ICMP Header (RFC 792)	11
PING (Echo/Echo Reply) - ICMP Header (792)	12
Address Resolution Protocol - ARP (RFC 826)	13
Domain Name System - DNS (RFC 1035)	14
Dynamic Routing Protocols	15
OSPF v2 (RFC 1583)	16
Generic Routing Encapsulation - GRE (RFC 2784)	17
Authentication Header - AH (RFC 2402)	18
Encapsulating Security Payload - ESP (RFC 2406)	19
IPV6 Header (RFC 2460)	21
IEEE Framing	24
Ethernet II Frame Format (similar to IEEE 802.3)	25
Ethernet IEEE 802.2 Frame Format (802.3 with 802.2)	26
Ethernet IEEE 802.3 SNAP Frame Format	27
Ethernet Novell Netware 802.3 "Raw" Frame Format	28
802.11 (IEEE 1999 Reference Specification)	29
Kismet	32
TCPDUMP / WINDUMP	33
NGREP	35
Ethereal / Wireshark	36
Windows TCP / UDP Ports	37
OS Fingerprinting	41
Decimal to Hexadecimal to ASCII Chart	42
References	43

**Subnet Breakdown (Binary to Decimal)**

# Equations

## TCP & IP Equations

### TCP Options Length =

$$(TCP\ Header\ Length * 4\ byte\ multiplier) - (Minimum\ TCP\ Header\ Length * 4\ byte\ multiplier)$$

$$(TCP\ Header\ Length * 4\ byte\ multiplier) - 20\ bytes$$

### Length of IP Packet Payload =

$$IP\ total\ Length - ((IP\ Header\ Length * 4\ byte\ multiplier) + (TCP\ Header\ Length * 4\ byte\ multiplier))$$

## Logic Equations

1 AND 1 is 1	1 OR 1 is 1	1 XOR 1 is 0
1 AND 0 is 0	1 OR 0 is 1	1 XOR 0 is 1
0 AND 1 is 0	0 OR 1 is 1	0 XOR 1 is 1
0 AND 0 is 0	0 OR 0 is 0	0 XOR 0 is 0

## Subnetting Equations

### Number of hosts on a subnet =

$$2^n - 2$$

Where n is the number of bits in the ip address / subnet dedicated to the host  
Remember the -2 is because host bits of all 0's is the network address and all 1's is the broadcast address for that subnet

### Number of subnets that can be created from n subnet bits =

$$2^n$$

Where n is the number of bits dedicated to the subnet  
Note: This assume you have something like "ip subnet zero" on your network device.  
Otherwise you have to - 2 from your total where all the subnet bits are 0's or 1's

### Number of host bits needed for X hosts to be on the same subnet =

$$\frac{\ln(X+2)}{\ln 2}$$

Where X is the number of hosts required on the subnet.  
Note: **ln** is the nature log. **Round up to the nearest whole number.**

### Number of network and subnet bits needed for X hosts to be on the same subnet =

$$32 - \frac{\ln(X+2)}{\ln 2}$$

Where X is the number of hosts required on the subnet.  
Note: **ln** is the nature log. **Round up to the nearest whole number.**

### Determining the network address from IP and subnet mask by doing a logical AND on the IP with the subnet mask

$$\begin{array}{r} 00000011\ 10101010\ 01010101\ 11111110 \\ 11111111\ 11111111\ 11111111\ 11110000 \\ \hline 00000011\ 10101010\ 01010101\ 11110000 \end{array}$$

10.170.85.254 is the IP address  
255.255.255.240 is the subnet mask  
10.170.85.240 is the network address for the subnet

## Converting Binary or Hexadecimal to Decimal

### The equation:

$$(b^p * n_p) + \dots + (b^1 * n_1) + (b^0 * n_0)$$

b is the base (b = 2 for binary and b = 16 for hexadecimal)  
p is the position of the number (counting starts from the rightmost character as 0)  
n is the number in the p<sup>th</sup> position

### Examples:

Convert from binary to decimal

10101111

$$(2^7 * 1) + (2^6 * 0) + (2^5 * 1) + (2^4 * 0) + (2^3 * 1) + (2^2 * 1) + (2^1 * 1) + (2^0 * 1)$$

$$128 + 0 + 32 + 0 + 8 + 4 + 2 + 1 = 175$$

Convert from hexadecimal to decimal

AC89

$$(16^3 * A) + (16^2 * C) + (16^1 * 8) + (16^0 * 9)$$

This is where you need to know hex A is decimal 10 and hex C is decimal 12

$$(16^3 * 10) + (16^2 * 12) + (16^1 * 8) + (16^0 * 9)$$

$$(4096 * 10) + (256 * 12) + (16 * 8) + (1 * 9)$$

$$40960 + 3072 + 128 + 9 = 44169$$

## Header Offset Shortcuts

Field	Length (bits)	TCPDUMP Filter	Notes
IP Header Length	4	ip[0] &0x0F	Remember to use a 4 byte multiplier to find header length in bytes
IP Packet Length	16	ip[2:2]	There is no multiplier for this length field
IP TTL	8	ip[8]	
IP Protocol	8	ip[9]	
	<b>Dec</b>	<b>Hex</b>	<b>Proto</b>
	1	0x01	ICMP
	2	0x02	IGMP
	6	0x06	TCP
	<b>Dec</b>	<b>Hex</b>	<b>Proto</b>
	9	0x09	IGRP
	17	0x11	UDP
	47	0x2F	GRE
	<b>Dec</b>	<b>Hex</b>	<b>Proto</b>
	50	0x32	ESP
	51	0x33	AH
	88	0x58	EIGRP
IP Address - Src	32	ip[12:4]	
IP Address - Dst	32	ip[16:4]	
IP Fragmentation	flag=3	ip[6] &0x20 = 0x20	More Fragment bit is set.
	offset=13	ip[6:2] &0x1fff != 0x0000	Fragment offset in not 0
ICMP Type	8	icmp[0]	
ICMP Code	8	icmp[1]	
TCP Src Port	16	tcp[0:2]	
TCP Dst Port	16	tcp[2:2]	
TCP Header Length	4	tcp[12] &0x0F	Remember to use a 4 byte multiplier to find header length in bytes
TCP Flags	8	tcp[13]	
TCP Windows Size	16	tcp[14:2]	
UDP Src Port	16	udp[0:2]	
UDP Dst Port	16	udp[2:2]	
UDP Header Length	16	udp[4:2]	There is no multiplier for this length field

# OSI vs. TCP/IP

<b>OSI</b>	<b>Application</b>	<b>7</b>	<b>TCP/IP</b>
	<b>Presentation</b>	<b>6</b>	
	<b>Session</b>	<b>5</b>	
	<b>Transport</b>	<b>4</b>	
	<b>Network</b>	<b>3</b>	
	<b>Data Link</b>	<b>2</b>	
	<b>Physical</b>	<b>1</b>	
	<b>Application</b>		
	<b>Transport (TCP)</b>		
	<b>Internet (Network) (IP)</b>		
	<b>Network Access (Data Link)</b>		

## Application Layer (Layer 7)

Determines the network services required.

**Examples:** DNS, FTP, LDP, Telnet, TFTP, SMTP and WWW

## Presentation Layer (Layer 6)

Presents data to the application layer. Essentially functions as a translator from computer to human readable form.

**Examples:** HTTP, TIFF, JPEG, MIDI and MPEG

## Session Layer (Layer 5)

Establishes and maintains the connection between systems and formats the data for transfer between nodes.

**Examples:** NFS, SQL, RPC

## Transport Layer (Layer 4)

Defines how to address physical locations, how to make connections between nodes, and how to handle the network of messages. This layer is responsible for **end-to end** integrity and control of the session and handles the sequencing of packets.

**Examples:** TCP, UDP, SPX

## Network Layer (Layer 3)

Defines how packets of data are routed between end systems over interconnected networks. Routing error detection, and control of node data traffic are managed at this layer.

**Examples:** IP, OSPF, ICMP, RIP

## Data Link Layer (Layer 2)

Defines the protocols that computers use in order to access the network for transmitting and receiving messages.

**Has two sub layers:** *Logical Link Control* and *Media Access Control*.

**Examples:** ARP, SLIP, PPP

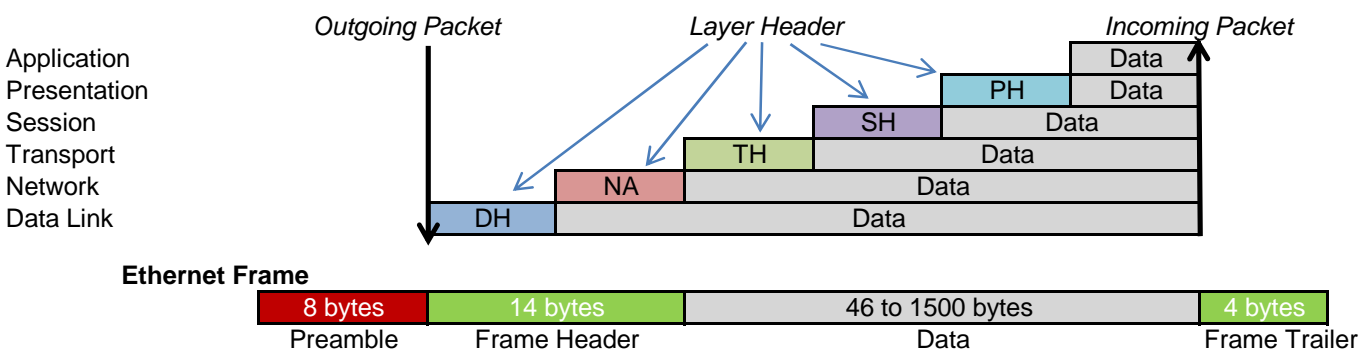

## Physical Layer (Layer 1)

Defines the physical connection (RJ48, BNC, HSSI, etc...) between a host and a network and converts the bits into voltages or light impulses for transmission.

**Examples:** HSSI, X.21, EIA/TIA-232 and EIA/TIA-449

## Encapsulation (In reverse is demultiplexing.)

For outgoing packets, the data + header from an upper layer is packaged into the data of the layer below it. For incoming packets, the layer header information is strip off and used to determine where the remaining data is to go.

Manchester encoding - Preamble is 62 bits of alternating 1's and 0's. followed by 11.

# IPv4 Header (RFC 791)

### IP Version Number

Valid values are:            4 for IP version 4            6 for IP version 6

### IP Header Length

(4 byte multiplier)  
Number of 32-bit words in IP header            minimum value 5 (5 x 4 = 20 bytes)            maximum value 15 (15 x 4 = 60 bytes)

### Type of Service

(Used by gateways as a QoS type field)            (Most OS's default to 0)  
If the first 3 high order bits are 1's, then possible it came from busy router that had to set tags to get through a backlog

### Total Length

(No multiplier)  
Number of bytes in packet            maximum length = 65,535

### IP Identification Number

Uniquely identifies every datagram sent by host, value typically incremented by 1 (AKA Fragment ID)

### Flags

R is reserved and must be set to 0

D is Don't Fragment Flag            1=Don't Fragment            0=Can Fragment

MF is More Fragments            1=More Fragments            0=No Fragment or no more Fragments

**(frag x:y@z where x is the fragment ID, y is # of bytes (must be divisible by 8) and z is the fragment offset)**

(In Ethernet the MTU 1500 should see middle fragments of size 1480 (1480 data + 20 ip header = 1500))

### Fragment Offset

(8 byte multiplier)            (Measured in units of 64 bits)            (Max fragment offset 65528 (8191\*8) )  
Position of this fragment in the original datagram            value is multiplied by 8 to get bytes

### Time To Live

#### IP Protocol

D	Hex		D	Hex		D	Hex		D	Hex	
1	0x01	ICMP	9	0x09	IGRP	47	0x2F	GRE	88	0x58	EIGRP
2	0x02	IGMP	17	0x11	UDP	50	0x32	ESP	89	0x59	OSPF
6	0x06	TCP	47	0x2F	GRE	51	0x33	AH			

### Header Checksum

Covers IP header only            Validated along the path from source to destination

### Options

D	Hex		D	Hex	
0	0x00	End of Option list	68	0x44	Timestamp
1	0x01	No operation (pad)	131	0x83	Loose source route (security risk)
7	0x07	Record Route (security risk)	137	0x89	Strict source route (security risk)

