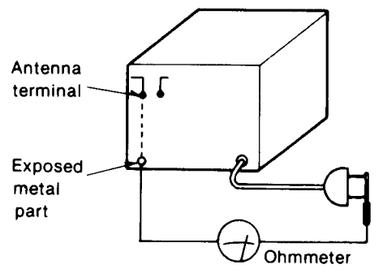
■ SAFETY PRECAUTION

1. Before servicing, unplug the power cord to prevent an electric shock.
2. When replacing parts, use only manufacturer's recommended components for safety.
3. Check the condition of the power cord. Replace if wear or damage is evident.
4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.
5. Before returning the serviced equipment to the customer, be sure to make the following insulation resistance test to prevent the customer from being exposed to a shock hazard.

• INSULATION RESISTANCE TEST

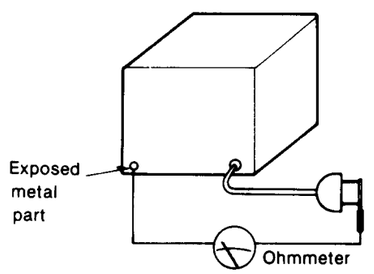
1. Unplug the power cord and short the two prongs of the plug with a jumper wire.
2. Turn on the power switch.
3. Measure the resistance value with ohmmeter between the jumpered AC plug and each exposed metal cabinet part, such as screwheads antenna, control shafts, handle brackets, etc. Equipment with antenna terminals should read between 3MΩ and 5.2MΩ to all exposed parts. (Fig. A) Equipment without antenna terminals should read approximately infinity to all exposed parts. (Fig. B)

Note: Some exposed parts may be isolated from the chassis by design. These will read infinity.



(Fig. A)

Resistance = 3MΩ—5.2MΩ

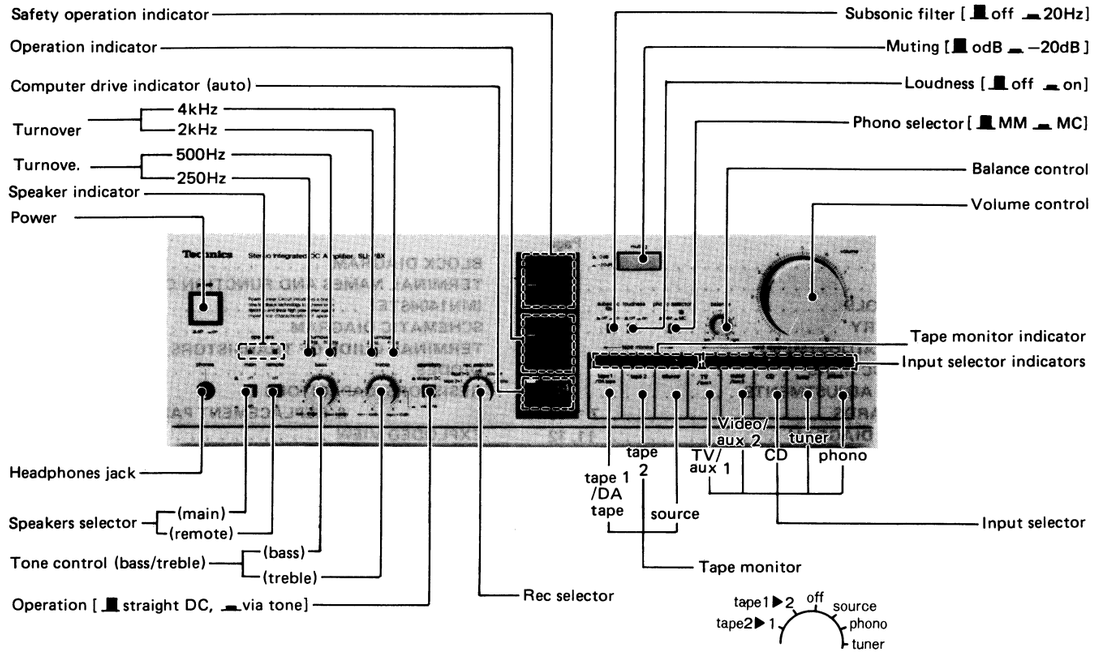


(Fig. B)

Resistance = Approx ∞

4. If the measurement is outside the specified limits, there is a possibility of a shock hazard. The equipment should be repaired and rechecked before it is returned to the customer.

