Warnings and cautions

Warnings

- IF THE DEVICE CAN BE INSTALLED IN A VEHICLE, CARE MUST BE TAKEN ON INSTALLATION IN VEHICLES FITTED WITH ELECTRONIC ENGINE MANAGEMENT SYSTEMS AND ANTI-SKID BRAKING SYSTEMS. UNDER CERTAIN FAULT CONDITIONS, EMITTED RF ENERGY CAN AFFECT THEIR OPERATION. IF NECESSARY, CONSULT THE VEHICLE DEALER/ MANUFACTURER TO DETERMINE THE IMMUNITY OF VEHICLE ELECTRONIC SYSTEMS TO RF ENERGY.
- THE PRODUCT MUST NOT BE OPERATED IN AREAS LIKELY TO CONTAIN POTENTIALLY EXPLOSIVE ATMOSPHERES, FOR EXAMPLE, PETROL STATIONS (SERVICE STATIONS), BLASTING AREAS ETC.
- OPERATION OF ANY RADIO TRANSMITTING EQUIPMENT, INCLUDING CELLULAR TELEPHONES, MAY INTERFERE WITH THE FUNCTIONALITY OF INADEQUATELY PROTECTED MEDICAL DEVICES. CONSULT A PHYSICIAN OR THE MANUFACTURER OF THE MEDICAL DEVICE IF YOU HAVE ANY QUESTIONS. OTHER ELECTRONIC EQUIPMENT MAY ALSO BE SUBJECT TO INTERFERENCE.
- BEFORE MAKING ANY TEST CONNECTIONS, MAKE SURE YOU HAVE SWITCHED OFF ALL EQUIPMENT.

Cautions

- Servicing and alignment must be undertaken by qualified personnel only.
- Ensure all work is carried out at an anti-static workstation and that an anti-static wrist strap is worn.
- Ensure solder, wire, or foreign matter does not enter the telephone as damage may result.
- Use only approved components as specified in the parts list.
- Ensure all components, modules, screws and insulators are correctly re-fitted after servicing and alignment.
- Ensure all cables and wires are repositioned correctly.
- Never test a mobile phone WCDMA transmitter with full Tx power, if there is no possibility to perform the measurements in a good performance RF-shielded room. Even low power WCDMA transmitters may disturb nearby WCDMA networks and cause problems to 3G cellular phone communication in a wide area.
- During testing never activate the GSM or WCDMA transmitter without a proper antenna load, otherwise GSM or WCDMA PA may be damaged.

Copyright © 2010 Nokia. All rights reserved.

ESD protection

Nokia requires that service points have sufficient ESD protection (against static electricity) when servicing the phone.

Any product of which the covers are removed must be handled with ESD protection. The SIM card can be replaced without ESD protection if the product is otherwise ready for use.

To replace the covers ESD protection must be applied.

All electronic parts of the product are susceptible to ESD. Resistors, too, can be damaged by static electricity discharge.

All ESD sensitive parts must be packed in metallized protective bags during shipping and handling outside any ESD Protected Area (EPA).

Every repair action involving opening the product or handling the product components must be done under ESD protection.

ESD protected spare part packages MUST NOT be opened/closed out of an ESD Protected Area.

For more information and local requirements about ESD protection and ESD Protected Area, contact your local Nokia After Market Services representative.

Care and maintenance

This product is of superior design and craftsmanship and should be treated with care. The suggestions below will help you to fulfil any warranty obligations and to enjoy this product for many years.

- Keep the phone and all its parts and accessories out of the reach of small children.
- Keep the phone dry. Precipitation, humidity and all types of liquids or moisture can contain minerals that will corrode electronic circuits.
- Do not use or store the phone in dusty, dirty areas. Its moving parts can be damaged.
- Do not store the phone in hot areas. High temperatures can shorten the life of electronic devices, damage batteries, and warp or melt certain plastics.
- Do not store the phone in cold areas. When it warms up (to its normal temperature), moisture can form inside, which may damage electronic circuit boards.
- Do not drop, knock or shake the phone. Rough handling can break internal circuit boards.
- Do not use harsh chemicals, cleaning solvents, or strong detergents to clean the phone.
- Do not paint the phone. Paint can clog the moving parts and prevent proper operation.
- Use only the supplied or an approved replacement antenna. Unauthorised antennas, modifications or attachments could damage the phone and may violate regulations governing radio devices.

All of the above suggestions apply equally to the product, battery, charger or any accessory.

Battery information

Note: A new battery's full performance is achieved only after two or three complete charge and discharge cycles!

The battery can be charged and discharged hundreds of times but it will eventually wear out. When the operating time (talk-time and standby time) is noticeably shorter than normal, it is time to buy a new battery.

Use only batteries approved by the phone manufacturer and recharge the battery only with the chargers approved by the manufacturer. Unplug the charger when not in use. Do not leave the battery connected to a charger for longer than a week, since overcharging may shorten its lifetime. If left unused a fully charged battery will discharge itself over time.

Temperature extremes can affect the ability of your battery to charge.

For good operation times with Li-Pol batteries, discharge the battery from time to time by leaving the product switched on until it turns itself off (or by using the battery discharge facility of any approved accessory available for the product). Do not attempt to discharge the battery by any other means.

Use the battery only for its intended purpose.

Never use any charger or battery which is damaged.

Do not short-circuit the battery. Accidental short-circuiting can occur when a metallic object (coin, clip or pen) causes direct connection of the + and - terminals of the battery (metal strips on the battery) for example when you carry a spare battery in your pocket or purse. Short-circuiting the terminals may damage the battery or the connecting object.

Leaving the battery in hot or cold places, such as in a closed car in summer or winter conditions, will reduce the capacity and lifetime of the battery. Always try to keep the battery between 15°C and 25°C (59°F and 77°F). A phone with a hot or cold battery may temporarily not work, even when the battery is fully charged. Batteries' performance is particularly limited in temperatures well below freezing.

Do not dispose of batteries in a fire!

Dispose of batteries according to local regulations (e.g. recycling). Do not dispose as household waste.

Product selection

RM-612/RM-624 is a GSM/HSDPA/WCDMA tri-mode handportable multimedia computer with a person centric touch UI, integrated GPS (A-GPS OMA SUPL), WLAN and side slide form factor. RM-612 supports EGSM 850/900/1800/1900 and WCDMA 900/1900/2100 bands. RM-624 supports EGSM 850/900/1800/1900 and WCDMA 850/1900/2100 bands. The device supports CSD/HSCSD, GPRS/EGPRS and WCDMA/HSDPA data bearers.

For WCDMA the maximum bit rate is up to 384 kbit/s for downlink and 384 kbit/s for uplink with simultaneous CS speech or CS video (max. 64 kbit/s). The HSDPA peak is 3.6 Mbit/s downlink (with limited use cases).

For 2G and 2.5G networks the device is a Class A EGPRS DTM MSC 11 which means a maximum download speed of up to 296 kbit/s with EGPRS, and up to 107kbit/s with GPRS. According to GSM standard 05.05 it responds to class 4 (max. 2W) in GSM 850 and EGSM 900 class 1 (1W) in DCS 1800 and class 1 in PCS 1900. The device supports EGPRS (EDGE) class B as well as Bluetooth 2.0 + EDR standard.

The device has a large nHD 3.2" (640 x 360 pixels) colour display (active area 39.6 mm x 70.4 mm) with 16 million colors. It also has a 5 megapixel autofocus main camera with 4 x digital zoom and an integrated LED flash and secondary camera (QCIF) for video calls. The device supports two way video calls with two integrated cameras, one on the front and one on the back.

The MMS implementation follows the OMA MMS standard release 1.3. The Browser is a highly advanced internet browser also capable of viewing operator domain XHTML Mobile Profile (MP) content.

The device uses a S60 5.0 operating system and supports the full Web Browser for S60, which brings desktop-like Web browsing experience to mobile devices. It also supports MIDP Java 2.0, providing a good platform for compelling 3rd party applications.

Product features and sales package

Imaging

Main camera:

- Sensor: 5 megapixel
- Optics: Tessar TM™ lens
- F number/Aperture: F2.8

Copyright © 2010 Nokia. All rights reserved.

- Focal length: 4.7 mm
- Focus range: 10 cm ~ infinity
- Macro focus distance: 10-50 cm
- Shutter speed: Mechanical shutter 1/1000 ~ 2 s

Secondary camera:

- Sensor: QVGA (320 x 240 pixels)
- F number/Aperture: F2.8
- Focal length: 43 mm (35 mm equivalent)
- Focus range: 10 cm ~ infinity

Video:

- Video resolution: QHD or VGA at 30 fps
- Audio recording: AAC (AMR for MMS)
- Video stabilization
- Video clip length: 90 min or limited to MMS size
- Video file format: .mp4 (default), .3gp (for MMS)
- White balance: automatic, sunny, cloudy, incandescent, fluorescent
- Scene: Auto, Night
- Colour tone: normal, sepia, black & white, vivid, negative
- Zoom (digital): up to 4x
- Tone for video indicator

Photo:

- Still image resolutions: up to 5 megapixel: 2592 x 1944
- Still image file format: JPEG/EXIF
- Auto focus
- Auto exposure: center weighted AE
- Image orientation: automatic
- Exposure compensation: +2 ~ -2EV at 0.5 step
- White balance: automatic, sunny, cloudy, incandescent, fluorescent
- Scene: auto, sports, portrait, close-up, landscape, night, user defined
- Colour tone: normal, sepia, B&W, vivid, negative
- Zoom (digital): up to 4x
- LED flash

Edit

- On device Photo editor and Video editor (manual & automatic)

View

- 3.2” nHD (640 x 360 pixels) colour display (active area 39.6 mm x 70.4 mm), up to 16M colors, 16:9 aspect ratio
- Digital Ambient Light Sensor (ALS) – used to optimize display/key brightness and power consumption
- Slide show from Gallery

Copyright © 2010 Nokia. All rights reserved.

Share

- Nokia XpressShare - share effortlessly from Gallery or after capture via Email, Bluetooth or MMS
- Video call and video sharing support (WCDMA services)
- Online Album: Image/Video uploading from Gallery

Print

- Nokia XpressPrint – direct printing via USB (PictBridge), Bluetooth (BPP), and WLAN (UPnP), from memory card or via online printing

Store

- Up to 32 GB internal user memory
- Nokia XpressTransfer – easy to transfer and organize photos and video between your device and a compatible PC
- Nokia Lifeblog (mobile & PC)

Music

- Digital music player: supports MP3/ AAC/ AAC+/ eAAC+/ WMA with playlists, equalizer and album art.
- Synchronise music with Microsoft Windows Media Player 10 & 11
- One click CD ripping, converting and transferring music to your device using Nokia Music Manager
- Stereo FM radio (87.5-108MHz /76-90MHz) with Visual Radio™ support
- Integrated handsfree speaker
- Nokia Stereo Headset (WH-102), inbox

Media

- Full-screen video playback to view downloaded, streamed or recorded video clips
- Supported video formats: MPEG-4 , H.264/AVC, H.263/3GPP, RealVideo 8/9/10

Productivity

Messaging:

- Email (SMTP, IMAP4, POP3), MMS, SMS

Office applications:

- Viewing of email attachments – .doc, .xls, .ppt, . pdf

PIM:

- Contacts, calendar, to-do, notes, recorder, calculator, clock, converter

Synchronization:

- Local/Remote (using SyncML)
  - Data: Calendar, Contacts, To-do, Notes, E-mail
  - PC Applications: Microsoft Outlook (98, 2000, 2002, 2003), Outlook Express, Lotus Organizer (5.0, 6.0), Lotus Notes (5.0, 6.0)

Call management:

- Call logs, speed dial, voice dialling (with SIND) and voice commands
- Nokia Push to Talk (PoC)

Copyright © 2010 Nokia. All rights reserved.

Connectivity

- Integrated GPS (A-GPS OMA SUPL)
- WLAN - IEEE802.11 g/b with UPnP support
- Micro USB interface with USB 2.0 high speed
- Bluetooth wireless technology 2.0 + EDR + A2DP
- MicroSD memory card - support up to 16 GB
- Nokia 3.5 mm AV connector

Add-on software framework

- Symbian 9.4 OS
- Nokia Series 60, 5th edition, feature pack 2
- Java: MIDP2.0
- C++ and Java SDKs

Additional technical specifications

- Vibrating alert
- 3GPP Rel 5/6 WCDMA , Rel 4 EGSM compliant
- Speech codecs supported in WCDMA: AMR
- Speech codecs supported in GSM: FR AMR/HR AMR/EFR/FR/HR
- WCDMA 2 Mbps, HSDPA 7.2 Mbps
- Dual Transfer Mode (DTM) support for simultaneous voice and packet data connection in GSM/EDGE networks. Simple class A, multi slot class 11, max speed DL/UL: 118.4/118.4 kbits/s
- EGPRS class B, multi slot class 32, (5 Rx + 3 Tx / Max Sum 6), max speed DL/UL= 296 / 177.6 kbits/s
- GPRS class B, multi slot class 32 (5 Rx + 3 Tx / Max Sum 6), max speed DL/UL= 107 / 64.2 kbits/s

Sales package

- Transceiver RM-612/RM-624
- Charger (AC-8 or AC-15)
- Battery (BL-4J)
- Stereo headset (WH-102)
- Connectivity cable (CA-101D)
- Video connectivity cable (CA-75U)
- 2 GB MicroSD card
- User Guide

	GSM1900: +0 ... +30dBm/1.0mW ... 1W
	WCDMA VIII (900): -50 ... +24 dBm/0.01µW ... 251.2mW
	WCDMA V (850): -50 ... +24 dBm/0.01µW ... 251.2mW
	WCDMA II (1900): -50 ... +24dBm/0.01µW ... 251.2mW
	WCDMA I (2100): -50 ... +24 dBm/0.01µW ... 251.2mW
EDGE output power	EDGE850: +5 ... +29dBm/3.2mW ... 794mW
	EDGE900: +5 ... +29dBm/3.2mW ... 794mW
	EDGE1800: +0 ... +26dBm/1.0mW ... 400mW
	EDGE1900:+0 ... +26dBm/1.0mW ... 400mW
Number of RF channels	GSM850: 124
	GSM900: 174
	GSM1800: 374
	GSM1900: 299
	WCDMA VIII (900): 152
	WCDMA V (850): 108
	WCDMA II (1900): 289
	WCDMA I (2100): 277
Channel spacing	200 kHz (WCDMA V and II 100/200 kHz)

Copyright © 2010 Nokia. All rights reserved.

Parameter	Unit
Number of Tx power levels	GSM850: 15
	GSM900: 15
	GSM1800: 16
	GSM1900: 16
	WCDMA VIII (900): 75
	WCDMA V (850): 75
	WCDMA II (1900): 75
	WCDMA I (2100): 75

Battery endurance

Battery	Capacity (mAh)	Talk time	Stand-by time	Charging time with AC-8
BL-4J	1200	GSM: up to 7 h	GSM: up to 400 h	1 h 45 min
		WCDMA: up to 5 h	WCDMA: up to 400 h	

Environmental conditions

Environmental condition	Ambient temperature	Notes
Normal operation	-10 ºC ... +55 ºC	Specifications fulfilled
Reduced performance	55 ºC ... +70 ºC	Operational only for short periods
Intermittent or no operation	-40 ºC ... -15 ºC and +70 ºC ... +85ºC	Operation not guaranteed but an attempt to operate will not damage the phone
No operation or storage	<-40 ºC and >+85 ºC	No storage. An attempt to operate may cause permanent damage
Charging allowed	-15 ºC ... +55 ºC	
Long term storage conditions	0 ºC ... +85 ºC	
Humidity and water resistance		Relative humidity range is 5 to 95%. Condensed or dripping water may cause intermittent malfunctions. Protection against dripping water has to be implemented in (enclosure) mechanics. Continuous dampness will cause permanent damage to the module.

Service tools

Product specific tools

The table below gives a short overview of service devices that can be used for testing, error analysis, and repair of product RM-612; RM-624. For the correct use of the service devices, and the best effort of workbench setup, please refer to various concepts.

	FS-141	Flash adapter	
	FS-141 is meant for flashing (also dead phones) with SS-46, RF testing and tuning, and EM calibration on AT0 level with SS-62 (mechanical locking concept). CU-4 supported.		
	MJ-263	Light Module Jig	
	MJ-263 is meant for component level troubleshooting. The jig includes RF interface for Bluetooth, WLAN and GPS. In addition, it has the following features: • Provides mechanical interface with the engine module • Provides galvanic connection to all needed test pads in module • Multiplexing between USB and FBUS media, controlled by Vusb • Connector for control unit • Access for Audio-, MMC, and USB connectors For MJ-263 module jig attenuation values, see Module jig attenuation values (page 2–6) .		
	RJ-230	Soldering jig	
	The jig is used for soldering and as a rework jig for the system module. It is made of lead-free rework compatible material.		
	SA-131	RF coupler	
	SA-131 is a generic device for GPS testing. It is used together with SS-62.

WCDMA V	880.0	-0.2	835.0	-0.2
WCDMA VIII	942.6	-0.2	897.6	-0.2
WLAN	N/A	N/A	2442.0	-0.4

Disassembly instructions

Steps

1. Open the locking mechanism of the battery cover.

Copyright © 2010 Nokia. All rights reserved.

2. Lift the lower end up and pull the battery cover from the phone (and remove the battery).

3. Remove 5 pcs M1.6 x 5.0 torx+ 6IP slide module screws with a Torx screwdriver.

4. Remove 3 pcs M1.4 x 3.4 torx+ 4IP press fit insert screws.

Copyright © 2010 Nokia. All rights reserved.

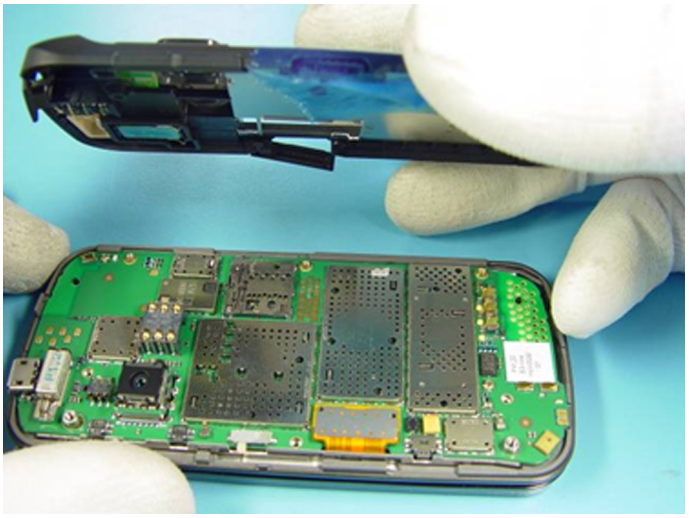
5. To avoid losing the Locking key, use the blue protection foil to fix it.

6. Open the USB door.

7. Open the QWERTY frame latches from both sides.

Copyright © 2010 Nokia. All rights reserved.

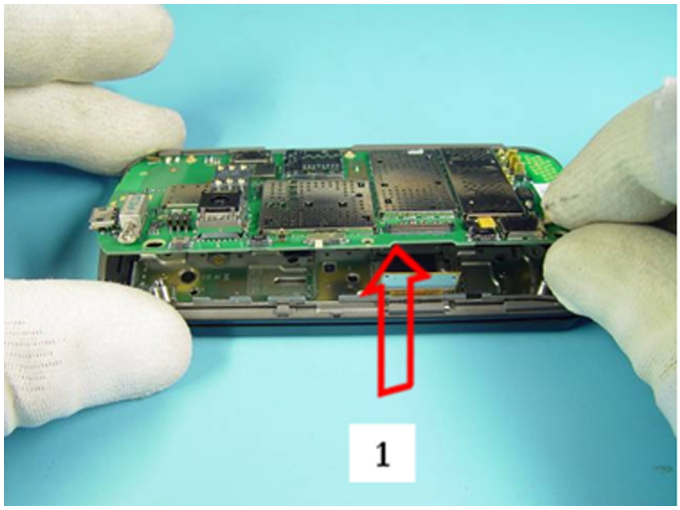
8. Remove the B-Cover from the QWERTY frame.

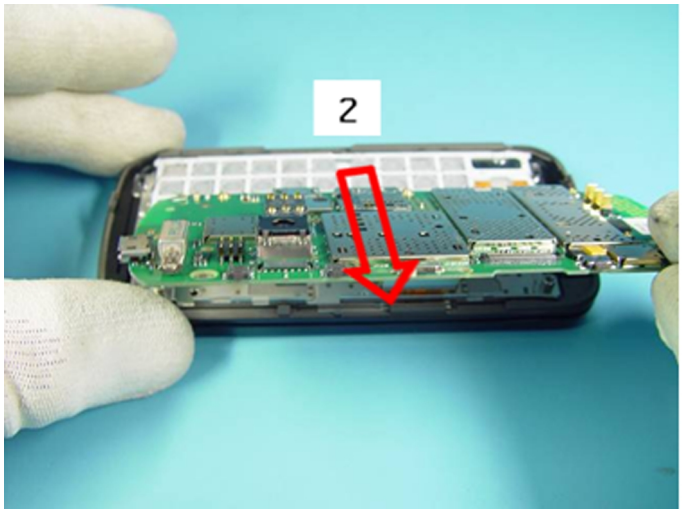


9. Open the Dynamic flex B2B connector using the SRT-6 tool.

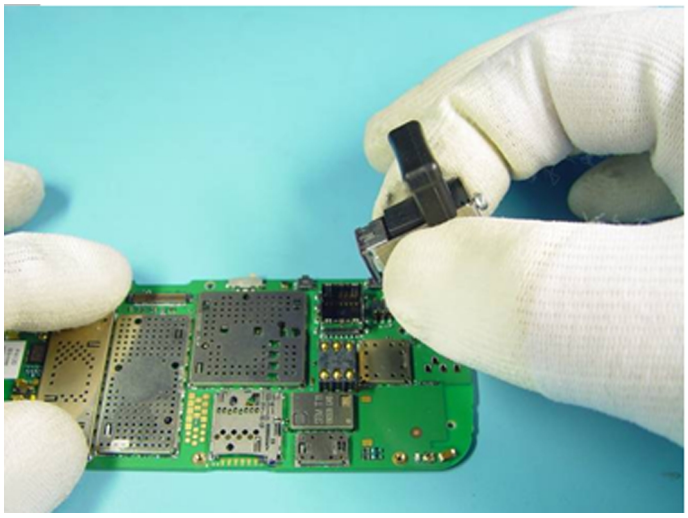
Copyright © 2010 Nokia. All rights reserved.

10. Lift up the PWB to the direction shown in the pictures below and remove it.





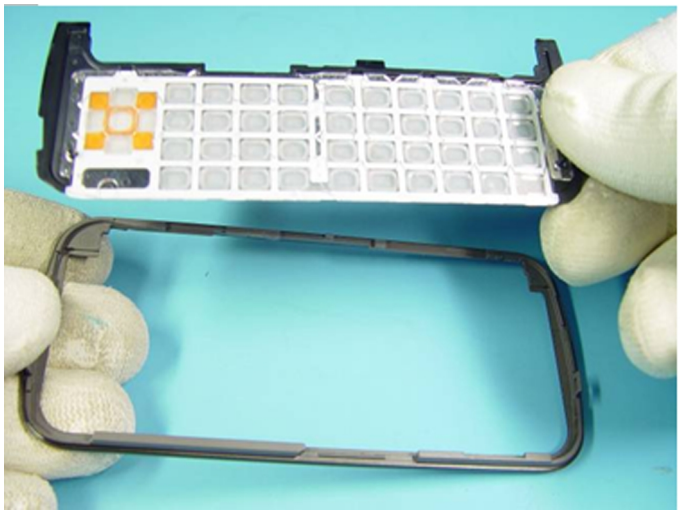
11. Remove the Camera Module using the SS-210 v2 tool.



Copyright © 2010 Nokia. All rights reserved.

12. Remove the QWERTY Frame and QWERTY keymat.

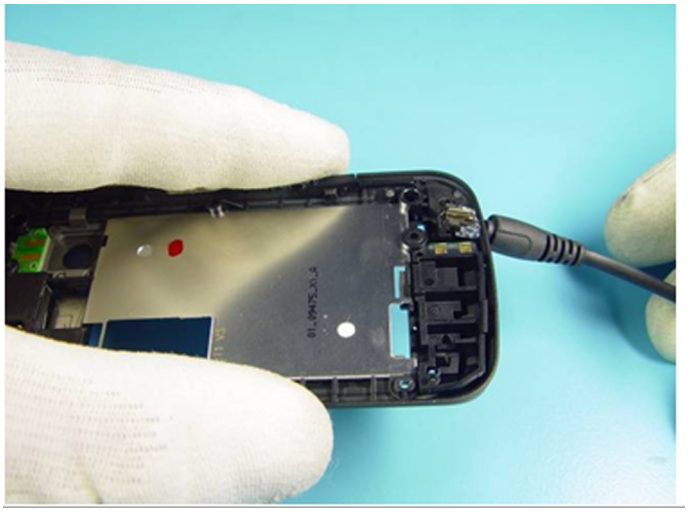
13. Separate the QWERTY frame from the QWERTY keymat.



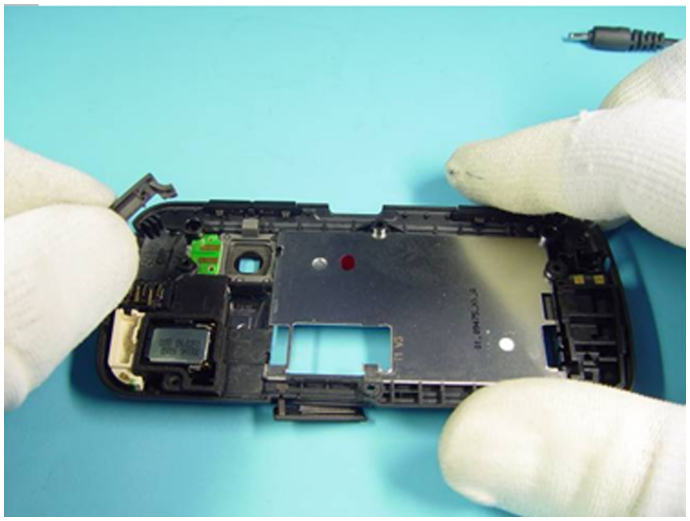
14. Remove the Locking key.

Copyright © 2010 Nokia. All rights reserved.

15. Remove the DC Jack using a DC Plug.

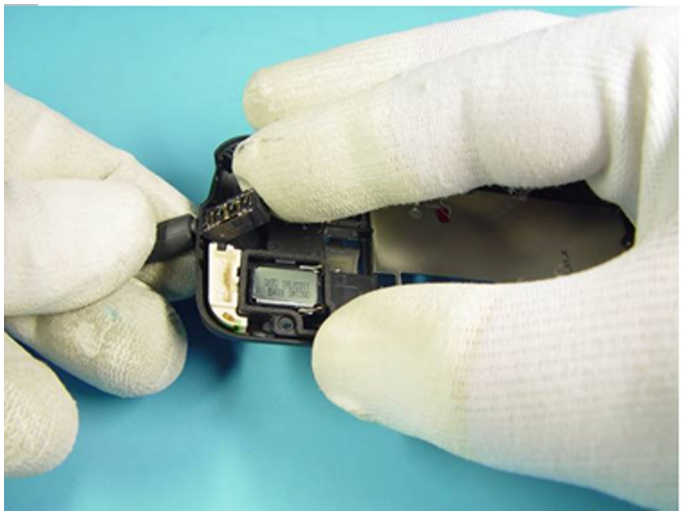


16. Remove the USB door.



Copyright © 2010 Nokia. All rights reserved.

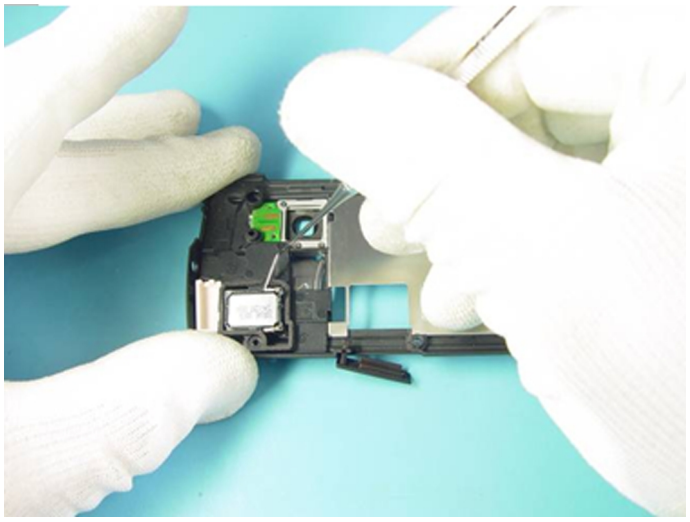
17. Lift up the AV connector using an AV plug and remove it.



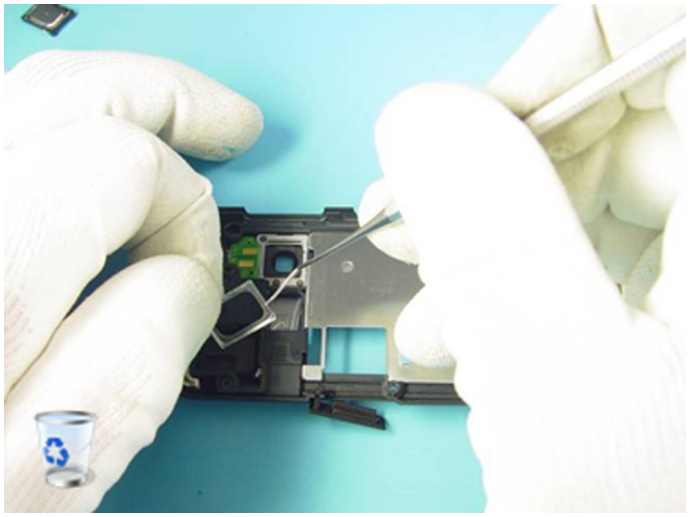
18. Remove the main Antenna.

Copyright © 2010 Nokia. All rights reserved.

19. Release the IHF speaker using the Dental tool and remove it.



20. Remove the IHF adhesive.

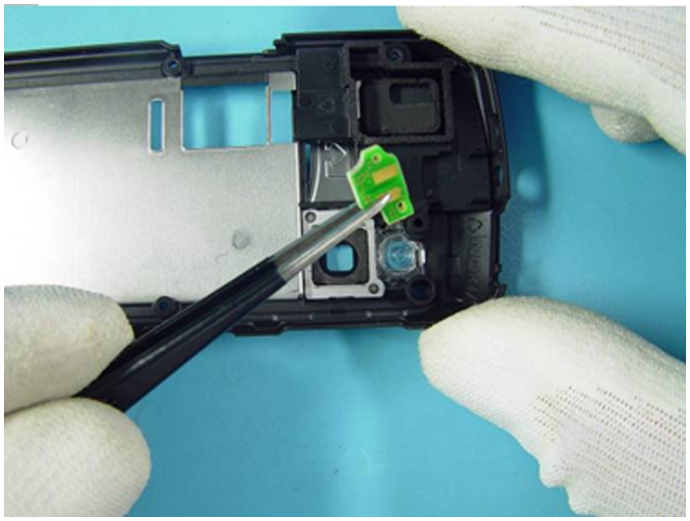


Copyright © 2010 Nokia. All rights reserved.

21. Separate the GPS/BT/WLAN ANTENNA.

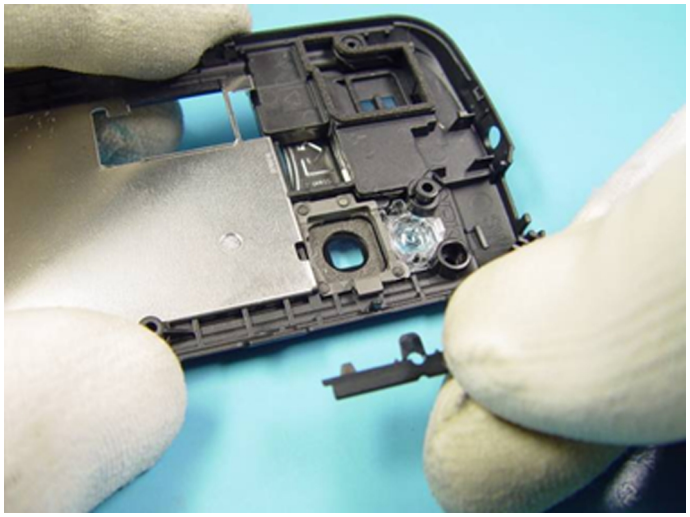
22. Separate the SD DOOR.

23. Remove the FLASH LED ASSY from the B-COVER using tweezers.

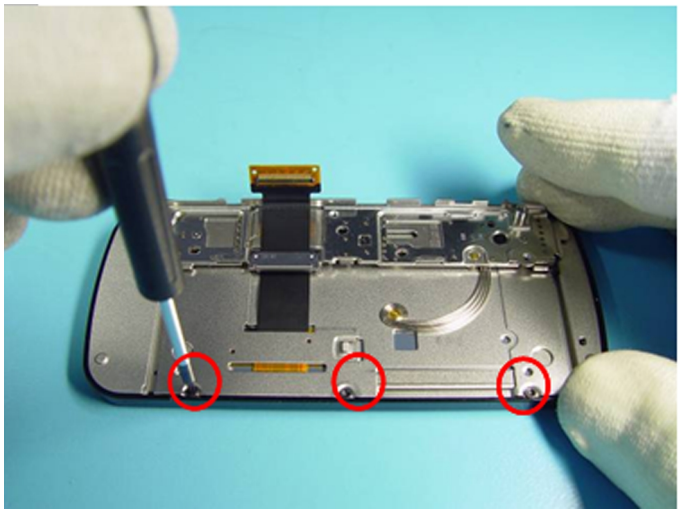


Copyright © 2010 Nokia. All rights reserved.