# IPv4 Header (cont.)

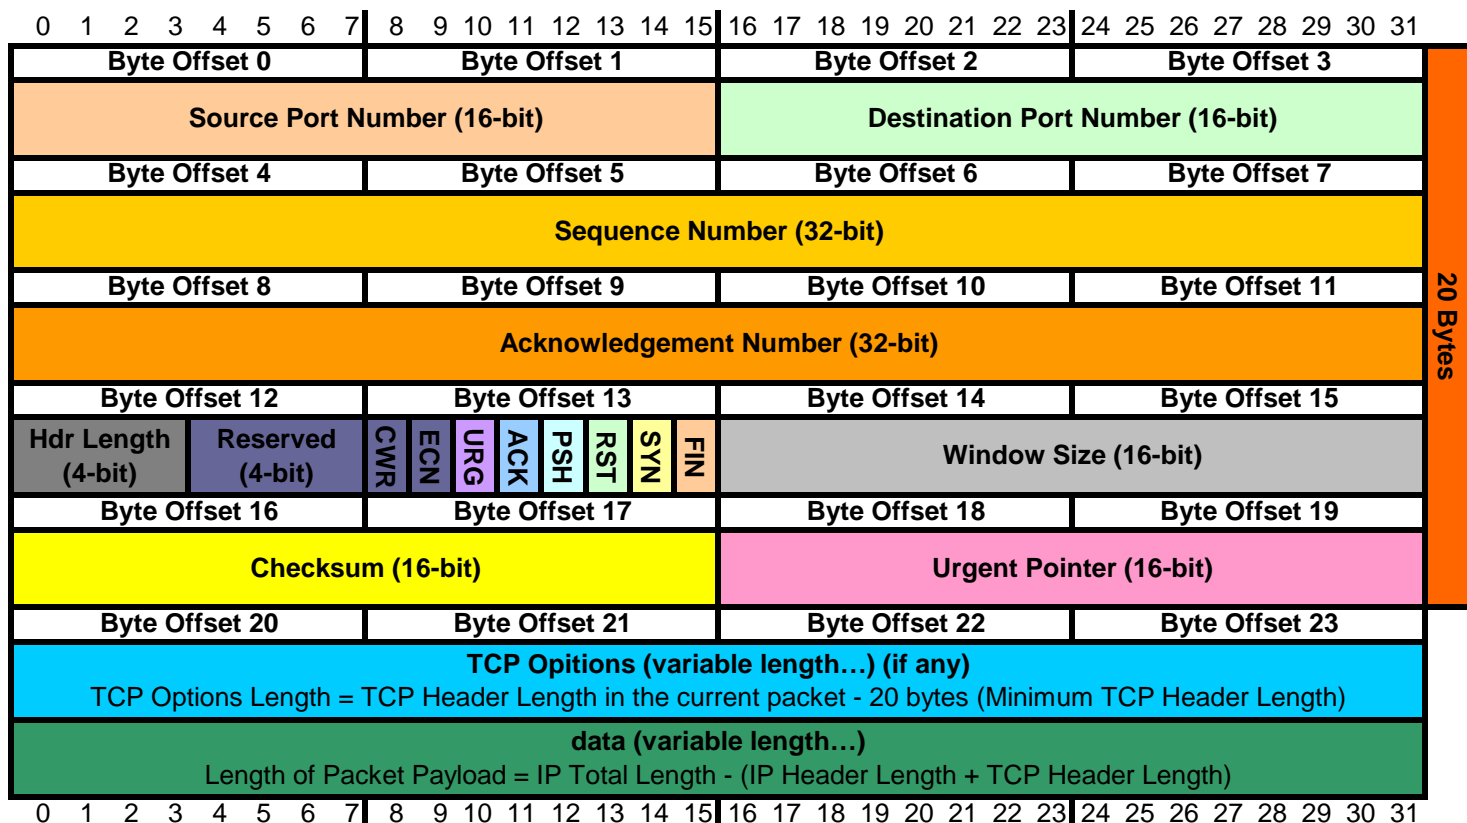

**Type of Service** (Used by gateways as a QoS type field) (Most OS's default to 0)

Bit 0 - 2	Precedence	
Bit 3	0 = Normal Delay	1 = Low Delay
Bit 4	0 = Normal Throughput	1 = High Throughput
Bit 5	0 = Normal Reliability	1 = High Reliability
Bit 6 & 7	Reserved for future use (Always set to 0)	

Precedence	Protocol	TOS Value
1 1 1	Network Control	Telnet
1 1 0	Internetwork Control	FTP Control
1 0 1	CRITIC / ECP	FTP Data
1 0 0	Flash Override	TFTP
0 1 1	Flash	SMTP Command
0 1 0	Immediate	SMTP Data
0 0 1	Priority	DNS UDP Query
0 0 0	Routine	DNS TCP Query
		DNE Zone Transfer
		NNTP

		BOOTP

# Transmission Control Protocol - TCP Header (RFC 793)

20 Bytes

## Common Port Numbers

D	Hex		D	Hex		D	Hex		D	Hex	
7	0x07	echo	25	0x19	smtp	119	0x77	nntp	389	0x185	ldap
19	0x13	chargen	53	0x35	domain	137	0x89	netbios-ns	443	0x1BB	https (ssl)
20	0x14	ftp-data	79	0x4F	finger	139	0x8B	netbios-ssn	445	0x1BD	ms-ds
21	0x15	ftp-control	80	0x50	http	143	0x8F	imap			
22	0x16	ssh	110	0x6E	pop3	179	0xB3	bgp			

## Sequence Number

32-bit number uniquely identifies initial byte of segment data.

## Acknowledgement Number

Represents next byte of data receiving host expects: (last received sequence number + 1)

## Header Length (4 byte multiplier)

Number of 32-bit words in TCP header      minimum value 5 (5x4=20bytes)      maximum value 15 (5x15=60bytes)

## Reserved 4 bits set to 0

## Congestion Window Reduced (CWR)

Set to 0 unless ECN is used.      (1 = sender cuts congestion window in half)

## Explicit Congestion Notification Echo (ECN)

Set to 0 unless ECN is used.      (1 = receiver cuts congestion window in half)

## Flags

URG = Urgent      ACK = Acknowledgment      PSH = Push      RST = Reset      SYN = Synchronize  
FIN = Finish      (Note: Push means don't buffer data but push it to be processes as soon as it comes in.)

## Window Size

Acts as flow control. Window size dynamically changes as data is received. A 0 window size tells src host to wait.

## Checksum

Covers pseudo header (IP Header source and destination addresses, the protocol and the computed TCP length (the TCP header length and the data length in octets)) and the TCP header

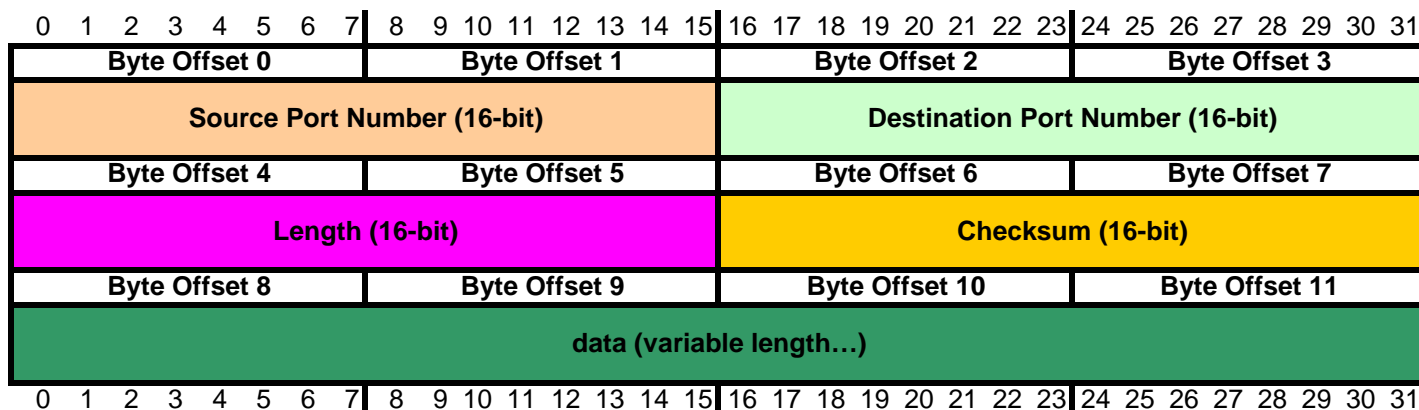

## Urgent Pointer

Points to the sequence number of the octet following the urgent data.

## Options

0 End of Options List	2 Maximum segment size	4 Selective ACK ok
1 No Operation (pad)	3 Window scale	8 Timestamp

# User Datagram Protocol - UDP Header (RFC 768)

## Common Port Numbers

D	Hex	Protocol	D	Hex	Protocol	D	Hex	Protocol
7	0x07	echo	69	0x45	tftp	500	0x1F4	isakmp
19	0x13	chargen	123	0x7B	ntp	514	0x202	syslog
37	0x25	time	137	0x89	netbios-ns	520	0x208	rip
53	0x35	domain	138	0x8A	netbios-dgm	33434	829A	traceroute
67	0x43	bootps	161	0xA1	snmp			
68	0x44	bootpc	162	0xA2	snmp-trap			

## Length

Number of bytes in the entire datagram including header

minimum value 8 bytes

(Which is the length of just the header with no data)

maximum value 65515 bytes (or 65507 bytes of UDP data)

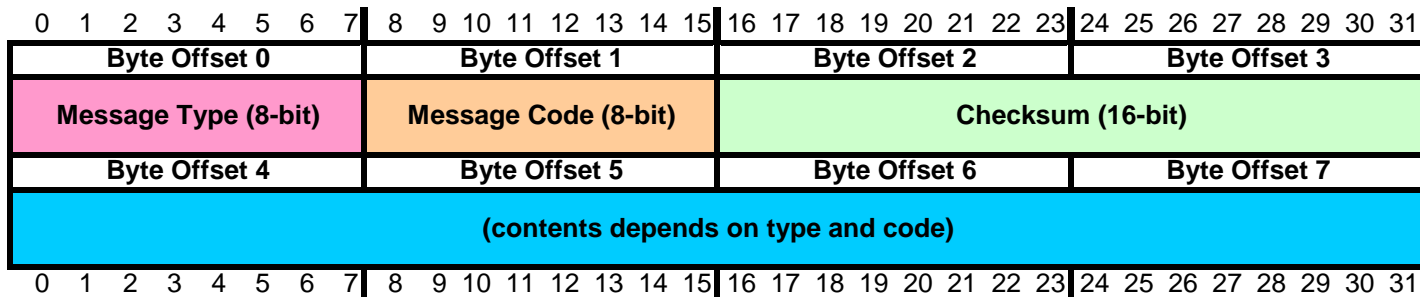

(Max IP is 65535 bytes - 20 byte header = 65515 bytes for UDP packet - 8 bytes of UDP header = 65507)

## Checksum

Covers pseudo header (IP Header source and destination addresses, the protocol and UDP length) and entire UDP datagram

**(Note: By RFC, the crc is not required)**

# Internet Control Message Protocol - ICMP Header (RFC 792)

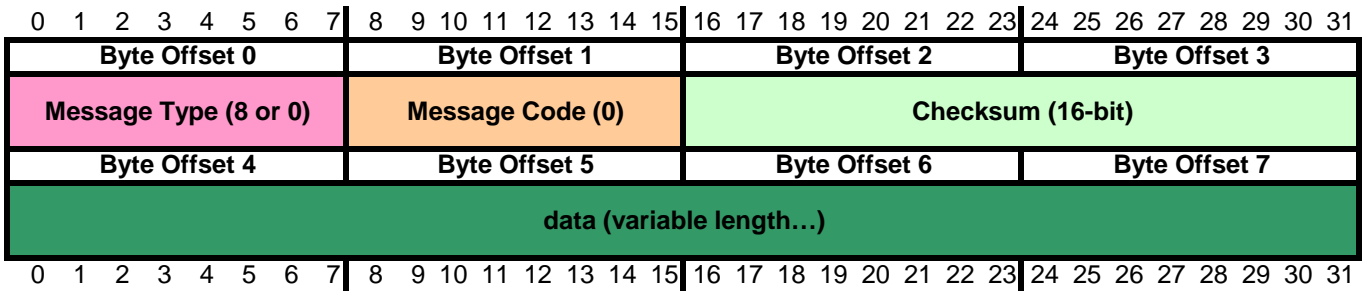

## Common Types & Codes

Type	Type Description	Code	Message Code Description
0	Echo reply	0	
3	Destination Unreachable	0	Net Unreachable
		1	Host Unreachable
		2	Protocol Unreachable
		3	Port Unreachable
		4	Fragmentation Needed & Don't Fragment Flag Set
		5	Source Route Failed
		6	Destination Network Unknown
		7	Destination Host Unknown
		8	Source Route Isolated
		9	Network Administratively Prohibited
		10	Host Administratively Prohibited
		11	Network Unreachable for TOS
		12	Host Unreachable for TOS

# Dynamic Routing Protocols

## **RIPv1**

---

Distance Vector  
Default Administrative Distance 120  
Maximum hop count 15  
Classful  
Broadcast based (255.255.255.255)  
No support for VLSM networks  
Auto-summarization  
No authentication  
No support for discontinuous networks  
Broadcast all routes every 30 seconds  
Uses lowest hop count for best route (Bellman-Ford)  
Slow convergence

## **RIPv2**

---

Distance Vector  
Default Administrative Distance 120  
Maximum hop count 15  
Classless  
Uses multicast (224.0.0.9)  
Supports Variable Length Subnet Mask(VLSM) networks  
Auto-summarization  
Allows for MD5 authentication  
Supports discontinuous networks  
Broadcast all routes every 30 seconds  
Uses lowest hop count for best route (Bellman-Ford)  
Slow convergence

## **IGRP (Cisco Proprietary / No longer supported)**

---

Distance Vector  
Default Administrative Distance 100  
Maximum hop count 255 (default 100)  
Classful  
Broadcast based (255.255.255.255)  
No support for VLSM networks  
  
No authentication  
No support for discontinuous networks  
Broadcast all routes every 90 seconds  
Uses bandwidth and delay for best route  
Uses autonomous system numbers

