ABOUT THIS GUIDE

This chapter lists guide conventions and related documentation, and describes how to contact customer service and technical documentation.

Release notes are issued with some products—visit our website at <http://support.utstar.com>. If the information in the release notes differs from the information in this guide, follow the instructions in the release notes.

Conventions

This guide may contain notices, figures, screen captures, and certain text conventions.

Notices

Table 1 lists notice icons used in this guide.

Table 1 Notice Icon Descriptions

Icon	Notice Type	Description
	Information Note	Information that contains important features or instructions but is not hazard-related.
	Caution or Warning	Cautions are preceded with the word Caution . This type of caution indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also alert against unsafe practices and potential program, data, system, or device damage. Warnings are preceded with the word Warning . This type of warning indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
	Caution or Warning due to potential electrical hazard	Cautions due to potential electrical hazards are preceded with the word Caution . This type of caution indicates a potential electrical hazard. This hazard, if not avoided, may result in minor or moderate injury. It may also alert against unsafe practices and potential program, data, system, or device damage. Warnings due to potential electrical hazards are preceded with the word Warning . This type of warning indicates a potential electrical hazard. This hazard, if not avoided, could result in death or serious injury.
	ESD	Information that indicates proper grounding precautions are required before handling a product.

Figures and Screen Captures This guide provides figures and screen captures as examples. These examples contain sample data. This data may vary from the actual data on an installed system.

Text [Table 2](#) lists text conventions in this guide.

Table 2 Text Convention Descriptions

Convention	Description
Text represented as a screen display	This typeface represents text that appears on a terminal screen, for example <code>login:</code> .
Text represented as user entry .	This typeface represents commands entered by the user, for example, <code>cd \$HOME</code> .
Text represented as menu , sub-menu , tab , and field names	This typeface represents all menu, sub-menu, tab, and field names within procedures, for example: On the File menu, click New .
Text represented by <code><variable></code>	This typeface represents a required variable, for example: <code><filename></code>

Related Documentation This documents contain additional information about the iAN-02EX Release 1.0:

- iAN-02 EX Command Line Interface (CLI) User Manual
UTSI-NJTC-20040647

Contacting Customer Service For information about customer service, including support, training, code releases and updates, contracts, and documentation, visit our website at <http://support.utstar.com>.

Refer to the documentation CD-ROM for information about product warranty.

Before contacting technical support, have this information available:

- Contract number
- Problem description
 - Symptoms
 - Known causes
- Product information
 - Software and hardware versions
 - Serial numbers
- Trouble locating and clearing attempts

Contacting Technical Documentation To provide comments on this documentation, send an e-mail to:
techdoc.feedback@utstar.com

Please include the name and part number of the guide being referenced. If applicable, provide the chapter and page number.

1

OVERVIEW

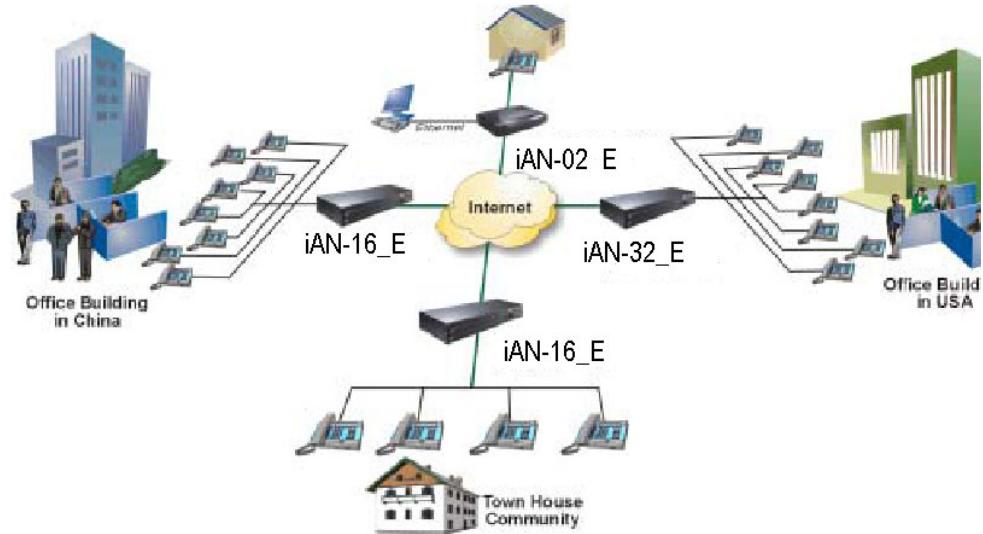

Overview

The iAN-02EX is a Customer Premises Equipment that enables Voice over IP. It interfaces regular POTS telephones with IP based telephony networks.

It is standalone device which provides a cost effective voice communication over an existing broadband connection.

The iAN-02EX is a standard's based communication devices that deliver true, next-generation voice-over-IP (VoIP) terminations to businesses and residences worldwide. This is designed to address the needs of enterprise companies, small-office environments, and the emerging VoIP managed voice services and local services market by helping companies to cost-effectively turn their analog telephones into IP devices.

Figure 1 iAN Product Deployment Schematic

Note: The iAN-16/32_E is a product from the iAN family with 16 and 32 POTS interfaces

The iAN-02EX CPE equipment has the following interfaces:

- WAN Interface: 1 RJ45 10/100 Base-TX Auto-Negotiate
- LAN Interface: 1 RJ45 10/100 Base-TX Auto-Negotiate

- Phone Interface: 2 FXS/POTS Interface to connect regular analogue phone
- PSTN Interface: 1 FXO / PSTN Line interface (Optional)
- Power Supply Connector

Key Features of iAN-02EX:

- IOP (Inter-Operability) with major soft-switch vendors
- Multi-facet signaling supporting MGCP, SIP & H323
- SNMP based EMS for VoIP deployments
- Supports remote software upgrades
- Plug & Play, Auto Configuration / Auto Provisioning
- Auto Switch to PSTN in case of power failure (Optional)

The iAN-02EX box has two Voice ports. Each of the two voice ports on the supports independent telephone numbers, giving you two separate lines. In addition, the internal Ethernet switch allows for a direct connection to a 10/100BASE-T Ethernet network via an RJ-45 interface, with single LAN connectivity for both the iAN-02EX box and a co-located PC or other Ethernet-based device.

Note: H323 is not available in the factory shipped firmware. Separate firmware is needed for this application.

Package Contents

Carefully unpack your package and make sure that you have the following items. If you find anything missing, mismatched or damaged, promptly contact your dealer who you purchased your product from for help.

- One VoIP Residential Gateway
- One RJ-11 telephone line for first telephone
- One RJ-11 telephone line for second telephone (optional)
- One RJ-11 telephone line for PSTN backup use (optional)
- One RJ-45 Ethernet cable
- One power adapter
- One user manual

System Requirements

- One RJ-45 Broadband Internet connection via cable modem or ADSL modem
- One PC with 10Mbps, 100Mbps, or 10/100 Mbps Ethernet card installed
- TCP/IP protocol for each PC
- Microsoft Internet Explorer 4.0 or later (5.0 is strongly recommended for web configuration)

- One or two standard touch-tone telephone(s)
- Subscribe to a VoIP service provider for VoIP services

2

HARDWARE INSTALLATION

Panel & LEDs

Figure 2 Front Panel of 2-Port VoIP Gateway

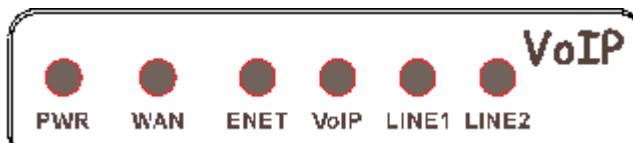

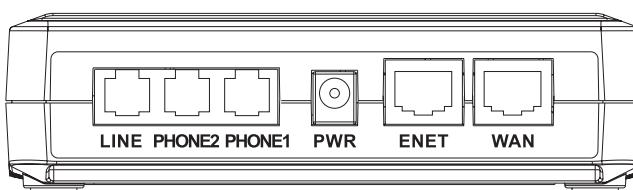

Table 3 LED

LED	Color	Status	Description
PWR	Green	On	When the 2-port VoIP Gateway is powered on
		Off	No power supply
WAN	Green	Blinking	When data is being transmitted or received
		On	When ADSL connection is established
		Off	When there is no ADSL connection
ENET	Green	Blinking	When data is being transmitted or received
		On	When Ethernet connection is established
		Off	When there is no Ethernet connection
VoIP	Green	On	When VoIP telephone service is ready
		Off	When VoIP telephone service is not ready
LINE1 & LINE2	Green	Blinking	When there is an incoming call (the telephone is ringing)
		On	When the telephone is in use
		Off	Switches to PSTN back-up line

Figure 3 Rear Panel of 2-Port VoIP Gateway

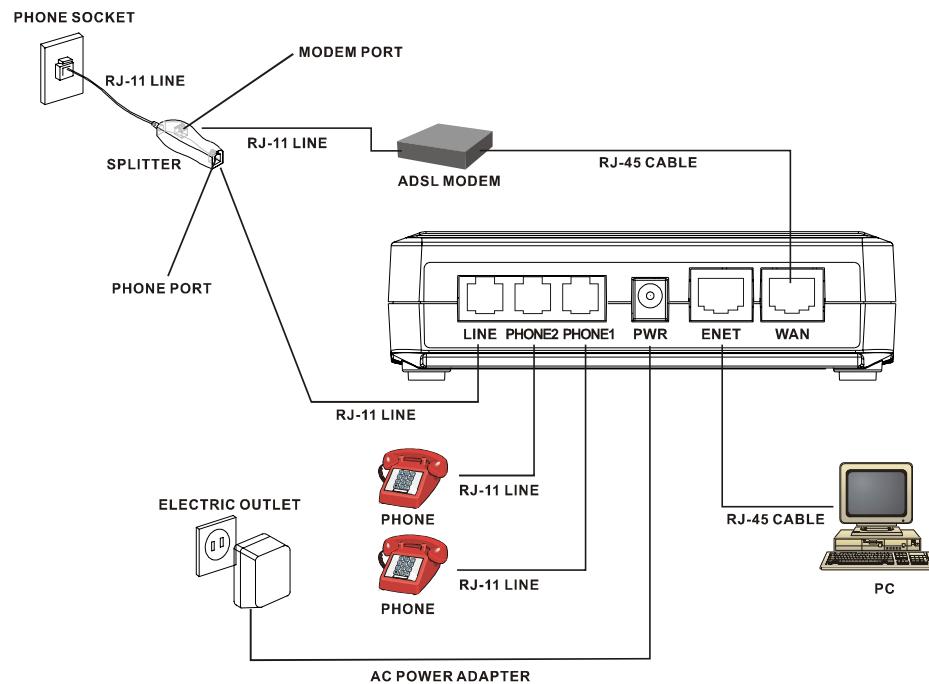

- LINE: RJ-11 connector, connected to PSTN back-up line
- PHONE1 & PHONE2: RJ-11 connectors, connected to IP telephones
- PWR: Power connector, connected to the power adapter packaged with the VoIP Gateway

- ENET: Ethernet RJ-45 connector, connected to PC using a RJ-45 Ethernet cable
- WAN: Ethernet RJ-45 connector, connected to WAN access device, such as the cable modem or ADSL modem

Installation Procedure

Figure 4 Installation Diagram

- 1 **LINE:** Plug one end of the RJ-11 telephone line into the LINE port and plug the other end into the phone port of the splitter. Then connect the splitter to the phone socket in the wall using a RJ-11 telephone line. The LINE port is for back-up use. The telephone is using VoIP service by default. However, if the 2-port VoIP Gateway loses WAN connection or the VoIP function is not available, the 2-port VoIP Gateway will make the telephone to use PSTN (Public Switched Telephone Network) service.
- 2 **PHONE1 & PHONE2:** Plug one end of the RJ-11 telephone line into the PHONE1 or PHONE2 port and plug the other end into the phone socket on a telephone set.
- 3 **PWR:** Plug one end of the power adapter into the PWR port and plug the other end into an electric outlet in the wall.
- 4 **ENET:** Plug one end of the RJ-45 Ethernet cable into the ENET port and plug the other end into the Ethernet socket of NIC on your PC.
- 5 **WAN:** Plug one end of the RJ-45 Ethernet cable into the WAN port and plug the other end into the Ethernet port of the Internet service device, such as the cable modem or ADSL modem. Then connect the cable modem or ADSL modem to the modem port of the splitter using a RJ-11 telephone line.

3

TECHNICAL SPECIFICATION

Table 4 Technical Specifications

Item	Specifications
MANAGEMENT AND PROVISIONING	Automatic System firmware/Configuration download via TFTP/HTTP servers Authentication based on user name, password and login ID Flexibility to use TFTP only, HTTP only or both TFTP/HTTP Configurable TFTP/ HTTP priority order selection TFTP port enable/disable, TFTP port hunting up to 3 ports Configurable TFTP/HTTP feature with enable/disable flags URL based entry for TFTP/HTTP provisioning 3 Optional config for provisioning Encryption utility available for Config file for download Auto sensing of TFTP port and disable download function, if Port unavailable 2 Logins for Maintenance with Online debug capability with 4 debug levels System Telnet and CLI interface for maintenance operations EMS (Element Management System) support based on SNMP traps Reset to factory default via digit map. Shipping & Storage	-25° C to 65° C, Low humidity for Low temperatures, 90% at 45° C and 30% at 65° C
REGULATORY COMPLIANCE	CE, FCC part 15 Class B, UL certified

4

CONFIGURING TCP/IP PROTOCOL

The iAN-02EX ATA has two modes of operation to communicate from a PC to the iAN-02EX ATA:

- [Gateway Mode](#)
- [Bridge Mode](#)

The factory default mode is Gateway mode. After the PC is properly configured, the ATA can be accessed with the procedures listed in [Web Browser](#).

Gateway Mode

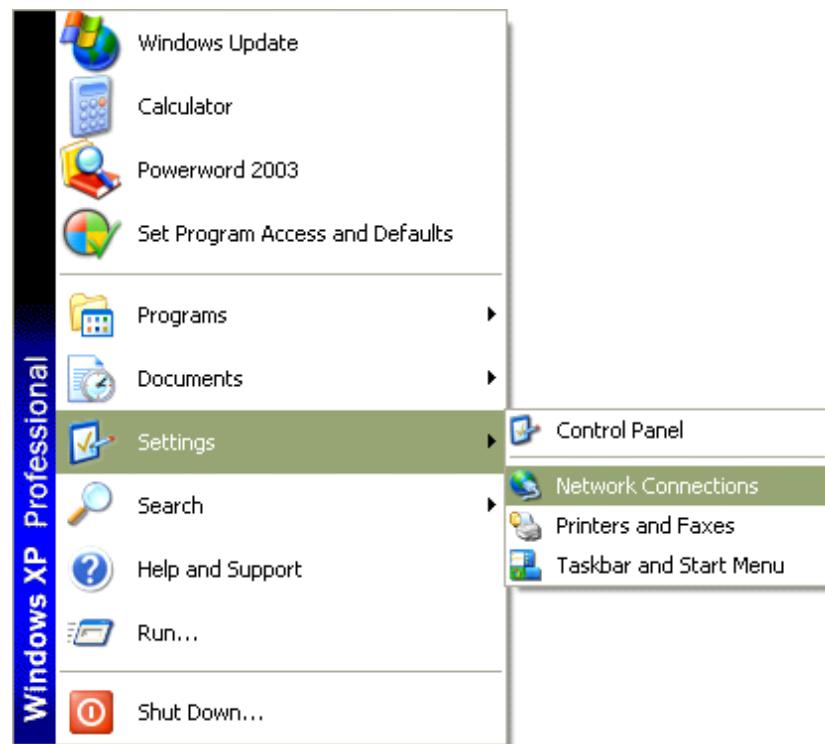

To communicate and configure iAN-02EX, the PC on your LAN must install TCP/IP protocol. Make sure that the TCP/IP protocol of the PC is configured for **Obtain IP address from DHCP** and is connected to the **ENET** (Ethernet) port of the ATA. In doing so the PC obtains an IP address of 172.25.25.2 from the iAN-02EX.

The iAN-02EX assumes an IP address of 172.25.25.1 without network connectivity. This IP address is used for communicating with the iAN-02EX via the Web UI or Telnet, with the PC connected to the ENET port.

The iAN-02EX assumes a DHCP IP address on the WAN side if connected to the network. In this case user can communicate with the same IP address 172.25.25.1 with PC connected to the ENET port. PC in the network can communicate with the DHCP IP address allocated to iAN-02EX.

Following the procedures below to configure TCP/IP protocol for Windows 2000 or Windows XP operating system.

- 1 From the **Start** menu, click **Settings** and then select **Network Connections**.

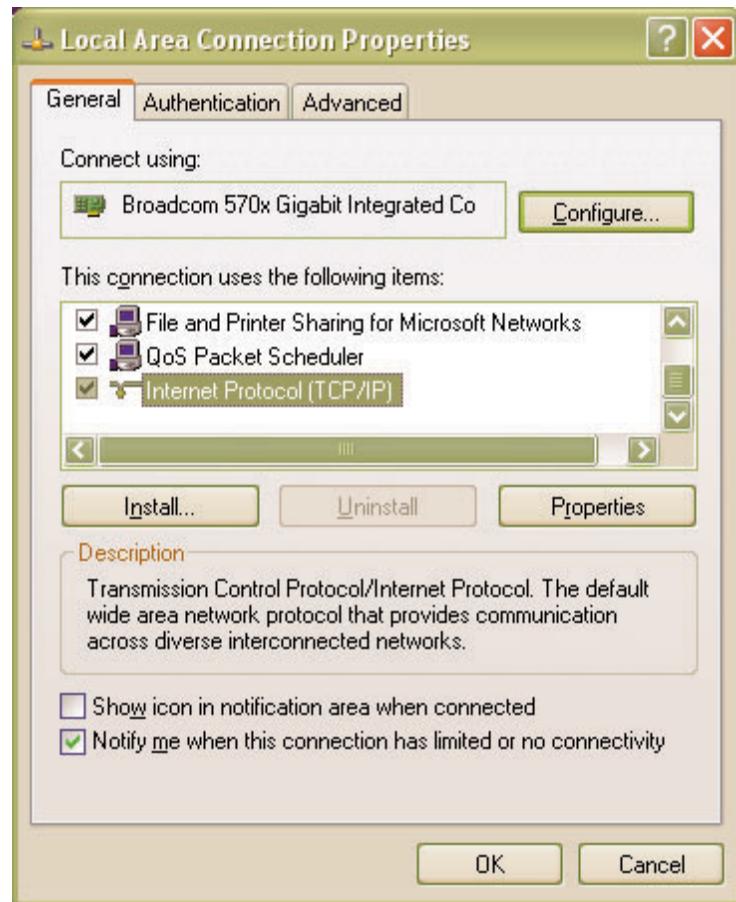

Figure 5 Settings - Network Connections - Gateway Mode

2 Right click **Local Area Connection** and select **Properties**.

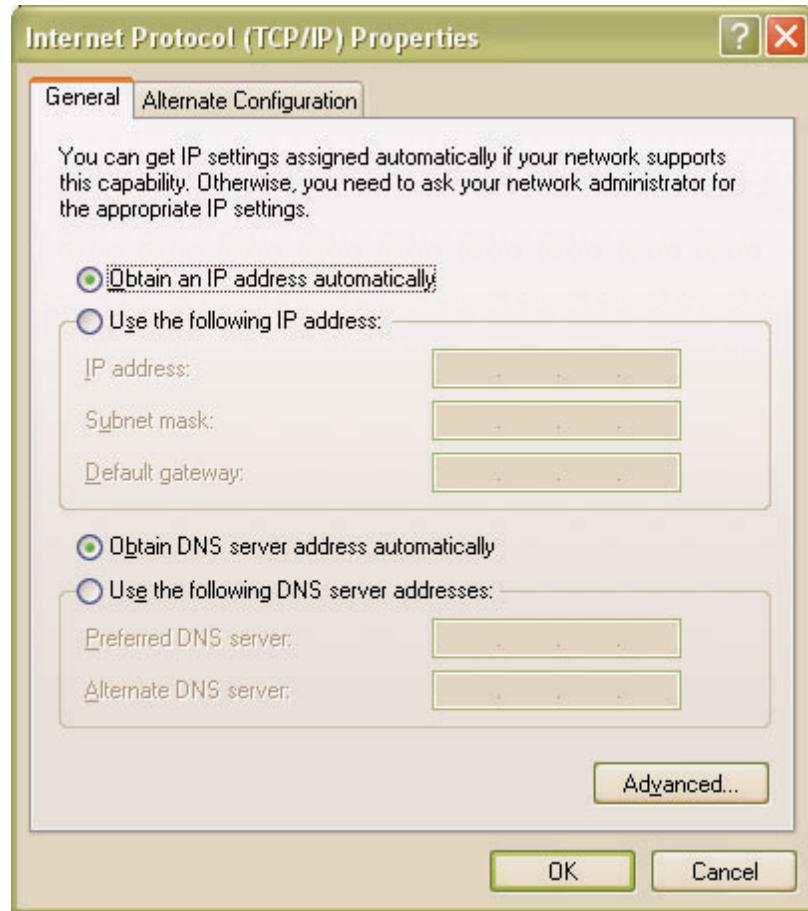

Figure 6 Local Area Connection - Properties - Gateway Mode

3 Select **Internet Protocol (TCP/IP)** and then click **Properties** in [Figure 7](#).

Figure 7 Local Area Connection Properties - Gateway Mode

- 4 Select the radio button for **Obtain an IP address automatically** in [Figure 8](#) and click **OK** to return to [Figure 7](#). Click **OK** to exit.

Figure 8 Internet Protocol (TCP/IP) Properties - Gateway Mode

The Configuration for Windows 2000/XP is now completed. Refer to [Web Browser](#) for configuration procedures via web browser.

Bridge Mode

To communicate and configure iAN-02EX, the PC on your LAN must install TCP/IP protocol. Make sure that the PC is configured with static IP address of 172.25.25.100 and is connected to the **ENET** (Ethernet) port of the ATA. Ensure that the WAN port is not connected.

The iAN-02EX assumes an IP address of 172.25.25.1 without network connectivity. This IP address is used for communicating with the iAN-02EX via the Web UI or Telnet, with the PC connected to the ENET port.

The iAN-02EX assumes a DHCP IP address on the WAN side if connected to the network. In the Bridge mode, the PC that connects to the ENET port also is allocated a DHCP IP address. In this case user can communicate with the PC in the network or PC connected to the ENET port using the DHCP IP allocated to the user.

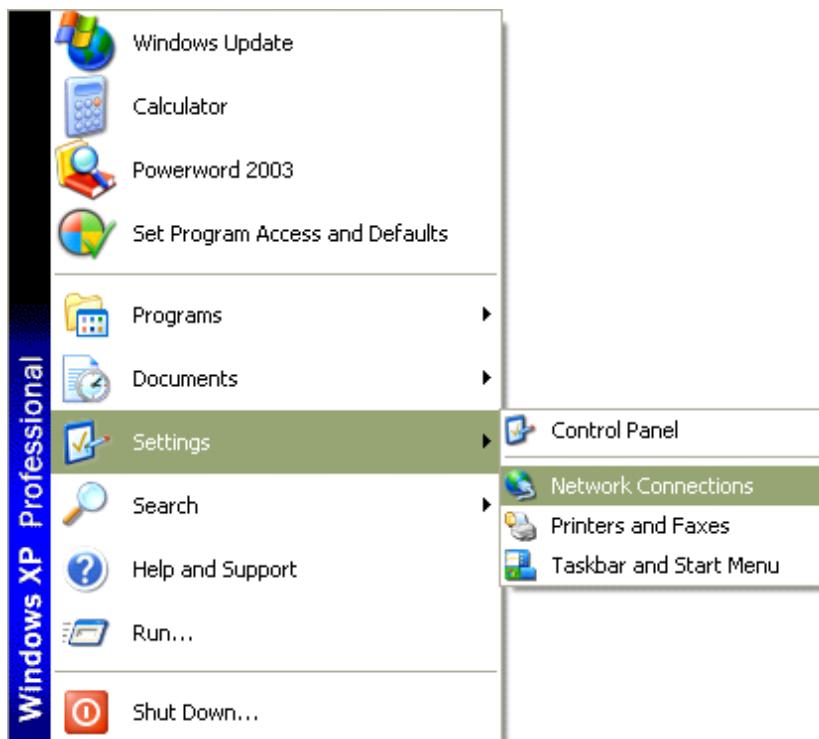

Note: the ISP normally has to provide 2 IP addresses, one for the ATA and one for the PC connected to the LAN port.

Following the procedures below to configure TCP/IP protocol for Windows 2000 or Windows XP operating system.

- 1 From the **Start** menu, click **Settings** and then select **Network Connections**.

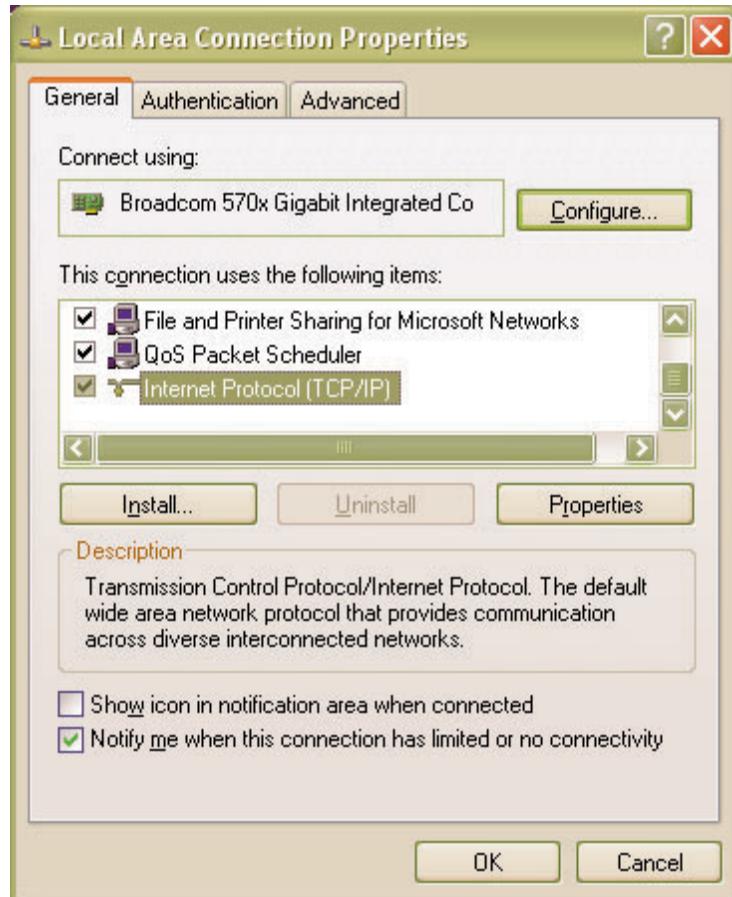

Figure 9 Settings - Network Connections - Bridge Mode

- 2 Right click **Local Area Connection** and select **Properties**.

