IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards ought to be provided by the customer so as to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, license, warranty or endorsement thereof.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations and notices. Representation or reproduction of this information with alteration voids all warranties provided for an associated TI product or service, is an unfair and deceptive business practice, and TI is neither responsible nor liable for any such use.

Resale of TI's products or services with <u>statements different from or beyond the parameters</u> stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service, is an unfair and deceptive business practice, and TI is not responsible nor liable for any such use.

1 Introduction

This document describes how to use the Vision SDK "make" based build system. It explains the basic's on how to compile and link Vision SDK binaries and it also explains various methods by which build can be customized and made faster for advanced users.

Section 2 Basic Usage explains the steps first time users or basic users need to follow to get started

Section 3 Fast Builds gives tips to enable fast builds.

Subsequent sections explain more details about different aspects of build system. This can be useful for basic and advanced users to help customize their build based on their specific requirements.

2 Basic Usage

Follow below steps if you are a first time user and are trying to build Vision SDK

- 1. Identify the build config for which you want to build.
 - Ex, if you want build for TDA2xx SoC on TI EVM with BIOS on all CPUs with all default demos, use build config as "tda2xx_evm_bios_all"
 - **TIP:** Default build config names are the folder names that are present in "vision_sdk/\$(MAKEAPPNAME)/configs/"
- 2. Set required build config in "vision_sdk/build/Rules.make" at below line
 - MAKECONFIG?=tda2xx_evm_bios_all
- 3. Or alternatively pass the value of make variable MAKECONFIG via command line when invoking make as shown below
 - > make -s -j MAKEAPPNAME=apps MAKECONFIG=tda2xx evm bios all
 - All subsequent discussion will assume MAKEAPPNAME and MAKECONFIG value is set in Rules.make
- 4. When building for first time do below on command prompt. This will setup the build environment based on selected MAKEAPPNAME and MAKECONFIG, it will build the drivers in PDK and EDMA3LLD.
 - > make -s -j depend
 - TIP: DON'T do this step every time application needs to be built. This
 affects build time of the application in next step. This needs to be done
 only when building for first time or when there is change in any drivers
 (PDK, EDMA3LLD) or when config that is used or parameter values of
 current config are changed.
- To build the Vision SDK link framework and apps do below. This will build the complete framework, links, algplugins, usecases and finally it will generate the "CCS" loadable binaries in folder "vision_sdk/binaries/\$(MAKEAPPNAME)/\$(MAKECONFIG)/vision_sdk/bin/\$(PLATFORM)/"
 - > make -s -j
- 6. To make the SD card loadable application image do below. This will create the "AppImage" and put it in folder "vision_sdk/binaries/\$(MAKEAPPNAME)/\$(MAKECONFIG)/vision_sdk/bin/\$(PLATFORM)/sbl_boot"
 - > make -s -j appimage
 - NOTE: This step is applicable when BIOS runs on all CPUs
- 7. Refer respective platform userguide on steps to generate the SD card bootloader and steps to run the generated AppImage on the EVM.
- In order to "clean" current configuration delete below folder "vision_sdk/binaries/\$(MAKEAPPNAME)/\$(MAKECONFIG)/"
 - Ex, > rm -rf vision_sdk/binaries/apps/tda2xx_evm_bios_all
- 9. TIP: To see current config parameters do below
 - > make showconfig

3 Fast Builds

This section lists some tips to enable faster builds in the Vision SDK build system.

It gives the top level tips and refers to relevant sections in this document for exact details $% \left({{{\mathbf{r}}_{\mathrm{s}}}^{\mathrm{T}}} \right)$

- 1. It is recommend to create your own build config (section 4.3 Adding user specific build config)
- 2. Customize the build based on your requirements (refer section 4 Build Configuration for details). Specifically do the below in the config folder
 - a. Modify PROC_<CPU>_INCLUDE to mark as "no" the CPUs that are not needed (vision_sdk/config/\$(MAKECONFIG)/cfg.mk)
 - Modify vision_sdk/config/\$(MAKECONFIG)/uc_cfg.mk to keep only use-cases you are interested in
 - c. Use "make showconfig" to confirm the config options that are being used for the build
- 3. Use "-s -j" option when invoking make in command line (section 5.1 Make Targets)
- 4. When doing incremental build, only invoke make for the targets that are required. Refer section 5.1 Make Targets for the available make targets which allow granular compilation of modules
- 5. When doing incremental build, only build for CPUs that have modifications (see section 5.2.1 Selecting CPU to build via command line)
- When one is not sure which modules are modified do "make -s -j depend" followed by "make -s -j" to allow build system to scan and build all modified modules.

4 Build Configuration

Build configuration is the means by which various build level parameters are set depending on SOC, Board, OS, application.

General guidelines used by TI for naming a build config is below

- <soc>_<boardname>_<os>_<application>
 - <soc>, can be TI TDA SoC like TDA2x, TDA2Ex, TDA3x
 - <boardname>, can be name for a board built using one of SoC, eg, "evm" for TI EVM or "rvp" for RVP board or "mc" for xCAM board
 - <os>, can be "bios" for BIOS ONLY OS used on all CPUs or "linux" for Linux+BIOS OS used across different CPUs
 - <application>, can be "all" for all demos in Vision SDK package or "opencx" for all OpenCV, OpenCL demos.