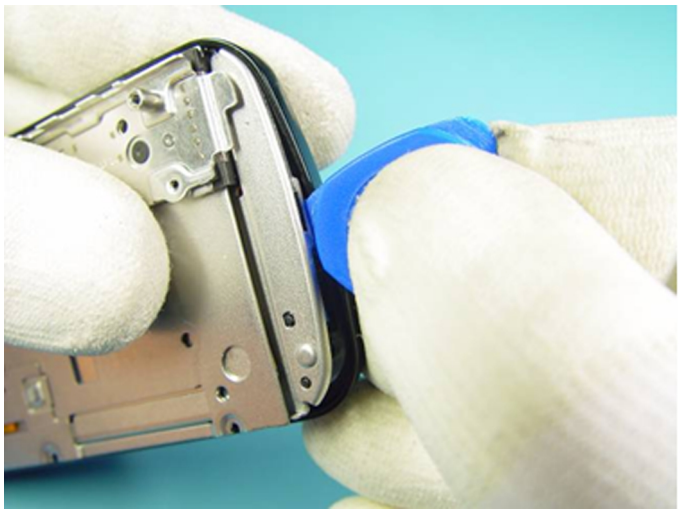
24. Separate the Volume keys.



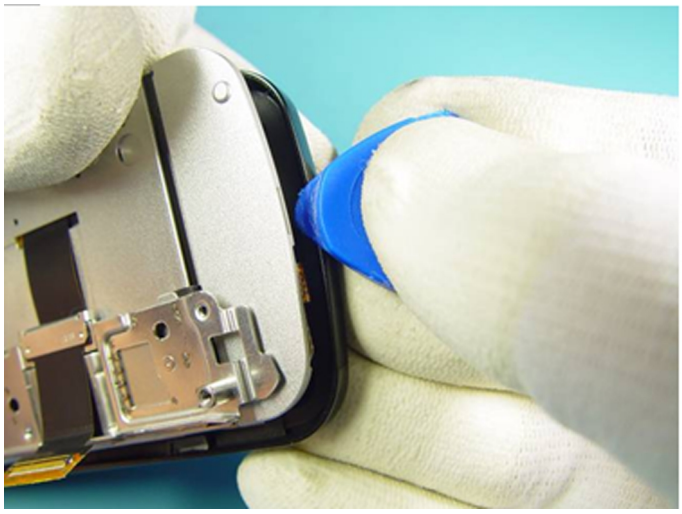
25. Remove 3 pcs lid screws M1.4 x 2.5 torx+ 4IP.



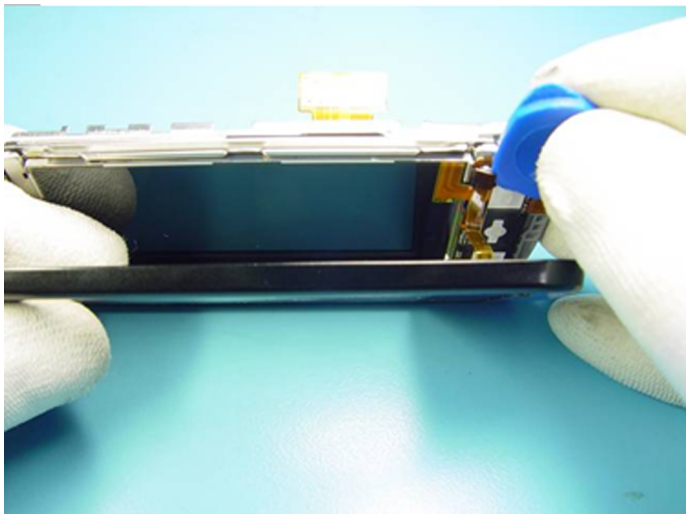
26. Open the A-Cover latches from both sides.



Copyright © 2010 Nokia. All rights reserved.



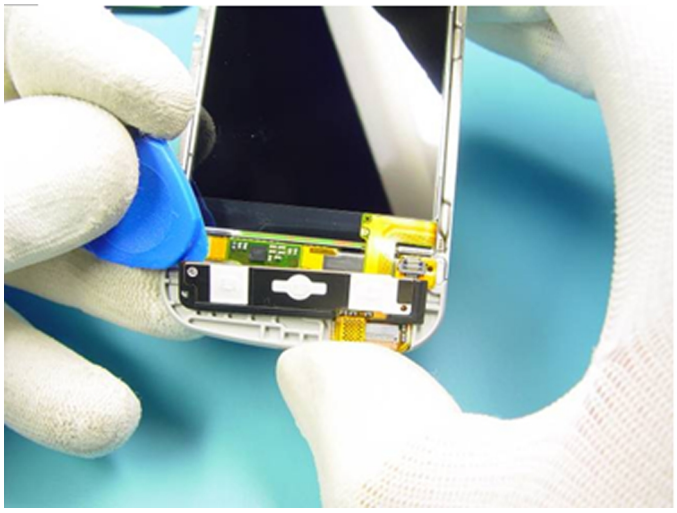
27. Release the touch connector from the UI flex assy.

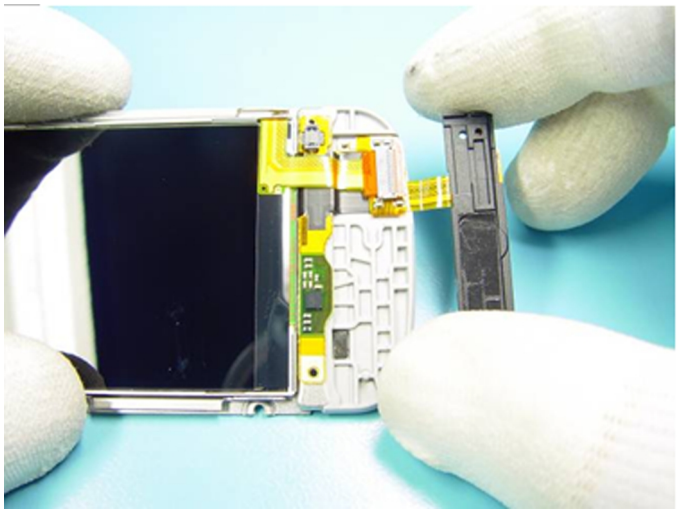


28. Separate the A-Cover from the slide module.

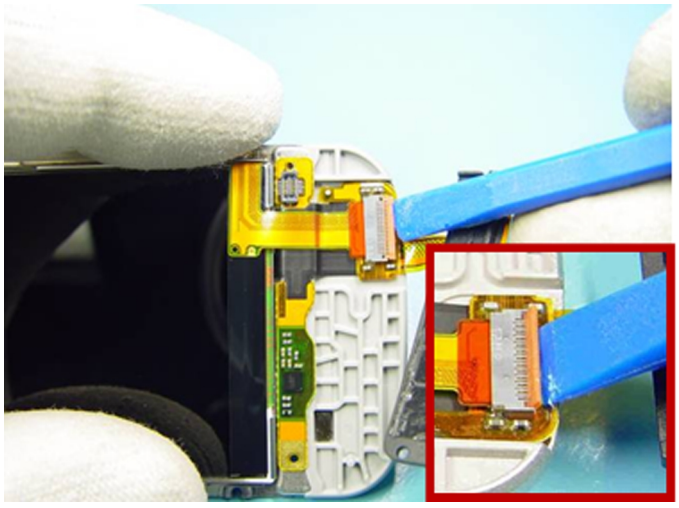
Copyright © 2010 Nokia. All rights reserved.

29. Lift up the function key support from the slide module.





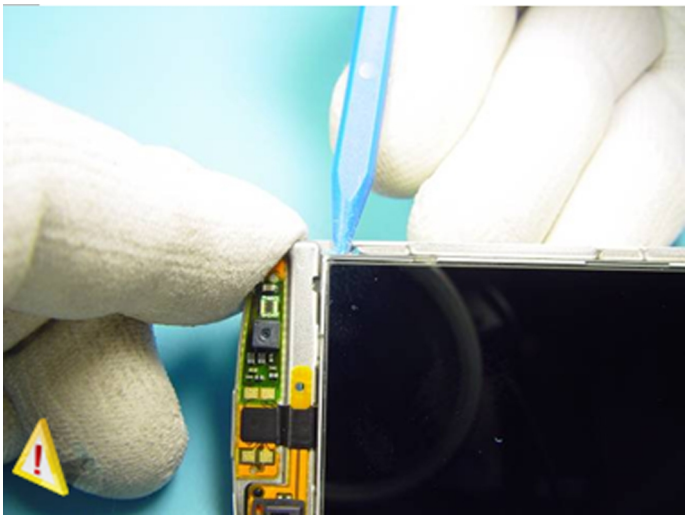
30. Open the lid from the LCD flex zif connector.



Copyright © 2010 Nokia. All rights reserved.

31. Lift the LCD flex from the zif connector.

32. Fit the SS-93 tool carefully under the LCD and lift it up. Be extremely careful not to break the LCD.



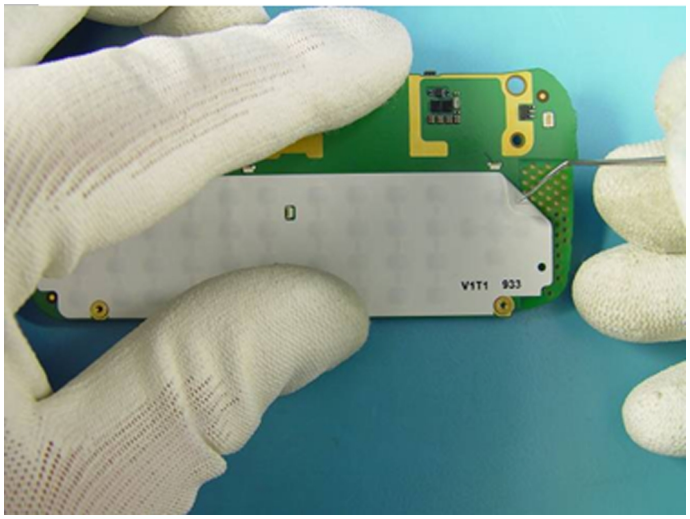
Copyright © 2010 Nokia. All rights reserved.

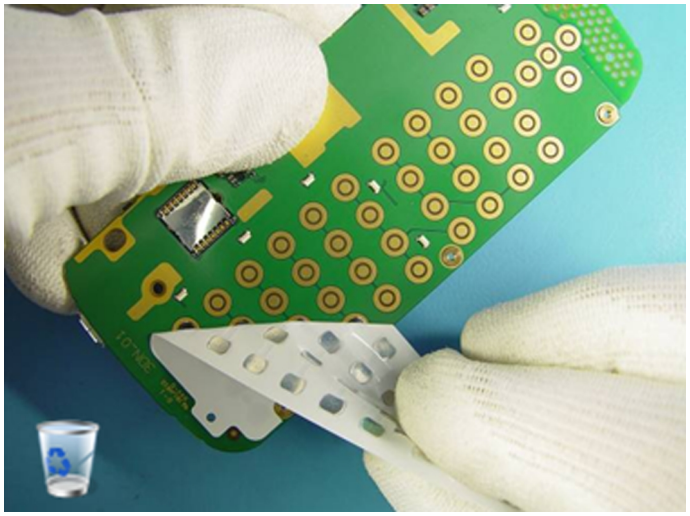
33. Protect the LCD with protection foil to avoid scratches.

34. Lift up the Earpiece using the Dental tool and remove it.

Copyright © 2010 Nokia. All rights reserved.

35. Use the Dental tool to lift up the Domesheet and remove it.



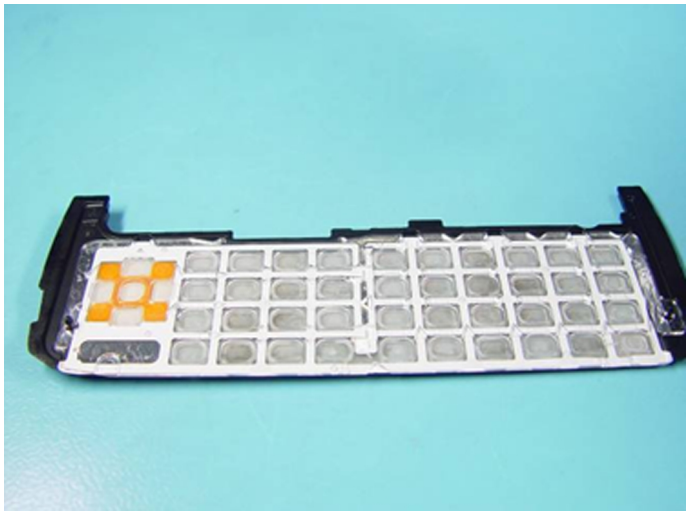


Copyright © 2010 Nokia. All rights reserved.

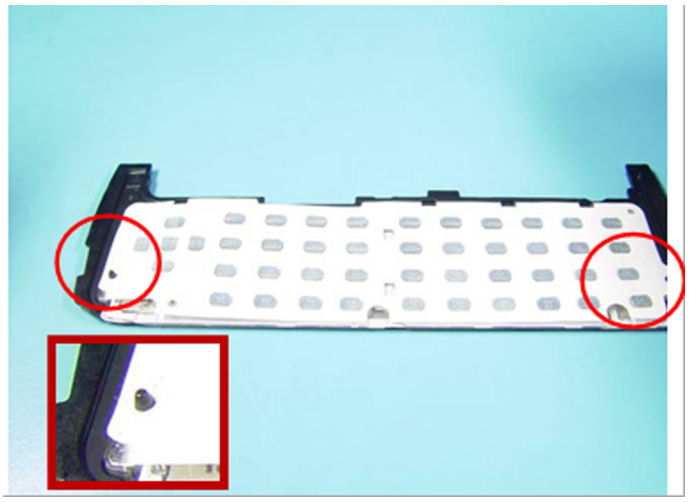
QWERTY Domesheet assembly instructions

Steps

1. Take the QWERTY keymat and...

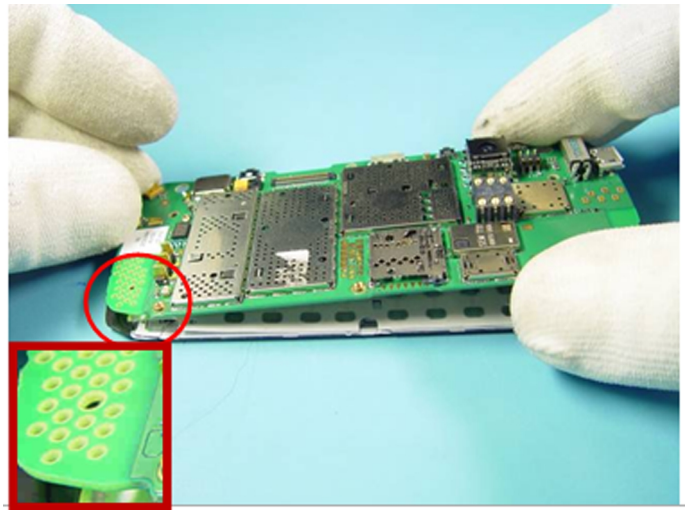


2. ...place the Domesheet on the QWERTY keymat.

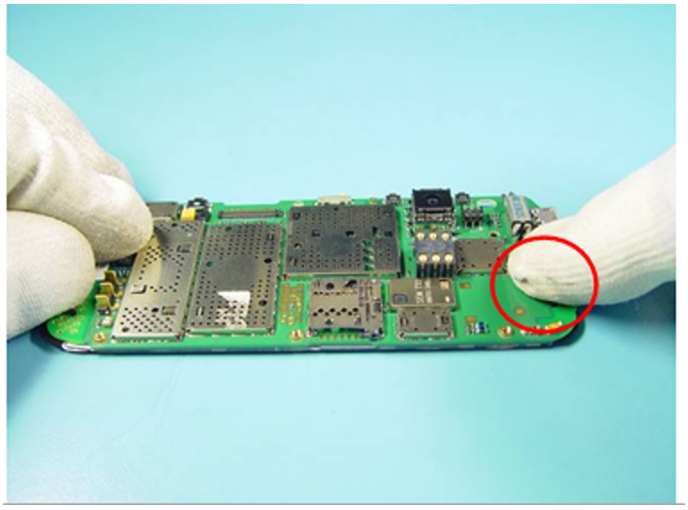


Copyright © 2010 Nokia. All rights reserved.

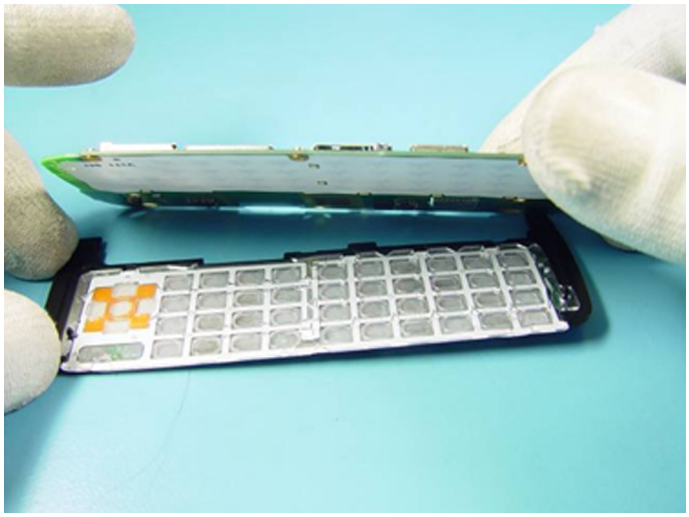
3. Place the PWB to the QWERTY/Domesheet first from the left side.



4. Then place the PWB from the right side.

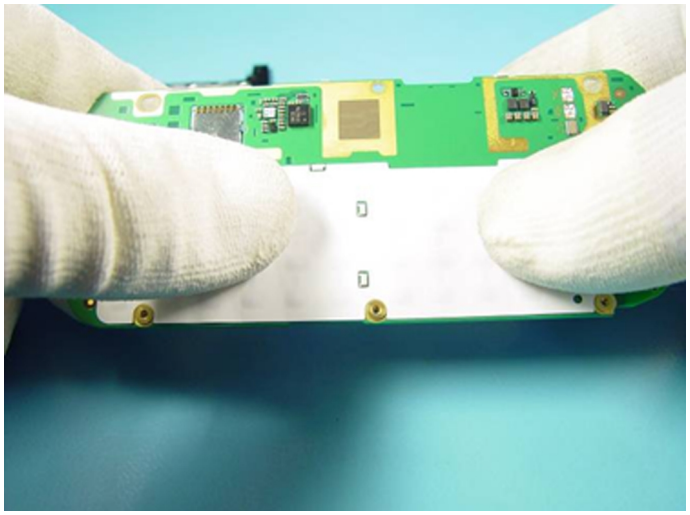


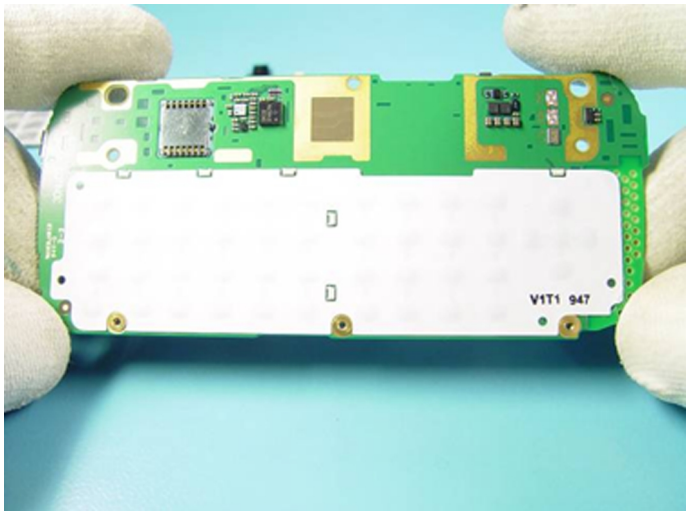
5. Lift up the PWB.



Copyright © 2010 Nokia. All rights reserved.

6. Make sure the Domesheet is properly attached to the PWB.





General tools

The table below gives a short overview of service devices that can be used for testing, error analysis, and repair of product RM-612; RM-624. For the correct use of the service devices, and the best effort of workbench setup, please refer to various concepts.

	AC-35	Power supply	
	Universal power supply for FPS-21; included in the FPS-21 sales package. Input 100V...230V 50Hz...60Hz, output voltage of 12 V and output current up to 3 A.		

Copyright © 2010 Nokia. All rights reserved.

CU-4

CU-4	Control unit	

CU-4 is a general service tool used with a module jig and/or a flash adapter. It requires an external 12 V power supply.

The unit has the following features:

- software controlled via USB
- EM calibration function
- Forwards FBUS/Flashbus traffic to/from terminal
- Forwards USB traffic to/from terminal
- software controlled BSI values
- regulated VBATT voltage
- 2 x USB2.0 connector (Hub)
- FBUS and USB connections supported

When using CU-4, note the special order of connecting cables and other service equipment:

Instructions

1 Connect a service tool (jig, flash adapter) to CU-4.
2 Connect CU-4 to your PC with a USB cable.
3 Connect supply voltage (12 V)
4 Connect an FBUS cable (if necessary).
5 Start Phoenix service software.

Note: Phoenix enables CU-4 regulators via USB when it is started.

Reconnecting the power supply requires a Phoenix restart.

Copyright © 2010 Nokia. All rights reserved.

FLS-5	Flash device	

FLS-5 is a dongle and flash device incorporated into one package, developed specifically for POS use.

Note: FLS-5 can be used as an alternative to PK-1.

FPS-21

FPS-21	Flash prommer	

FPS-21 sales package:

- FPS-21 prommer
- AC-35 power supply
- CA-31D USB cable

FPS-21 interfaces:

Front

- Service cable connector

  Provides Flashbus, USB and VBAT connections to a mobile device.
- SmartCard socket

  A SmartCard is needed to allow DCT-4 generation mobile device programming.

Rear

- DC power input

  For connecting the external power supply (AC-35).
- Two USB A type ports (USB1/USB3)

  Can be used, for example, for connecting external storage memory devices or mobile devices
- One USB B type device connector (USB2)

  For connecting a PC.
- Phone connector

  Service cable connection for connecting Flashbus/FLA.
- Ethernet RJ45 type socket (LAN)

  For connecting the FPS-21 to LAN.

Inside

- Four SD card memory slots

  For internal storage memory.

  Note: In order to access the SD memory card slots inside FPS-21, the prommer needs to be opened by removing the front panel, rear panel and heatsink from the prommer body.

Copyright © 2010 Nokia. All rights reserved.

	JXS-1	RF shield box	
	Because the WCDMA network disturbs the RX side testing of the WCDMA phone and the Tx signal of the WCDMA phone can severely disturb the WCDMA network, a shield box is needed in all testing, tuning and fault finding which requires WCDMA RF signal. The shield box is not an active device, it contains only passive filtering components for RF attenuation.		
	PK-1	Software protection key	
	PK-1 is a hardware protection key with a USB interface. It has the same functionality as the PKD-1 series dongle. PK-1 is meant for use with a PC that does not have a series interface. To use this USB dongle for security service functions please register the dongle in the same way as the PKD-1 series dongle.		
	SB-6	Bluetooth test and interface box (sales package)	
	The SB-6 test box is a generic service device used to perform Bluetooth bit error rate (BER) testing, and establishing cordless FBUS connection via Bluetooth. An ACP-8x charger is needed for BER testing and an AXS-4 cable in case of cordless interface usage testing . Sales package includes: • SB-6 test box • Installation and warranty information		
	SB-7	WLAN test box	
	WLAN test requires defined position for the device.		

Copyright © 2010 Nokia. All rights reserved.

	SRT-6	Opening tool	
	SRT-6 is used to open phone covers. **Note:** The SRT-6 is included in the Nokia Standard Toolkit.		
	SS-210	Camera removal tool	
	The camera removal tool SS-210 is used to remove/attach the camera module from/to the socket.		
	SS-46	Interface adapter	
	SS-46 acts as an interface adapter between the flash adapter and FPS-21.		
	SS-62	Generic flash adapter base for BB5	
	• generic base for flash adapters and couplers • SS-62 equipped with a clip interlock system • provides standardised interface towards Control Unit • multiplexing between USB and FBUS media, controlled by VUSB		
	SS-93	Opening tool	
	SS-93 is used for opening JAE connectors. **Note:** The SS-93 is included in Nokia Standard Toolkit.		

Copyright © 2010 Nokia. All rights reserved.

	SX-4	Smart card	
	SX-4 is a BB5 security device used to protect critical features in tuning and testing. SX-4 is also needed together with FPS-21 when DCT-4 phones are flashed.		

Cables

The table below gives a short overview of service devices that can be used for testing, error analysis, and repair of product RM-612; RM-624. For the correct use of the service devices, and the best effort of workbench setup, please refer to various concepts.

	CA-101	Micro USB cable	
	The CA-101 is a USB-to-microUSB data cable that allows connections between the PC and the phone.		
	CA-158RS	RF tuning cable	
	Product-specific adapter cable for RF tuning.		
	CA-31D	USB cable	
	The CA-31D USB cable is used to connect FPS-21 to a PC. It is included in the FPS-21 sales package.		

Copyright © 2010 Nokia. All rights reserved.

CA-89DS	Cable	
Provides VBAT and Flashbus connections to mobile device programming adapters.		

PCS-1	Power cable	
The PCS-1 power cable (DC) is used with a docking station, a module jig or a control unit to supply a controlled voltage.		

XRS-6	RF cable	
The RF cable is used to connect, for example, a module repair jig to the RF measurement equipment. SMA to N-Connector approximately 610 mm. Attenuation for: • GSM850/900: 0.3+-0.1 dB • GSM1800/1900: 0.5+-0.1 dB • WCDMA/WLAN: 0.6+-0.1dB

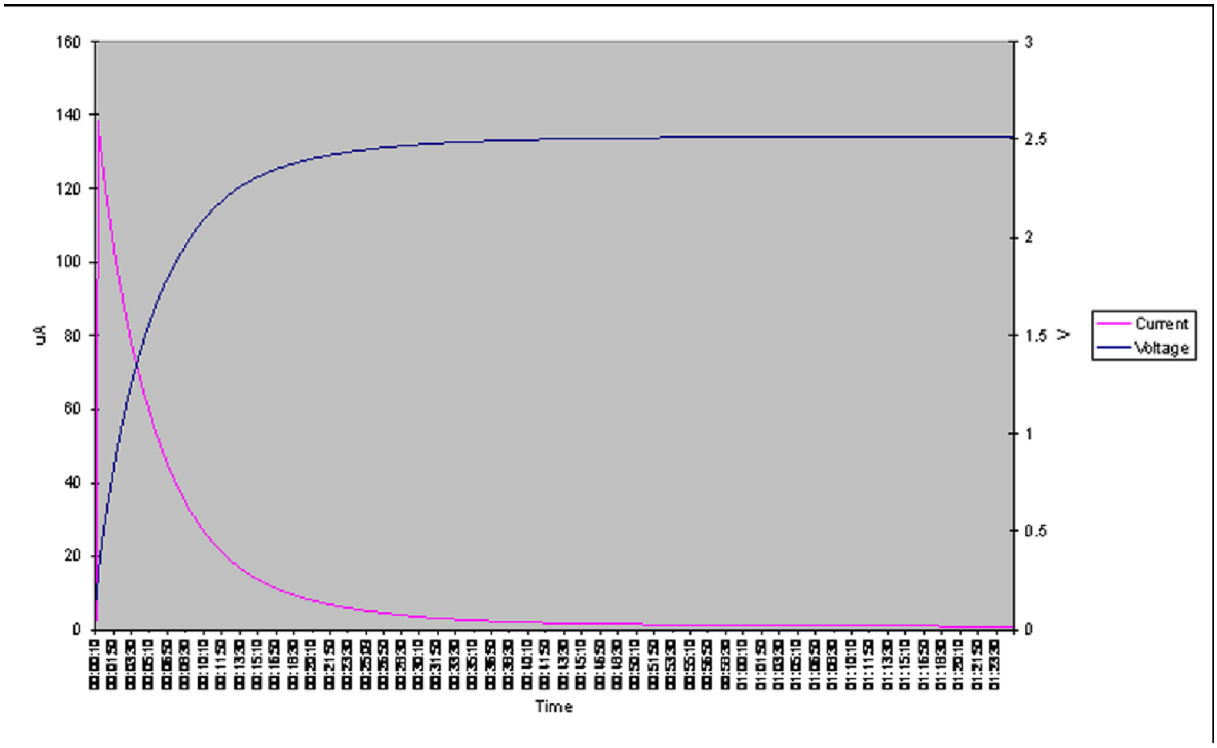
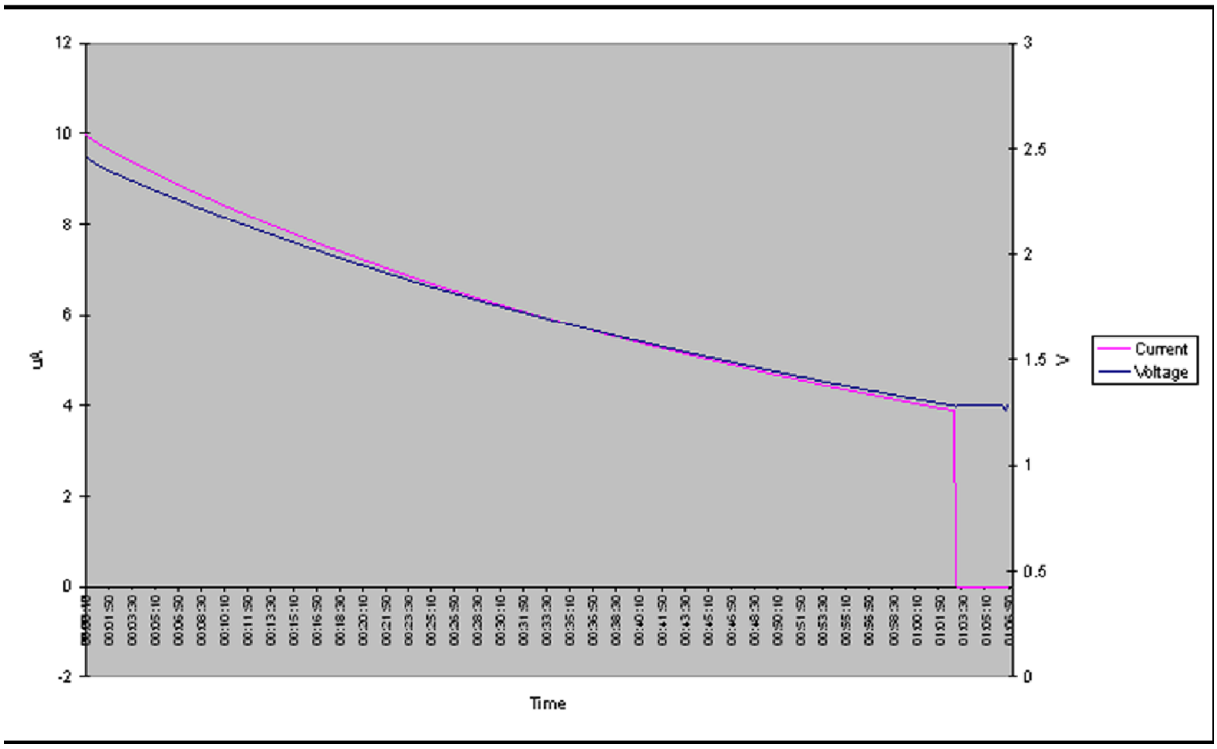
Backup battery troubleshooting

Verify that the backup battery G2200 is empty (U<1V). Switch the phone on. Measure voltage of the battery when the main battery is connected to the phone and the phone is switched on. Wait a few minutes and monitor that the backup battery voltage rises. Switch off the phone, disconnect the main battery and monitor that the voltage of the backup battery decreases. Normal behaviour of the voltage is described in the figures below:





Copyright © 2010 Nokia. All rights reserved.

If the voltage rises and falls quickly, check the back-up battery G2200 contacts for loose soldering or short-circuit, and repair or change G2200 if necessary. If the voltage stays ~0V, check resistance VBACK against GND. If there is no shortcircuit, AVILMA N2200 is faulty. Replace N2200.