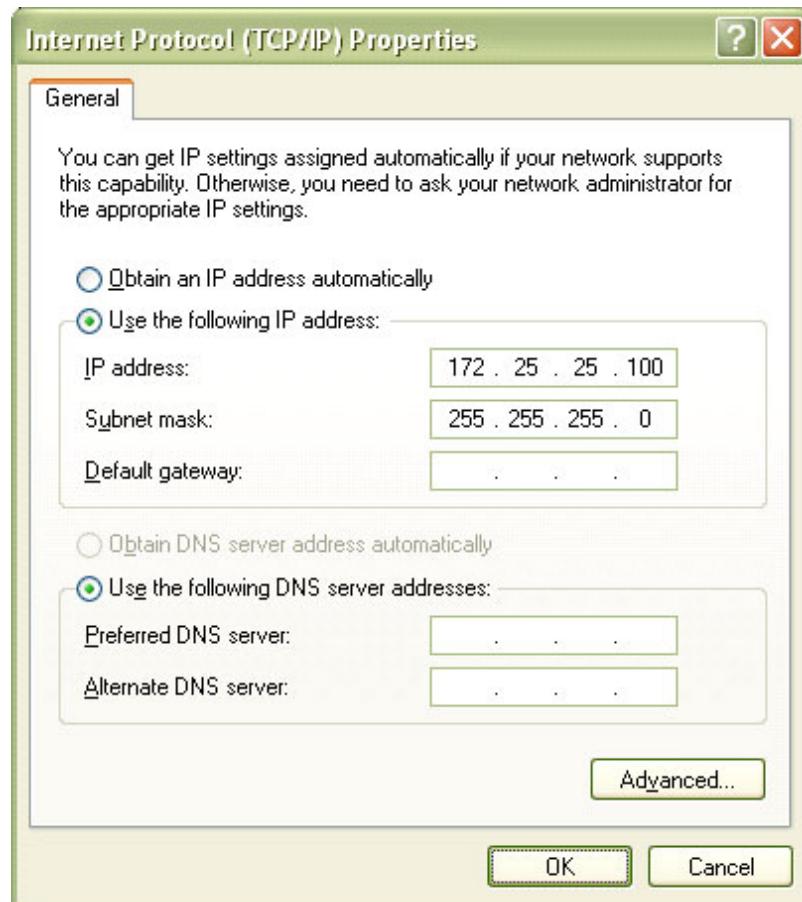

Figure 10 Local Area Connection - Properties - Bridge Mode

3 Select Internet Protocol (TCP/IP) and then click **Properties** in [Figure 11](#).

Figure 11 Local Area Connection Properties - Bridge Mode

- 4 Select the radio button for Using the following IP address in [Figure 12](#). Set IP address as **172.25.25.100** and set Subnet mask as **255.255.255.0**. Click **OK** to confirm the settings and return to [Figure 11](#). Click **OK** again to exit.

Figure 12 Internet Protocol (TCP/IP) Properties - Bridge Mode

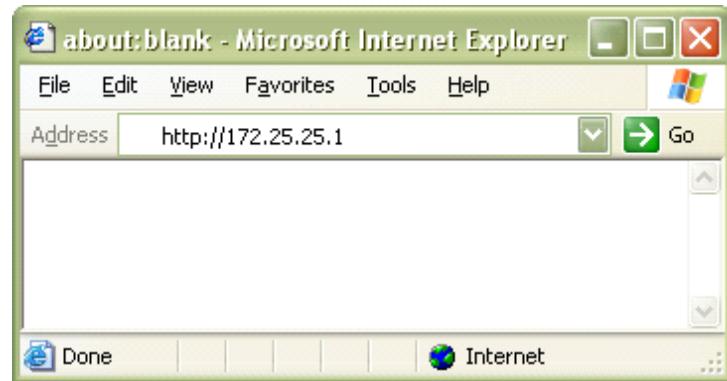

The Configuration for Windows 2000/XP is now completed. Refer to [Web Browser](#) for configuration procedures via web browser.

Web Browser

Once the TCP/IP of the PC is properly configured, please proceed the following steps:

- 1 Start a web browser window.
- 2 Enter the default IP address, **172.25.25.1**, of this device in the address box to access the web configuration menu.

Figure 13 Starting Web Browser Window - Gateway Mode

- 3 [Figure 14](#) prompts for user name and password. The web configuration menu provides two operation modes: user mode and supervisor mode. For user mode, enter the predefined user name as **user** and password as **12345**. For the supervisor mode, enter the predefined user name as **supervisor** and password as **utstar**. Click OK to access the configuration as shown in [Figure 15](#).

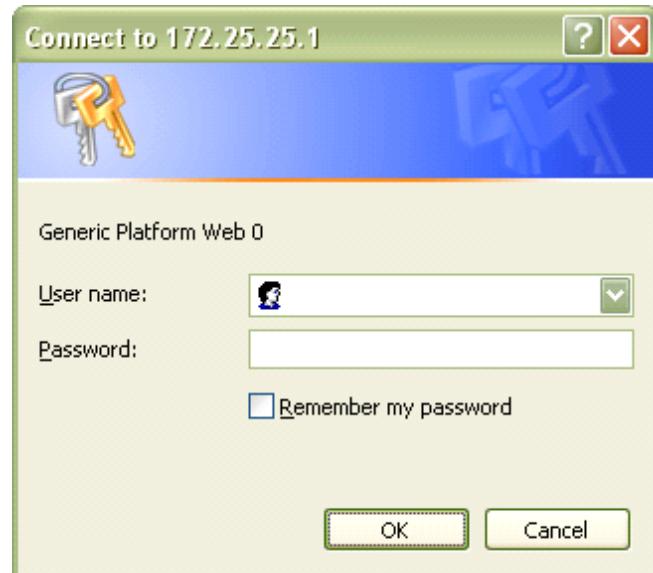

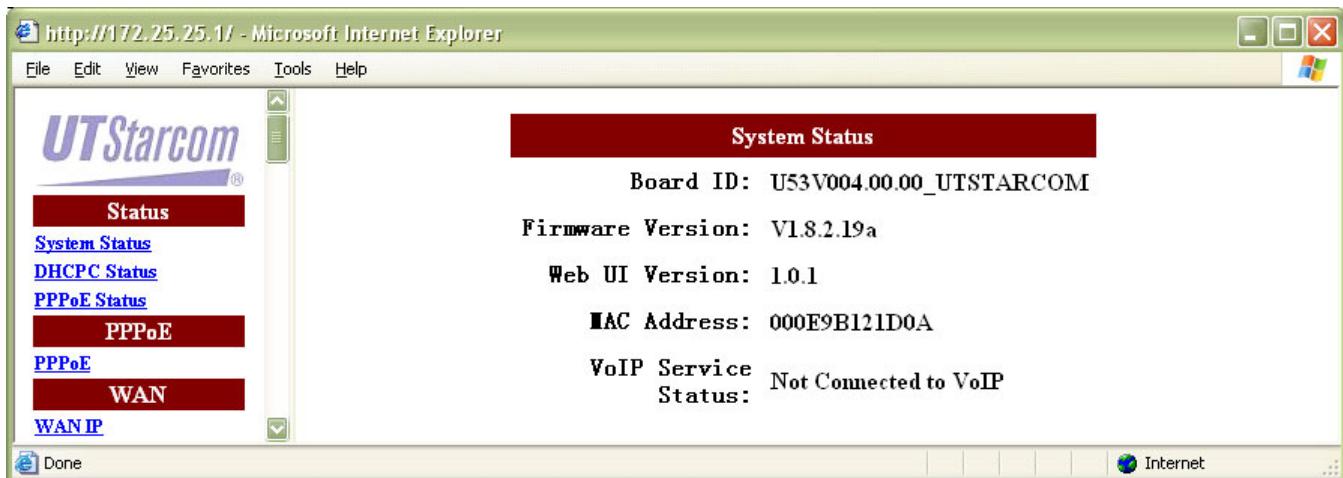

Figure 14 User Name / Password Window - Gateway Mode

Figure 15 Web Configuration Main Menu - Gateway Mode

Refer to [Chapter 5 - Configuration](#) for more details of web configuration operations.

5

CONFIGURATION

iAN-02EX Gateway implements a Web server allowing user configure this device via the Web interface. This Interface provides comprehensive system management scheme, including system configuration, performance monitoring, system maintenance and administration. Refer to [Table 5](#) for the features and functions available to "Supervisor" vs. "User" privileges.

Table 5 Feature Lists

Features	Functions	User Level	Supervisor Level
Status	System Status	V	V
	WAN Status	V	
	DHCP Status	V	V
	PPPoE Status	V	V
PPPoE	PPPoE	V	V
WAN	WAN IP	V	V
	Device Mode	V	V
	MTU Rate	V	
DOS	Denial of Service	V	
NTP	NTP	V	
Gateway Mode Settings	LAN Configuration	V	V
	Port Forwarding	V	V
	IP Filter	V	V
	DMZ	V	V
QoS	QoS Configuration	V	
	DSCP	V	
	VLan Tag	V	
Mac Cloning	Mac Cloning	V	V

Save	Save Configuration Load Default Settings Load Default Settings using FXS Ports Load Default Keypad	V	V
Reboot	Reboot	V	V

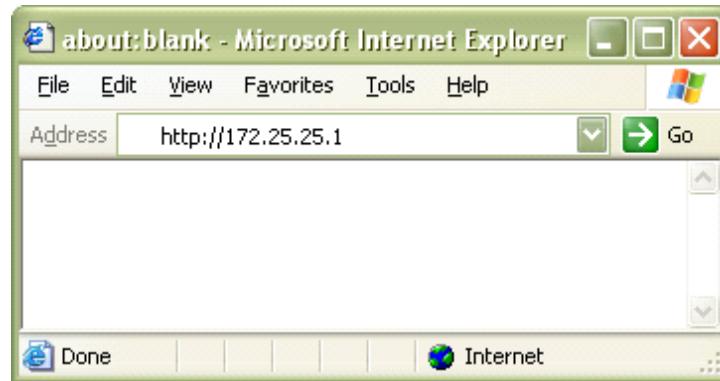

Note: Unless otherwise noted, this chapter uses Gateway Mode with Supervisor level in all examples. Please note that some sections may not apply to Bridge Mode or User level login.

Configuring via Web Browser

Once the TCP/IP of the PC is properly configured, please proceed the following steps:

- 1 Start a web browser window.
- 2 For Gateway mode, enter the default IP address of 172.25.25.1 to access the web configuration menu. For Bridge Mode, enter the default IP address of 172.25.25.1.

Figure 16 Starting Web Browser Window - Gateway Mode

- 3 **Figure 17** prompts for user name and password. The web configuration menu provides two operation modes: user mode and supervisor mode. For user mode, enter the predefined user name as **user** with password as **12345**. For the supervisor mode, enter the predefined user name as **supervisor** with password as **utstar**. Click **OK** to access the configuration as shown in [Figure 18](#).

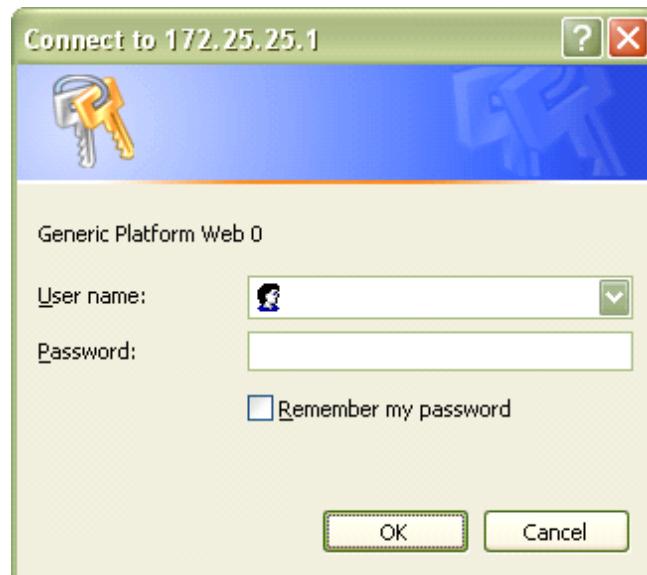

Figure 17 User Name / Password Window - Gateway Mode

Figure 18 Web Configuration Main Menu - Gateway Mode

*Note: Click **OK** on any page to apply the modification. Navigating to another page without clicking **OK** does not save any modifications and the configuration are ignored. After making all necessary settings, you **MUST Save** the configurations and then **Reboot** for the new settings to take effect. Refer to [Save](#) and [Reboot](#) for more information.*

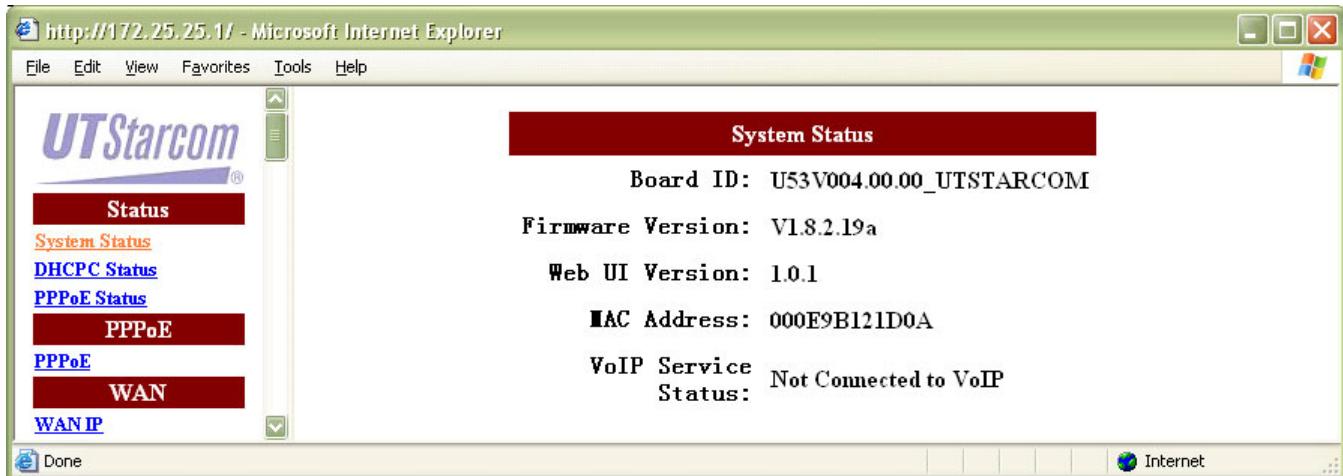

Status

The Status provision contains the following sections:

- [System Status](#)
- [WAN Status](#)
- [DHCP Status](#)
- [PPPoE Status](#)

System Status

Click **System Status** in the **Status** section. [Figure 19](#) prompts for current system status. Refer to [Table 6](#) for more information of the parameters.

Figure 19 Status - System Status**Table 6** Status - System Status Field Description

Field	Description
Board ID	The ID number of this module
Firmware Version	The current firmware version number
Web GUI Version	The current Web UI version number
MAC Address	The unique hardware number of this module
VoIP Service Status	The current VoIP connection status Value range: Connected to VoIP / Not Connected to VoIP.

WAN Status Click **WAN Status** in the **Status** section. [Figure 20](#) prompts for current WAN status. Refer to [Table 7](#) for more information of the parameters.

Note: This section is applicable for User mode only. It is not applicable for Supervisor mode.

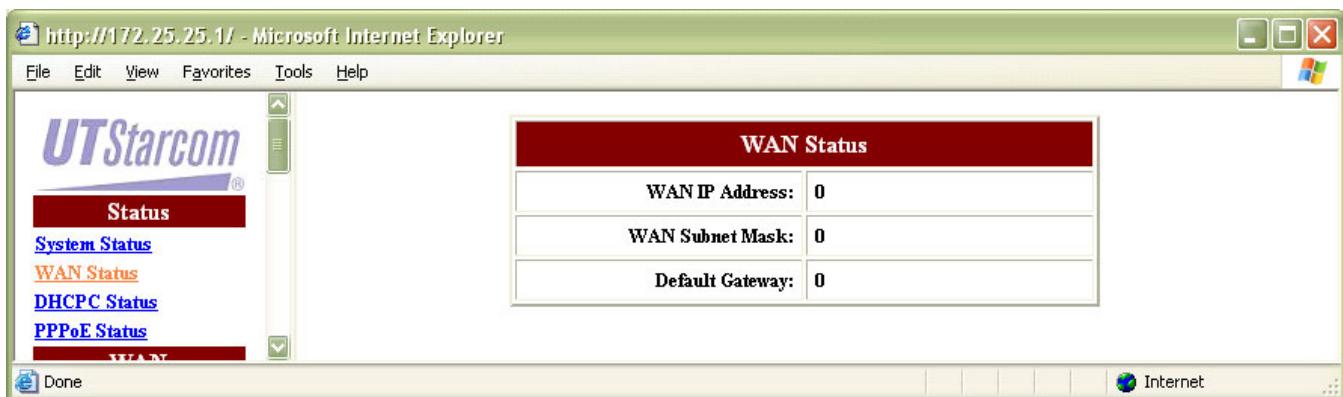

Figure 20 Status - WAN Status

Table 7 Status - WAN Status Field Description

Field	Description
WAN IP Address	The IP address of the WAN
WAN Subnet Mask	The subnet mask of the WAN
Default Gateway	The gateway address of the WAN

Note: The parameters contain meaningful data only when static IP address scheme is used for WAN connection. All parameters are 0 or null when static IP is not used. Refer to [WAN IP](#) for WAN connection mode configuration.

- DHCP Status** Click **DHCP Status** in the **Status** section. [Figure 21](#) prompts for current DHCP status. Refer to [Table 8](#) for more information of the parameters.

Figure 21 Status - DHCP Status

The screenshot shows a Microsoft Internet Explorer window displaying the 'DHCP Status' page of the UTStarcom iAN-02EX VoIP gateway. The URL in the address bar is 'http://172.25.25.1'. The left sidebar menu includes 'Status', 'System Status', 'DHCP Status' (which is highlighted in orange), 'PPPoE Status', 'PPPoE', 'WAN', 'WAN IP', 'Device Mode', and 'MTU Rate'. The main content area has a title 'DHCP Status' and a table with the following data:

DHCP Status	
IP:	0
Subnet Mask:	0
Broadcast:	0
Gateway:	0
DNS1:	0
DNS2:	0
NTP Server:	0

Table 8 Status - DHCP Status Field Description

Field	Description
IP	The IP address of the iAN-02EX VoIP gateway
Subnet Mask	The subnet mask of the iAN-02EX VoIP gateway
Broadcast	The DHCP broadcast address
Gateway	The gateway address of the iAN-02EX VoIP gateway
DNS1	The IP address of domain name server 1
DNS2	The IP address of domain name server 2
NTP Server	The IP address of network time protocol server

Note: The parameters contain meaningful data only when DHCP scheme is used for WAN connection. All parameters are 0 or null when DHCP is not used. Refer to [WAN IP](#) for WAN connection mode configuration.

PPPoE Status Click **PPPoE Status** in the **Status** section. [Figure 22](#) prompts for current PPPoE status. Refer to [Table 9](#) for more information of the parameters.

Figure 22 Status - PPPoE Status

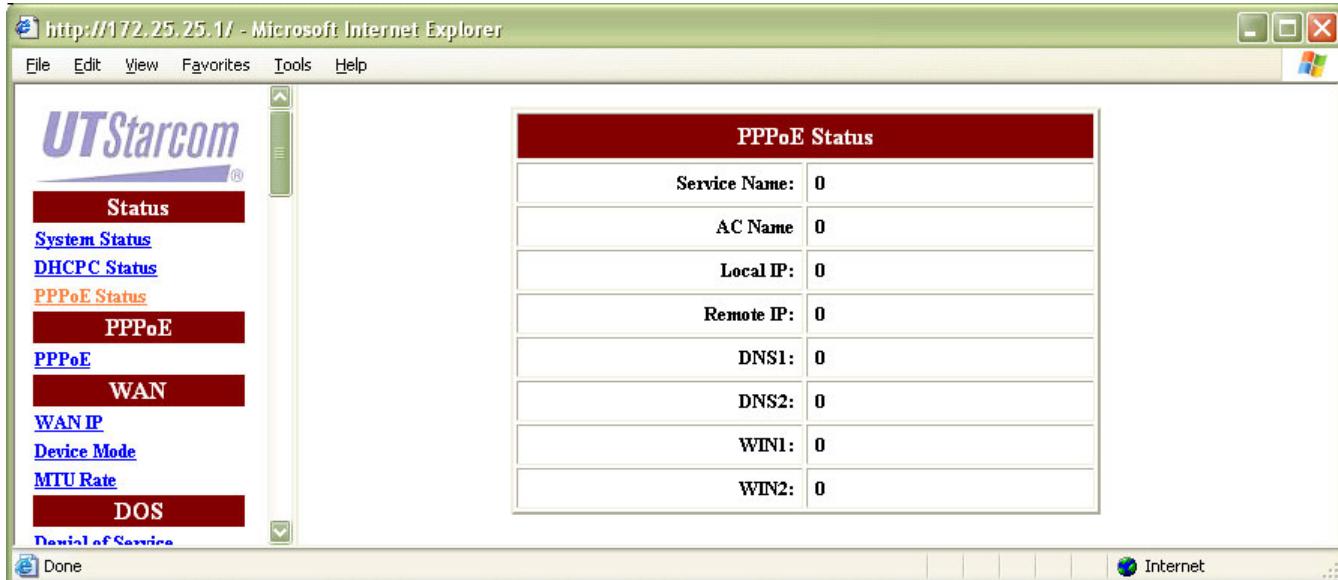

Table 9 Status - PPPoE Status Field Description

Field	Description
Service Name	The service group name
AC Name	Specific server account details
Local IP	The Client IP address
Remote IP	The Server IP address
DNS1	The IP address of domain name server 1
DNS2	The IP address of domain name server 2
WIN1	The IP address of WIN Server 1
WIN2	The IP address of WIN Server 2

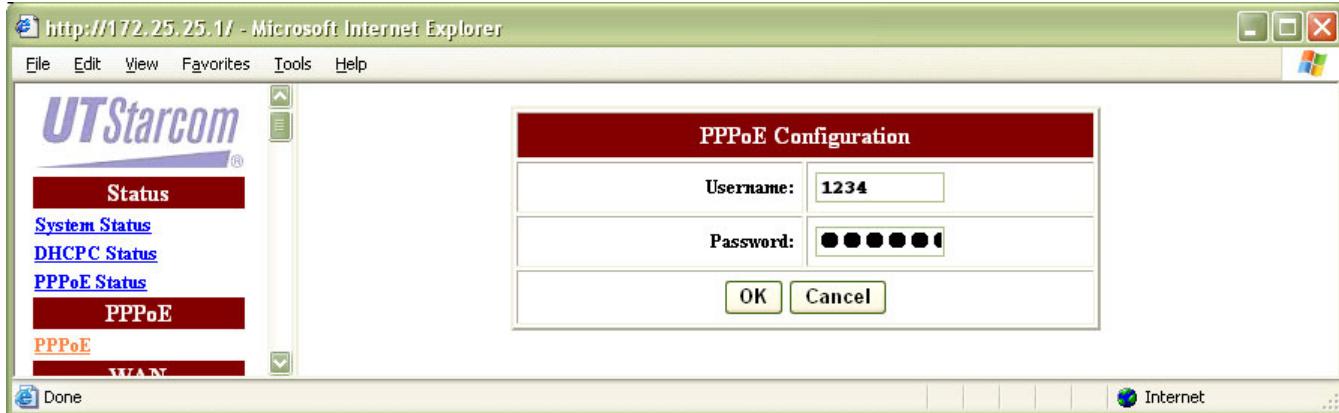

Note: The parameters contain meaningful data only when PPPoE scheme is used for WAN connection. All parameters are 0 or null when PPPoE is not used. Refer to [WAN IP](#) for WAN connection mode configuration.

PPPoE

PPPoE A valid pair of user name and password is required when PPPoE mode is selected for obtaining the WAN IP address for the iAN-02EX VoIP gateway.

Click **PPPoE** in the **PPPoE** section. [Figure 23](#) prompts for current PPPoE status. Refer to [Table 10](#) for more information of the parameters.

Figure 23 PPPoE - PPPoE**Table 10** PPPoE - PPPoE Field Description

Field	Description
Username	User name for PPPoE registration recognized by the Internet service provider
Password	Password for PPPoE registration recognized by the Internet service provider

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and **Reboot** the module for the new configuration to take effect.

Note: Refer to [WAN IP](#) for PPPoE mode configuration and refer to [PPPoE Status](#) for PPPoE status.