TIP: User defined build configs can follow naming convenient and logical for the user

4.1 Modifying Build Configuration Files

- Build configuration files are present in folder "vision_sdk/\$(MAKEAPPNAME)/configs/\$(MAKECONFIG)", i.e the name of the build config is the folder name under "vision_sdk/\$(MAKEAPPNAME)/configs"
- All subsequent discussion assumes MAKECONFIG=tda2xx_evm_bios_all
- Build config conists on one mandatory file "cfg.mk" which the build system expects
 - Ex, vision_sdk/apps/configs/tda2xx_evm_bios_all/cfg.mk
- In this folder this is also a uc_cfg.mk file, this file is inturn included by cfg.mk, so in this sense uc_cfg.mk is not required by the build system but is created to allow modularity in specifying different build options
- cfg.mk lists all the selected parameter values for this config.
 - $\circ~$ Ex, PROC_xxx_INCLUDE specifies if a given CPU is included in this application
 - $\circ~$ Ex, VSDK_BOARD_TYPE specifies the HW board for which this config is valid. This indirectly selects the SoC for which this config is valid
- Users can customize the config based on their requirements
 - TIP: make the CPUs not required for your application to "no". Ex, if IPU1-1 is not required, removed it from build as modifying cfg.mk as below
 - PROC_IPU1_1_INCLUDE=no
- Uc_cfg.mk specifies the use-cases that are included in the final application. Use-cases inturn invoke different algplugins. Algplugins that are excluded in the build if none of the selected use-cases need the algplugin
 - Ex, if application needs only framecopy and capture-display usecase it can comment all lines except the ones shown below in uc_cfg.mk
 - UC_vip_single_cam_frame_copy=yes
 - UC_vip_single_cam_view=yes
- **TIP:** Removing use-cases that are not required and CPUs that are not required will help reduce overall build time as well binary size

- When values in cfg.mk or uc_cfg.mk are changed, the build environment needs to be updated to reflect updated values. This can be done by doing
 - \circ > make -s -j depend
- TIP: To see what config options are selected by current config do below
 - \circ > make showconfig

4.2 Build Configuration Options

Build configuration options are divided into below categories

- System level config parameters
- Use-case selection config parameters
- Alg-plugin selection config parameters

TIP: To see current selected list of config values do "make showconfig"

4.2.1 System level config parameters

The list of currently supported system level config parameters are given in below table.

NOTE: Parameter values are case sensitive.

NOTE: Parameter which take values of "yes" or "no". All values other than "yes" are considered as "no".

Parameter	Valid Values	Description
PROC_IPU1_0_INCLUDE	yes, no	"yes" means the CPU is included in application and will be built
PROC_IPU1_1_INCLUDE		built
PROC_IPU2_INCLUDE		
PROC_A15_0_INCLUDE		
PROC_DSP1_INCLUDE		
PROC_DSP2_INCLUDE		
PROC_EVE1_INCLUDE		
PROC_EVE2_INCLUDE		
PROC_EVE3_INCLUDE		
PROC_EVE4_INCLUDE		
VSDK_BOARD_TYPE	TDA2EX_EVM TDA2XX_EVM TDA3XX_EVM TDA3XX_RVP TDA2XX_MC	Used to select, the board for which the SDK needs to be built, TDA2EX_EVM selects TDA2EX SoC TI EVM board TDA2XX_EVM selects TDA2xX SoC TI EVM board TDA3XX_EVM selects TDA3xX SoC D3 RVP board TDA3XX_RVP selects TDA2xX SoC XCAM board
DUAL_A15_SMP_BIOS	yes, no	"yes" means A15 runs BIOS in SMP mode. Only valid for TDA2x SoC
DDR_MEM	DDR_MEM_512M DDR_MEM_128M	Selects the memory map to use for application. DDR_MEM_512M means 512MB memory map DDR_MEM_128M means 128MB memory map (only valid for TDA3x SoC)

a15_0 "none" means NDK is disabled. ipul_1 On TDAS, SOC die to pinnux confit when MMCSD is disabled. none Dabled (PATS, PROC_TO_USE is mone) NDK is disabled. none DITDA3x, ipul_0 DITDA3x, ipul_0 DITDA3x, ipul_0 DITDA3x, ipul_0 DITDA3x, ipul_0 PATPS_PROC_TO_USE ipul_0 a15_0 -BIOS ONLY mode and AVB is enabled, ipul_1 -BIOS ONLY mode and AVB is disabled, none -BIOS ONLY mode and AVB is disabled, none FATPS_PROC_TO_USE ipul_0 Selects the CPU on which FAT filesystem using MMCSD is enabled (PATS, PROC_TO_USE is one and VAB is disabled. a15_0 none On TDA3x, So Cuite to pinnux confit when MMCSD is enabled (PATS, PROC_TO_USE is one and VAB is disabled. a15_0 none On TDA3x, So Cuite to pinnux confit when MMCSD is enabled (PATS, PROC_TO_USE is one) NDK is disabled automatically by build system. VPE_INCLUDE yes, no "yes" means VPE HWA is included in application DSS_INCLUDE yes, no "yes" means DSS HWA is included in application	IVAHD_INCLUDE	yes, no	"yes" means IVAHD HWA is included in application
DSS_INCLUDE yes, no "yes" means DSS HWA is included in application	VPE_INCLUDE	yes, no	"yes" means VPE HWA is included in application
	DSS_INCLUDE	yes, no	"yes" means DSS HWA is included in application
ISS_INCLUDE yes, no "yes" means ISS HWA is included in application	ISS_INCLUDE	yes, no	"yes" means ISS HWA is included in application
ISS_ENABLE_DEBUG_TAPS yes, no "yes" means ISS Debug taps to dump intermediate ISS otuputs is enabled	ISS_ENABLE_DEBUG_TAPS	yes, no	"yes" means ISS Debug taps to dump intermediate ISS otuputs is enabled