## **EIGRP (Cisco Proprietary)**

---

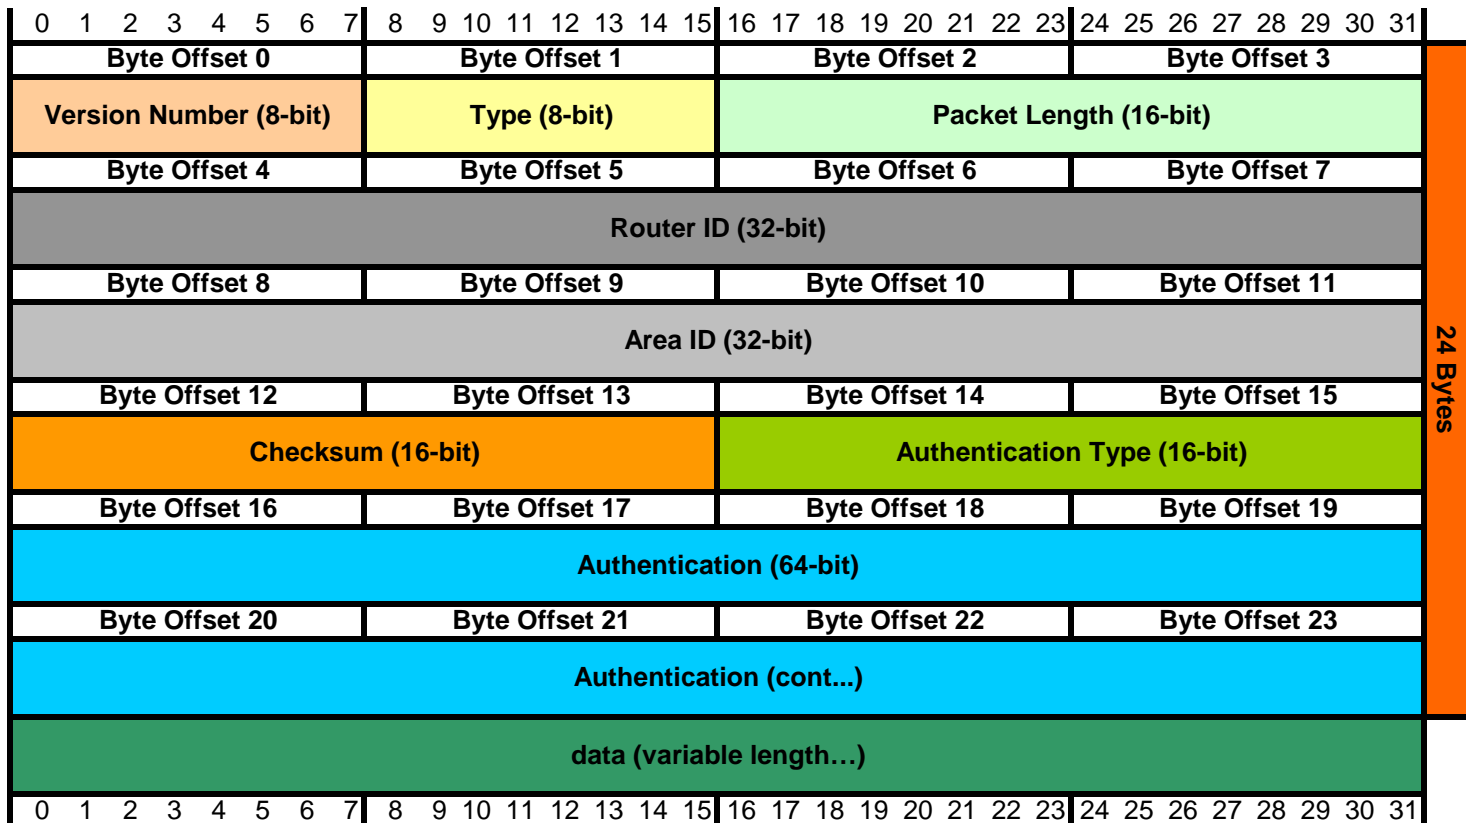

Hybrid  
Default Administrative Distance 90 (External is 170)  
Maximum hop count 255 (default 100)  
Classless  
Broadcast based (255.255.255.255)  
Supports Variable Length Subnet Mask(VLSM) networks  
Auto and manual summarization  
Allows for authentication  
Supports discontinuous networks & route summaries  
No periodic route updates. Hello messages with neighbors  
Best Path selection via Diffusing Update Algorithm (DUAL)  
Uses autonomous system numbers  
Communication via Reliable Transport Protocol (RTP)  
Support for IPv4 and IPv6

## **OSPF**

---

Link State  
Default Administrative Distance 110  
Maximum hop count limit - none  
Classful  
Broadcast based (255.255.255.255)  
Supports Variable Length Subnet Mask(VLSM) networks  
Manual summarization  
Allows for authentication  
Supports discontinuous networks & route summaries  
Multicast on change  
Uses bandwidth and delay for best route (Dijkstra)  
Uses autonomous system numbers  
Fast convergence  
Uses wildcard masks (inverse) in Cisco routers

# OSPF v2 (RFC 1583)

24 Bytes

### Version Number

Valid values are: 12 for OSPF version 2

### Type

Type	Description	Type	Description
1	Hello	4	Link state Update
2	Databse Description	5	Link State Acknowledgment
3	Link State Update		

### Packet Length

(Used by gateways as a QoS type field) (Most OS's default to 0)

The length of the protocol packet in bytes including the standard OSPF header

### Router ID

The router ID of the packet's sour maximum length = 65,535

### Area ID

Identifies the are that this packet belongs to. Packets travelling over a virtual link are labelled with the backbone Area ID og 0.0.0.0

### Checksum

Standard IP checksum of the entire contents of the OSPF packet excluding the 64-bit authentication field.

### Authentication Type

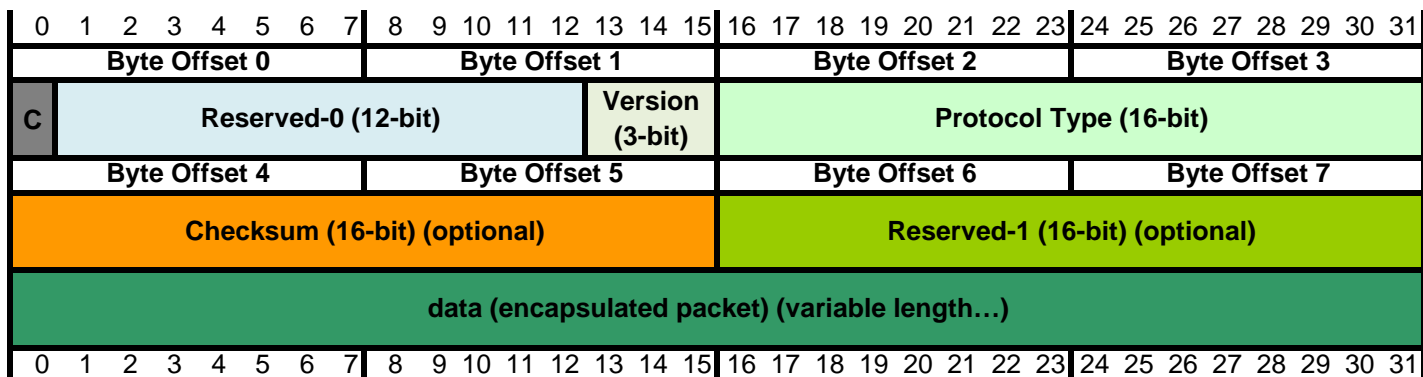

Identifies the authentication scheme to be used for the packet.

Type	Description
0	No authentication
1	Simple password in the clear
rest	Reserved for assignment by the IANA

### Authentication

Used by the authentication scheme

# Generic Routing Encapsulation - GRE (RFC 2784)

### Checksum Present Bit

If the checksum bit is set to 1 then the Checksum and Reserved-1 fields are present.

### Reserved-0

If bits 1 through 5 are non-zero then the packet should be discarded unless receiver implements RFC 1701. Bits 6 through 12 are reserved for future use. The bits must be set to 0 and ignored on receipt.

### Version Number

The version number fields must be 0.

### Protocol Type

Contains the protocol type of the payload packet. Values are listed in the "ETHER TYPES" section of RFC 1700

Type	Value (Hex)
XNS	0600, 0807
IP version 4	0800
ARP	806
IP (VINES)	0BAD, 80C4
DRP	6003
LAT	6004
DRP	6003

Type	Value
LAVC	6007
IPX	8037
AppleTalk	809B
ARP (Atalk)	80F3
NetWare	8137
IP version 6	86DD

### Checksum

Standard IP checksum of the all the 16 bit words in the GRE header and payload packet.

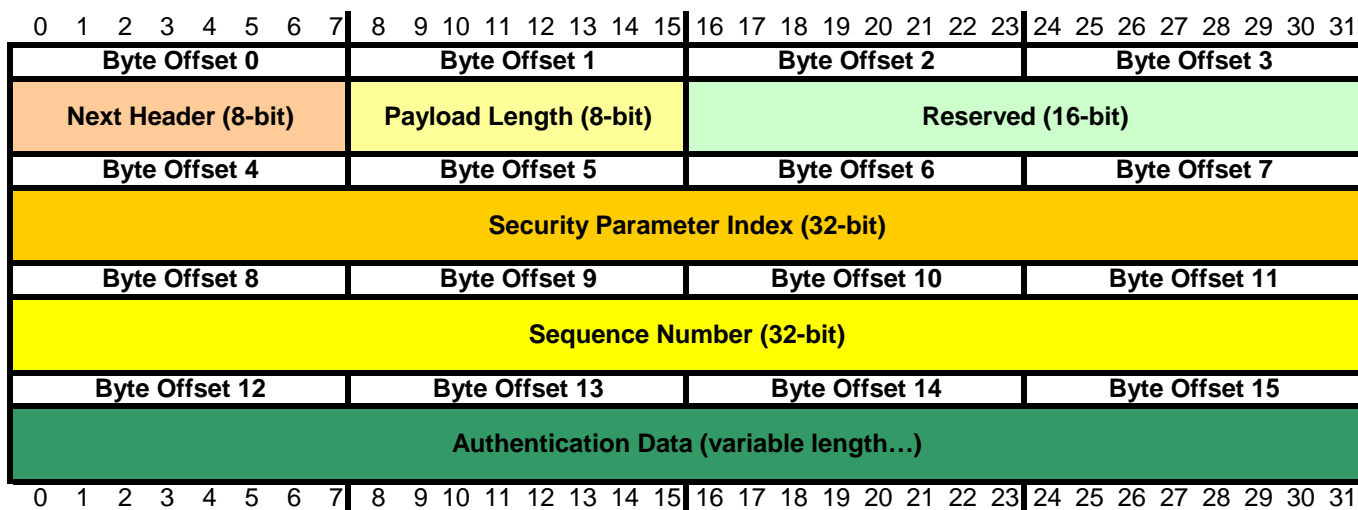

### Reserved - 1

Reserved for future use. Only present if checksum bit is set and if present must be 0.

### Authentication

Used by the authentication scheme

## Authentication Header - AH (RFC 2402)

### Next Header

Equivalent to the IP Protocol Identifier field in IPv4

D	Hex	Protocol	D	Hex	Protocol	D	Hex	Protocol	D	Hex	Protocol
1	0x01	ICMP	9	0x09	IGRP	47	0x2F	GRE	88	0x58	EIGRP
2	0x02	IGMP	17	0x11	UDP	50	0x32	ESP	89	0x59	OSPF
6	0x06	TCP	47	0x2F	GRE	51	0x33	AH			

### Payload Length

Specifies the length of the Authentication Header (number of 32-bit words - 2 for IPv6 compatibility)

### Reserved

Zero filled field

### Security Parameter Index (SPI)

Random 32-bit value used with destination IP address and IP Sec protocol to uniquely identify the SA.

The SPI is generally selected by the destination IP Sec node.

### Sequence Number

A 32-bit sequence number starting at zero and incremented by one for each packet.

This monotonically increasing sequence number is the AH anti-replay mechanism.

### Authentication Data

A variable-length field that contains the Integrity Check Value (ICV) for the packet.

The length of the IVC must be an integral multiple of 32 bits (IPv4) or 64 bits (IPv6); will need to be padded or truncated to meet the requirement.

### Original Packet

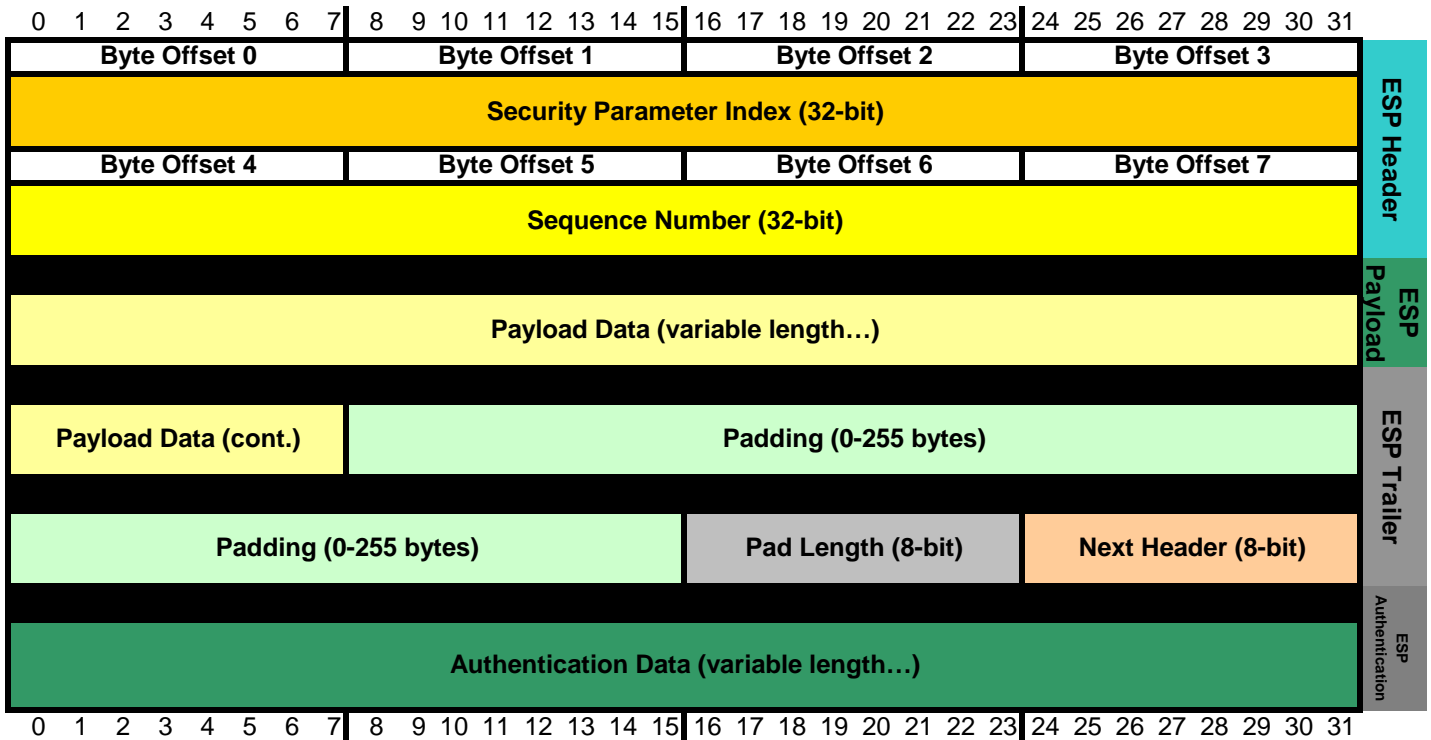

### AH Transport Mode Packet

### AH Tunnel Mode Packet

## Encapsulating Security Payload - ESP (RFC 2406)

### ESP Header

#### Security Parameter Index (SPI)

Random 32-bit value used with destination IP address and IP Sec protocol to uniquely identify the SA. The SPI is generally selected by the destination IP Sec node.

