# Welcome!

*I didn't change my mind, it changed all by itself.*

– Luna, *Double Feature* (1995)

THE VAN DER MEER LAB brings together people who share an interest in how the brain works. We aim to better understand how learning, memory, and decision-making arise from the coordinated activity of neurons. In the pursuit of this goal, we perform brain surgery, design and construct strange mazes, painstakingly build small devices so we can read the minds of rats, solder tiny circuit boards to even tinier wires, write thousands of lines of computer code, collect beautiful data, produce even more beautiful plots, and many other activities.

EACH OF US BRINGS their own particular blend of motivations for engaging in these lab activities, but there are a few common threads: curiosity about how the physical stuff of the brain gives rise to thought and to behavior, a love for animals and computers alike, a desire to help solve some of the big mysteries, and contributing to human knowledge and ultimately a better world.

OUR EFFORTS ARE *collaborative*, not only within the lab, but also with other labs in the department of Psychological & Brain Sciences at Dartmouth. We share equipment, space, and interests with these labs, and collaborate on joint projects and on creating a scientifically exciting and supportive culture where everyone can thrive. We also have joint projects with other labs around the world. We collaborate because the problems we are trying to solve are hard, and because learning from and working with others is one of the great joys of working in science!

Figure 1: Some strange mazes. (From Emily Irvine's *shortcut* experiment.)

Figure 2: A small device for rat mind-reading (by Andrew Alvarenga).

WORKING WITH OTHERS brings not only joy, but also expectations. Coding and data analysis can be fun, but are full of pitfalls. Sharing space and expensive equipment with others demands respect. There is satisfaction in getting an experiment to work, but it can be a long slog to get there. Perhaps most importantly of all, the use of animals in research comes with practical as well as moral responsibilities. *This manual is intended to provide guidance on how to navigate these issues, with particular focus on the van der Meer lab.*

IF YOU ARE NEW TO THE LAB, I would like you to read this manual through in its entirety. If you will not be working with animals directly, it may seem like chapter on [Animal Management](#) does not apply to you, but it will give you important insights into how the lab operates.

WELCOME. Let's do some great science together!

– MvdM

Figure 3: Some beautiful data, recorded from R050's hippocampus (by Alyssa Carey). Vertical tick marks indicate spikes (one row per neuron, sorted by place field location); horizontal axis indicates time; blue trace shows a local field potential. Scale bar is 1 s.

## About this manual

THIS DOCUMENT describes the principles that shape how the members of the lab interact and work. Rather than dealing with the nuts and bolts of how to get stuff done in the lab, the manual is about lab philosophy, expectations, and resources. It is an introduction to the lab. The lab manual is one of several classes (categories) of shared documents in the lab, which are:

- *Lab Manual*. You are looking at it. It contains information that does not change frequently. Only MvdM can change the lab manual, but he wants to hear from you if you have thoughts of suggestions! Periodically, we will review the manual as a group at lab meeting to determine what needs updating.
- Private *GitHub repositories*<sup>1</sup> that contain protocols, i.e. documentation for experimental procedures<sup>2</sup>, and a separate repository for behavioral tasks and associated computer code<sup>3</sup>. This documentation is on GitHub so that we can say things like, “I used version 1.1 of the histology protocol”, and so that we can track changes to those protocols as well as the reasons for those changes. If you perform procedures in the lab, you are expected to follow and to contribute to these protocols; see section XXX for a more detailed explanation.
- A *lab wiki*<sup>4</sup> that contains tutorials, guides, lists of useful links, et cetera. The wiki is a more dynamic, easier to edit resource for content that doesn't rely as much on version control. The wiki currently contains the lab's MATLAB data analysis tutorials.
- We also have a lab *Slack team*<sup>5</sup> which is used for day to day communication. It hosts shared documents best described as “everything else”, something that isn't a protocol, task, or tutorial.

These different venues reflect an overall organization ranging from content that is easy to create and easy to change (low overhead, quick; Slack, wiki), to content that is moderately stable and takes a

<sup>1</sup> [www.github.com/vandermeerlab](http://www.github.com/vandermeerlab).

Because these repositories are private, you will not be able to see them unless you are logged in and a member of the vandermeerlab organization.

<sup>2</sup> Examples include electrode plating, histology, drive building, et cetera: [mvdmlab-protocols repository](#)

<sup>3</sup> [mvdmlab-tasks](#)

<sup>4</sup> [discovery.dartmouth.edu/~mvdm/wiki](http://discovery.dartmouth.edu/~mvdm/wiki)

<sup>5</sup> [mvdmlab.slack.com](http://mvdmlab.slack.com)

bit more effort to change (but easier to track; GitHub), to principles that rarely change (lab manual). For instance, an idea for an experiment may be initially discussed on Slack, lead to a draft protocol shared there, and then get pushed to GitHub.

There are a number of other kinds of documents used in the lab that, unlike the above categories, are not typically consulted by multiple lab members. Most important among these are (1) animal records, described in more detail in section XXX, and (2) lab notebooks, described in section YYY.

I assume the lab manual and procedures on GitHub are accurate. This means that you should follow all of the policies and procedures contained in the manual and GitHub. If you notice something that seems to be wrong, please let me know (for the lab manual) or change it yourself (if on GitHub). If there is something in the lab manual or GitHub that you notice people aren't doing, please bring this up at lab meeting, or to me directly. Don't assume this is okay (it's not).

