SKYROUTE™

Wireless Communications

Installation Manual

WARNING: *This manual contains information on limitations regarding product use and function and information on the limitations as to liability of the manufacturer. The entire manual should be carefully read.*

version 2.3

Table of Contents

> ⚠ **WARNING: To satisfy FCC RF exposure requirements for mobile transmitting devices, a separation distance of 30 cm or more should be maintained between the antenna of this device and persons during device operation. To ensure compliance, operation at closer than this distance is not recommended.**

SKYROUTE QUICK INSTALL GUIDE

IMPORTANT: You must be enrolled with CONNECT 24 to activate a Skyroute transceiver. If you are not already enrolled, please call 1-888-955-5583 in Canada or 1-888-251-7458 in the U.S. at least 24 hours prior to your first activation.

STEP 1 – DETERMINE BEST SIGNAL LOCATION *(See Section 5.1)*

Connect the Skyroute transceiver to a 7 Ah battery, as described in Section 5.1. Determine the best location for signal strength. If good signal strength cannot be found, an antenna extension or relocation may be required.

STEP 2 – CONNECT THE SKYROUTE TO THE PANEL *(See Section 5.13)*

Mount and connect the Skyroute to the control panel as shown in Section 5.13.

STEP 3 – PROGRAM THE SKYROUTE *(See Section 6)*

Enter ***8 + Installer Code** to enter Programming Mode. Go to section 803, and program the following sections:

DEFAULT THE SKYROUTE - Section [99]
Select the Default option as described in Section 6.1 of this manual:
 • For FULL REPORTING………………enter 00 into Section [99]
 • For FALLBACK REPORTING…….......enter 11 into Section [99]
 • For GENERIC REPORTING………..…enter 22 into Section [99]
The Skyroute module will automatically restart, and default to the new setting.

PROGRAM THE ZONE DEFINITIONS - Sections [01] through [04]
 • Program the Zone Definitions as described in Section 6.2.

SELECT THE CELLULAR CHANNEL - Section [06]
The Skyroute transceiver is defaulted for Channel B. If you require Channel A (see the SID List for the channel of the cellular service provider in your area), perform the following:
 • In Section [06], TURN OFF OPTION 2, and TURN ON OPTION 1 (Press # to exit section [06])
 • In Section [10], enter the transmission time of day in 24-hour format (HHMM).
   NOTE: Due to the volume of wireless traffic generated by test signals, please select a time which is NOT on the :30 minute marks (i.e., **NOT** 02:30, 04:00, etc. Select a time like 02:24, or 04:07, etc. wherever possible.
 • In Section [11], select the transmission day of the week.
   NOTE: This section is not to be used for UL Listed applications.
 • In Section [13], select Daily or Weekly testing as required.
   NOTE: Select this option in conjunction with the CONNECT 24 rate plan you are using for this installation. The default setting is weekly. For UL Listed applications daily test reports are required.

STEP 4 – ACTIVATE THE SKYROUTE WITH CONNECT 24 *(See Section 6.3)*

Call the Voice Response Unit (VRU) at the toll free number provided with your Dealer Confirmation.

**Once activated, send two signals to your
central station to confirm proper operation.**

YOUR SKYROUTE INSTALLATION IS NOW COMPLETE.
ALL OTHER PROGRAMMING SECTIONS IN THIS MANUAL ARE OPTIONAL.

Section 1 - Contents

1.1 Important Information

This manual is based on the production version of the included wireless device. Software changes may have occurred after the revision of this manual.

Caution

Any changes or modifications not expressly approved in this document could void your warranty for this equipment and void your authority to use this equipment.

Warning

Only use the antenna provided by DSC. The use of any other type will invalidate the warranty and may be dangerous.

1.2 Skyroute Transceiver Glossary of Terms

The following is a description of various terms used with respect to cellemetry technology.

Electronic Serial Number (ESN)

The ESN is used to carry data information in a Cellemetry Network

Mobile Identification Number (MIN)

A 10-digit decimal number used for registrations and pages.

Page

A transmission that is sent from the Cellemetry Gateway to the Cellemetry radio.

Registration

A transmission that is sent from the Cellemetry radio to the Cellemetry Gateway.

System Identification Number (SID)

Identification of the Cellemetry Provider.

Switch Number (SNO)

Switch number the Cellemetry radio uses to transmit pages to the Cellemetry Gateway.

Clearing House

The clearing house is a routing center that automatically forwards data between Skyroute transmitters and central stations.

Section 2 - What is it?

2.1 Introducing the Skyroute Transceiver

The Skyroute transceiver offers a new wireless communication method for the transmission of event information using the *Cellemetry^{TM} service. Events are transmitted from the Skyroute transceiver via the Cellemetry network to the clearing house and then to the central station in a fast, reliable manner. The Skyroute receiver has been designed for simple and straightforward installation. Using Keybus^{TM} technology, wiring connections are made directly between Skyroute module and the security control panel.

2.2 Specifications

2.2.1 Compatible Control Panels
- DSC PC5010 / Partner P-832 software version v1.XX; v2.X and higher
- DSC PC1555 / Partner P-6B software version v2.XX and higher
- DSC PC580 / Partner P-48 software version v2.XX and higher
- DSC PC5015 / Partner P-832DL software version v1.XX; v2.2X and higher
- DSC PC5020/PC5020CF / Partner P-8+/P-8+CF software version v3.2X and higher

2.2.2 Communication Method
- AMPS Control Channel

2.2.3 Dual Path Communications
- The system can be used as the sole method of communication to the central station or as a second transmission path in addition to the standard land line. **Please contact your central station on dual signal communication.**
- Automation system at central station must be able to suppress redundant signals.

2.2.4 Antenna
- 3 dB gain, TNC connector
- Extension Kits available:
  LAE - 3: The 3 Foot Antenna Kit for Skyroute Transceiver
  LAE - 15: The 15 Foot Antenna Kit for Skyroute Transceiver
  LAE - 25: The 25 Foot Antenna Kit for Skyroute Transceiver
  SKR-025: 25 Foot External Antenna Kit

2.2.5 RF Power Output
- 3.0 Watts maximum

2.2.6 Power Supply Ratings
- 12 VDC @30mA, from panel Keybus; DSC Keybus control panel required
- 12 VDC, from bell circuit
  Current in standby 90mA
  Current when receiving 135mA
  Current when transmitting 1.3A
- For DSC control panels the required minimum transformer is one rated at 16VAC 40 VA. The minimum battery requirement is 12Vdc 7 Ah.

2.2.7 Dimension
- 3.5" x 4.6" x 1.8" (85 mm x 115 mm x 45 mm)

2.2.8 Weight
- 0.5 lbs. (0.2 kg)

2.2.9 Operating Temperature
- 0°C - 49°C (32°F - 120°F)
- 85% humidity, non-condensing

*Cellemetry is a registered trademark of Numerex Corporation.

Section 3 - How Does It Work?

3.1 Cellemetry Communication

The Skyroute transceiver communicates using the control channel of the existing cellular network. Signals are routed to the Cellemetry Gateway via the SS7 cellular network. A clearing house then receives the signals and forwards the events to the central station. Upon receiving an acknowledgement signal from the central station, the clearing house then returns a confirmation of delivery signal to the Skyroute transceiver over the network. For transmission sequence see drawing below:

- The Skyroute transceiver reads the system activity directly from the Keybus. It also sends the corresponding signals over the cellular network, depending on what you have programmed the Skyroute transceiver to send.
- The Skyroute transceiver cannot be programmed as a land line backup communicator. It will transmit all signals to the central station in parallel with the land line communicator.
- The Skyroute transceiver can be reprogrammed for full or generic reporting (see Sections 6.1 and 7.1 'Defaulting').
- The Skyroute transceiver does not consider the signal to be received at the central station until it receives confirmation from the clearing house. Relay between signals can be up to 60 seconds apart.