#### Sequence Number

A 32-bit sequence number starting at zero and incremented by one for each packet. This monotonically increasing sequence number is the AH anti-replay mechanism.

### ESP Payload

#### Payload Data

A variable-length field containing the data to be protected by the ESP protocol; i.e., the original IP packet

### ESP Trailer

#### Padding

A 0-255 byte field used for variety of purposes. It is primarily used to ensure that the Payload, Pad Length, & Next Header align on a 32-bit boundary. It can also be used if the ESP encryption algorithm requires a certain minimum number of bytes. Finally, it may be used to hide the real size of the payload (protect against traffic flow analysis)

#### Pad Length

8-bit value indicating the number of Pad bytes that were inserted.

#### Next Header

Equivalent to the IP Protocol Identifier field in IPv4

D	Hex		D	Hex		D	Hex	
1	0x01	ICMP	9	0x09	IGRP	47	0x2F	GRE
2	0x02	IGMP	17	0x11	UDP	50	0x32	ESP
6	0x06	TCP	47	0x2F	GRE	51	0x33	AH
						88	0x58	EIGRP
						89	0x59	OSPF

### ESP Authentication

#### Authentication Data

A variable-length field that contains the Integrity Check Value (ICV) for ESP the packet. The length of the this field is dependent upon the authentication function used. This field is present only if an authentication service is being employed in the SA.

# Encapsulating Security Payload - ESP (cont.)

Original Packet

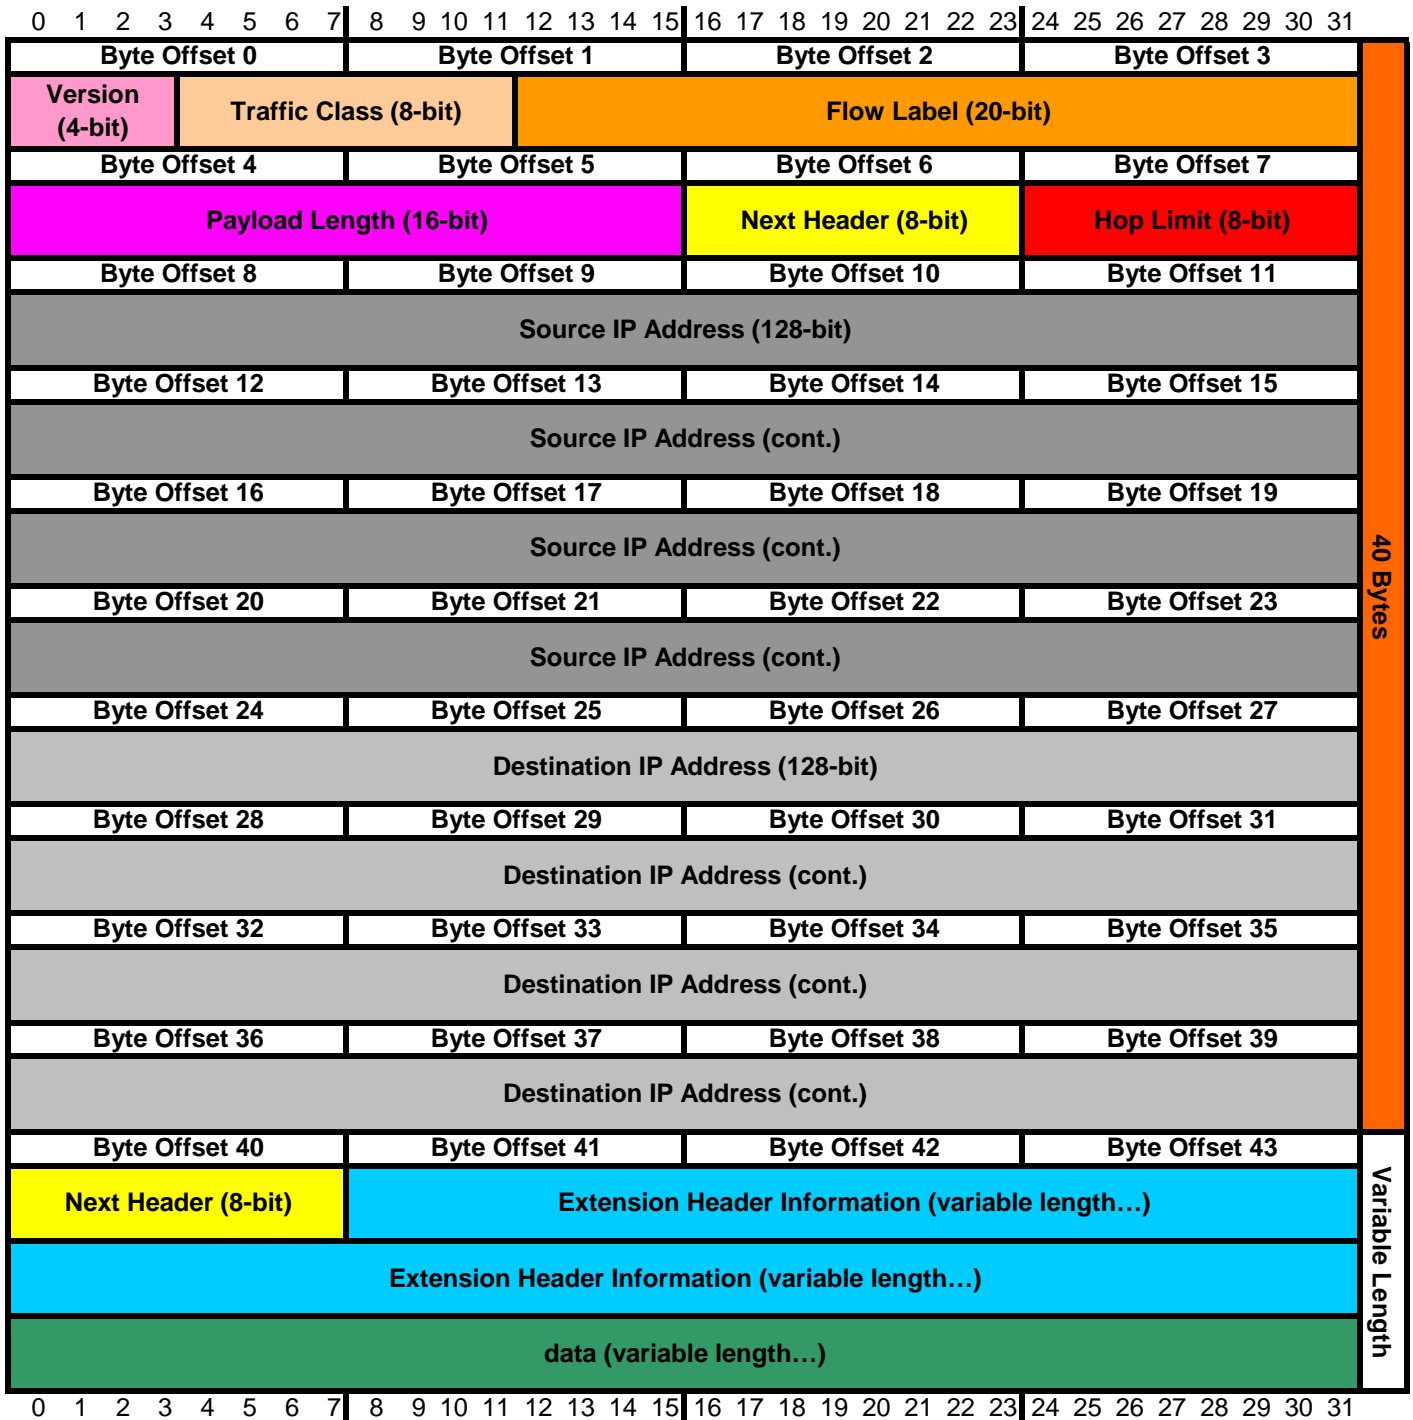

ESP Transport Mode Packet

ESP Tunnel Mode Packet

## IPv6 Header (RFC 2460)

<b>IP Version Number</b>	6 for IP version 6	4 for IP version 4
<b>Traffic Class</b>	8-bit field similar to IPv4 type of service field	
<b>Flow Label</b>	To tag packets of a specific flow to differentiate the packets at the network layer. (QoS)	
<b>Payload Length</b>	The total length of the data portion of the packet	
<b>Next Header</b>	Similar to the protocol field of IPv4 packet header	
<b>Hop Limit:</b>	Similar to Time to Live field in IPv4 packet header	
<b>Source Address</b>	128-bit source address field	
<b>Destination Address</b>	128-bit destination address field	

## IPv6 (cont.)

A IPv6 Address is 16 bytes (128 bits) this give us  $3.4 \times 10^{38}$

Samble IPv6 Address:

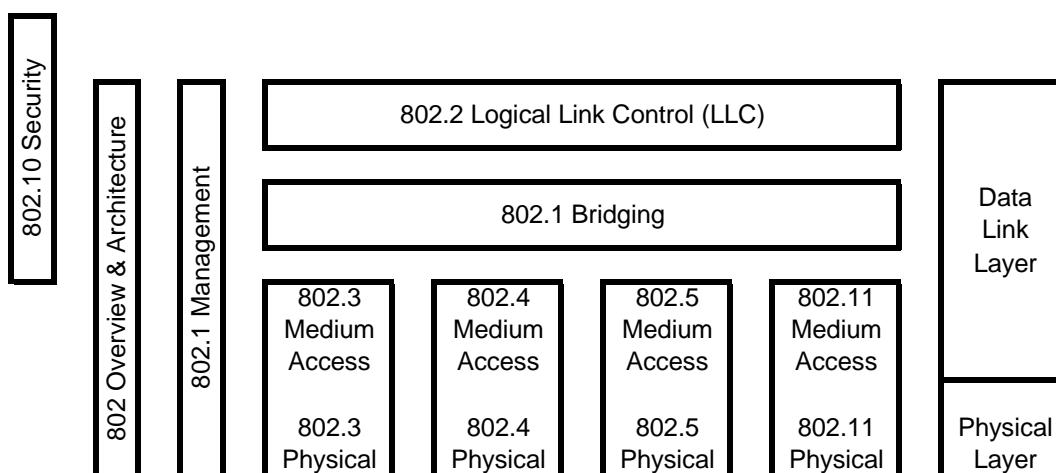

2001: 0db8: abcd:	1234:	0000: 0000: 9865: 4321
Global Prefix	Subnet	Interface ID

### Special IPv6 Addresses

Address	Description
<b>0:0:0:0:0:0:0:0</b>	Equal ::. This is the equivalent to IPv4's 0.0.0.0.
<b>0:0:0:0:0:0:0:1</b>	Equals ::1. This is equivalent to IPv4's local host of 127.0.0.1.
<b>0:0:0:0:0:0:192.168.100.1</b>	IPv4 address written in a mixed IPv6 / IPv4 network environment.
<b>2000::/3</b>	The global unicast address range.
<b>FC00::/7</b>	The unique local unicast range. Same Idea as the IPv4 RFC 1918 private addresses.
<b>FE80::/10</b>	The link-local unicast range. Same Idea as the IPv4 RFC 1918 private addresses. <b>But for on a single LAN. Non routeable.</b>
<b>FF00::/8</b>	The multicast range.
<b>3FFF:FFF::/32</b>	Reserved for examples and documentation.
<b>2001:0DB8::/32</b>	Reserved for examples and documentation.
<b>2002::/16</b>	Used with 6to4, which is the structure that allows IPv6 packets to be transmitted over an IPv4 network without the need to configure explicit tunnels.

**This page purposely left blank**

## IEEE Framing

### Ethernet II

A physical layer standard that defines the CSMA/CD access method on a bus topology. **This is the most common frame type for Ethernet IP traffic.**

### IEEE 802.1

#### Flavors of 802.1 (common)

- 802.1P** Provides a mechanism for implementing Quality of Service (QoS)
- 802.1Q** VLAN Tagging
- 802.1X** Port based network access control

### IEEE 802.2

A data link layer standard used with 802.3, 802.4, and 802.5 & 802.11

### IEEE 802.3

A physical layer standard that defines the CSMA/CD access method on a bus topology.

#### Flavors of 802.3

- 802.3 "RAW"** This framing does not use 802.2 LLC. **Novell used this framing.**
- 802.3 with 802.2** This framing does use the 802.2 LLC.
- 802.3 with 802.2 SNAP** This framing does have the LLC and SNAP. **Used in conjunction with Wireless traffic on the wired side.**

### IEEE 802.4

This is Token Passing Bus Access Method and Physical Layer Specifications.

### IEEE 802.5

Token Ring Access Method and Physical Layer Specifications.