■ LOCATION OF CONTROLS



*** [EGA] areas are provided without voltage selector.**
*** 240V (50/60Hz) for Australia and United Kingdom.**
*** 220V (50/60HZ) for Continental Europe.**
*** Phono input capacitance is about 150pF.**

■ PROTECTION CIRCUITRY

The protection circuitry may have operated if either of the following conditions is noticed:

- No sound is heard when the power is turned on.
- Sound stops during a performance.

The function of this circuitry is to prevent circuitry damage if, for example, the positive and negative speaker connection wires are "shorted" or if speaker systems with an impedance less than the indicated rated impedance of this unit are used.

If this occurs, follow the procedure outlines below:

1. Turn off the power.
2. Determine the cause of the problem and correct it.
3. Turn on the power once again after one minute.

Note

When the protection circuitry functions, the unit will not operate unless the power is first turned off and then on again.

■ BEFORE REPAIR AND ADJUSTMENT

1. Turn off the power supply and short-circuit of power supply capacitors (C401 ~ C404, 8200 μF) at resistance (about 10Ω,5W) in order to discharge the charged voltage. Do not short between C401 ~ C404 by screwdriver. It may damage the component.
2. Before turning on the power supply after completion of repair, slowly apply the primary voltage by using a power supply voltage controller to make sure that the consumed current is free of abnormality. The consumed current at 60Hz/50Hz in no signal mode is shown below with respect to supply voltage 110V/120V/220V/240V.

Power supply voltage		AC110V	AC120V	AC220V	AC240V
Cousumed current	50Hz	420 ~ 950mA	400 ~ 880mA	220 ~ 480mA	200 ~ 440mA
	60Hz	400 ~ 910mA	370 ~ 840mA	200 ~ 460mA	180 ~ 410mA

■ MEASUREMENTS AND ADJUSTMENTS

1. Idling (ICQ) Adjustment (after reparing the main amp.)

(1) After the repair, set the sound volume to maximal before tuning on the power switch, and connect nothing to the speaker terminals.
(2) Completely turn ICQ control (VR301, VR302) counter clockwise.
(3) Increase the voltage applied to the amplifier gradually from OV by means of a power supply voltage controller, and make sure of the value in the Figure on page 4 before starting the adjustment.
(4) Connect the DC electronic voltmeter to TP301 (+) and TP303 (–) (Lch) or TP302 (+) and TP304 (–) (Rch).
(5) Adjust VR301 (Lch) or VR302 (Rch) so that the voltage is 23mV about 15 ~ 20 min. after power switch "on".

In this set, ICQ is controlled by microcomputer, and ICQ a little more that the normal level is applied by "PREHEAT" for about 15 sec. after power ON.
After that, the output level and transistor temperature are detected by "AUTO", thereby automatically controlling ICQ.

2. Check of DC Detection Circuit

(1) Set the input selector to the "tuner" position.
(2) Apply DC voltage +1V (to Lch) to the playback terminal of tape 1, –1V (to Rch) to the playback terminal of tape2.
(3) Set the input selector to the "tape 1" position.
(4) Make sure
- – relay is off.
- – "auto" indicator "on" goes out.
- – "safety operation" indicator blinks.

3. Check of Overload Detection and Protection Circuit

(1) Connect the audio oscillator to the aux1 terminals and apply the input signal of 1kHz to the terminals.
Then adjust the output level of the audio oscillator so that the output level of the speaker terminals becomes 3V.
(2) Connect 0.33 Ω (5W) resistor to the remote speaker terminal.
(3) Make sure
- – relay is off.
- – "auto" indicator "on" goes out.
- – "safety operation" indicator blinks.