NOTE: *While the panel is in walk test mode, the Skyroute will still communicate all alarms.*

CONNECT 24 ™
DATA COMMUNICATIONS
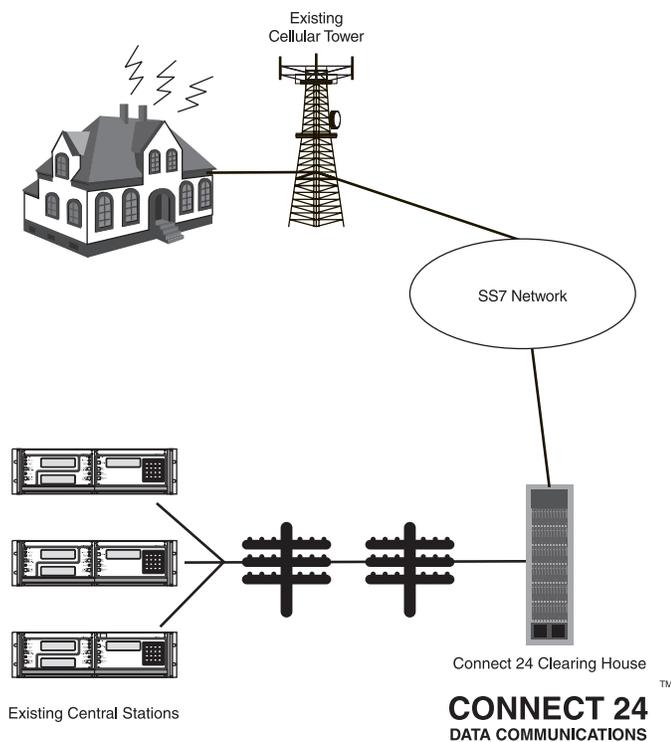

3.2 Skyroute Reporting Methods

Reporting via Skyroute is in addition to landline communications. Land line communications are unaffected by which reporting method the Skyroute is using. A default of the Skyroute must be performed before activation (Enter 00, 11 or 22 in sub-section [99] 'Software Defaulting of the Skyroute'). This is necessary to configure the Skyroute for one of the three possible reporting methods:

1. 'Full Reporting' (Enter 00 in sub-section [99])
2. 'Generic Reporting' (Enter 22 in sub-section [99])
3. 'Generic Reporting with fallback to Full Reporting'(Enter 11 in sub-section [99])

Other important things to note:

- For an event to report via the Skyroute, the event reporting code in sections [30]-[78] must be programmed as [FF] and the associated 'Transmission Option' (in section [22]) must be enabled.
- To disable a specific event from reporting via the Skyroute, program the reporting code as [00].
- To disable a group of reporting codes from reporting via the Skyroute, turn OFF the respective 'Transmision Option' in section [22].
- The Skyroute does not follow the 'Event Buffer Follows Swinger Shutdown' option in the control panel.

3.2.1 Full Reporting

(Enter 00 in sub-section [99])

All events in sections [30]-[78] are automatically programmed as [FF] and will be sent by the Skyroute. To disable a specific event from sending via the Skyroute, program the reporting code as [00]. To disable a group of reporting codes from sending via the Skyroute, Turn OFF the respective 'Transmision Option' in section [22].

When using 'Full Reporting' it is very important to understand that when multiple signals need to be sent, there is approximately a one-minute delay between each signal sent via the Skyroute. Because of this delay, the Skyroute will buffer signals when multiple events occur and transmit them in the order received.

For example; if you need to send 4 signals (i.e. alarm zone 1, alarm restore zone 1, alarm zone 2, alarm restore zone 2), it will take approximately 3 minutes for the Skyroute to send all 4 signals. The first signal sends immediately, then the remaining three signals are each sent approximately 1 minute apart in the order that they occurred.

When using Full Reporting, the central station will receive the same signal from the panel via landline communications and from the panel via Skyroute Communications. This is why it is important to contact your central station regarding dual signal communication. The automation system at the central station must be able to suppress redundant signals.

3.2.2 Generic Reporting
(Enter 22 sub-section [99])

Generic Reporting is used to avoid duplicate alarm signals from being received at the central station. It also avoids the large delays between landline signals and Skyroute signals that occur when multiple events of the same type happen within a short time period. (Both of which occur when using 'Full Reporting').

Generic reporting only applies to certain types of alarm events. These events are grouped together into one of 4 categories. Each category has a specific alarm reporting code. When one of these alarms occur, the Skyroute will send the associated alarm reporting code for the category the alarm belongs to – and then start a timer for that category (5 minutes at default programmed in section [21]). If another alarm occurs in the same category while its timer is active, then no signal is generated via the Skyroute for that category. If an alarm occurs in a different category, then the Skyroute will send the associated alarm reporting code for that category – and then start a timer for that category (5 minutes at default – programmed in section [21]). Each category has it's own timer. If a new alarm event occurs after the timer has expired for its category, the sequence restarts. All events that are not included in one of the 4 categories (noted below) will be fully transmitted by the Skyroute (if the associated reporting codes are programmed and 'Transmission Options' are ON).

While in Generic Mode, the panel will group the following alarm events together as follows:

- Burglary: Delay 1, Delay 2, Instant, Interior, Interior Stay/Away, Delay Stay/Away, 24 Hour Burglary, 24 Hour Latching Tamper, Momentary Keyswitch Arm, Maintained Keyswitch Arm, Links Answer
- Fire: Delayed Fire, Standard Fire, Delayed Fire (wireless), Standard Fire (wireless), 2-Wire Smoke (PGM2), Keypad Fire.
- Supervisory: 24 Hour Supervisory Buzzer, Silent 24 Hr (PGM2), Audible 24 Hr (PGM2), Zone Expander Supervisory Alarm.
- Panic: 24 Hour Panic, Keypad Panic

Generic Signals

	SIA	Contact ID
Burglary	Partition x Event BA zone 98	Partition x Event 130 zone 098
Fire	Partition x Event FA zone 98	Partition x Event 110 zone 098
Supervisory	Partition x Event US zone 98	Partition x Event 140 zone 098
Panic	Partition x Event PA zone 98	Partition x Event 120 zone 098

3.2.3 Generic Reporting with Fallback to Full Reporting
(Enter 11 in sub-section [99])

Normally, the Skyroute will use 'Generic Reporting' (described earlier). At any time if the Skyroute receives either a FTC (Failure to Communicate) or a TLM (Telephone Line Monitor) trouble from the main panel via the Keybus, the Skyroute will switch into 'Full Reporting' and send alarm signals as outlined above in 'Full Reporting' (Note: When using 'Generic Reporting with Fallback to Full Reporting' and the Skyroute switches to 'Full Reporting' upon receiving and 'FTC' or 'TLM' from the panel, the Skyroute will transmit the alarm signals with the specific zone numbers without restorals).

When the Skyroute switches into 'Full Reporting', the FTC or TLM trouble will be the first signal sent by the Skyroute. For the Skyroute to switch back into 'Generic Reporting', the TLM or FTC trouble must restore and a signal must be received by the Skyroute from the main panel via the Keybus.

Upon restoral of the TLM or FTC Trouble, any signals that occurred before the TLM or FTC trouble restored that still need to be transmitted will be sent via the Skyroute until the Skyroute's communications buffer is empty. In addition, if new alarms occur after switching back to 'Generic Reporting' while full reporting events are still in the Skyroute's communication buffer, the Skyroute will generate the generic signal, place it at the end of the communication buffer and function as outlined above for 'Generic Reporting'.

Section 4 - What Do I Do before Installing a Skyroute Transceiver?

CONNECT 24 is your Skyroute Cellemetry service provider.

If you have not yet enrolled as a Skyroute dealer, you must do so at least 1 business day before your first Skyroute installation.

NOTE: *If you do not have the numbers required below, please call Connect 24 at 1-888-955-5583 in Canada or 1-888-251-7458 in the U.S. "Dealer Enrolment".*

Activation of your Skyroute transmitter can be accomplished in minutes, at any time 24 hours a day, 365 days a year, by calling our toll-free CONNECT 24 **Voice Response Unit at 877-759-7688 (Canada) or 888-251-7554 (U.S.)**. This guide will provide you with an example of what to expect when you are using the VRU.

Before you begin, make sure you have all of the information that you will need to enter into the VRU system.

What you will need...

- The **Profile Number** for your installation
  The Profile Number represents the Central Station Receiver/Rate Plan combination and the communication format you are using. Make sure that you know which profile number to use when doing an installation.
- Your **Installer ID** Number
  Each individual installer who was listed on your Dealer Enrolment Form was given a unique Installer ID Number. This number can be found on the Authorized Installer Card sent with the Dealer Confirmation Form.
- Your **Installer PIN**
  Each installer is provided a four digit Personal Identification Number (PIN) on the Dealer Enrolment Form. If you have forgotten your PIN, please contact CONNECT 24.

- The **Central Station Account Number** for the alarm system
  This is the account number you wish to be transmitted to the central station. If the profile is set to send SIA format, enter a maximum of six digits; if Contact ID format, enter a maximum of four digits.
- The **Skyroute MIN** (Mobile Identification Number)
  The MIN identifies the Skyroute transmitter. The 10-digit MIN is located on the label affixed to your Skyroute transmitter.
- The **System ID Number** (SID) for the cellular provider in your area
  The five-digit System ID Number tells CONNECT 24 (and the cellular network) the home area in which your transmitter is installed. When you program this number into the DSC alarm panel, it is entered in HEX format. However, when entering this number into the CONNECT 24 VRU, it is entered in DECIMAL format.

NOTE: *For US locations, please refer to the "U.S.A SID List - By State" document which comes with each Skyroute transceiver as a separate booklet.*

Section 5 - Installing a Skyroute Transceiver

Time-Saving Tips: By powering up the Skyroute transceiver on a battery alone (battery red to Bell In and Keybus red, battery black to Keybus black), you can quickly determine a location where your signal strength is strong prior to installing the unit. The Skyroute unit does not have to be active to show signal strength.