### IEEE 802.11

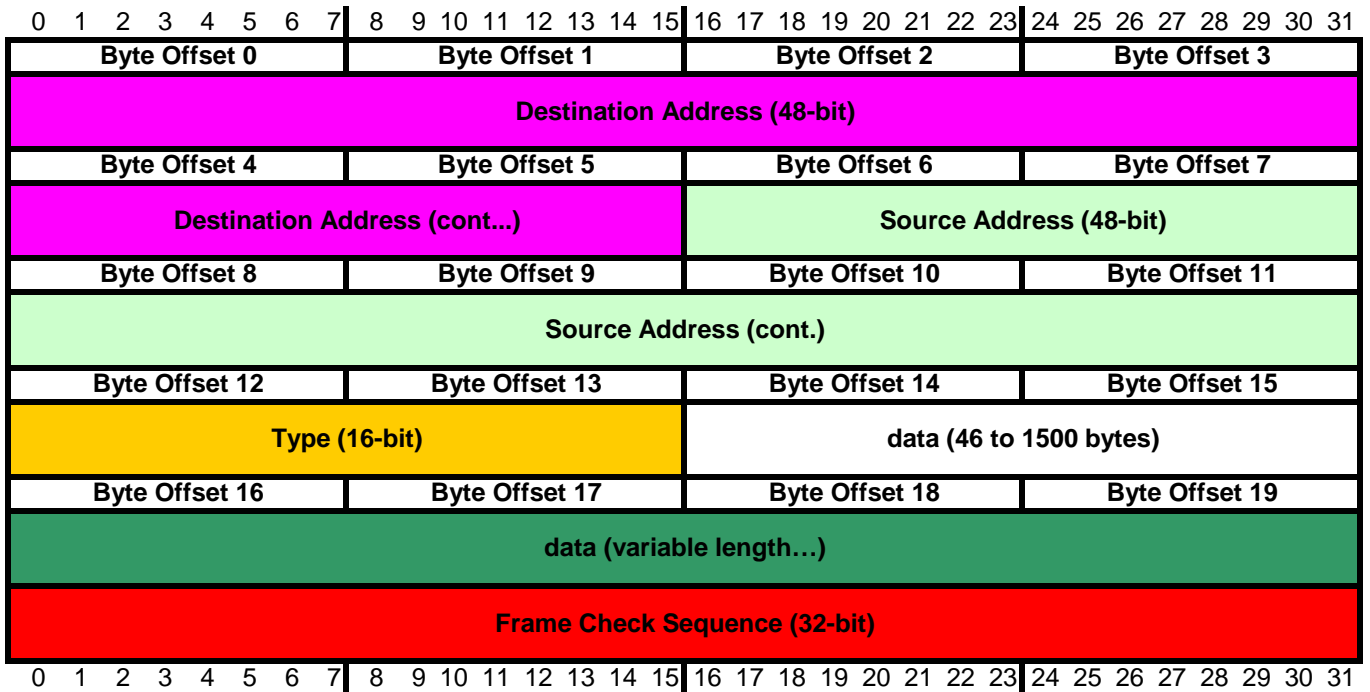

Wireless LAN Medium Access Control (MAC) and Physical Layer Specifications.

#### Flavors of 802.11 (common)

- 802.11a** 54 Mbit/s using the 5 GHz band with up to 23 non overlapping channels. (~15 users per AP)
- 802.11b** 11 Mbit/s using the 2.4 GHz band with 3 non-overlapping channels. (~25 users/AP)(Marketed - WiFi)
- 802.11g** 54 Mbit/s using the 2.4 GHz band with 3 non-overlapping channels. (~20 users/AP)(Marketed - WiFi)
- 802.11n** Allows for greater Mbit/s using multiple-input multiple-output (MIMO), channel bonding and frame aggregation. This standard can be used in the 2.4 with 3 non overlapping channels and 5.0 GHz band with up to 23 non overlapping channels. (~15 users per AP)

Organizationally Unique Identifier (OUI) This is the first 3 bytes of the Media Access Control (MAC) Address  
<http://standards.ieee.org/regauth/oui/oui.txt>

## Ethernet II Frame Format (similar to IEEE 802.3)

### Most common format of Ethernet packets today.

- Preamble:** 8 bytes (64 bit) At the head of each frame is a preamble used for synchronization  
1010...10101011 this is know as Manchester encoding.
- Destination Address:** 6 byte (48 bit) destination media access control (MAC) address
- Source Address:** 6 byte (48 bit) source media access control (MAC) address
- Type:** 2 byte (16 bit) field that specifies the upper-layer protocol  
Note: The **difference** between **Ethernet II** and **IEEE 802.3** is that this field in the IEEE standard is called the length field.

Type	Value (Hex)
XNS	0600, 0807
IP version 4	0800
ARP	0806
IP (VINES)	0BAD, 80C4
DRP	6003
LAT	6004
DRP	6003

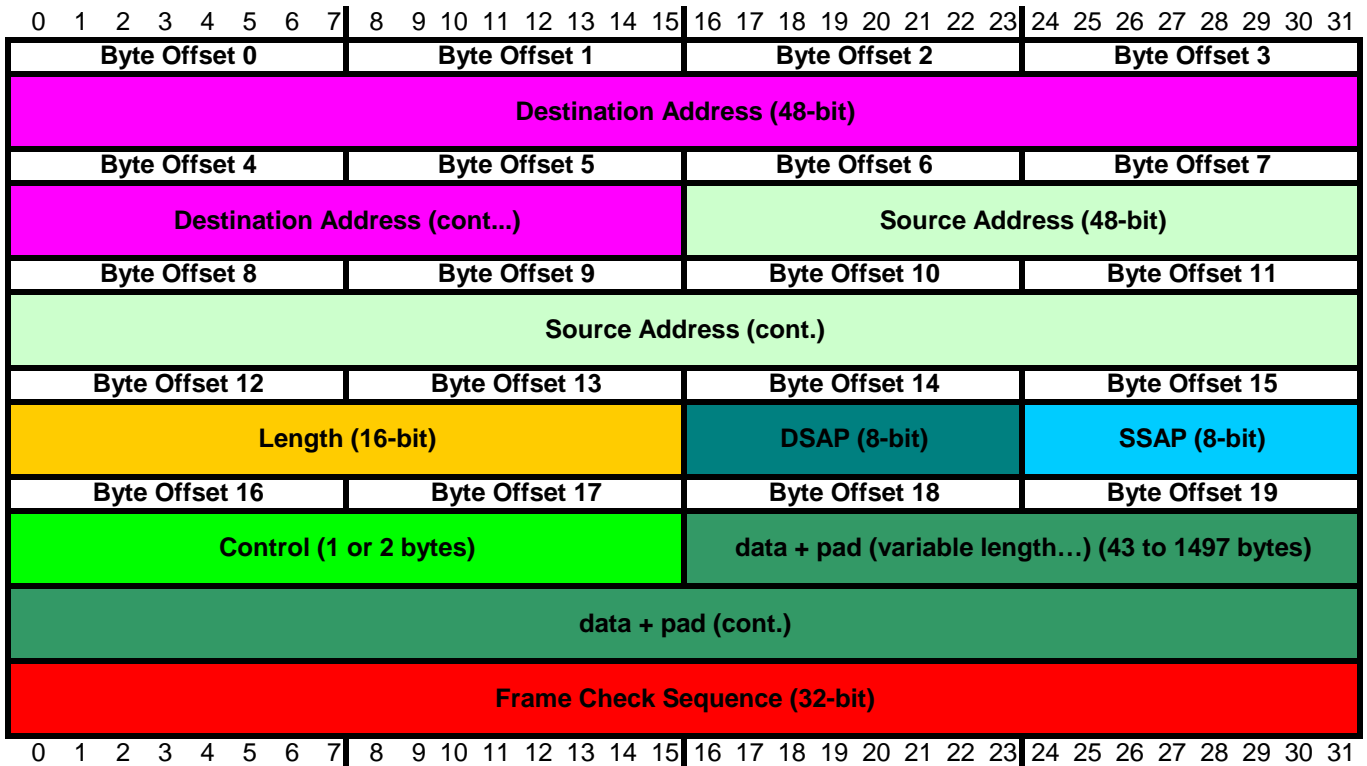

Type	Value
LAVC	6007
IPX	8037
AppleTalk	809B
ARP (Atalk)	80F3
NetWare	8137
IP version 6	86DD

- Data:** 46 to 1500 bytes of upper-layer protocol information
- Frame Check Sequence:** The cyclic redundancy check (CRC) or checksum for the Ethernet Frame

Min Ethernet Frame:  
 $14 \text{ byte frame header} + 46 \text{ bytes of encapsulated data} + 4 \text{ byte frame trailer} = 64 \text{ bytes}$

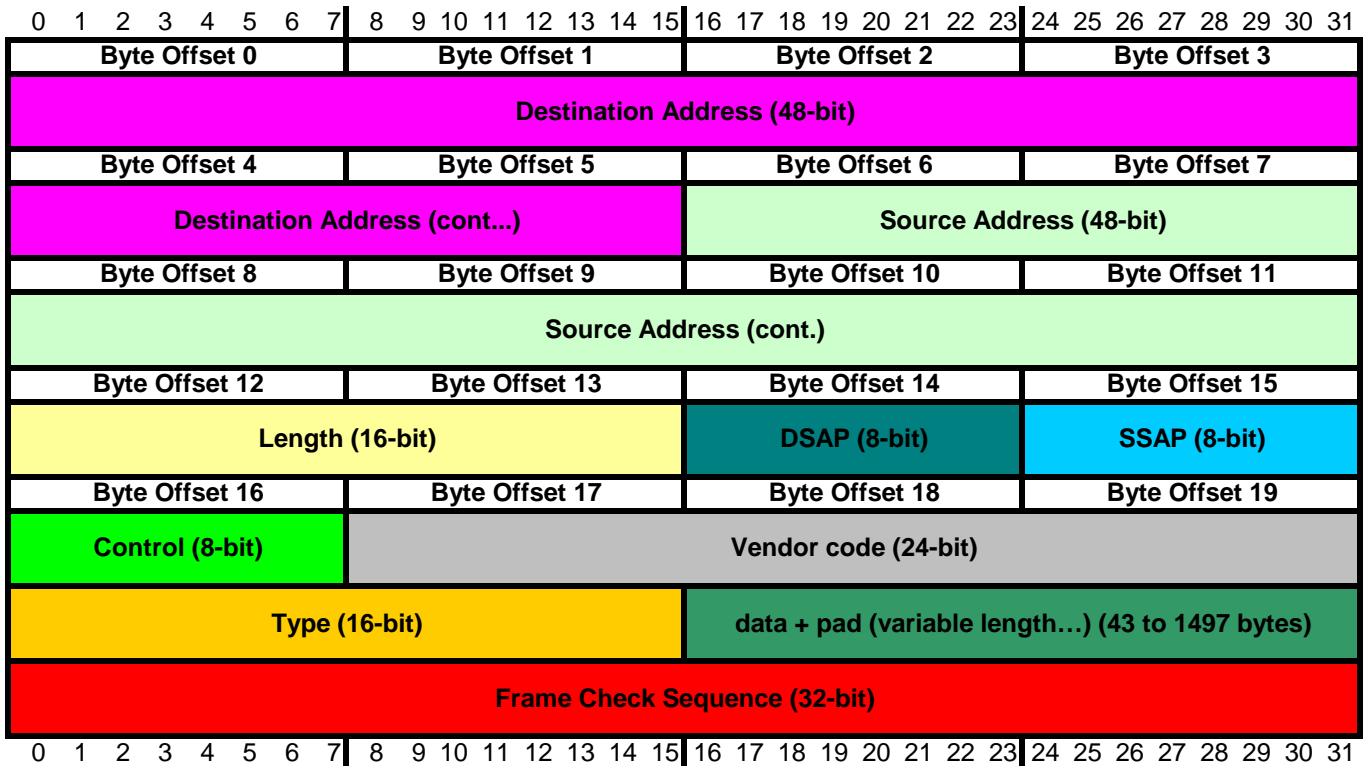

Max Ethernet Frame:  
 $14 \text{ byte frame header} + 1500 \text{ bytes of encapsulated data} + 4 \text{ byte frame trailer} = 1518 \text{ bytes}$

## Ethernet IEEE 802.2 Frame Format (802.3 with 802.2)

- Preamble:** 8 bytes (64 bits) At the head of each frame is a preamble used for synchronization  
1010...10101011
- Destination Address:** 6 bytes (48 bits) destination media access control (MAC) address (**Part of 802.3 Header**)
- Source Address:** 6 bytes (48 bits) source media access control (MAC) address (**Part of 802.3 Header**)
- Length:** 2 bytes (16 bits) field that specifies the number of bytes (3-1500) in the LLC and data fields (**Part of 802.3 Header**)
- Logical Link control**
  - The logical link control (LLC) is made up of the DSAP, SSAP and Control fields. This is a method for telling the 802.3 IEEE and Netware (RAW) formats. The IEEE 802.3 format has the LLC and the NetWare 802.3 "Raw" format does not. (**This is the 802.2 Header**)
  - DSAP:** 1 byte destination service access point; receiving process at destination
  - SSAP:** 1 byte source service access point; sending process at source
  - Control:** 1 byte is various control information (Connection less)  
2 bytes are for connection-oriented LLC
- Pad:** Pads the frame to minimum of 46 bytes of data and LLC (so collisions can be detected)
- Data:** 46 to 1500 bytes of upper-layer protocol information
- Frame Check Sequence:** The cyclic redundancy check (CRC) or checksum for the Ethernet Frame

## Ethernet IEEE 802.2 SNAP Frame Format (802.3 with 802.2 SNAP)

This is the Framing formate used on the Ethernet (wired) side with 802.11 with 802.2 SNAP for the wireless.

