

Program Instructions

Creating Torrent style File

The create torrent button will allow torrent inspired files to be made from any zip file or single file. The file is then uploaded to the tracker

Downloading Torrent style File

The file can either be opened by opening a file dialog (Open Torrent button) or the file can be downloaded from the tracker. The refresh list button will load any files currently on the server into the panel above the button. These can then be downloaded by selecting one of the entries and pressing download.

Once the file is opened into the program, the tracker is contacted and any other active versions of the program downloading the same file will eventually connect.

The tracker is contacted every 30 seconds, so sometimes there is a small waiting period to see a connected.

The refresh tracker button will send another request for each torrent style file opened into the program.

The pause button will pause the currently selected torrent from the main panel.

The show in folder button will open the content a torrent file is representing. It will open the currently selected active torrent file in the main panel

ID

The id is used so the program can be closed and reopened, keeping any part complete or fully complete files from a previous session. It also allows the program to be used on the same machine, creating separate users to remember