5.1 Location of the Skyroute Unit

It is very important to determine the best location for maximum signal strength.

Verify signal strength prior to installation!

LED 1: Good signal strength
LED 2: Acceptable signal strength
LED 3: Poor signal strength

LED 4: One blink = Transmit TX
         Two blinks = Receive RX

LED 5: Status (number of blinks)
         1: Normal (activated)
         2: Radio not responding
         3: Failed self-test
         4: No cell network
         5: Fail to communicate
         6: Ready to activate
         8: Keybus Fault (check wiring)

12V 7Ah Battery
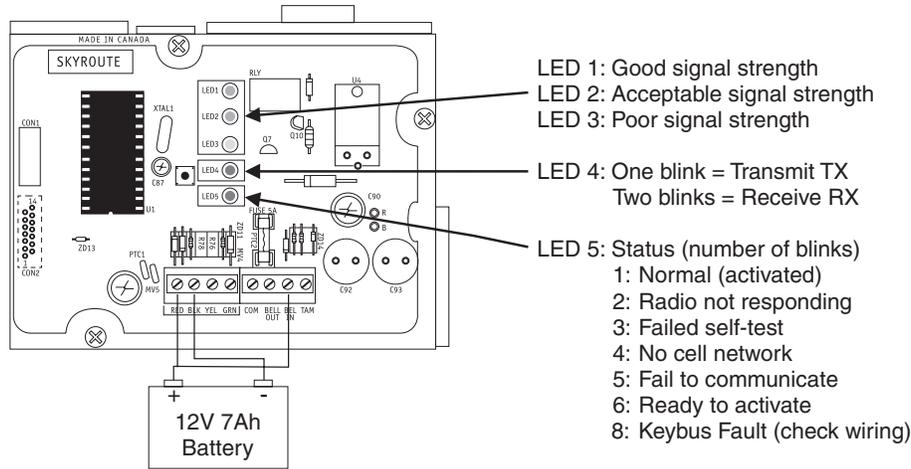

1: **Normal (activated)** The radio is operating normally and there are no troubles with the Skyroute.

2: **Radio not Responding** Possible causes; the radio in the Skyroute is not powered up, the initialization of cellemetry radio has failed, an internal problem with the radio, bad data connections between the radio and the panel.

3: **Failed self-test** A self-test of the cellemetry module has failed.

4: **No cell network** The cellemetry modem has failed to register with the cellular network (Ie. no network coverage or very weak signal).

5: **Failure to communicate** The Skyroute has not successfully communicated a signal to the central station (the Skyroute has not received the acknowledgement that the central station successfully received a signal).

6: **Ready to Activate** The Skyrotue has not been activated with Connect 24.

• If there is a Skyroute trouble, the panel it is connected to will display a 'General System Supervisory' trouble.

• If the [TAM] to [COM] terminals are open on the Skyroute, the panel it is connected to will display a 'General System Tamper' trouble.

8: **Keybus Fault** The Skyrotue cannot communicate to the panel.

5.2 Relocating the Skyroute Transceiver

Since the Skyroute transceiver is a Keybus accessory, it is possible to relocate the module up to 150 feet (45.4 m) from the main control panel when the panel is not located in a good Cellemetry coverage area (a control panel installed in a vault for example). When relocating the module, follow theses rules:

• Maximum of 150 feet (45.4 m) from the main control. Keybus (Red, Black, Yellow, Green) from the panel to the Skyroute transceiver.

• A UL1481 Listed power supply 12V@1.5A must be used for UL installations.

• The power supply (+ positive) is connected to the Skyroute transceiver (BELL IN) terminal and the power supply (–negative) to the Skyroute transceiver (COM) terminal.

• The cabinet must be installed in a secure location and should have a tamper circuit connected to the Skyroute (TAM and COM) terminals.

5.3 Relocating the Antenna

If a suitable location is not available for proper Cellemetry coverage, obtain an Antenna Extension Bracket Kit from your DSC supplier. Each kit contains an extension cable, a mounting bracket, instructions, and all required hardware. Three lengths of extension cable are available:

Extension Kit	Length of cable
LAE-3	3 feet (0.91 m)
LAE-15	15 feet (4.57 m)
LAE-25	25 feet (7.62 m)
SKR-025	25 feet (7.62 m)

Only use the Extension Kits to extend the mounting range of the antenna. Do not cut or splice the extension cable. The maximum distance between the Skyroute transceiver and the antenna is 25 feet (7.62 m) as obtained by using the LAE-25 or SKR-025 Extension Kit. Make sure the antenna is in a physically secured location to avoid tampering.

Secure the TNC connector from the Extension Kit to the mounting bracket, ensuring that the star washers make solid electrical contact with the mounting bracket.

Remove the antenna from the Skyroute module and connect the extension cable to the TNC connector on the module. Secure the antenna to the TNC connector mounted on the Extension Kit mounting bracket. Locate the mounting bracket and antenna away from possible sources of electrical interference. Moving the antenna just a short distance will likely be adequate. Temporarily secure the mounting bracket in the new location and proceed with testing. If the test is successful, permanently secure the mounting bracket and antenna at the new location.

Antenna Relocation Diagram

WARNING
Remove all AC and battery power from main control before wiring the Skyroute module, or damage to the unit will occur.

Antenna Extension Kits
LAE-3   3-ft. (0.9m) extension kit
LAE-15 15-ft. (4.6m) extension kit
LAE-25 25-ft. (7.6m) extension kit
SKR-025 25-ft. (7.6m) extension kit (external)
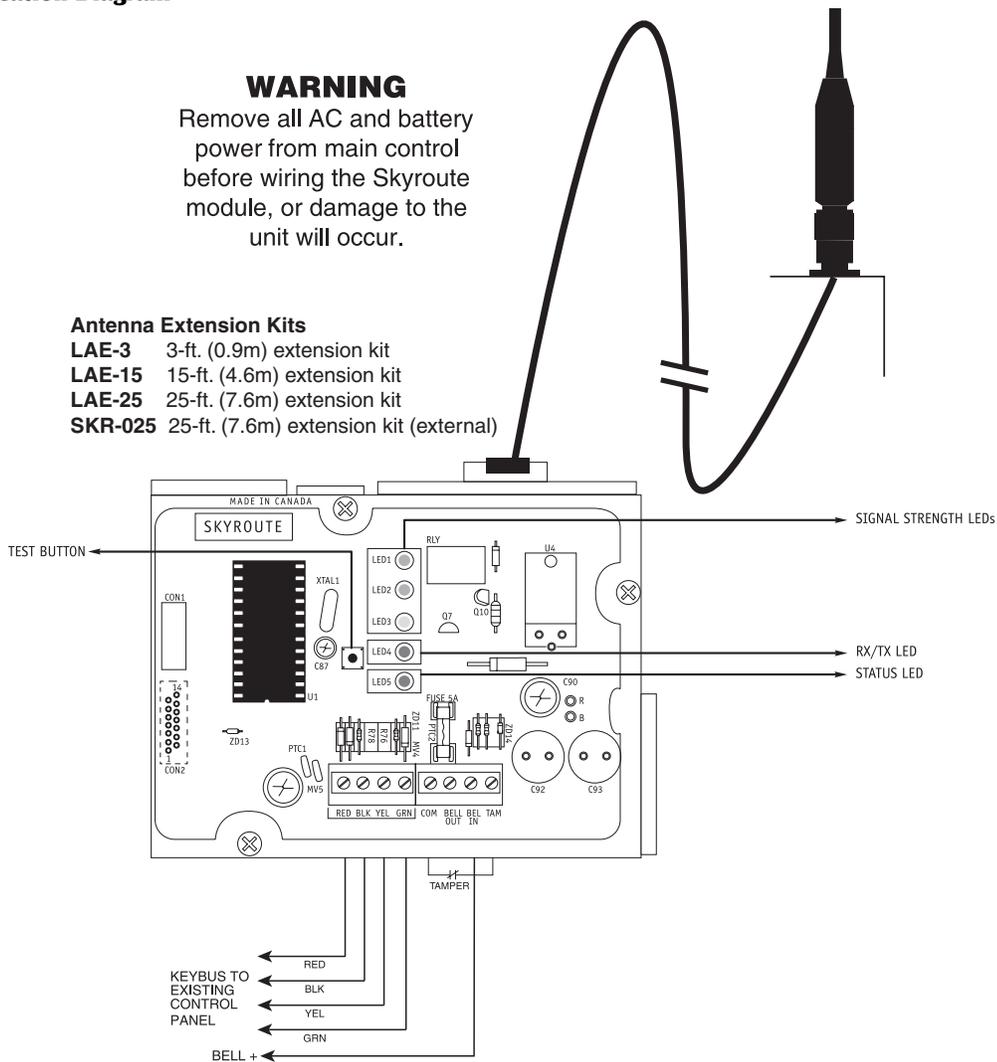

Skyroute Antenna Cable Installation.