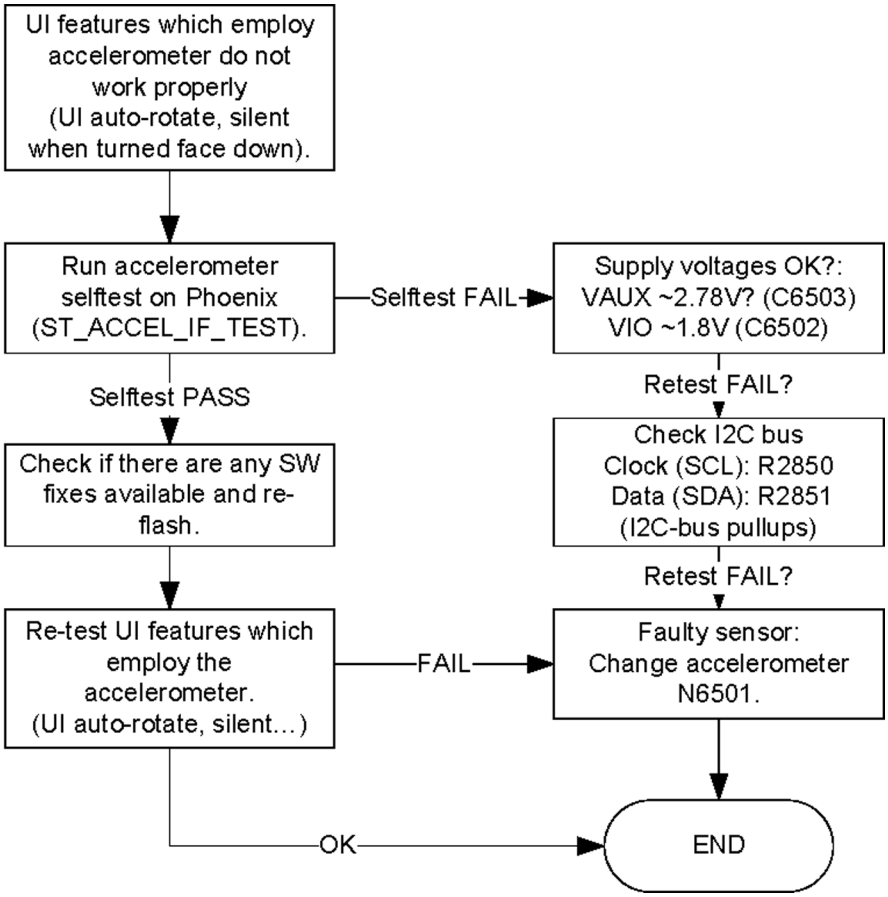
Accelerometer troubleshooting

Troubleshooting flow

Accelerometer selftest: (ST_ACCEL_IF_TEST) verifies the digital parts and the sensor elements inside the component. Selftest is available in LOCAL and TEST modes.

Note! The phone needs to be stable when running the selftest to get correct results. If changes in acceleration are detected by component during the test, it may cause the selftest to fail.



Touch screen troubleshooting

Introduction to touch screen troubleshooting

The device has a resistive touch screen user interface, which means that the device does not have a traditional ITU-T keypad. The key components of the touch screen user interface are:

- Touch window with touch controller (TSC2004)
- Proximity sensor

The resistive touch window is located above the display. It enables finger as well as stylus touch, and it provides tactile feedback. The tactile feedback is implemented by using the same vibra that is used for alerting. The touch controller includes drivers and the control logic to measure touch pressure.

The proximity sensor is attached to the upper flex assembly. It sends out a beam of IR light, and then computes the distance to any nearby objects from the characteristics of the returned (reflected) signal. There is a booth between the sensor and the touch window, which isolates the IR transmitter from the IR receiver by preventing the reflection from the touch window surface.

Copyright © 2010 Nokia. All rights reserved.

Proximity sensor troubleshooting

Context

Proximity sensor troubleshooting is broken down into two parts. The main purpose of the automatic check is to identify the fault automatically without any manual checks. If the automatic flow does not provide enough information, a manual check can be done to narrow down the cause of the fault.

Hardware keys troubleshooting

Context

There are two possible failure modes in the keyboard module:

- One or more keys can be stuck, so that the key does not react when a keydome is pressed. This kind of failure is caused by mechanical reasons (dirt, rust).

Copyright © 2010 Nokia. All rights reserved.

- Malfunction of several keys at the same time; this happens when one or more rows or columns are failing (short circuit or open connection).

If the failure mode is not clear, start with the Keyboard Test in Phoenix.

Troubleshooting flow

Display module troubleshooting

General instructions for display troubleshooting

Context

- The display is in a normal mode when the phone is in active use.
- Display is in a partial idle mode when the phone is in the screen saver mode.
- The operating modes of the display can be controlled with the help of *Phoenix*.

Table 7 Display module troubleshooting cases

Display blank	There is no image on the display. The display looks the same when the phone is on as it does when the phone is off. The backlight can be on in some cases.
Image on the display not correct	Image on the display can be corrupted or a part of the image can be missing. If a part of the image is missing, change the display module. If the image is otherwise corrupted, follow the appropriate troubleshooting diagram.
Backlight dim or not working at all	Backlight LED components are inside the display module. Backlight failure can also be in the connector or in the backlight power source in the main engine of the phone.
Visual defects (pixel)	Pixel defects can be checked by controlling the display with Phoenix. Use both colours, black and white, on a full screen. The display may have some random pixel defects that are acceptable for this type of display. The criteria when pixel defects are regarded as a display failure, resulting in a replacement of the display, are presented the following table.

Table 8 Pixel defects

Item		White dot defect				Black dot defect	Total
1	Defect counts	R	G	B	White Dot Total	1	1
		1	1	1	1		
2	Combined defect counts	Not allowed. Two single dot defects that are within 5 mm of each other should be interpreted as combined dot defect.					

Steps

1. Verify with a working display that the fault is not on the display module itself.

   Note: The display module cannot be repaired.

Copyright © 2010 Nokia. All rights reserved.

2. Check that the cellular engine is working normally.
   i To check the functionality, connect the phone to a docking station.
   ii Start *Phoenix* service software.
   iii Read the phone information to check that the engine is functioning normally (you should be able to read the Phone ID).
3. Proceed to the display troubleshooting flowcharts.
   Use the **Display Test** tool in *Phoenix* to find the detailed fault mode.

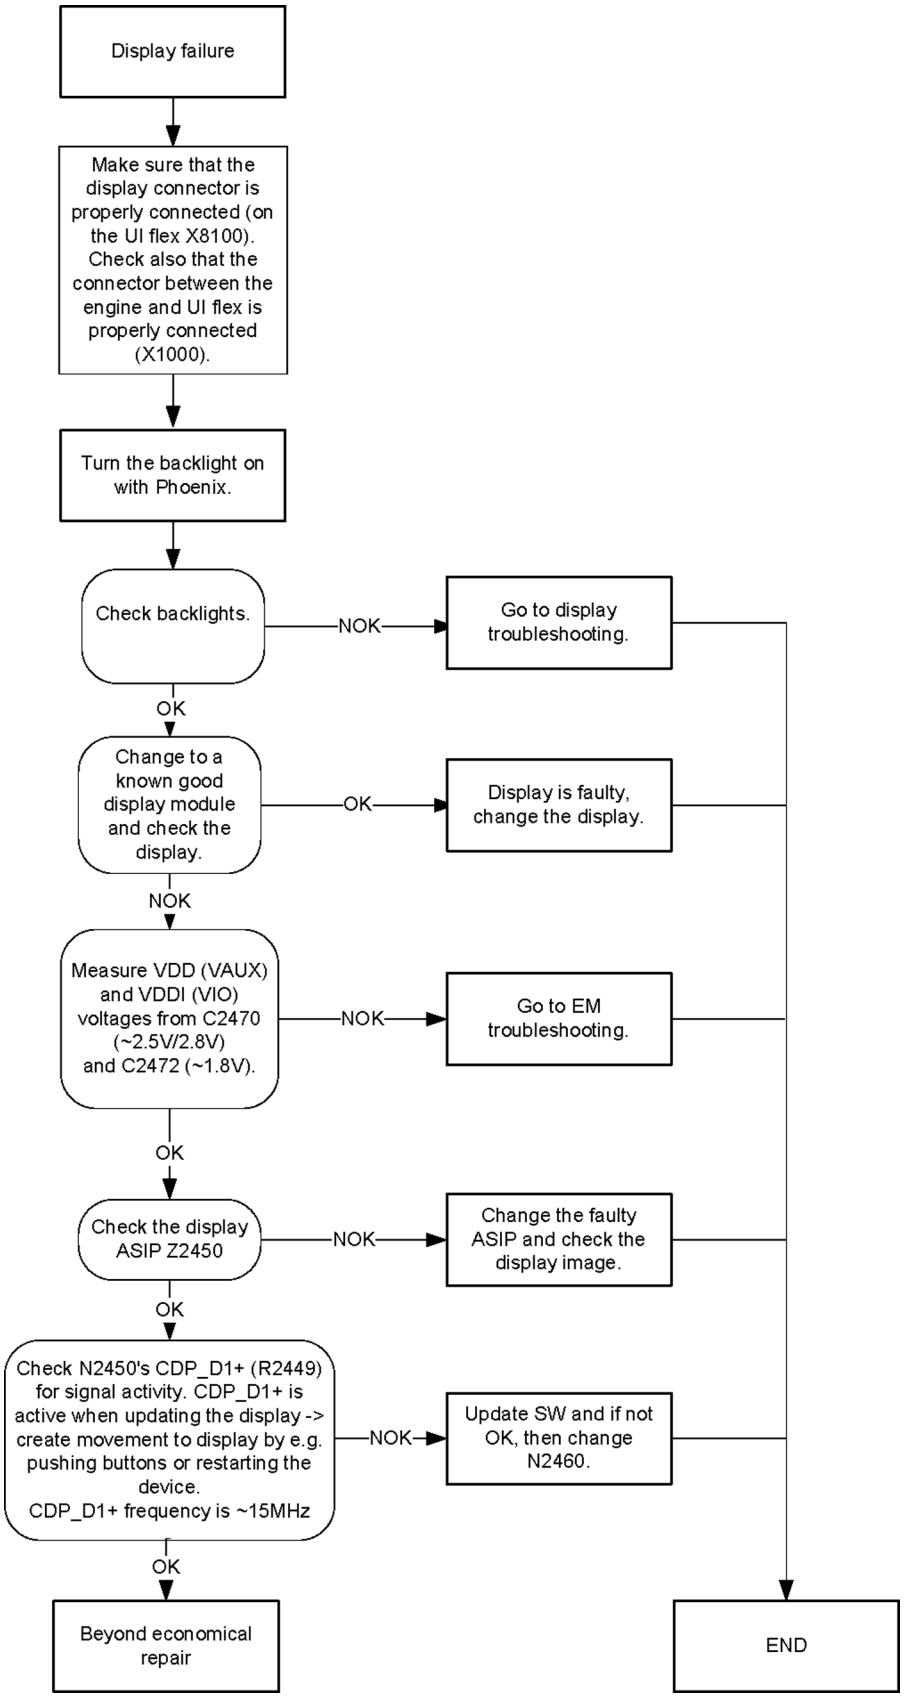
Display troubleshooting

Context

Before going to display troubleshooting flow, make sure that the engine is working and starting up correctly. If the problem is in the engine, go to baseband troubleshooting.

Copyright © 2010 Nokia. All rights reserved.

Troubleshooting flow



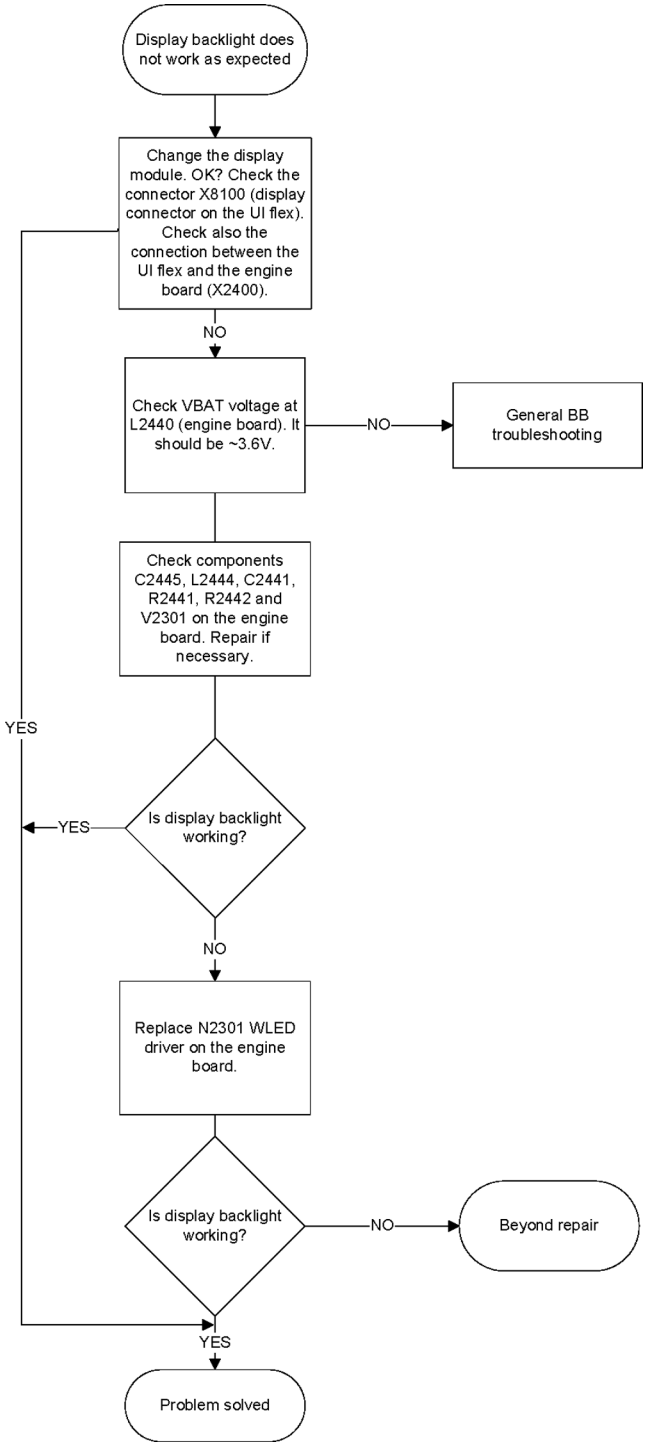
Copyright © 2010 Nokia. All rights reserved.

Display backlight troubleshooting

Context

The device has a dedicated display WLED driver whose intensity is controlled by Display itself by CABC (content adaptive backlight control) signal.

Troubleshooting flow



Copyright © 2010 Nokia. All rights reserved.

LED and LED driver troubleshooting

Context

The device has two LED drivers that provide current for the keyboard and several LEDs (Send, End, Home) . The brightness of the backlights can be adjusted manually, and it affects the keypad. The keyboard backlights and some LEDs can be turned ON/OFF separately but not without switching on the display lights.

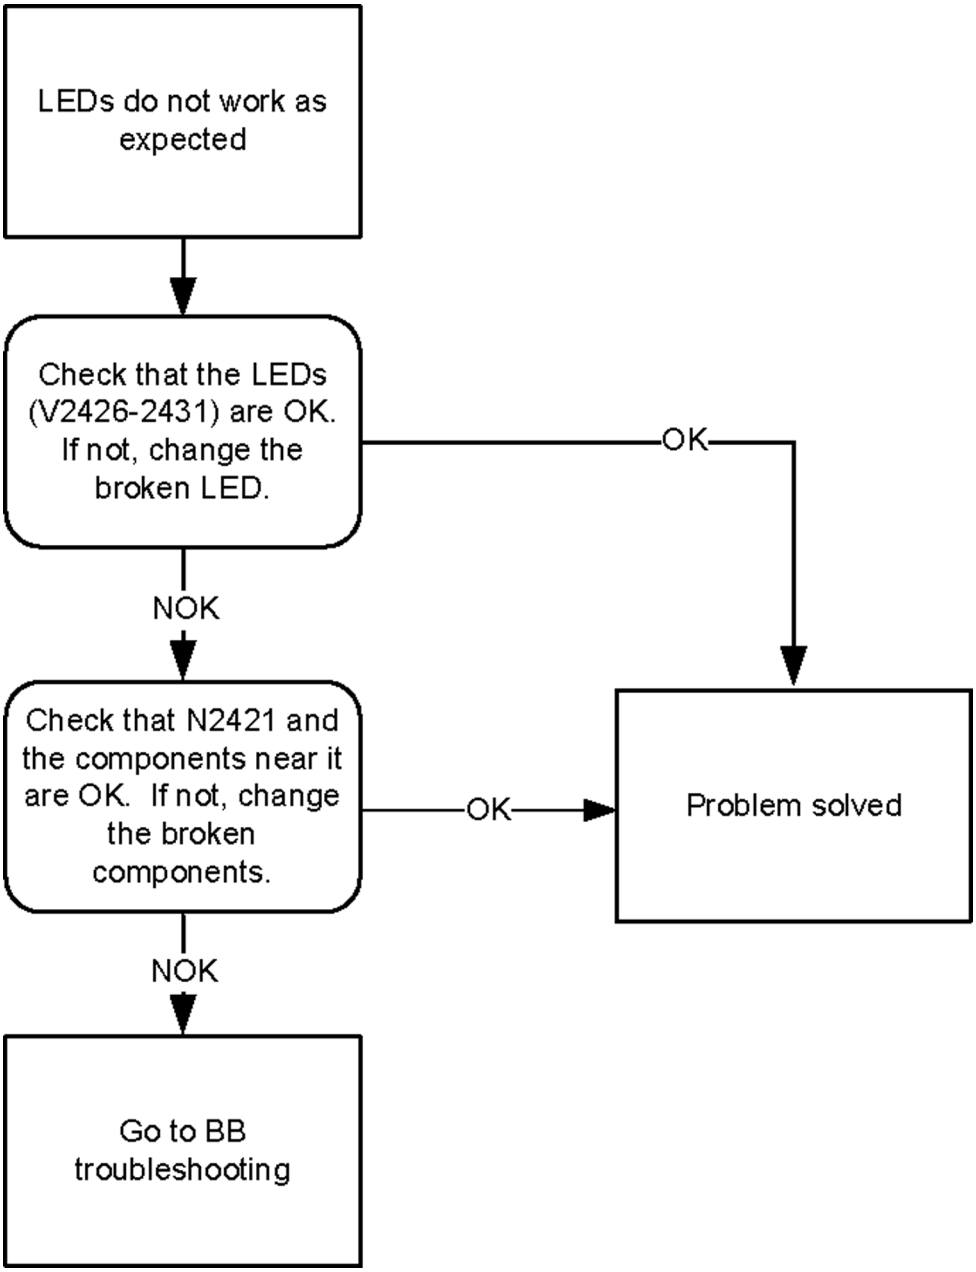

Figure 18 QWERTY LEDs

Ambient Light Sensor troubleshooting

Introduction to ALS troubleshooting

If the Ambient Light Sensor (ALS) functionality is inoperative, check the ambient light sensor (N8104) and change it, if necessary. Also, check the capacitor C8102 (100n).

The ALS components are located at the top of the UI flex as illustrated in the figure below.

Copyright © 2010 Nokia. All rights reserved.

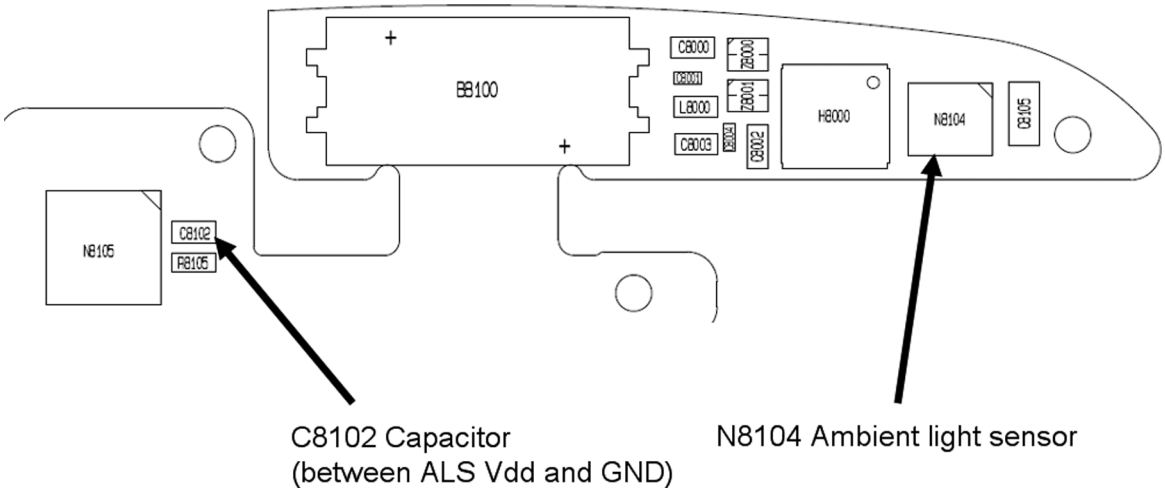

Figure 19 ALS placement

GPS troubleshooting

GPS antenna

The GPS antenna is located on the back side of the B-cover (right-hand side, next to the IHF speaker).

Figure 20 GPS antenna

The GPS antenna is connected to the PWB with a c-clip. The RF connector for conducted measurements and testing is located next to the c-clip.

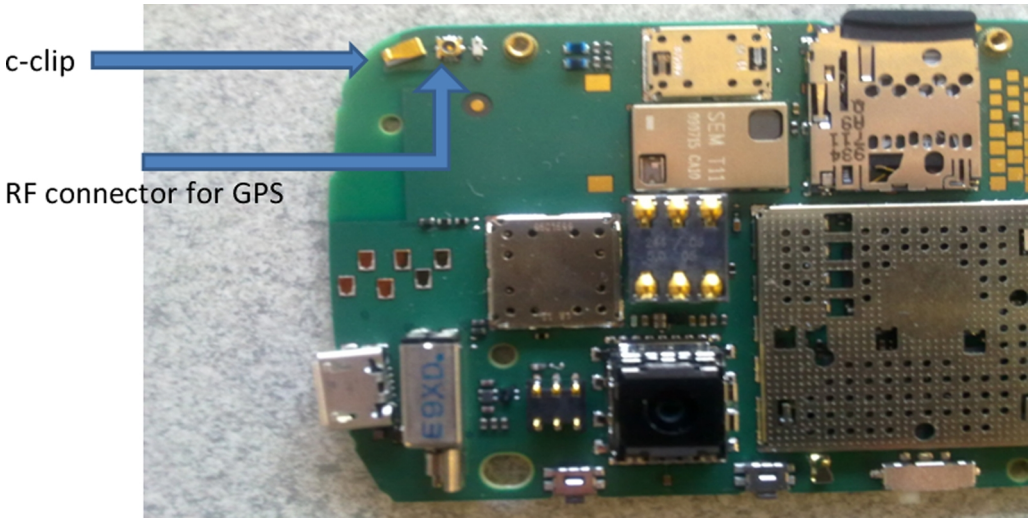

Figure 21 C-clip and RF connector location

GPS settings for Phoenix

GPS control

Context

Use the following to test GPS using Phoenix.

Steps

1. Start Phoenix service software.
2. From the **File** menu, select **Scan Product** and check that the correct product version is displayed.
3. From the **Testing** menu, select **GPS Control**. This opens up *GPS Control* dialog box, as shown in the figure below, and enables the GPS.

   Select **Idle** to confirm the GPS is enabled and is in idle mode.

Copyright © 2010 Nokia. All rights reserved.

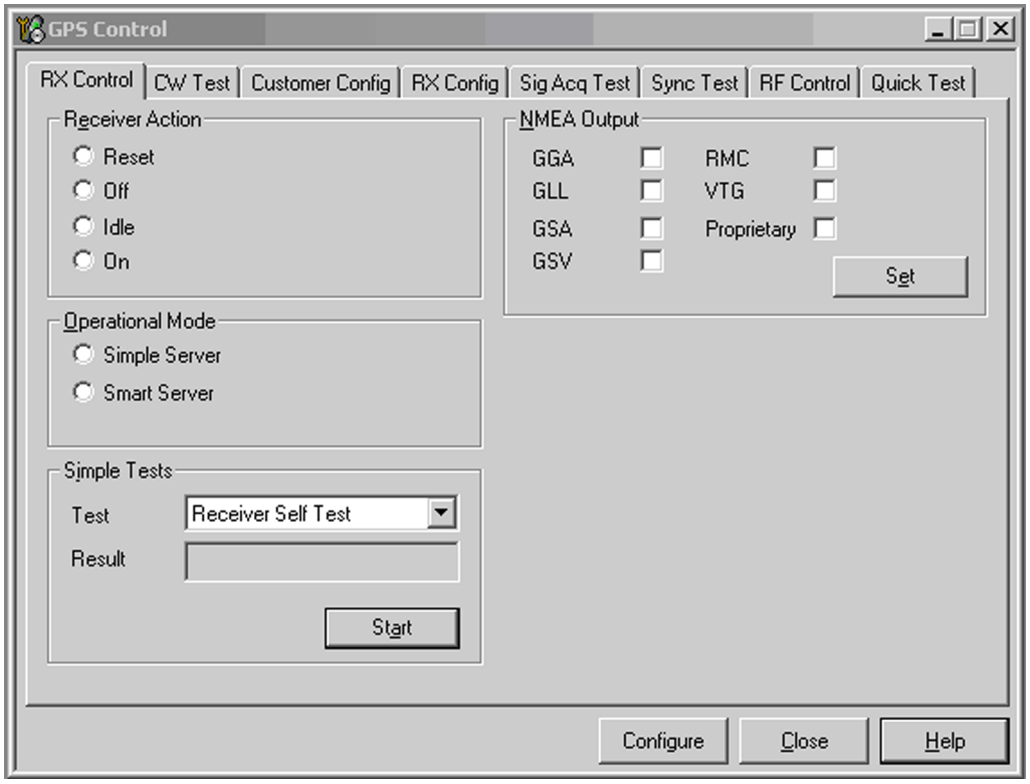

Figure 22 GPS Control dialog box

Oscillator test

Context

The 16.368 MHz GPS Clk is compared against the CE Ref Clk and the output is the GPS Clk offset.

Steps

1. Start Phoenix service software.
2. From the **Testing** menu, select **GPS Control**. This opens up *GPS Control* dialogue box and enables the GPS.
   In the *Rx Control* window, go to the **Simple Tests** section, select **Oscillator Test** and click **Start**. The Offset result will be returned and should be within the limits of +- 84Hz.

Copyright © 2010 Nokia. All rights reserved.

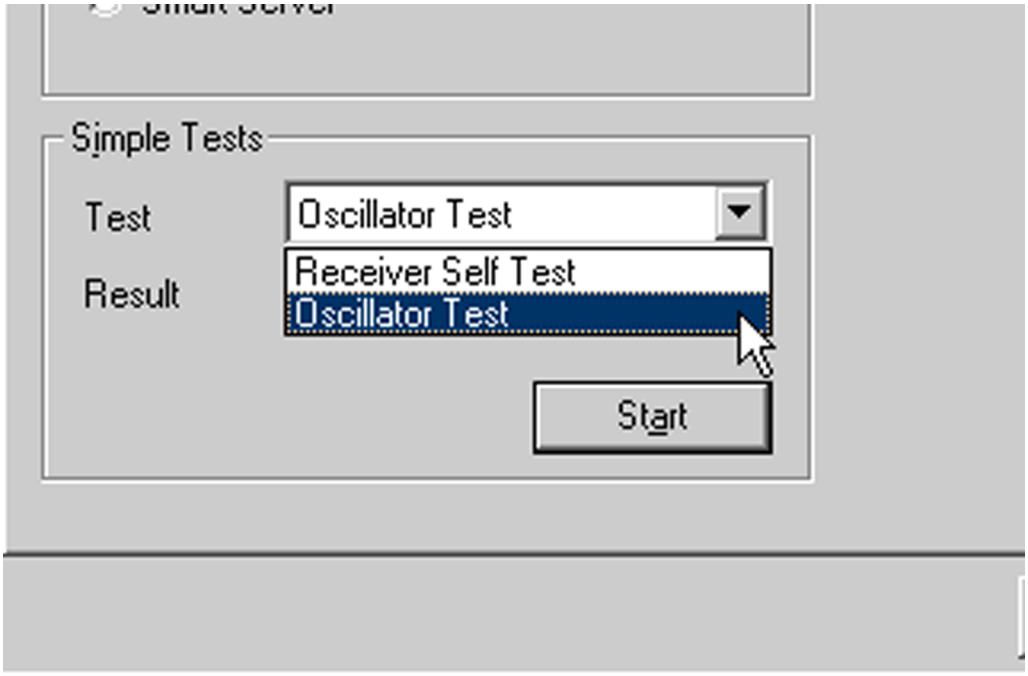

Figure 23 Simple Tests – Oscillator Test

Receiver self test

Context

Receiver self test can be used to check the correct functionality of the receiver core. For the test, GPS software configures internal test source to generate synthetic GPS-like data, processing it in the baseband and writing the results into the channel processor memory. The test compares the data in the channel memory against the expected value and reports a PASS/FAIL status.

Steps

1. Start Phoenix service software.
2. From the **Testing** menu, select **GPS Control**. This opens up *GPS Control* dialogue box and enables the GPS.

   In the *Rx Control* window, go to the **Simple Tests** section, select **Receiver Self Test** and click **Start**. The test returns a PASS/FAIL result.

   Note: The Oscillator Test should not be run after the Receiver Self Test. This sequence of tests may cause the Oscillator test to prolong and result in Phoenix timing out. If you are carrying out both of these tests, run the Oscillator Test first, after which you can run the Receiver Self Test.

Copyright © 2010 Nokia. All rights reserved.

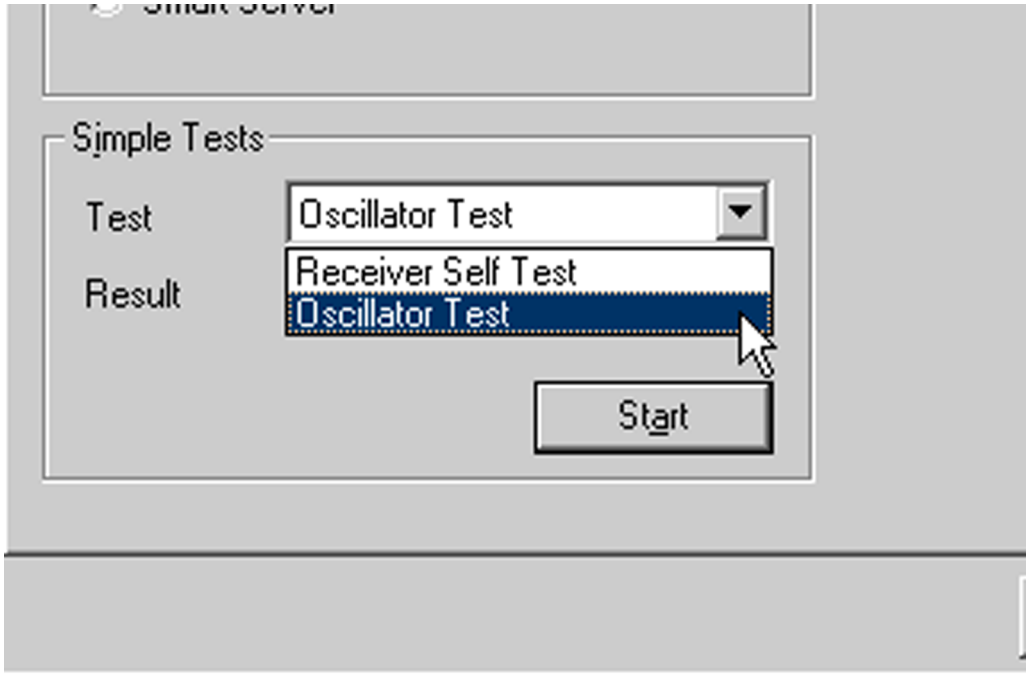

Figure 24 Simple Tests – Receiver Self Test

CW Test

Context

This test reports the SNR of a CW signal input to the GPS antenna port.

Steps

1. Start Phoenix service software.
2. From the **Testing** menu, select **GPS Control**. This opens up *GPS Control* dialog box and enables the GPS.

   In the *CW Test* window, ensure that the input settings are as shown in the figure below. Inject 1575.520152 MHz tone at the GPS RF connector at a level of -110dBm and click **Start**.

   For Pin = -110dBm and negligible other losses, the expected result ranges are:

   - Galvanic 29.8dB to 38.1dB
   - Radiated 25.8dB to 38.1dB

Copyright © 2010 Nokia. All rights reserved.