# Research Using Animals

WE USE ANIMALS in the lab, based on the conviction that doing so accelerates scientific progress and provides a net benefit to humans, and perhaps to animals, too. There are many examples of scientific discoveries that were directly enabled by research in animals<sup>6</sup>. However, past successes do not mean we can experiment freely on any animal we want. The use of animals for research carries a moral, scientific, and legal obligation to only perform experiments when the benefits can be reasonably expected to outweigh the costs, to do so only if no suitable alternatives are available, and to do so while caring for our animals to the fullest extent possible. These notions are often phrased as the “3 R’s” (reduction, replacement, refinement)<sup>7</sup>.

More generally, research in animals demands that we do the best job possible, and maximize the usefulness of the research outcomes.

This means that:

- *We take care of our animals.* If animals are comfortable and well cared for, they will perform the behavioral tasks we want, be easier to handle, and the resulting findings will be more likely to generalize.
- *We strive to design experiments such that the outcomes will be as informative as possible.* There are many resources on this topic, including the specific demands on rigor and reproducibility mandated by the NIH<sup>8</sup>. Many experimental design decisions can be brought into focus by preparing a formal preregistration of your proposed experiment<sup>9</sup>, which requires justifying how many subjects you plan to run, what analyses you will carry out, and the inferences supported by possible outcomes.
- *We aim to collect the highest quality data possible.* We often invest a tremendous amount of time in each animal through behavioral training, construction of chronic implants, surgery, and so on. If

<sup>6</sup> Some good examples are highlighted in the “Position statement of the Max Planck Society concerning the use of animals in experiments for basic research”, [https://www.mpg.de/10882259/MPG\\_Whitepaper.pdf](https://www.mpg.de/10882259/MPG_Whitepaper.pdf)

<sup>7</sup> Some references on the 3 Rs

Figure 4: Visualization of human-rat synergy.

<sup>8</sup> NIH reference

<sup>9</sup> Preregistration

any one of these procedures is not performed diligently, then your investment in all the others may come to nothing.

- For the data to be interpretable, *good records* need to be kept. Recordkeeping includes informal written notes and the completion of highly organized templates produced as procedures are performed. It also encompasses the process of translating these notes into computer-readable formats suitable for data analysis.
- *Data is valuable*. It needs to be protected against inadvertent loss, and its impact needs to be maximized by making it possible for a single data set to inform multiple questions, including those asked by different investigators within and outside the lab. This means it needs to be organized and annotated in a specific common format.

In sum, the fact we are working with animals shapes both our lab philosophy and many practical aspects of working in the lab. Much of the content that follows in this manual is essentially unpacking the above points in more detail.

### *Institutional oversight*

ANIMAL RESEARCH AT DARTMOUTH is overseen by the Institutional Animal Care and Use Committee (IACUC). All work with animals needs to receive prior approval from the IACUC in the form of *protocols*<sup>10</sup>. Only *procedures*<sup>11</sup> that have been approved by the IACUC may be performed on animals, and only by approved personnel (listed on the protocol). We are required to log all procedures. Invasive procedures, such as electrode implant surgery, require follow-up procedures providing post-operative care (administration of analgesia, monitoring).

**Important:** Violations of the above requirements, such as performing a procedure not previously approved, or neglecting to log a procedure that was performed, are serious. Beyond potentially violating our moral responsibility towards our animal subjects, the lab, the department, and Dartmouth risks losing federal approval to perform animal research if found delinquent. Systems are in place to minimize the likelihood of mistakes from happening; however, we are all human and mistakes do happen. If you notice any slips, please take action: rectify if you can, consider how to prevent this happening again, and let MvdM know.

ANIMAL HUSBANDRY<sup>12</sup> AT DARTMOUTH is provided by the Center

Figure 5: A cartoon rat with some objects. Figure from Dudchenko et al.

<sup>10</sup> *Protocol*: document outlining the scientific rationale, aims, and a set of proposed experiments, including specific animal numbers for each. The total number of approved animals may not be exceeded.

<sup>11</sup> *Procedure*: Any action or change beyond picking an animal up in the colony room (e.g. for changing cages or weighing) counts as a procedure

<sup>12</sup> That is, animal care not consisting of procedures, such as changing cages and providing food and water.

for Comparative Medicine Research (CCMR). CCMR maintains a satellite animal facility in the basement of Moore Hall, where our animals are housed and cared for by CCMR staff. CCMR also employs veterinary staff, who are “on call” to provide support and advice (and in unusual cases, can mandate an animal be euthanized).

# *Values and Expectations*

The lab values personal and scientific integrity, respect for each other, for animals, for equipment, and for data. We care about shaping and maintaining an environment that fosters personal development, curiosity, exploration, and the joy of discovery. We choose to work on hard problems that require dedication, persistence, resourcefulness, and resilience. We are humble. We support each other in when things get tough, and celebrate each other's successes. We value opportunities to learn from each other, set high standards but do not judge.

Holding these values implies the following:

## *Expectations: everyone*

- Behave respectfully and professionally towards others in the lab, department, and beyond. Doing this well requires considering how your actions (or lack of them) affect others<sup>13</sup>. We value behaviors that enable everyone to flourish. Behaviors that exclude anyone based on race, gender, religion, or appearance are not OK. See the Code of Conduct below for details.
- Treat your animal subjects with care.
- Participate in our weekly lab meetings.
- Take initiative. If you are stuck, try something different. Ask someone.
- Document. Anything you do more than once, or that you or someone else might have to do again, should be written up as an experimental protocol<sup>14</sup>. Anything done with an animal is a procedure and needs to be logged. Good recordkeeping is essential to doing good science. Keep track of what you did with experiments and analyses in your lab notebook.

<sup>13</sup> Recurse guidelines

<sup>14</sup> Not to be confused with an animal (IACUC) protocol.