• Power down the Skyroute module, by removing both AC and DC power from the control panel.
• Attach one end of the extension cable to the Skyroute unit, and attach the bracket and antenna to the other end.
• Reapply the AC and DC power to the Skyroute unit. No reprogramming is necessary.
• Move the antenna and bracket around until you get good signal strength.
• Mount the antenna extension bracket at that location.

5.4   UL Requirements

5.4.1 Grade A - Central Station Service, Residential Fire and Burglary Installations
• Programming [013] - Option 2 Test Rates must be "ON".
• Every 24 hours a check-in signal must be sent to the central station. Refer to compatible Listed control unit's installation instructions for programming.
• Dialing attempts must be programmed for 5 to 10 attempts. Skyroute transmitter makes 4 attempts which is not programmable. Refer to compatible Listed control unit's installation instructions for programming.
• Alarm signals must be sent over both primary and secondary communication paths -
1. Compatible Listed control unit's land line to central station (primary).

2. Skyroute transmission through Cellemetry to the clearing house (Connect 24) (secondary).
• DACT must be enabled for Listed compatible control unit.

5.4.2 Police Station Connect with Basic Line Security
• Same as Grade A Central Station Installations.

5.4.3 Commercial Fire Installations
• Same as Grade A Central Station Installations.
• The BELL+ and BELL- terminals on the control panel shall not power other devices. Refer to Compatible Listed control unit installation instructions for wiring and programming.

5.5 Installation

It is mandatory that the power be removed from the system before any wiring changes are performed on the Skyroute module. Neglecting to do so will result in damage to the Skyroute transceiver.

5.6 Mounting the Skyroute Transceiver

The Skyroute transceiver can be mounted in the upper right hand corner of the panel's cabinet through the knockout. The Skyroute transceiver case attaches to the panel's cabinet through the use of clips and two screws.

5.7 Mounting the Antenna

NOTE: The antenna should always be attached to the Skyroute transceiver for proper operation. The unit will not function properly and/or be damaged if the antenna is not installed.

The antenna attaches to the TNC connector of the Skyroute transceiver. The antenna should be mounted as high above ground level as possible while at the same time care should be taken not to place the antenna under a radio frequency shield of any kind. For example, do not mount the antenna directly below a metal roofing overhang. The Skyroute transceiver functions best when installed in an unobstructed line of sight to the cellular antenna site.

5.8 Keybus Connection

The Skyroute transmitter has 4 terminals marked red, black, yellow and green. Connect these four terminals to the 4 terminals on the main control panel marked Keybus (red, black, yellow and green).

5.9 Bell IN Terminal

This terminal is used to power the Cellemetry modem of the Skyroute module. This connects to the BELL + on the control panel. No other wire should be connected to the Bell+ of the control panel.

An extra power supply can be used to power the modem if it is not located near the main control panel or is located where the system cannot provide enough power for the transmissions. Connect the positive of the power supply to the BELL IN and the negative to the COM to ensure proper grounding (see diagram on this page).

5.10 Bell OUT Terminal

This terminal is used to power the siren or any other devices that would usually connect to the control panel BELL+ terminal. This output is powered through the 5A fuse for protection of the radio transmitting power.

5.11 Tamper Terminal

Connect TAM and COM to a normally closed switch that will be used to monitor tamper. If no tamper switch is desired place a wire between TAM and COM.

5.12 Secure Installation

For a secure installation, the Skyroute transceiver and its host panel must be locked and protected. An instant trip IR sensor would be the most appropriate for supervision of the panel. A cabinet tamper switch connected to the TAM terminal of the Skyroute transceiver is also suggested.

5.13 Connection Diagrams

Standard Connection with Compatible Control Panels (Non-Commercial Fire Applications)

WARNING!
All connections to the Skyroute module are power limited. Do not route any wiring over the circuit boards. Maintain at least 1″ (25.4mm) separation between circuit board and wiring.
A minimum of 1/4″ (7mm) separation must be maintained at all points between non power limited wiring and power limited wiring.
Refer to your control panel Installation Manual for any additional information.

DSC panel minimum power requirements:
16V$_{AC}$ 40 VA transformer
12V$_{DC}$ 7 Ah battery

NOTE: For commercial Fire Applications DO NOT connect any devices on the "BELL+" terminal (PC5020CF) other than the Skyroute module.
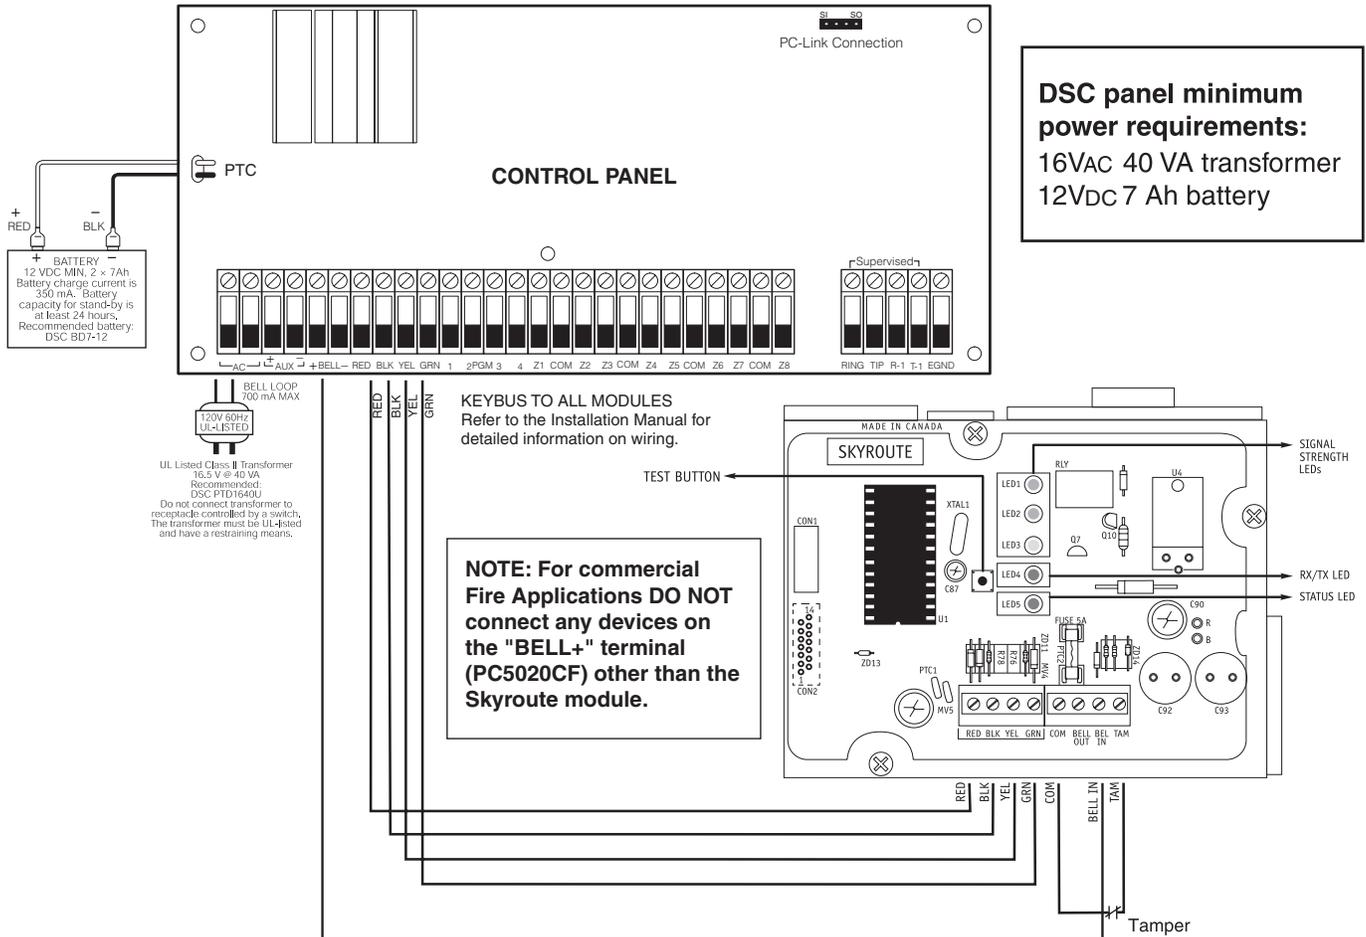

Wiring Skyroute to a DSC PC5020CF/P-8+CF
• Remove the circular knock out in the top right-hand corner of the control cabinet, and mount the Skyroute unit in its place.
• Secure the Skyroute module to the cabinet using the supplied screws.
• Attach the Skyroute antenna to the unit .
• With both AC and battery disconnected removed from the DSC control panel, wire the Skyroute to the panel using 4 wires from the Keybus of the panel to the RED, BLK, YEL and GRN terminals of the Skyroute unit.
• Wire a Normally Closed tamper switch between the COM and TAM terminals of the Skyroute unit. If a tamper switch is not going to be used place a jumper wire between the COM and TAM terminals.
• Wire the panel's BELL+ to the Skyroute BELL IN terminal.
• Apply AC and DC to the main control panel. Both the Skyroute and the panel should power up.
• Do the necessary programming that is required.
• Call Connect 24's VRU to activate your Skyroute account.