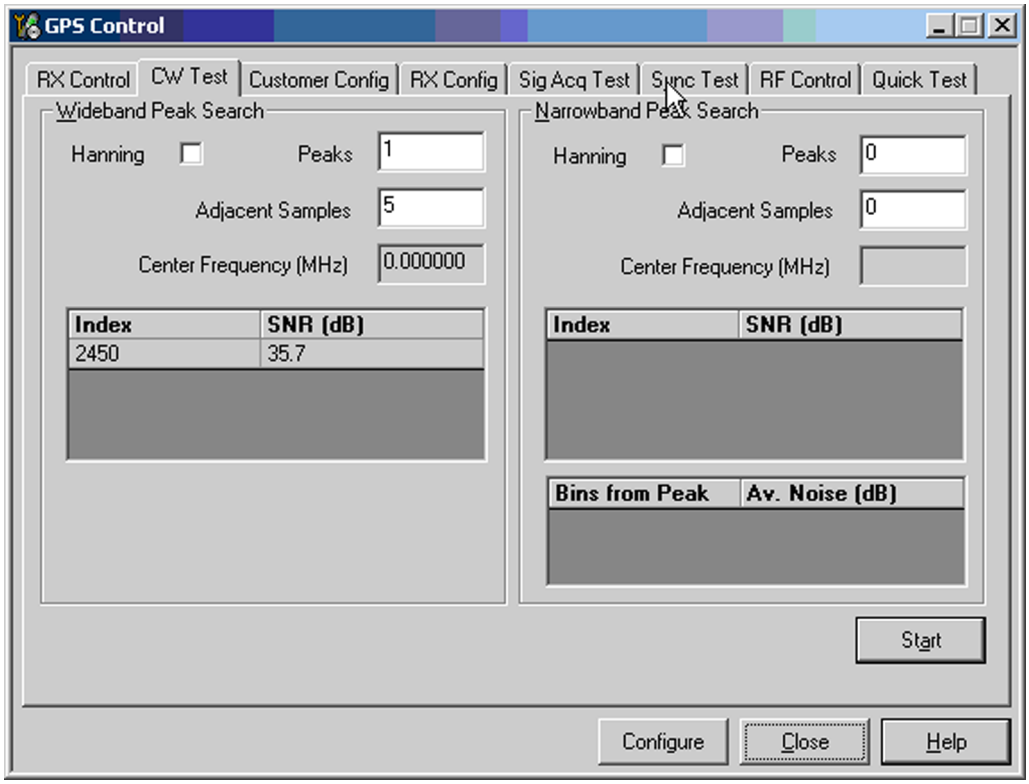

Figure 25 CW Test window

Quick Test window

Because the *Quick Test* runs the *Receiver Self Test* before the *Oscillator Test*, it may cause a timeout on the *Oscillator Test*. It does not necessarily mean that Oscillator Test has failed, but carrying out the Oscillator Test (page 3–45), Receiver Self Test (page 3–46) and CW Test (page 3–47) individually will give more valid results.

Copyright © 2010 Nokia. All rights reserved.

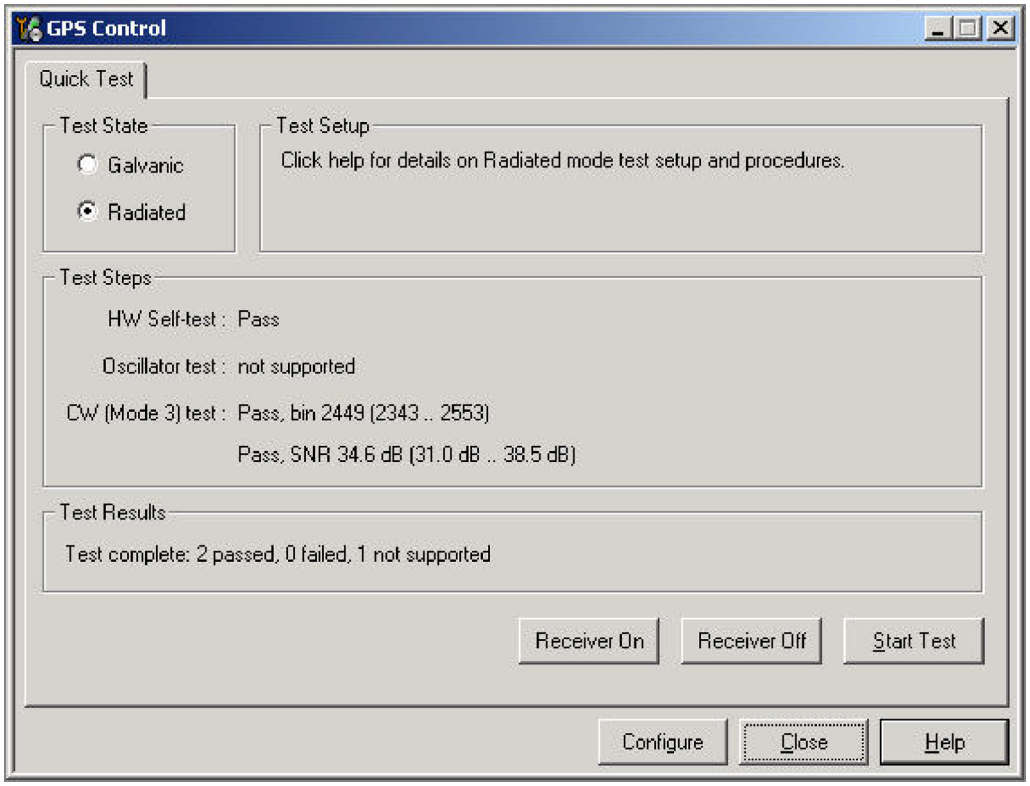

Figure 26 GPS Quick Test window for GPS troubleshooting

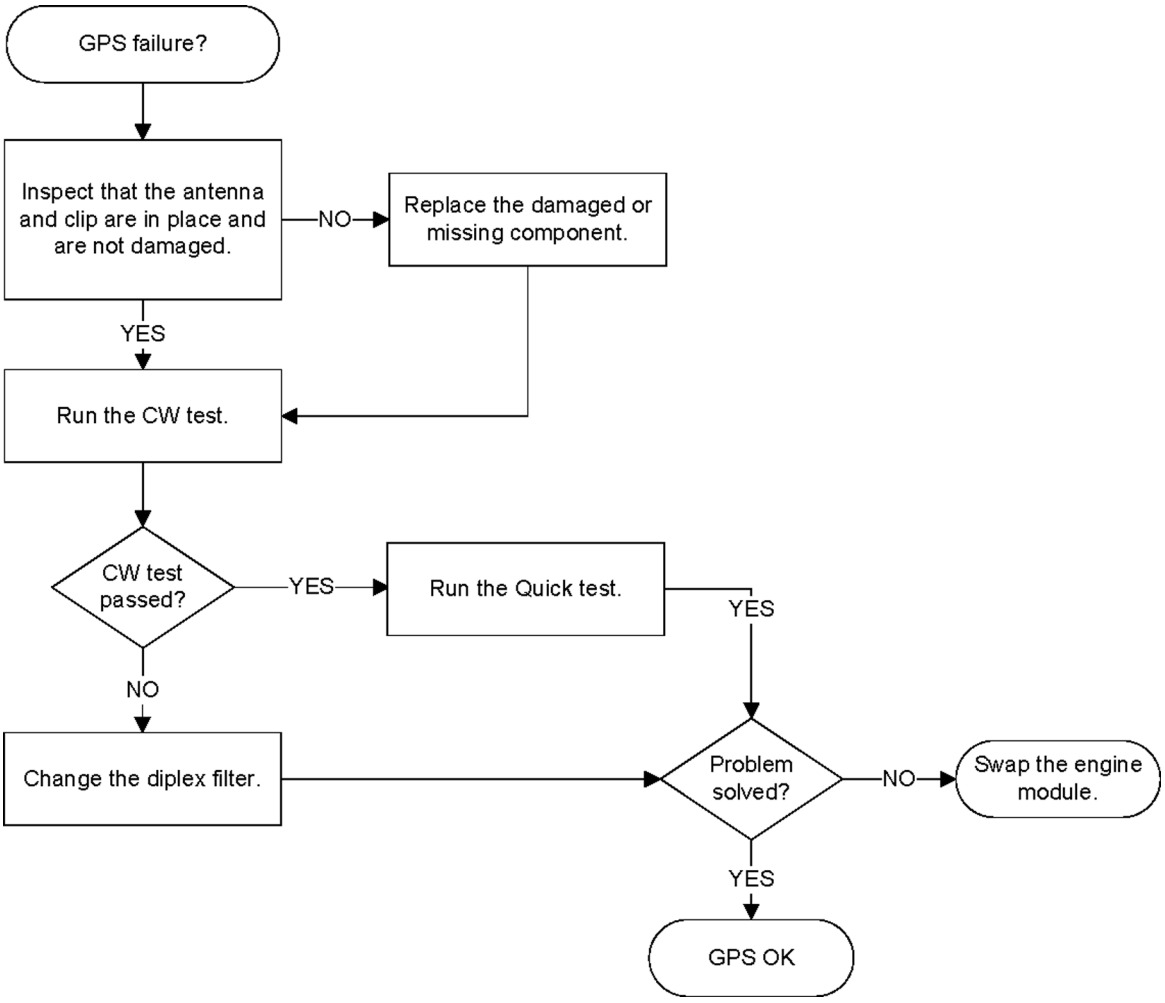
GPS failure troubleshooting

Context

The GPS failure troubleshooting flow can be followed and, where applicable, will feed into the basic checks.

Copyright © 2010 Nokia. All rights reserved.

Troubleshooting flow



WLAN troubleshooting

WLAN functional description

The Size 4 WLAN module is designed for use with a single antenna shared between itself and a co-located BT device. The WLAN SW is downloaded from the host engine when the WLAN is turned on over the dedicated SPI interface. The BT and WLAN engines use common reference clock from the RF engine.

Copyright © 2010 Nokia. All rights reserved.

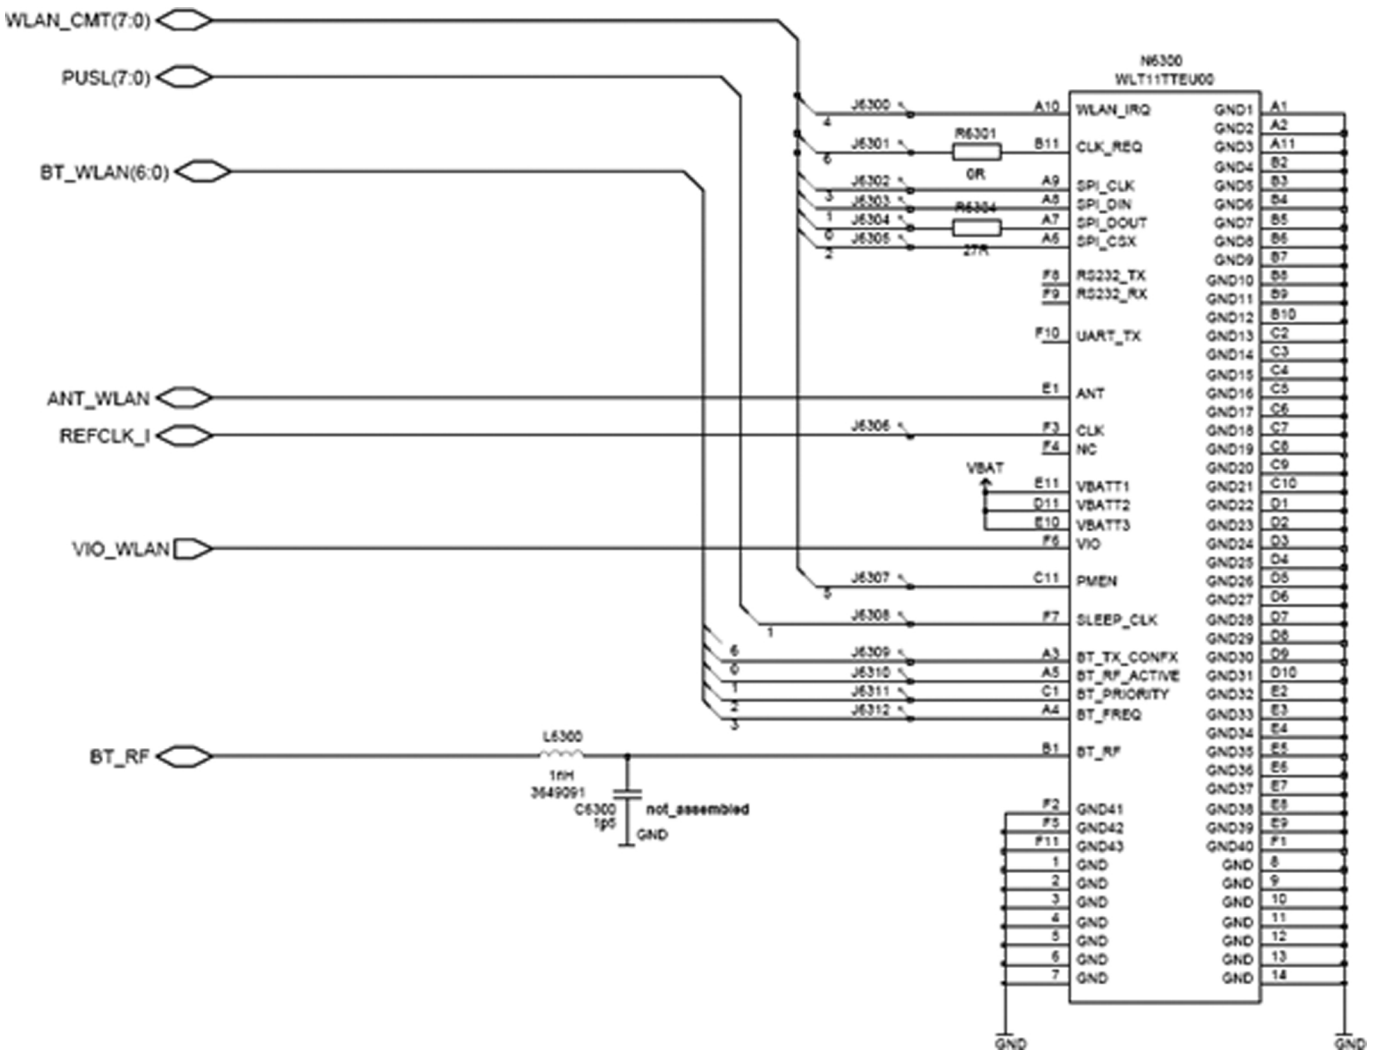


Figure 27 WLAN circuitry

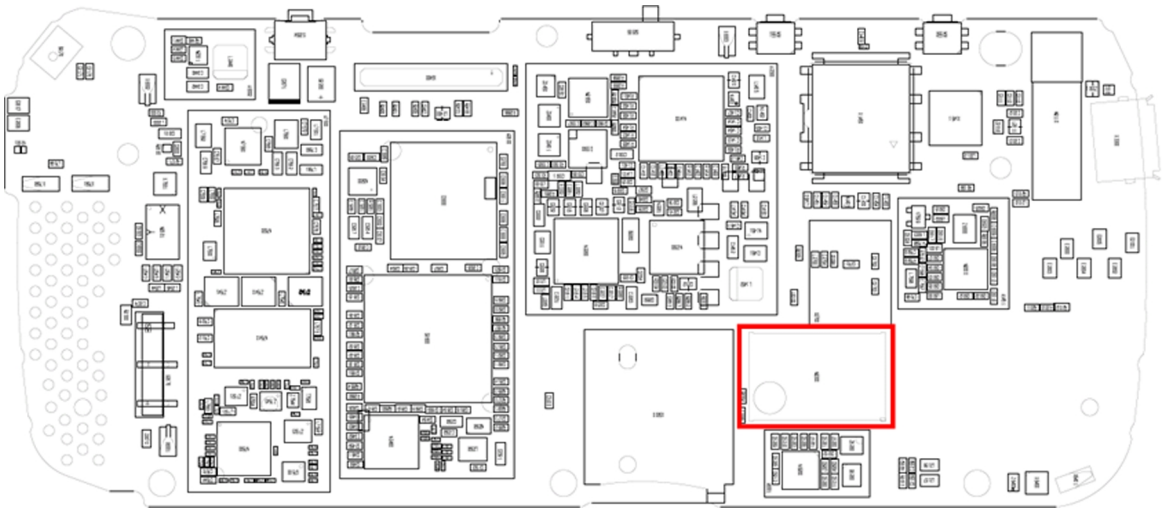

Figure 28 WLAN component placement

WLAN settings for Phoenix

Use the following to test WLAN using Phoenix:

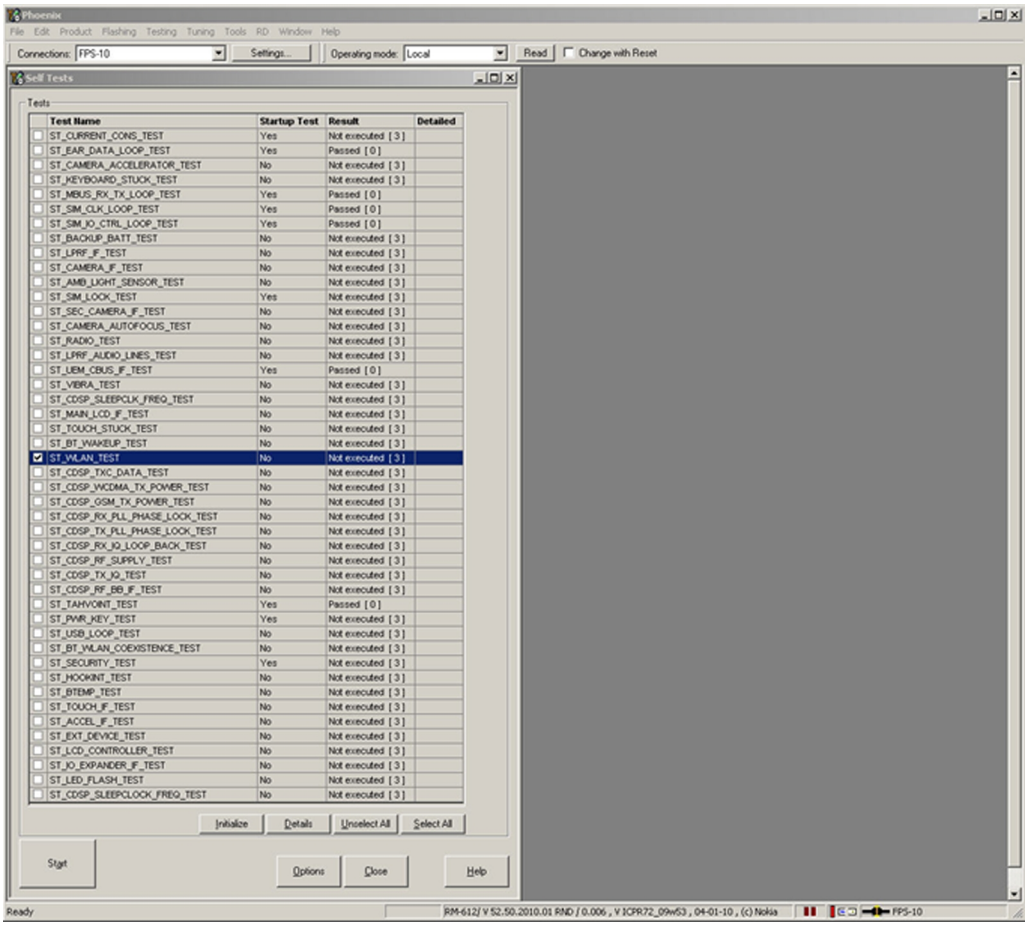
1 Set phone into Local Mode .

Copyright © 2010 Nokia. All rights reserved.

2 From the **File** menu, select **Scan Product** and check that the correct product version is displayed

3 From the **Testing** menu, select **Self Test**. This opens up a **Self Tests**dialog, as shown below.

Select the **ST_WLAN_TEST** check box as shown and then press the **Start** button. The test turns the WLAN on , sets up the SPI interface and then downloads the WLAN firmware into the WLAN module. During the download the WLAN acknowledges the data blocks and so the self test is a good way to confirm that the WLAN module is communicating with the Host. The result column changes to **Passed** after a few seconds if it is operating properly.

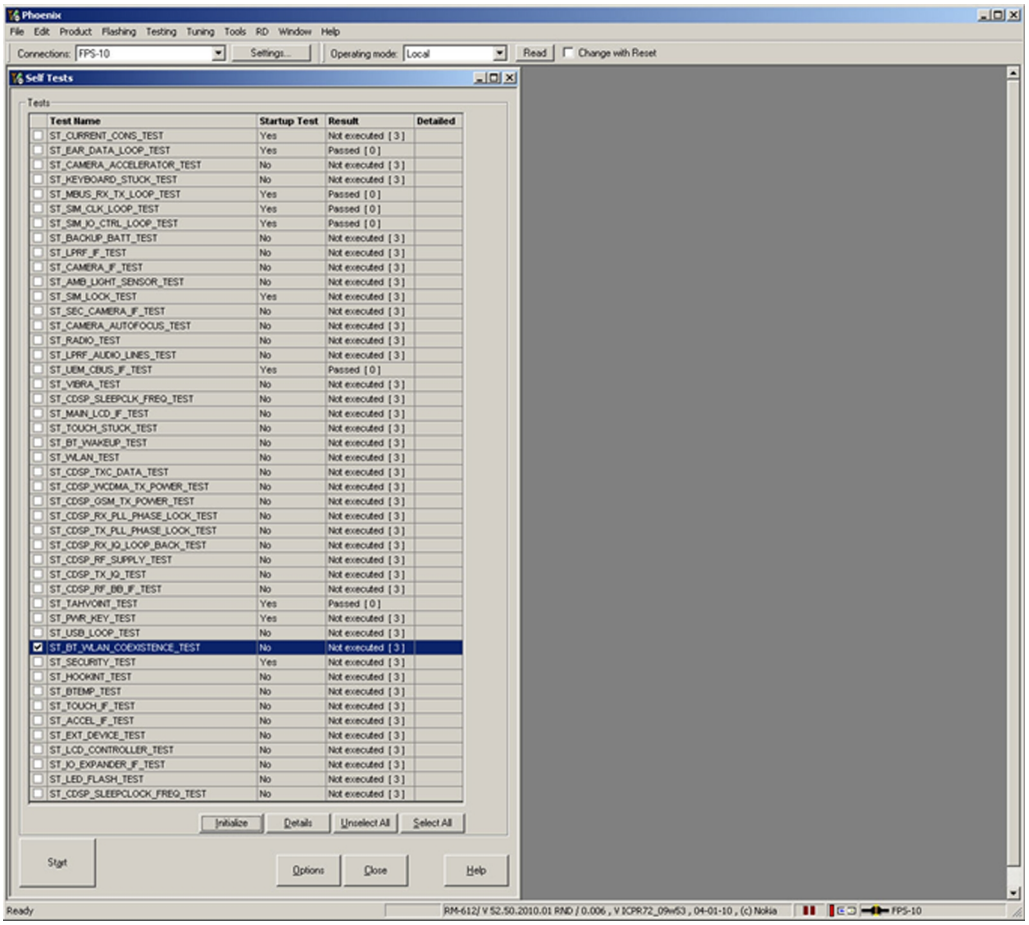


In addition, a test of the WLAN to BTH interface can be done by selecting the **ST_BT_WLAN_COEXISTENCE_TEST** check box and pressing the **Start** button.

This test verifies that the WLAN to BTH co-existence interface signals are properly connected and there are no open circuist or shorts on the four interface signals.

The co-existence interface comprises BTH Txconfig, BTH RF Active, BTH Priority, and BTH Frequency.

Copyright © 2010 Nokia. All rights reserved.



In summary these two Self Tests provide a simple means of ensuring that the Host engine is able to communicate with the WLAN module and check the interface to BTH. A more detailed WLAN performance test is covered in the WLAN functional tests (page 3–53) section.

WLAN functional tests

On/Off test

Prerequisites

A flash adapter connected to a PC with Phoenix service software is required.

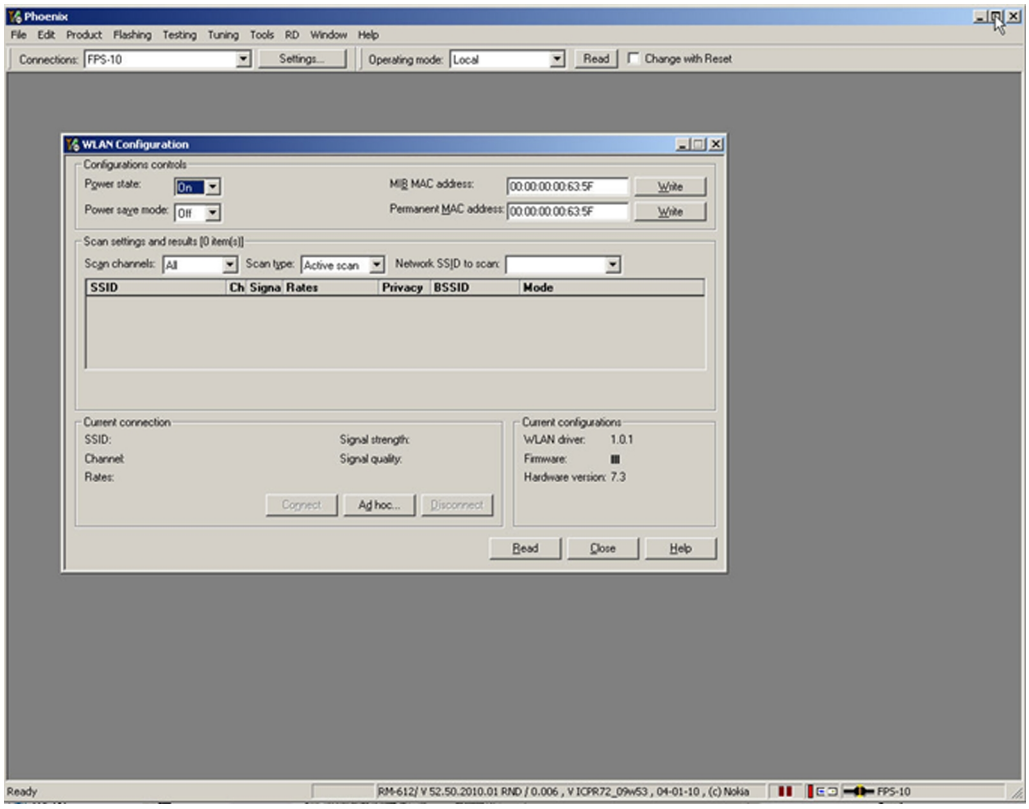
From the **Testing** toolbar, select **WLAN Configuration** option. This opens the **WLAN Configuration** dialog as shown below. WLAN can be turned ON and OFF by selecting **On** or **Off** from the **Power state** drop-down list (as indicated in the picture below):

1 With **Power State** set to **Off**, measure the dc power supply current consumption of the flash adaptor.

2 Next return the **Power State** to **On** and re-measure the dc power supply current of the flash adaptor.

The difference between the currents in (1) and (2) should be between 190 to 220 mA. When WLAN is ON, the firmware has been downloaded and the WLAN module is in the receive state. When WLAN in OFF, WLAN is powered down.

Copyright © 2010 Nokia. All rights reserved.



TX tests

Prerequisites

Connect a complete phone assembly with C-cover to a PC with Phoenix service software using a USB data cable.

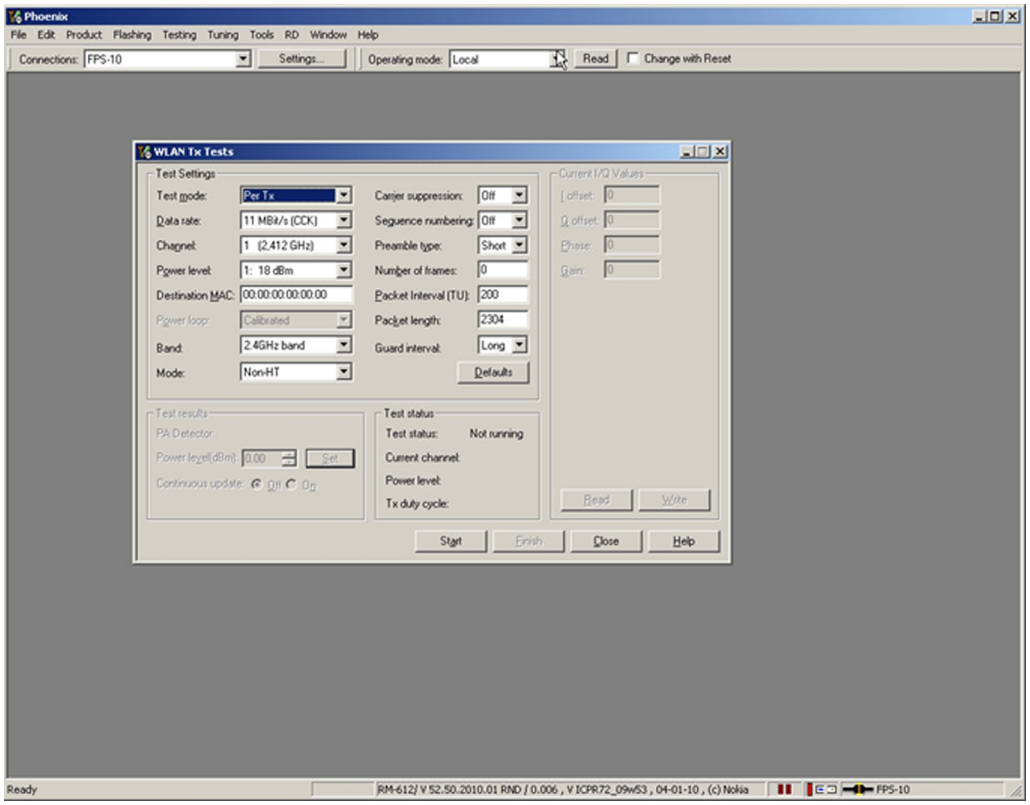
From the **Testing** toolbar, select **WLAN Tx Tests** option as shown below. This test can be used to verify TX configuration and functionality. The default settings are sufficient for testing the TX operation, although other channels and data rates are equally suitable. To start the test, press the **Start** button:

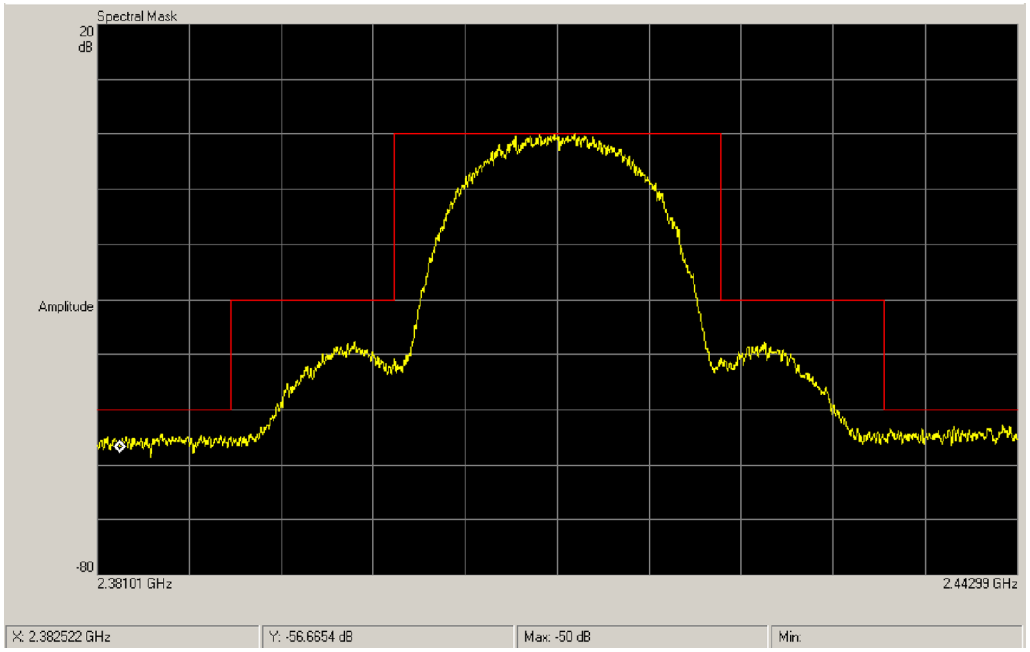
1 Monitor the WLAN TX spectrum on a Spectrum analyser. (When making a radiated test ensure that other WLAN devices are not transmitting as these may be detected as well, confusing the result). A typical 11 Mbps TX spectrum is shown in the figure below.

2 To finish the test, Press the **Finish** button.

The difference between the two readings should be approximately 150 mA and measures the transmit current in 11 Mbps, 802.11b mode of operation.

Copyright © 2010 Nokia. All rights reserved.





RX Tests

Prerequisites

Connect a complete phone assembly with C-cover to a PC with Phoenix service software using a USB data cable.

There are different options available for testing the Rx path. The simplest is to use the WLAN to report Rx packets when operating in an area where there is an active WLAN network. Simply starting an Rx test shows the number of packets detected by the WLAN module as it monitors the network. However, it requires a properly configured WLAN network.