WDR_LDC_INCLUDE	yes, no	"yes" means WDR, LDC feature of ISS is enabled
RTI_INCLUDE	yes, no	"yes" means RTI features are enabled.
		Only valid for TDA3x SoC.
ECC_FFI_INCLUDE	yes, no	"yes" means EFF, FFI features are enabled
DCC_ESM_INCLUDE	yes, no	"yes" means DCC, ESM features are enabled.
		Only valid for TDA3x SoC.
AVBRX_INCLUDE	yes, no	"yes" means AVBRX features are enabled.
		Only valid for TDA2x, TDA2Ex SoC.
DCAN_INCLUDE	yes, no	"yes" means DCAN features are enabled
RADAR_INCLUDE	yes, no	"yes" means Radar related algplugins and use-cases are enabled. This is top level flag to include or exclude Radar features.
RADAR BOARD	none, TDA3XX AR12 ALPS,	Defines what is the board connected to the set up.
	TDA3XX AR12 VIB DAB B	
	TDA3XX RADAR RVP	
FAST BOOT INCLUDE	Ves no	"ves" means rear view camera fast boot features are
1101_0001_1102002	, 65, 110	enabled.
		Only valid for TDA3x SoC.
SRV_FAST_BOOT_INCLUDE	yes, no	"yes" means TDA3x surround view fast boot features are enabled
		Only valid for TDA3x SoC.
CPU IDLE ENABLED	yes, no	"yes" means, CPU will go to low power state when it is
	,	IDLE.
DATA_VIS_INCLUDE	yes, no	"yes" means, Data Visualization feature is enabled
OPENCL_INCLUDE	yes, no	"yes" means, OpenCL framework is included in application.
		Only valid for TDA2x SoC
ENABLE_OPENCV	yes, no	"yes" means, OpenCV framework is included in application.
		Only valid for TDA2x SoC
HS_DEVICE	yes, no	"yes" means "High Security" mode of application is enabled.
DEFAULT_UBOOT_CONFIG	dra7xx_evm_vision_config	Config file used to build Linux uboot
		Only valid when A15_TARGET_OS=Linux
DEFAULT_KERNEL_CONFIG	omap2plus_defconfig	Config file used to build Linux kernel
		Only valid when A15_TARGET_OS=Linux
DEFAULT_DTB	dra72-evm-infoadas.dtb	Device tree file used
	dra7-evm-infoadas.dtb	dra72-evm-infoadas.dtb is DTB file for TDA2Ex EVM
		dra7-evm-infoadas.dtb is DTB file for TDA2x EVM
IPUMM_INCLUDE	yes, no	"yes" means IPUMM framework is included in application.
		Univ valid when A15_TARGET_OS=Linux
		THOSE SET IVARD_INCLODE=10 When this is enabled.
<u>IPC LÍB INCLUDE</u>	<u>yes, no</u>	"yes" means the framework will use IPCLib in the PDK drivers.
		"no" (default) will use the SYSBIOS IPC libraries.
ULTRASONIC_INCLUDE	yes, no	"yes" means Ultrasonic support is included in application.
		Valid for TDA2xx Bios only build configuration.

4.2.2 Use-case selection config parameters

- These are typically specified in uc_cfg.mk which is included by cfg.mk
- These parameters have the format of
 - UC_<usecasename>=yes

- If a use-case is not required then comment the line or make the value as "no" or remove the line completely.
 - #UC_<usecasename>=yes
 - OR
 - UC_<usecasename>=no
- <usecasename> is the name of the folder in which the use-case code is present
 - $_{\odot}$ $\,$ The folders where use-cases are located in Vision SDK are
 - BIOS ONLY mode use-cases
 - "vision_sdk\apps\src\rtos\usecases"
 - "vision_sdk\apps\src\rtos\radar\src\usecases"
 - Linux+BIOS mode use-cases
 - "vision_sdk\apps\src\hlos\adas\src\usecases"
 - "vision_sdk\apps\src\hlos\infoadas\src\chains"

4.2.3 Algplugin selection config parameters

- Algplugins are included based on use-case that is selected
- Every use-case folder has a cfg.mk file in which algplugins that are required for the use-case are marked as "yes"
 - Ex, "vision_sdk/apps/src/rtos/usecases/<usecasename>/cfg.mk"
 - These algplugin parameters have the format of
 - ALG_<algpluginname>=yes
- If algplugin is not required then comment the line or remove the line completely.
 - #ALG_<algpluginname>=yes
- **IMPORTANT:** Do mark a ALG_<algpluginname>=no if it is not required by a usecase since some other use-case may need it
- <algpluginname> is the name of the folder in which the algplugin code is present
 - $_{\odot}$ $\,$ The folders where use-cases are located in Vision SDK are
 - BIOS ONLY mode use-cases
 - "vision_sdk\apps\src\rtos\alg_plugins"
 - "vision_sdk\apps\src\rtos\radar\src\alg_plugins"
 - Linux+BIOS mode use-cases
 - "vsdk_dev\vision_sdk\apps\src\hlos\adas\src\alg_plugins"