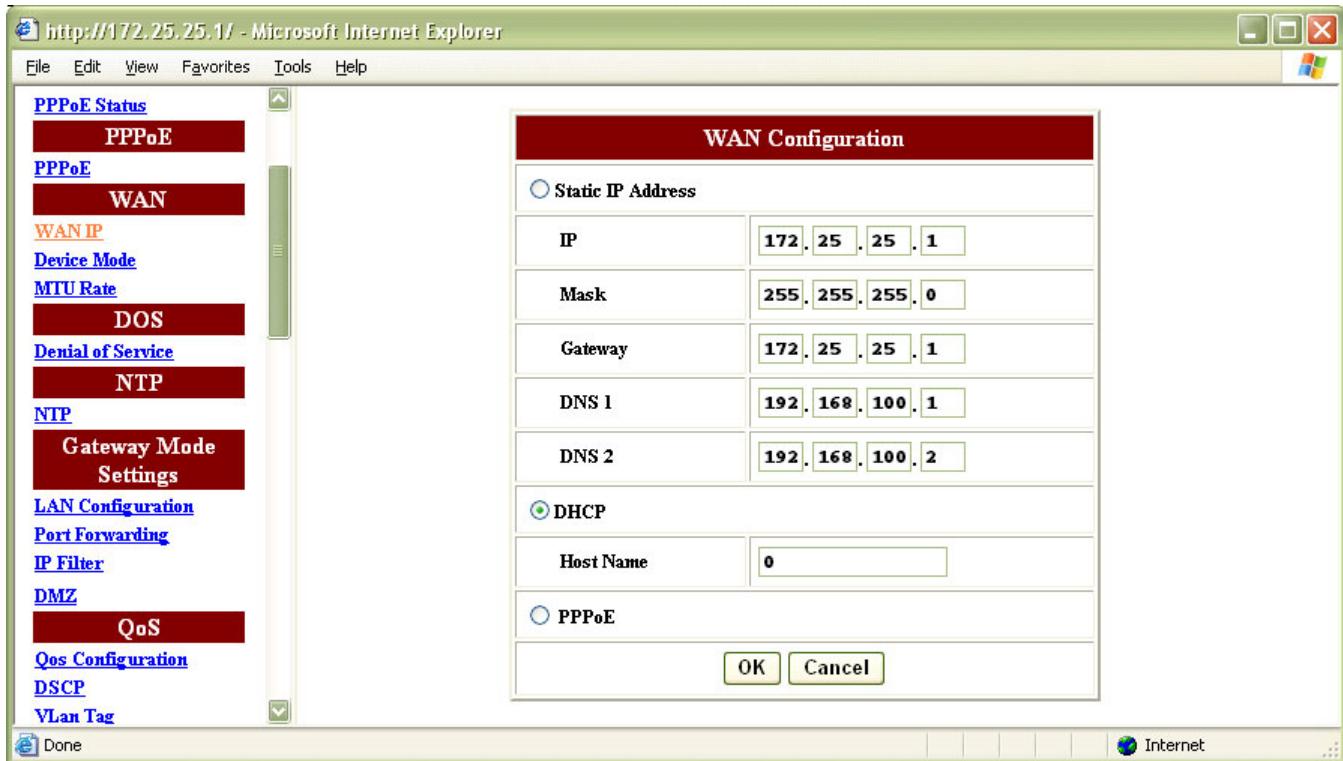

WAN

The WAN port is the connection of the iAN-02EX module to the existing broadband device such as cable modem or ADSL CPE. The WAN provision contains the following sections:

- [WAN IP](#)
- [Device Mode](#)
- [MTU Rate](#)

WAN IP

iAN-02EX supports three methods of obtaining the WAN IP address; static, DHCP or PPPoE. Click **WAN IP** in the **WAN** section. [Figure 24](#) prompts for configuration. Refer to [Table 11](#) for more information of the parameters.

Figure 24 WAN - WAN IP**Table 11** WAN - WAN IP Field Description

Field	Description
Static IP Address	To configure a static IP address.
IP	The static IP address of the iAN-02EX VoIP gateway Default: 171.25.25.1
Mask	The subnet mask of the iAN-02EX VoIP gateway Default: 255.255.255.0
Gateway	The network gateway address of the iAN-02EX VoIP gateway Default: 172.25.25.1
DNS 1	The IP address of domain name server 1. Default: 192.168.100.1
DNS 2	The IP address of domain name server 2. Default: 192.168.100.2
DHCP	To obtain an IP address through DHCP. Default connection mode.
Host Name	The name of the DHCP host. Default: 0
PPPoE	To obtain an IP address through PPPoE.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Note: Refer to [DHCP Status](#) for PPPoE status.

Device Mode

iAN-02EX has two operational modes: Bridge mode and Gateway mode. With bridge mode, iAN-02EX acts as a transparent bridge to pass traffic between the module and an end-user device. The WAN port and the LAN (ENET) port share the same IP address. With gateway mode, iAN-02EX acts as a NAT device and so that a group of users can use a private IP address in a LAN environment. The WAN port and the LAN (ENET) port have distinct IP addresses.

Click **Device Mode** in the **WAN** section. [Figure 25](#) prompts for configuration. Refer to [Table 12](#) for more information of the parameters.

Figure 25 WAN - Device Mode

Table 12 WAN - Device Mode Field Description

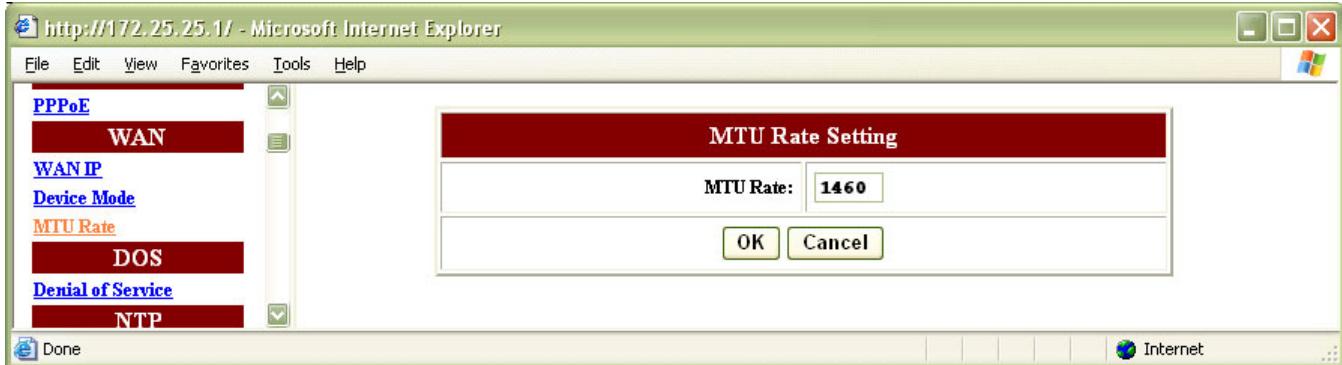

Field	Description
Bridge	The LAN port (ENET) is bridged to the WAN Port. NAT function is disabled.
Gateway	NAT is applied between the LAN (ENET) and WAN Port. Default mode.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

MTU Rate

Click **MTU Rate** in the **WAN** section. [Figure 26](#) prompts for configuration. Refer to [Table 13](#) for more information of the parameters.

Figure 26 WAN - MTU Rate**Table 13** WAN - MTU Rate Field Description

Field	Description
MTU Rate	Specify the network MTU rate
	Default: 1460

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

DOS	DOS (Denial of service) provides access control for RTP packets, web/telnet provisioning, etc.
Denial of Service	Click Denial of Service in the DOS section. Figure 27 prompts for configuration. Refer to Table 14 for more information of the parameters.

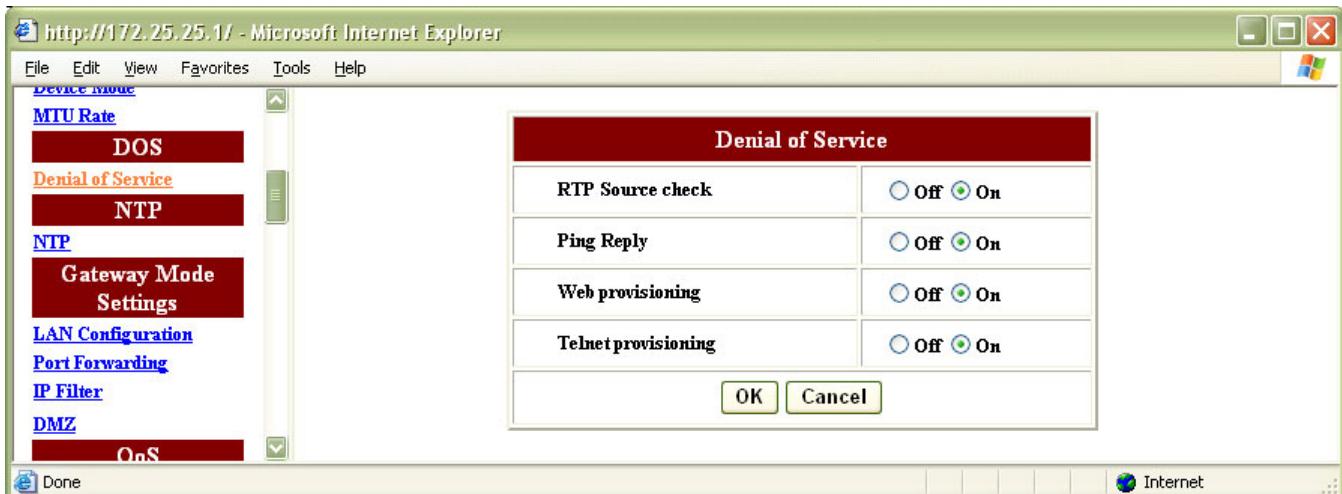

Figure 27 DOS - Denial of Service

Table 14 DOS - Denial of Service Field Description

Item	Description
RTP Source Check	Enable / disable RTP source checking. When enabled, RTP packets with source ip/port not presented in remote SDP are dropped.
Ping Reply	Enable / disable ping reply to ICMP request
Web Provisioning	Enable / disable web provisioning from WAN side. For Gateway mode only.
Telnet Provisioning	Enable / disable telnet provisioning from WAN side. For Gateway mode only.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

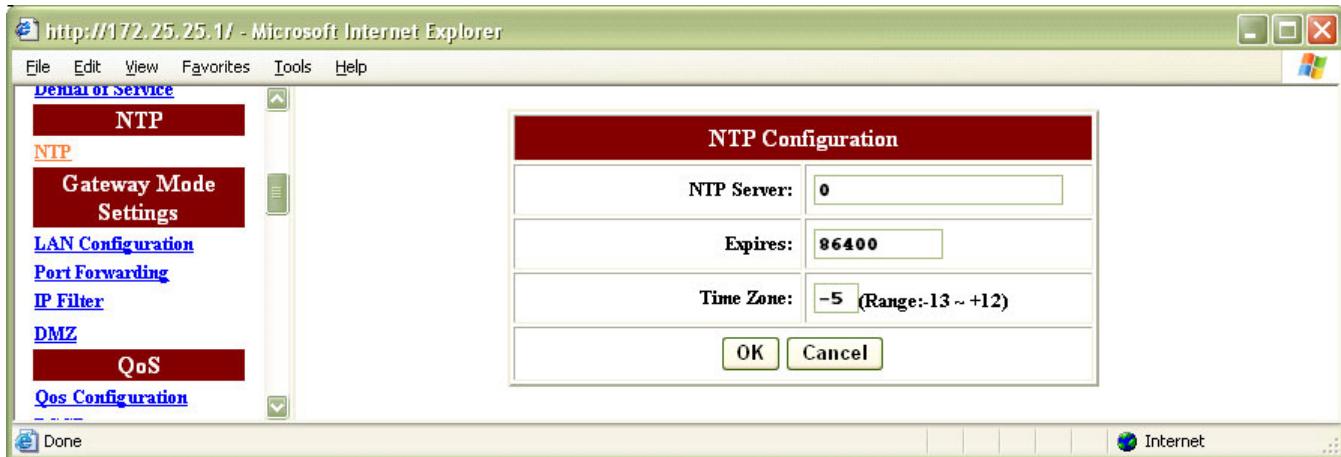

NTP

NTP (network time protocol) is a protocol that allows local computers to synchronize the clocks. When a NTP client initiates a time request exchange with the NTP server, the client can adjust its local clock to exactly match the clock at the server's computer. Accurate time information is critical for monitoring the device with system log.

The device will synchronize itself with an external NTP server automatically when one of the following conditions occurs:

- Rebooting the device
- The **Expires** time having run out

NTP Click **NTP** in the **NTP** section. [Figure 28](#) prompts for configuration. Refer to [Table 15](#) for more information of the parameters.

Figure 28 NTP - NTP**Table 15** NTP - NTP Field Description

Item	Description
NTP Server	The IP address of the network time protocol server.
Expires	The period that the VoIP gateway retrieves time from NTP server. Default: 86400 seconds
Time Zone	The time difference between the local time and GMT. Default: -5

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Note: The Time Zone does not adjust automatically to the North America daylight saving time. Adjust the value manually when needed. -4 is the time zone with daylight saving and -5 is without daylight saving. The value can also be modified through the configuration file.

Gateway Mode Settings

The Gateway Mode Settings provision contains the following sections:

- [LAN Configuration](#)
- [Port Forwarding](#)
- [IP Filter](#)
- [DMZ](#)

Note: The functions described in this section apply only to Gateway mode. Refer to [Device Mode](#) for device mode configuration.

LAN Configuration When the module operates in the Gateway mode, it supports the NAT (NAPT) feature. It means the WAN and LAN interfaces are located in different network segments and therefore the data traffic needs to be routed between the two interfaces.

To properly communicate with iAN-02EX, an IP address must also be assigned to the LAN port of the user's PC. There are 2 ways to assign a proper IP address to the user PC's LAN port:

- Manual configuration of the user PC: This is required if the user configures the iAN-02EX WAN port with a static IP address as described in [WAN IP](#).
- Dynamic IP assignment with DHCP: iAN-02EX can act as a DHCP server which dynamically assigns an IP address to user's PC located in the LAN-side network.

Click **LAN Configuration** in the **Gateway Mode Settings** section. [Figure 29](#) prompts for configuration. Refer to [Table 16](#) for more information of the parameters.

Figure 29 Gateway Mode Settings - LAN Configuration

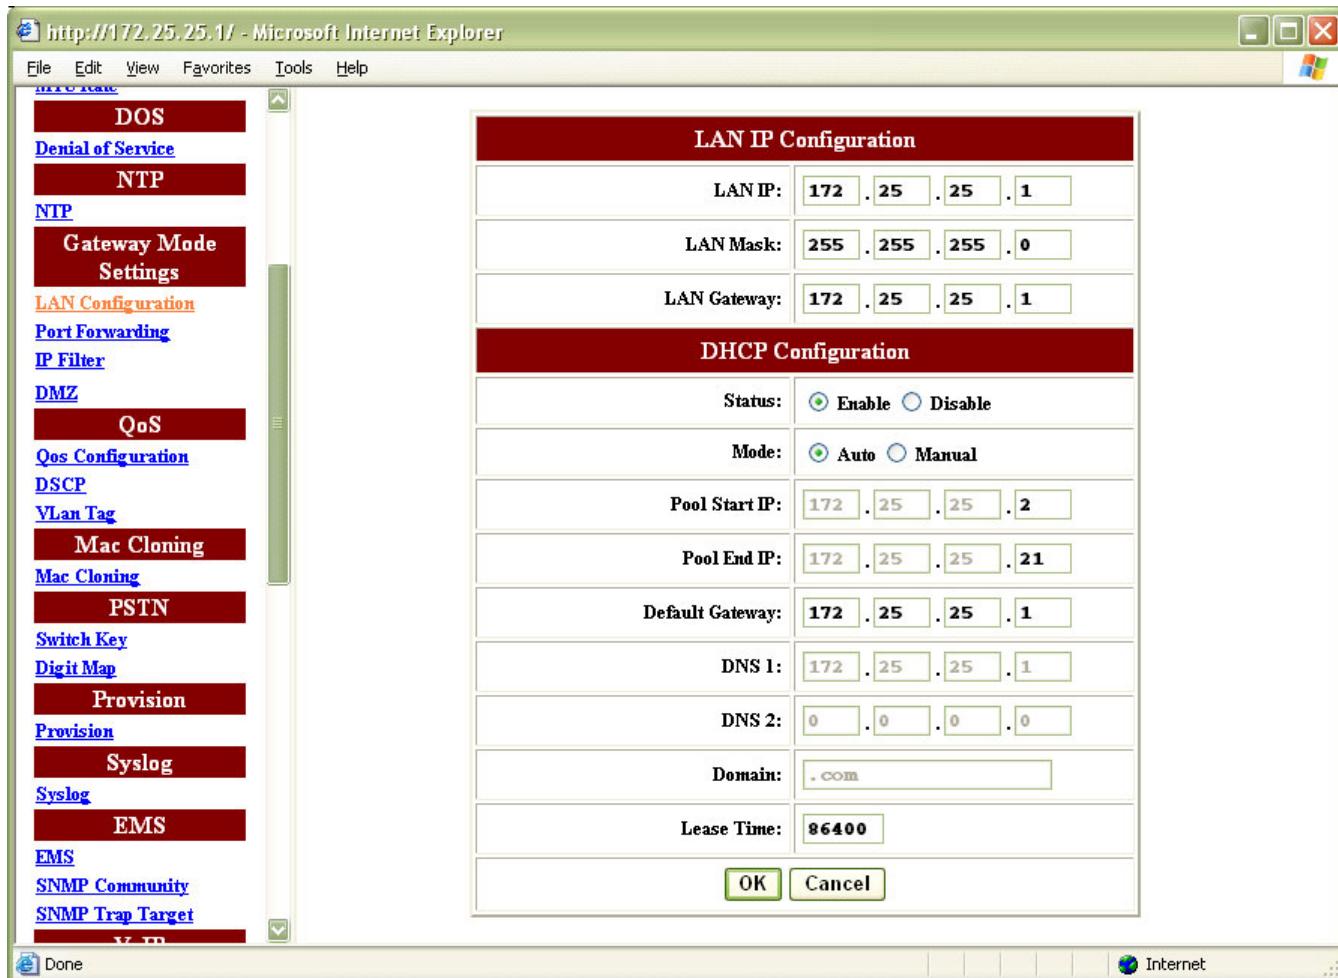

Table 16 Gateway Mode Settings - LAN Configuration Field Description

Item	Description
LAN IP Configuration	
LAN IP	The LAN IP address Default: 172.25.25.1
LAN Netmask	The LAN netmask Default: 255.255.255.0
LAN Gateway	The LAN gateway IP address. Default: 172.25.25.1
DHCP Configuration	
Status	To enable/disable DHCP server's dynamic IP address assignment. Default: Enable
Mode	To automatically obtain or manually assign the DNS server address. Default: Auto
Pool Start IP	The starting IP address of the IP address pool. Default: 172.25.25.1
Pool End IP	The ending IP address of the IP address pool. Default: 172.25.25.21
Default Gateway	The default network gateway IP address. Default: 172.25.25.1
DNS 1	The IP address of domain name server 1. Configurable with Manual mode. Default: 172.25.25.1
DNS 2	The IP address of domain name server 2. Configurable with Manual mode. Default: 0.0.0.0
Domain	The domain name. Default: .com
Lease Time	The time duration for which the settings will be in effect. Default: 86400 seconds

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Port Forwarding

A NAPT application creates a firewall between LAN and WAN. A firewall keeps unwanted traffic away from user computers in the LAN. A tunnel can be created through user firewall so that a distant server on the Internet can communicate with one of the user computers in the LAN via a single port.

Click **Port Forwarding** in the **Gateway Mode Settings** section. [Figure 30](#) prompts for configuration. Refer to [Table 17](#) for more information of the parameters.

Figure 30 Gateway Mode Settings - Port Forwarding

Table 17 Gateway Mode Settings - Port Forwarding Field Description

Field	Description
Forwarding Rule	
tcp / udp / both	Forward the packets based on tcp, udp or both
Forward Port	The port number of the tcp or udp packets the user wants to check against with the configured rules.
To Private IP	The IP Address of the user's PC on the LAN-side network where packets of matching criteria will be forwarded to.
ID	The ID of the port-forwarding rule from the rule table.
Rule Table	
ID	A unique ID number assigned by the system.
Type	NAPT
	Port Forwarding
Public IP	The originating IP address to be forwarded from.
Private IP	The destination IP address to be forwarded to
Forward Port	The originating port to be forwarded from.

Configure the parameters accordingly and click **Add** to create a new entry. Click **Refresh** to obtain the latest configuration information.

Enter the corresponding ID number listed in the table and click **Delete** to remove the entry.

Save the configuration and **Reboot** the module for the new configuration to take effect.

Note: Rule ID # 10 is a module default entry. Do not delete this entry.

IP Filter iAN-02EX provides the option to block access from the IP addresses specified in the IP filter.

Click **IP Filter** in the **Gateway Mode Settings** section. [Figure 31](#) prompts for configuration. Refer to [Table 18](#) for more information of the parameters.

Figure 31 Gateway Mode Settings - IP Filter

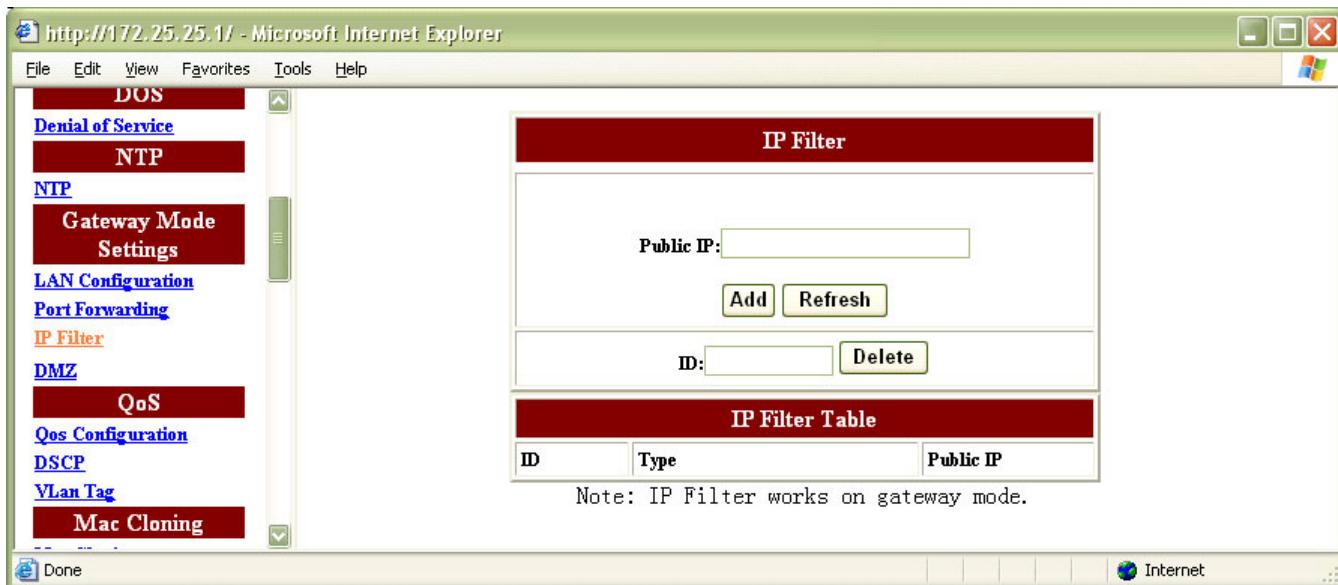

Table 18 Gateway Mode Settings - IP Filter Field Description

Field	Description
IP Filter	
Public IP	The public IP address to be blocked.
ID	The ID of the filter rule from the IP filter table.
IP Filter Table	
ID	A unique ID number assigned by the system.
Type	IP filter.
Public IP	The public IP address to be blocked.

Configure the parameters accordingly and click **Add** to create a new entry. Click **Refresh** to obtain the latest configuration information.

Enter the corresponding ID number listed in the table and click **Delete** to remove the entry.

Save the configuration and Reboot the module for the new configuration to take effect.

DMZ DMZ (De-Militarized Zone) is a firewall feature governing real-time information exchanged through the VOIP gateway device. DMZ allows a single computer on the LAN side network to expose all of its ports to the Internet, which means the exposed computer is no longer behind the firewall. When a packet enters the VOIP gateway, the packet is transferred to the DMZ if it is not filtered nor port-forwarded.

Click **DMZ** in the **Gateway Mode Settings** section. [Figure 32](#) prompts for configuration. Refer to [Table 19](#) for more information of the parameters.

Figure 32 Gateway Mode Settings - DMZ

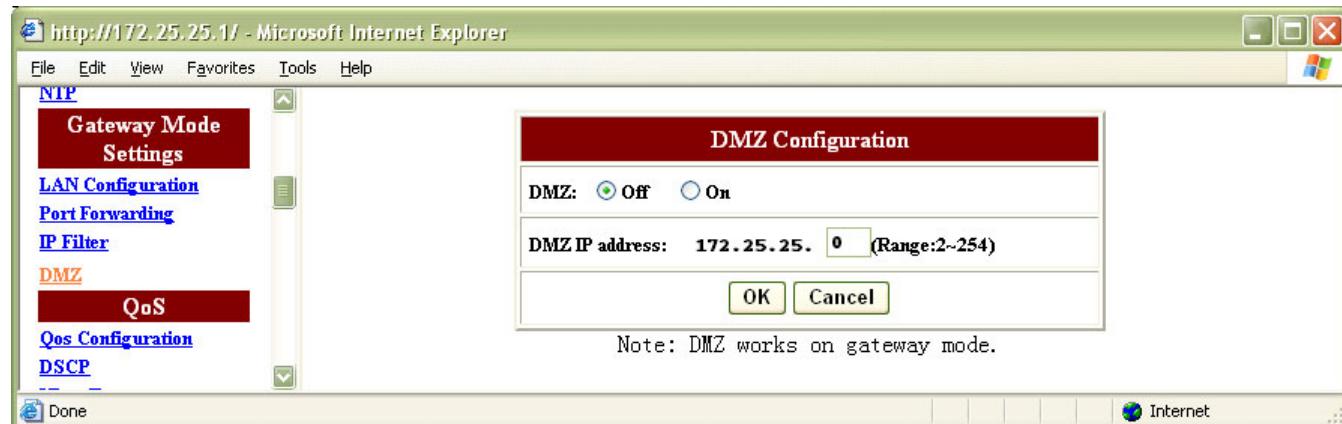

Table 19 Gateway Mode Settings - DMZ Field Description

Field	Description
DMZ	Off: Disable DMZ. Default. On: Enable DMZ
DMZ IP Address	The IP address of the DMZ

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

QoS

The QoS configuration contains the following sections:

- [QoS Configuration](#)

- [DSCP](#)
- [VLAN Tag](#)

QoS Configuration iAN-02EX supports the function of attaching ToS (Type of Service) or DSCP (Differentiated Services Code Point) information on outgoing packets so these packets may be processed with higher priority.

Click **QoS Configuration** in the **QoS** section. [Figure 33](#) prompts for configuration. Refer to [Table 20](#) for more information of the parameters.

Figure 33 QoS - QoS Configuration

Table 20 QoS - QoS Configuration Field Description

Field	Description
QoS Type	Disable No QoS / packet priority to be placed on outgoing packets
	Diff Serv Use DiffServer as packet priority mechanism Default.
Tos	Use TOS marking as packet priority mechanism
Tos	TOS value. This parameter is applicable only if the QoS type is Tos. Default: 16
Signal DSCP	The diffserve priority value for signaling packets. This parameter is applicable only if the QoS type is DiffServ. Default: 160
Media DSCP	The diffserve priority value for media / RTP packets. This parameter is applicable only if the QoS type is DiffServ. Default: 184

Configure the parameters accordingly. Click **OK** to confirm the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

- DSCP** iAN-02EX provides the option to retain or remove the outgoing packet priority for ToS.

Click **DSCP** in the **QoS** section. [Figure 34](#) prompts for configuration. Refer to [Table 21](#) for more information of the parameters.

Figure 34 QoS - DSCP

Table 21 QoS - DSCP Field Description

Field	Description
Trusted	Retain the DSCP priority associated with outgoing packets. Default.
Un-Trusted	Remove the DSCP priority associated with outgoing packets.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Note: Refer to [QoS Configuration](#) for ToS configuration.