- Communicate. Tell others what you are working on, what is working well and what could be improved. Post on updates on Slack frequently.
- Contribute to community resources and space. If you notice something that can be improved, fix it, mention it on Slack, or open a GitHub issue.
- Collaborate. Share your expertise. Make arrangements with others to take care of their animals one weekend and reciprocate another. Offer to do code reviews, read each other's manuscript, offer feedback on practice talks.
- Showing up. There will be days when it feels like you aren't making any progress and nothing is working. Don't underestimate the power of an iterative routine.
- Be a little obsessive.
- Be punctual and consistent if you are running experiments. Hours can be somewhat flexible, but in general all full-time lab members are expected to be in at work during at least the core hours of 11-4, so that we can interact. If you are going to be away from the lab for more than a day or two, enter it into the lab calendar.
- Take care of yourself. Know when it's time to push, and when it's time to take a walk in Pine Park<sup>15</sup>.
- Tell others when you notice they did something well, or when they made your life a little better today<sup>16</sup>.
- Keep at it. While brilliant ideas, creativity and skill certainly help, the best predictor of success is how consistently you put in the work.
- If you have an issue with a member of the lab, tell MvdM. If you have an issue with MvdM that you are not comfortable discussing, the graduate student representative, department chair, and other faculty are available.
- Pictures/videos. Before taking pictures with a lab member in them, ask their consent first. Ask consent again before posting to social media. If you'd like to take pictures of an experimental subject, ask MvdM.

<sup>15</sup> See here for a guide to some of Hanover's best trails, accessible from the lab in the space of a lunch break.

<sup>16</sup> We have the octothorp, awarded during lab meeting. But don't stop there!

### *Principal Investigator*

- Provide an environment where great science can be done and

people can thrive.

- Give my perspective on where the field is going, and how work in the lab will help shape that direction.
- Secure operating funds for the lab, which may include your stipend or salary.
- Be a mentor, supporter, and resource for you. This includes providing you with training in diverse aspects of science, helping you plan your career, promote your work and provide you with opportunities.
- Hold weekly lab meetings and project one-on-ones with you.
- Give you timely feedback on project ideas, conference posters, talks, manuscripts, figures, grants.
- Support and monitor your trajectory in yearly feedback meetings.

### *Graduate Students*

- Your goal is to make an original contribution to knowledge, in the form of a thesis that you will defend. Become really good at at least one marketable technique or skill.
- When you first join the lab, you are expected to take on an existing or previously proposed project, so you can learn the ropes with plenty of interaction time with MvdM and senior lab members. As you progress, you are expected to take a more active role in helping to shape project directions within the scope of the lab's current and planned funding.
- Your productivity is expected to be low initially (1-2 years), but then ramp up. Expect to submit at least one paper per year in years 3+. Research is the clear priority— avoid spending too much time on coursework and teaching assistantships.
- Become the world expert on your thesis topic. Read superficially in a broad area, and deep in your chosen area<sup>17</sup>.
- Submit fellowship applications. Help MvdM write grants and review papers.
- Be aware of the program requirements, and everything else that is in the PBS grad guide. Be in charge of these program requirements. Coursework and milestones.
- Attend B4, and present regularly (this is a program requirement)

<sup>17</sup> See "How to read a book" book and MvdM's slides for some pointers on different kinds of reading.

- Attend departmental colloquia, and go to lunch with the speaker a few times each year.
- Participate in Dartmouth research events (Neuroscience Day) and major conferences in the field.
- Participate in rotating lab assignments that change on a term-by-term basis (animal care, space, codebase, protocols, journal club chair, social chair).
- Attend a summer school such as Neural Systems & Behavior at MBL<sup>18</sup>.
- Be aware of what is required to take the next step of career paths you are considering<sup>19</sup>. If you are thinking about postdocs, identify potential advisors early on and take steps to get them to know about you and your work. Read some example letters of recommendation, and proactively consider what you would like yours to say.
- If you are going to be away from the lab for more than a day or two, ask MvdM (and enter the dates in the lab calendar).
- Use Twitter wisely: it is a great way to stay in touch with new work and useful resources, but it can be a real time sink.
- Take an active role in monitoring and promoting your mental health.

<sup>18</sup> [www.mbl.edu/nsb](http://www.mbl.edu/nsb)

<sup>19</sup> Some starting points for thinking about industry vs. academia include:

### *Research Technicians*

- Work regular hours as defined by your contract. Flexibility is encouraged, but seek approval from MvdM first.
- cc MvdM on all PCARD transactions. Request permission first for anything unusual and anything over \$500.
- Discuss attending talks (B4, colloquia) with MvdM first before going.

### *Undergraduates*

If you do animal work, be reliable and punctual.

Letters of recommendation. You can expect me to write letters of recommendation for you if you have worked in the lab for a year (three terms) or more.

Funding sources for research and travel.

### *Code of Conduct*

The lab is committed to providing a safe, friendly, and accepting environment for everybody. We will not tolerate any verbal or physical harassment or discrimination on the basis of gender, gender identity and expression, sexual orientation, disability, physical appearance, body size, country of origin, native language, race, or religion. We will not tolerate intimidation, stalking, following, unwanted photography or video recording, sustained disruption of talks or other events, inappropriate physical contact, and unwelcome sexual attention.

If you notice or experience any of these, please tell MvdM. If MvdM is the cause of your concern, there are a number of trusted sources available<sup>20</sup>. Please be assured that your concerns will be taken seriously, that you will be listened to, and that you can share them without fear of retaliation. You should be aware of the distinction between *private resources* and *confidential resources*<sup>21</sup>.