4.2.4 CPUs required in application

- Users selected the CPUs they want in their application by marking the CPU as "yes" via the variable PROC_<cpu>_INCLUDE=yes
- The build system gives a hint to user if CPUs selected by user do match the CPUs required by the use-cases and config options selected by the user
 - \circ $\;$ In this case if user continues, the use-case or application may not run
 - \circ $\;$ The user should enabled these CPUs in their config $\;$

- The build system also gives a hint to user if the CPUs selected by users are not used by the use-cases and config options selected by the user
 - $\circ~$ In this case user can disable these CPUs in their config to save build time and application size
- These hints are told by the build system when "make showconfig" is done. It is also shown at the beginning of "make -s -j depend"
- As example log is shown below, in this log
 - it says IPU1_1 is not required in build and can be disabled from build.
 - $\circ~$ It also EVE1 is required from the build and should be enabled in the build

#
CPUs that are NOT required but included in config [tda2xx_evm_bios_all],
#
WARNING: IPU1_1 can be excluded from application
#
CPUs that are required but NOT included in config [tda2xx_evm_bios_all],
#
ERROR: EVE1 MUST be included in application
#
Edit D:/vision_sdk/build/configs/tda2xx_evm_bios_all/cfg.mk to include c
exclude CPUs in an application
#

4.3 Adding user specific build config

- Other than default build configs users can add their own build configs and give their own name to it.
- This is useful in scenario's like below
 - $\circ~$ Scenario 1: User is working on a subset of features and needs only few use-cases of alg-plugins
 - \circ $\;$ Scenario 2: User is working on features not enabled in default configs $\;$
 - Scenario 3: User is adding their own algplugin/use-case/feature to Vision SDK and needs specific features
 - $\circ~$ Scenario 4: User is working on custom board in which features needed are different from default features
- To add a user specific config, it recommended to first identify a default config which is closest to user required config, ex, on the same SoC or same OS, or same board
- Identify a name for user config, say, "my_config"
- Next create a folder in "vision_sdk/\$(MAKEAPPNAME)/configs" called "my_config"
- Copy the cfg.mk and uc_cfg.mk files from the closest default config to "my_config"
- Edit cfg.mk and uc_cfg.mk in user config folder based on user required features
- Set the user config name in vision_sdk/build/Rules.make
 - NOTE: config name is the folder name within "vision_sdk/\$(MAKEAPPNAME)/configs" i.e "my_config" in this case

- It is recommended to confirm the config settings by doing "make showconfig"
- All output files .o, .lib, .out from build this config will be placed in folder "vision_sdk/binaries/\$(MAKEAPPNAME)/<configname>"
 - \circ $\;$ This way outputs from multiple configs can co-exists simulatenously
 - $\circ~$ Hence user could be working on multiple indepedant configs on the same codebase at the same time

5 Make Targets and Command Line Options

5.1 Make Targets

Below table lists the top level makefile targets that can be used by basic and advanced users $% \left({\left| {{{\mathbf{x}}_{i}} \right|_{i \in I}} \right)$

Make targets are invoked on command line as shown below

> make -s -j <maketarget>

TIP: It is recommended to use make options "-s -j'' when specifying a target.

"-j" ensures make invokes targets in parallel whenever possible.

"-s" hides detailed info and only shows important info on the console window

5.1.1 Basic User Targets

Target	Description
help	Show targets that can be invoked from top level make.
showconfig	Show current build config.
depend	Generate config, Build PDK, EDMA3LLD, touch dependant files
vision_sdk	Incremental build, build links framework and application specific targets (alg plug ins, use cases and other necessary modules) based on the \$(MAKEAPPNAME).
	When no target is specified this is the target that is invoked.
appimage	Generate bootable application image
sbl	Generate SBL including SBL firmware for SD boot, QSPI_SD and NOR boot modes (TDA3x, TDA2x, TDA2Ex)

5.1.2 Advanced Targets

These targets give more granular control on the modules to build. Here users known what part of the system has changed and therefore will build only the required part.

TIP: when in doubt do "make -s -j depend" followed by "make -s -j". This may will more time to build but it will ensure all dependencies get built.

Target	Description
makeconfig	Generate config related files. Also invoked internally by "depend". Also invoked internally by "depend". Use this when it is required to only generate the config header files
pdk	Build PDK. Also invoked internally by "depend". Use this to only build the PDK drivers.
edma3lld	Build EDMA3LLD. Also invoked internally by "depend". Use this to only build the starterware drivers.
algorithmslib	Build Algorithm libraries. Used by TI for internal development.
links_fw_libs	Build Vision SDK link framework library
app_alg_plugins	Build Vision SDK algo plugins
apps_libs	Build Vision SDK use cases and other necessary modules.

5.1.3 Linux Related Targets

These targets are used when Linux runs on A15.