- VLan Tag** Click **VLan Tag** in the **QoS** section. [Figure 35](#) prompts for configuration. Refer to [Table 22](#) for more information of the parameters.

Figure 35 QoS - VLan Tag**Table 22** QoS - VLan Tag Field Description

Field	Description
VLan Tag	To disable/enable VLan tag Default: Disable
Data Priority	The priority value for data packet Default: 0
Data VLan ID	The data VLan ID Default: 4
Voice Priority	The priority value for voice packet Default: 1
Voice VLan ID	The voice VLan ID Default: 3

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Mac Cloning

MAC cloning is to present a user defined MAC address to the WAN. It is useful when the ISP has restrictions on the MAC address.

Mac Cloning

Click **Mac Cloning** in the **Mac Cloning** section. Figure 36 prompts for configuration. Refer to Table 23 for more information of the parameters.

Figure 36 Mac Cloning - Mac Cloning**Table 23** Mac Cloning - Mac Cloning Field Description

Field	Description
Mac Cloning	To disable/enable MAC cloning Default: Disable
Mac Address	The Mac address to be assigned to the WAN. Default: 000000000000

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

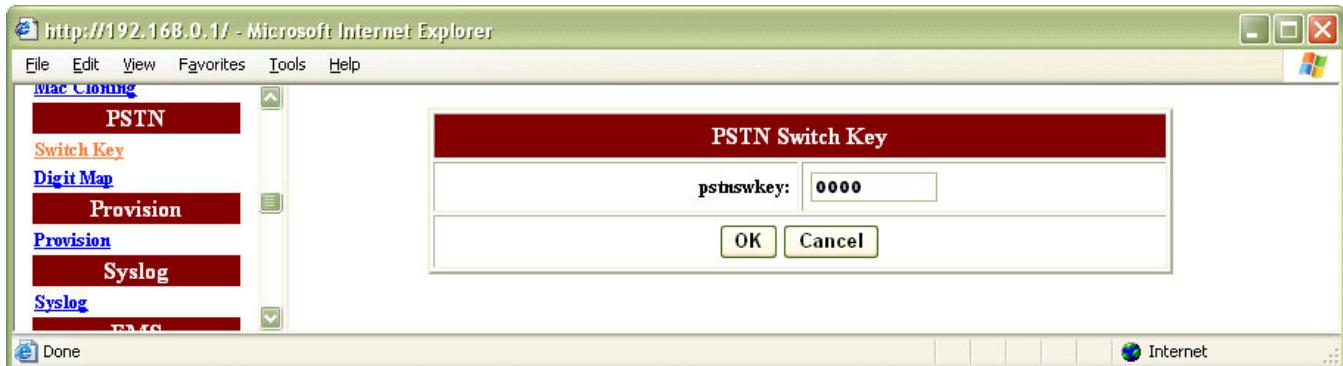

PSTN

The PSTN section is applicable ONLY if there is PSTN connectivity on the Line port of the iAN-02EX VoIP Gateway. The PSTN configuration contains the following sections:

- [Switch Key](#)
- [Digit Map](#)

Switch Key This function allows the users to set the PSTN access number / switch number. Normally, the telephone is using VoIP service unless the VoIP service is not available. However, the user can manually switch from VoIP mode to PSTN mode by entering 4-digit switch key.

Click **Switch Key** in the **PSTN** section. [Figure 37](#) prompts for configuration. Refer to [Table 24](#) for more information of the parameters.

Figure 37 PSTN - Switch Key**Table 24** PSTN - Switch Key Field Description

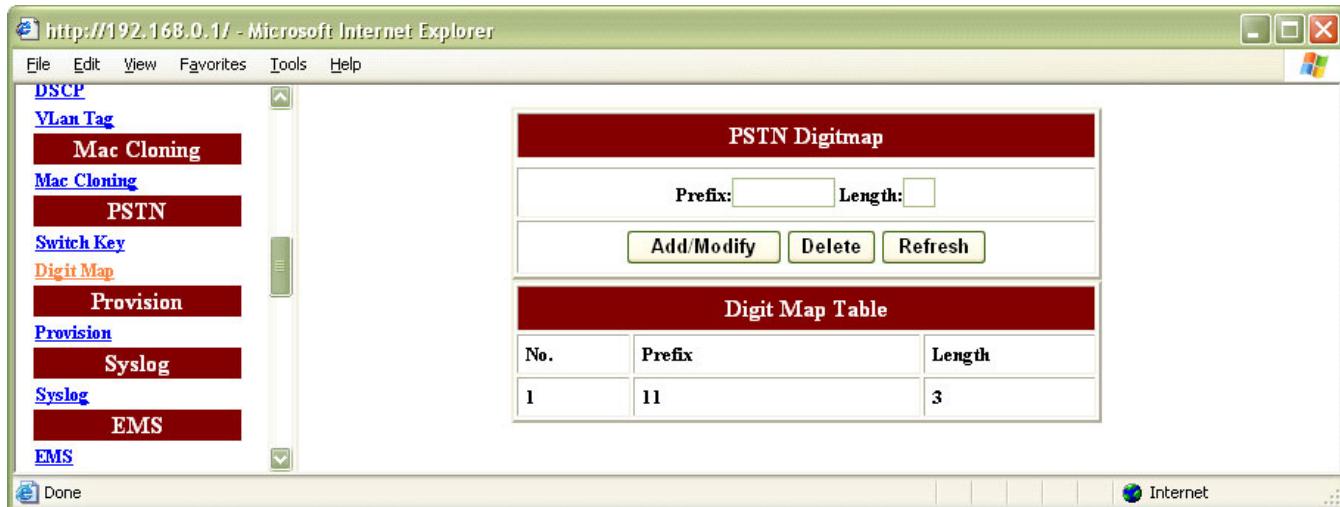

Field	Description
Pstnswkey	The PSTN switch key for swathing from VoIP mode to PSTN mode. Default: 0000

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Digit Map This function allows the users to set PSTN digit map. Normally the telephone is using VoIP service unless the VoIP service is not available. However, the user can set up a list of numbers with specific prefix and total length to switch from VoIP mode to PSTN mode. The module supports up to 10 PSTN digit maps.

Click **Digit Map** in the **PSTN** section. [Figure 38](#) prompts for configuration. Refer to [Table 25](#) for more information of the parameters.

Figure 38 PSTN - Digit Map**Table 25** PSTN - Digit Map Field Description

Item	Description
PSTN Digitmap	
Prefix	Enter the prefix of the telephone number to be added/modified/deleted
Length	Enter the total length of the telephone number. The length is ranged from 0~64. "0" means the length is not fixed.
Digit Map Table	
No.	The digit map ID number.
Prefix	The prefix of the telephone number.
Length	The length of the telephone number.

Configure the parameters accordingly and click **Add / Modify** to create / modify an entry.

Note: The modify function only allows length modification of an existing digit map. To modify the prefix for an existing digit map, delete the current digit map and create a new one.

Enter the corresponding Prefix number listed in the table and click **Delete** to remove the entry. Click **Refresh** to obtain the latest configuration information.

Save the configuration and **Reboot** the module for the new configuration to take effect.

Provision

iAN-02EX VoIP Gateway supports download of provisioning and configuration data from a server on the network. The Gateway downloads the configuration from provision server and compares the parameters of the downloaded setting

and the existing local setting. If the downloaded setting parameter is newer, then it will overwrite the existing local setting parameters.

- Provision** Click **Provision** in the **Provision** section. [Figure 39](#) prompts for configuration. Refer to [Table 26](#) for more information of the parameters.

Figure 39 Provision - Provision

Table 26 Provision - Provision Field Description

Item	Description
Provision Priority	The priority of the provision server. Default: TFTP First
TFTP Server Address	The IP address or URL of the TFTP provision server. Default: devicecfg.private.net/devicecfg/utstarcom/config
TFTP Server Port	The port numbers of the TFTP provision server. When enabled, port 1 is required and port 2 & 3 are optional. When specified, port 2 is used if port 1 is not available. Port 3 is used if port 1 and port 2 are not available. Default: 69, 100, 200

Table 26 Provision - Provision Field Description

Item	Description
HTTP Server Address	The IP address or URL of the HTTP provision server. Default: devicecfg.private.net/devicecfg/utstarcom/config
HTTP Server Port	The port numbers of the HTTP provision server. Default: 80
Group	The group the VoIP gateway belongs to. The maximum length is 64. Default: 0
Expires	The period (in seconds) that the VoIP gateway retrieves configuration files from Provision server. The valid period for this device's IP address assigned by DHCP server or PPPoE server. Enter the value provided by user's ISP. Default: 3600 seconds
TFTP Upgrade Server Address	The IP address or URL of the TFTP upgrade server. Default: devicecfg.private.net/firmware/utstarcom
TFTP Upgrade Server Port	The port numbers of the TFTP upgrade server. Default: 69
HTTP Upgrade Server Address	The IP address or URL of the HTTP upgrade server. Default: devicecfg.private.net/firmware/utstarcom
HTTP Upgrade Server Port	The port numbers of the HTTP upgrade server. Default: 80
Sync Check	Enable/Disable SIP proxy to trigger sync check event. When enabled, ATA reboots and starts the default provisioning process if SIP proxy triggers sync check event. Default: Disable Note: Authentication option will be supported in future release.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Refer to [Appendix B](#) for more information of provision procedures and rules.

Syslog

This iAN-02EX VoIP Gateway supports sending system log (sending UDP packets via Syslog port (514)) and keeping log messages in Log server.

Syslog

Click **Syslog** in the **Syslog** section. [Figure 40](#) prompts for configuration. Refer to [Table 27](#) for more information of the parameters.

Figure 40 Syslog - Syslog**Table 27** Syslog - Syslog Field Description

Item	Description
Server Address	The IP address of syslog server. Default: 0, disable syslog server
Server Port	The port number of syslog server. Default: 514
Level-3/Level-4 Debug	Disable / enable sending level-3/level-4 debug messages to syslog server Default: Disable

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

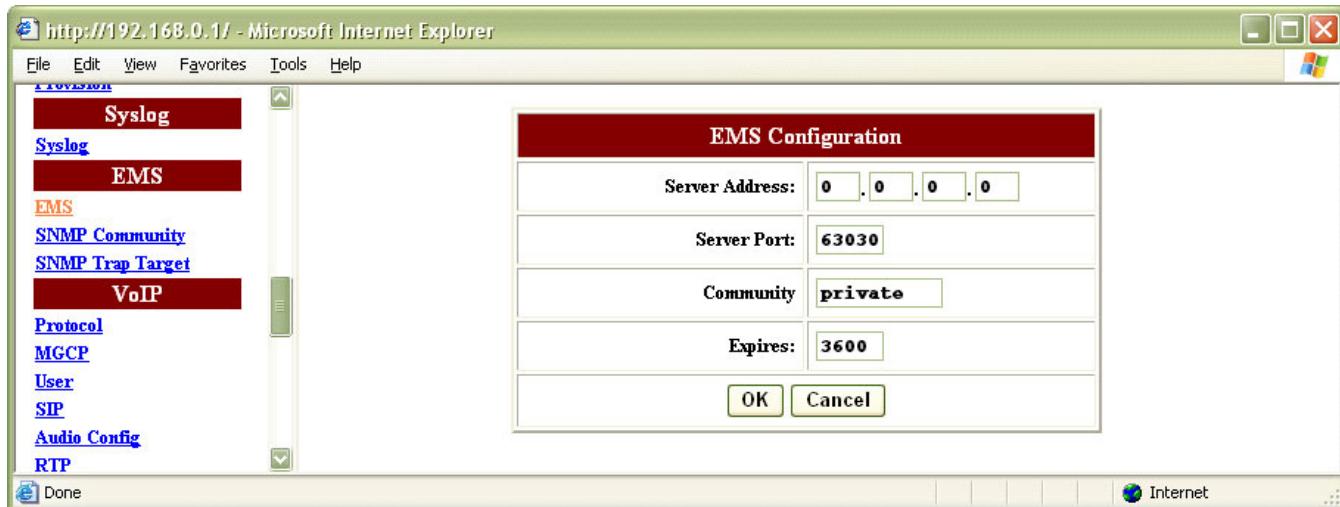

Element Management System (EMS)

The EMS configuration contains the following sections:

- [EMS](#)
- [SNMP Community](#)
- [SNMP Trap Target](#)

||||||||||||||||||||||

EMS Click **EMS** in the **EMS** section. [Figure 41](#) prompts for configuration. Refer to [Table 28](#) for more information of the parameters.

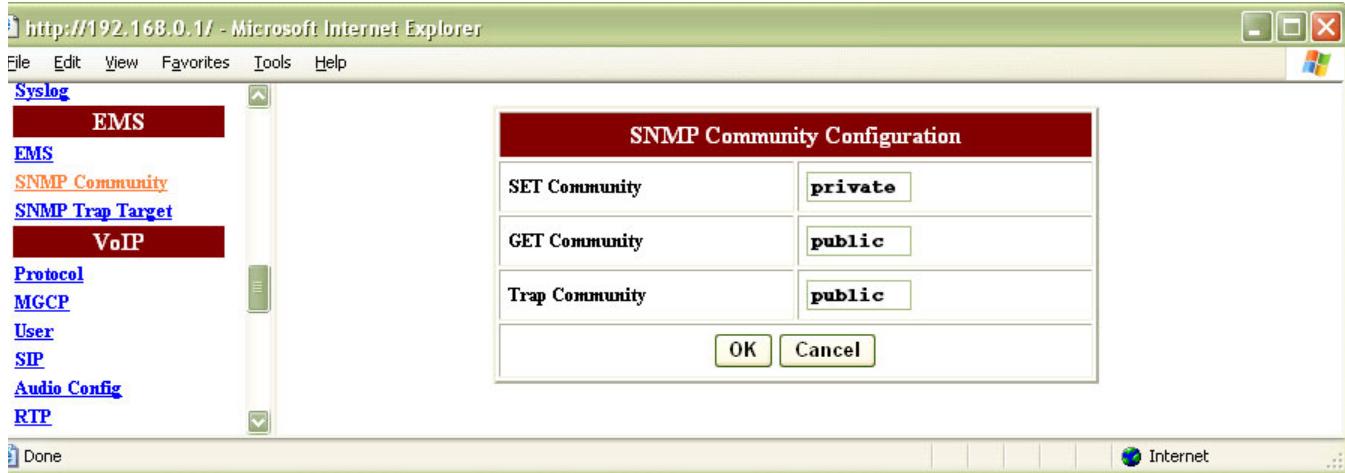

Figure 41 EMS - EMS**Table 28** EMS - EMS Field Description

Item	Description
Server Address	The IP Address of the EMS server 0: Disable syslog server
Server Port	The port number of the EMS server Default: 63030
Community	The community used by the EMS server Value range: Public community / Private community Default: private
Expires	The period that the VoIP Gateway sends keeping-alive message to EMS server. This is to check the connection status in case the VoIP Gateway is accidentally disconnected from the EMS server. Default: 3600 seconds

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

SNMP Community Click **SNMP Community** in the **EMS** section. [Figure 42](#) prompts for configuration. Refer to [Table 29](#) for more information of the parameters.

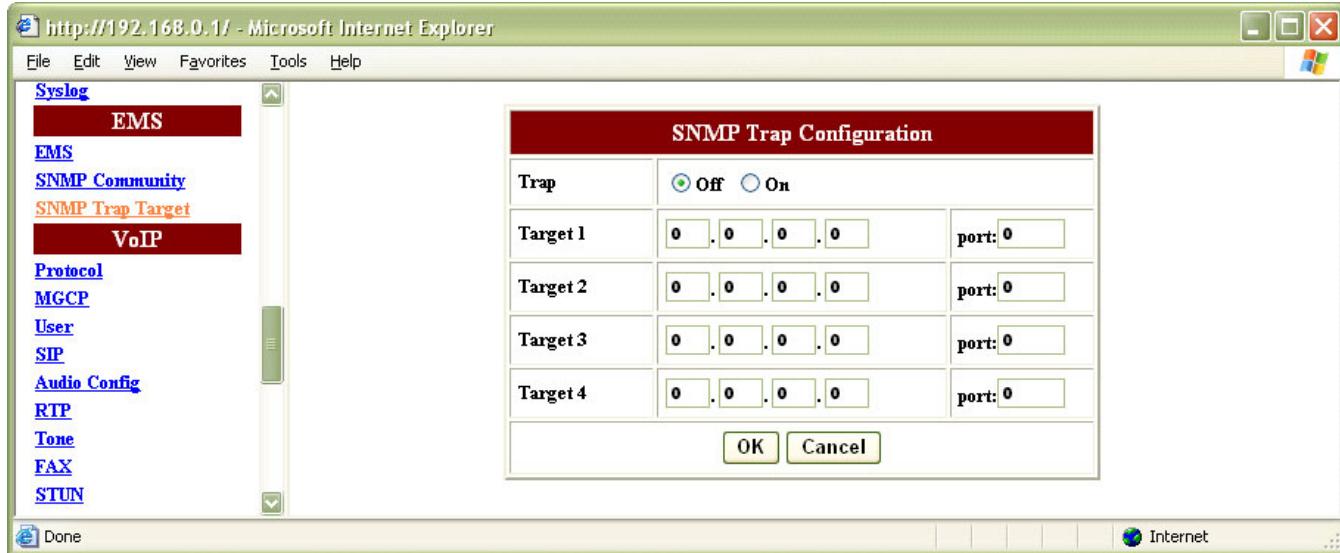

Figure 42 EMS - SNMP Community**Table 29** EMS - SNMP Community Field Description

Item	Description
Set Community	The community for the set function on EMS. Default: private
Get Community	The community for the get function on EMS. Default: public
Trap Community	The Community used when the user processes the traps. Default: public

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

SNMP Trap Target Click **SNMP Community** in the **EMS** section. [Figure 43](#) prompts for configuration. Refer to [Table 30](#) for more information of the parameters.

Figure 43 EMS - SNMP Community**Table 30** EMS - SNMP Trap Target Field Description

Field	Description
Trap	Disable / enable SNMP trap Default: Off
Target 1~ 4	Specify the IP address to which the traps of the VOIP
Port 1~ 4	Specify the Port to which the traps of the VOIP Gateway will be sent

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

VoIP

The VoIP configuration contains the following sections:

- [Protocol](#)
- [MGCP](#)
- [User](#)
- [SIP](#)
- [Audio Config](#)
- [RTP](#)
- [Tone](#)
- [FAX](#)
- [STUN](#)

- [Speed Dial](#)
- [Call Features](#)
- [Digit Map](#)
- [Hook Flash](#)
- [Jitter Buffer](#)

Protocol Click **Protocol** in the **VoIP** section. [Figure 44](#) prompts for configuration. Refer to [Table 31](#) for more information of the parameters.

Figure 44 VoIP - Protocol

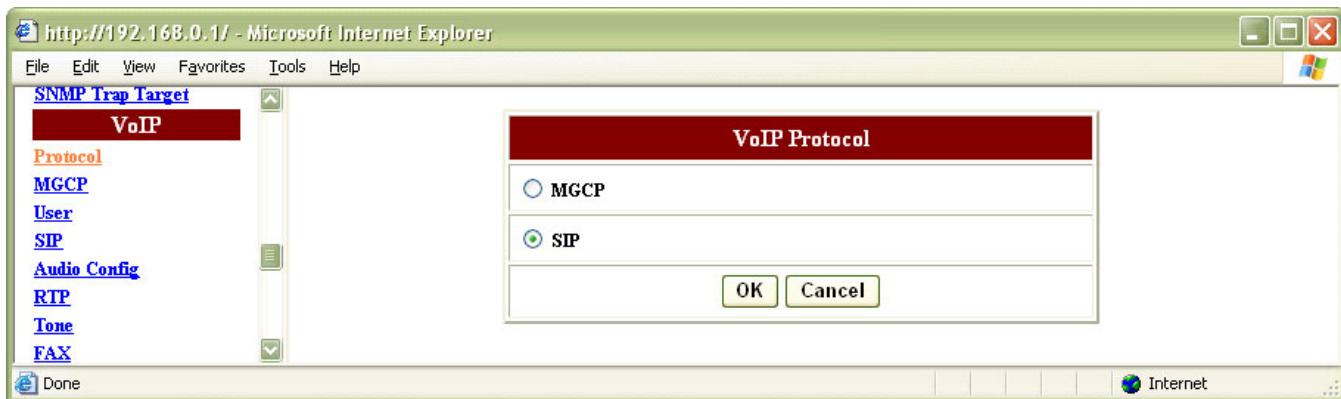

Table 31 VoIP - Protocol Field Description

Field	Description
MGCP	MGCP voice signaling protocol
SIP	SIP voice signaling protocol Default.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

MGCP Click **MGCP** in the **VoIP** section. [Figure 45](#) prompts for configuration. Refer to [Table 32](#) for more information of the parameters.

Figure 45 VoIP - MGCP**Table 32** VoIP - MGCP Field Description

Item	Description
Local Port	This port number to receive/send data from/to the call agent. Default: 2427
Call Agent Address	The IP address of call agent. Default: 127.0.0.1
Call Agent Port	This port number to receive/send data from/to the VoIP gateway. Default: 2727
Wild-carded RSIP	Enable / disable wild carded RSIP Default: disable
Endpoint Name Style	Style: aaln/#[ip_addr], mac_addr/#[ip_addr], aaln/#[mac_addr], aaln/#[domain_name]. Default: aaln/#[ip_addr]
Gateway Domain	The domain name of the gateway Default: domain.net
Expires	The period that the VoIP gateway sends keeping-alive message to the call agent. This is check the connection status in case the VoIP gateway is accidentally disconnected from the call agent. Default: 150 seconds.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Note: Refer to [Protocol](#) for disable/enable MGCP mode.

- User** Click **User** in the **VoIP** section. [Figure 46](#) prompts for configuration. Refer to [Table 33](#) for more information of the parameters.

Figure 46 VoIP - User

VoIP User					
	User	Username	Password	Displayname	Login ID
<input checked="" type="checkbox"/>	user0:	0	00000000	0	0
<input checked="" type="checkbox"/>	user1:	0	00000000	0	0

Table 33 VoIP - User Field Description

Protocol	Description
User Check Box	To select/deselect the user
Username	The name (or phone number) of the user
Password	The password for this user
Display name	The user name to be displayed
Login ID	The ID for this user

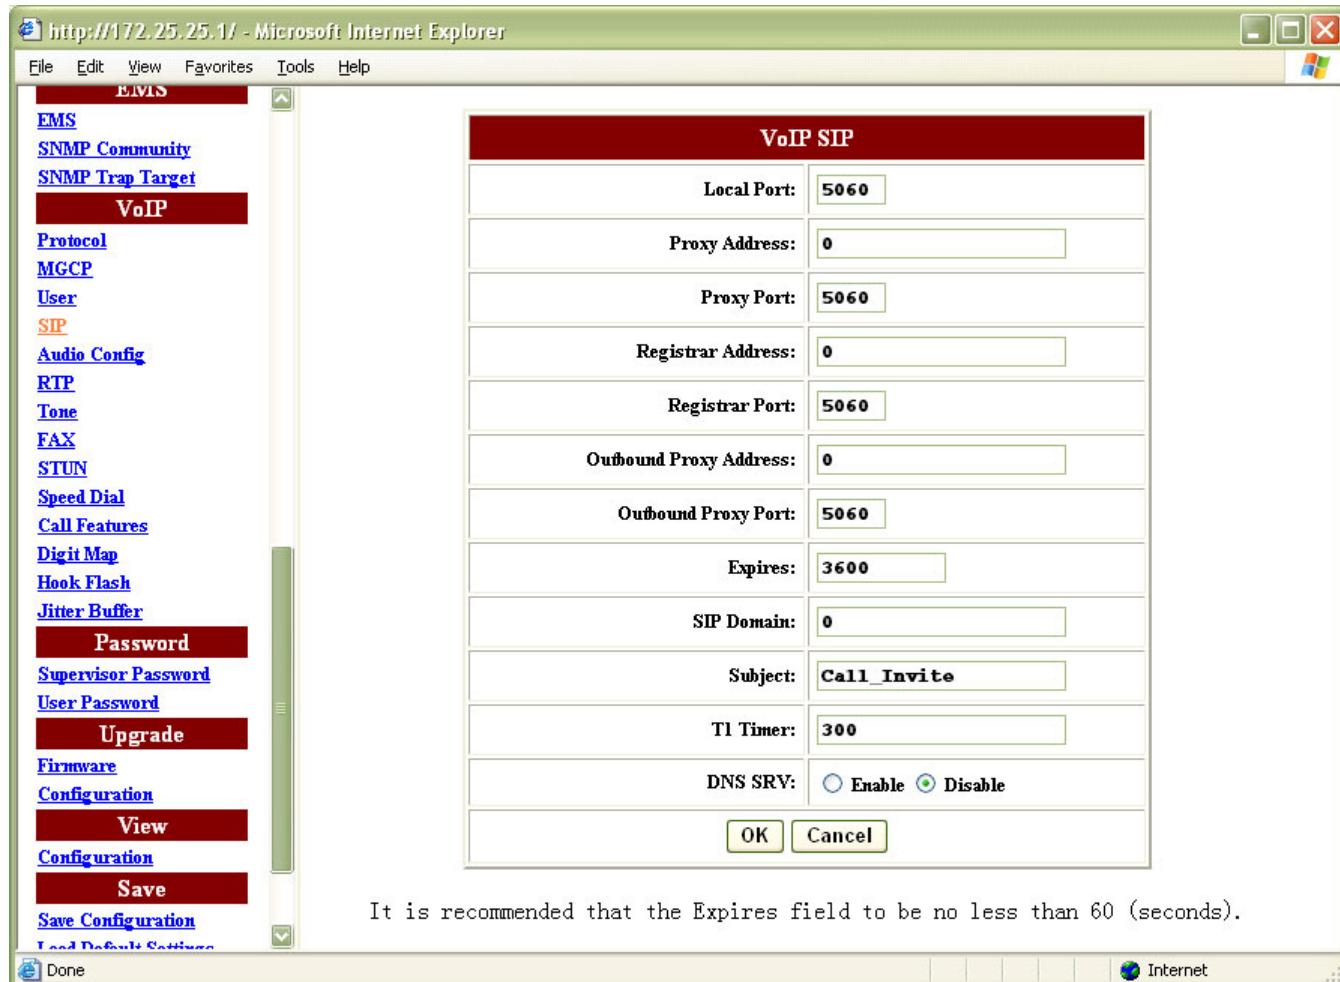

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Note: Certain SIP proxies use login ID for authentication purpose. Configure the login ID as specified by SIP proxy. If login ID is not required, keep the login ID as 0.