NOTE: If a Bell/Siren is not going to be used, wire the Bell/Siren terminals on the panel with a 1K Ω resistor, and then only wire the BELL (+) to the BELL IN of the Skyroute unit.
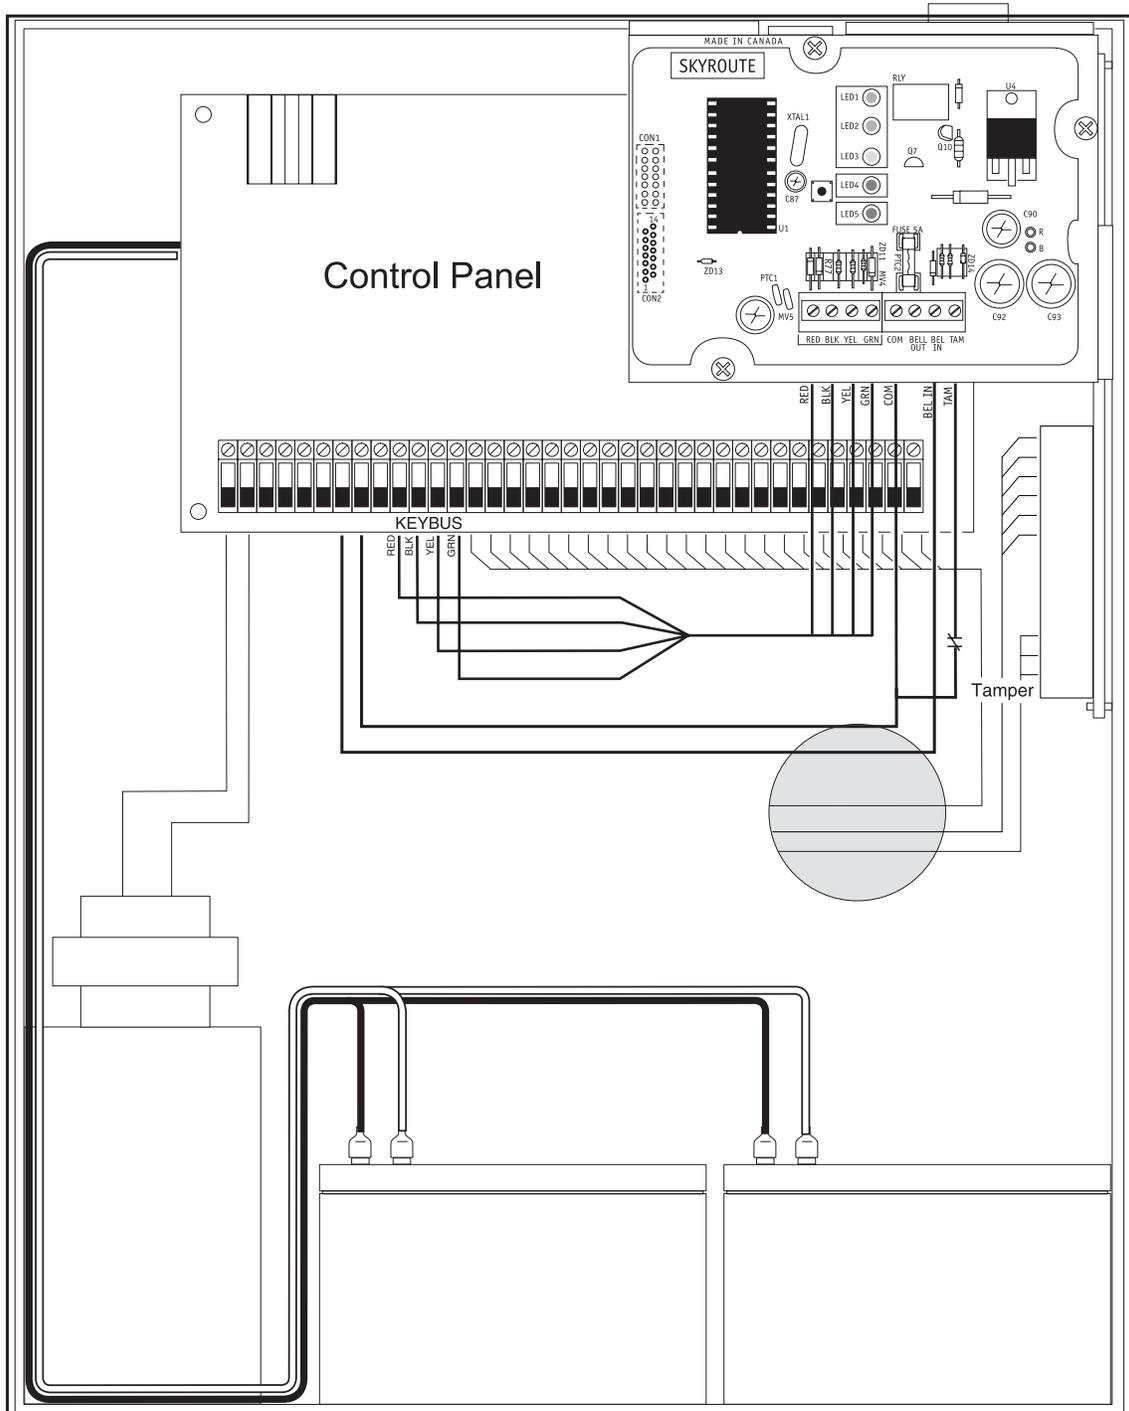

INSTALL BATTERY AND AC WIRING AS SHOWN ABOVE
IMPORTANT: A minimum ¼" (7mm) separation must be maintained at all points between battery/primary AC wiring and all other wiring and connections.

5.14 Wiring Skyroute to a DSC/Partner Control Panel

- Remove the circular knockout in the top left corner of the control panel cabinet. Mount the Skyroute unit in its place.
- Secure the Skyroute module to the cabinet using the supplied screws.
- Attach the Skyroute antenna to the unit.
- Disconnect and remove the AC and battery power from the control panel. Wire the red, black, yellow and green wires from the panel Keybus to the corresponding RED, BLK, YEL and GRN terminals on the Skyroute transceiver.
- Wire a normally closed tamper switch between the COM and TAM terminals of the Skyroute module. If a tamper switch is not going to be used, place a jumper wire between the COM and TAM terminals.
- Wire the BELL+ terminal of the panel to the BELL IN terminal of the Skyroute unit. The wire run must not exceed 150 ft. / 45.5 m.
- Wire the BELL- terminal of the panel to the negative (-) terminal of the bell/siren.
- Wire the BELL+/SIREN+ terminal of the bell/siren to the BELL OUT terminal of the Skyroute transceiver.
- Apply AC and DC power to the control panel. Power up both the Skyroute module and the panel.
- Do the programming if it is required.
- Call the Connect 24 VRU (Voice Reponse Unit) to activate your Skyroute account.

NOTE: *If a bell or siren is not going to be used in the system, wire the BELL/SIREN terminals on the panel with a 1000 Ohm resistor. Then wire only the BELL+ terminal of the panel to the BELL IN terminal of the Skyroute module.*

5.15 Supervised Power Supply Connection

Power Requirements
The PC5204 power supply requires a 16V, 40 VA transformer and a 12V, 7 Ah battery.

NOTE: *If a battery is not connected to the PC5204 power supply, an expansion trouble and a restoral will be generated every time a signal is transmitted.*

Connections
- The Keybus from the panel is connected to both the PC5204 module and the Skyroute transceiver.
- A wire is connected from the AUX terminal on the PC5204 module to the BELL IN of the Skyroute transceiver.
- A jumper or a normally closed switch is required between the TAM and the COM terminals on the Skyroute transceiver.
- A jumper or a normally closed switch is required between the TAM and the BLK terminals for the tamper of the PC5204 power supply.
- Wire the positive lead of the device to the AUX+ terminal.
- Connect a 1000 Ohm resistor between AUX+ and O1 terminals.

NOTE: *for secure installation a tamper switch must be installed on the Skyroute module.*
Using the PC5204 power supply module for this configuration is not UL Listed. A UL1481 Listed power supply (e.g., PS5350) must be used.