Target	Description
linux	Build linux kernel, uboot, sgx drivers
linux_install	Install kernel, uboot, sgx files into filesystem. Typically called after "linux" to copy the output files to filesystem and boot folder.
vision_sdk_linux	Build Vision SDK linux side library and binaries. Invoked as part of "vision_sdk" target. Use this when BIOS side code is build earlier and not modified further.
uboot	Build uboot. Also invoked as part of "linux"
kernel	Build kernel. Also invoked as part of "linux"
sgx	Build sgx drivers. Also invoked as part of "linux"

5.2 Command Line Options

5.2.1 Selecting CPU to build via command line

In many situation user knows which part of the code they have modified and they know the CPU that needs to built for the new changes to take effect. When "make -s -j" is invoked it checks against all CPUs included in the application and then generates the required binaries. This process of checking even though nothing is changed for the other CPUs takes non-trivial time on some systems. To solve this, the build system allows user to specify exact CPUs to build for in such cases.

This is specified by passing the list of CPUs to build for via the command line variable BUILD_CPUS="<cpu1> <cpu2> .."

NOTE: An application consists on multiple CPUs. This is specified via the PROC_<CPU>_INCLUDE=yes in the config file. "BUILD_CPUS" only control if the files associated with that CPU are built or not. "BUILD_CPUS" is useful in incremental build context when all CPUs included in application are built atleast once and further build is required for only select CPUs for which user had done some file modifications.

Some examples are shown below. Wildcard names can be used to specify CPUs, multiple CPUs can be specified as shown below.

Example make command	CPUs that get built
make -s -j BUILD_CPUS="ipu1_0"	Build a single CPU ipu1_0
make -s -j BUILD_CPUS="dsp*"	Build all DSPs that are included in build
make -s -j BUILD_CPUS="ipu1_0 eve*"	Build ipu1_0 and all EVEs
make -s -j BUILD_CPUS="ipu1* dsp1 eve*"	Build ipu1_0, ipu1_1, dsp1 and all EVEs

The detailed list of CPU names that can be passed in the <code>`BUILD_CPUS'</code> string value are listed below

CPU name

Description

ipu1_0	Build IPU1_0 CPU
ipu1_1	Build IPU1_1 CPU
ipu1*	Build IPU1_0, IPU1_1 CPU
ipu2	Build IPU2 CPU
ipu*	Build IPU1_0, IPU1_1, IPU2 CPU
dsp1	Build DSP1 CPU
dsp2	Build DSP2 CPU
dsp*	Build DSP1, DSP2 CPU
eve1	Build EVE1 CPU
eve2	Build EVE2 CPU
eve3	Build EVE3 CPU
eve4	Build EVE4 CPU
eve*	Build EVE1, EVE2, EVE3, EVE4 CPUs
a15_0	Build A15_0 CPU
a15*	Build for all A15 Core's
all	Build all CPUs

5.2.2 Additional Command Line Options

Following additional command line options can be used to further control the build form the make command line

Example Command line option	Description
make –s –j PROFILE=debug	Overides PROFILE value specified on config file and uses the one specified at command line.
	Use this to quickly switch between "debug" and "release" mode without having to modify config file
make –s –j MAKECONFIG="abcd_config"	Overirides MAKECONFIG value specified in Rules.make. Use this to use user defined config without modifying Rules.make file

6 Adding new use-cases, algplugins to build

The below section assumes usecases are located in "vision_sdk\\$(MAKEAPPNAME)\src\rtos\usecases" and alg plugins are located in "vision_sdk\\$(MAKEAPPNAME)\src\rtos\alg_plugins"

6.1 Adding new use-cases to build (BIOS ONLY mode)

Follow below steps to add a new use-case to the build system.

- Create a folder for the use-case, "my_usecase" in folder "vision_sdk\\$(MAKEAPPNAME)\src\rtos\usecases"
- 2. Add .c files related to this use-case in this folder
- 3. Create a file "SRC_FILES.MK" in "my_usecase" folder
- 4. Open file "SRC_FILES.MK" for editing
 - a. Add below line to include folder name in make build SRCDIR += \$(vision_sdk_PATH)/\$(MAKEAPPNAME)/src/rtos/usecases /my_usecase
 - b. Add below line to include .c files for this use-case in make build SRCS_\$(IPU_PRIMARY_CORE) += \ file1.c \
 - file2.c \
- 5. Create a file "cfg.mk" in "my_usecase" folder
- 6. Open file "cfg.mk" for editing
 - a. Add variables for each ALG plugin required by this use-case and set to value "yes". Alg plugin variable name is ALG_<algpluginfoldername>.
 - <algpluginfoldername> is name of folder present under "vision_sdk\apps\src\rtos\alg_plugins"
 - b. Add variables for CPUs that are needed inorder to run this use-case and set value to "yes". The CPUs needed variable name is NEED_PROC_<CPU>
 - i. <CPU> can be IPU1_0, IPU1_1, IPU2, DSP1, DSP2, EVE1, EVE2, EVE3, EVE4, A15_0
- 7. Open file "vision_sdk\\$(MAKEAPPNAME)\configs\cfg.mk" for editing
 - a. Add new use-case variable to list of use-cases. UC variable name format is UC_<usecase_foldername>
 - i. Ex, UC_LIST = \setminus
 - UC_avbrx_dec_display \
 - UC_my_usecase
- Open build config file "vision_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\uc_cfg.mk"
 - a. Enable newly added use-case in build by making usecase variable name as "yes"
 - i. Ex, UC_my_usecase=yes
- 9. Confirm the use-case is added correctly to config by doing "make showconfig"
 - a. You should see your use-case listed under
 - # Use-cases included in build,
 - b. You should see the alg plugins that the use-case needs under, # Alg plugins included in build,
- 10. Open file $\ \$ wision_sdk apps src rtos common chains main_bios misc.c
 - a. We assume use-case will be added to "misc" submenu as an example
 - b. Add menu-item string as shown below