- SIP** Click **SIP** in the **VoIP** section. [Figure 47](#) prompts for configuration. Refer to [Table 34](#) for more information of the parameters.

Figure 47 VoIP - SIP**Table 34** VoIP - SIP Field Description

Item	Description
Local Port	The port number of the SIP stack. Default: 5060
Proxy Address	The IP address of SIP proxy Default: 0, disable
Proxy Port	The port number used by SIP Proxy Default: 5060
Registrar Address	The IP Address of Registration server. Registration Server is often the same as SIP Proxy Server. Default: 0, disable
Registrar Port	The port number of Registration server. Default: 5060
Outbound Proxy Address	Specifies the IP Address of SIP Outbound Proxy server. Default: 0, disable

Table 34 VoIP - SIP Field Description

Item	Description
Outbound Proxy Port	Specifies the port number of SIP Proxy server. Generally the default is 5060.
Expires	The period (in seconds) that the VoIP Gateway sends keeping-alive message to Registration server. This is to check the connection status in case the VoIP Gateway is accidentally disconnected from the Registration server. Default: 3600
SIP Domain	The domain name for the URL to be registered. Default: 0
Subject	The content of the subject header in outgoing INVITE message. This is used to indicate the title of the call. Default: Call_Invite
T1 Timer	Default: 300
DNS SRV	To enable / disable DNS service. When enabled, ATA handles DNS-SRV as the first priority and if it fails, ATA will do DNS-A records. Default: Disabled

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

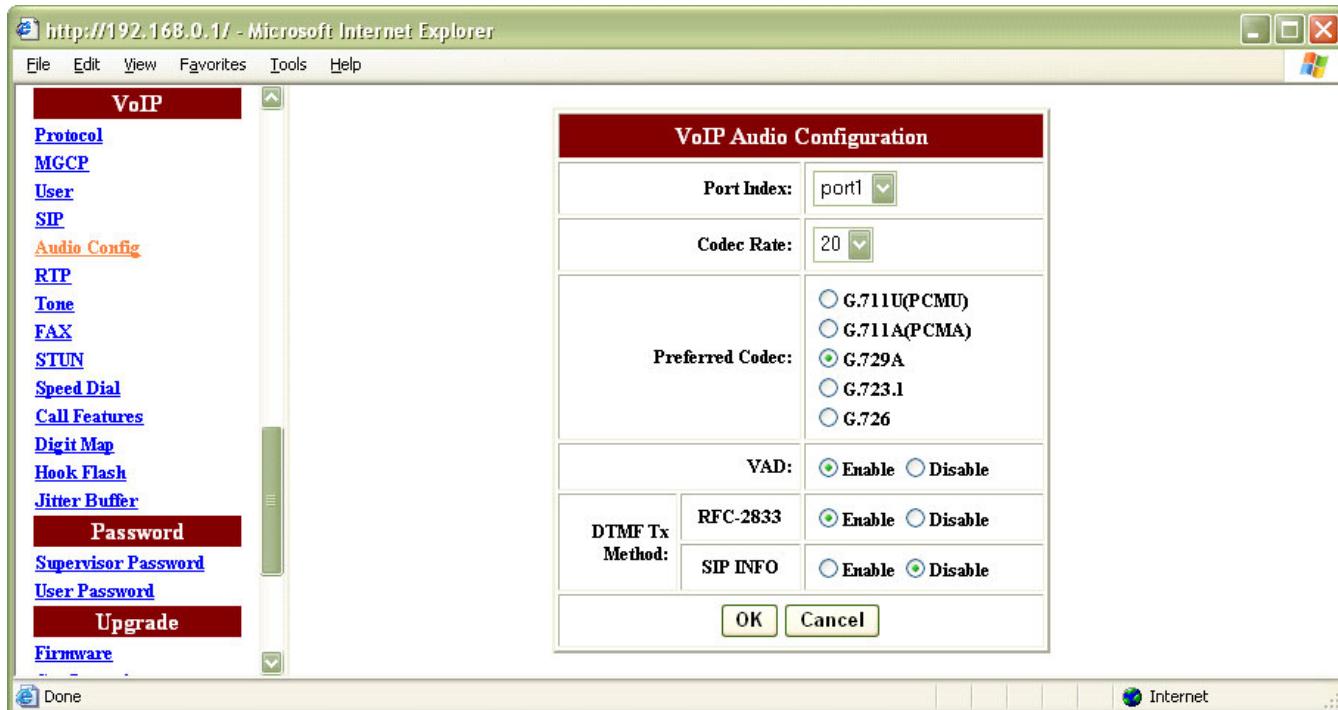

Note: The following values needs to be configured accordingly before disabling the register:

- *The value of registrar address/port is 0.*
- *The value of proxy address cannot be 0.*

Audio Config

Click **Audio Config** in the **VoIP** section. [Figure 48](#) prompts for configuration. Refer to [Table 35](#) for more information of the parameters.

Figure 48 VoIP - Audio Config**Table 35** VoIP - Audio Config Field Description

Item	Description
Port Index	Port 1 / Port 2
Codec Rate	The period (in milliseconds) that the VoIP Gateway sends voice packets to call party. This value must be a multiple of 10. Default: 20
Preferred Codec	The preferred method of voice compression on per port basis. Default: G.729A
VAD (Voice Activity Detection)	Enable: sending packets only while the user is speaking. This will save the bandwidth but cause time delay. Disable: sending packets no matter the user is speaking or not. This will improve the voice quality to be more smoothly but increase more traffic load. Default: Enable
DTMF Tx Method	
RFC-2833	Enable/disable RFC-2833 on per port basis. If both RFC-2833 and SIP-INFO are disabled, ATA takes DTMF pass through. Default: Enable
SIP INFO	Enable/disable SIP info on per port basis. If both RFC-2833 and SIP-INFO are disabled, ATA takes DTMF pass through. Default: Disable

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

- RTP** Click **RTP** in the **VoIP** section. [Figure 49](#) prompts for configuration. Refer to [Table 36](#) for more information of the parameters.

Figure 49 VoIP - RTP

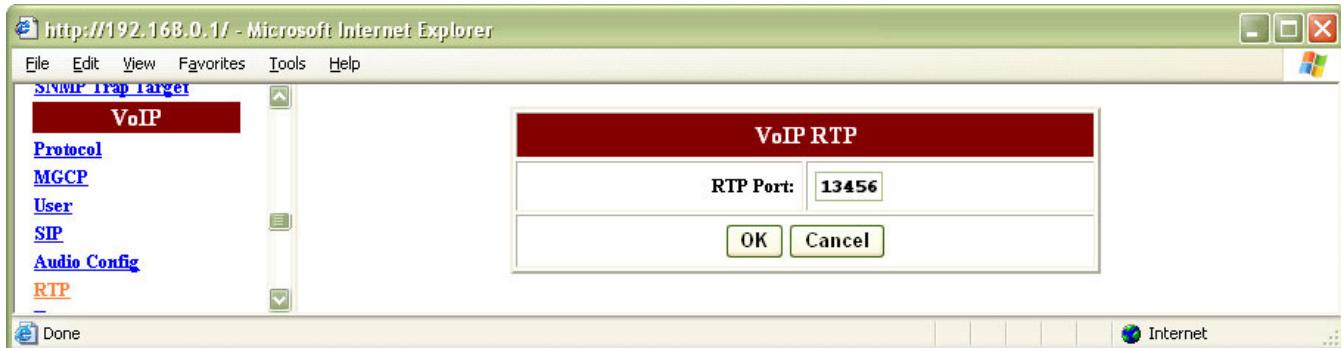

Table 36 VoIP - RTP Field Description

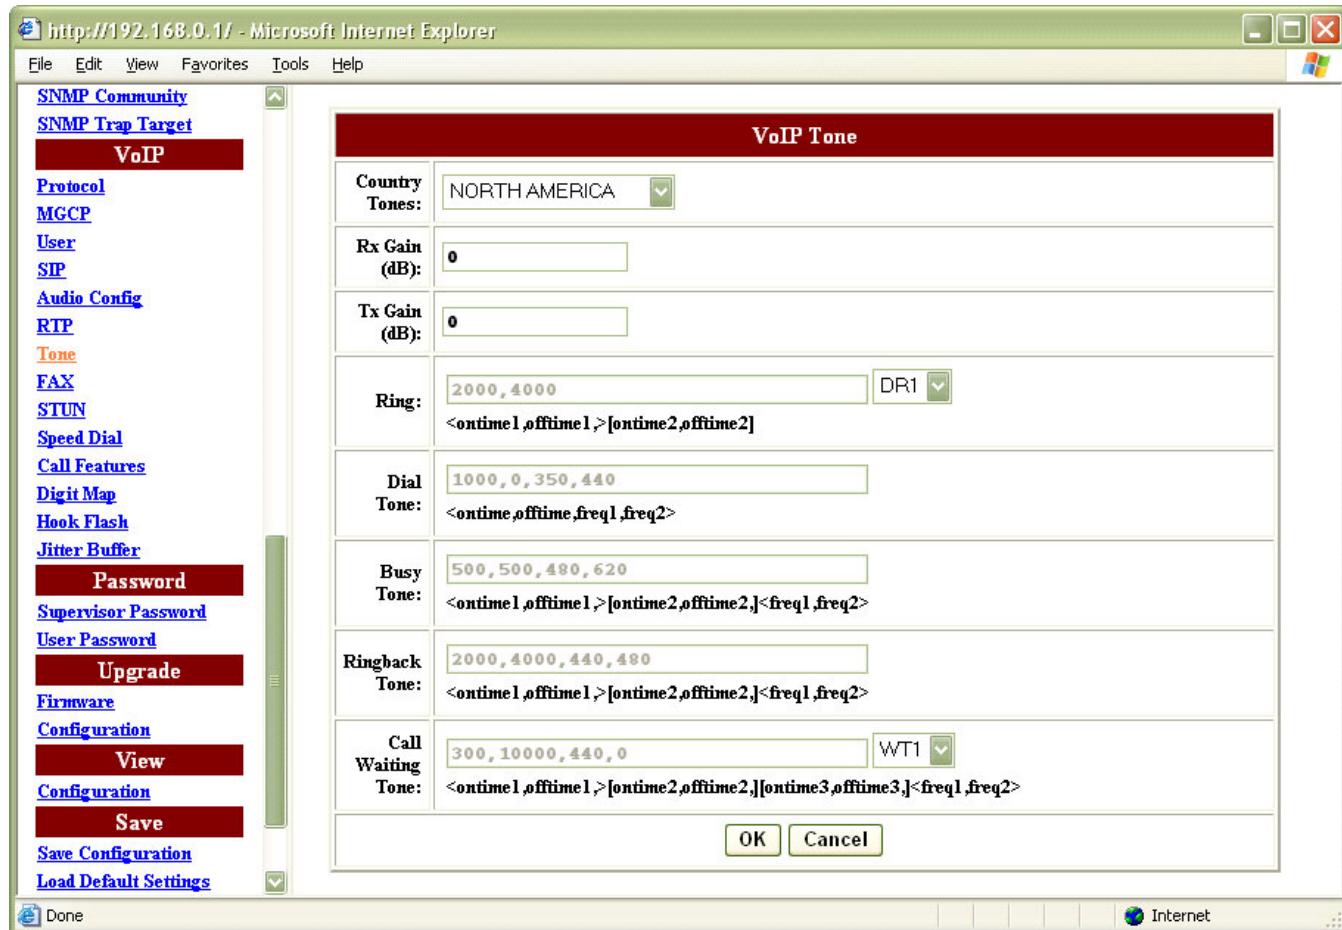

Item	Description
RTP Port	RTP port number
	Default: 13456

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

- Tone** iAN-02EX supports configuration of pre-configured audible tones based on the geographical location.

Click **Tone** in the **VoIP** section. [Figure 50](#) prompts for configuration. Refer to [Table 37](#) for more information of the parameters.

Figure 50 VoIP - Tone**Table 37** VoIP - Tone Field Description

Item	Description
Country Tones	Custom Specific Tone North America
Rx Gain (dB)	Adjusts the receiving audio gain to be higher or lower. Default: 0
Tx Gain (dB)	Adjusts the transmitting audio gain to be higher or lower. Default: 0

Table 37 VoIP - Tone Field Description

Item	Description
Ring	<p>The ringing cadence.</p> <p><ontime,offtime (in milliseconds)></p> <p>Select the tone from the drop down box for DR1 to DR8. DR1 to DR5 are preconfigured and DR6 to DR8 can be modified.</p> <ul style="list-style-type: none"> ■ DR1 <2000, 4000> ■ DR2 <800, 400, 800, 4000> ■ DR3 <400, 200, 400, 200, 800, 4000> ■ DR4 <300, 200, 1000, 200, 300, 4000> ■ DR5 <500, 500> ■ DR6 <2000, 4000> ■ DR7 <2000, 4000> ■ DR8 <2000, 4000>
Dial Tone	<p>The dialing tone pattern. Adjustable when the country tone is Custom Specific Tone.</p> <ul style="list-style-type: none"> ■ <ontime,offtime (in milliseconds),freq1,freq2 (in Hz)>
Busy Tone	<p>The busy tone pattern. Adjustable when the country tone is Custom Specific Tone.</p> <ul style="list-style-type: none"> ■ <ontime,offtime (in milliseconds),freq1,freq2 (in Hz)>
Ring back Tone	<p>The ringing back tone pattern. Adjustable when the country tone is Custom Specific Tone.</p> <ul style="list-style-type: none"> ■ <ontime,offtime (in milliseconds),freq1,freq2 (in Hz)>
Call Waiting Tone	<p>The call waiting tone pattern.</p> <ul style="list-style-type: none"> ■ <ontime,offtime (in milliseconds),freq1,freq2 (in Hz)> <p>Select the tone from the drop down box for WT1 to WT4:</p> <ul style="list-style-type: none"> ■ WT1 <300, 10000, 440, 0> ■ WT2 <100, 100, 100, 10000, 440, 0> ■ WT3 <100, 100, 100, 100, 100, 10000, 440, 0> ■ WT4 <100, 100, 300, 100, 100, 10000, 440, 0>

**Note:**

- If the country tone is set to North America, the dial tone, busy tone and ringback tone cannot be modified. If the country tone is set to Custom Specific Tone, the ring tone (RT1 - RT8) and call waiting tone (WT1 - WT4) are grayed out.
- DR1 - DR8 are defined as per Telcordia specification GR-506.
- DR6 - DR8 are user specific and can be customized.
- WT1 - WT4 are defined as per Telcordia specification GR-30.

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

- FAX** Click **Fax** in the **VoIP** section. [Figure 51](#) prompts for configuration. Refer to [Table 38](#) for more information of the parameters.

Figure 51 VoIP - Fax

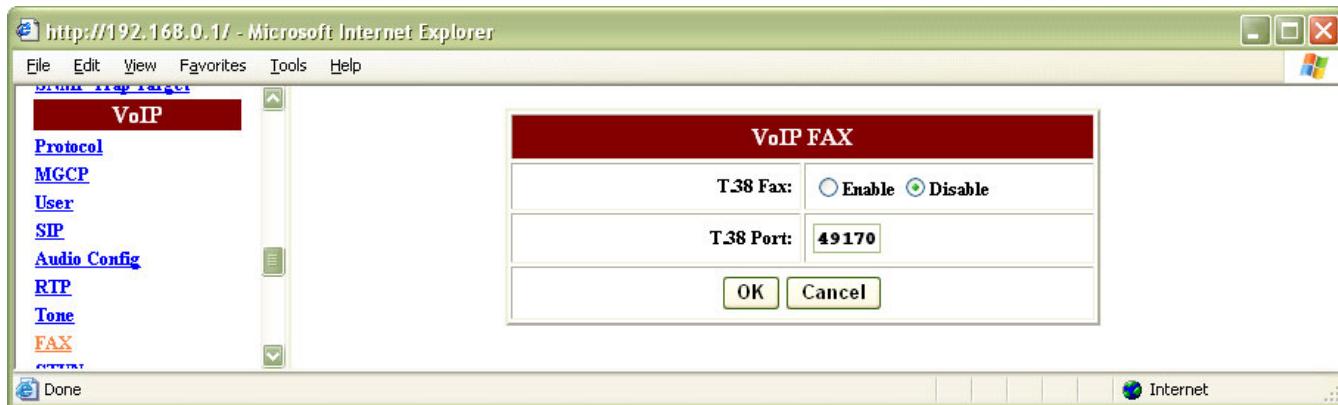

Table 38 VoIP - FAX Field Description

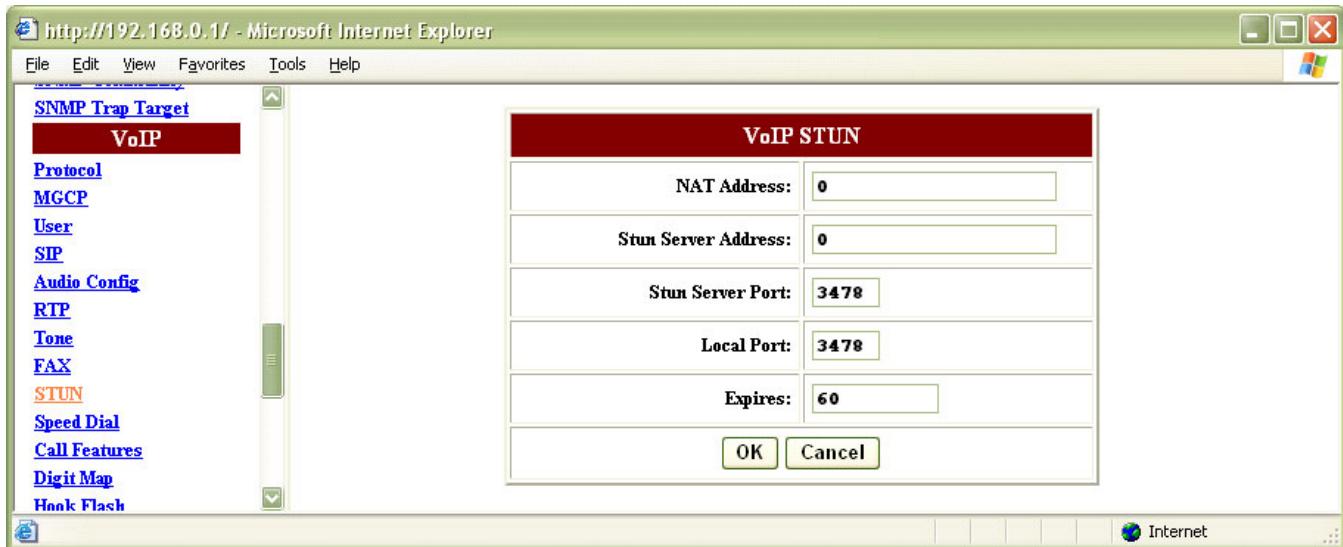

Item	Description
T.38 Fax	Enable/disable data-resending mechanism in case of any missing data during transmission Default: Enable
T.38 Port	The port number for sending/receiving T.38 packets Default: 49170

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

- STUN** iAN-02EX supports simple traversal of user datagram protocol (UDP) through network address translation (STUN). This function allows application to discover the presence and the types of NATs and firewalls between itself and the public Internet. It also provides the ability for applications to determine the public IP address allocated by the NAT.

Click **Stun** in the **VoIP** section. [Figure 52](#) prompts for configuration. Refer to [Table 39](#) for more information of the parameters.

Figure 52 VoIP - Stun**Table 39** VoIP - STUN Field Description

Item	Description
NAT Address	The IP address of NAT firewall. Default: 0
Stun Server Address	The IP address of STUN (Simple Traversal of User Datagram) server. Default: 0
Stun Server Port	The port number of STUN server. Default: 3478
Local Port	The local port number of STUN client. Default: 3478
Expires	The period that the VoIP Gateway sends STUN message to STUN server. This is to check the connection status in case the VoIP gateway is accidentally disconnected from STUN server. Default: 60 seconds

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Speed Dial The speed dial is used to set up a list of telephone numbers and SIP addresses for the frequently called callee. In this list, a shorter number is assigned to the called party instead of original phone numbers or addresses. The module supports up to 10 speed dial numbers.

Click **Speed Dial** in the **VoIP** section. [Figure 53](#) prompts for configuration. Refer to [Table 40](#) for more information of the parameters.

Figure 53 VoIP - Speed Dial

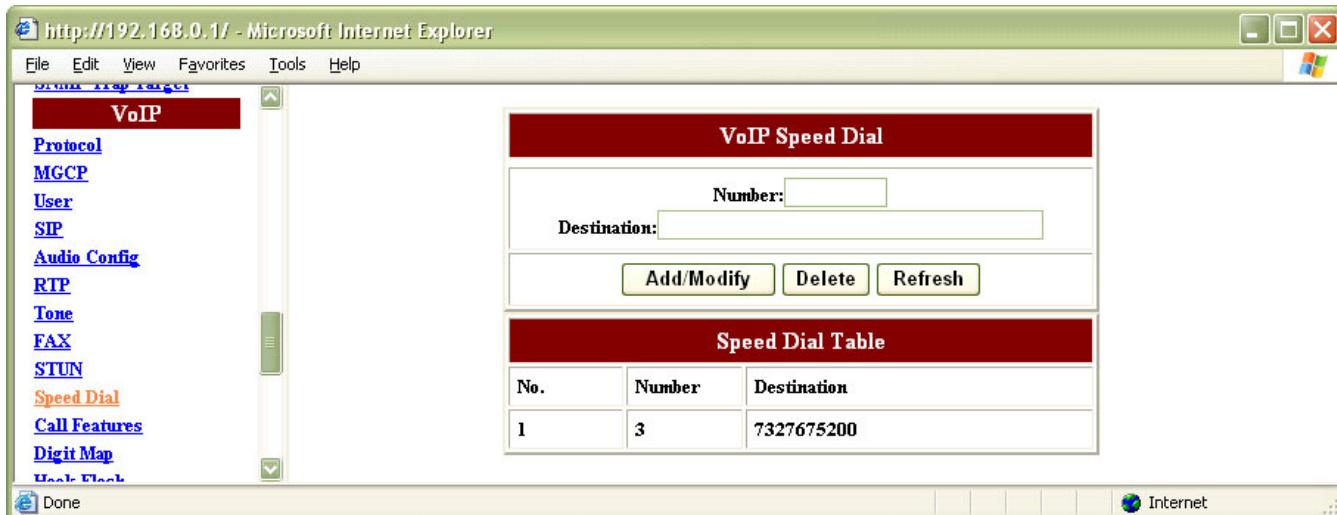

Table 40 VoIP - Speed Dial Field Description

Item	Description
VoIP Speed Dial	
Number	The speed dial number of the call party.
Destination	The SIP address or PSTN number of the called party
Speed Dial Table	
No.	The ID number for a speed dial entry
Number	The assigned speed dial number for a called party.
Destination	The full address of the called party.

Configure the parameters accordingly and click **Add / Modify** to create / modify an entry.

Note: The modify function only allows destination modification of an existing speed dial. To modify the number for an existing speed dial, delete the current speed dial and create a new one.

Enter the corresponding speeddial number listed in the table and click **Delete** to remove the entry. Click **Refresh** to obtain the latest configuration information.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Call Features Click **Call Features** in the **VoIP** section. [Figure 54](#) prompts for configuration. Refer to [Table 41](#) for more information of the parameters.

Internet

Table 41 VoIP - Call Feature Field Description

Field	Description
Port Index	Port 1 or Port 2
General Feature Code	Disconnect Code
Call Hold	Enable/disable the Call Hold feature. This must be supported by the Call Agent.

Table 41 VoIP - Call Feature Field Description

Field	Description	
Call Waiting	Enable/disable the Call waiting tone Per Call Deactivate: deactivate call waiting for 1 call	
Call Transfer (CT)	Without Consultation CT to another station without prior talking to the receiving station by pressing flash and then dialing the Feature Code and the end station number With Consultation CT to another station with prior talking to the receiving station by pressing flash and then dialing the Feature Code and consulting the the end station if the station wants to take the call perform transfer using the Feature Code.	
Three-Way Conference	Enable/disable the 3-way conference feature.	
Call Forwarding	Always On - Code used to enable Call Forwarding Always on a per call basis from the PSTN Phone Off - Code used to disable Call Forwarding Always on a per call basis from the PSTN Phone Destination - The destination telephone number the call needs to be forwarded if CF is always turned on Busy On - Code used to enable Call Forwarding Busy on a per call basis from the PSTN Phone Off - Code used to disable Call Forwarding Busy on a per call basis from the PSTN Phone Destination - The destination telephone number the call needs to be forwarded if Port is busy	
No-Answer	Enable/disable the Call Forwarding No-Answer. On - Code used to enable Call Forwarding No-Answer on a per call basis from the PSTN Phone Off - Code used to disable Call Forwarding No-Answer on a per call basis from the PSTN Phone Destination - The destination telephone number the call needs to be forwarded if Port is not answered Number of Ring - Number of rings after which call is forwarded	
DND (Do Not Disturb)	Enable/disable the DND feature	
Calling Line ID Blocking	Enable/disable the Calling Line ID Blocking feature Per Call Deactivate: deactivate calling line ID blocking for 1 call	
Anonymous Call Rejection	Enable/disable the Anonymous Call Rejection feature	
Priority Reversal	Enable/disable the Priority Reversal feature (Currently not available in this release).	
Repeat Dialing On Busy	Enable/disable the Repeat Dialing On Busy feature (Currently not available in this release) Repeat time - The time to repeat the dialing Stop Time - The time to stop repeating dialing	

Configure the parameters accordingly. Click **OK** to confirm the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Note: The features mentioned above are subject to SIP-Proxy or Soft switch support; therefore some features may not work when enabled.

Note: For the features to work properly, call flows of the SIP-Proxy and call agent (softswitch) are needed for customization.

Digit Map In contrast to the PSTN digit map, the VOIP digit map allows VOIP calls made with leading digits and length matching the rules specified to be dialed out immediately.

Click **Digit Map** in the **VoIP** section. [Figure 55](#) prompts for configuration. Refer to [Table 42](#) for more information of the parameters.