- Preamble:** 8 bytes (64 bite) At the head of each frame is a preamble used for synchronization  
1010...10101011
- Destination Address:** 6 byte (48 bit) destination media access control (MAC) address (**Part of 802.3 Header**)
- Source Address:** 6 byte (48 bit) source media access control (MAC) address (**Part of 802.3 Header**)
- Length:** 2 byte (16 bit) field that specifies the number of bytes (3-1500) in the LLC and data fields

**Logical Link control** The logical link control (LLC) is made up of the DSAP, SSAP and Control fields. This is a method for telling the 802.3 IEEE and Netware (RAW) formats. The IEEE 802.3 format has the LLS and the NetWare 802.3 "Raw" format does not. (**Part of the 802.2 SNAP Header**)

- DSAP:** 1 byte destination service access point; receiving process at destination (**Always AA**)
- SSAP:** 1 byte source service access point; sending process at source (**Always AA**)
- Control:** 1 byte is various control information (Connection less)  
2 bytes are for connection-oriented LLC

**SNAP Header** The Subnet Access Protocol Header consists of the Vendor Code and Type fields

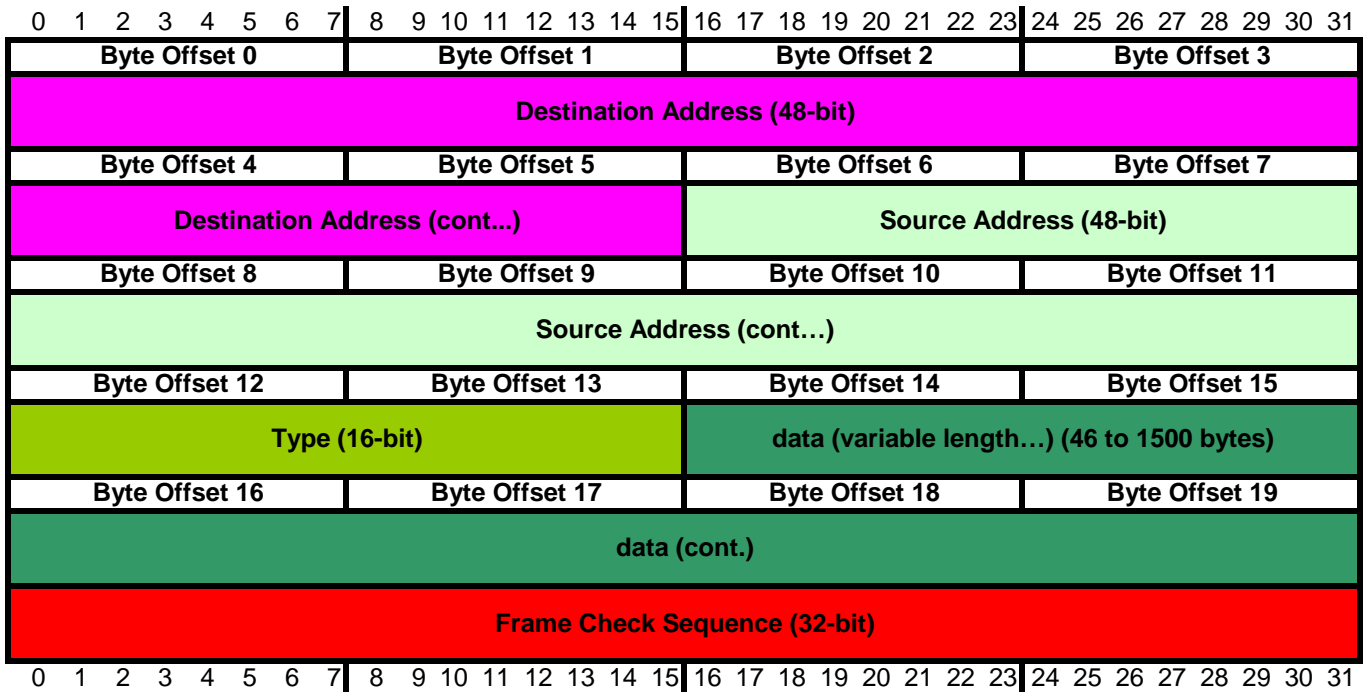

- Vendor Code:** 3 byte (24 bit) field to identify the vendor
- Type:** 2 byte (16 bit) field that specifies the upper-layer protocol

Type	Value
NetWare	8137
XNS	0600, 0807
IP	800
IP (VINES)	0BAD, 80C4
ARP	806

Type	Value
RARP	8035
DRP	6003
LAT	6004
LAVC	6007
ARP (Atalk)	80F3

- Pad:** Pads the frame to minimum of 46 bytes of data and LLC (so collisions can be detected)
- Data:** 46 to 1500 bytes of upper-layer protocol information
- Frame Check Sequence:** The cyclic redundancy check (CRC) or checksum for the Ethernet Frame

## Ethernet Novell Netware 802.3 "Raw" Frame Format (802.3 without 802.2)

### IP Version Number

**Preamble:** 8 bytes (64 bits) At the head of each frame is a preamble used for synchronization  
1010...10101011

**Destination Address:** 6 bytes (48 bits) destination media access control (MAC) address

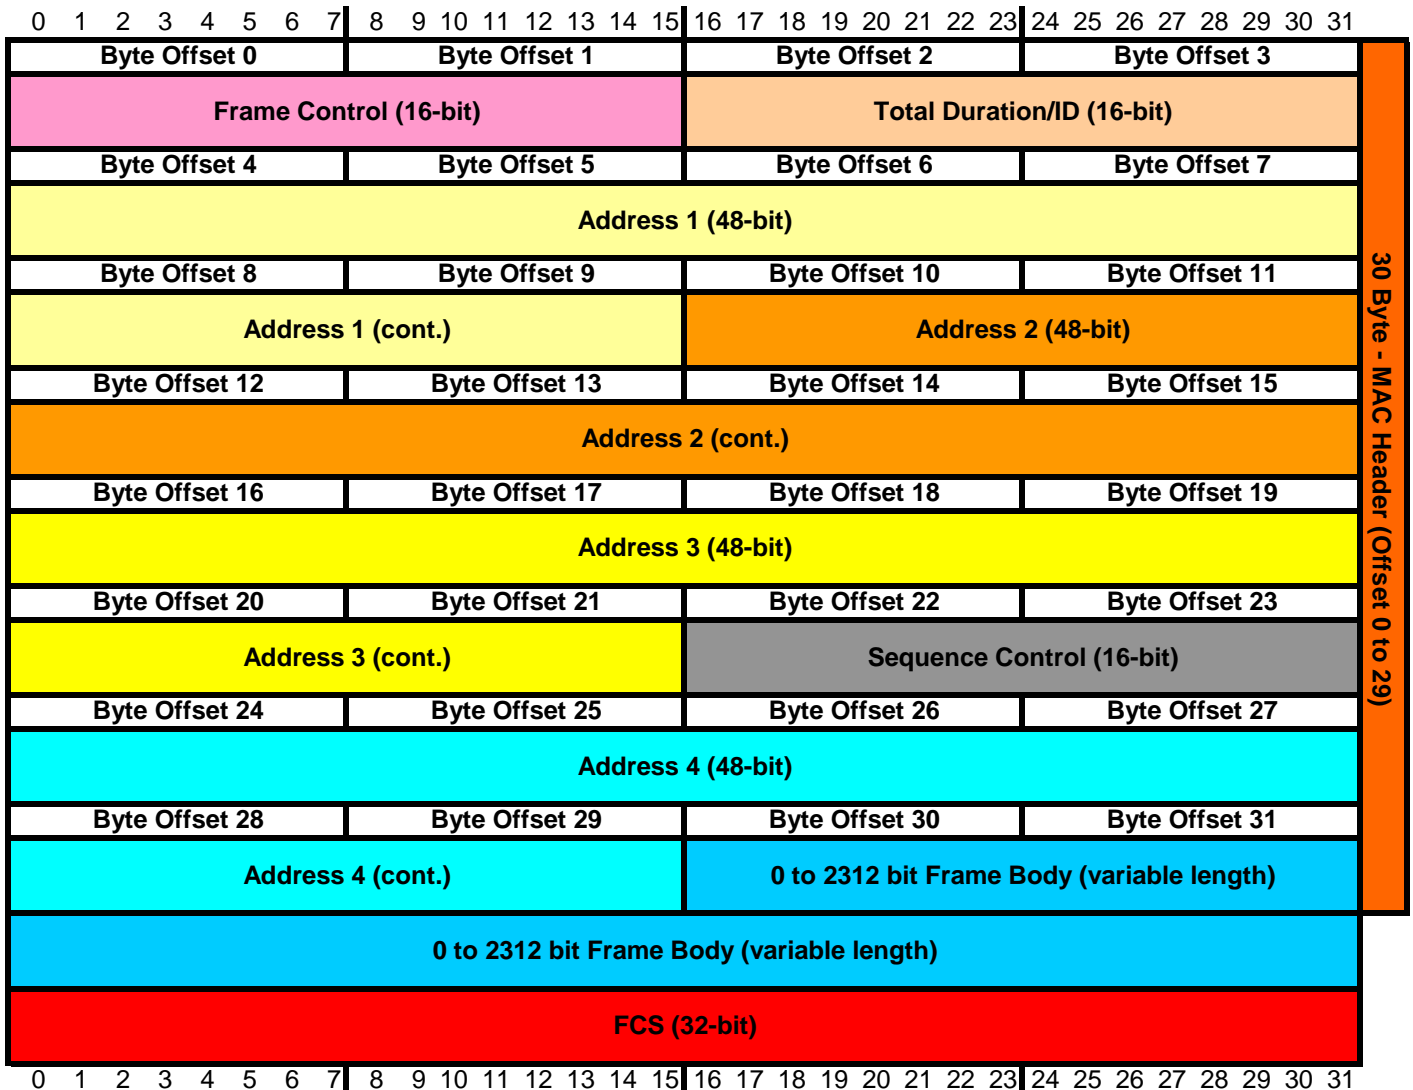

**Source Address:** 6 bytes (48 bits) source media access control (MAC) address

**Length:** 2 bytes (16 bits) field that specifies the number of bytes (46-1500) in the LLC and data fields  
Note the lack of the LLC fields, this is how you tell Netware 802.3 from IEEE 802.3

**Data:** 46 to 1500 bytes of upper-layer protocol information. IPX header starting with 2 byte checksum (usually FFF) followed by NetWare higher layers ('data')

**Frame Check Sequence:** The cyclic redundancy check (CRC) or checksum for the Ethernet Frame

## 802.11 (IEEE 1999 Reference Specification)

**Frame Control** Consists of the following subfields: Protocol Version (bits 0-1), Type (bits 2-3), Subtype (bits 4-7), To DS (bit 8), From DS (bit 9), More Fragment (bit 10), Retry (bit 11), Power management (bit 12), More Data (bit 13), WEP (bit 14) and Order (bit 15)

**Duration / ID** **Duration/ID field encoding**

15	14	bit 13 - 0	Usage
0		0 - 32767	Duration
1	0	0	Fixed value within frames transmitted during the CFP
1	0	1-16383	Reserved
1	1	0	Reserved
1	1	1-2007	Association Identifier (AID) in PS-Poll frames <b>(Max association per AP is 2007)</b>
1	1	2008 - 16383	Reserved

**Address Fields** There are 4 address fields in the MAC frame format. These fields are used to indicate the BSSID, source address (SA), destination address (DA), transmitting station address (TA), and the receiving station address (RA).

**Sequence Control** Consists of the following subfields: Fragment Number (bits 0-3) and Sequence Number (bits 4-15). Frames that have a payload larger than **2312 bytes** will be fragmented.

**Frame Body** Variable length field that contains information specific to individual frame types and subtypes.

**FCS** 32-bit check sum field calculated over all the fields of the MAC header and Frame body

## 802.11 (cont.)

Frame Control

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
Byte Offset 0								Byte Offset 1								
PV (2-bit)	Type (2-bit)	Subtype (4-bit)				TDS	FDS	MF	Retry	PM	MD	WEP	Orde			

**Protocol Version**

Currently the value should always be 0

**Type / Subtype**

The type and subtype field together identify the function of the frame

Type		Type	Subtype				Subtype Description
b3	b2	Description	b7	b6	b5	b4	
0	0	Management	0	0	0	0	Association Request
0	0	Management	0	0	0	1	Association Response
0	0	Management	0	0	1	0	Reassociation Request
0	0	Management	0	0	1	1	Reassociation Response
0	0	Management	0	1	0	0	Probe Request
0	0	Management	0	1	0	1	Probe Response

1	0	Data	0	1	0	1	CF-Ack (no data)
1	0	Data	0	1	1	0	CF-Poll (no data)
1	0	Data	0	1	1	1	CF-Ack + CF-Poll (no data)
1	0	Data	1000-1111				Reserved
1	1	Reserved	0000-1111				Reserved

### Miscellaneous Info

802.11a	54 Mbit/s using the 5 GHz band
802.11b	11 Mbit/s using the 2.4 GHz band (Marketed under the name WiFi)
802.11g	54 Mbit/s using the 2.4 GHz band (Marketed under the name WiFi)
802.11n	Allows for greater Mbit/s using multiple-input multiple-output (MIMO), channel bonding and frame aggregation. This standard can be used in the 2.4 and 5.0 GHz band.

802.11 header information was compiled from the 802.11 1999 reference specification available at  
<http://standards.ieee.org/getieee802/download/802.11-1999.pdf>

## 802.11 (cont.)

### Frame Control

	0	1	2	3	4	5	6	7		8	9	10	11	12	13	14	15
	Byte Offset 0							Byte Offset 1									
	PV (2-bit)	Type (2-bit)	Subtype (4-bit)				TDS	FDS	MF	Retry	PM	MD	WEP	Order			

### To DS

Set to 1 in data type frames destined for the DS. This includes all data type frames sent by wireless stations associated with an AP. The To DS field is set to 0 in all other frames.

### From DS

Set to 1 in data type frames exiting the DS. It is set to 0 in all other frames.