WARNING

Remove all power AC and battery power from main control panel before wiring the Skyroute module, or damage to the unit will occur.
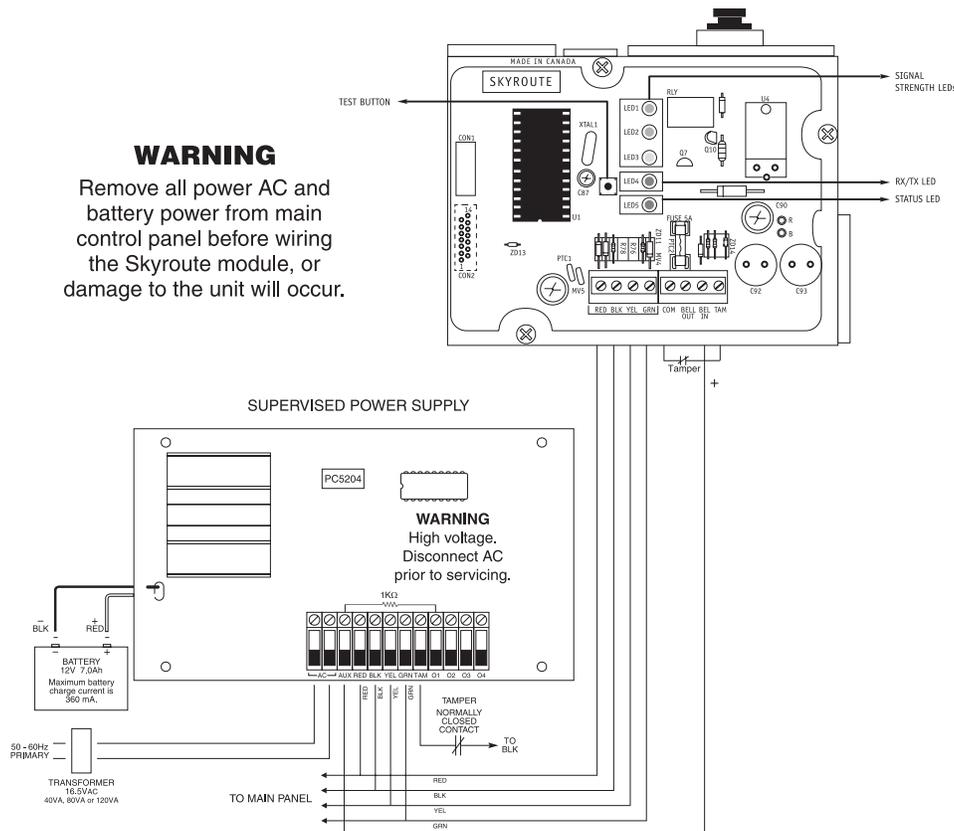

Section 6 - Programming and Activating a Skyroute

6.1 Defaulting

NOTE: This product must be defaulted BEFORE programming/activating.

Select the type of default as follows:

6.1.1 Full Reporting
- Entering 00 in sub-section [99]
  1. A complete default of the system is performed
  2. All reporting sub-sections, [30] through [78] are automatically programmed as [FF] and will be sent by the Skyroute transceiver.

6.1.2 Generic Reporting with Fallback to Full Reporting
- Entering 11 in sub-section [99]*
  1. A complete default is performed
  2. Alarm Restoral Reporting Code, sub-sections [34] through [38], will be automatically programmed to [00], except the duress alarm.
  3. The Keypad and PGM Restorals in section [39] will be programmed to [00]. Zone Tamper & Restoral reporting code, sub-sections [40] through [48], will be programmed to [00]**.
  4. Zone Supervisory & Restoral, sub-sections [49] through [56], will be programmed to [00]**.
  5. Zone Low Battery Alarm & Restoral, sub-sections [57] through [64], will be programmed to [00]***.
  6. Keypad Zone Restoral, sub-section [39], last 4 programming locations, will be programmed as [00].
  7. Miscellaneous Restoral and Periodic Test in sections [77] and [78] will be programmed as [00].

6.1.3 Generic Reporting
- Entering 22 in sub-section [99]*
  1. A complete default is performed
  2. Alarm Restoral reporting code, sub-sections [34] through [38], will be automatically programmed to [00], except the duress alarm.
  3. The Keypad and PGM Restorals in section [39] will be programmed to [00]. Zone Tamper & Restoral reporting code, sub-sections [40] through [48], will be programmed to [00]**.
  4. Zone Supervisory & Restoral, sub-sections [49] through [56], will be automatically programmed to [00]**.
  5. Zone Low Battery Alarm & Restoral, sub-sections [57] through 64], will be automatically programmed to [00]***.
  6. Keypad Zone Restoral, sub-section [39], last 4 programming locations, will be programmed as [00].
  7. Miscellaneous Restoral and Periodic Test in sections [77] and [78] will be programmed as [00].

  *Any reporting code sub-section not mentioned is programmed as [FF].

  **These signals only apply to installations with double EOL.

  ***These signals only apply to installations with wireless zone modules.

In Generic mode, see Appendix A for Generic signals. (See Section 3 'How Does It Work?' for description of each reporting method.)

6.2 Programming Options

All programming on the Skyroute transceiver is done in the Installer Programming mode. Refer to the control panel's Installation Manual for instructions on how to enter Installer Programming. From Installer Programming, enter section [803] to go to the Skyroute programming sections.

Sub-sections [01] to [22] apply to **all** installations.

Sub-sections [30] to [78] are only relevant when using the Skyroute transceiver for either Full Reporting or for Generic Reporting with Fallback to Full Reporting. These sections are not relevant when using the Skyroute transceiver for Generic Reporting only.

6.2.1 Basic Programming (applies to all installations)
Zone Definition: Sub-sections [01] to [05]

These sections must be programmed exactly the same as the main control panel. This allows the Skyroute transceiver to translate information sent along the Keybus and identify the proper event.

NOTE: The Skyroute module will not follow any zone transmission delays; i.e., any zones programmed with a delay will be sent immediately by the Skyroute transceiver.

Configuration Options: Sub-section [06]
- Channel A enable/disable..............option [1]
  This option must be selected when the Cellemetry provider is an "A" side carrier.
- Channel B enable/disable..............option[2]
  This option must be selected when the Cellemetry provider is a "B" side carrier.
- Home system only enable/disable…option[3]
  This option must be programmed to ensure that the Skyroute transceiver is communicating using the proper carrier. When selected, the transceiver will only use towers with the same SID (as programmed in section [07]).

NOTE: For US locations please refer to 'U.S.A. SID List - By State'. For Canadian locations please select channel B.

- To activate the Skyroute module in Home mode:
  1. Select a channel, A or B, in address 06 (Option 1 or 2)
  2. Wait for signal strength.
  3. Enter in address 07 the Home SID number in hexadecimal format.
  4. Select Home mode (Option 3) and deactivate A or B channel in address 06.

*NOTE: After changing sub-section [06] or [07] a restart is required. Enter [*FF] in section [99].*

**Skyroute transceiver SID (System ID):
Sub-section [07]**
Please refer to the SID table included with the Skyroute module to determine the SID number for your area.

Skyroute Test Time: Sub-section [10]

In this section enter the time of the day (24-hour format) you want the test transmission to be sent.

Test Transmission Day Mask: Section [11]

In this section select the day of the week on which you want the test transmission to be sent.

NOTE: This option cannot be used for UL Listed installations.

Skyroute Test Rates: Sub-section [13]

• Option 1- Not used.
• Option 2- Daily Test: If this option is ON, the Skyroute will self-generate a 'Skyroute Test Transmission' signal (TX-00 or E603-000) every day.
• Option 3- Weekly Test: If this option is ON, the Skyroute will self-generate a 'Skyroute Test Transmission' signal (TX-00 or E603-000) every week.
• Option 4 – Keybus Tests Enabled: If this option is ON, the Skyroute will send a 'Periodic Test Transmission' signal (RP-00 or E602-000) at the same time the main panel sends its 'Periodic Test Transmission' via the land line.

Generic Signal Timer: Sub-section [21]

This is the timer used by Generic Reporting. See Section 3 for more information.

1E   I___I___I   (number x 10 seconds)

Transmission Options: Sub-section [22]

This section will enable sections of reporting codes. (See table for different service plans.)

Default		Option		
ON	I___I	1	Alarms/Restoral	Disabled
OFF	I___I	2	Tamper Restoral/Restoral	Disabled
OFF	I___I	3	Supervisory/Restoral	Disabled
OFF	I___I	4	Low Battery/Restoral	Disabled
OFF	I___I	5	Opening/ Closing	Disabled
ON	I___I	6	Maintenance/Restoral	Disabled
OFF	I___I	7 & 8	Not Used	

Refer to Appendices A and B to find out which reporting codes are controlled by each transmission option.

6.2.2 Advanced Programming

Individual Event: Sub-sections [30] to [78]

These sections are used to determine if an event will be transmitted by the Skyroute transceiver. If '00' is entered, that event will not be transmitted. If 'FF' is programmed, the event will be transmitted. 'FF' is the default value.