Figure 55 VoIP - Digit Map

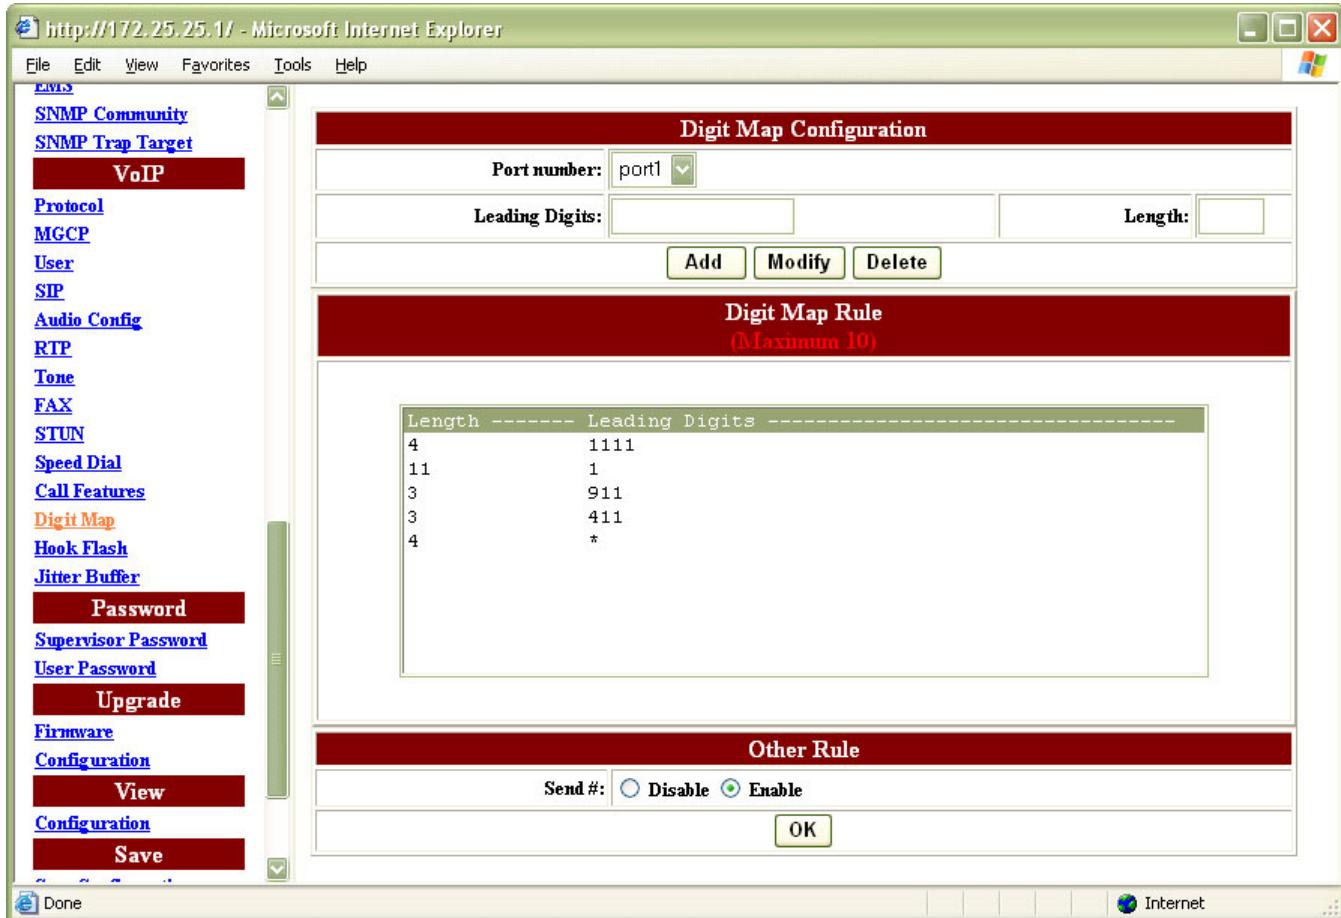

Table 42 VoIP - Digit Map Field Description

Item	Description
Port Number	Port 1 / Port 2
Leading Digits	The prefix or leading digits of the telephone number(s) to be dialed.
Length	The total length of the telephone number. "0" means the length is not fixed.
Send #	Enable: send the digit number at end of dial string is sent to the SIP-Proxy. Disable: the digit number at end of dial string is taken as a terminator. Default: Enable

Configure the parameters accordingly and click **Add** to create a new entry.

Select an entry in the **Digit Map Rule** table and modify the parameters accordingly. Click **Modify** to confirm the modification.

Select an entry in the **Digit Map Rule** table and click **Delete** to remove the entry.

Configure **Send #** and click **OK** to confirm the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

- Hook Flash** Click **Hook Flash** in the **VoIP** section. [Figure 56](#) prompts for configuration. Refer to [Table 43](#) for more information of the parameters.

Figure 56 VoIP - Hook Flash

Table 43 VoIP - Hook Flash Field Description

Protocol	Description
Port Index	Port 1 / Port 2
Detection Minimum Time	The minimum time to detect hook flash Default: 200 ms
Detection Maximum Time	The maximum time to detect hook flash Default: 800 ms

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

Save the configuration and Reboot the module for the new configuration to take effect.

Jitter Buffer Click **Jitter Buffer** in the **VoIP** section. [Figure 57](#) prompts for configuration. Refer to [Table 44](#) for more information of the parameters.

Figure 57 VoIP - Jitter Buffer

Table 44 VoIP - Jitter Buffer Field Description

Protocol	Description
Jitter Buffer Minimum Time	The minimum jitter that the adaptive jitter buffer can handle Value range: 5 - 150 ms
Jitter Buffer Maximum Time	The maximum jitter that the adaptive jitter buffer can handle Value range: 5 - 150 ms
Jitter Buffer Target Time	This is the adaptive jitter buffer which attempts to hold the packets to the target holding time. This is the minimum delay the jitter buffer that adds to the system. Value range: 5 - 150 ms

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

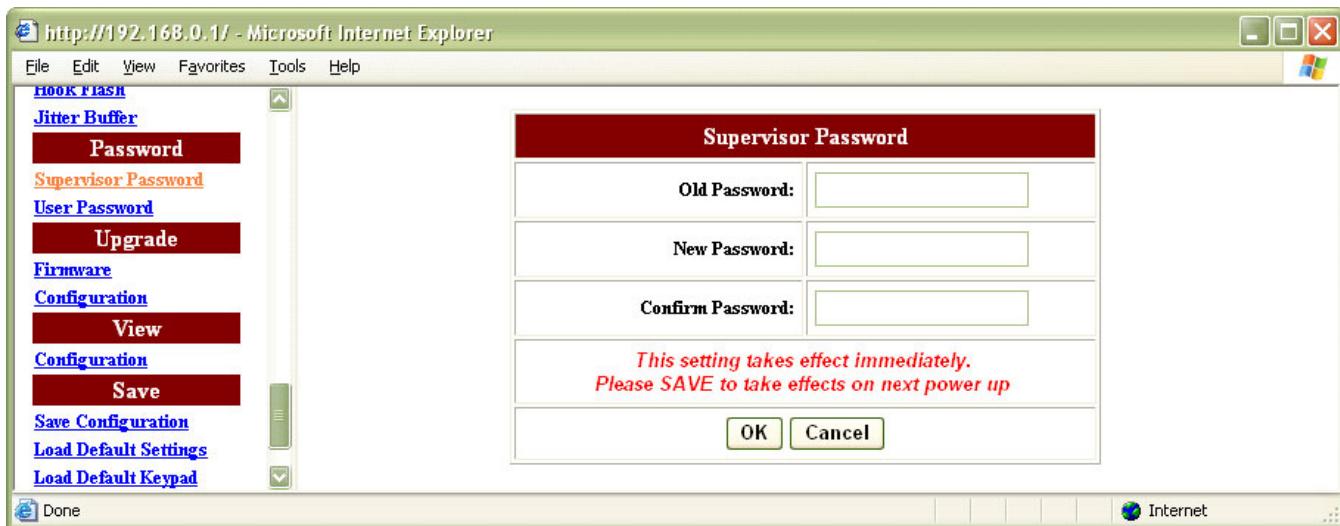

Password

The Password configuration contains the following sections:

- [Supervisor Password](#)
- [User Password](#)

Supervisor Password

Click **Supervisor Password** in the **Password** section. [Figure 58](#) prompts for configuration.

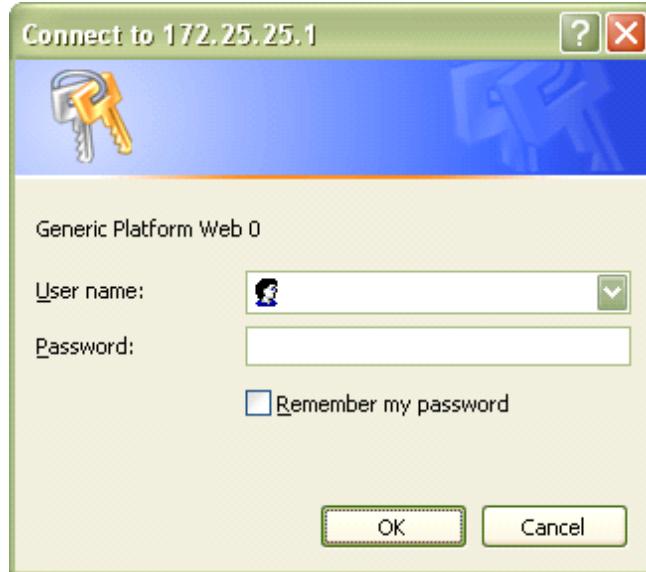

Figure 58 Password - Supervisor Password

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification. [Figure 59](#) prompts for modification confirmation.

Figure 59 Password - Supervisor Password - Confirmation

Click **OK** in [Figure 59](#) and the system requires the user to re-login with the new supervisor password as shown in [Figure 60](#). Enter the new password and click **OK** to login.

Figure 60 Password - Supervisor Password - Re-login

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

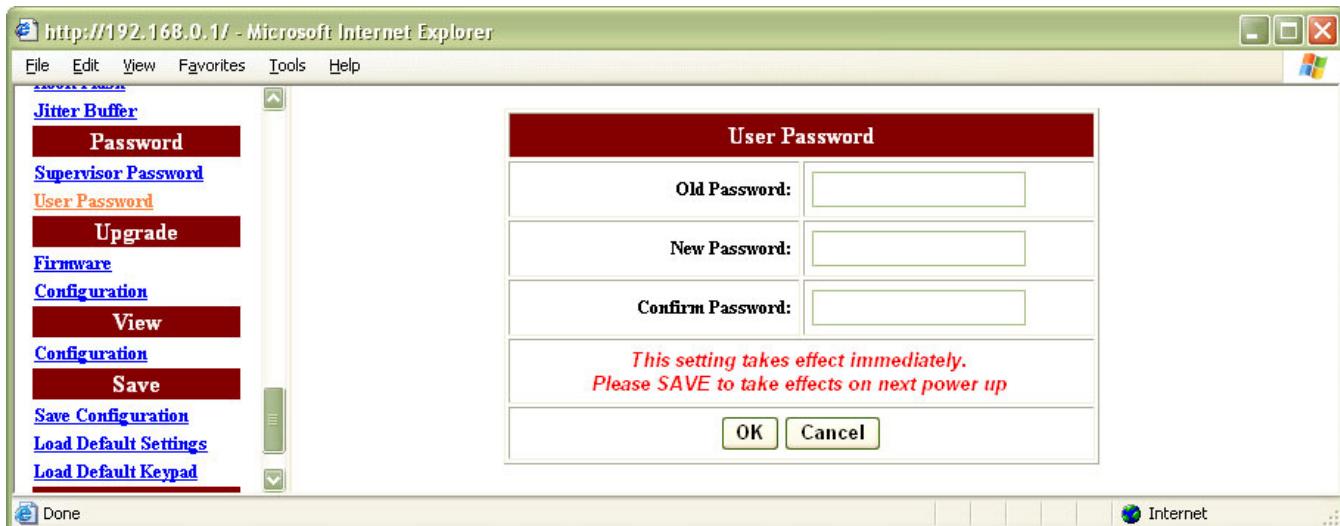

Note: The password will be used for authentication. It is strongly recommended that the user resets the default password for administrative security.

*Note: The default supervisor password is **utstar**.*

User Password Click **User Password** in the **Password** section. [Figure 61](#) prompts for configuration.

Figure 61 Password - User Password

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification. [Figure 62](#) prompts for modification confirmation.

Figure 62 Password - User Password - Confirmation

Click **OK** in [Figure 62](#). If currently the ATA is in user mode, the system requires the user to re-login with the new user password as shown in [Figure 63](#). Enter the new password and click **OK** to login.

Figure 63 Password - User Password - Re-login

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Note: The password will be used for authentication. It is strongly recommended that the user resets the default password for administrative security.

Note: The default user password is 12345.

Upgrade

The Upgrade configuration contains the following sections:

- [Firmware](#)
- [Configuration](#)

Firmware This feature allows the user to upgrade the firmware on the iAN-02EX VoIP Gateway from the web browser. The firmware on the iAN-02EX VoIP Gateway is stored on FLASH ROM.

Download the new firmware to the local machine. Click **Firmware** in the **Upgrade** section. [Figure 64](#) prompts for configuration. Click **Browse** to locate the new firmware on the local machine and click **Upgrade** to start the process.

Figure 64 Upgrade - Firmware

After the upgrade is completed, [Reboot](#) the module for the new configuration to take effect.

Note: Do not power off the unit during the upgrade process.

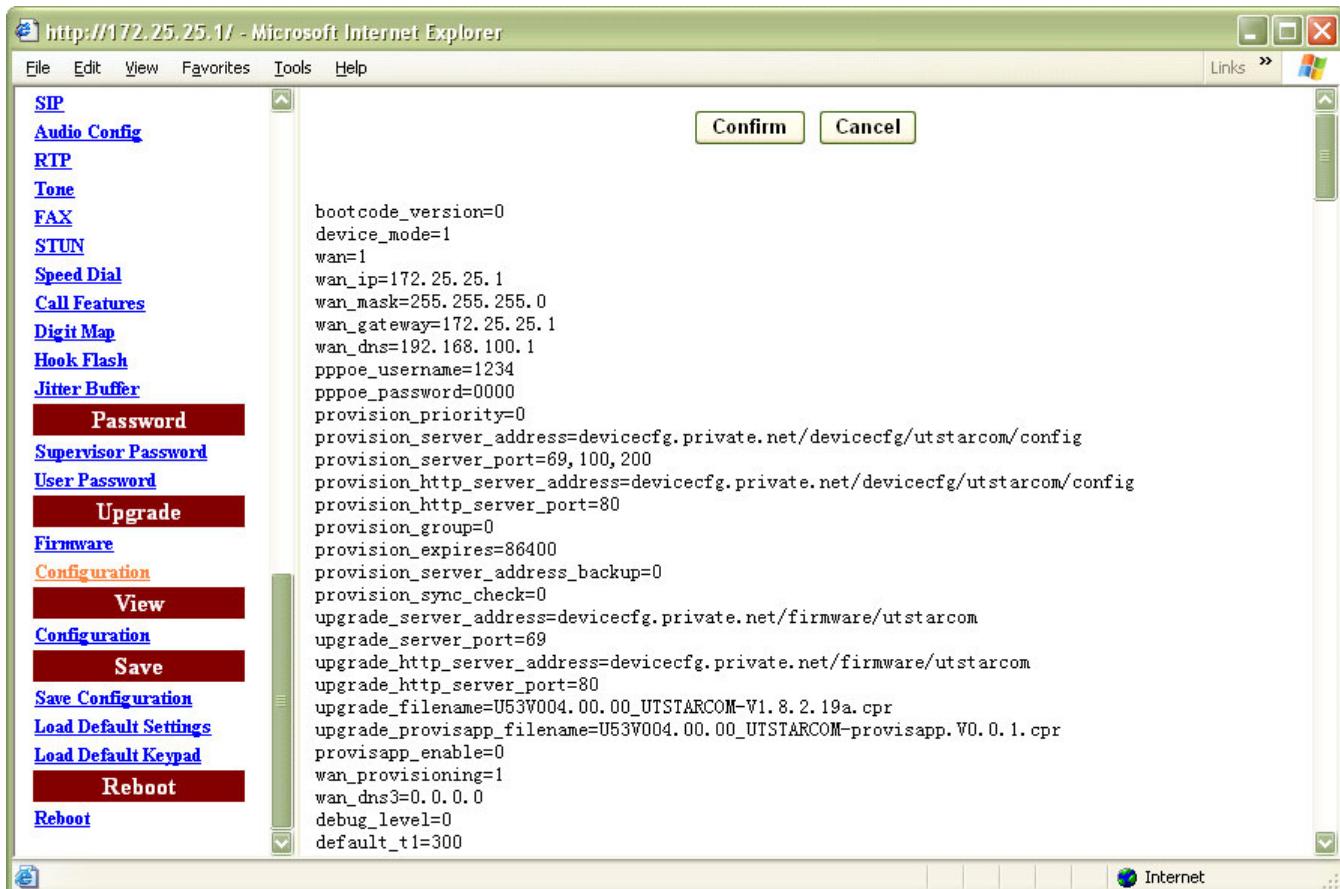

Configuration

This feature allows the user to upgrade the configuration file on the iAN-02EX VoIP Gateway from the web browser. The configuration on the iAN-02EX VoIP Gateway is stored on FLASH ROM.

Download the new configuration file to the local machine. Click **Configuration** in the **Upgrade** section. [Figure 65](#) prompts for configuration. Click **Browse** to locate the new configuration on the local machine and click **Apply**.

Figure 65 Upgrade - Configuration

Click **Confirm** in [Figure 66](#) to confirm the upgrade or **Cancel** to cancel.

Figure 66 Upgrade - Configuration File - Apply

After the upgrade is completed, [Reboot](#) the module for the new configuration to take effect.

Note: Do not power off the unit during the upgrade process.

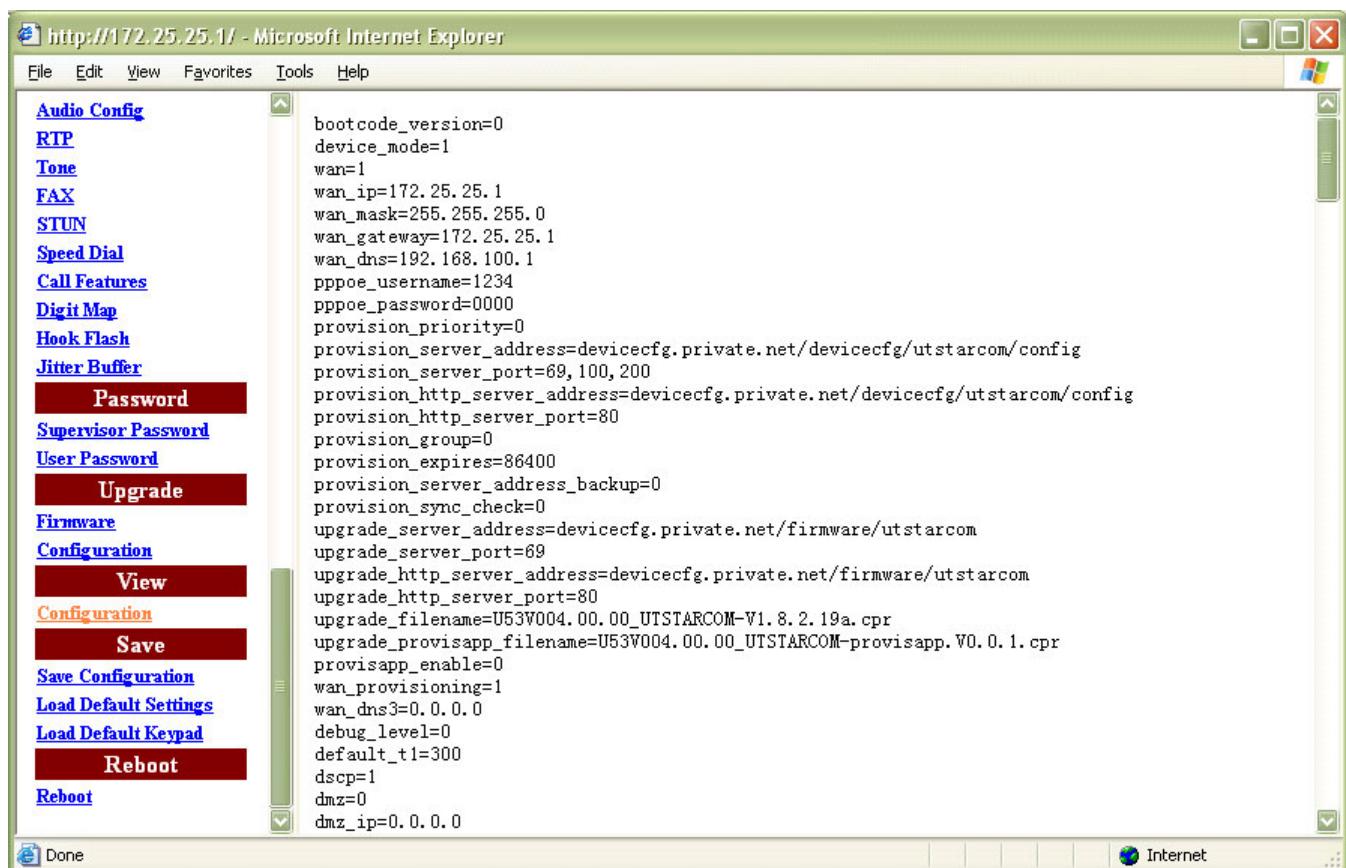

View The abconfig.cfg contains all the configuration information of the ATA. User can modify the configuration with the

Configuration Click **Configuration** in the **View** section. Click the configuration file listed in [Figure 67](#) to display the details shown in [Figure 68](#).

Figure 67 View - Configuration

Figure 68 View - Configuration - abconfig.cfg

Right click **abconfig.cfg** in [Figure 67](#) and click **Save Target As** to backup the configuration file to a local directory. The backup file is displayed in [Figure 69](#). Refer to [Appendix C.- Default Value and Value Range](#) for the default settings.

- [Load Default Settings using FXS Ports](#)
- [Load Default Keypad](#)

Save Configuration

Whenever there's new configuration or modification, the user **MUST** save the new configuration data and then restart the device for the new settings to take effect.

Click **Save Configuration** in the **Save** section. [Figure 70](#) prompts for confirmation. Click **Save** to write the new configuration data into the FLASH Memory immediately.

Figure 70 Save - Save Configuration

[Reboot](#) the module for the new configuration to take effect.

Load Default Settings

Note: Do not power off the unit during the save process.

Click **Load Default Settings** in the **Save** section. [Figure 71](#) prompts for configuration. Refer to [Table 45](#) for more information of the parameters.

Figure 71 Save - Load Default Settings

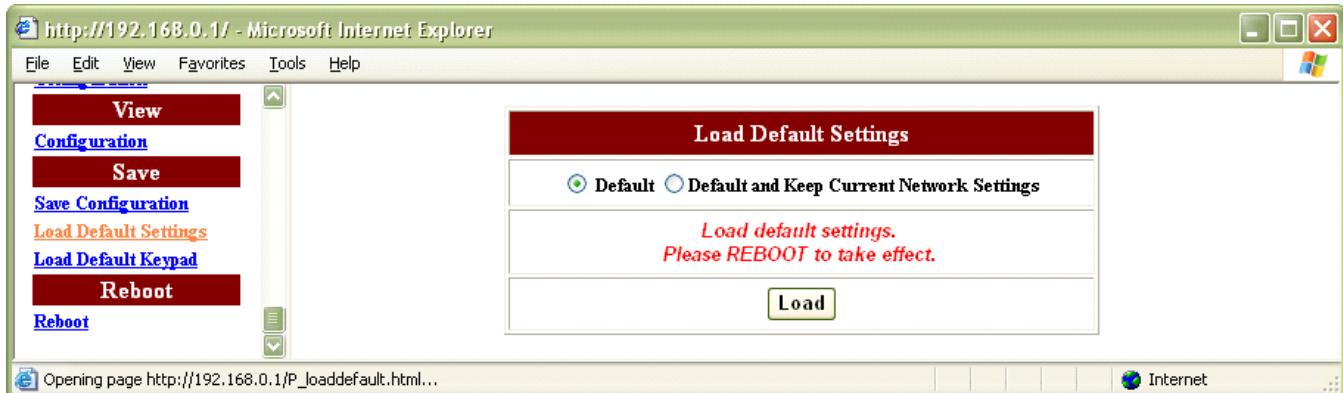

Table 45 Save - Load Default Settings Field Description

Field	Description
Default	Load all default values that includes all network related fields
Default and Keep Current Settings	Load all default values while excluding the following network related fields: WAN: <ul style="list-style-type: none">■ Wan Type (Static IP/DHCP/PPPoE)■ IP address■ Mask address■ Gateway IP address LAN: <ul style="list-style-type: none">■ IP address■ Mask address■ Gateway IP address■ DNS1 IP address■ DNS2 IP address

Click **Load** to load the configuration data immediately.

[Reboot](#) the module for the new configuration to take effect.

Note: Do not power off the unit during the load process.

Load Default Settings using FXS Ports

iAN-02EX also supports the function to restore to default settings using the FXS ports.

From the ATA simply dial *#**322867973738**. The ATA will restore the default settings and reboot automatically.

This access is pre-configured on the ATA and cannot be changed. After reboot, the ATA will restore the default values. This is useful in the event of the service operator is unable to telnet or access the Web-base management of the ATA. This feature is available even if network is not available on the ATA.

- Load Default Keypad** Click **Load Default Keypad** in the **Save** section. [Figure 72](#) prompts for configuration.

Figure 72 Save - Load Default Keypad

Configure the parameters accordingly. Click **OK** to confirm the modification or click **Cancel** to discard the modification.

[Save](#) the configuration and [Reboot](#) the module for the new configuration to take effect.

Reboot

- Reboot** Click **Reboot** in the **Reboot** section. [Figure 73](#) prompts for confirmation.

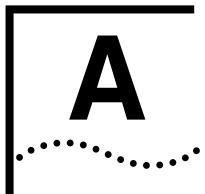

Figure 73 Reboot - Reboot

Click **Reboot** to restart the system and update the configuration data stored in the FLASH Memory.

Note: Do not power off the unit during the reboot process.

TROUBLESHOOTING

This section provides possible problems that may be encountered while using the iAN-02EX VoIP Gateway and suggested solutions to them. If you follow the suggested solutions below but the iAN-02EX VoIP Gateway still does not work properly, contact technical support for further advice.

Q: Power LED does not light up.

- **S:** First check the AC adapter rating. The input rating must meet the specification of the country. The AC adapter must be DC 10V/1.2A output.
- **S:** If the AC adapter output is correct. The problem will be on the VoIP Gateway. Please replace the VoIP Gateway.

Q: Ethernet interface cannot work.

- **S:** Make sure the Ethernet adapter card installed in the PC is workable. The technician can use Hub/Switch to test it.
- **S:** Make sure the Ethernet cable is workable, and the connection between PC and the VoIP Gateway is secure.

Q: Broadband access cannot work.