Important resources:

- Dartmouth policies
- PBS diversity page
- Confidential resources: WISE, Dick's House, ...
- Private resources: MvdM, department chair, ...

### *Visitors to the lab*

Please ask MvdM for permission first. Some visitors lack the context to interpret what they see in the lab.

<sup>20</sup>

<sup>21</sup> Private resources are legally obligated to share a disclosure of sexual misconduct with the Title IX office, including all details that are known. This is to ensure adequate support for those who may need it. Confidential resources may not share any information (with very few exceptions).

## *Doing good science*

This chapter provides some general strategies that effective scientists use.

### *Failing fast and often, but learn from your mistakes*

Science involves a lot of trial and error. You will be asking questions whose answers are often not yet known, using combinations of techniques and analyses that do not yet exist or have not been applied to your particular question. So you want to find ways to learn from errors as quickly as possible, and ways to avoid making them in the first place.

The general principle to do this is to find ways to get feedback often. For projects that are at the idea stage, talk with your peers about it, and solicit feedback from more senior colleagues. Find out what the likely pitfalls and challenging steps are, and who has already tried or even solved them before.

For projects that are experimental, the same idea applies: find a setup in which the feedback cycle is as short as it can be. For instance, if your project requires recording from a brain area that the lab has not recorded from before, chronically implanting an animal would take much longer until you find out if you hit, compared to doing an acute (non-recovery) surgery.

Experiments often consist of multiple steps or components that all need to work – failure in any component will make all the other steps in vain<sup>22</sup>. This implies that you should find ways to get feedback about whether each component is working correctly. For instance, inspect your tetrodes under a microscope before attaching them to the interface board.

For analysis projects, a similar logic again applies: formulate expectations about what the output of a given analysis step should look

<sup>22</sup> A typical example is that if you do not follow aseptic surgical procedures, an infection may cause your implant to detach. Having built perfect electrodes is then moot.

like.

For all of these processes, apply a hacker/startup mindset that takes the quickest path towards a minimal working example or proof of principle. At that point, if the results look promising, you should clean up, improve and document things.

Often, things will not work. This is not always a problem – sometimes you just want to try something and only follow up if it looks like things are going to work. However, some failures actually block your way forward, and you will need to resolve them. Notes, as described next, will help you (and others) identify what the problem might be. Making the same mistake twice is not a good use of time and resources.

### *Documentation and taking good notes*

One way to avoid making the same mistake twice or to avoid making them in the first place is to have good documentation.

A related but different reason to care about documentation is that a desirable property of a scientific study is that it should be possible for others to replicate the result.

### *Lab notes*

You are expected to keep notes in a lab notebook. This can be a physical notebook, or an electronic document. I keep notes in a binder for experiments, and in a Google Doc for data analysis<sup>23</sup>. Make a habit of writing notes every day that you perform experiments or analysis.

Some examples of things to keep notes about:

- Building a drive for implanting. Document the lengths of the pieces used, the height and weight of the drive, which tetrode wire you used, et cetera.
- Improvising a new way to glue an optical fiber to a silicon probe.
- The filename of a new piece of code you used to try out a new analysis (that you're not ready to commit to GitHub yet), some screenshots of the plots it produced, your interpretation of what you see, and the next step you plan to take the next day.

Of course, any procedures performed with experimental subjects need to be logged in that subject's binder. Commonly performed

<sup>23</sup> Be aware that images pasted into any of the Google online documents are stored with lossy compression, so you will not be able to recover the original image!

procedures, such as histology and surgery, will have a protocol with fields that can be completed as you go along (discussed below). If you perform mostly well-established procedures, your notes binder will consist primarily of protocol sheets. Having your notes in a binder is great for this because you can mix protocol sheets and written notes.

### *Protocols*

Protocols are step-by-step instructions of procedures used in the lab. Anything you expect to do again in the future should be written up as a protocol. If you only do a thing once, you should still take notes!

Protocols are hosted on GitHub. Why?

What makes a good protocol? Use standard structure (purpose, ingredients, equipment). Step-by-step instructions: it should be a recipe, and algorithm. The main procedures should be clean and minimal so that it is easy to get an overview, but adding copious notes and explanations as footnotes/sidenotes/appendices are great. Steps should be as easy as possible to follow, with checks/tests that can be used to tell if things are working as expected. Pictures can be very helpful here.

Some example protocols are:

If you use a protocol, update it regularly, even if it is to say when it was last used successfully (and by whom).

### *Asking good questions*

#### *Questions about science.*

Experiments and analyses are ways of asking nature a question. Your goal should never be to obtain a certain answer. You should formulate expectations about possible answers and consider if those would in fact inform the question you are asking.

Working models are good sources of questions.

#### *Questions about computer code.*

When troubleshooting computer code, aim to create a Minimal, Complete, and Verifiable example. In doing so, you make it easier for others to replicate the problem you are experiencing, helping them help you. Moreover, often you'll find that in the process of

creating such an example, you discover the source of the problem. See [this page](#) on Stack Overflow<sup>24</sup> for more detailed instructions.

<sup>24</sup> [www.stackoverflow.com](http://www.stackoverflow.com), an excellent resource for crowdsourced answers to programming issues.

### *Reading papers*

Inspectional, analytical, syntopical

Bibliography management

Find the classic papers and intellectual roots of the question you are working on. If this doesn't motivate or energize you at least from time to time, ask yourself how much you actually care about your question.

### *Communication*

#### *Writing well*

Clear thesis

Structure of argument

Vomit draft, results packet

Iterating often

Citing: first, best, and most recent (this is a good rule of thumb to guide your reading, too.)