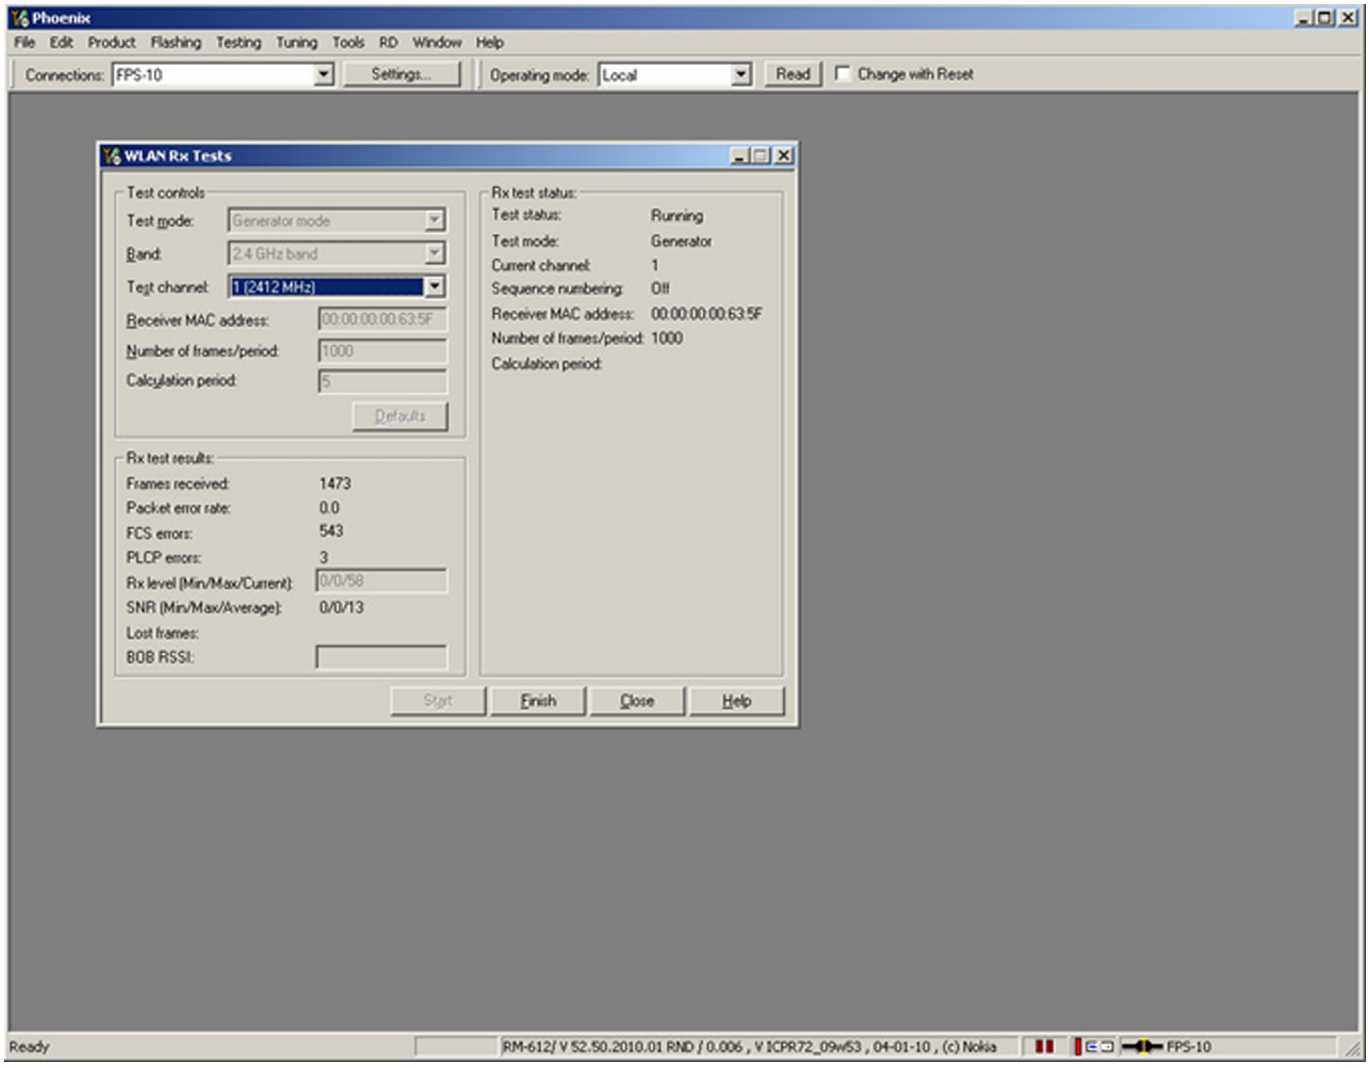
Copyright © 2010 Nokia. All rights reserved.

From the **Testing** toolbar, select **WLAN Rx Tests** option as shown below. This test can be used to verify Rx configuration and functionality.

To start the test, press the **Start** button.

As the WLAN monitors an active WLAN network, the Rx test results window updates and shows the number of Frames received, as well as the Packer error rate.

Monitoring the detected frames is a simple method to verify that the WLAN antenna and receiver path are working properly.



WLAN auto tuning

In case of WLAN ASIC change, RF power auto tuning is needed. Connect WLAN RF test connector to CMU200 input using proper RF cable. Start Phoenix WLAN autotune window. Check the settings and verify your PC communicates with CMU200 via GPIB.

Auto tuning procedure

1 Start tuning by pressing **Tune**.

Copyright © 2010 Nokia. All rights reserved.

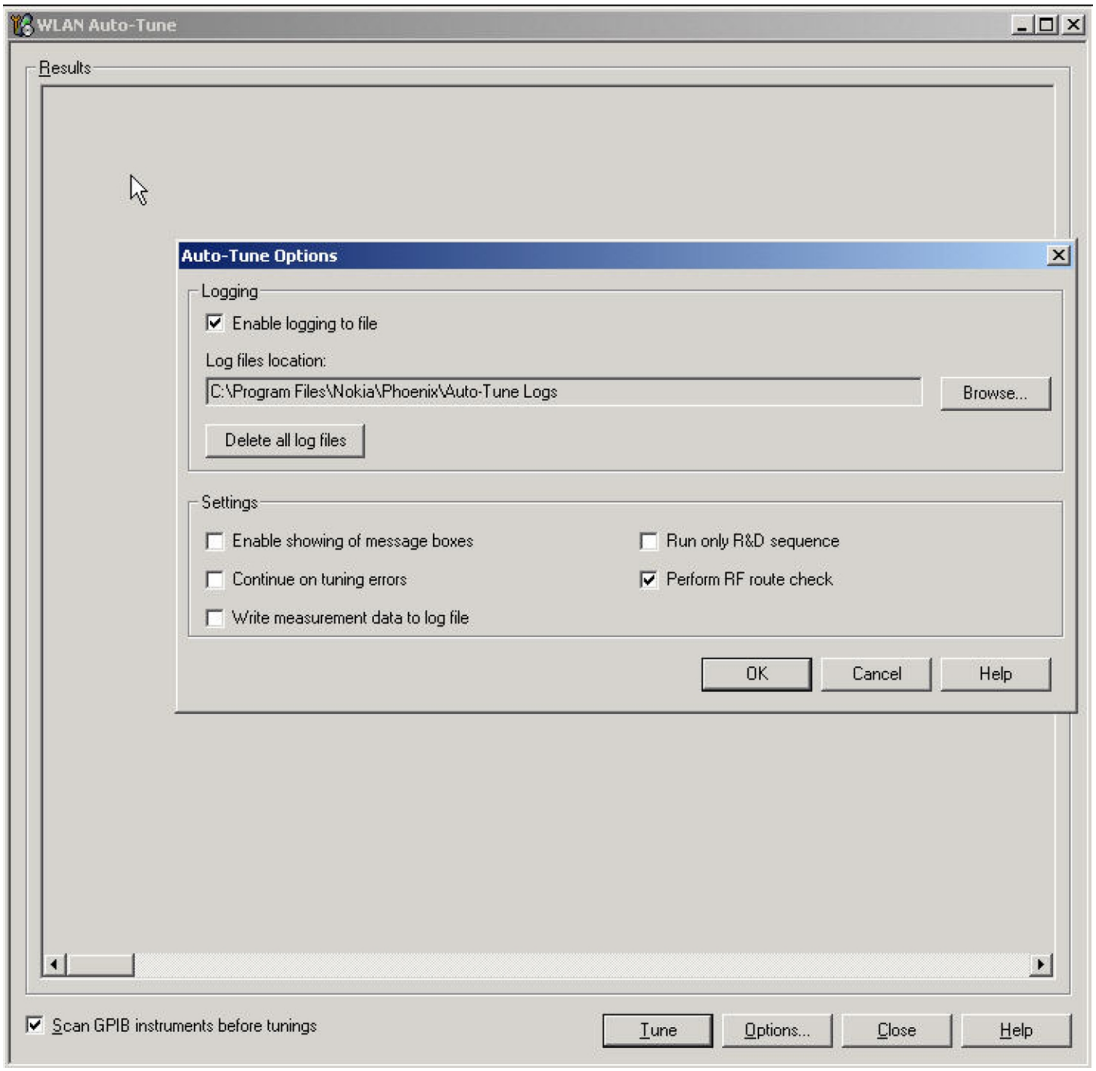


Figure 29 WLAN auto tune settings

Copyright © 2010 Nokia. All rights reserved.

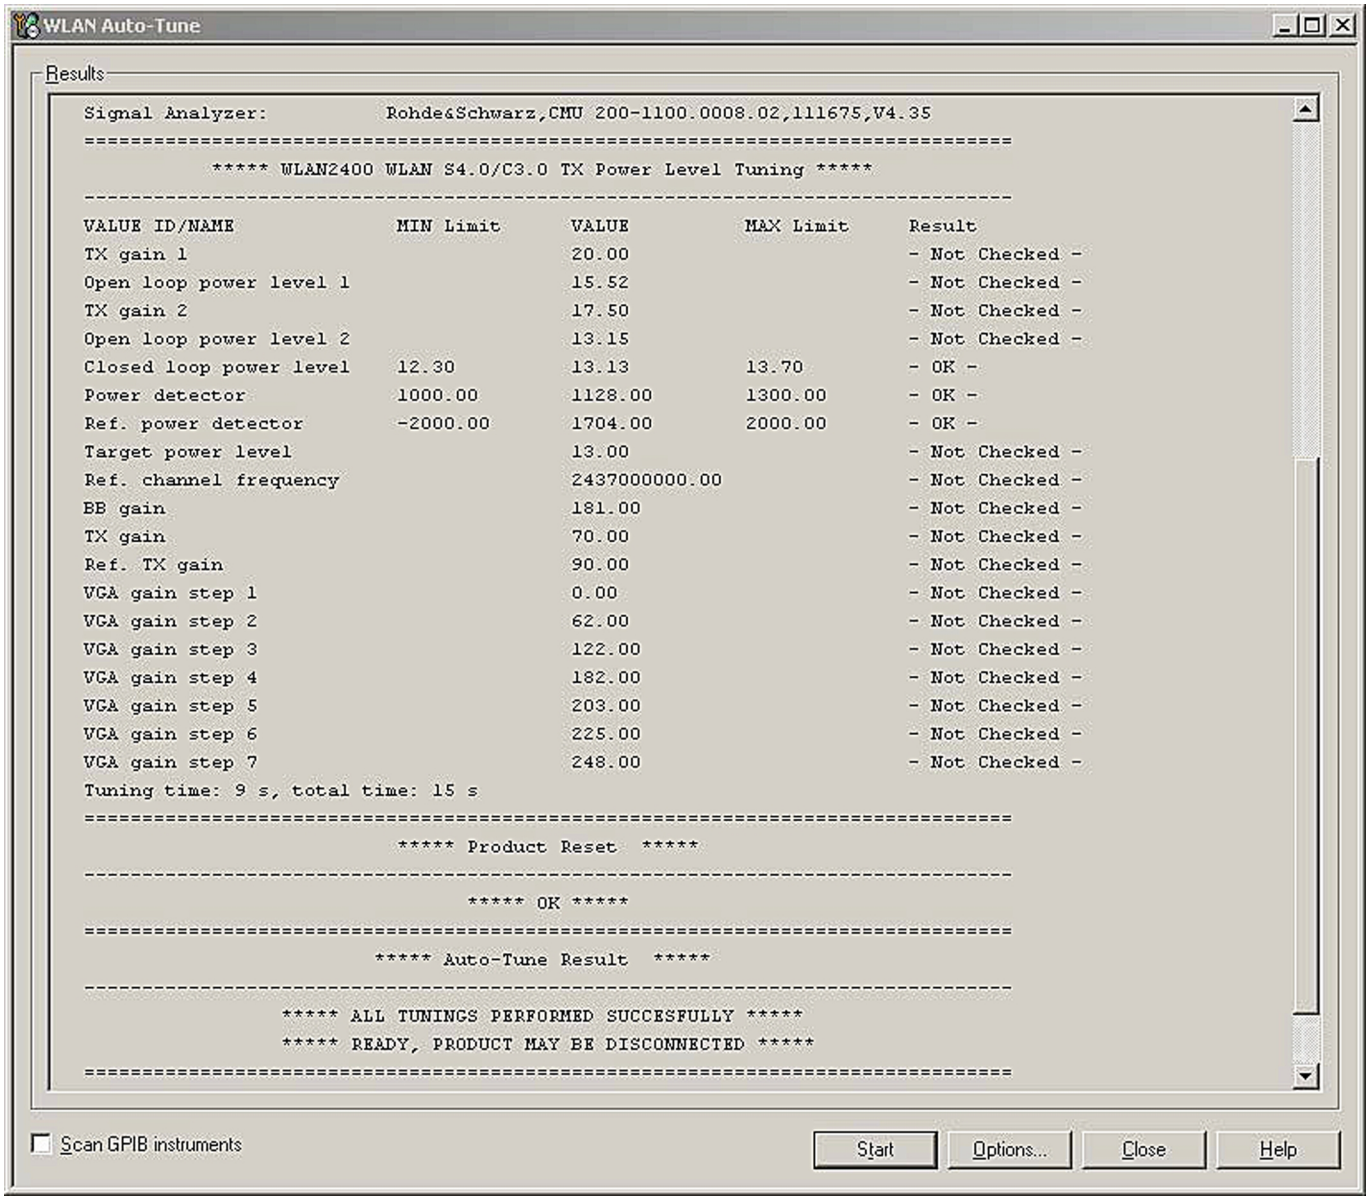

Figure 30 WLAN autotuning results

Bluetooth and FM radio troubleshooting

Introduction to Bluetooth/FM radio troubleshooting

Bluetooth/WLAN antenna

The BT RF signal is routed from BTHFMRDS2.2D through the WLAN module to the shared WLAN/BT/GPS antenna in the phone's top side on the B cover. The antenna has two resonators for BT/WLAN ISM band and also the GPS band and antenna are conducted with a feed (spring) on the PWB.

Copyright © 2010 Nokia. All rights reserved.

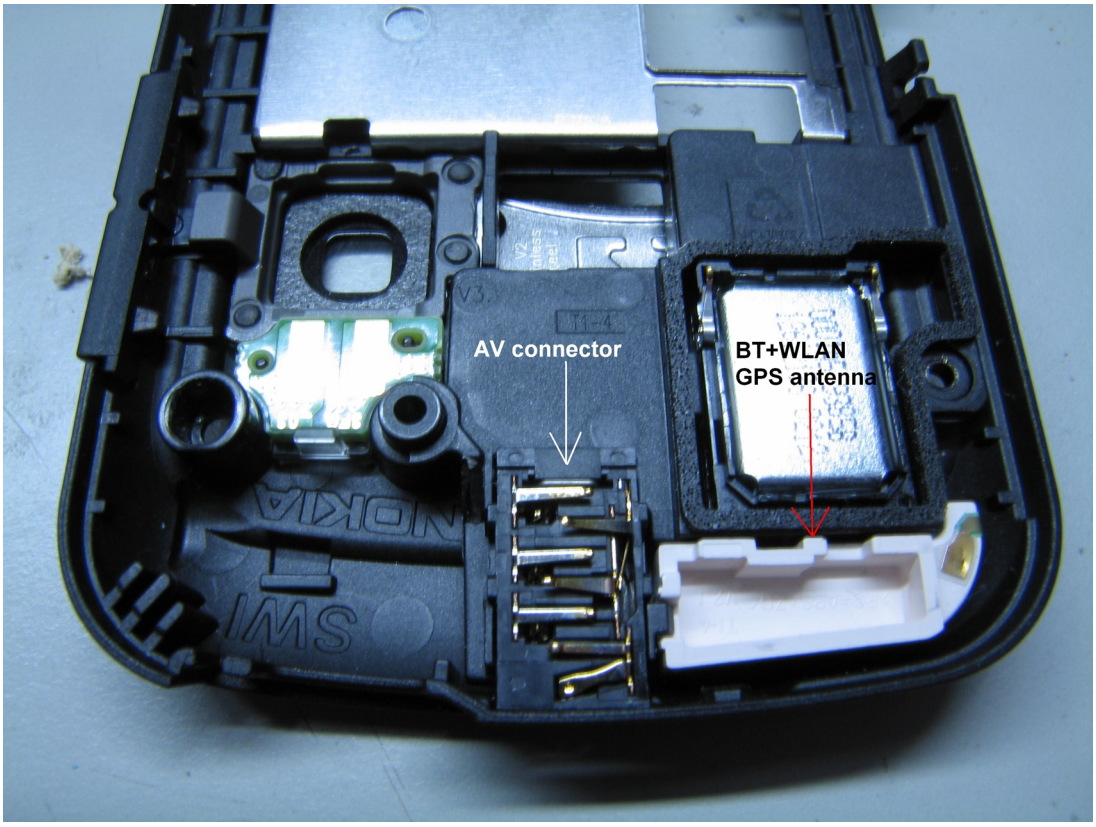

Figure 31 WLAN/BT/GPS antenna

Introduction to Bluetooth/FM radio troubleshooting

The Bluetooth and FM radio are combined in the same ASIC, so both features are checked when troubleshooting.

The following problems can occur with the Bluetooth and FM radio hardware:

Symptom	Problem	Repair solution
Unable to switch on the Bluetooth on the phone user interface	Open circuit solder joints or component failure of BTH/FM ASIC/module BB ASICs or SMD components	Replacement of engine
Able to send a data file to another Bluetooth device, but unable to hear audio through a functional Bluetooth headset	Open circuit solder joints or component failure of BTH/FM ASIC/module BB ASICs	Replacement of engine
Able to switch on Bluetooth on the phone user interface, but unable to detect other Bluetooth devices	Open circuit solder joints or Pogo Pins not making contact with c-cover	Repair of antenna circuit or replacement of BT/WLAN/ GPS antenna
Able to turn on FM radio and Bluetooth on the phone user interface, but unable to detect local FM radio stations with a Nokia headset inserted	Open circuit solder joints or detached component in FM antenna circuit	Repair of FM antenna circuit or replacement of AV connector

Copyright © 2010 Nokia. All rights reserved.

Symptom	Problem	Repair solution
Able to perform scans to detect local FM radio stations with a functional Nokia headset inserted, but unable to hear FM audio through the headset	Open circuit solder joints or detached component in FM audio path between Bluetooth/ FM ASIC and headset	Repair or replacement of FM audio AV connector and circuits

Users may experience the following problems resulting in functional phones being returned to the repair centre:

Symptom	Problem	Repair solution
Bluetooth feature does not operate as desired with another Bluetooth device.	Bluetooth Profile implemented in a Bluetooth accessory not supported in a Nokia phone	Use a Bluetooth accessory with Bluetooth profiles supported by the phone.
Poor FM radio reception (unable to detect many radio stations)	Nokia headset not being used	Use a Nokia headset.

Test coverage

The tests listed in the table below should be performed to verify whether the Bluetooth and FM receiver and transmitter are functional. The use of Self Tests are described in section *BT and FM Self Tests in Phoenix*

Test	Test Coverage	Repair solution
Blueooth Self Test: ST_LPRF_IF_TEST	Bluetooth-FM ASIC UART interface (controls Bluetooth and FM receiver and transmitter)	Replacement of engine (or repair of the phone BB)
Bluetooth Self Test: ST_BT_WAKEUP_TEST	Bluetooth ASIC interrupt control interface	Replacement of engine (or repair of the phone BB)
Bluetooth Self Test: ST_LPRF_AUDIO_LINES_TEST	Bluetooth ASIC PCM interface	Replacement of engine (or repair of the phone BB)
Bluetooth Functional Test: BER test with BT-Box or functional test with another Bluetooth device	Bluetooth antenna circuit	Repair of Bluetooth antenna matching circuit or replacement of B/WLAN/GPS antenna
FM Radio Self Test: ST_RADIO_TEST	FM Radio I2C interface	Replacement of engine (or repair of the phone BB)
FM Radio Functional Test: Perform a scan for local radio stations and check the station list displayed on the phone.	FM receiver antenna circuit	Repair of FM antenna matching circuit or replacement of AV connector and flex
FM Radio Functional Test: Listen to a local radio station.	FM receiver audio circuit	Repair of FM antenna matching circuit or replacement of AV connector and flex

The self tests run from the Phoenix software are used for fault diagnosis.

Copyright © 2010 Nokia. All rights reserved.

If the Phoenix software is not available the functional tests with phone accessories are sufficient to verify the functionality of the Bluetooth and FM radio receiver and transmitter.

Bluetooth/FM radio component layout and test points

The Bluetooth antenna is product specific (ceramic antenna conducted by feed on the PWB). On phones with WLAN and GPS, the Bluetooth RF signal is routed through a WLAN front-end module via diplexer and a shared Bluetooth/WLAN/GPS antenna is used.

The FM RF signal is routed through the FM antenna matching circuit to the phone headset AV connector.

The FM radio audio signal is routed to the headset AV connector through the BB ASIC shared by the phone audio functions.

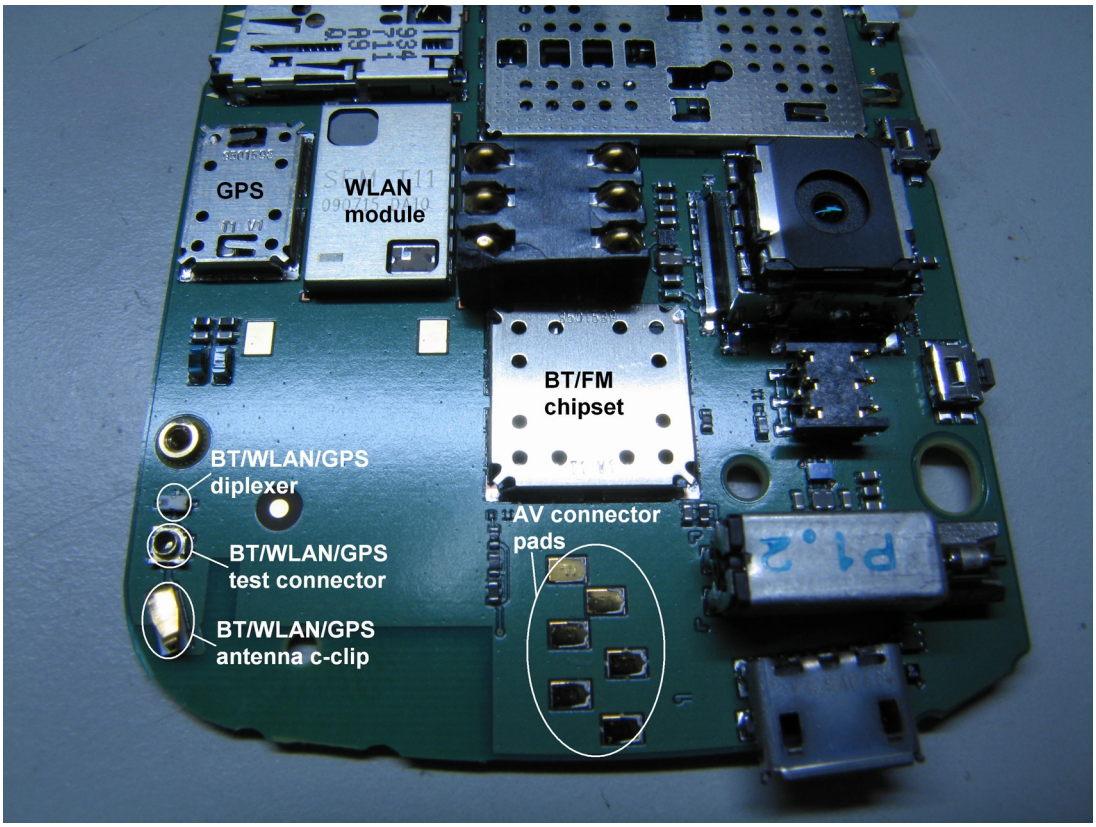

Figure 32 Bluetooth/FM radio component layout and test points

Bluetooth BER test

Prerequisites

JBT-9, or SB-6 Bluetooth test box (BT-box) is required to perform a BER test. If a BT-box if not available Bluetooth functionality can be checked by transfering a file to another Bluetooth phone.

Steps

1. Place the phone in the flash adapter or connect data cable to phone.
2. Start *Phoenix* service software.
3. Choose **File → Scan Product**.
4. Choose **Testing → Bluetooth LOCALS** .
5. Locate the BT-box serial number (12 digits) found in the type label on the back of the JBT-9, or SB-6 Bluetooth test box.

Copyright © 2010 Nokia. All rights reserved.

6. In the Bluetooth *LOCALS* window, write the 12-digit serial number on the *Counterpart BT Device Address* line.
7. Place the BT-box near (within 10 cm) of the phone and click **Start BER Test**.

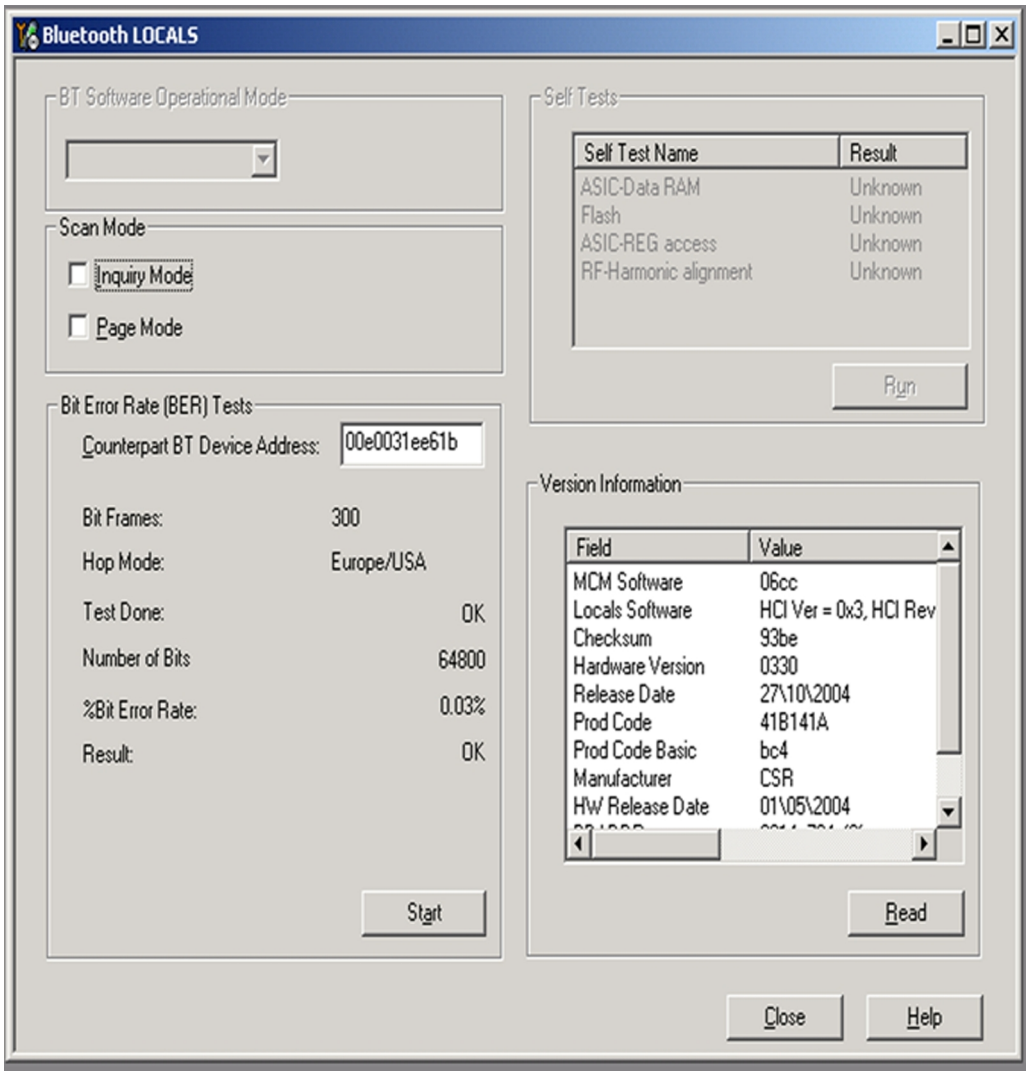

Figure 33 Bluetooth BER test

Bluetooth and FM radio self tests in Phoenix

Prerequisites

A flash adapter (or phone data cable) connected to a PC with Phoenix service software is required.

Steps

1. Place the phone in the flash adapter or connect data cable to phone.
2. Start *Phoenix* service software.
3. Choose **File → Scan Product.**
4. From the **Mode** drop-down menu, set mode to **Local**.
5. Choose **Testing → Self Tests.**
6. In the *Self Tests* window check the following Bluetooth and FM radio related tests:
   - **ST_LPRF_IF_TEST**

Copyright © 2010 Nokia. All rights reserved.

- **ST_LPRF_AUDIO_LINES_TEST**
- **ST_BT_WAKEUP_TEST**
- **ST_RADIO_TEST**

7. To run the tests, click **Start**.

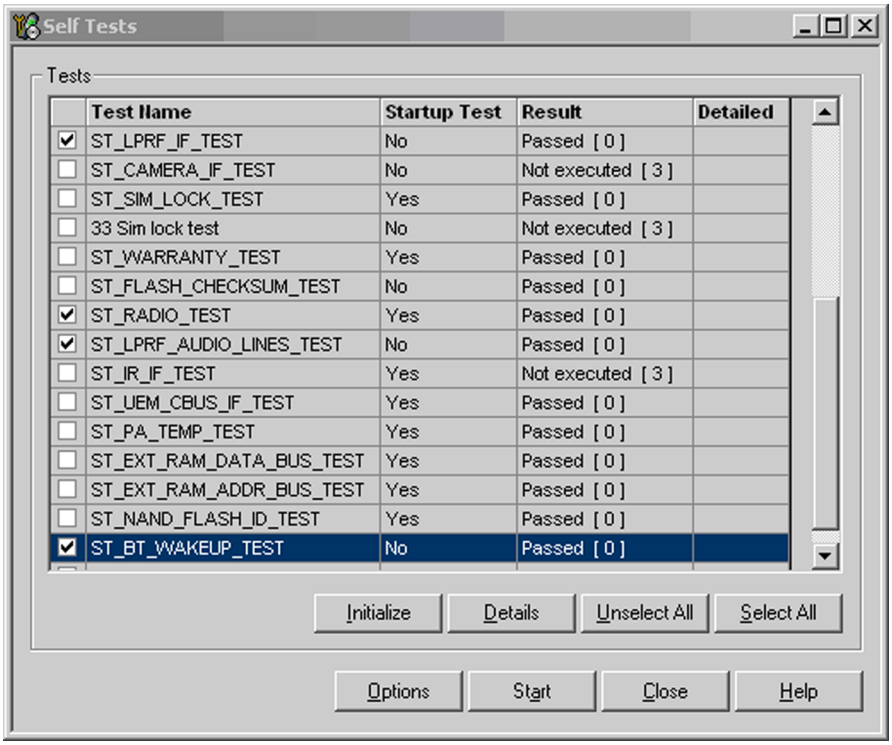

Figure 34 Bluetooth and FM radio self tests in *Phoenix*

FM radio testing

Steps

1. Set signal generator parameters:
   - FM modulation on
   - Frequency 100MHz
   - FM deviation 22kHz
   - Modulation frequency 1kHz
   - RF level should be varied during the test to obtain good audio signal quality
   - Connect suitable antenna to signal generator

     Note: You may alternately use a known good FM radio broadcast as a test signal.
2. Attach the Nokia headset to the phone's AV connector.
3. Use Scroll button to autotune to the radio frequency.
4. Set volume to suitable level.
5. Check audio quality with a headset.

Copyright © 2010 Nokia. All rights reserved.

Audio troubleshooting

Audio troubleshooting test instructions

Single-ended external earpiece and differential internal earpiece outputs can be measured either with a single-ended or a differential probe.

When measuring with a single-ended probe each output is measured against the ground.

Internal handsfree output is measured using a current probe, if a special low-pass filter designed for measuring a digital amplifier is not available. Note also that when using a current probe, the input signal frequency must be set to 2 kHz.

The input signal for each loop test can be either single-ended or differential. Exception to this is a digital microphone, which needs input signal from an external sound source (laptop speaker) to playback for example 1 kHz sine wave from 5 cm distance.

Required equipment

The following equipment is needed for the tests:

- Oscilloscope
- Function generator (sine waveform)
- Current probe (Internal handsfree PWM output measurement)
- Phoenix service software
- Battery voltage 3.7V
- Sound source (laptop speaker or B&K type 4231 calibrator)

Test procedure

Audio can be tested using the Phoenix audio routings option. Three different audio loop paths can be activated:

- AV microphone to AV earpiece
- AV microphone to HP earpiece
- External microphone in Internal handsfree out
- HP microphone to AV earpiece

Each audio loop sets routing from the specified input to the specified output enabling a quick in-out test. Loop path gains are fixed and they cannot be changed using Phoenix. Correct pins and signals for each test are presented in the following table.

Phoenix audio loop tests and test results

The results presented in the table apply when no accessory is connected and battery voltage is set to 3.7V.

Earpiece, internal microphone and speaker are in place during measurement. Applying a headset accessory during measurement causes a significant drop in measured quantities.

The gain values presented in the table apply for a differential output vs. single-ended/differential input.

Copyright © 2010 Nokia. All rights reserved.

Loop test	Input terminal	Output terminal	Path gain [dB] (fixed)	Input voltage [mVp-p]	Output voltage [mVp-p]	Output DC level [V]	Output current [mA]
AV Mic to AV Earpiece	HS_MIC & GND	HS_EAR_L & GND HS_EAR_R & GND		100		1.2	NA
AV Mic to HP Earpiece	HS_MIC & GND	EarP & GND EarN & GND		100		1.2	NA
HP Mic to AV Earpiece	Acoustical input, 1kHz sine wave	HS_EAR_L & GND HS_EAR_R & GND	NA	94 dB SPL	100		NA
External Mic in Internal handsfree out	HS_MIC & GND	E2002 E2005		1000

Acoustics troubleshooting

Introduction to acoustics troubleshooting

Acoustics design ensures that the sound is detected correctly with a microphone and properly radiated to the outside of the device by the speaker. The acoustics of the phone includes three basic systems: earpiece, Integrated Hands Free (IHF) and microphone.