- **S:** Make sure the Ethernet cable is workable, and the connection between Broadband device and the VoIP Gateway is secure.
- **S:** Check the DHCP or PPPoE server setting. You have to enter correct username and password for PPPoE registration.

Q: Cannot download the proper configuration file.

- **S:** Check if the connection between Provisioning Server and the VoIP Gateway is secure.
- **S:** Check if the file name and setting of Provisioning file are correct.

Q: VoIP LED does not light up.

- **S:** Check if configuration file indicates correct IP address and information of Soft-Switch.
- **S:** Check if the VoIP Gateway is able to connect to Soft-Switch.
- **S:** Check if the authorization content between the VoIP Gateway and Soft-Switch are the same.

Q: Cannot use PSTN backup line.

- **S:** Disconnect the VoIP Gateway from the power supply and then check if PSTN backup line is workable.
- **S:** Check the settings of "PSTN switch key and digit map" are correct.

iAN-02EX PROVISIONING METHODOLOGY

Provisioning overview

UTStarcom iAN-02EX supports extensive device provisioning mechanisms. This includes firmware upgrade and configuring parameters modification on the device.

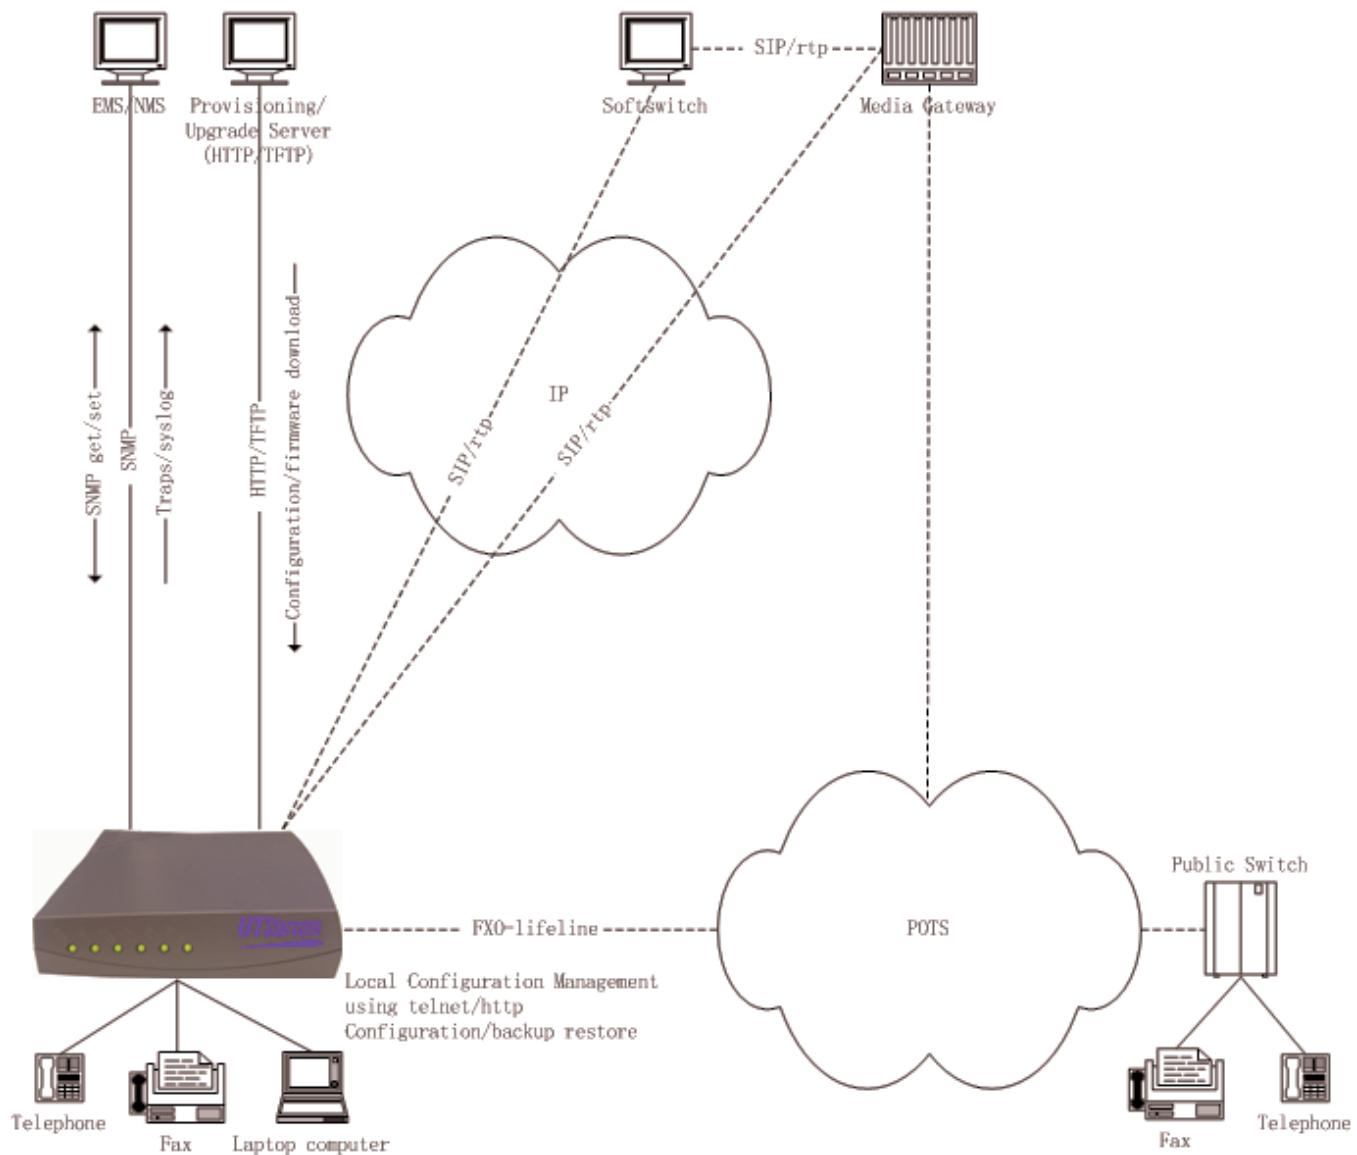

The devices are generally provisioned independently using the following methods.

- a** Using the HTTP/TFTP provisioning/Upgrade server via the WAN side access connection of ATA towards the network.
- b** Using the GUI "firmware upgrade tab" and "Config upgrade tab" via the laptop/desktop computer connected to LAN side of the ATA.
- c** Using the TFTP server and Telnet Console via the laptop/desktop computer connected to the LAN side of the ATA.

Typical provisioning/upgrade scenario is as shown in [Figure 74](#).

Figure 74 Provisioning / Upgrade Scenario

iAN-02EX Provisioning

In this mechanism, the device configuration/firmware can be defined on a centralized server called the Provisioning/Upgrade server (Refer section 3).

This configuration/firmware can be downloaded to the device manually or can be fetched from the device periodically. The device configuration can be defined in a flat file format (Refer section 3.8.4.), which can be either encrypted or non-encrypted ((Refer section 3.8)

Provisioning Features

The UTStarcom iAN-02EX supports two main features in its design.

- a Remote Configuration - Auto upgrade of ATA (Analog Telephone Adapter) configuration using remote Provisioning server and configuration files.
- b Remote Firmware Upgrade - Auto upgrade of ATA firmware using remote Upgrade Server and firmware file.

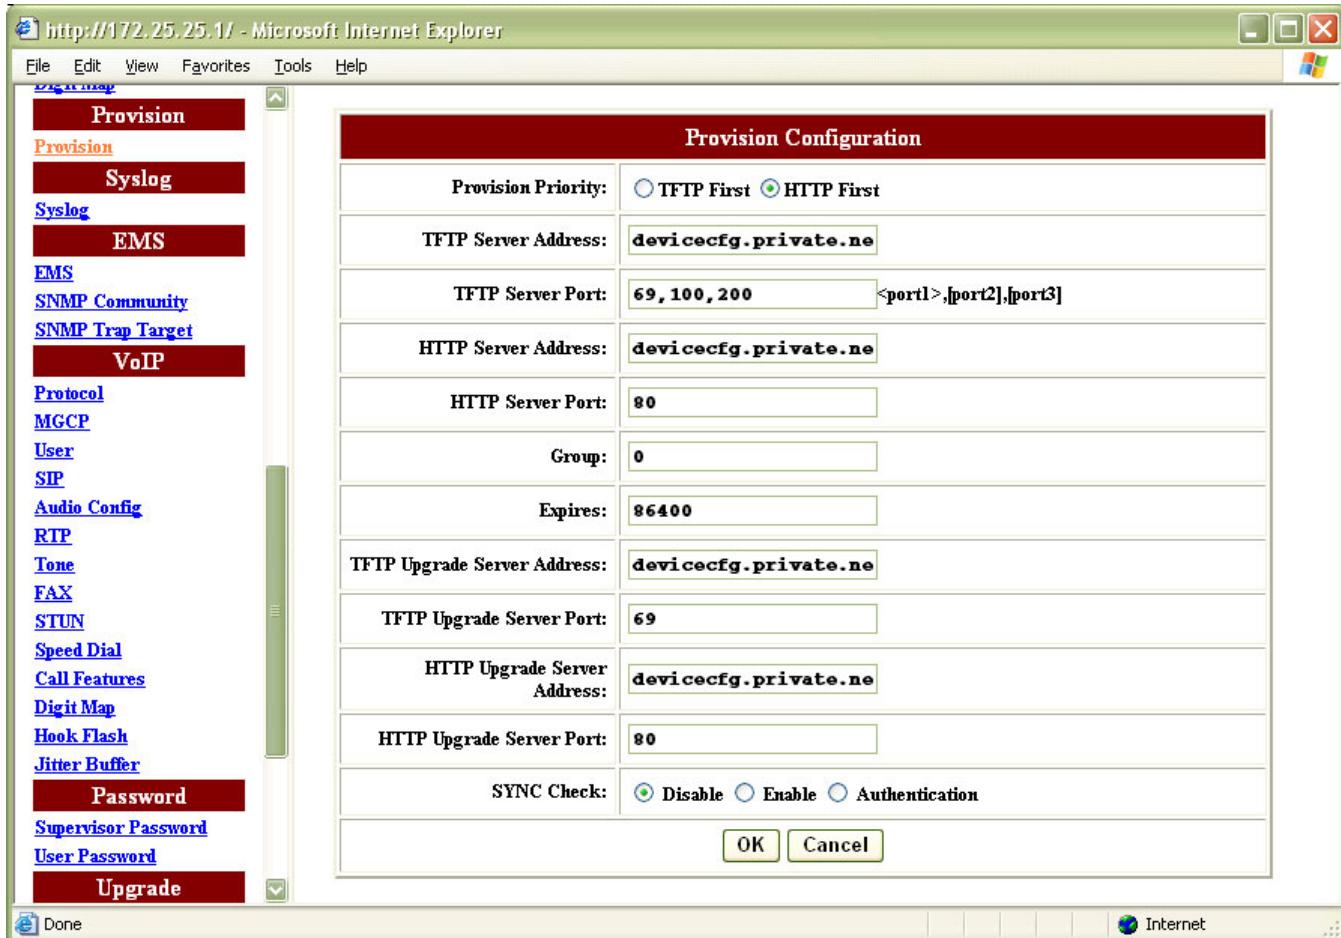

The Provisioning and Upgrade servers can use both TFTP/HTTP protocol in order to transact the configuration and firmware files to the ATA.

The rules and provisioning methodology are explained in the subsequent sections.

GUI Settings for Provisioning/Upgrade Server

[Figure 75](#) shows the provisioning tab on the GUI.

Figure 75 Provisioning / Upgrade Server GUI Settings

User needs to setup the provisioning / Upgrade servers and ports in order to start up the process. The detailed description of the provisioning process is as described in [Chapter 5](#).

Following are the default values used for provisioning/upgrade server.

- Provisioning priority defines the provisioning/upgrade server priority example HTTP protocol first, TFTP protocol second.

Default value=0 [HTTP first and TFTP second]

- Provisioning TFTP Server Address is set to default UTStarcom provisioning server.

This server is used for transacting all configuration files using TFTP protocol.

Default values=devicecfg.private.net/devicecfg/utstarcom/config

- Provisioning TFTP server ports are set to port 69 (1st-Priority), port 100 (2nd-Priority) and port 200(3rd Priority). These are TFTP ports used on the TFTP servers and their order of priority.

Default values=69,100,200

- Provisioning HTTP Server Address is set to default UTStarcom, provisioning server.

This server is used for transacting all configuration files using HTTP protocol.

Default values=HTTP Address:

devicecfg.private.net/devicecfg/utstarcom/config

- Provisioning HTTP server port is set to 80.

This is the HTTP port to be used for the HTTP Provisioning server.

Default values=80

- User enters Group name in the group field. This information is used in the group configuration file.

Default values=0

- Provisioning expiry timer is set currently to 86400 seconds (24 hours). This implies that the ATA will restart its next provisioning cycle after this provisioning timer expires.

- Upgrade TFTP Server Address is set to default UTStarcom, provisioning server.

This server is used for transacting the firmware file using TFTP protocol.

Default values= devicecfg.private.net/firmware/utstarcom

- Upgrade TFTP server port is set to 69.

This is the TFTP port to be used for the TFTP Upgrade server.

Default values=69

- Upgrade HTTP Server Address is set to the default UTStarcom provisioning server.

This server is used for transacting the firmware file using HTTP protocol.

Default values=devicecfg.private.net/firmware/utstarcom

- Upgrade HTTP server port is set to 80.

This is the HTTP port to be used for the HTTP Upgrade server.

Default values=80

- Sync Check is a feature where the SIP proxy initiates a sync check event in a SIP message. The ATA restarts the entire provisioning process to keep in sync with the provisioning and upgrade servers. The Authentication feature is utilized to authenticate the requesting ATA. Currently this feature has been disabled on the ATA's. In order to activate this feature, the SIP-Proxy should support this feature.

Note: Factory shipped V1.8.2.2a version does not have these provisioning features. User has to upgrade the unit to V1.8.2.19a or later version in order to utilize these provisioning features.

Provisioning Process rules

Auto-Configuration

The UTStarcom iAN-02EX supports remote auto configuration updates using remote provisioning (HTTP/TFTP) server. It has the capability to access a remote Provisioning HTTP or TFTP server and download the configuration files and perform auto updates.

Brief description on HTTP/TFTP Provisioning servers

TFTP Provisioning servers

Provisioning TFTP server can be defined as either an IP-address or a URL.

User has the flexibility to disable HTTP and TFTP. This could be achieved by putting the values as, HTTP/TFTP server=0

Port hunting feature

3 ports can be defined for TFTP servers. If timeout occurs on one port then the ATA will hunt the remaining 2 ports as defined by the user.

During the hunting process the ATA will look for the 3 configuration files on all 3 ports.

If it finds the configuration file on one port then it will not look for this configuration file in the remaining 2 ports. This is done in order to reduce the total provisioning time.

If the value for a particular port is zero, then the port will not be tried.

If all configuration files/Firmware files are received during this process, the TFTP port hunting system will not try an HTTP configuration file search.

HTTP Provisioning servers

Provisioning HTTP server can be defined either as an IP-address or a URL.

HTTP will have only one port e.g. port 80 or 8080. If the value for this particular port is zero, then the port will not be tried and the HTTP process will not occur.

User has the flexibility to disable TFTP and only enable HTTP. This could be achieved by putting the value as, TFTP server=0

If all configuration files/Firmware files are received during this process, then the HTTP port hunting system will not try a TFTP configuration file search.

Selection Priority for HTTP or TFTP servers	User can define the priority for provisioning. Following are the priorities available for configuration using the definition mentioned in the HTTP/TFTP provisioning/upgrade server definition. <ul style="list-style-type: none">■ HTTP 1st, TFTP 2nd■ TFTP 1st, HTTP 2nd■ HTTP only■ TFTP only
Frequency of Upgrade	The frequency of auto updates can be set depending on the provisioning expiry timer. The time for next update is calculated from the last reboot of the ATA. Provisioning process is generally started in the following conditions. <ol style="list-style-type: none">1 Always on "power on".2 After expiry timer defined by user.3 On Sync check request from SIP-Proxy.
Provisioning Server configuration files	User will have 3 Sets of files on the TFTP/HTTP server. Mainly the Provisioning (TFTP/HTTP) servers will contain these file e.g. General, MAC and Group file. User can place these Configuration files on the Provisioning server for each ATA in separate directory as defined in the URL. The General and group files will not be encrypted and they will only have general and group information depending on the area they are installed. The MAC file is always encrypted and will have all critical data required by the ATA, which needs to be protected.

The iAN-02EX ATA supports three types of Configuration files:

- General Configuration File: This is used to configure all the general parameters of the ATA.
- Group Configuration File: This is used to configure the parameters that are similar to a specific group of ATAs. The GUI interface of the ATA has a field to set the group to which the ATA belongs and then the ATA can download the group specific configuration from the group specific cfg file.
- MAC address specific Configuration File: This is used to configure the unique parameters specific to a particular ATA.

Note: In case of the same parameter is in any of these files, the priority order is highest for MAC address specific configuration file, followed by the group configuration file, the last being the general configuration file.

Internally the ATA maintains one configuration file, which contains parameters taken from all of the above configuration files.

File format of the configuration File

General Configuration File naming convention

The General file contains only the general information of the ATA. It is represented as: U53V005.00.00_UTSTARCOM-GENERAL.CFG.

File format is as follows:

<Board id>_<company>-<General>.cfg

Example: U53V005.00.00_UTSTARCOM-GENERAL.CFG

<Board id>= U53V005.00.00

<Company>=UTSTARCOM

<Type>=GENERAL

This file should include the general settings that are applicable to all units deployed.

The ATA compares the board ID and the company name fields on the cfg file to that which is set in the hardware. If it matches then ONLY the ATA considers this configuration file authentic and downloads it and takes the configuration parameters.

If there is a change in the parameter values compared to what is stored in the ATA, the ATA makes changes to the configuration and performs an auto reboot to bring the new configuration into effect.

Group Configuration File

The Group file contains the group information for a set of ATA's. It is represented as: U53V005.00.00_UTSTARCOM- ISELIN.CFG.

File format is as follows:

```
<Board id>_<company>-<group name>.cfg  
<Board id>= U53V005.00.00  
<Company>=UTSTARCOM  
<Type>=Group
```

Example: U53V005.00.00_UTSTARCOM-ISELIN.CFG

This file should include the settings that are common to a specific group of users.

Any parameter value in this file supersedes the value from the GENERAL.cfg, in case of duplications.

The ATA compares the board ID and the company name fields on the cfg file to that which is set in the hardware. If it matches then ONLY the ATA considers this configuration file authentic and downloads it and takes the configuration parameters.

If there is a change in the parameter values compared to what is stored in the ATA, the ATA makes changes to the configuration and performs an auto reboot to bring the new configuration into effect.

MAC address specific Configuration File

The MAC file contains the encrypted information using the MAC ID as the key. The MAC file is represented as:
U53V005.00.00_UTSTARCOM-00028A59FF35.CFG.

File format is as follows:

```
<Board id>_<company>-<device MAC>.cfg  
<Board id>= U53V005.00.00  
<Company>=UTSTARCOM  
<Type>=MAC ID example 00028A59FF35
```

This file should include settings that are specific to a particular ATA.

For example this MAC file is used to encrypt the username and password for SIP proxy/registrar. This file will be used to set the telephone number for each subscriber.

Please note that this file needs to be encrypted before putting it on the provisioning server.

UTStarcom provides an encryption engine (crypt.exe). The encryption key is the MAC address of the specified device. This program is available for lab testing only as it is limited to encrypting one file at a time.

After encryption the file name changes from .cfg to .enc. Rename this file as a CFG file.

Encryption Engine UTStarcom supplies the MD5 based encryption engine "Crypt.exe" which can run in a windows environment. Other variants for different operating systems like Linux or Sun Solaris are also available.

Provisioning mechanism with MD5 based crypto utility:

- 1 This is used only for the Mac-specific configuration files. The other .cfg files are kept in .cfg format (plain- text format) on the provisioning server.
- 2 Use the ATA MAC as the secret key.

For example use "00028A59FF26" to encrypt the file.

Then create the filename as:

U53V005.00.00_UTSTARCOM-00028A59FF26.CFG

After encryption the file is called *.ENC

U53V005.00.00_UTSTARCOM -00028A59FF26.ENC

- 3 The ATA will then use its own MAC for decryption and will update the ATA with the new configuration settings.

Usage of the Simple Crypt Utility on a Windows platform:

- 1 Only for test convenience and has the limitation of encrypting one file at a time.
- 2 Click File->Settings to determine whether creating new (en, de) cryptd file or just overwriting the source file.

Encryption tools

The encryption tools/kits are available on the Windows; Linux or Sun Solaris platforms. Please contact your UTStarcom, Inc Network Consultant or Sales representative for further details and files.

```

Firmware Upgrade

The UTStarcom iAN-02EX supports remote firmware upgrade using HTTP or TFTP servers. The frequency of auto updates can be set using the provisioning expiry timer.

Firmware is the main software image, which the ATA needs to perform all tasks in real time. Firmware upgrades are required for adding new features or to resolves bugs.

The ATA supports a mechanism to remotely access a HTTP or TFTP server and download a new firmware image.

The ATA verifies the file name as mentioned in the .cfg file to authenticate board id of the ATA and the firmware image. After a successful download the ATA performs an auto reboot to bring the new firmware image into effect.

During the period of firmware upgrade three LEDs on the unit blink simultaneously. In the event of an unsuccessful firmware download the ATA continues to function on the old image.

In order to enable remote Firmware upgrade, the items below are essential:

- 1 Make sure upgrade_server_address and upgrade_filename are included in the config file to be downloaded to the device.

- 2 Ensure that the firmware filename follows the format <board_id>-<version>.cpr.
- 3 Make sure that the filename version matches the actual version of the firmware.

For example: V2.8.2.19a must have the file name <board_id>- V2.8.2.19a.cpr

File naming convention

The file naming convention is expressed as follows:

Example: U53V004.00.00_UTSTARCOM-V1.8.2.Xa.cpr

<Board id>_<company>.cpr
<Board id>= U53V005.00.00
<Company>=UTSTARCOM
.<cpr>= firmware file extension.

The user will have to place this file on the Upgrade Server at the specific location where the ATA will download this file.

Example: UTSI generic release is called V1.8.2.Xa.

Note: The GUI does not allow entry of the firmware file name, this can be configured only by CLI or using the configuration file on the ATA.

Provisioning Default Values	The default provisioning priority is HTTP first priority, TFTP second priority. It has been noticed in the field that the provisioning of configuration files and firmware is faster when using the HTTP protocol. TFTP Address: devicecfg.private.net/devicecfg/utstarcom/config TFTP ports 69, 100, 200 HTTP Address: devicecfg.private.net/devicecfg/utstarcom/config HTTP port 80 TFTP upgrade Server Address: devicecfg.private.net/firmware/utstarcom TFTP ports 69 HTTP Upgrade Server Address: devicecfg.private.net/firmware/utstarcom HTTP port 80
------------------------------------	--

UTStarcom, Provisioning Default Flag Values	Provision_priority=0 Provision_server_address=devicecfg.private.net/devicecfg/utstarcom/config
--	---