char gChains_menuMiscTests[] = {

```
"\r\n "
"\r\n Miscellaneous Test's"
"\r\n 1: File IO using MMCSD"
#ifdef UC_my_usecase
"\r\n 2: My usecase"
#endif
"\r\n "
"\r\n r\n : Exit "
"\r\n Enter Choice: "
"\r\n "
};
```

c. Invoke usecase entry point

Function: Void Chains_menuMiscTestRun()
switch(ch)
{
case '1':
Utils_fileTestRun();
break;
#ifdef UC_my_usecase
Case `2':
MY_usecase_run(&gChains_usecaseCfg);
break
#endif

11. Build and run the application which includes the new use-case.

6.2 Adding new use-cases to build (Linux + BIOS mode)

Follow below steps to add a new use-case to the build system.

- 1. Create a folder for the use-case, "my_usecase" in folder "vision_sdk\apps\src\hlos\adas\src\usecases"
- 2. Add .c files related to this use-case in this folder
- Copy "MAKEFILE.MK" in "my_usecase" folder from an existing usecase folder under "vision_sdk\apps\src\hlos\adas\src\usecases". This will setup same make options as other use-cases.
- 4. Create a file "cfg.mk" in "my_usecase" folder
- 5. Open file "cfg.mk" for editing
 - a. Add variables for each ALG plugin required by this use-case and set to value "yes". Alg plugin variable name is ALG_<algpluginfoldername>.
 - i. <algpluginfoldername> is name of folder present under "vision_sdk\apps\src\rtos\alg_plugins" or "vision_sdk\apps\src\hlos\adas\src\usecases" or
 - Add variables for CPUs that are needed inorder to run this use-case and set value to "yes". The CPUs needed variable name is NEED PROC <CPU>
 - i. <CPU> can be IPU1_0, IPU1_1, IPU2, DSP1, DSP2, EVE1, EVE2, EVE3, EVE4, A15_0
- 6. Open file "vision_sdk\\$(MAKEAPPNAME)\configs\cfg.mk" for editing
 - c. Add new use-case variable to list of use-cases. UC variable name format is UC_<usecase_foldername>
 - i. Ex, LINUX_TDA2XX_UC_LIST = \
 UC_avbrx_dec_display \

UC_my_usecase

- 7. Open build config file
 - "vision_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\uc_cfg.mk"
 - Enable newly added use-case in build by making usecase variable name as "yes"
 - i. Ex, UC_my_usecase=yes
- 8. Confirm the use-case is added correctly to config by doing "make showconfig"
 - e. You should see your use-case listed under
 - # Use-cases included in build,
 - f. You should see the alg plugins that the use-case needs under, # Alg plugins included in build,
- - g. Add menu-item string as shown below

10. Build and run the application which includes the new use-case.

6.3 Adding new alg plugins to build (BIOS side)

Follow below steps to add a new alg plugin to the build system.

- 1. Create a folder for the use-case, "my_algplugin" in folder "vision_sdk\apps\src\rtos\alg_plugins"
- 2. Add .c files related to this alg plugin in this folder
- 3. Create a file "SRC_FILES.MK" in "my_algplugin" folder
- 4. Open file "SRC_FILES.MK" for editing
 - Add below line to include folder name in make build SRCDIR += my_algplugin
 - b. Add below line to include .c files for this use-case in make build SRCS_<cpuname> += $\$
 - file1.c \ file2.c \
 - c. <cpuname>, is the name of the CPU for which the .c file should be compiled. This depends on the CPU on which the algorithm is supposed to run.
 - i. Valid CPU names are arp32_1, c66xdsp_1, ipu1_0, a15_0
 - ii. NOTE: Algplugins are build once for a given CPU type so CPU name should refer to first instance of the CPU only
- 5. Open "vision_sdk\\$(MAKEAPPNAME)\configs\cfg.mk" for editing
 - a. Add new alg plugin variable to list of alg plugins. Alg plugin variable name format is ALG_<algplugin_foldername>
 - i. Ex, ALG_LIST = \

ALG_autocalibration \setminus

ALG_my_algplugin

- 6. Enable algplug in a required use-case cfg.mk file (see section 6.1 Adding new use-cases to build (BIOS ONLY mode))
- Confirm the alg-plugins is added correctly to config by doing "make showconfig"
 - a. You should see your use-case listed under # Use-cases included in build,
 - b. You should see the alg plugins that the use-case needs under,
 # Alg plugins included in build

6.4 Adding new alg plugins to build (Linux side)

Follow below steps to add a new alg plugin to the build system.