The Skyroute module will send these events when they occur in the system unless they are programmed as '00'. Refer to Appendices A and B for more information.

6.3 Activating a Skyroute Transceiver

Before activating the Skyroute transceiver, ensure that the control panel is wired, programmed and operating properly. Make sure that the Skyroute transmitter is properly connected to the Keybus and to the bell (+ positive) circuit. When power is applied to the system, the Skyroute transceiver will perform self-diagnostics for a few seconds, before giving visual feedback by indicating signal strength on LED1, LED2 or LED3.

6.3.1 Calling Connect 24

Once the Skyroute transceiver is indicating the signal strength of the network, and the status indicator (LED5) is blinking 6 times (not connected to the clearing house), you are ready to call Connect 24's Voice Response Unit. Follow the voice prompt and when asked to perform a test, press SW1 on the Skyroute transceiver to transmit a test signal. When transmitting, LED4 blinks once. If the test is successful, the VRU will give you a confirmation and LED5 will then blink steady every second. Refer to the Connect 24 information package for more information on the activation process.

NOTE: The confirmation of a successful test from Connect 24 does not guarantee proper transmission of the event to your central station. You must perform normal tests with your central station after activation with Connect 24.

6.3.2 Transmitting and Receiving

LED4 on the Skyroute module will blink once (1) to indicate the cellular tower has received the signal. It will blink twice (2) to indicate the alarm central station has received and acknowledged the signal.

6.3.3 Skyroute Transceiver Trouble Supervision

The Skyroute transceiver automatically monitors its operation and indicates trouble conditions by flashing LED5 on the circuit board. LED5 normally flashes once every 2 seconds when the Skyroute transceiver is on standby (ready to transmit) mode. Troubles are indicated when LED5 flashes more than once every 2 seconds. See Section 5.1 'Location of the Skyroute Unit' for the number of flashes used to indicate each trouble condition in order of importance.

Section 7 - [803] Skyroute Programming Worksheets
(PC5020/5010/580/1555/5015/P-832/P-48/P-6B/P-832DL)

7.1 Defaulting

NOTE: Default must be performed before activating the Skyroute transceiver.
For UL Listed installations, refer to the compatible control panel Installation Manual for programming the number of total attempts between control panel and Skyroute unit. The number has to be a total of 5 to 10 attempts. The Skyroute transceiver is set to make 4 attempts, which is not a programmable setting.

[99]Section [99] is for software defaulting of the Skyroute module

I___I___I

- Entering 00 will cause a software default of the Skyroute module to Full Reporting.
- Entering 11 will cause a software default of the Skyroute module and Generic reporting with fall-back to Full reporting if TLM or FTC trouble occurs.
- Entering 22 will cause a software default of the Skyroute module and Generic reporting.
- Entering FF will cause restart of the Skyroute transceiver.

7.2 Basic Programming

BASIC PROGRAMMING COMPLETED

7.3 Advanced Programming OPTIONAL

The following sub-sections (30 -78) have automatically been programmed. How they are programmed depends on how you default the Skyroute (see Section 6.1). You may make changes if wanted.

Sub-sections [30] to [78]:

If '00' is entered, reporting code is disabled.

If 'FF' is entered, default reporting code is enabled.

[30] Alarm Reporting Codes, Zones 1-16

Generic Reporting	Full Reporting			Generic Reporting	Full Reporting

Section 8 - Testing

Testing your control to the Central Station

Be sure to perform normal tests with your central station via the land line.

There is a 1-minute delay between successive signals sent by the Skyroute transmitter.

For example: If you trip 3 zones and you have the Skyroute module programmed to send the alarm and restoral reporting codes for each zone (6 signals in total), it will take about 5 minutes for all the signals to go through. The first signal goes through immediately. There will be a 1-minute delay before the second signal is sent and another 1-minute delay before the third signal is sent, etc.

Section 9 - Troubleshooting

Problem: • LED5 is blinking 2 times - Radio is not powered

Solution: • Make sure that BELL(+) on the panel is connected to BELL IN on the Skyroute module.

• Perform a default on the Skyroute module.

Problem: • LED5 is blinking 4 times - No service

Solution: • Relocate either the Skyroute transmitter or the antenna to a different location on the premises. Higher or closer to a window usually improves the signal strength.

• Remove the Skyroute transmitter from any environmental interference such as AC power lines or large pieces of metal duct work, water heater, electrical box, etc.

Problem: • LED5 is blinking 5 times - Failure to communicate

Solution: • This trouble means that the Skyroute transceiver was not acknowledged from the central station. To clear this trouble, perform a reset: [*8] [Installer code] [803] [99] [FF]. To prevent this trouble in the future, make sure your signal strength is good.

Problem: • LED5 is blinking 6 times - Skyroute transceiver is not activated with Connect 24

Solution: • Activate the Skyroute transceiver with Connect 24. Please have your information ready when you call the VRU. If you do not have these numbers, please call 888-251-7458 (US) or 888-955-5583 (Canada).

Problem: • LED5 is blinking 8 times - Skyroute is not receiving Keybus data

Solution: • Check for proper connection to the Power Series panel on the 4-wire Keybus.

Problem: • Skyroute unit displays poor signal strength.

Solution: • Relocate either the Skyroute transmitter or the antenna to a different location on the premises. Higher or closer to a window usually improves the signal strength.

• Remove the Skyroute transmitter from any environmental interference such as AC power lines or large pieces of metal duct work, water heater, electrical box, etc.

Problem: • Skyroute transmitter unit has good signal strength but it is not transmitting the signals.

Solution: • Make sure that the Skyroute transmitter is programmed for the proper channel (A or B). Correct channel for your area can be obtained from the SID list provided by Connect 24. The default channel is B.

Problem: • My Skyroute transmitter is sending Zone 98 when I wanted to send the actual zone numbers.

Solution: • Enter the installer ID in Installer Programming (*8). Enter 00 in sub-section [99] of section [803]. This will default all the programming to factory settings. You will then have to program your Skyroute module completely. You will notice that LED5 is blinking 6 times. Please see the following problem for solution.

Problem: • The Skyroute transmitter was activated, but a default was performed; now LED5 is blinking 6 times.

Solution: • Enter the installer ID in Installer Programming (*8). Enter sub-section [06] of section [803] and turn bit# 4 on.
• Enter FF (which is *66) in sub-section [99]. The Skyroute module will restart.
• LED5 should be blinking once.

WARNING Please Read Carefully

Note to Installers

This warning contains vital information. As the only individual in contact with system users, it is your responsibility to bring each item in this warning to the attention of the users of this system.

System Failures

This system has been carefully designed to be as effective as possible. There are circumstances, however, involving fire, burglary, or other types of emergencies where it may not provide protection. Any alarm system of any type may be compromised deliberately or may fail to operate as expected for a variety of reasons. Some but not all of these reasons may be:

■ Inadequate Installation

A security system must be installed properly in order to provide adequate protection. Every installation should be evaluated by a security professional to ensure that all access points and areas are covered. Locks and latches on windows and doors must be secure and operate as intended. Windows, doors, walls, ceilings and other building materials must be of sufficient strength and construction to provide the level of protection expected. A reevaluation must be done during and after any construction activity. An evaluation by the fire and/or police department is highly recommended if this service is available.

■ Criminal Knowledge

This system contains security features which were known to be effective at the time of manufacture. It is possible for persons with criminal intent to develop techniques which reduce the effectiveness of these features. It is important that a security system be reviewed periodically to ensure that its features remain effective and that it be updated or replaced if it is found that it does not provide the protection expected.

■ Access by Intruders

Intruders may enter through an unprotected access point, circumvent a sensing device, evade detection by moving through an area of insufficient coverage, disconnect a warning device, or interfere with or prevent the proper operation of the system.

■ Power Failure

Control units, intrusion detectors, smoke detectors and many other security devices require an adequate power supply for proper operation. If a device operates from batteries, it is possible for the batteries to fail. Even if the batteries have not failed, they must be charged, in good condition and installed correctly. If a device operates only by AC power, any interruption, however brief, will render that device inoperative while it does not have power. Power interruptions of any length are often accompanied by voltage fluctuations which may damage electronic equipment such as a security system. After a power interruption has occurred, immediately conduct a complete system test to ensure that the system operates as intended.

■ Failure of Replaceable Batteries

This system's wireless transmitters have been designed to provide several years of battery life under normal conditions. The expected battery life is a function of the device environment, usage and type. Ambient conditions such as high humidity, high or low temperatures, or large temperature fluctuations may reduce the expected battery life. While each transmitting device has a low battery monitor which identifies when the batteries need to be replaced, this monitor may fail to operate as expected. Regular testing and maintenance will keep the system in good operating condition.

■ Compromise of Radio Frequency (Wireless) Devices

Signals may not reach the receiver under all circumstances which could include metal objects placed on or near the radio path or deliberate jamming or other inadvertent radio signal interference.