Simpler is better

See SOFTWARE SECTION for more info on recommendations.

#### *Importance of visuals*

Simpler is better

See SOFTWARE SECTION.

# *Lab space*

Our lab space consists of the following:

Include map.

## *General expectations*

In the lab, we assemble precision devices that will be surgically implanted in live animals. We perform behavioral experiments that are sensitive to changes in many different conditions. The amount of time invested in these procedures, and the fact that we are doing this in live animals, demand careful attention. In addition, lab space is subject to general lab safety requirements ([link](#)) and IACUC inspections ([link](#)).

The principle that guides the use of shared lab space is that any lab member needs to be able to come in, find the items they need, and get things done to a high standard. In addition, the condition in which the lab spaces are kept should reflect pride taken in doing good work – it will be seen and interpreted by others viewing our space. Depending on the specific rooms this can mean somewhat different things, discussed in more detail below, but there are some common principles:

- *Clean up after yourself.* Use common sense about when to do this. If you're in the middle of something and stepping out to get some lunch, it makes no sense to clear your work area. However, if you've finished what you were working on, definitely clean up. Before going home for the day is usually a good time to at least clean a bit. See the specific room schedules for more specific cleaning requirements.
- *Organize where things are stored.* Any item in the lab has a home. Some individual items are sufficiently important that they have a dedicated place, such as "final cut scissors" (PICTURE). Some

items don't have a dedicated place but are a member of a more general category, such as "BNC interconnects". If you find an item that does not have an obvious home, check on Slack if anyone has suggestions, and/or create one for it. Creating a home for an item can be as simple as labeling a piece of a shelf somewhere. Make sure you tell everyone about it on Slack, in accordance with the Communication Principle!

- *Track stock levels.* If something is running low, don't just ignore it. Post about it on Slack. Store parts that go with a certain piece of equipment with that equipment (for instance, by taping a ziploc baggie to it).
- *Label things.* Any liquid and food containers MUST be labeled with the contents and expiry date, if applicable. When you open a new package of something, write on it when you opened it. When a new thing comes in, write on it when it was received.
- *Treat tools with respect.* What may look like a cheap pair of scissors is likely to cost at least \$300. Use tools for their intended purpose, and use the correct tool for the job. For instance, don't use fine scissors to make rough cuts into hard materials. Don't use fine forceps to hold metal parts. <sup>25</sup>
- *Be safe.* The general lab safety training covers the basics, but specific spaces have hazards described below. First Aid kits are available in the FAR and in B101.

<sup>25</sup> Quick guide to forceps: #55 are finest.

## *Experiment rooms*

### AKA "running rooms"

These are the main spaces that our rats interact with. That has a few consequences:

- If you have a rat out, have the doors closed. Put a sign on the door saying, "Experiment in Progress".
- Don't make changes to the layout of the room while you are running an experiment. Changing the cues and landmarks available can change what strategy animals use to solve a behavioral task.
- Work to keep light levels, sound levels, and odor cues consistent.
- Any surface rats interact with needs to be cleanable. So, no cardboard, unsealed wood, and so on.
- Our IACUC protocols require cleaning apparatus at least weekly.

Cleanliness and organization is important, but don't let that hold you back in shaping your workspace to enable you do perform your experiments well and efficiently. Tape procedures you are using to the walls, print out the relevant atlas sections, make temporary storage spaces for the tools you use frequently.

### *Fine Assembly Room (FAR)*

#### *Surgery and anteroom*

If there is any single room that is especially important to be clean and organized, this is it!

#### *Workshop*

Beware the Dremel and the belt sander. Wear gloves and goggles.

#### *Shared facilities*

Histology.

#### *Vivarium space*

Our rats are in Moore B63, and our mice in Moore B61.

Vivarium rooms need to have binders containing weights and animal records.

#### *Offices*

## *Electronic resources*

### *GitHub*

GitHub hosts multiple repositories containing important lab resources. These include:

- `mvdmlab-protocols`: contains descriptions of experimental procedures.
- `mvdmlab-tasks`: contains descriptions of behavioral tasks.
- `mvdmlab-designs`: contains CAD designs for use with our 3D printer or printing services.
- The main lab codebase. MATLAB version and Python version
- Code and data associated with the lab's publications.
- Assorted project-specific repositories.

To access some of these repositories, you need to be a member of the vandermeerlab organization (URL). Ask MvdM to become a member.

### *Slack*

[www.slack.com](http://www.slack.com) is a software platform for having group conversations in topic-specific channels. The lab Slack is [mvdmlab.slack.com](http://mvdmlab.slack.com).

The lab Slack is used for everyday communication about all aspects of the lab's work, ranging from animal-related logistics and ordering supplies to logging and discussing ongoing project results and sharing grants. I suggest you join all channels initially – even channels on topics not necessarily related to your interests you should look at on occasion to see what is happening.

Figure 6: Slack.

## *Wiki*

## *Calendar*

The lab has a Google account (credentials: ) which is associated with a number of calendars. All experiment rooms and surgery have their own calendar, which you should use to schedule your planned use of these rooms. The main lab calendar contains labmeeting times and other scheduled events (e.g. journal clubs).

## *Mailing list*

The lab mailing list is used for announcements such as lab meetings and journal clubs.

## *Lab servers*

## *Datavault*

## *Continuous integration server*

## *Others*

We use Dropbox to facilitate sharing of files across computers. It should never be used for storage of data!

Dropbox credentials:

However, if you see an opportunity to promote any files currently on Dropbox to the relevant GitHub repo, please do so (or create an issue first).