- a.<u>1.</u> Create a folder for the use-case, "my_algplugin" in folder "vision_sdk\apps\src\hlos\adas\src\alg_plugins"
- b.2. Add .c files related to this alg plugin in this folder
- **c.**<u>3.</u>__Copy "MAKEFILE.MK" in "my_algplugin" folder from an existing algplugin folder under "vision_sdk\apps\src\hlos\adas\src\alg_plugins". This will setup same make options as other algplugins.
- d.<u>4.</u> Alg plugins on Linux side are always compiled and granular compile and selection is not supported for Linux side algplugins.

Formatted: Bullets and Numbering

6.5 Building Algorithm plugins for individual cores

In current build configuration for algorithm plugins, to optimize build time, the plugin libraries are built only for single core of core family when more than one core is enabled. For example – only library for DSP1 will be built when both DSP1 & DSP2 are enabled; only EVE1 library will be built when EVE1/2/3/4 are enabled. Once library is built it is linked to other enabled cores. If first core is not enabled then library for second core would be built and used for subsequent cores.

```
ifeq ($(PROC IPU BUILD INCLUDE), yes)
      ifeq ($(PROC_IPU1_0_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=ipu1_0
      else ifeq ($(PROC_IPU1_1_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=ipu1_1
      endif
endififeq ($(PROC_DSP_BUILD_INCLUDE),yes)
      ifeq ($(PROC_DSP1_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=c66xdsp_1
      else ifeq ($(PROC_DSP2_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=c66xdsp_2
      endif
endif
ifeq ($(PROC_EVE_BUILD_INCLUDE),yes)
      ifeq ($(PROC_EVE1_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_1
      else ifeq ($(PROC_EVE2_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_2
      else ifeq ($(PROC_EVE3_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_3
      else ifeq ($(PROC_EVE4_INCLUDE), yes)
            $(MAKE) $(TARGET) CORE=arp32 4
      endif
endif
```

So in the algorithm plugins SRC_FILES.MK you would need to make sure to add your plugin sources to SRCS_c66xdsp_1, SRCS_arp32_1 and SRCS_\$(IPU_PRIMARY_CORE). Adding to SRCS_c66xdsp_2 or SRCS_arp32_2/3/4 when first core is enabled would have no effect and plugin wouldn't be build.

As the main file for DSPs, EVEs is common the algorithm plugin initialization happens for all enabled cores.

This arrangement is done to save build time as plugin library is built only for one core. But it has following tradeoffs w.r.t binary size and run-time.

- a. The build system doesn't allow sources to be added to second core but not one. Also sources should be added to each of cores like c66xdsp_1, c66xdsp_2.
- b. In case you want to build plugin only on one core, you can't do that.
- c. Plugin initiation happens even if plugin is not used on core.

If you want to optimize run-time/size or want to enable plugin only on specified core you need to change makefile (vision_sdk\apps\src\rtos\alg_plugins\MAKEFILE.MK) to enable build on each cores like below. In addition to changing makefile you would need to change individual SRC_FILES.MK to add/remove sources for cores.

```
ifeq ($(PROC IPU BUILD INCLUDE), yes)
      ifeq ($(PROC_IPU1_0_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=ipu1_0
      endif
      ifeq ($(PROC_IPU1_1_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=ipu1_1
      endif
endif
ifeq ($(PROC_DSP_BUILD_INCLUDE),yes)
      ifeq ($(PROC_DSP1_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=c66xdsp_1
      endif
      ifeq ($(PROC_DSP2_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=c66xdsp_2
      endif
endif
ifeq ($(PROC_EVE_BUILD_INCLUDE),yes)
      ifeq ($(PROC_EVE1_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_1
      endif
      ifeq ($(PROC_EVE2_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_2
      endif
      ifeq ($(PROC_EVE3_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_3
      endif
      ifeq ($(PROC_EVE4_INCLUDE),yes)
            $(MAKE) $(TARGET) CORE=arp32_4
      endif
endif
```

7 Adding new system config parameters to build config

In some situation users need to add new config parameters and export them throughput the make system as well within the .c, .h files. This can be done as shown below

- 1. Consider users wants to add a variable MY_CFG_VAR which can take value <code>`CFG_A'', `CFG_B''</code>
- 2. Make this config value visible to C code by doing below
 - a. Open and edit file "\vision_sdk\build\rtos\makerules\component.mk"
 - b. Add lines for each value the config option can take

ifeq (\$(MY_CFG_VAR), CFG_A)
 vision_sdk_CFLAGS += -DMY_CFG_VAR_CFG_A
endif
ifeq (\$(MY_CFG_VAR), CFG_B)
 vision_sdk_CFLAGS += -DMY_CFG_VAR_CFG_B
endif

- 3. Export this variable throughout the make system by doing below.
 - a. Add export MY_CFG_VAR in file \vision_sdk\\$(MAKEAPPNAME)\configs\autorules_footer_cfg.mk
- 4. Set default value for this variable in file \vision_sdk\\$(MAKEAPPNAME)\configs\defaults.mk

a. Ex, MY_CFG_VAR=CFG_A

- 5. Set value for this config variable in config required file \vision_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\cfg.mk
- 6. Now #ifdef MY_CFG_VAR_CFG_A or #ifdef MY_CFG_VAR_CFG_B can be used in .c, .h file to control C code based on this config value
- 7. Now MY_CFG_VAR can be used in make system to control the make build