```
Provision_server_port=69,100,200
Provision_http_server_address=devicecfg.private.net/devicecfg/utstarcom/config
Provision_http_server_port=80
Provision_group=0
Provision_expires=86400
Provision_server_address_backup=0
Provision_sync_check=0
Upgrade_server_address=devicecfg.private.net/firmware/utstarcom
Upgrade_server_port=69
Upgrade_http_server_address=devicecfg.private.net/firmware/utstarcom
Upgrade_http_server_port=80
Upgrade_filename=U53V004.00.00_UTSTARCOM-V1.8.2.19a.cpr
```

Sample Provisioning Flow Behavior	<p>In the default provisioning process the Provisioning/Upgrade HTTP servers have been given priority over the Provisioning/Upgrade TFTP servers.</p> <p>By default, the ATA will be using the default UTStarcom, Inc provisioning servers.</p> <p>Provisioning/Upgrade HTTP servers are enabled on port 80</p> <p>Provisioning/Upgrade TFTP servers are enabled on 3 ports. They are 69, 100 and 200.</p> <p>Configuration group file feature is not used during the provisioning configuration file search.</p> <p>Expiry, by default, is set to 24 hours (86400 seconds).</p> <p>Sync feature has been disabled in this flow.</p> <p>Firmware upgrade is done for the file defined in the upgrade_filename flag.</p>
--	---

Provisioning Flow

1 Step1:

ATA will first check the provisioning flag set in the current configuration.

By default the ATA will look for HTTP server.

2 Step2:

ATA will look for general, group (currently disabled) and MAC [Encrypted] configuration file from the HTTP server. If these files are received by the ATA the subsequent TFTP configuration file search is stopped.

3 Step3:

Once these files are received the ATA will compare the configuration within the ATA and reboot to assume the new configuration.

4 Step4:

After the completion of configuration file update, the ATA will recheck the 3-configuration files status and proceed for the Upgrade firmware process. The ATA will check the current firmware version and if required will download the new firmware and reboot when the download is complete.

5 Step5:

If the HTTP server is not available for some reason the system will go into the TFTP configuraiton file provisioning.

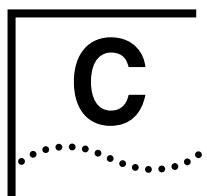

During this operation the ATA will look for the 3 configuration files on each port. If the configuraiton file is available on one port the same configuration file is not tried again on subsequent ports.

If the port value is zero on any given port then that particular port will not be tried.

Once these files are received the ATA will compare the configuration within the ATA and reboot to assume the new configuration.

6 Step6:

After the completion of configuration file update(s), the ATA will recheck the 3-configuration files status and proceed for the Upgrade firmware process. The ATA will check the current firmware version and if required will download the new firmware and reboot when the download is complete.

DEFAULT SETTING & VALUE

Default Value and Value Range

Table 46 abconfig.cfg Default Value and Value Range

Field	Default Value	Valid Range
bootcode_version	V1.6.7	Read-only.
device_mode	1	0: Bridge Mode 1: Gateway Mode
wan	1	0: Static IP 1: DHCP client 2: PPPoE client
wan_ip	172.25.25.1	Valid IP address
wan_mask	255.255.255.0	Valid Netmask
wan_gateway	172.25.25.1	Valid IP address
wan_dns	172.25.25.1	Valid IP address
pppoe_username	1234	A generic string with up to 32 characters.
pppoe_password	0000	A generic string with up to 32 characters.
provision_priority	0	Provision priority=0 HTTP 1st and TFTP 2nd Provision priority=1 TFTP 1st and HTTP 2nd Provision priority=0 HTTP only (Set TFTP provisioning/upgrade server value=0) Provision priority=1 TFTP only (Set HTTP provisioning/upgrade server value=0)
provision_server_address	devicecfg.private.net/devicecfg/ utstarcom/config	Valid IP address or URL 0: Disable
provision_server_port	69, 100, 200	Valid port number 0: Disable (Port not used)
provision_http_server_address	devicecfg.private.net/devicecfg/ utstarcom/config	Valid IP address or URL 0: Disable
provision_http_server_port	80	Valid port number
provision_group	0	Enter any group number or name. 0: Disable
provision_expires	86400	Time in seconds
provision_server_address_backup	0	Valid IP address

Table 46 abconfig.cfg Default Value and Value Range

Field	Default Value	Valid Range
upgrade_server_address	devicecfg.private.net/firmware/ utstarcom	Valid IP address or URL 0: Disable
upgrade_server_port	69	Valid port number
upgrade_http_server_address	devicecfg.private.net/firmware/ utstarcom	Valid IP address or URL 0: Disable
upgrade_http_server_port	80	Valid port number
upgrade_filename	0	A valid file with cpr extension.
upgrade_provisapp_filename	U53V004.00.00_UTSTARCOM -provisapp.V0.0.1.cpr	Read-only.
provision_sync_check=0	0:disable	0: disable 1: enable 2: enable and authenticate (Currently authenticate feature not implemented)
provisapp_enable	1	Flag for enable/disable recovery image upgrade 0: disable 1: enable
wan_provisioning	1	0: disable 1: enable
wan_dns3	0.0.0.0	Valid IP address
debug_level	0	0: do not show debug messages 1: show ERROR 2: show ERROR and WARNING 3: show ERROR, WARNING and INFO 4: show ERROR, WARNING, INFO and DEBUG
default_t1	Generic: 500	SIP-RFC 3261 T1 Timer value Range: 100 to 5000
dscp	1	1: trusted mode 2: un-trusted mode
Dmz	0	0: disable DMZ1: enable DMZ
Dmz_ip	0.0.0.0	Valid IP address
dhcp_start	172.25.25.2	Valid IP address
dhcp_end	172.25.25.21	Valid IP address

voip_info user0	0	SIP-INFO 0=disable 1=enable
voip_info_user1	0	SIP-INFO 0=disable 1=enable
voip_jitterbufMin	0	0 to 150
voip_jitterbufMax	150	0 to 150
voip_jitterbufTarget	0	0 to 150
vlan_tag_priority_port0	0	0 - 65535
vlan_tag_priority_port1	0	0 - 65535
vlan_tag_vlan_id_port0	4	0 to 100
vlan_tag_vlan_id_port1	4	0 to 100

Table 46 abconfig.cfg Default Value and Value Range

Field	Default Value	Valid Range
vlan_tag_enable	0	0: disable 1: enable
vlan_tag_add_port0	0	0: disable 1: enable
vlan_tag_add_port1	0	0: disable 1: enable
vlan_tag_remove_port0	0	0: disable 1: enable
vlan_tag_remove_port1	0	0: disable 1: enable
vlan_tag_replace_port0	0	0: disable 1: enable
vlan_tag_replace_port1	0	0: disable 1: enable
vlan_tag_voice_priority	1	0 to 8
vlan_tag_voice_vlan_id	3	0 to 100

iAN-02EX SNMP MIB REFERENCE

MIB Scalar Objects as defined in UTSI-VOIPRG-MIB.mib are listed below.

Note: Please contact your UTStarcom, Inc Network Consultant or Sales representative for the UTSI-VOIPRG-MIB.mib file.

MIB Scalar Objects

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
System Status 1.3.6.1.4.1.4684.1.1.0 read-only current	The device status. It will be queried by SNMP platform.	INTEGER <ul style="list-style-type: none">■ normal(1)■ minor(2)■ major(3)
systemVersion 1.3.6.1.4.1.4684.1.2.0 read-only current	System software version. It will be queried by SNMP platform for matching LCT and GW SW version.	DisplayString (0..20)
currentAlarmNum 1.3.6.1.4.1.4684.5.1.1.1.1.5.1.0 read-only current	The number of entries in current alarm table	INTEGER
rgCommonReset 1.3.6.1.4.1.4684.5.4.1.1.0 read-write current	Reset system. Trigger(1), Normal(2).	INTEGER <ul style="list-style-type: none">■ trigger(1)■ normal(2)
rgCommonFactoryReset 1.3.6.1.4.1.4684.5.4.1.2.0 read-write current	Reset to factory default setting. Trigger(1), Normal(2).	INTEGER <ul style="list-style-type: none">■ trigger(1)■ normal(2)
rgCommonHardwareVersion 1.3.6.1.4.1.4684.5.4.1.3.0 read-only current	Hardware version.	DisplayString (0..255)
rgCommonFirmwareVersion 1.3.6.1.4.1.4684.5.4.1.4.0 read-only current	software version.	DisplayString (0..255)
rgCommonBootVersion 1.3.6.1.4.1.4684.5.4.1.5.0 read-only current	Boot code version.	DisplayString (0..255)

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgCommonDeviceType 1.3.6.1.4.1.4684.5.4.1.6.0 read-only current	Device type of device.	DisplayString (0..255)
rgCommonDeviceDescription 1.3.6.1.4.1.4684.5.4.1.7.0 read-only current	A textual description of the system device. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software. It is mandatory that this only contain printable ASCII characters.	DisplayString (0..255)
rgCommonLastBuildDate 1.3.6.1.4.1.4684.5.4.1.100.0 read-only current	Last build date of system software	DisplayString (0..255)
rgCommonLastBuildTime 1.3.6.1.4.1.4684.5.4.1.101.0 read-only current	Last build time of system software	DisplayString (0..255)
rgSysDescription 1.3.6.1.4.1.4684.5.4.2.1.0 read-write current	The description of system.	DisplayString (0..255)
rgSysDateTime 1.3.6.1.4.1.4684.5.4.2.2.0 read-only current	Current system date and time in GMT.	DisplayString (0..255)
rgSysPhysAddr 1.3.6.1.4.1.4684.5.4.2.3.0 read-only current	Physical address of system.	DisplayString (0..255)
rgSysIpAddr 1.3.6.1.4.1.4684.5.4.2.4.0 read-only current	The IP address of system.	IpAddress
rgSysSubnetMask 1.3.6.1.4.1.4684.5.4.2.5.0 read-only current	The net mask of system.	IpAddress
rgSysDefGateway 1.3.6.1.4.1.4684.5.4.2.6.0 read-only current	The default gateway of system.	IpAddress
rgSysPassSupervisor 1.3.6.1.4.1.4684.5.4.2.7.0 read-only current	Login password for supervisor.	DisplayString (0..255)
rgSysPassUser 1.3.6.1.4.1.4684.5.4.2.8.0 read-only current	Login password for user.	DisplayString (0..255)

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgSysLedPower 1.3.6.1.4.1.4684.5.4.2.9.0 read-only current	LED display status for power supply indicator.	INTEGER ■ on(1) ■ off(2) ■ blink(3)
rgSysLedLan 1.3.6.1.4.1.4684.5.4.2.10.0 read-only current	LED display status for LAN linking indicator.	INTEGER ■ on(1) ■ off(2) ■ blink(3)
rgSysLedWan 1.3.6.1.4.1.4684.5.4.2.11.0 read-only current	LED display status for WAN linking indicator.	INTEGER ■ on(1) ■ off(2) ■ blink(3)
rgSysLedVrdy 1.3.6.1.4.1.4684.5.4.2.12.0 read-only current	LED display status for VoIP ready indicator.	INTEGER ■ on(1) ■ off(2) ■ blink(3)
rgSysInternetAccessMode 1.3.6.1.4.1.4684.5.4.2.13.0 read-write current	The method of Internet(WAN) access.	INTEGER ■ static(1) ■ dhcp(2) ■ pppoe(3)
rgSysNteEnable 1.3.6.1.4.1.4684.5.4.2.14.0 read-write current	Enable/Disable NTE function	INTEGER ■ on(1) ■ off(2) default = off
rgPortNumTotal 1.3.6.1.4.1.4684.5.4.3.1.0 read-only current	The total port number of VoIP Gateway(FXS interface).	Integer32
rgPortNumUsable 1.3.6.1.4.1.4684.5.4.3.2.0 read-only current	The usable port number of VoIP Gateway(FXS interface).	Integer32
rgPortNumBusy 1.3.6.1.4.1.4684.5.4.3.3.0 read-only current	The busy port number of VoIP Gateway(FXS interface).	Integer32
rgPortNumFault 1.3.6.1.4.1.4684.5.4.3.4.0 read-only current	The fault port number of VoIP Gateway(FXS interface).	Integer32
rgPortNumForbidden 1.3.6.1.4.1.4684.5.4.3.5.0 read-only current	The forbidden port number of VoIP Gateway(FXS interface).	Integer32

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgVoipProtocol 1.3.6.1.4.1.4684.5.4.4.1.0 read-write current	VoIP signaling protocol.	INTEGER ■ mgcp(1) ■ sip(2) ■ h323(3)
rgVoipMgcpLocalport 1.3.6.1.4.1.4684.5.4.4.2.1.0 read-write current	The local listening port of MGCP stack.	INTEGER (1..65535)
rgVoipMgcpPriCallAgentAddress 1.3.6.1.4.1.4684.5.4.4.2.2.0 read-write current	The network IP address of the primary CallAgent.	IpAddress
rgVoipMgcpPriCallAgentPort 1.3.6.1.4.1.4684.5.4.4.2.3.0 read-write current	The port number of the primary CallAgent.	INTEGER (1..65536)
rgVoipMgcpSecCallAgentAddress 1.3.6.1.4.1.4684.5.4.4.2.4.0 read-write current	The network IP address of the secondary CallAgent.	IpAddress
rgVoipMgcpSecCallAgentPort 1.3.6.1.4.1.4684.5.4.4.2.5.0 read-write current	The port number of the secondary CallAgent.	INTEGER (1..65536)
rgVoipMgcpExpires 1.3.6.1.4.1.4684.5.4.4.2.6.0 read-write current	The period(in seconds) of sending keep alive message to callagent.	Integer32
rgVoipMgcpWildRsip 1.3.6.1.4.1.4684.5.4.4.2.7.0 read-write current	Enable / Disable sending RSIP with wildcarded endpoint id.	INTEGER ■ on(1) ■ off(2) default = off
rgVoipMgcpEpldStyle 1.3.6.1.4.1.4684.5.4.4.2.8.0 read-write current	Specify endpoint id style.	INTEGER ■ aaln-IpAddr(0) ■ macAddr-IpAddr(1) ■ aaln-MacAddr(2) ■ aaln-DomainName(3)
rgVoipSipLocalport 1.3.6.1.4.1.4684.5.4.4.3.1.0 read-write current	The local listening port of SIP stack.	INTEGER (1..65536)
rgVoipSipProxyAddress 1.3.6.1.4.1.4684.5.4.4.3.2.0 read-write current	The network IP addresss of SIP proxy.	IpAddress

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgVoipSipProxyPort 1.3.6.1.4.1.4684.5.4.4.3.3.0 read-write current	The port number of SIP proxy.	INTEGER (1..65536)
rgVoipSipRegistrarAddress 1.3.6.1.4.1.4684.5.4.4.3.4.0 read-write current	The network IP address of SIP registrar.	IpAddress
rgVoipSipRegistrarPort 1.3.6.1.4.1.4684.5.4.4.3.5.0 read-write current	The port number of SIP registrar.	INTEGER (1..65536)
rgVoipSipExpires 1.3.6.1.4.1.4684.5.4.4.3.6.0 read-write current	The period(in seconds) that the SIP registration will expire.	Integer32
rgVoipSipDomain 1.3.6.1.4.1.4684.5.4.4.3.7.0 read-write current	The SIP domain name for the URI to be registered. e.g., if the settings are, username : 1234 domain : iptel.org registrar: 195.37.77.101 then the URI sip:1234@iptel.org will be registered in 195.37.77.101.	DisplayString (0..255)
rgVoipSipSubject 1.3.6.1.4.1.4684.5.4.4.3.8.0 read-write current	The content of the SIP subject header in outgoing INVITE message. This is used to indicate the title of the call.	DisplayString (0..255)
rgVoipH323Localport 1.3.6.1.4.1.4684.5.4.4.4.1.0 read-write current	The local listening port of H.323 stack.	INTEGER (1..65536)
rgVoipH323GatekeeperAddress 1.3.6.1.4.1.4684.5.4.4.4.2.0 read-write current	The network IP address of H.323 gatekeeper.	IpAddress
rgVoipH323GatekeeperPort 1.3.6.1.4.1.4684.5.4.4.4.3.0 read-write current	The listening port of H.323 gatekeeper.	INTEGER (1..65536)
rgVoipH323Expires 1.3.6.1.4.1.4684.5.4.4.4.4.0 read-write current	The period(in seconds) of sending keep alive message to gatekeeper.	Integer32
rgVoipH323Faststart 1.3.6.1.4.1.4684.5.4.4.4.5.0 read-write current	Enable/Disable H.323 fast connect procedure.	TruthValue
rgVoipCodecRate 1.3.6.1.4.1.4684.5.4.4.5.0 read-write current	The preferred codec rate (packet period) in milliseconds.	INTEGER (1..256)

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgVoipCodecPrefer 1.3.6.1.4.1.4684.5.4.4.6.0	The preferred codec. (e.g., PCMU(G.711 u-law), PCMA(G.711 A-law), G.729A, G.723.1). read-write current	INTEGER ■ pcmu(1) ■ pcma(2) ■ g729a(3) ■ g7231(4) default = pcmu
rgVoipCodecVad 1.3.6.1.4.1.4684.5.4.4.7.0	Enable/Disable Voice Activity Detection(VAD). read-write current	INTEGER ■ on(1) ■ off(2)
rgVoipFaxT38 1.3.6.1.4.1.4684.5.4.4.8.0	Enable/Disable T.38 fax. read-write current	INTEGER ■ on(1) ■ off(2)
rgVoipFaxT38Port 1.3.6.1.4.1.4684.5.4.4.9.0	The port number to send/receive T.38 packets. read-write current	INTEGER (1..65536)
rgVoipPstnSwitchkey 1.3.6.1.4.1.4684.5.4.4.10.0	The keys of switching from VoIP mode to PSTN mode. read-write current	DisplayString (0..255)
rgVoipRtpPort 1.3.6.1.4.1.4684.5.4.4.11.0	Specify the port number to send/receive RTP packets. port : INTEGER (1..65536) used by 1st RTP session port + 2: used by 2nd RTP session read-write current	
rgVoipRtpTos 1.3.6.1.4.1.4684.5.4.4.12.0	The IP TOS(type of service) of RTP packet. read-write current	INTEGER (1..256)
rgVoipRxGain 1.3.6.1.4.1.4684.5.4.4.13.0	The adjustment of receive audio gain value in dB. dB: -36 ~ +18. read-write current	INTEGER (-36..18)
rgVoipTxGain 1.3.6.1.4.1.4684.5.4.4.14.0	The adjustment of transmit audio gain value in dB. dB: -36 ~ +18. read-write current	INTEGER (-36..18)
rgVoipSpeedDialCount 1.3.6.1.4.1.4684.5.4.4.15.1.0	The entry count of PSTN redialing digitmap. read-only current	Integer32
rgVoipDigitmapCount 1.3.6.1.4.1.4684.5.4.4.16.1.0	The entry count of PSTN redialing digitmap. read-only current	Integer32
rgCallHistoryVoipInCount 1.3.6.1.4.1.4684.5.4.5.2.0	The incoming count of Call History entry. read-only current	Counter32

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgCallHistoryVoipOutCount 1.3.6.1.4.1.4684.5.4.5.3.0 read-only current	The outgoing count of Call History entry.	Counter32
rgCallHistoryVoipOutSuccess 1.3.6.1.4.1.4684.5.4.5.4.0 read-only current	The total number of successful placed outgoing call.	Counter32
rgCallHistoryVoipOutFail 1.3.6.1.4.1.4684.5.4.5.5.0 read-only current	The total number of failed placed outgoing call.	Counter32
rgCallHistoryPstnInCount 1.3.6.1.4.1.4684.5.4.5.6.0 read-only current	The incoming count of Call History entry.	Counter32
rgCallHistoryPstnOutCount 1.3.6.1.4.1.4684.5.4.5.7.0 read-only current	The outgoing count of Call History entry.	Counter32
mgToneType 1.3.6.1.4.1.4684.5.4.6.1.0 read-write current	Select the tone type you want to config. ring(1) : or ringback(2): or dial(3) : busy(4) : or callwait(5): or	INTEGER <ul style="list-style-type: none"> ■ ring(1) ■ ringback(2) ■ dial(3) ■ busy(4) ■ callwait(5)
mgToneOnTime1 1.3.6.1.4.1.4684.5.4.6.2.0 read-write current	The active time of ring tone cadence.	INTEGER (1..65536)
mgToneOffTime1 1.3.6.1.4.1.4684.5.4.6.3.0 read-write current	The inactive time of ring tone cadence.	INTEGER (1..65536)
mgToneOnTime2 1.3.6.1.4.1.4684.5.4.6.4.0 read-write current	The active time of ring tone cadence. 0 means we don't need this object value.	INTEGER (0..65536) default = 0
mgToneOffTime2 1.3.6.1.4.1.4684.5.4.6.5.0 read-write current	The inactive time of ring tone cadence. 0 means we don't need this object value.	INTEGER (0..65536) default = 0
mgToneFreq1 1.3.6.1.4.1.4684.5.4.6.6.0 read-write current	The first frequency of tone type cadence.	Integer32
mgToneFreq2 1.3.6.1.4.1.4684.5.4.6.7.0 read-write current	The second frequency of tone type cadence.	Integer32

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
mgToneOperation 1.3.6.1.4.1.4684.5.4.6.8.0 read-write current	Enable/Disable tone modulation by tone type.	INTEGER ■ on(1) ■ off(2)
rgMgtDhcpServerIp 1.3.6.1.4.1.4684.5.4.7.1.0 read-only current	The network IP address of the local DHCP server for LAN.	IpAddress
rgMgtPriDnsIp 1.3.6.1.4.1.4684.5.4.7.2.0 read-only current	The network IP address of primary DNS server.	IpAddress
rgMgtSecDnsIp 1.3.6.1.4.1.4684.5.4.7.3.0 read-only current	The network IP address of secondary DNS server.	IpAddress
rgMgtPppoeServer 1.3.6.1.4.1.4684.5.4.7.4.0 read-only current	The network IP address of PPPoE server.	IpAddress
rgMgtPppoeUsername 1.3.6.1.4.1.4684.5.4.7.5.0 read-write current	Specify the user name of PPPoE client.	DisplayString (0..255)
rgMgtPppoePassword 1.3.6.1.4.1.4684.5.4.7.6.0 read-write current	Specify the password of PPPoE client.	DisplayString (0..255)
rgMgtProvisionServerAddress 1.3.6.1.4.1.4684.5.4.7.7.0 read-write current	The network IP address of the provision server.	IpAddress
rgMgtProvisionServerPort 1.3.6.1.4.1.4684.5.4.7.8.0 read-write current	The port number of the provision server.	INTEGER (1..65536)
rgMgtProvisionServerGroup 1.3.6.1.4.1.4684.5.4.7.9.0 read-write current	The group that device belongs to.	DisplayString (0..255)
rgMgtProvisionServerExpires 1.3.6.1.4.1.4684.5.4.7.10.0 read-write current	The period(in seconds) of retrieving configuration from provision server.	Integer32
rgMgtNtpServerAddress 1.3.6.1.4.1.4684.5.4.7.15.0 read-write current	The network IP address of the NTP server.	IpAddress
rgMgtNtpTimezone 1.3.6.1.4.1.4684.5.4.7.16.0 read-write current	The time zone of current location for NTP.	INTEGER (-12..12)

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgMgtNtpExpires 1.3.6.1.4.1.4684.5.4.7.17.0 read-write current	The period(in seconds) of retrieving time from NTP server.	Integer32
rgMgtNtpSync 1.3.6.1.4.1.4684.5.4.7.18.0 read-write current	Synchronize local time with ntp server.	INTEGER <ul style="list-style-type: none"> ■ on(1) ■ off(2) default = off
rgMgtSyslogServerAddress 1.3.6.1.4.1.4684.5.4.7.19.0 read-write current	The network IP address of the syslog server.	IpAddress
rgMgtSyslogServerPort 1.3.6.1.4.1.4684.5.4.7.20.0 read-write current	The port number of the syslog server.	INTEGER (1..65536)
rgMgtVoipStunNatAddress 1.3.6.1.4.1.4684.5.4.7.21.0 read-write current	The network IP address of the NAT firewall. Should be specified if this device is located behind a NAT firewall. The NAT firewall should also activate port mapping or DMZ funtions to forward incoming voip signaling packet and RTP packets to this device. Make sure the STUN(Simple Traversal of User Datagram) server address is 0 if you want to specify nataddress by yourself. If the IP address of the NAT firewall is unknown, specify STUN server to determine it automatically.	IpAddress
rgMgtVoipStunServerIp 1.3.6.1.4.1.4684.5.4.7.22.0 read-write current	The network IP address of STUN(Simple Traversal of User Datagram) server. It is used to detecting the IP address of the NAT firewall. If this function is enabled, after detecting the IP address of the NAT firewall, 'nataddress' will be changed automatically.	IpAddress
rgMgtVoipStunServerPort 1.3.6.1.4.1.4684.5.4.7.23.0 read-write current	The port number of the STUN server.	INTEGER (1..65536)
rgMgtVoipStunLocalport 1.3.6.1.4.1.4684.5.4.7.24.0 read-write current	The local listening port number of the STUN client.	INTEGER (1..65536)
rgMgtVoipStunExpires 1.3.6.1.4.1.4684.5.4.7.25.0 read-write current	The period(in seconds) of sending STUN message to STUN server.	Integer32
rgEmsSnmpGetCommunity 1.3.6.1.4.1.4684.5.4.8.1.0 read-write current	The snmp get community name of system.	DisplayString (0..255)
rgEmsSnmpSetCommunity 1.3.6.1.4.1.4684.5.4.8.2.0 read-write current	The snmp set community name of system.	DisplayString (0..255)

Table 47 MIB Scalar Objects Table

Node / OID	Description	Settings
rgEmsSnmpTrapCommunity 1.3.6.1.4.1.4684.5.4.8.3.0 read-write current	The snmp trap community name of system.	DisplayString (0..255)
rgEmsSnmpTrapIP1 1.3.6.1.4.1.4684.5.4.8.4.0 read-write current	The network IP address of SNMP server for receiving traps.	IpAddress
rgEmsSnmpTrapIP2 1.3.6.1.4.1.4684.5.4.8.5.0 read-write current	The network IP address of SNMP server for receiving traps.	IpAddress
rgEmsSnmpTrapIP3 1.3.6.1.4.1.4684.5.4.8.6.0 read-write current	The network IP address of SNMP server for receiving traps.	IpAddress
rgEmsSnmpTrapIP4 1.3.6.1.4.1.4684.5.4.8.7.0 read-write current	The network IP address of SNMP server for receiving traps.	IpAddress
rgEmsSnmpTrapPort1 1.3.6.1.4.1.4684.5.4.8.8.0 read-write current	The port number of SNMP server for receiving traps.	INTEGER (1..65536)
rgEmsSnmpTrapPort2 1.3.6.1.4.1.4684.5.4.8.9.0 read-write current	The port number of SNMP server for receiving traps.	INTEGER (1..65536)
rgEmsSnmpTrapPort3 1.3.6.1.4.1.4684.5.4.8.10.0 read-write current	The port number of SNMP server for receiving traps.	INTEGER (1..65536)
rgEmsSnmpTrapPort4 1.3.6.1.4.1.4684.5.4.8.11.0 read-write current	The port number of SNMP server for receiving traps.	INTEGER (1..65536)
rgEmsExpires 1.3.6.1.4.1.4684.5.4.8.12.0 read-write current	The period(in seconds) of sending IP inform message to EMS server.	Integer32
rgCurrentAlarmReset 1.3.6.1.4.1.4684.5.4.9.2.0 read-write current	Reset current alarm table.	INTEGER <ul style="list-style-type: none"> ■ trigger(1) ■ normal(2)
rgHistoryAlarmNum 1.3.6.1.4.1.4684.5.4.10.1.0 read-only current	The number of entries in history alarm table	INTEGER
rgHistoryAlarmReset 1.3.6.1.4.1.4684.5.4.10.2.0 read-write current	Reset history alarm table.	INTEGER <ul style="list-style-type: none"> ■ trigger(1) ■ normal(2)

UPGRADE PROCEDURE

Upgrade Procedure

Follow the procedures below to upgrade Generic units from V1.8.2.2a or interim Generic release to V1.8.2.19a.

1 Step1

- Connect PC to LAN side.
- Connect ATA using ip-address 192.168.0.1
- Please verify using ipconfig command on the PC connected to the LAN side.
- The ATA on the LAN side should get ip-address 192.268.0.2
- Login=supervisor password=utstar
- System screen should be available on the PC connected to the LAN side.
- Display should show V1.8.2.2a [Factory shipped generic version]

2 Step2

- Go to firmware **Upgrade** tab and select firmware [V1.8.2.19a].
- ATA will read the file and VoIP, Line1 and Line2 LED's will flicker after 2 minutes.
- Once done ATA will reboot.

3 Step3

- Wait for a while and check the LAN LED on the ATA.
- Connect PC to LAN side.
- Connect ATA using ip-address 192.168.0.1
- Login=**supervisor** password=**utstar**

4 Step4

- Go to **Load Default Settings** tab.
- Select radio button **Default** settings
- ATA will load the default and the **Reboot screen** will appear.
- Select reboot, ATA will now reboot with the new default values.

5 Step5

- Connect PC to LAN side
- Please verify using ipconfig command on the PC connected to the LAN side
- Connect ATA using ip-address 172.25.25.1
- ATA on the LAN side should get ip-address 172.25.25.2
- Login=**supervisor** password=**utstar**

Upgrade Notes

LAN side ip-address change	The upgrade from V1.8.2.2a (Generic) units to V1.8.2.19a will change the default LAN side ip-address from 192.168.0.x to 172.25.25.1. Hence after upgrade please make sure to connect to 172.25.25.1 to gain access to the ATA.
WAN side Static ip-address configuration.	On doing load default user will need to configure the IP-Address of the WAN side if static ip-address was used previously. Configuration of Static WAN ip-address can be done using the GUI us the WANIP tab. If DHCP option is used for the acquiring WAN-Side ip-address behavior will be the same as before upgrade.