■ System Users

A user may not be able to operate a panic or emergency switch possibly due to permanent or temporary physical disability, inability to reach the device in time, or unfamiliarity with the correct operation. It is important that all system users be trained in the correct operation of the alarm system and that they know how to respond when the system indicates an alarm.

■ Smoke Detectors

Smoke detectors that are a part of this system may not properly alert occupants of a fire for a number of reasons, some of which follow. The smoke detectors may have been improperly installed or positioned. Smoke may not be able to reach the smoke detectors, such as when the fire is in a chimney, walls or roofs, or on the other side of closed doors. Smoke detectors may not detect smoke from fires on another level of the residence or building.

Every fire is different in the amount of smoke produced and the rate of burning. Smoke detectors cannot sense all types of fires equally well. Smoke detectors may not provide timely warning of fires caused by carelessness or safety hazards such as smoking in bed, violent explosions, escaping gas, improper storage of flammable materials, overloaded electrical circuits, children playing with matches or arson.

Even if the smoke detector operates as intended, there may be circumstances when there is insufficient warning to allow all occupants to escape in time to avoid injury or death.

■ Motion Detectors

Motion detectors can only detect motion within the designated areas as shown in their respective installation instructions. They cannot discriminate between intruders and intended occupants. Motion detectors do not provide volumetric area protection. They have multiple beams of detection and motion can only be detected in unobstructed areas covered by these beams. They cannot detect motion which occurs behind walls, ceilings, floor, closed doors, glass partitions, glass doors or windows. Any type of tampering whether intentional or unintentional such as masking, painting, or spraying of any material on the lenses, mirrors, windows or any other part of the detection system will impair its proper operation.

Passive infrared motion detectors operate by sensing changes in temperature. However their effectiveness can be reduced when the ambient temperature rises near or above body temperature or if there are intentional or unintentional sources of heat in or near the detection area. Some of these heat sources could be heaters, radiators, stoves, barbeques, fireplaces, sunlight, steam vents, lighting and so on.

■ Warning Devices

Warning devices such as sirens, bells, horns, or strobes may not warn people or waken someone sleeping if there is an intervening wall or door. If warning devices are located on a different level of the residence or premise, then it is less likely that the occupants will be alerted or awakened. Audible warning devices may be interfered with by other noise sources such as stereos, radios, televisions, air conditioners or other appliances, or passing traffic. Audible warning devices, however loud, may not be heard by a hearing-impaired person.

■ Telephone Lines

If telephone lines are used to transmit alarms, they may be out of service or busy for certain periods of time. Also an intruder may cut the telephone line or defeat its operation by more sophisticated means which may be difficult to detect.

■ Insufficient Time

There may be circumstances when the system will operate as intended, yet the occupants will not be protected from the emergency due to their inability to respond to the warnings in a timely manner. If the system is monitored, the response may not occur in time to protect the occupants or their belongings.

■ Component Failure

Although every effort has been made to make this system as reliable as possible, the system may fail to function as intended due to the failure of a component.

■ Inadequate Testing

Most problems that would prevent an alarm system from operating as intended can be found by regular testing and maintenance. The complete system should be tested weekly and immediately after a break-in, an attempted break-in, a fire, a storm, an earthquake, an accident, or any kind of construction activity inside or outside the premises. The testing should include all sensing devices, keypads, consoles, alarm indicating devices and any other operational devices that are part of the system.

■ Security and Insurance

Regardless of its capabilities, an alarm system is not a substitute for property or life insurance. An alarm system also is not a substitute for property owners, renters, or other occupants to act prudently to prevent or minimize the harmful effects of an emergency situation.

Limited Warranty

Digital Security Controls Ltd. warrants the original purchaser that for a period of twelve months from the date of purchase, the product shall be free of defects in materials and workmanship under normal use. During the warranty period, Digital Security Controls Ltd. shall, at its option, repair or replace any defective product upon return of the product to its factory, at no charge for labour and materials. Any replacement and/or repaired parts are warranted for the remainder of the original warranty or ninety (90) days, whichever is longer. The original purchaser must promptly notify Digital Security Controls Ltd. in writing that there is defect in material or workmanship, such written notice to be received in all events prior to expiration of the warranty period. There is absolutely no warranty on software and all software products are sold as a user license under the terms of the software license agreement included with the product. The Customer assumes all responsibility for the proper selection, installation, operation and maintenance of any products purchased from DSC. Custom products are only warranted to the extent that they do not function upon delivery. In such cases, DSC can replace or credit at its option.

International Warranty

The warranty for international customers is the same as for any customer within Canada and the United States, with the exception that Digital Security Controls Ltd. shall not be responsible for any customs fees, taxes, or VAT that may be due.

Warranty Procedure

To obtain service under this warranty, please return the item(s) in question to the point of purchase. All authorized distributors and dealers have a warranty program. Anyone returning goods to Digital Security Controls Ltd. must first obtain an authorization number. Digital Security Controls Ltd. will not accept any shipment whatsoever for which prior authorization has not been obtained.

Conditions to Void Warranty

This warranty applies only to defects in parts and workmanship relating to normal use. It does not cover:

- damage incurred in shipping or handling;

- damage caused by disaster such as fire, flood, wind, earthquake or lightning;

- damage due to causes beyond the control of Digital Security Controls Ltd. such as excessive voltage, mechanical shock or water damage;

- damage caused by unauthorized attachment, alterations, modifications or foreign objects;

- damage caused by peripherals (unless such peripherals were supplied by Digital Security Controls Ltd.);

- defects caused by failure to provide a suitable installation environment for the products;

- damage caused by use of the products for purposes other than those for which it was designed;

- damage from improper maintenance;

- damage arising out of any other abuse, mishandling or improper application of the products.

Items Not Covered by Warranty

In addition to the items which void the Warranty, the following items shall not be covered by Warranty: (i) freight cost to the repair centre; (ii) products which are not identified with DSC's product label and lot number or serial number; (iii) products disassembled or repaired in such a manner as to adversely affect performance or prevent adequate inspection or testing to verify any warranty claim. Access cards or tags returned for replacement under warranty will be credited or replaced at DSC's option. Products not covered by this warranty, or otherwise out of warranty due to age, misuse, or damage shall be evaluated, and a repair estimate shall be provided. No repair work will be performed until a valid purchase order is received from the Customer and a Return Merchandise Authorisation number (RMA) is issued by DSC's Customer Service.

Digital Security Controls Ltd.'s liability for failure to repair the product under this warranty after a reasonable number of attempts will be limited to a replacement of the product, as the exclusive remedy for breach of warranty. Under no circumstances shall Digital Security Controls Ltd. be liable for any special, incidental, or consequential damages based upon breach of warranty, breach of contract, negligence, strict liability, or any other legal theory. Such damages include, but are not limited to, loss of profits, loss of the product or any associated equipment, cost of capital, cost of substitute or replacement equipment, facilities or services, down time, purchaser's time, the claims of third parties, including customers, and injury to property. The laws of some jurisdictions limit or do not allow the disclaimer of consequential damages. If the laws of such a jurisdiction apply to any claim by or against DSC, the limitations and disclaimers contained here shall be to the greatest extent permitted by law. Some states do not allow the exclusion or limitation of incidental or consequential damages, so that the above may not apply to you.

Disclaimer of Warranties

This warranty contains the entire warranty and shall be in lieu of any and all other warranties, whether expressed or implied (including all implied warranties of merchantability or fitness for a particular purpose) And of all other obligations or liabilities on the part of Digital Security Controls Ltd. Digital Security Controls Ltd. neither assumes responsibility for, nor authorizes any other person purporting to act on its behalf to modify or to change this warranty, nor to assume for it any other warranty or liability concerning this product.

This disclaimer of warranties and limited warranty are governed by the laws of the province of Ontario, Canada.

WARNING: Digital Security Controls Ltd. recommends that the entire system be completely tested on a regular basis. However, despite frequent testing, and due to, but not limited to, criminal tampering or electrical disruption, it is possible for this product to fail to perform as expected.

Installer's Lockout

Any products returned to DSC which have the Installer's Lockout option enabled and exhibit no other problems will be subject to a service charge.

Out of Warranty Repairs

Digital Security Controls Ltd. will at its option repair or replace out-of-warranty products which are returned to its factory according to the following conditions. Anyone returning goods to Digital Security Controls Ltd. must first obtain an authorization number. Digital Security Controls Ltd. will not accept any shipment whatsoever for which prior authorization has not been obtained.

Products which Digital Security Controls Ltd. determines to be repairable will be repaired and returned. A set fee which Digital Security Controls Ltd. has predetermined and which may be revised from time to time, will be charged for each unit repaired.

Products which Digital Security Controls Ltd. determines not to be repairable will be replaced by the nearest equivalent product available at that time. The current market price of the replacement product will be charged for each replacement unit.