8 Adding new library to application

User may have separate build system to compile and make libraries for a specific CPU. This section shows how to make the Vision SDK application link to these libraries

- 1. Identify the CPU type to which the library belongs. Assume name of the library is "mylib.lib" and is present in folder "vision_sdk/mylibs"
- 2. Open and edit file \vision_sdk\build\rtos\makerules\rules_<cputype>.mk
 - a. <cputype>, can be m4, a15, arp32 (for EVE), 66 (for DSP)
 - b. Goto position file where LIB_PATHS += is used to link to libraries
 - c. Add your library to this list LIB_PATHS += \$(vision_sdk_PATH)/mylibs/mylib.lib"

9 Changing compiler, linker options

User may want to add or check CPU specific compiler, linker options. This section shows how to do the same

- 1. Identify the CPU type for which compiler, linker options needs to be reviewed, modified.
- 2. Open and edit file \vision_sdk\build\rtos\makerules\rules_<cputype>.mk
 - a. <cputype>, can be m4, a15, arp32 (for EVE), 66 (for DSP)
 - b. CFLAGS_INTERNAL variable holds the compiler flags. Modify this as required.
 - c. LNKFLAGS_INTERNAL_PROFILE variables holds the linker flags. Modify this as required.

10 Build Config Implementation Details (Advanced Users)

10.1 Build config generated .h file

- The process of applying make config generates a .h file at below location "vision_sdk\links_fw\include\config\\$(MAKEAPPNAME)\\$(MAKECONFIG)\system_cfg.h".
- Users need to include the file #include < system_cfg.h > to get access to config options in their C code

10.2 Build config makefiles

Build config makefiles are located at path "vision_sdk\ $(MAKEAPPNAME)\configs"$ and below table list the purpose of each file

File	Description	
cfg.mk	Top level config file which further includes the user specified config file.	
	Also lists all the possible algplugins, use-cases in the system. This list is used to pick the algplugins, use-cases based on values set by user in config files	
defaults.mk	Default values for config variables	
autorules_header_cfg.mk	Derived variables or rules that are applied before including build tools	
autorules_footer_cfg.mk	Derived variables or rules that are applied after including build tools	
build_makeconfig.mk	Build config related make targets. Invoked from top level makefile via "makeconfig" and "showconfig" targets	

11 Add and Delete links into links framework

The links framework is highly modularized. Each link is treated as a module and a library is created for it. This makes addition and deletion of the links very convenient.

11.1 Adding a link

Each link source folder has the following 3 files present along with the link source *.c files.

- component.mk
- makefile
- SRC_FILES.MK

The 'component.mk' file defines the Module Name (MODNAME) for the link, the name of the library created will have the same name.

It adds the link to the list of links framework libs (linksfw_LIB_LIST) and defines the following parameters for the link:

- : Absolute path of the link source \$(MODNAME)_PATH
- \$(MODNAME)_BOARD_DEPENDENCY •
- : yes/no
- \$(MODNAME)_CORE_DEPENDENCY : yes/no
- \$(MODNAME)_PLATFORM_DEPENDENCY : yes/no
- \$(MODNAME)_SOCLIST : list of supported SoCs •
- \$(MODNAME)_\$(SOC)_CORELIST : list of supported Cores

The 'makefile' includes the list of internal and external dependencies and includes the link's SRC FILES.MK file.

The SRC_FILES.MK file populates the SRC_COMMON and SRC_\$(CORE) make rules variables with the link's *.c files which are required to be compiled.

After the above files are created for the link an entry for the link should be made into the top level 'linksfw_component.mk' file:

For eq,

```
-include
$(vision sdk PATH)/links fw/src/rtos/links common/algorithm/component.m
k
```

The '-include' option doesn't throw error even when the link folder is not present.

Now

the

open '\vision sdk\links fw\src\rtos\links common\system\system initDeinitLinks.c' file, add link init and deInit calls in the System_initLinks() and System_deInitLinks() functions respectively under '#define <MODNAME>' as shown below:

Void System initLinks (void)

Vps_printf(" SYSTEM: Initializing Links !!! \r\n");

```
/* Links init based on the links which are part of the build
 */
#ifdef links_common_avb_rx
   AvbRxLink_init();
#endif
   .
   .
   .
   Vps_printf(" SYSTEM: Initializing Links ... DONE !!! \r\n");
```

```
Void System_deInitLinks(void)
{
    Vps_printf(" SYSTEM: De-Initializing Links !!! \r\n");
    /* Links de init based on the links which are part of the build
    */
    #ifdef links_common_avb_rx
        AvbRxLink_deInit();
    #endif
    .
    .
    Vps_printf(" SYSTEM: De-Initializing Links ... DONE !!! \r\n");
}
```

11.2 Deleting a link

The link can be deleted from the links framework by

- Deleting the link source code.
- Removing the entry for the link from the linksfw_component.mk file

NOTE:

Whenever a link is added or deleted `make -s -j depend' should be run so that system cfg files are regenearated.

12 Revision History

Version	Date	Revision History
0.1	02nd Oct 2016	First Draft
0.2	05 th July 2017	Updated for Vision SDK release 3.0
0.3	18 th Dec 2017	Updated with algorithm plugin build support for individual cores.