DS		TO/From DS Values	Meaning
To	From		
0	0		A data frame direct from one wireless station to another wireless within the same IBSS, as well as all management and control type frames. ( <b>AD HOC</b> ) <b>Address 1 is Destination, Address 2 is Source, Address 3 is BSSID*</b>
0	1		Data frame destined for the DS ( <b>to</b> a wired network) from a wireless station ( <b>Infrastructure</b> ) <b>Address 1 is Destination, Address 2 is BSSID, Address 3 is Source</b>
1	0		Data frame exiting the DS ( <b>from</b> a wired network) to a wireless station ( <b>Infrastructure</b> ) <b>Address 1 is BSSID, Address 2 is Source, Address 3 is Destination</b>
1	1		Wireless distribution system ( <b>WDS</b> ) frame being distributed from one AP to another AP <b>Address 1 is Receiver, Address 2 is Transmitter</b> <b>Address 3 is Destination, Address 4 is Source</b>

\* **Note:** The BSSID in an IBSS network is a randomly-selected value with the first 2 bits consistently set to 01. The value is in the range of 40:00:00:00:00:00 to 7f:ff:ff:ff:ff:ff.

### More Fragments

Set to 1 in all data management type frames that have another fragment of the current MSDU or current MMPDU to follow. It is set to 0 in all other frames.

### Retry

Set to 1 in any data or management type frame that is a retransmission of an earlier frame. It is set to 0 in all other frames. A receiving station uses this indication to aid in the process of eliminating duplicate frames.

### Power Management

Set to 1 indicates that the STA will be in power-save mode. A value of 0 indicates that the STA will be in active mode. This field is always set to 0 in frames transmitted by an AP.

### More Data

Set to 1 in directed data type frames transmitted by a contention-free (CF)-Pollable STA to the point coordinator (PC) in response to a CF-Poll to indicate that the STA has at least one additional buffered MSDU available for transmission in response to a subsequent CF-Poll. Set to 0 in all other directed frames.

### WEP

Set to 1 if the Frame Body field contains information that has been processed by the WEP algorithm. The WEP field is set to 0 in all other frames. When the WEP bit is set to 1, the Frame Body field is expanded.

### Order

Set to 1 if any data type frame that contains an MSDU, or fragment thereof, which is being transferred using the Strictly Ordered service class. Set to 0 in all other frames.

### Sequence Control

	0	1	2	3	4	5	6	7		8	9	10	11	12	13	14	15
	Byte Offset 22							Byte Offset 23									
	Fragment # (4-bit)				Sequence Number (12-bit)												

### Fragment field

Field value can be 0 to 4096. Normally 0 because packets are not normally fragmented. Each fragment is assigned a unique fragment number with the entirety of the packet identified with a single sequence number. **Note:** Frames that have a payload larger than 2312 bytes will be fragmented.

<b>Kismet</b>	
<b>Commands</b>	
Key	Description
<b>QUICK REFERENCE</b>	
e	List Kismet servers
z	Toggle fullscreen zoom of network view
m	Toggle muting of sound and speech
t	Tag (or untag) selected network
g	Group tagged networks
u	Ungroup current group
c	Show clients in current network
L	Lock channel hopping to the current network channel
H	Return to normal channel hopping
+	Expand groups
-	Collapse groups
^L	Force a screen redraw
<b>POPUP WINDOWS</b>	
h	Help
n	Name current network
i	detailed information about selected network
s	Sort network list
l (lower case L)	Show wireless card power levels
d	Dump printable strings
r	Packet rate graph
a	Statistics
p	Dump packet type
f	Follow network center
w	Track alerts
x	Cloase popup window
Q	Quit

#### Definitions of Symbols

<b>Network/Group Types:</b>		
Symbol	Name	Description
P	Probe Request	No associated connection yet
A	Access Point	Standard wireless network
H	ad-hoc	Point-to-point wireless network (IBSS)
T	Turbocell	Turbocell (aka Karlnet or Lucent Outdoor Router) network
G	Group	Group of wireless networks
D	Data	data only network with no control packets
<b>Status Flags</b>		
Symbol	Description	
F	Vulnerable factory configuration.	
T#	Address range of # octets found via TCP traffic	
U#	Address range of # octets found via UDP traffic	
A#	Address range of # octets found via ARP traffic	
D	Address range found via observed DHCP traffic	
W	WEPed network decrypted with user-supplied key	

Information obtained from the Kismet help screen

# TCPDUMP / WINDUMP

windump -i <interface> -nX capture from interface (-i <interface>) do not convert names(-n) and print out hex and ascii (-X)

windump -i <interface> -nX -s0 capture from interface (-i <interface>) do not convert names(-n), print out hex and ascii (-X) and capture all the packet

windump -r <file> -nXp capture from file (-r <file>), do not convert names (-n), print out hex and ascii (-X), not in promiscuous mode (-p)

## Keywords

Bit Masking	tcpflags	icmptype	icmp-echoreply	icmp-echo	icmp-paramprob
And unwanted bits with 0	tcp-fin		icmp-unreachable	icmp-ireq	icmp-tstamp
And wanted bits with 1	tcp-syn		icmp-sourcequench		icmp-tstampreply
0 AND 0 = 0	tcp-rst		icmp-redirect		icmp-ireq
0 AND 1 = 0	tcp-push		icmp-routeradvert		icmp-ireqreply
1 AND 0 = 0	tcp-ack		icmp-routersolicit		icmp-maskreq
1 AND 1 = 1	tcp-urg		icmp-timxceed		icmp-maskreply

**Expressions:** >, <, >=, <=, =, !=, +, -, \*, /, &, | ! or not && or and || or or

**filter format <protocol header>[offset:length]<relation><value>**  
 tcpdump [command line options] ['filter']  
 windump [command line options] ["filter"]

## Examples

host A and B	Connections between host A and host B				
ip[9] = 1	icmp	ip[9] = 6	tcp	ip[9] = 17	udp
tcp[2:2] < 20	The TCP dst port is greater than 20		udp[6:2] != 0	Non-zero UDP checksum	
tcp[tcpflags]=tcp-syn	Only Syn	tcp[13] &0x02 != 0	At minimum the SYN bit set		
tcp[tcpflags]=tcp-ack	Only Ack	tcp[13] &0x10 != 0	At minimum the ACK bit set		
tcp[tcpflags]=tcp-fin	or	tcp[13] &0xff=0x01	Only the FIN bit is set		tcp[13] &0xff = 1
tcp[13] &0xff = 16	or	tcp[13] &0xff = 0x10	Only the ACK bit is set		
icmp[0]=3 and icmp[1]=2	icmp type 3 is destination unreachable category and a code of 2 specifies that this is an ICMP protocol unreachable ( <b>Good filter for detecting protocol scans</b> )				
(tcp and (tcp[13] &0x0f != 0) and not port 25 and not port 20)	A tcp packet where any combination of PSH, RST, SYN, FIN are set and the packet is not port 25 or 20				
udp[21:4]=0x56455253	Looks for "VERS" in udp payload for VERSION.BIND				
tcp[20:4] = 0x5353482d	Looks for "SSH-" in TCP payload				
ip[6:2] & 0x3fff != 0	Look for ALL fragmented ip packets				
ip[6] &0x20 = 0x20 or ip[6:2] &0x1fff != 0	Look for more fragment bit set <b>or</b> fragment offset greater than 0 ( <b>Look for ALL fragmented ip packets</b> )				
ip[6] &0x20 = 0 and ip[6:2] &0x1fff != 0	Look for more fragment bit <b>not</b> set <b>and</b> fragment offset greater than 0 ( <b>Last fragment packets</b> )				

## TCPDUMP / WINDUMP (cont.)

Command Line Options	
Options	Description
-a	Attempt to convert network and broadcast addresses to names
-A	
-B <size>	Set driver's buffer size to size in KiloBytes. The default buffer size is 1 megabyte (i.e 1000).
-c <count>	Exit after receiving <count> of packets
-C <file size>	Before writing a raw packet to a savefile, check whether the file is currently larger than file_size and, if so, close the current savefile and open a new one.
-d	Dump the compiled packet-matching code in a human readable form to standard output and stop
-dd	Dump packet-matching code as a C program fragment
-ddd	ddd Dump packet-matching code as decimal numbers (preceded with a count)
-D	Print the list of the interface cards available on the system. WINDUMP ONLY
-e	Print the link-level header on each dump line
-E <algo:secret>	Use algo:secret for decrypting IPsec ESP packets where algorithms may be des-cbc, 3des-cbc, blowfish-cbc, rc3-cbc, cast128-cbc, or none.
-f	Print 'foreign' internet addresses numerically rather than symbolically
-F <file>	Use file as input for the filter expression
-i <interface>	Listen on interface (defaults to lowest numbered interface)
-l	Make stdout line buffered. ``tcpdump -l   tee dat" or ``tcpdump -l > dat & tail -f dat"
-L	
-m <module>	Load SMI MIB module definitions from file module
-n	Don't convert addresses to names
-nn	Don't convert addresses or port numbers (port numbers are resolved based on information the the linux /etc/service file or the windows %windir%\system32\drivers\etc\services file.)
-N	Don't print domain name qualification of host names
-O	Do not run the packet-matching code optimizer
-p	Don't put the interface into promiscuous mode
-q	Quick output – print less protocol information
-r <file>	Read packets from file (created with the –w option)
-R	Assume ESP/AH packets to be based on old specs
-s <snaplen>	Snarf snaplen bytes of data from each packet (default is 68)
	1518 Max Ethernet Frame (14 byte Ethernet header + 1500 byte IP + 4 byte Ethernet trailer) 64 Min Ethernet Frame (14 byte Ethernet header + 64 byte IP + 4 byte Ethernet trailer)
	<b>Note: -s0 mean full ethernet packet</b>
-S	Print absolute, rather than relative TCP sequence numbers
-t	Don't print a timestamp on each dump line
-T <type>	Force packets selected by "expressions" to be interpreted the specified type (cnfp, rpc, rtp, snmp, wb)
-tt	Print an unformatted timestamp on each dump line
-ttt	Print a delta (in micro-seconds) between current and previous line on each dump line
-tttt	Print a timestamp in default format proceeded by date on each dump line
-u	Print undecoded NFS handles
-U	
-v	Verbose output (TOS, TTL, IP ID, Fragment Offset, IP Flags, length)
V	
-w <file>	Write the raw packet to file rather than parsing and printing to stdout
-x	Print each packet (minus link level header) in hex
-X	Print each packet in hex and ascii
-y <datalinktype>

<http://windump.polito.it/docs/manual.htm#Wdump>

## NGREP

### ngrep

<-hXViqpevxIDt> <-IO pcap\_dump> <-n num> <-d dev> <-A num> <-s snaplen> <-S limitlen>  
**<match expression>**  
**<bpf filter>**

### Command Line Options

<b>-A (num)</b>	is dump num packets after a match
<b>-D</b>	is replay pcap_dumps with their recorded time intervals
<b>-d (device)</b>	is use a device different from the default (pcap)
<b>-e</b>	is show empty packets
<b>-h</b>	is help/usage
<b>-i</b>	is ignore case
<b>-I (file)</b>	is read packet stream from pcap format file pcap_dump ( <b>Capitol I</b> )
<b>-l</b>	is make stdout line buffered
<b>-n (num)</b>	is look at only num packets
<b>-O (file)</b>	is dump matched packets in pcap format to pcap_dump
<b>-p</b>	is don't go into promiscuous mode
<b>-q</b>	is be quiet
<b>-S (limitlen)</b>	is set the limitlen on matched packets
<b>-s (snaplen)</b>	is set the bpf caplen
<b>-t</b>	is print timestamp every time a packet is matched
<b>-T</b>	is print delta timestamp every time a packet is matched
<b>-V</b>	is version information
<b>-v</b>	is invert match
<b>-w</b>	is word-regex (expression must match as a word)
<b>-X</b>	is interpret match expression as hexadecimal
<b>-x</b>	is print in alternate hexdump format

<match expression> is either an extended regular expression or a hexadecimal string. see the man page for more information.  
 <bpf filter> is any bpf filter statement.