The sound reproduced from the earpiece radiates through a single hole on the front cover (A-cover). The sound reproduced from the IHF speakers radiate through dual sound holes located at the top and bottom of the phone. The microphone is located around the 'space' key in the keymat of the phone.

For a correct functionality of the phone, all sound holes must be always open. When the phone is used, care must be taken not to close any of those holes with a hand or fingers. The phone should be dry and clean, and no objects must be located in such a way that they close any of the holes.

Baseband manual tuning guide

Certificate restoring

Context

This procedure is performed when the device certificate is corrupted for some reason.

All tunings (RF & Baseband, UI) must be done after performing the certificate restoring procedure.

The procedure for certificate restoring is the following:

- Flash the phone with the latest available software using FPS-10 or FPS-21.

  Note: If the COMBO memory of a phone is replaced, the ENO SW must be flashed first before performing the "normal" firmware flashing.
- Execute the certificate restore process in Phoenix.
- Tune the phone completely.

  Note: SX-4 smart card is needed.
- If the phone resets after certificate restoring, reflash the phone again.

Required equipment and setup:

- *Phoenix* service software v 2008.34.6 or newer.
- The latest phone model specific *Phoenix* data package.
- PKD-1 dongle
- SX-4 smart card (Enables testing and tuning features)
- External smart card reader
- Activated FPS-10 **OR** FPS-21 flash prommer
- Latest flash update package for FPS-10 or FPS-21 flash prommers
- CU-4 control unit
- USB cable from PC USB Port to CU-4 control unit
- Phone model specific adapter for CU-4 control unit
- PCS-1 cable to power CU-4 from external power supply
- XCS-4 modular cable between flash prommer and CU-4

  Note: CU-4 must be supplied with +12 V from an external power supply in all steps of certificate restoring.

Steps

1. Program the phone software.

   Note: If the COMBO memory of a phone is replaced, the ENO SW must be flashed first before performing the "normal" firmware flashing.
2. Execute the certificate restore process in Phoenix.

Next actions

After a successful rewrite, you must retune the phone completely by using *Phoenix* tuning functions.

Important: Perform all tunings: RF, BB, and UI.

Copyright © 2010 Nokia. All rights reserved.

Energy management calibration

Prerequisites

Energy Management (EM) calibration is performed to calibrate the setting (gain and offset) of AD converters in several channels (that is, **battery voltage**, **BSI**, **battery current**) to get an accurate AD conversion result.

Hardware setup:

- An external power supply is needed.
- Supply 12V DC from an external power supply to CU-4 to power up the phone.
- The phone must be connected to a CU-4 control unit with a product-specific flash adapter.

Steps

1. Place the phone to the docking station adapter (CU-4 is connected to the adapter).
2. Start *Phoenix* service software.
3. Choose **File** → **Scan Product.**
4. Choose **Tuning** → **Energy Management Calibration.**
5. To show the current values in the phone memory, click **Read**, and check that communication between the phone and CU-4 works.
6. Check that the **CU-4 used** check box is checked.
7. Select the item(s) to be calibrated.

   Note: ADC calibration has to be performed before other item(s). However, if all calibrations are selected at the same time, there is no need to perform the ADC calibration first.
8. Click **Calibrate**.

   The calibration of the selected item(s) is carried out automatically.

   The candidates for the new calibration values are shown in the *Calculated values* column. If the new calibration values seem to be acceptable (please refer to the following "Calibration value limits" table), click **Write** to store the new calibration values to the phone permanent memory.

Table 9 Calibration value limits

Parameter	Min.	Max.
ADC Offset	-20	20
ADC Gain	12000	14000
BSI Gain	1100	1300
VBAT Offset	2400	2650
VBAT Gain	19000	23000
VCHAR Gain	N/A	N/A
IBAT (ICal) Gain	9000	11000

9. Click **Read**, and confirm that the new calibration values are stored in the phone memory correctly. If the values are not stored to the phone memory, click **Write** and/or repeat the procedure again.
10. To end the procedure, close the *Energy Management Calibration* window.

General RF troubleshooting

Introduction to RF troubleshooting

Most RF semiconductors are static discharge sensitive

ESD protection must be applied during repair (ground straps and ESD soldering irons).

Measuring equipment

All measurements should be done using:

- An oscilloscope for low frequency and DC measurements. Recommended probe: 10:1, 10Mohm//8pF.
- A radio communication tester including RF generator and spectrum analyser, for example Rohde & Schwarz CMU200. (Alternatively a spectrum analyser and an RF generator can be used. Some tests in this guide are not possible to perform if this solution is chosen).

  Note: A mobile phone WCDMA transmitter should never be tested with full TX power (it is only possible to perform the measurements in a good RF-shielded room). Even low power WCDMA transmitters may disturb nearby WCDMA networks and cause problems to 3G cellular phone communication in a wide area.

  Note: All communication Test Set Screen dumps are from CMU200. Other testers are different.

  Note: All measurements with an RF coupler should be performed in an RF-shielded environment because nearby base stations can disturb sensitive receiver measurements. If there is no possibility to use RF shielded environment, testing at frequencies of nearby base stations should be avoided.

Level of repair

The scope of this guideline is to verify functionality of the cellular RF block without removing RF shield.

RF key components

The figure below shows the key components of RM-612 and RM-624.

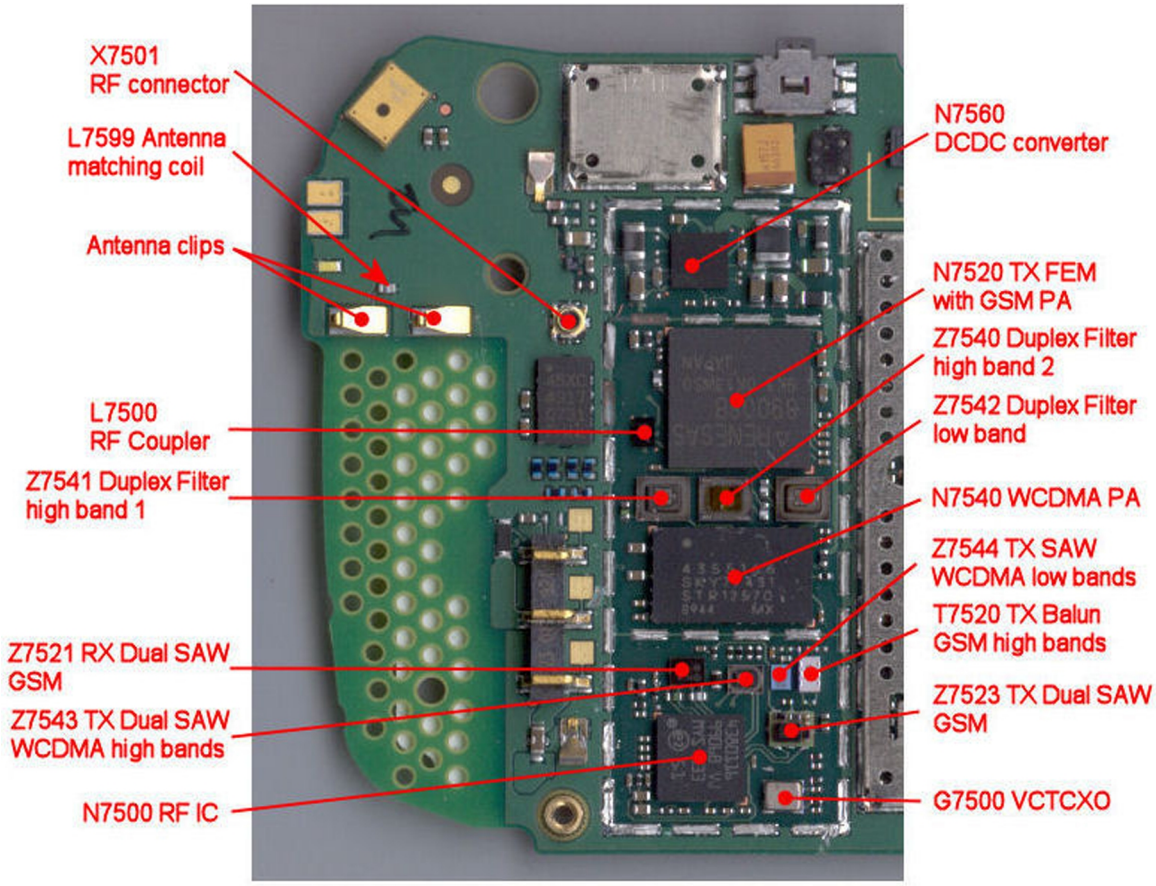

Figure 39 RF key components

Auto tuning

Introduction to RF tunings

RF tuning is always performed with the help of a product-specific module jig, never with an RF coupler. Using an RF coupler in the tuning phase will cause a complete mistuning of the RF part.

Cable and adapter losses

RF cables and adapters have some losses. They have to be taken into account when the phone is tuned. As all RF losses are frequency dependent, the user has to act very carefully and understand the measurement setup. For RF attenuations of the module jig and RF cable, please refer to the Service Tools section.

Auto tuning

This phone can be tuned automatically.

Auto tuning is designed to align the phone's RF part easier and faster. It performs calibrations, tunings and measurements of RX and TX. The results are displayed and logged in a result file, if initiated.

Hardware set up

For hardware requirements for auto tuning, please refer to Service concept for RF testing and RF/BB tuning (page 4–41) .

Phoenix preparations

Install the phone specific data package, for example *_dp_1.78_sw_sh3.26.exe*. This defines phone specific settings.

Copyright © 2010 Nokia. All rights reserved.

Auto tuning procedure

1 Make sure the phone (in the jig) is connected to the equipment. Otherwise some menus will not be shown in Phoenix.
2 To go to autotune, select **Tuning (Alt-U)** → **Auto-Tune (Alt-A)** from the menu.
3 Start autotuning by clicking the *Tune* button.

Self test troubleshooting

Troubleshooting with RF self tests

Context

Vapaus (N7500) RF ASIC contains test structures that can be used to detect certain RF related errors. In order to use these self tests most efficient way, it is very important that the tests are performed in a certain order, or at least that the error data is analysed in this order. The tests are designed so that by going through them in this order it is easy to find the problem component without any redundant checks. The flowchart presented in this document is based on that idea. So, if RFBUS fails , there is no need to spend time wondering why there is no power at TX, and so on.

The testing order recommended and used in this troubleshooting guide is the following:

1 ST_CDSP_RF_BB_IF test (86)
   - Tests the functionality of the BB/Vapaus serial interface & Reset lines.
   - If this test fails, it means that there is a problem in programming of the N7500 and all of the following tests can not give correct data.
2 ST_CDSP_RF_SUPPLY_TEST (83)
   - Tests the functionality of N7500 bias block, regulators, reference voltage line and, supply connections.
   - If these fail, all other N7500 tests can/will fail.
3 ST_CDSP_TX_IQ_TEST (85)
   - Test checks that the TXIQ lines between BB and N7500 are properly connected.
   - If this fails also power tests and RXIQ loopback will fail.
4 ST_CDSP_TXC_DATA_TEST (74)
   - This tests that the TXC line between AVILMAS (N2200) & Vapaus (N7500) is properly connected.
   - If this fails TX power tests will also fail.
5 ST_CDSP_RX_PLL_PHASE_LOCK_TEST (79)
   - Tests the functionality of RX PLL.
   - If this fails none of the RX related measurements can be trusted.
6 ST_CDSP_TX_PLL_PHASE_LOCK_TEST (80)
   - Tests the functionality of TX PLL.
   - If this fails the TX power tests will also fail.
7 ST_CDSP_TX_WCDMA_POWER_TEST (75)
   - Checks the output power of the WCDMA transmitter.
8 ST_CDSP_RX_IQ_LOOPBACK (81)
   - Tests that the RXI lines and VREFCM line between BB and N7500 are connected.
9 ST_CDSP_TX_GSM_POWER_TEST (77)
   - Checks the output power of the GSM transmitter.

Receiver troubleshooting

Introduction to receiver (RX) troubleshooting

RX can be tested by making a phone call or in local mode. For the local mode testing, use Phoenix service software.

The main RX troubleshooting measurement is RSSI reading. This test measures the signal strength of the received signal. For GSM RSSI measurements, see *GSM RX chain activation for manual measurements/GSM RSSI measurement*. For a similar test in WCDMA mode, see *WCDMA RSSI measurement*.

GSM RX chain activation for manual measurements/GSM RSSI measurement

Prerequisites

Make the following settings in Phoenix service software:

Setting	GSM850	GSM900	GSM1800	GSM1900
Phoenix Channel	190	37	700	661

Copyright © 2010 Nokia. All rights reserved.

Setting	GSM850	GSM900	GSM1800	GSM1900
Signal generator to antenna connector	881.66771MHz	942.46771MHz	1842.86771MHz	1960.06771MHz
	(67.71kHz offset)	(67.71kHz offset)	(67.71kHz offset)	(67.71kHz offset)
	at -60dBm	at -60dBm	at -60dBm	at -60dBm

Steps

1. Set the phone to local mode.
2. Activate RSSI reading in Phoenix (**Testing** → **GSM** → **RSSI reading**)

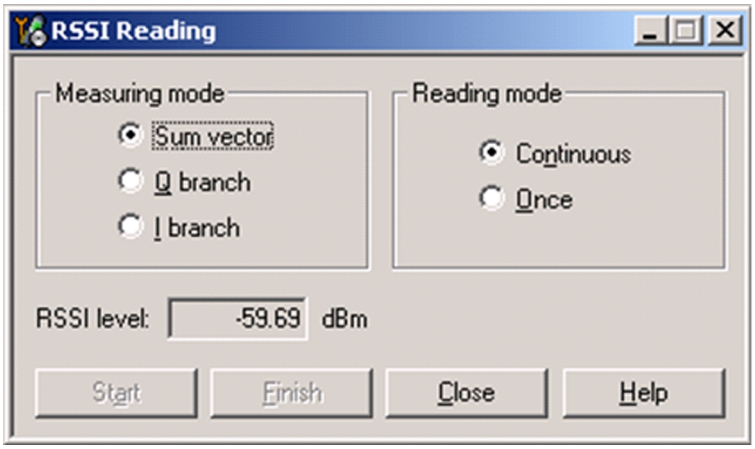

Figure 40 Phoenix GSM RSSI reading window

Results

The reading should reflect the level of the signal generator (-losses) +/- 5 dB.

When varying the level in the range -30 to -102 dBm the reading should then follow within +/-5 dB.

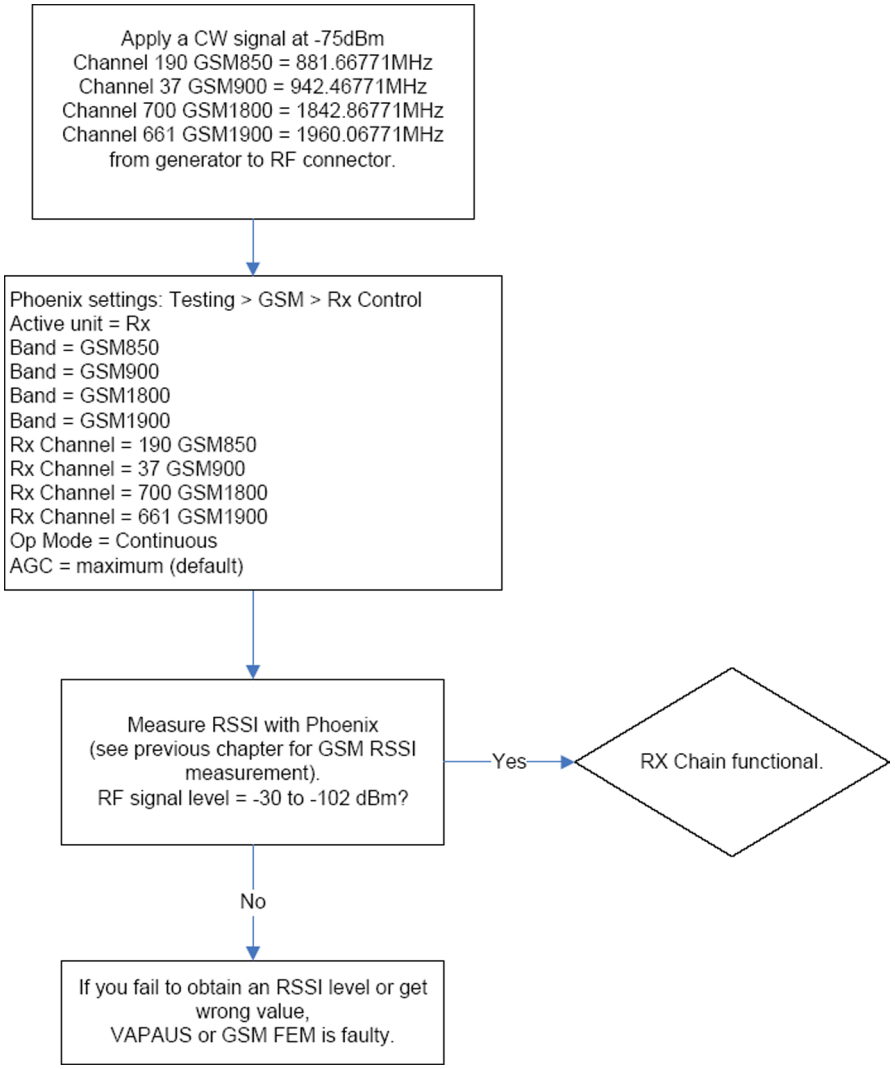
GSM receiver troubleshooting flowchart

Troubleshooting flow



WCDMA RX chain activation for manual measurement

Steps

1. Via Phoenix Testing menu, choose **WCDMA/RX Control**.
2. In the RX control window, make the following settings:

Copyright © 2010 Nokia. All rights reserved.

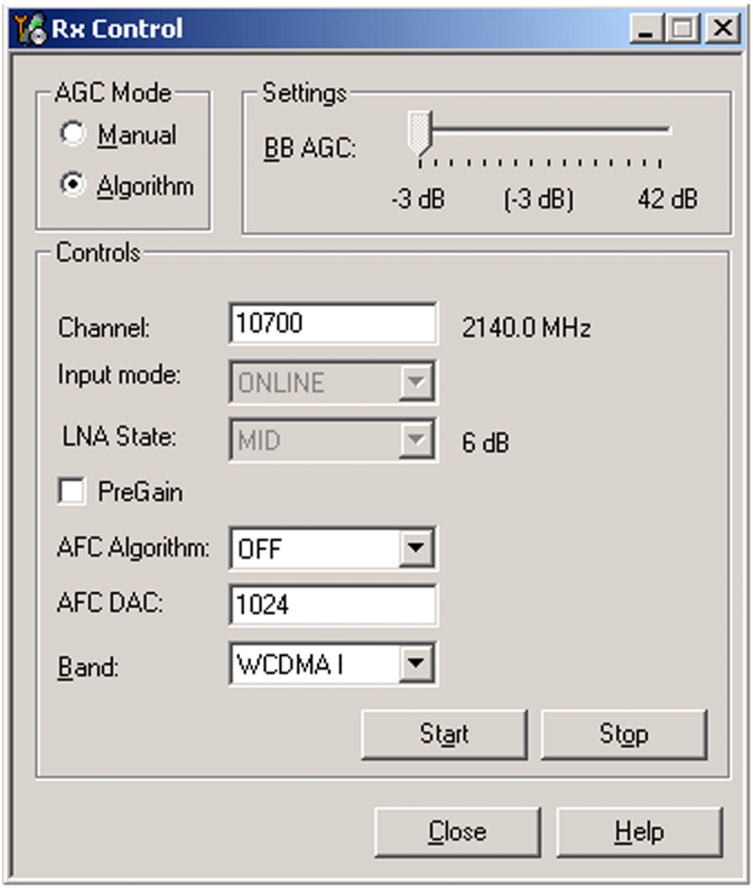


Figure 41 Phoenix WCDMA RX Control window

Note: Channel for band WCDMA II 9800, V 4408, VIII 3012

3. Click **Start** to activate the settings.

   If the settings are changed later on (for example, change of channel) you have to click **Stop** and **Start** again.

   Note: Clicking **Stop** also disables TX control if it was active.

WCDMA RSSI measurement

Prerequisites

WCDMA RX must be activated before RSSI can be measured. For instructions, please refer to WCDMA RX chain activation. Connect signal generator to RF connector and use appropriate frequency for each channel (2141MHz for channel 10700 WCDMA band I, WCDMA modulation).

Steps

1. Set the following RF generator settings:

Copyright © 2010 Nokia. All rights reserved.

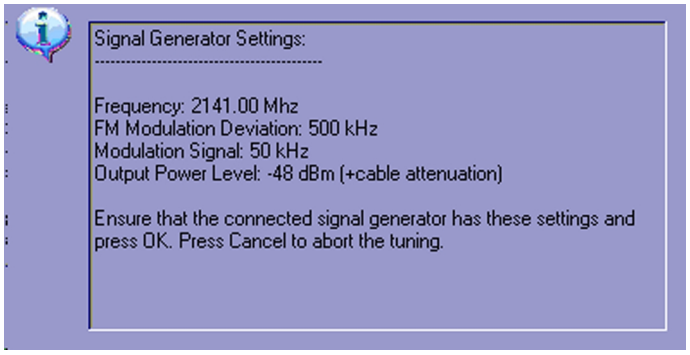

Figure 42 WCDMA RX generator settings

Note: Frequency for band WCDMA II 1961.0MHz, V 882.6MHz, VIII 943.4MHz

2. From the Phoenix testing menu, select **WCDMA → RX Power measurement**
3. In the RX power measurement window, make the following settings:

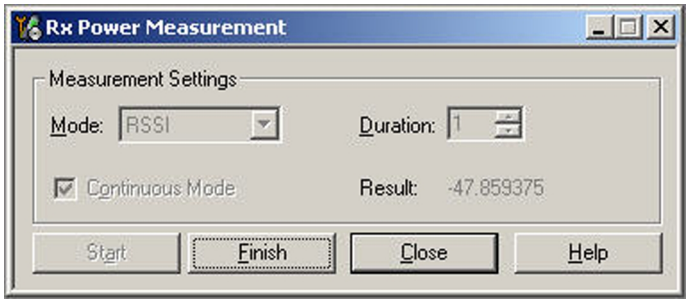

Figure 43 Phoenix WCDMA RX power measurement window

4. Click **Start** to perform the measurement.

Note: WCDMA RSSI measurement is accurate only with WCDMA modulated signal.

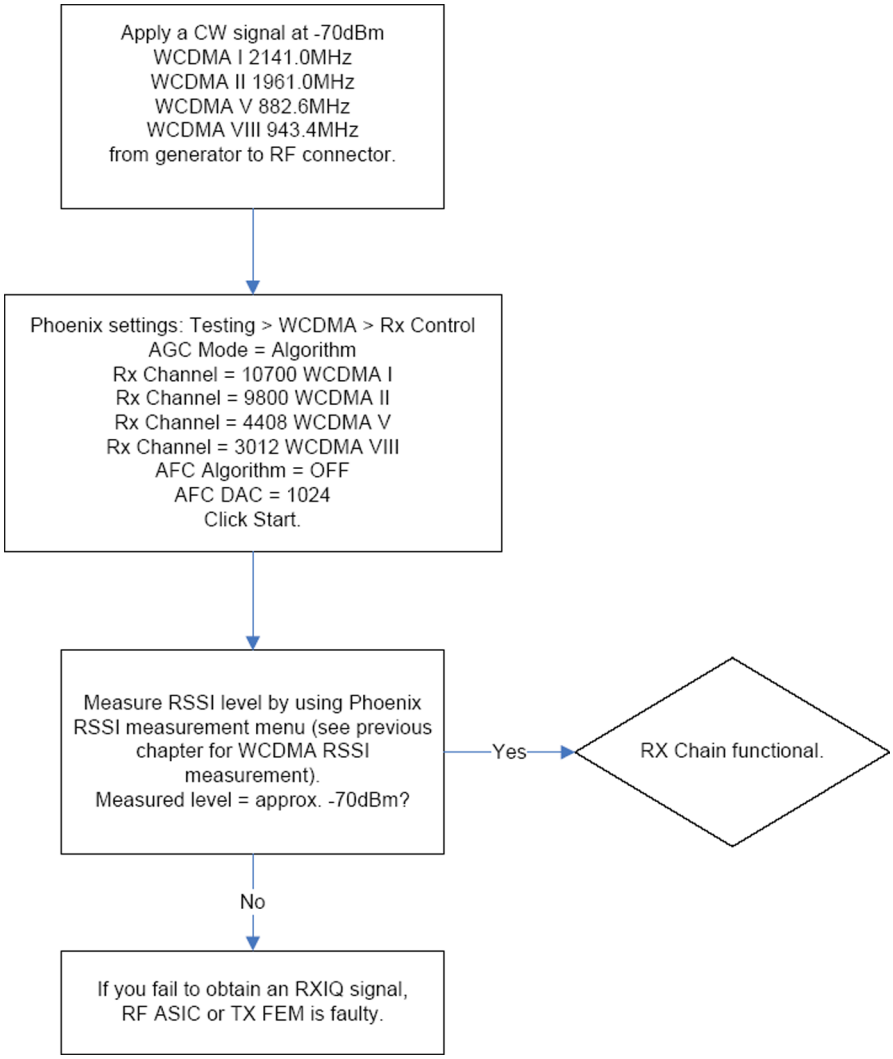
WCDMA receiver troubleshooting flowchart

Troubleshooting flow



Transmitter troubleshooting

General instructions for transmitter (TX) troubleshooting

Please note the following before performing transmitter tests:

- TX troubleshooting requires TX operation.
- Do not transmit on frequencies that are in use.
- The transmitter can be controlled in local mode for diagnostic purposes.
- The most useful Phoenix tool for GSM transmitter testing is “RF Controls”, in WCDMA transmitter testing the best tool is “TX Control”.
- Remember that re-tuning is not a fix! Phones are tuned correctly in production.

Note: Never activate the GSM or WCDMA transmitter without a proper antenna load. Always connect a 50 Ω load to the RF connector (antenna, RF-measurement equipment or at least a 2 W dummy load); otherwise the GSM or WCDMA Power amplifier (PA) may be damaged.

Copyright © 2010 Nokia. All rights reserved.

GSM transmitter troubleshooting

Steps

1. Set the phone to local mode.
2. Activate RF controls in Phoenix (**Testing** → **GSM** → **Rf Controls**).
   Make settings as shown in the figure:

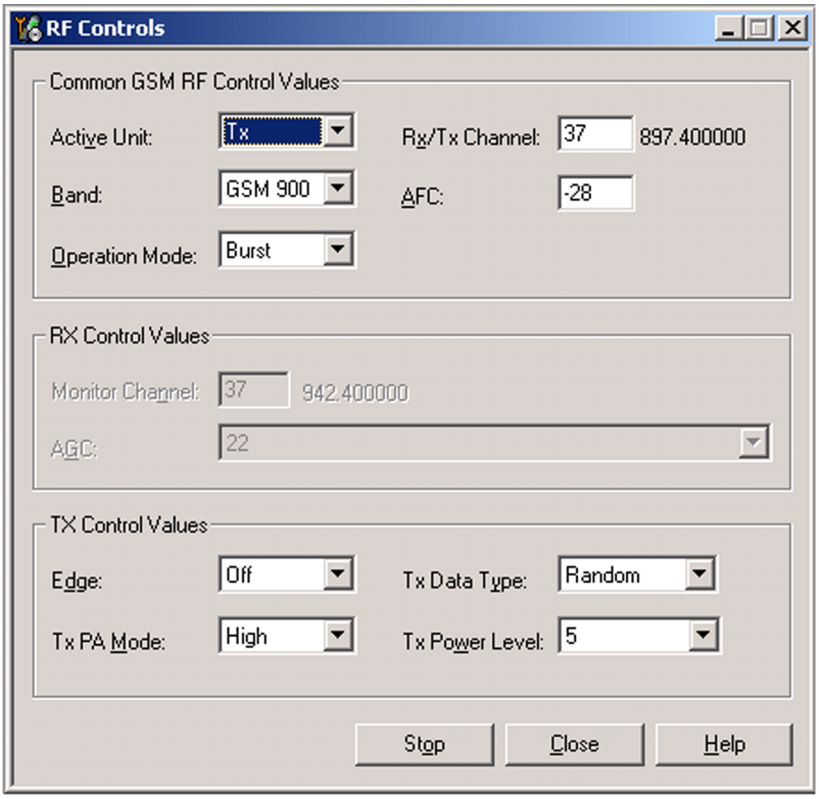


Figure 44 Phoenix GSM RF controls window

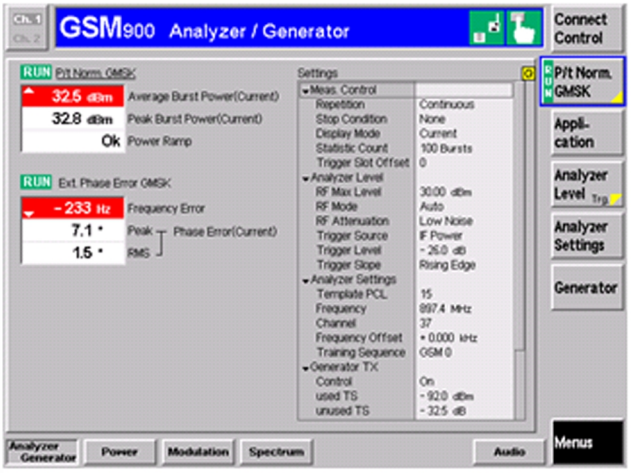
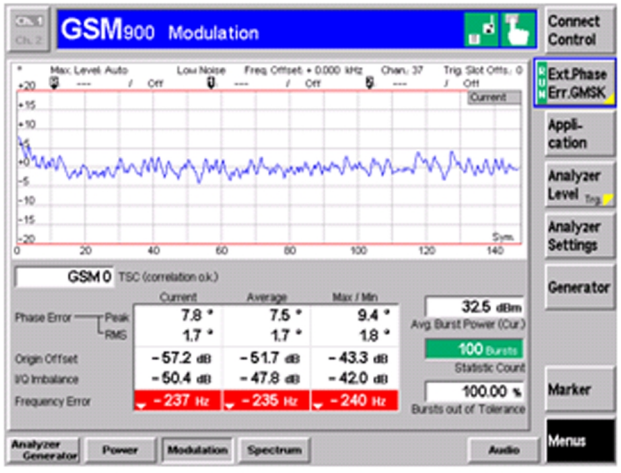
3. Check the basic TX parameters (i.e. power, phase error, modulation and switching spectrum), using a communication analyser (for example CMU200).

Copyright © 2010 Nokia. All rights reserved.

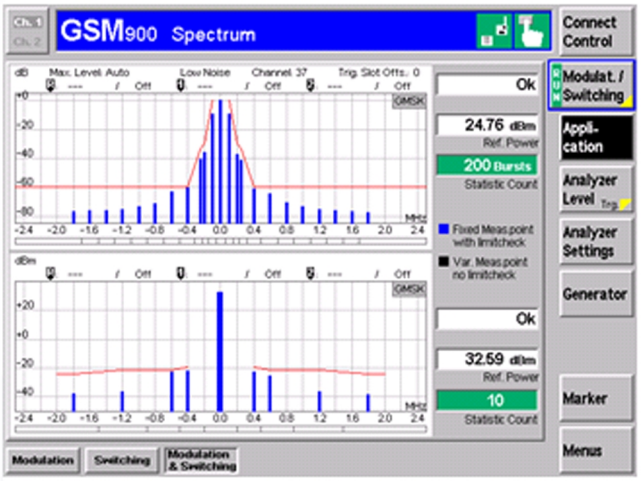
Analyser settings



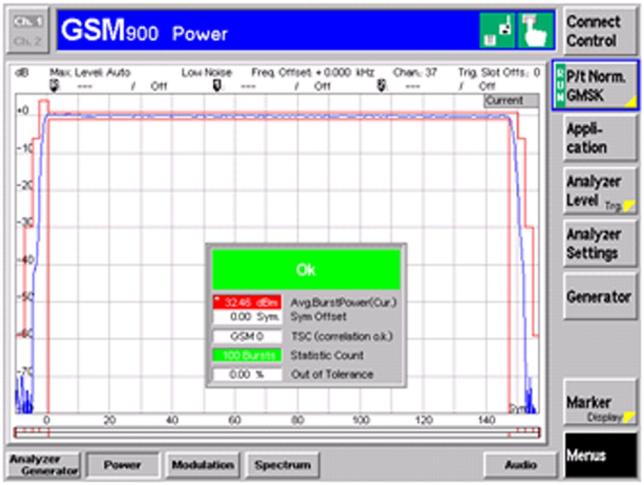
Phase error



Modulation/Switching spectrum



Power/Burst GSM/GPRS (GMSK)



Power/Burst - EDGE (8PSK)

4. Change power level (RF controls) and make sure the power reading follows accordingly.

Copyright © 2010 Nokia. All rights reserved.