# Computing

Computing plays an increasingly important role in (neuro)science and is central to many aspects of the lab's workflow. The safety of your hard-won data, the integrity and reproducibility of your analyses and results, the ongoing development and sharing of the best protocols and procedures, and the speed with which you can accomplish your goals all depend critically on correct use of the lab's computing resources.

Because many of these are shared (experimental machines) and/or inherently collaborative (lab database, codebase) it is especially important to be aware of the issues below. Experience with some of the more advanced concepts and tools is a highly valued skill in many labs and workplaces; mastery of these will set you apart from many of your peers.

## *Lab computers*

The lab's computers are a mixture of custom builds (assembled from parts by MvdM or someone else brave enough!), designed for a particular role, and general-purpose workstations purchased from Dartmouth Computing Services. The different roles determine the best way to use each machine. The roles are:

- Single-user machines in offices, one for each grad student/tech/postdoc.
- Shared machines. There is one in the FAR (B28), for use with the NanoZ and high-power microscope; one in B101, for use with the 3D printer; a laptop in surgery; and one computer associated with each data acquisition system (Neuralynx, Open Ephys).

### *Single user machines*

One of these will be exclusively yours to use during your tenure in the lab. You are free to install software and change settings to suit your needs as long as any changes (1) do not interfere with the machine's ability to support research, and (2) fall within the Dartmouth Computing guidelines<sup>26</sup>. However, remember that this is still a lab (Dartmouth)-owned machine, and should not be extensively used for private activity. You can feel free to choose your own username and password credentials.

<sup>26</sup> link

Single user machines have a boot drive (C:) for the operating system and frequently used software. This is a fast SSD drive with limited space, so be mindful of what you install here. Absolutely do not use this drive for any documents or data; use the data drive (D:) for this.

Many single-user machines use a RAID (automatically "mirrored") storage array for the D: drive. This means that if one hard drive fails, the data is still available on the other. However, mirroring will not help you if you accidentally delete or overwrite files. For this reason, *data* should always be available on the lab server, *code* should be regularly pushed to GitHub and/or stored on Dropbox<sup>27</sup>, and *documents* (e.g. your grant application, paper, or thesis) should be on Dropbox or equivalent.

<sup>27</sup> ...or a similar service such as Google Drive; note that Dropbox has a free academic account upgrade.

If you see Windows updates to install on any machine, go ahead and install them. If a computer needs rebooting because of updates and you can do so safely, go ahead.

### *Shared machines*

Unlike the single user machines, when using the shared machine you will need to consider how your actions affect other users. A few guidelines:

- If need to save your work, create a folder with your name on the Data (D:) drive. Do not leave work or data files on the desktop. If you find anything that's not supposed to be there on the desktop or anywhere else, put it in the lost-and-found folder on the desktop.
- Do not install any software, or change any software and system settings, without discussing with MvdM first. Do not delete any files, but place them in the lost-and-found folder on the Desktop instead.

- If you log in to web services, consider logging out when you are done.

### *Experimental machines*

The above considerations for shared machines apply. In addition:

- If you acquire data for your project, use correct renaming and backup procedure when you finish your acquisition session. This is absolutely essential: data is expensive, and you individually and the lab as a whole cannot afford to lose any of it, EVER. Do not leave data in the acquisition folder.
- If you encounter a potential data file or folder that is not yours and seems lost, make an effort to find out whose data it might be.
- NEVER delete anything that looks like it might be data, unless you are absolutely certain that it has been backed up correctly.

### *Lab web services accounts*

gmail: mvdmlab@gmail.com dropbox: mvdmlab@gmail.com skype: vandermeerlab (for contacting suppliers and other lab-related business)

### *Printing*

The departmental printer (in XX) is the primary way to print stuff. Please be considerate when using the printer. Keeping an electronic library of PDFs using an iPad, Dropbox and iAnnotate is a worthwhile investment that will make it much easier to find papers and your comments in the future, and will save a LOT of paper!

We also have a lab printer in the FAR. Only use this printer for printing experiment-related documents such as animal weight sheets and protocols.

### *Skills*

Growth mindset.

Basic skills: learning about your filesystem, what makes sense to store where

Learn to use the command line.

Learn to code. MATLAB and Python are the most important. In our subfield of neuroscience, MATLAB is still the most used, but Python is gaining ground.

Good coding practices.

Style guide.

Other important software: reference manager, LaTeX if you plan to write a paper or a thesis. Adobe Creative Suite for making figures.

How to ask good questions. Stack Overflow on how to create a [minimal, complete, and verifiable](#) example.

## Software

In general, you should feel free use whatever software is the best tool for the job<sup>28</sup>, and you should feel free to do so. However, there are startup costs associated with learning how to use new software, and the lab has built up expertise and resources in a number of software packages that work well. Learning to use these software packages will help you be productive in the lab, and will be applicable in other settings as well.

- **Git** is a tool for “collaborative version control”: a way to keep track of changes made to files such as computer code, experimental protocols or manuscript drafts, and to coordinate those changes across multiple contributors.
- **MATLAB** is a scientific computing environment that includes a programming language, libraries for performing specific tasks, a development environment with a fully featured editor, debugger, and interpreter, and many other features. It is widely used for data analysis in neuroscience. Although it is not free, Dartmouth has a site license that enables you to use it ([download page](#)). Python is becoming increasingly popular, and is far more widely used than MATLAB outside neuroscience. However, various toolboxes used in the lab such as Chronux and FieldTrip are still MATLAB-only, and MvdM is still a beginner in Python.
- **Adobe Creative Suite** is expensive, but produces superior documents. We use Illustrator to touch up and group together figure panels for manuscripts based on raw output from MATLAB or Graphviz, and to make posters. Photoshop is sometimes used to process image files such as those from histology. Free alternatives

<sup>28</sup> ...where “best” is defined as the intersection between the capabilities of the software itself, suitability for the task at hand, and the user’s ability to use it correctly.