#### Examples:

ngrep " icmp	print all UDP packets
ngrep " tcp	print all TCP packets
ngrep " udp	print all UDP packets
ngrep " port 53	print all packets to or from TCP or TDP port 53
ngrep " tcp port 53	print all packets to or from only TCP port 53
ngrep - v " tcp port 53	print all packets but those to or from TCP port 53
ngrep 'USER PASS' tcp port 21	print all packets to or from TCP port 21 where USER or PASS
ngrep 'SSH-' port tcp 22	print all packets to or from TCP port 22 where SSH-
ngrep 'LILWORD' port 138	print Microsoft browsing traffic for NT domain LILWORD
ngrep -iq 'rcpt to mail from' tcp port 25	monitor current delivery and print sender and recipients
ngrep 'user' port 110	monitor POP3
ngrep -q 'abcd' icmp	"pinging" host running a Microsoft operating system?
ngrep -i -I <input file> "Yahoo"	read from input file and search for case insensitive "Yahoo"

**Note:** You can use "frame contains <string>" in ethereal to do similar searches.

<http://www.packetfactory.net/projects/ngrep/usage.html>

## Wireless Filters

wlan.fc.wep = 1	Displays all the frames that do have the <b>WEP</b> bit (or privacy bit) set
wlan.fc.wep != 1	Displays all the frames that do <b>NOT</b> have the <b>WEP</b> bit (or privacy bit) set
eapol and eap.type == 17	Will display <b>Cisco Leap</b> packets
eap.type == 17 and eap.code == 2	Will display only <b>Cisco Leap</b> packets that are <b>EAP responses</b>
wlan_mgt.tag.number == 221	Displays <b>TKIP</b> or <b>AES</b> packets
wlan.bssid == <mac>	Displays only packets that have the specified BSSID
wlan.fc.type_subtype eq 32	Displays only data frames
wlan.fc.type_subtype eq 11 or wlan.fc.type_subtype < 6	Display all probe request and response packets
wlan.fc.type_subtype != 8	Will exclude all the beacon frames from a wireless packet capture
wlan.da[0:1] == 1	Displays packets where the 1st byte in the destination MAC address is 0x01, a multicast address. <a href="http://www.iana.org/assignments/multicast-addresses">http://www.iana.org/assignments/multicast-addresses</a> <a href="http://www.cavebear.com/Cavebear/ethernet/multicast.html">http://www.cavebear.com/Cavebear/ethernet/multicast.html</a>
(wlan.fc.wep != 1) and (wlan.fc.type_subtype eq 32) and !(STP or http or nbus or arp or dns or browser or rip)	

## General IP Filters

ip.proto == 0x??	Display ICMP if ??=01, TCP if ??= 06 and UDP if ??=11
tcp.flags.syn == 0	tcp.flags.ack == 0                      tcp.flags.fin == 0
tcp.flags.reset == 0	tcp.flags.push == 0

## IPSec Filters

ip.proto == 0x??	Display IPSec AH if ??=51 and ESP if ??=50
isakmp or udp.port eq 500 or udp.port eq 10000 or udp.port eq 5150	Displays ISAKMP traffic (Note 500/CheckPoint, 10000/Cisco, 5150/agere)
isakmp[18] eq 4	Display IPSec ISAKMP packets using aggressive IKE mode

## OS Finger Printing

browser.os_major < 5	Display pre-Windows 2000 Clients (Note: eq 5 WK2000 System)
----------------------	---

## Finds Data In A Packet

data contains "HTTP/1.1 240"	Displays a packets with HTTP error code 240 in the header
http.cookie contains "x"	Displays data "x" list in the cookie

Organizationally Unique Identifiers                      1st 24 bits of MAC. OUI to Org. <http://standards.ieee.org/regauth/oui/oui.txt>

## Windows TCP / UDP Ports

Port	Protocol	Application protocol	System service name
n/a	GRE	GRE (IP protocol 47)	Routing and Remote Access
n/a	ESP	IPsec ESP (IP protocol 50)	Routing and Remote Access
n/a	AH	IPsec AH (IP protocol 51)	Routing and Remote Access
7	TCP	Echo	Simple TCP/IP Services
7	UDP	Echo	Simple TCP/IP Services
9	TCP	Discard	Simple TCP/IP Services
9	UDP	Discard	Simple TCP/IP Services
13	TCP	Daytime	Simple TCP/IP Services
13	UDP	Daytime	Simple TCP/IP Services
17	TCP	Quotd	Simple TCP/IP Services
17	UDP	Quotd	Simple TCP/IP Services
19	TCP	Chargen	Simple TCP/IP Services
19	UDP	Chargen	Simple TCP/IP Services
20	TCP	FTP default data	FTP Publishing Service
21	TCP	FTP control	FTP Publishing Service
21	TCP	FTP control	Application Layer Gateway Service
23	TCP	Telnet	Telnet
25	TCP	SMTP	Simple Mail Transfer Protocol
25	UDP	SMTP	Simple Mail Transfer Protocol
25	TCP	SMTP	Exchange Server
25	UDP	SMTP	Exchange Server
42	TCP	WINS Replication	Windows Internet Name Service
42	UDP	WINS Replication	Windows Internet Name Service
53	TCP	DNS	DNS Server
53	UDP	DNS	DNS Server
53	TCP	DNS	Internet Connection Firewall/Internet Connection Sharing
53	UDP	DNS	Internet Connection Firewall/Internet Connection Sharing
67	UDP	DHCP Server	DHCP Server
67	UDP	DHCP Server	Internet Connection Firewall/Internet Connection Sharing
69	UDP	TFTP	Trivial FTP Daemon Service
80	TCP	HTTP	Windows Media Services
80	TCP	HTTP	World Wide Web Publishing Service
80	TCP	HTTP	SharePoint Portal Server
88	TCP	Kerberos	Kerberos Key Distribution Center
88	UDP	Kerberos	Kerberos Key Distribution Center
102	TCP	X.400	Microsoft Exchange MTA Stacks
110	TCP	POP3	Microsoft POP3 Service
110	TCP	POP3	Exchange Server
119	TCP	NNTP	Network News Transfer Protocol
123	UDP	NTP	Windows Time
123	UDP	SNTP	Windows Time
135	TCP	RPC	Message Queuing
135	TCP	RPC	Remote Procedure Call
135	TCP	RPC	Exchange Server
135	TCP	RPC	Certificate Services
135	TCP	RPC	Cluster Service
135	TCP	RPC	Distributed File System
135	TCP	RPC	Distributed Link Tracking
135	TCP	RPC	Distributed Transaction Coordinator
135	TCP	RPC	Event Log
135	TCP	RPC	Fax Service
135	TCP	RPC	File Replication

## Windows TCP / UDP Ports

Port	Protocol	Application protocol	System service name
135	TCP	RPC	Group Policy
135	TCP	RPC	Local Security Authority
135	TCP	RPC	Remote Storage Notification
135	TCP	RPC	Remote Storage Server
135	TCP	RPC	Systems Management Server 2.0
135	TCP	RPC	Terminal Services Licensing
135	TCP	RPC	Terminal Services Session Directory
137	UDP	NetBIOS Name Resolution	Computer Browser
137	UDP	NetBIOS Name Resolution	Server
137	UDP	NetBIOS Name Resolution	Windows Internet Name Service
137	UDP	NetBIOS Name Resolution	Net Logon
137	UDP	NetBIOS Name Resolution	Systems Management Server 2.0
138	UDP	NetBIOS Datagram Service	Computer Browser
138	UDP	NetBIOS Datagram Service	Messenger
138	UDP	NetBIOS Datagram Service	Server
138	UDP	NetBIOS Datagram Service	Net Logon
138	UDP	NetBIOS Datagram Service	Distributed File System
138	UDP	NetBIOS Datagram Service	Systems Management Server 2.0
138	UDP	NetBIOS Datagram Service	License Logging Service
139	TCP	NetBIOS Session Service	Computer Browser
139	TCP	NetBIOS Session Service	Fax Service
139	TCP	NetBIOS Session Service	Performance Logs and Alerts
139	TCP	NetBIOS Session Service	Print Spooler
139	TCP	NetBIOS Session Service	Server
139	TCP	NetBIOS Session Service	Net Logon
139	TCP	NetBIOS Session Service	Remote Procedure Call Locator
139	TCP	NetBIOS Session Service	Distributed File System
139	TCP	NetBIOS Session Service	Systems Management Server 2.0
139	TCP	NetBIOS Session Service	License Logging Service
143	TCP	IMAP	Exchange Server
161	UDP	SNMP	SNMP Service
162	UDP	SNMP Traps Outbound	SNMP Trap Service
389	TCP	LDAP Server	Local Security Authority
389	UDP	LDAP Server	Local Security Authority
389	TCP	LDAP Server	Distributed File System
389	UDP	LDAP Server	Distributed File System
443	TCP	HTTPS	HTTP SSL
443	TCP	HTTPS	World Wide Web Publishing Service
443	TCP	HTTPS	SharePoint Portal Server
443	TCP	RPC over HTTPS	Exchange Server 2003
445	TCP	SMB	Fax Service
445	TCP	SMB	Print Spooler
445	TCP	SMB	Server
445	TCP	SMB	Remote Procedure Call Locator
445	TCP	SMB	Distributed File System
445	TCP	SMB	License Logging Service
445	TCP	SMB	Net Logon
464	TCP	Kerberos Password V5	Net Logon
500	UDP	IPsec ISAKMP	Local Security Authority
515	TCP	LPD	TCP/IP Print Server
548	TCP	File Server for Macintosh	File Server for Macintosh
554	TCP	RTSP	Windows Media Services

The page is from the text provided at <http://support.microsoft.com/kb/832017>

## Windows TCP / UDP Ports

Port	Protocol	Application protocol	System service name
563	TCP	NNTP over SSL	Network News Transfer Protocol
593	TCP	RPC over HTTPS endpoint mapper	Remote Procedure Call
593	TCP	RPC over HTTPS	Exchange Server
636	TCP	LDAP SSL	Local Security Authority
636	UDP	LDAP SSL	Local Security Authority
993	TCP	IMAP over SSL	Exchange Server
995	TCP	POP3 over SSL	Exchange Server
1067	TCP	Installation Bootstrap Service	Installation Bootstrap protocol server
1068	TCP	Installation Bootstrap Service	Installation Bootstrap protocol client
1270	TCP	MOM-Encrypted	Microsoft Operations Manager 2000
1433	TCP	SQL over TCP	Microsoft SQL Server
1433	TCP	SQL over TCP	MSSQL\$UDDI
1434	UDP	SQL Probe	Microsoft SQL Server
1434	UDP	SQL Probe	MSSQL\$UDDI
1512	TCP	WINS	Windows Internet Name Service
1512	UDP	WINS	Windows Internet Name Service
1645	UDP	Legacy RADIUS	Internet Authentication Service
1646	UDP	Legacy RADIUS	Internet Authentication Service
1701	UDP	L2TP	Routing and Remote Access
1723	TCP	PPTP	Routing and Remote Access
1755	TCP	MMS	Windows Media Services
1755	UDP	MMS	Windows Media Services
1801	TCP	MSMQ	Message Queuing
1801	UDP	MSMQ	Message Queuing
1812	UDP	RADIUS Authentication	Internet Authentication Service
1813	UDP	RADIUS Accounting	Internet Authentication Service
1863	TCP	Microsoft Messenger Protocol	MSN Messenger
1863	UDP	Microsoft Messenger Protocol	MSN Messenger
1900	UDP	SSDP	SSDP Discovery Service
2101	TCP	MSMQ-DCs	Message Queuing
2103	TCP	MSMQ-RPC	Message Queuing
2105	TCP	MSMQ-RPC	Message Queuing
2107	TCP	MSMQ-Mgmt	Message Queuing
2383	TCP	OLAP Services 9.0	SQL Server: Downlevel OLAP Client Support (SQL 2005)
2393	TCP	OLAP Services 7.0 / 8.0	SQL Server: Downlevel OLAP Client Support
2394	TCP	OLAP Services 7.0 / 8.0	SQL Server: Downlevel OLAP Client Support
2460	UDP	MS Theater	Windows Media Services
2535	UDP	MADCAP	DHCP Server
2701	TCP	SMS Remote Control (control)	SMS Remote Control Agent
2701	UDP	SMS Remote Control (control)	SMS Remote Control Agent
2702	TCP	SMS Remote Control (data)	SMS Remote Control Agent
2702	UDP	SMS Remote Control (data)	SMS Remote Control Agent
2703	TCP	SMS Remote Chat	SMS Remote Control Agent
2703	UPD	SMS Remote Chat	SMS Remote Control Agent
2704	TCP	SMS Remote File Transfer	SMS Remote Control Agent
2704	UDP	SMS Remote File Transfer	SMS Remote Control Agent
2725	TCP	SQL Analysis Services	SQL Analysis Server
2869	TCP	UPNP	Universal Plug and Play Device Host
2869	TCP	SSDP event notification	SSDP Discovery Service
3268	TCP	Global Catalog Server	Local Security Authority
3269	TCP	Global Catalog Server over SSL	Local Security Authority over SSL
3343	UDP	Cluster Services	Cluster Service

The page is from the text provided at <http://support.microsoft.com/kb/832017>

## Windows TCP / UDP Ports

Port	Protocol	Application protocol	System service name
3389	TCP	Terminal Services	NetMeeting Remote Desktop Sharing
3389	TCP	Terminal Services	Terminal Services
3478	UDP	STUN	OCS A/V Edge Server for STUN Communications
3527	UDP	MSMQ-Ping	Message Queuing
4011	UDP	BINL	Remote Installation
4500	UDP	NAT-T	Local Security Authority
5000	TCP	SSDP legacy event notification	SSDP Discovery Service
5004	UDP	RTP	Windows Media Services
5005	UDP	RTCP	Windows Media Services
5061	TCP	SIP/MTLS	OCS Access Edge Server Communication
5062	TCP	SIP/MTLS	OCS Access Edge Server Authentication
6001	TCP	Information Store	Exchange Server 2003
6002	TCP	Directory Referral	Exchange Server 2003
6004	TCP	DSPProxy/NSPI	Exchange Server 2003
8057	TCP	PSOM/MTLS	OCS Web Conferencing Edge Server
42424	TCP	ASP.Net Session State	ASP.NET State Service
50000-59999	TCP	OCS A/V Edge Server	Used for inbound and outbound media transfer
51515	TCP	MOM-Clear	Microsoft Operations Manager 2000
<b>1024-65534</b>	<b>TCP</b>	<b>RPC (DCOM)</b>	<b>Randomly allocated high TCP ports</b>
			<b>Used with RPC endpoint Mapper listening on TCP 135</b>

The page is from the text provided at <http://support.microsoft.com/kb/832017>

### Kerberos

- 1 Authentication service (AS) Exchange
  - 2 Ticket-Granting Service (TGS) Exchange
  - 3 Client/Server (CS) Exchange
- The AS Exchange is where the Kerberos key distribution (KDC)

IPC\$ Inter-Process Communication

## OS Fingerprinting

OS	Version	Platform	TTL	Window	DF	TOS	TCP Options
DC-Osx	1.1-95	Pyramid/NILE	30	8192	n	0	
Windows	9x/NT	Intel	32	5000-9000	y	0

Windows	XP Pro	Intel	128	???	??	0	MSS, nop, nop, SackOk
Cisco	12	2514	255	3800-5000	n	192	
Solaris	2.x	Intel/Sparc	255	8760	y	0	

## ADDITIONAL NOTES

#

# Cisco IOS 12.0 normally starts all IP sessions with IP ID of 0

# Solaris 8 uses a smaller TTL (64) then Solaris 7 and below (255).

# Windows 2000 uses a much larger Window Size then NT.