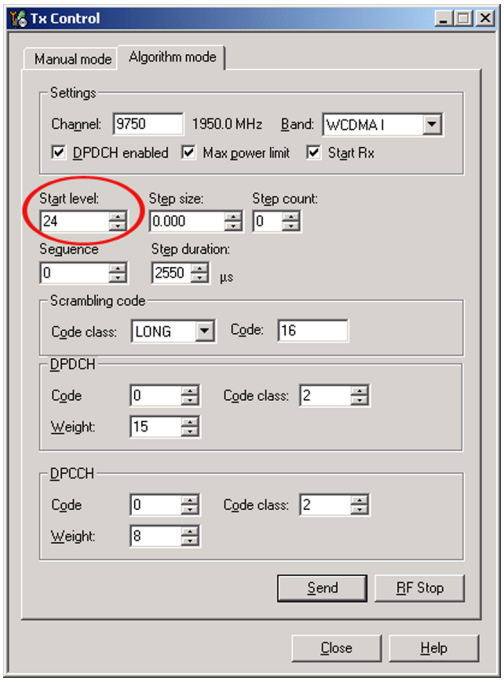
Next actions

If you want to troubleshoot the other bands, change band with RF controls and set the communication analyser accordingly.

WCDMA transmitter troubleshooting

Steps

1. Set the phone to local mode.
2. In Phoenix, select **Testing** → **WCDMA** → **TX control** .
3. In the TX control window, make settings as in the picture:



Note: For WCDMA TX channels: band V 4183, VIII 2787

4. Click **Send** to enable the settings and activate TX.

   If settings are changed (eg. new channel), you have to click **RF Stop** and **Send** again.
5. Check the basic TX parameters using a communication analyzer (for example CMU200).

Antenna troubleshooting

Antenna troubleshooting

Antenna contacts and matching components, visual check

In the main antenna there is one feed and one GND contact. Check that the GND and feed pads take proper contact to the C-clips on the main PWB. There is a matching coil (L7599) on the PWB. Check that it is properly soldered on the PWB. In case there is damage, you need to replace the component.

Introduction

Phone description

RAPIDOYAWE is the main digital baseband ASIC in the HW52. It contains functionality for both WCDMA and GSM EDGE.

AVILMA is power management ASIC having voltage regulators and audio transceiver and BETTY is energy management ASIC having charging switch and FBUS transceiver.

Memory components are internal COMBO 1 Gb/2 Gb and a card reader for MicroSD.

Function	Description	Item ref

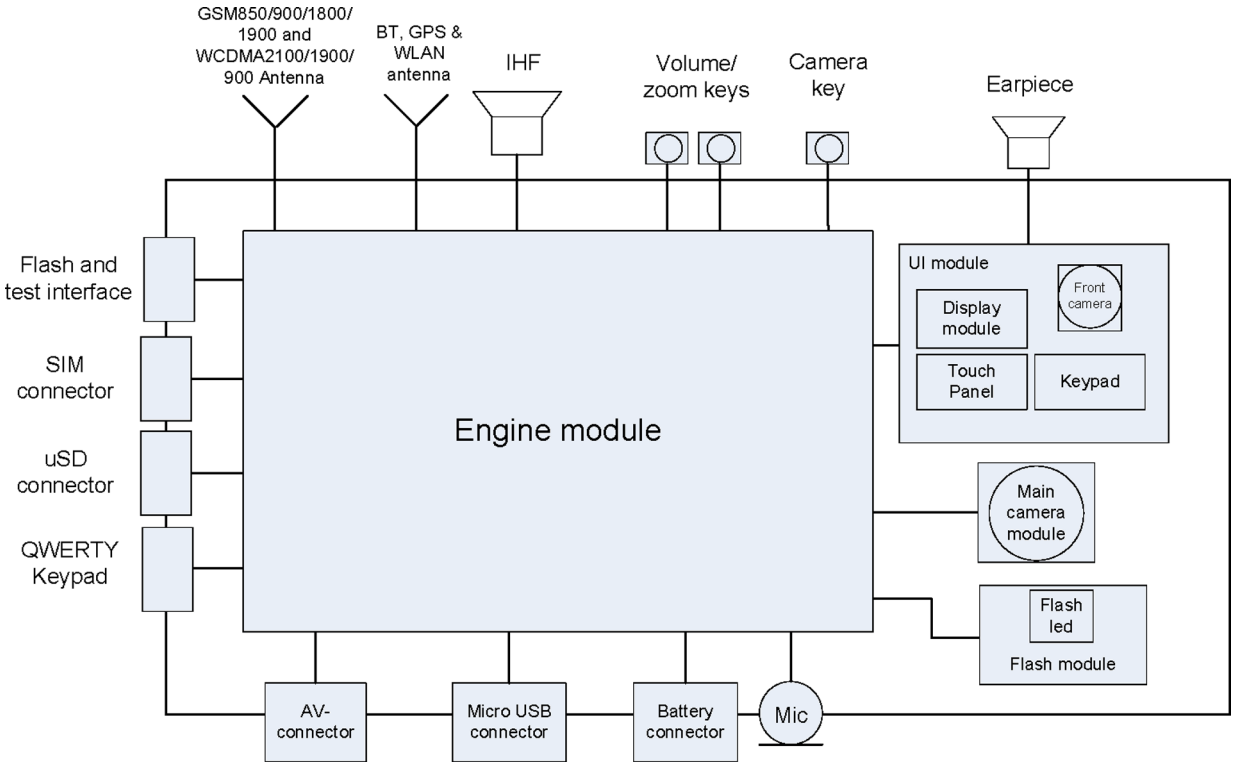

Figure 48 Board and module connections

Energy management

Battery and charging

BL-4J battery

The phone is powered by a 3-pole BL-4J battery pack (1200 mAh). The three poles are named VBAT, BSI and GND where the BSI line is used to recognize the battery capacity. This is done by means of an internal battery pull down resistor.

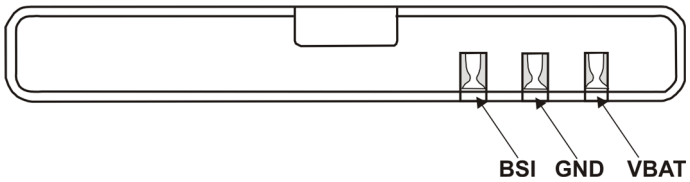

Figure 49 Battery pin order

The battery temperature is estimated by measuring separate battery temperature NTC via the BTEMP line. This is located on the main PWB, at the place where the phone temperature is closest to the battery temperature.

Battery connector

The battery connector is a blade connector. It has three blades;

- BSI (Battery size indicator)
- GND (Ground)

Copyright © 2010 Nokia. All rights reserved.

- VBAT (Battery voltage)

Figure 50 Blade battery connector

Charging

This phone is charged through the smaller Nokia standard interface (2.0 mm plug). The wider standard charger (3.5 mm) can be used together with the CA-44 charger adapter.

Figure 51 Small (right) and wide (left) charger plugs

Charging is controlled by energy management, and external components are needed to protect the baseband module against EMC, reverse polarity and transient frequency deviation.

Backup battery

When the main battery is not attached EM ASIC (N2200) goes in backup mode using back-up battery that supplies voltage to RTC in EM ASIC (N2200).

Normal and extreme voltages

Energy management is mainly carried out in the two Application Specific Integrated Circuits (ASICs) BETTY and AVILMA. These two circuits contains a number of regulators. In addition there are some external regulators too.

In the table below normal and extreme voltages are shown when a BL-4J battery is used.

Table 10 Nominal voltages

Voltage	Voltage [V]	Condition
General Conditions		
Nominal voltage	3.700	
Lower extreme voltage	3.145	
Higher extreme voltage		
(fast charging)	4.230

Video recording 640x352 30fps	400mA
Video playback 640x352 30fps	340mA
WCDMA voice call	250mA

Power key and system power-up

This device has no separate power key. The power key is the same as the end key. When the battery is placed in the phone, the power/end key circuits are energized. When the power/end key is pressed, the system boots up (if an adequate battery voltage is present).

Power down can be initiated by pressing the power/end key again (the system is powered down with the aid of SW). The power/end key is connected to EM ASIC N2200 (AVILMA) via PWRONX signal.

The power/end key may be disabled in certain charging cases.

Bluetooth and FM RDS radio module

Bluetooth and FM radio receiver are provided by the same ASIC (Broadcom BCM2048). The device supports Bluetooth operation and FM radio rececption in both European/USA and Japanese bands (the appropriate region-specific FM radio band is pre-configured in the phone software). The UART interface allows the device to communicate with the phone baseband engine using Bluetooth HCI commands. Commands to the FM radio can also be sent over the I2C interface.

When Bluetooth is switched on, the phone user interface the BT_RESETX line is toggled to reset the Bluetooth device, and commands are sent over the UART interface to configure the device. If UART communication fails (due to a hardware fault) it will not be possible to switch on Bluetooth from the phone user interface.

The device has two clock signals: SYS_CLK (19.2MHz, 26.0MHz, or 38.4MHz supported) and SLEEP_CLK (32.768kHz). The SLEEP_CLK is supplied all the time the phone is switched on. To maximise the phone standby time, it is only necessary to provide a SYS_CLK signal when Bluetooth activity occurs, such as sending Bluetooth data to another device, or checking periodically if there are any other Bluetooth devices attempting to communicate with it. At other times when the Bluetooth device is in standby mode or the FM radio is switched on it is only necessary to provide a SLEEP_CLK signal. The Bluetooth-FM ASIC is powered directly from the phone battery voltage line (VBAT). An internal regulator is enabled when Bluetooth or FM radio is switched on.

Bluetooth audio signals are sent to and from the device using a PCM interface. The Bluetooth RF signal is routed via a buried track to the Bluetooth antenna on the side of the PWB. An RF filter is needed between the Bluetooth antenna and Bluetooth ASIC to prevent interference to and from the celluar phone antenna. Phones that have both Bluetooth and WLAN use a shared antenna, as both services occupy the 2.4GHz ISM frequency band. The co-existence signaling interface between Bluetooth and WLAN ASICs controls the RF activity in the shared frequency band.

The audio signal from the FM radio is routed via the phone Audio ASIC to the phone headset or loudspeaker. The external wired headset is also used as an Antenna for the FM radio. The FM radio receiver RF signal is routed from the ASIC via a buried track to an impedance matching circuit placed near the headset connector.

The following block diagram shows how Bluetooth-FM is connected to the host engine.

Copyright © 2010 Nokia. All rights reserved.

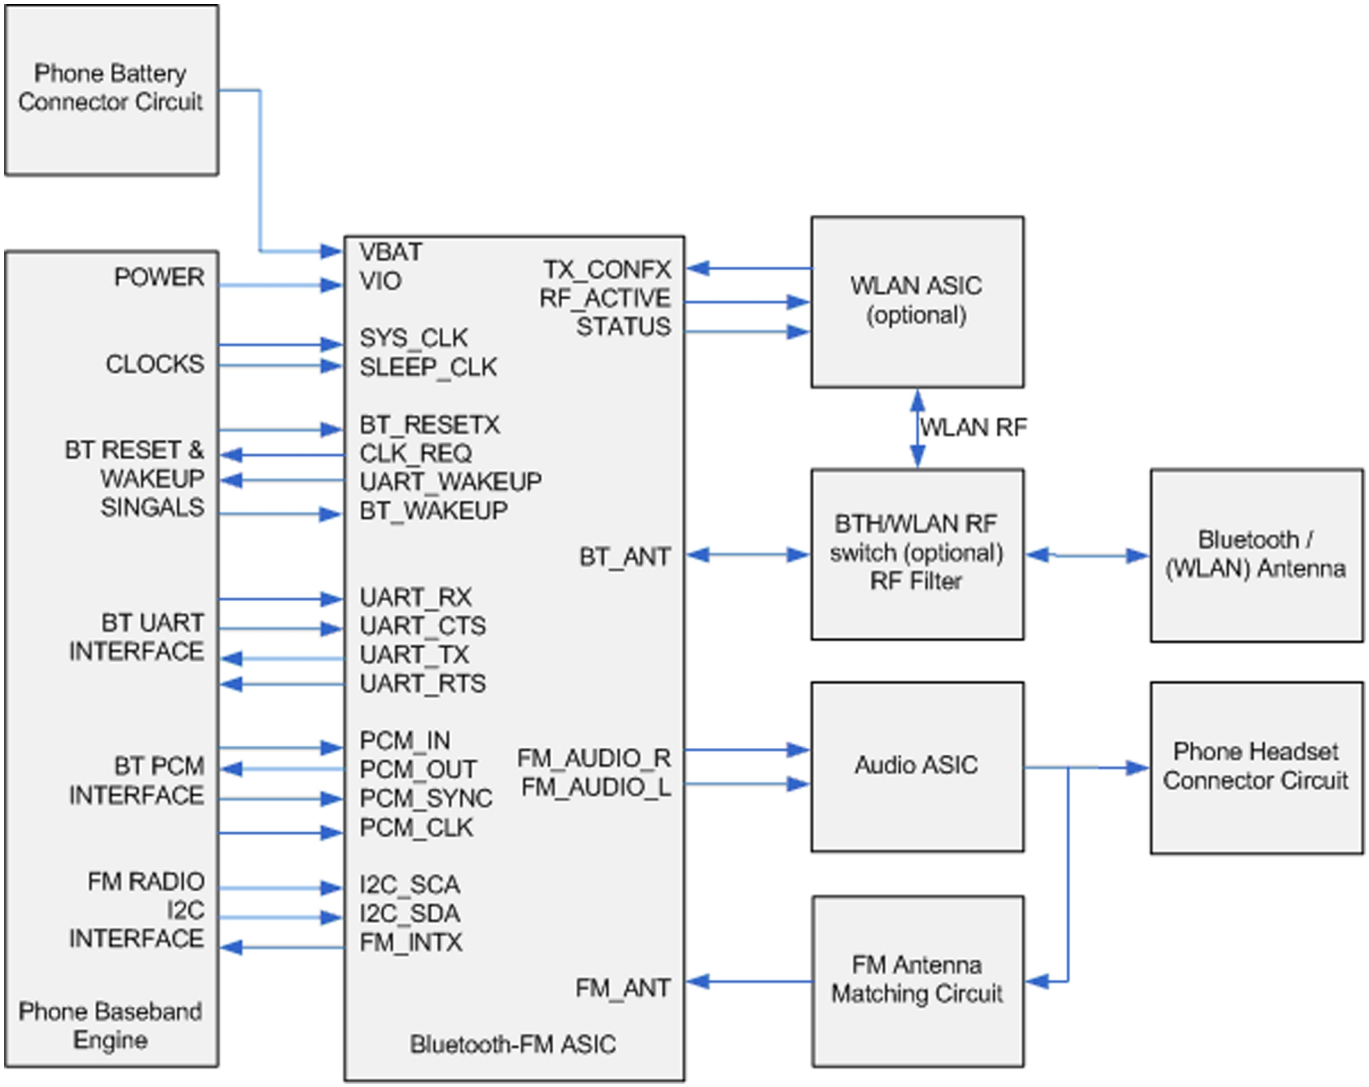

Figure 54 Bluetooth & FM radio block diagram

I/O Expander

I/O Expander is used for control signals that are not time critical, such as for keyboard inputs, enable & reset signals etc. It is connected to the I2C bus, and has its own interrupt. PURX is used as the I/O Expander's reset. The I/O Expander is powered from VIO 1.8V.

This device has a keyboard matrix. The keys are connected to the I/O expander.

GPS interface

Functional description

The device includes an inbuilt GPS receiver and it works as a stand-alone positioning device.

The GPS solution provides a full GPS HW and SW engine for devices capable of operation in all GPS modes:

- Autonomous (standalone) - no communication with network is required for GPS fix
- MS based - the device receives aiding information from the network and computes fix internally
- MS assisted - the device receives aiding information from the network and computes pseudorange measurements. The measurements are then sent back to the network for the fix calculation.

At the heart of the GPS solution is GPS5350 GPS receiver IC, which has GPS RF receiver and GPS BB processor integrated into a single IC. RF section performs down conversion, filtering and IF sampling, whereas BB section contains an enhanced version of multimode GPS with twelve hardware matched filters, post detection logic and an ARM controller core.

The features of the GPS solution include:

- 12 channels

Copyright © 2010 Nokia. All rights reserved.

- Integrated regulators for RF and BB (including external LNA)
- Direct connection to a battery
- Fast clock calibration through availability of 261MHz clock from RF PLL
- Improved tracking and Hot start (TTFF) reacquisition performance
- Advanced Power Management and Host Wakeup capability.

The I2C interface handles data transfer between GPS and the Rapido. GPS uses the CE RF system clock to calibrate its own GPS Clk.

GPS has three clock sources:

- 16.368MHz clock from a dedicated TCXO (G6200)
- 38.4MHz reference clock from Ahneus RF ASIC
- 32.768kHz Sleepclk

The GPS module is powered from VIO 1.8V and VBAT.

WLAN interface

The phone contains a WLAN transceiver that provides a fully integrated wireless radio solution. The WLAN transceiver supports the IEEE 802.11 standards for low error rate data transfer between mobiles and WLAN networks. Data rates up to 54Mbps are possible in 802.11g mode of operation. WLAN shares the antenna with Bluetooth.

The WLAN software is downloaded from the host engine when WLAN is turned on, over the dedicated SPI interface. The WLAN and Bluetooth co-existence is supported via BTH-WLAN interface.

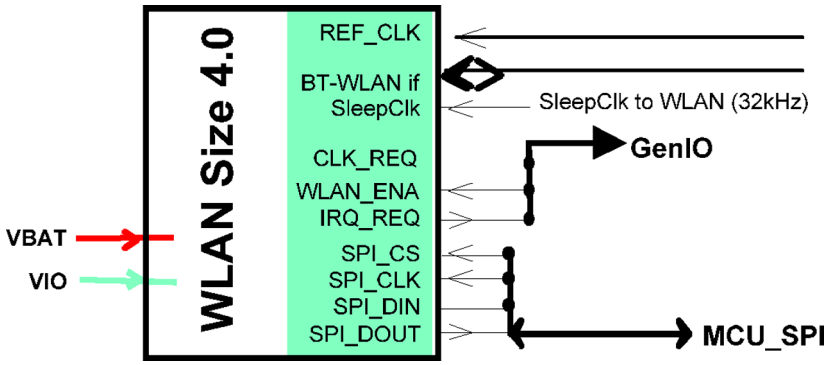

Figure 58 WLAN module

High-speed USB

High-speed USB

The device can transmit and receive USB data at high-speed (480 Mbit/s), full-speed (12 Mbit/s) and low-speed (1.5Mbit/s). The external interface is the micro-B connector X3300. The interface between D3300 USB transceiver and micro-B receptacle is the standard USB interface specified in the Universal Serial Bus specification Rev. 2.0. The USB transfers signal and power over four-wire interface, which carries differential

Copyright © 2010 Nokia. All rights reserved.

data, Vbus and GND. Signalling occurs over differential data line D+ and D-. The clock is transmitted encoded along with the differential data. ESD protection is done with USB ASIP Z3300. VBUS (+5V) is provided by the host device. The circuit is protected from an overvoltage condition by reference zenner diode V3301.

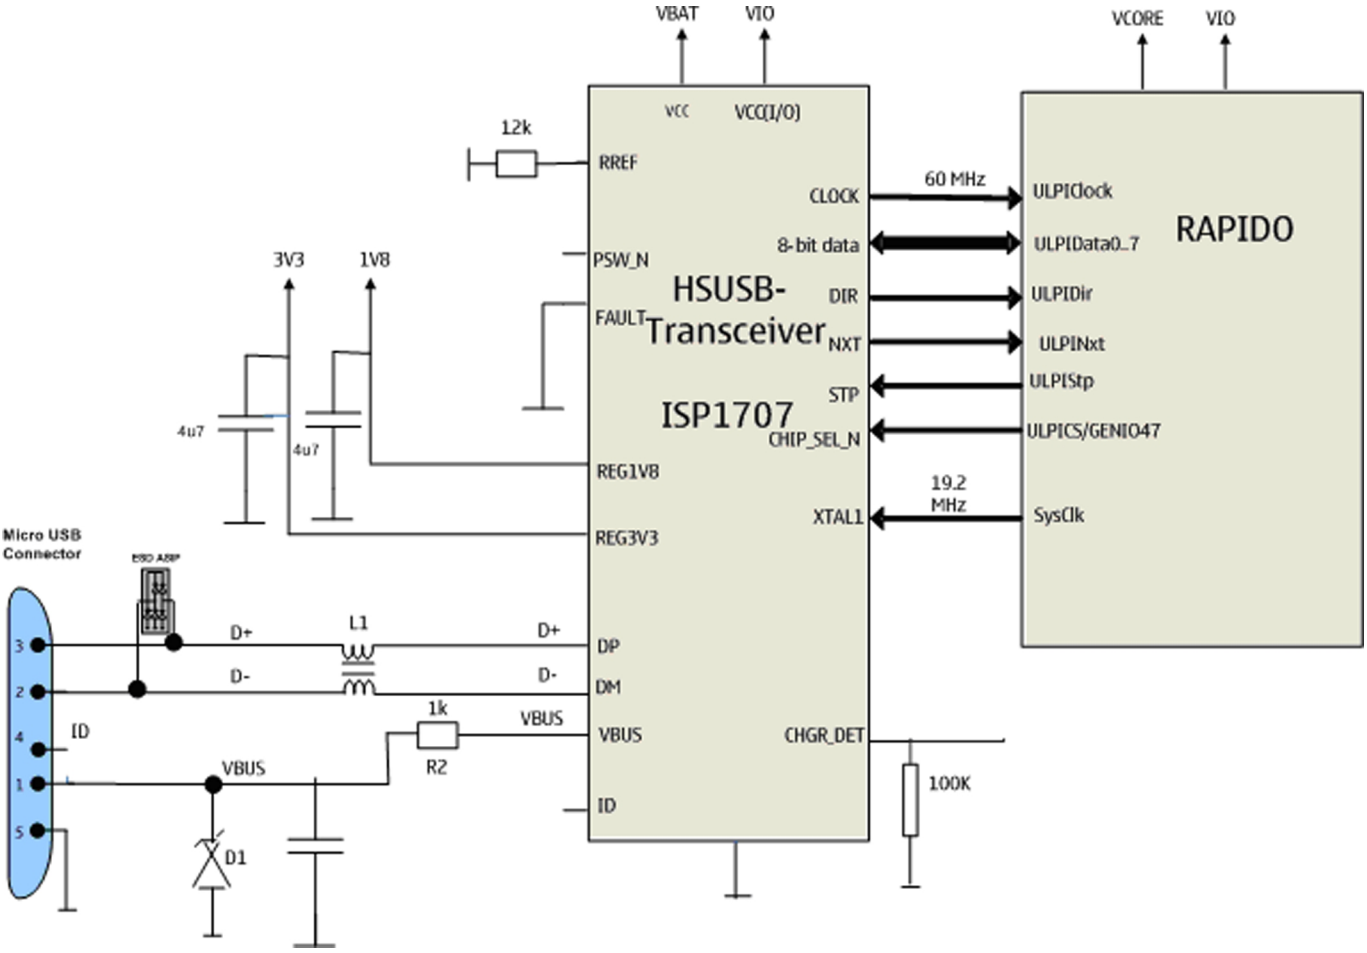

Figure 59 HS USB block diagram

CBUS interface

CBUS is a main system control bus in BB5. RAPIDO controls the functionality of EM ASICs AVilma (N2200) and Betty (N2300) with CBUS.

CBUS is a four-wire half-duplex master-slave interface. In HW52 CBUS clock frequency is 4.39 MHz.

FBUS interface

FBUS is a 2-wire serial communication bus between HW52 engine and service SW.

ECI interface

The ECI (Enhancement Control Interface) is a point-to-point, bi-directional, single line serial bus.

The purpose of the ECI is to identify and authenticate the accessory, and to act as a data bus (intended for control purposes) between the phone and the accessory .

SIM interface

The device has one SIM (Subscriber Identification Module) interface. It is only accessible if battery is removed. The SIM interface consists of an internal interface between RAPIDO and EM ASIC (N2200), and of an external interface between N2200 and SIM contacts.

Copyright © 2010 Nokia. All rights reserved.

The SIM IF is shown in the following figure:

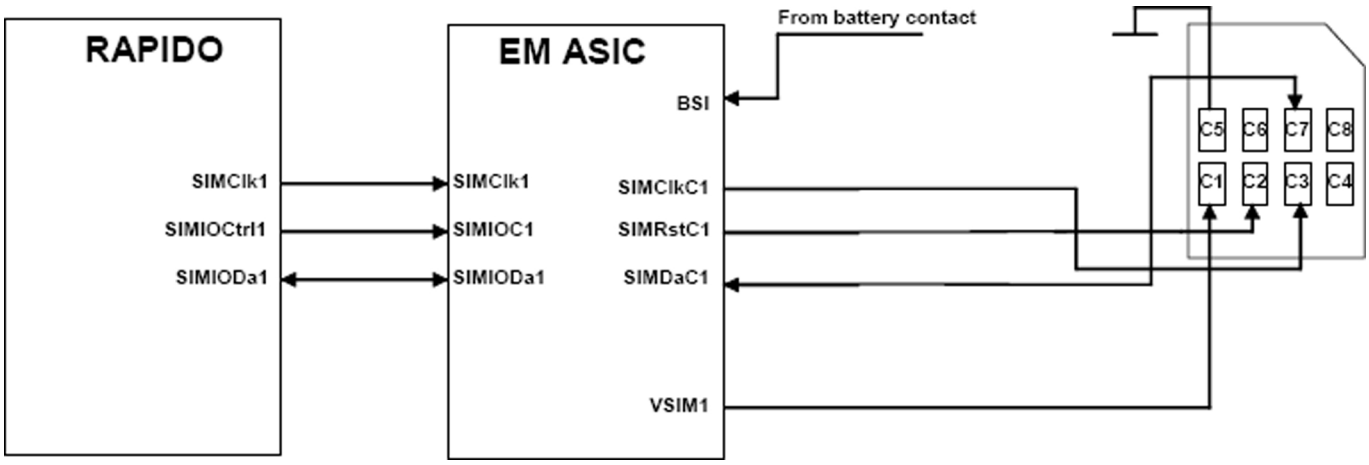

Figure 60 SIM interface

The EM ASIC handles the detection of the SIM card. The detection method is based in the BSI line. Because of the location of the SIM card, removing the battery causes a quick power down of the SIM IF.

The EM ASIC SIM1 interface supports both 1.8 V and 3.0 V SIM cards. The SIM interface voltage is first 1.8 V when the SIM card is inserted, and if the card does not response to the ATR a 3 V interface voltage is used.

MicroSD card interface

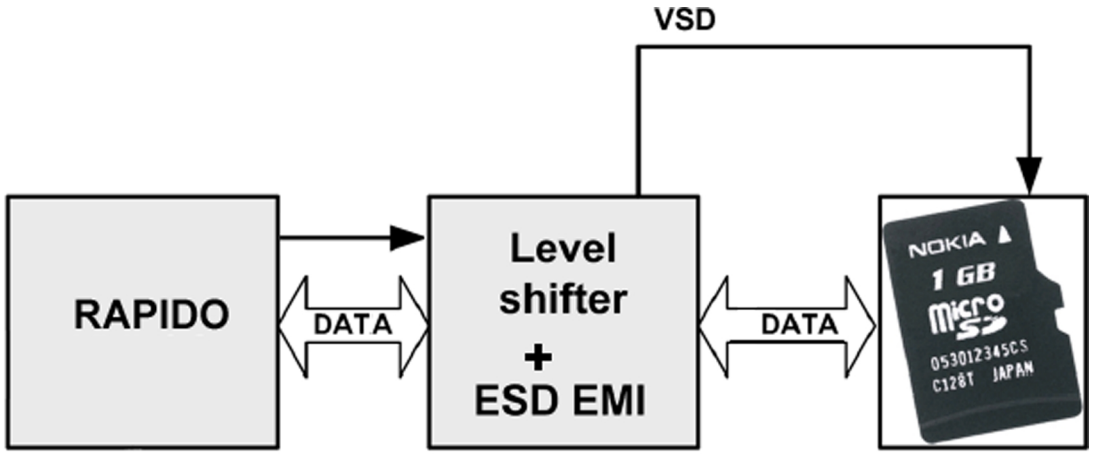

Figure 61 MicroSD card interface

The MicroSD card is connected to the engine by an external level shifter with an ESD protection filter. Supplied voltages:

- VSD: 2.85 V (from level shifter)
- VIO: 1.8 V (from VIO SMPS)

Hot swap is supported, which means that the card may be plugged in/out at any time, without removing the battery.

Camera concept

Camera concept

Camera subsystem concept

The camera subsystem contains the complete imaging system for the main 5 Mpixel camera. The main features of the imaging and video baseband subsystem are

- Hardware acceleration for image processing
- Support for 5 MPixel main camera
- Support for secondary VGA camera module
- Support for flash LEDs and its driver from ADI

Key components

- **DM5001D processor**

  Imaging Video baseband is implemented using DM5001D processor. DM5001D processor is a hardware accelerator for Imaging and Video application. This processor controls all the cameras and flashes in the system.

  This processor is controlled by Rapido processors via SPI interface. Boot code is downloaded into DM5001D internal memory via the SPI interface at power on. Further application code (self-test, image capture, video capture) is transferred depending on the usage case.

  Video and still image data is passed to the Rapido for display and storage after processing over a CCP bus (CCP_CMT).

- **Primary camera module (5 Mpixel camera)**

  The camera module is a SMIA95 compliant and is configured by the DM5001D using I2C control bus. Image data is transferred to the DM5001D over a CCP balanced bus (HIRES_CCP)

- **Secondary VGA camera module**

  The camera module is electrically a SMIA compliant module (not mechanically) and is configured by the DM5001D using I2C control bus. Image data is transferred to the DM5001D over a CCP balanced bus (LORES_CCP)

- **Flash LED**

  The camera flash LED is controlled from the DM5001D via the ADP1653 driver. The driver has GPIO control for STROBE/ENABLE and I2C bus control for configuring.

Powering

The camera subsystem is powered from 1.3V, 1.8V and 2.8V discrete regulators. The 1.3V regulator is powered from 1.8V regulator. The 1.8V and 2.8V regulators are powered from VBAT. The LED driver is powered directly from the VBAT supply. These supplies are turned off/on by the host processor using the GPIO (Julie_REG_EN), depending on the camera usage.

Block diagram

The high-level camera subsystem block diagram is presented in the following figure:

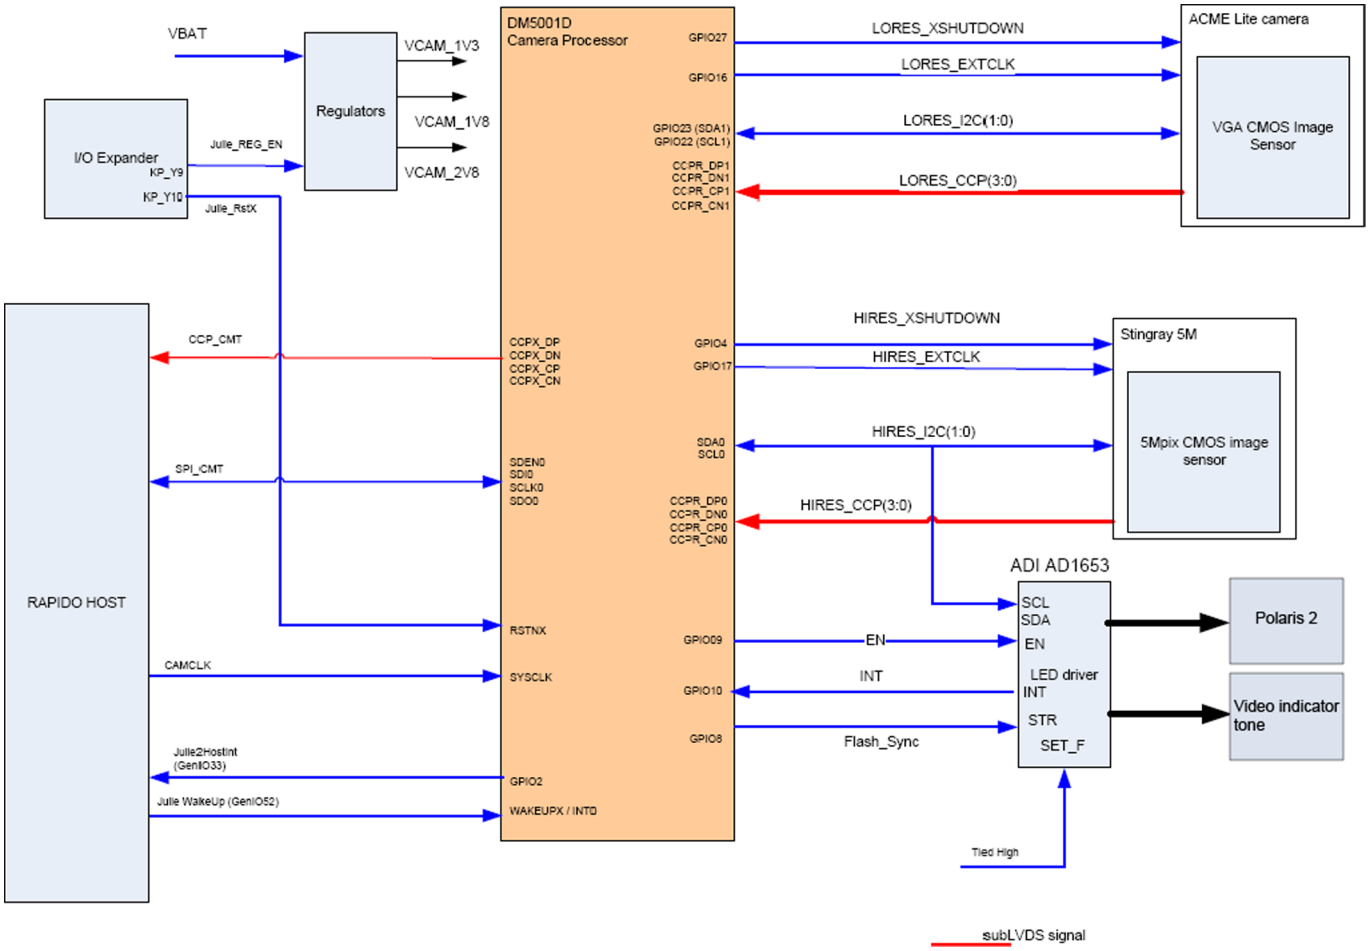

Figure 62 Camera subsystem block diagram

User interface

Resistive touch screen

Proximity sensor

The proximity sensor is used to turn off the touch input, when the phone is against user's ear during call. This prevents accidental touch signals that could happen when, for example, user's cheek touches the phone.