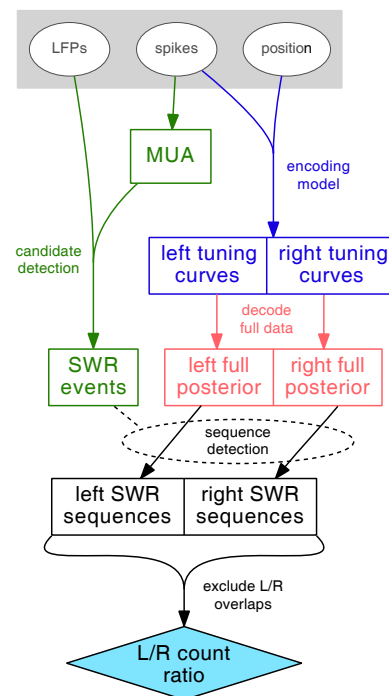

Figure 7: Example data analysis workflow, made with [Graphviz](#)

such as Inkscape and GIMP exist, can do the job for simple documents, but I don't (yet) recommend them for publication-quality output.

- **Graphviz** produces schematics such as the one in Figure 7. Unlike 'what-you-see-is-what-you-get' design software such as Photoshop and Illustrator, the Graphviz tools create graphics from a plain text source file. The source file contains a recipe for what the graphic output should look like.
- **LaTeX**. Unlike "what-you-see-is-what-you-get" content creation programs such as Word, LaTeX creates documents from a plain text source file. The source file contains instructions for what the document should look like. Compared to Word, LaTeX does much better with equations, produces more professional-looking documents<sup>29</sup>, and makes it much easier to maintain large documents.

Note that several of these require you to use the Command Line (Terminal).

<sup>29</sup> Especially where typesetting features such as spacing, kerning, and ligatures are concerned.

### *Operating Systems*

Lab computers use Windows and/or Ubuntu Linux. There are a few reasons for this: the data acquisition machines require Windows (Neuralynx) or Windows/Linux (Open Ephys), and custom machine builds are generally cheaper for PCs than for Apple Macs. Nevertheless, many lab members have Mac personal laptops that run OS X, and most of the above software works fine on them. However, some Neuralynx loaders only work on Windows, some codebase functions have only been compiled to work on some OSes, and the lab only has licenses for some software (Adobe) to work on Windows.

# Data management

DATA IS VALUABLE. After taking into account the number of hours that went into training an animal, building a hyperdrive, preparing for and performing surgery, painstakingly turning electrodes; animal housing costs, costs of parts and consumables, and so on, the cost of a single subject worth of data can run into tens of thousands of dollars – and this is without the moral calculation of considering an animal’s life. Data therefore needs to be treated with the greatest respect: specifically, it needs to be managed so that it can be maximally useful. The *first requirement* of data management is that data needs to be available – i.e. backed up so that it can never be lost, and accessible by those who need it. Our lab is committed to Open Science, of which public data sharing is one component. Increasingly, journals and funders demand that data is made publicly available. The *second requirement* of data management is that the data needs to be organized such that it can be easily understood and used.

Before discussing how these two requirements – data storage and data organization – are implemented in the lab, it is useful to distinguish between different categories of data.

- **Raw data** is what gets saved on a data acquisition machine, such as a running room computer connected to a Neuralynx recording system, or a machine connected to a microscope. Depending on the data you collect, a single session may yield many different files, such as behavioral tracking data and neural recording data, or a single file (an image). Raw data is only rarely suitable for analysis beyond a few quick checks. At a minimum, freshly acquired data sets typically must be annotated, and/or the files systematically renamed – for instance, with the ID of the experimental subject and some information about recording locations – so that the analyst can select which files to analyze, and combine results across sessions and subjects. More complex pre-processing steps include spike sorting (the process of assigning spike waveforms

to putative single neurons to obtain their spike times), artefact removal, and many others.

- **Promoted data** is data that is ready for analysis. Data files need to be organized in a specific folder structure, named according to the naming scheme, and supplied with annotations describing the data. If applicable, various preprocessing steps may have been carried out, for instance spike-sorting of raw voltage traces into spike trains of putative single neurons, filtering of position data to remove artifacts, and definition of trials on a behavioral tasks. PDFs of handwritten notes and procedure logs, and images of histology may also be included. A promoted data set typically does not include the raw data. Promoted data should be sufficiently well described and organized such that a competent reviewer or collaborator can use it.
- **InProcess data** is data that is being worked on to move it from raw to Promoted.

### *Data storage*

IMMEDIATELY AFTER DATA IS FIRST ACQUIRED, do the following:

- Create and/or rename the new data folder according to the Lab Data Naming Scheme.
- If applicable, compress any files that are large and compressible: typical examples include Neuralynx .nvt (video tracking) files<sup>30</sup>.
- Upload the data to the *Incoming* folder on the lab server. See section XXX for instructions.
- Move the data out of the location where it is saved, into a folder specific to your subject or experiment.
- Following completion of data collection from that subject or experiment, verify that indeed all data is correct and present on the server, and then delete it from the data acquisition machine.<sup>31</sup>

The lab server uses a redundant data storage system that can tolerate failure of a single hard drive without causing loss of data. The contents of the datavault folder are periodically backed up to “cold” offsite storage. However, it is good practice to also make your own personal backup of your raw and promoted data. One good way of doing this is to store that data on your desktop workstation, or move it to an external HDD, just in case.

<sup>30</sup> See section XXX for a quick primer on data compression.

<sup>31</sup> This is an important step, because if there is no space available on a data acquisition machine, we cannot acquire more data!

## *Data promotion*

What exactly is included in a promoted data set depends on the specific experiment, but typical features include the following:

- Data should be organized and (re)named according to the lab Data File Naming Scheme (link).
- Make sure raw and intermediate data files that are no longer needed are removed.
- ExpKeys file.
- If applicable, task-specific metadata file(s).
- A description of the task/experiment.
- PDFs of relevant task notes and histology.

As you collect data, you should start drafting an example ExpKeys file. Prior to starting data collection, you should have created a protocol that describes the procedures used. You should use this protocol as the basis for a description of the task/experiment.

Examples of nice promoted data with description include Alyssa's MotivationalT data (link) and Jimmie's CueCoding data<sup>32</sup>.

<sup>32</sup> <https://github.com/jgmaz/vStrCueCoding>

## *Data use cases*

Some examples (“use cases”) that motivate careful data management include:

- When analyzing your own data, you want to be able to easily specify which subject(s) and session(s) you are working on.
- If you have a question that can be answered with someone else's data, you want to be able to “plug in” that data into your existing workflow. When I (MvdM) joined the Redish lab, I ran a comparison of dorsolateral striatum, ventral striatum, and hippocampus data<sup>33</sup>. This was made possible through the use of a consistent data formatting and annotation scheme.
- When publishing your work, it is the policy of the lab, and an increasing number of journals and funders, that your data is made publicly available. You want it to be easy to use and understand, so that your colleagues are not annoyed with you and you don't have to answer their emails telling you things aren't working.

<sup>33</sup> van der Meer et al. Neuron 2010

- Before you get to publishing, you will need to convince MvdM of your results and conclusions. This likely involves him running your code on your data. That will only work if you've organized your data correctly.
- MvdM is always working on applications to obtain research funding. Some of these applications, and the pilot data used to support them, are planned in advance; others are more spur-of-the-moment, or even if planned, new insights can happen. Thus, there is often a need to produce an analysis or figure in short order. This is only possible, or at least made a lot easier, if the data is ready for analysis..

# Animal care and recordkeeping

Keeping detailed and accurate records on each of our animals is an IACUC requirement (and indirectly a federal issue), as well as scientifically important.

The main principles are that for any animal that is currently alive, there must be a binder (or a section in a binder) with that animal that contains an up to date record of all procedures<sup>34</sup> performed on that animal, as well as records of their weight.

Failure to log a procedure is a serious oversight that, if discovered, could have real consequences, such as creating more work for everyone, or making our IACUC renewals more painful. Don't let it happen to you.

When performing invasive procedures (surgery) and when administering drugs, CCMR requests that these are reported using a special cage card<sup>35</sup>. Writing procedures on these cards is *not* sufficient logging: you also need to log the procedure(s) in the animal's binder.

Once you euthanize an animal (or request it to be euthanized), collect all weight and procedure logs, along with any additional information (notes from behavior, for instance), scan them into a single PDF<sup>36</sup> and upload to the data vault.

If you are working with animals, read the Animal Recordkeeping Protocol ([link](#)), which provides detailed procedures for the above.

## Animal ownership and responsibility

By default, CCMR staff will feed, water, and change cages for all our animals. We pay them a *per diem* fee to do this.

By default, all animals receive *ad lib*<sup>37</sup> food and water.

<sup>34</sup> What counts as a procedure: anything beyond what's required to change a cage or weigh an animal. If in doubt, log it anyway.

<sup>35</sup> Picture of procedure cage card.

<sup>36</sup> The departmental copier/scanner is great for this, you can feed it a pile of documents and it can email you a PDF.

<sup>37</sup> Ad libitum is the Latin phrase for, literally, "to your libido", i.e. as much as desired. Incidentally, *i.e.* is Latin for *id est*, "it is".

We can also request CCMR to feed rats 18g/day. This is a useful amount that prevents rats from getting obese. To request this, use the relevant cage card<sup>38</sup>.

For any other food/water regimens, you'll need to use the "Experimenter will feed/water" cage card. Doing so implies that the experimenter listed takes ownership<sup>39</sup> of that animal.

When animals first arrive, they are typically group-housed (multiple animals per cage). They are named<sup>40</sup> and start out with communal status. Communal animals do not have an owner yet. They are weighed weekly by the Communal Animal Caretaker<sup>41</sup>. When communal animals are below 400g in weight, the Caretaker also handles them weekly (about 5 minutes per animal appears to be the sweet spot, although you may want to take ownership of an animal that will be implanted with a hyperdrive early on so that it can be handled more). When communal animals reach 400g, the Caretaker separates them into individual cages so that CCMR can feed them 18g/day.

These procedures are described in more detail in the Animal Recordkeeping Protocol.

<sup>38</sup> This one.

<sup>39</sup> As the owner of an animal, you are responsible for logging its weight and all procedures. If the animal is food and/or water-restricted, you are responsible for supplying those things, and logging that you have done so.

<sup>40</sup> Rats are named Rxxx, where xxx is a 3-digit counter that is incremented with each new animal. Mice are named Mxxx.

<sup>41</sup> Note that to track weights of group-housed animals, some kind of mark needs to be used. The lab convention is to write numbers 1, 2, 3 etc. on the base of the tail with a Sharpie. 1 indicates the animal with the lowest number. Mouse tails are too small to write numbers; stripes or rings can be used instead.