The main parts of the proximity sensor subsystem are:

- Proximity sensor
- Proximity boot (mechanical part)

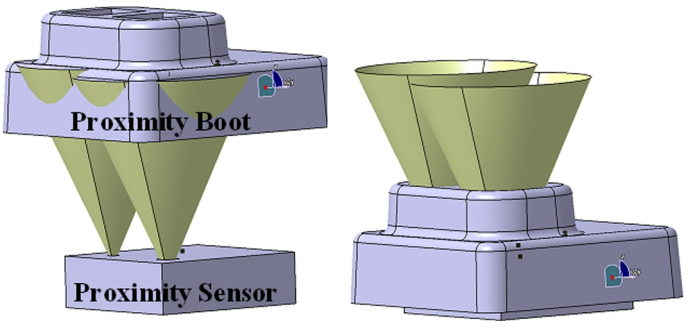

Figure 63 Proximity sensor and boot

Copyright © 2010 Nokia. All rights reserved.

The proximity sensor is located on the upper flex assembly.

Features

The Proximity sensor has following features:

- 2.8V
- 1.8V compatible IOs
- Low power consumption
- 20 mm working area
- Factory calibrated, no calibration required in care
- Pb free/RoHS compliancy

The proximity sensor works by sending out a beam of IR light, and then computing the distance to any nearby objects from characteristics of the returned (reflected) signal. When the object is under 20 mm distance detection will happen and output will go to high state (1.8V).

Reference design

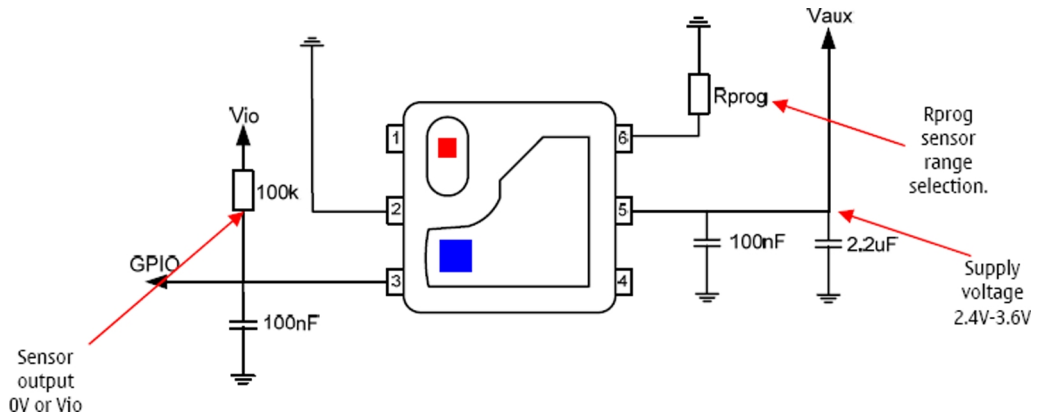

Figure 64 Proximity sensor reference design and measurement points

Pin	Signal name	Description
1	Anode LED	No connection
2	GND	Ground
3	OUT	Sensor output (0V or 1.8V Push-Pull)
4	TEST	No connection
5	VCC	Supply voltage (2.4V - 2.8V)
6	Rprog	Program resistor

Touch screen controller

TSC2004 (N8105 0n UI-flex) is a touch screen controller for resistive touch pads. It contains a complete ultralow-power, 12-bit, analog-to-digital (A/D) resistive touch screen converter, including drivers and control logic to measure touch pressure.

It also has embedded pre-processing function to reduce the output bus load. The host interface in TSC2004 is I2C.

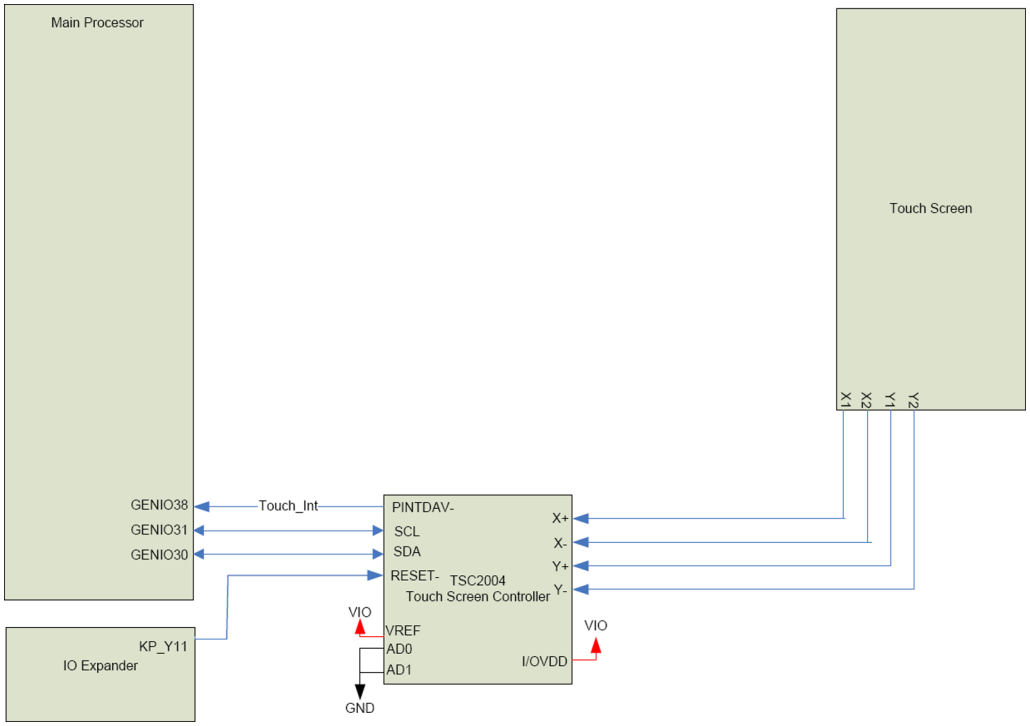

Figure 65 Touch screen controller

Display

Display

Rapido has an external display buffer with 8Mbit display RAM. The input interfaces for display buffer are ViSSI-12 for image data and LoSSI for commands.

The data interface between display buffer and display is CDP (Compact Display Port), display commands are sent by LoSSI interface. The display backlight control is controlled by the display.

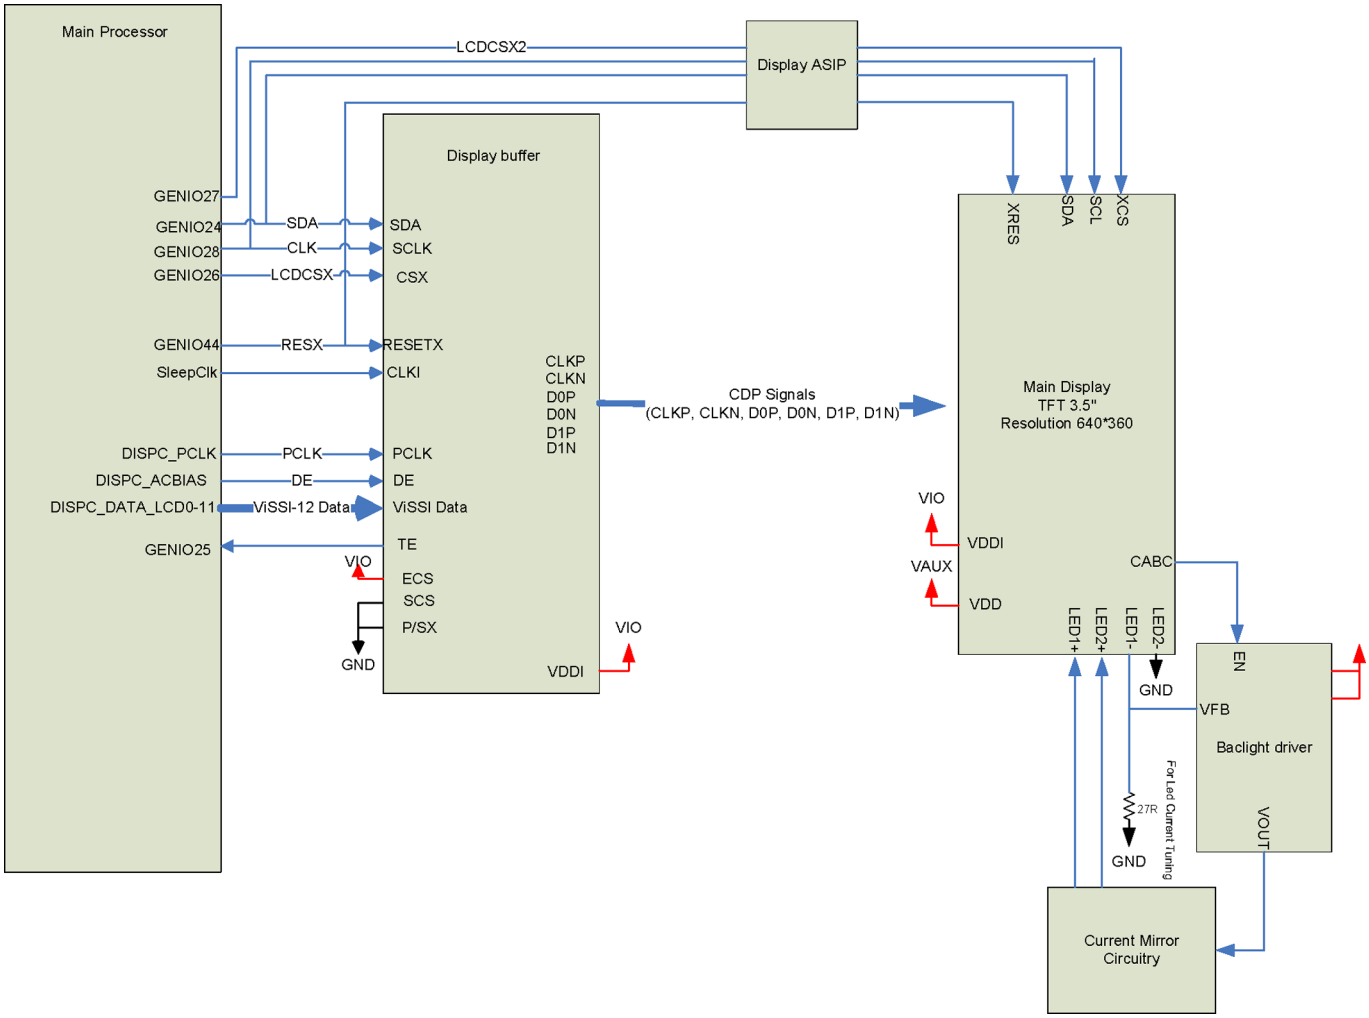

Figure 66 Display block diagram

Backlight and illumination

This device has two backlighting systems; one for the display and one for the HW keys and other illumination zones.

Backlighting for HW keys

The L5521 LED contoller is used for backlightning the HW keys . There is one LP5521 in the reference HW making it possible to have up to three LED zones. It can also drive the RGB LED.

Copyright © 2010 Nokia. All rights reserved.

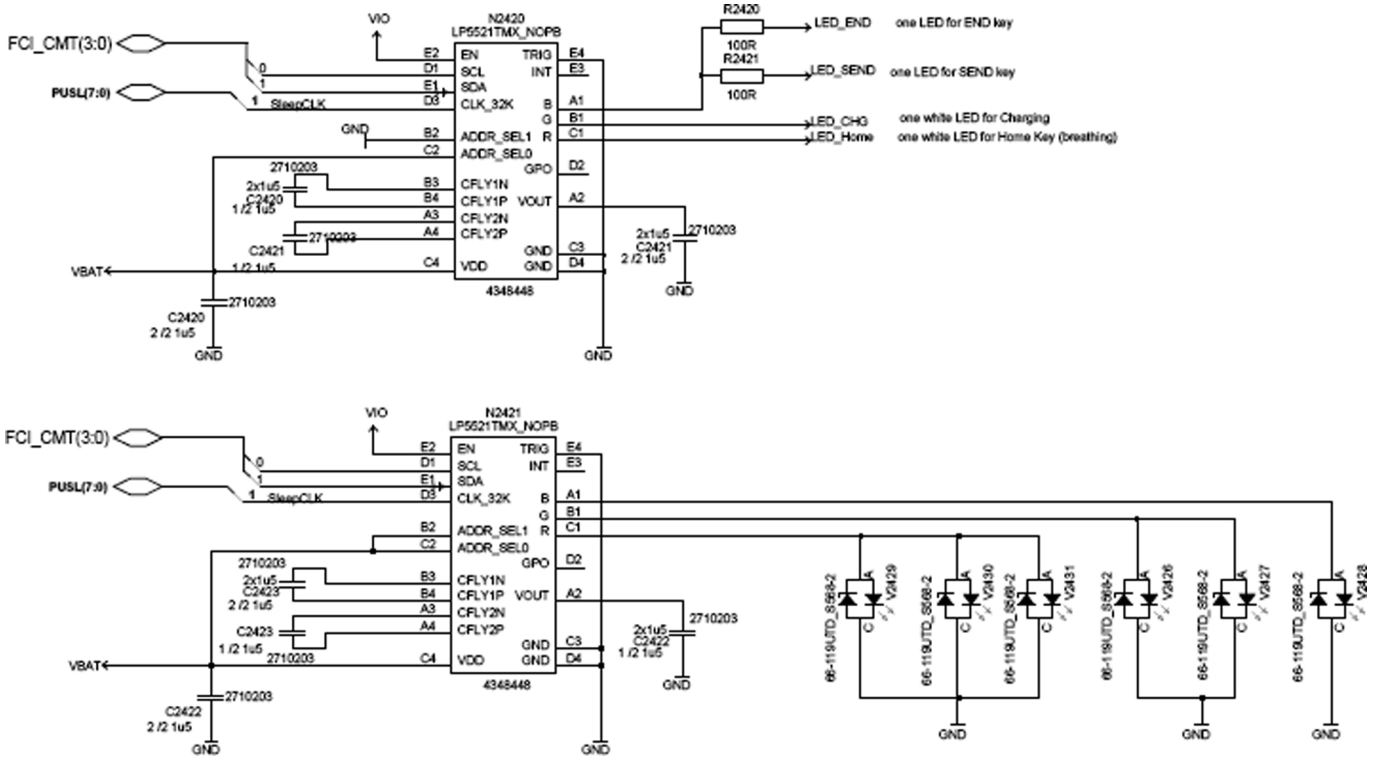

Figure 67 Backlight control for HW keys

Display backlights

Display backlights consist of two LED chains, each containing three LEDs in series powered by TK65604AB switching mode power supply. Display backlight brightness is controlled by the CABC signal, and the equality of the current (and thus the brightness) through the two LED chains is ensured by a current mirror.

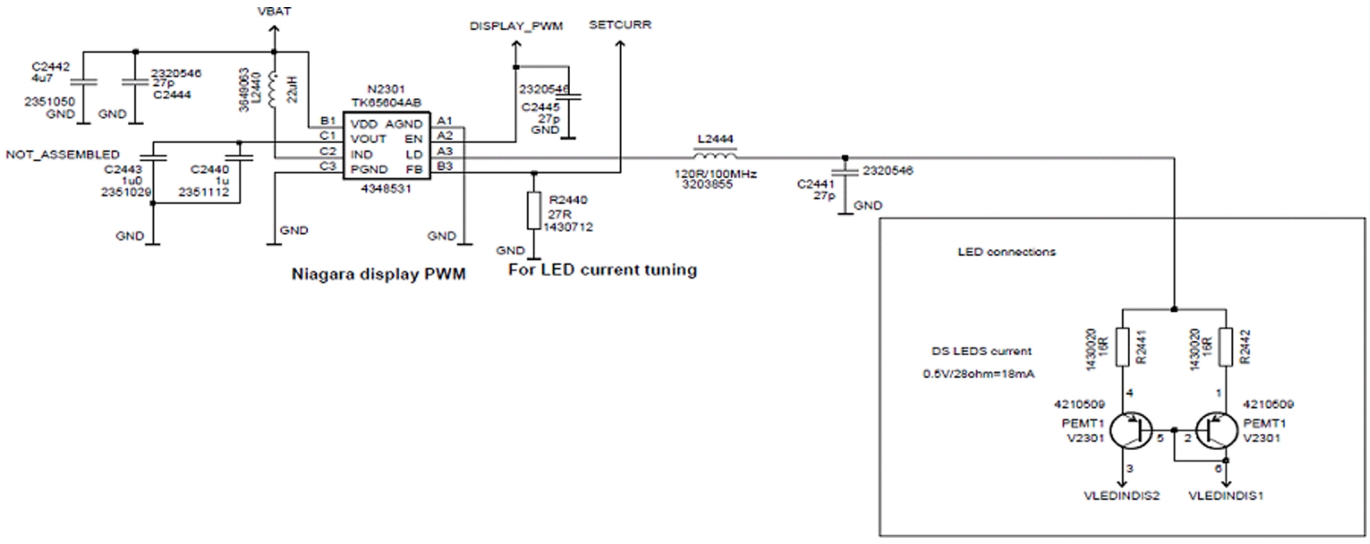

Figure 68 Display backlighting system

Digital Ambient Light Sensor (ALS)

The Digital Ambient Light Sensor (N8104 on UI-Flex) approximates ambient light. Ambient light level together with CABC and user settings adjust the display and keyboard illumination brightness. The Ambient Light Sensor is located on the UI-Flex.

Copyright © 2010 Nokia. All rights reserved.

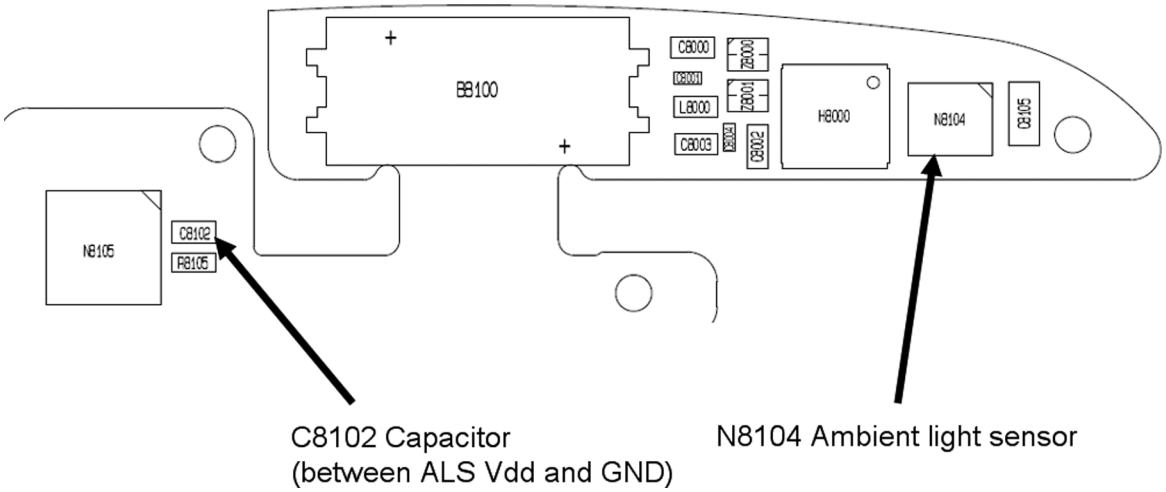

Figure 69 Digital Ambient Light Sensor location

It is connected to the I2C bus, and powered by the VOUT (2.5V) voltage.

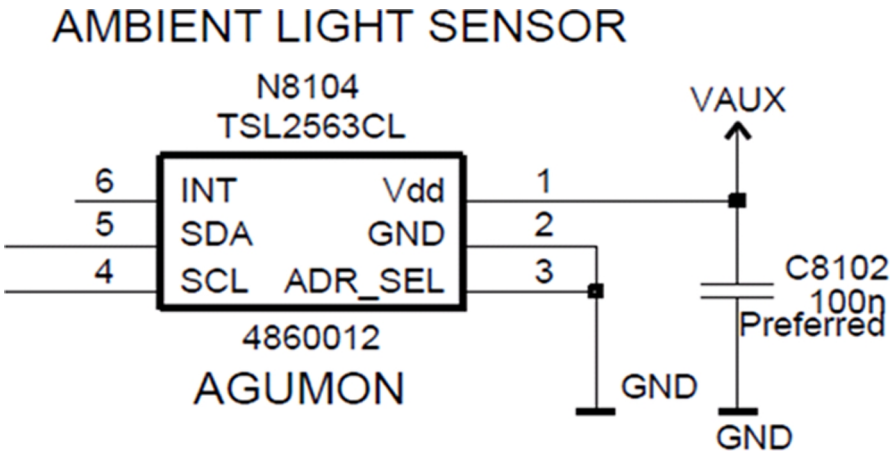

Figure 70 Digital Ambient light sensor schematics

Hall sensor

The hall sensor system is comprised of a hall sensor in the lower part of the phone and a magnet in the upper sliding/pivoting part of the phone.

When the sensor detects a magnet, the output is triggered and the phone changes mode from open to closed accordingly.

ASICs

RAPIDOYAWE

RAPIDOYAWE ASIC (D2800) is a die-stacked Processor (RAPIDO) with 3G HDSPA logic (YAWE). RAM memory is integrated into RAPIDO.

EM ASIC BETTY N2300

The EM ASIC (N2300) includes the following functional blocks:

- Core supply generation
- Charge control circuitry
- Level shifter and regulator for USB/FBUS

Copyright © 2010 Nokia. All rights reserved.

- Current gauge for battery current measuring
- LED control for display backlighting
- Digital interface (CBUS)

EM ASIC VILMA N2200

The EM ASIC (N2200) includes the following functional blocks:

- Start up logic and reset control
- Charger detection
- Battery voltage monitoring
- 32.768kHz clock with external crystal
- Real time clock with external backup battery
- SIM card interface
- Stereo audio codecs and amplifiers
- A/D converter
- Regulators
- Vibra interface
- Digital interface (CBUS)

EMC ASIP (Appcation Specified Integrated Passive) have been integrated inside the ASIC. It includes biasing passives for microphone , EMC filter for SIM, microphones etc.

Device memories

Combo memory

The memory of the device consists of stacked DDR SDRAM and MuxedMassMemory (M3). Combo memory DDR/ M3 memory has 1Gb DDR + 2Gb M3.

Audio concept

Audio HW architecture

The functional core of the audio hardware is built around three ASICs: RAPIDOYAWE engine ASIC, mixed signal ASIC Avilma and D/A converter DAC33.

DAC33 converts the digital audio signal to analog and is routed to the FM Transmitter and amplifier TPA6130 which provides an interface for the transducers and the accessory connector.

AVilma provides analog signal for the earpiece and for the D-class audio amplifier TPA2012D2, which drives the integrated stereo handsfree speaker.

There are four audio transducers:

- 5 x 10 mm dynamic earpiece
- One 8 x 12 mm dynamic speaker
- Digital microphone

Avilma provides an output for the dynamic vibra component. All wired audio accessories are connected to the AV accessory connector. A Bluetooth audio and FM radio module, which is connected to RAPIDOYAWE, supports the Bluetooth audio and FM radio functionality.

Copyright © 2010 Nokia. All rights reserved.

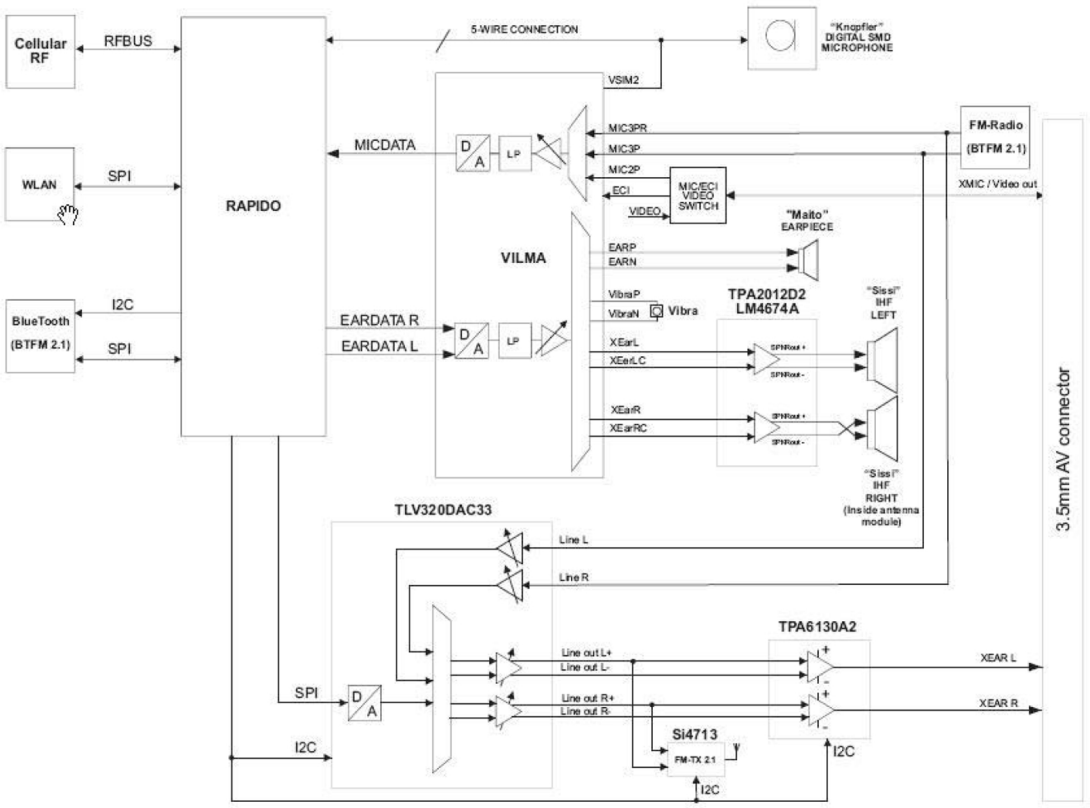

Figure 71 Audio system block

Internal microphone

The internal microphone is used for HandPortable (HP) and Internal HandsFree (IHF) call modes. A digital microphone data and clock line are connected to Rapidoyawe and operating voltage is received from Avilma.

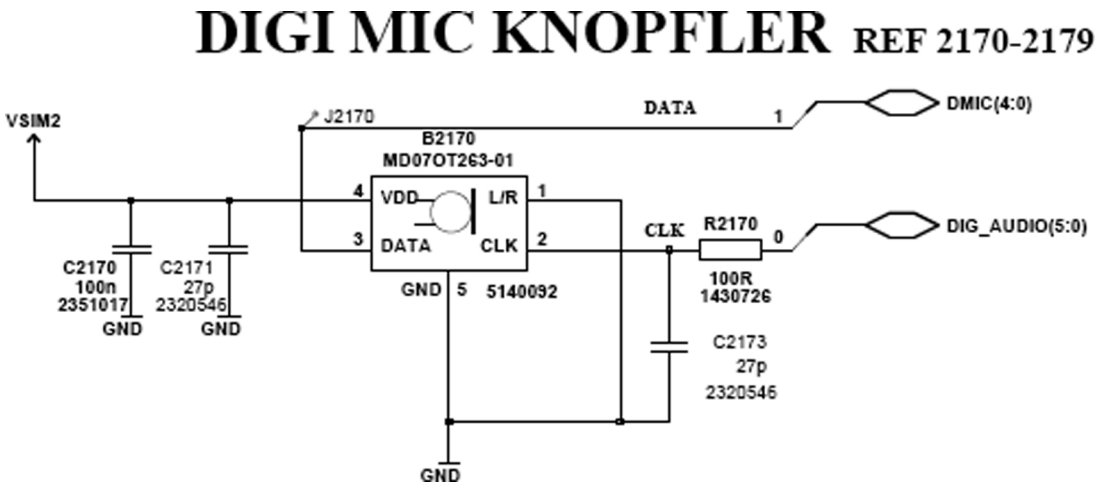

Figure 72 Internal microphone

Internal earpiece

Internal earpiece is used for the HandPortable (HP) call mode. A dynamic 5 x 10 mm earpiece capsule is connected to Avilma ASIC's differential output EarP and EarN.

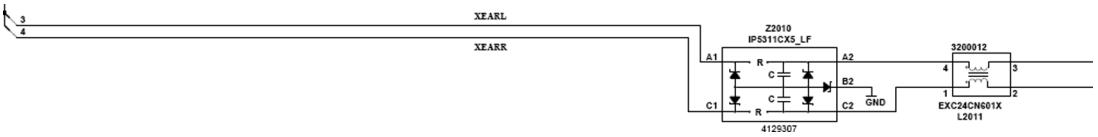

Figure 73 Internal earpiece circuitry

Internal speaker

The internal speaker is used for Internal HandsFree (IHF) call mode, video call, ringing tones, FM radio and music listening.

The dynamic 15 x 11 mm speaker is connected to Avilma ASIC's outputs XearR/XearL via stereo D-class IHF amplifier TPA2012D2. The amplifier has 12 dB fixed gain and it is put to shutdown mode when not in use.

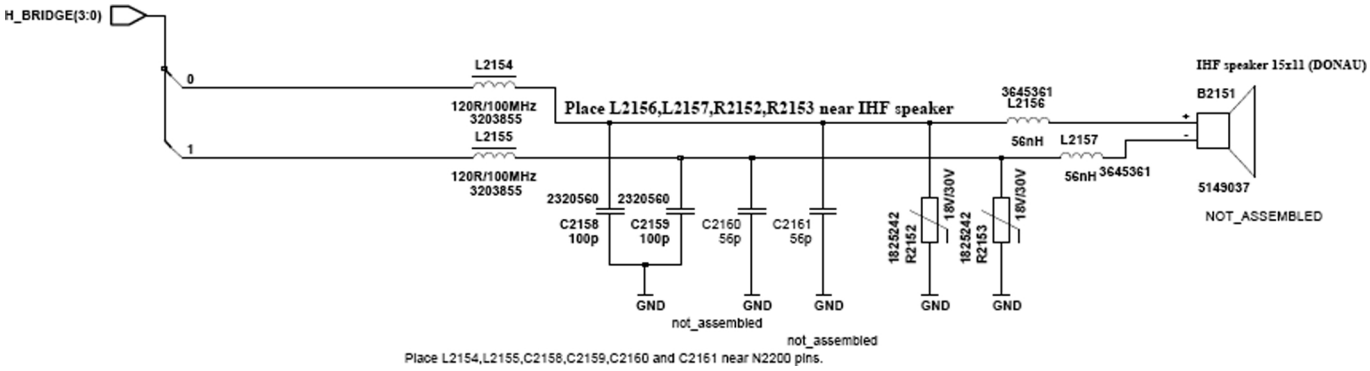

Figure 74 Internal speaker

Vibra circuitry

Vibra is used for the vibra alarm function.

The vibra motor is connected to the Avilma ASIC VibraP and VibraN Pulse Width Modulated (PWM) outputs.

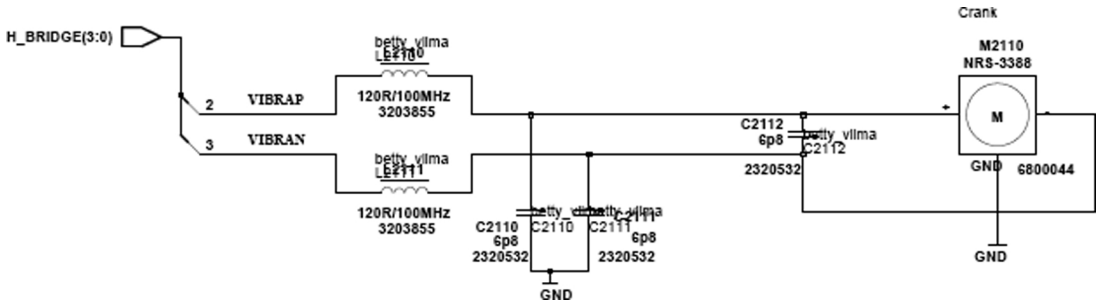

Figure 75 Vibra circuitry

Accessory AV connector

The features that are supported by the accessory interface are the following:

- Audio output (stereo headset/headphones having the impedance >16ohm)
- Audio input (mono microphone from the headset)
- Control data (ECI)
- Connects the FM receiver to the headphones, which serves as the FM antenna

RF technical description

RF block diagram

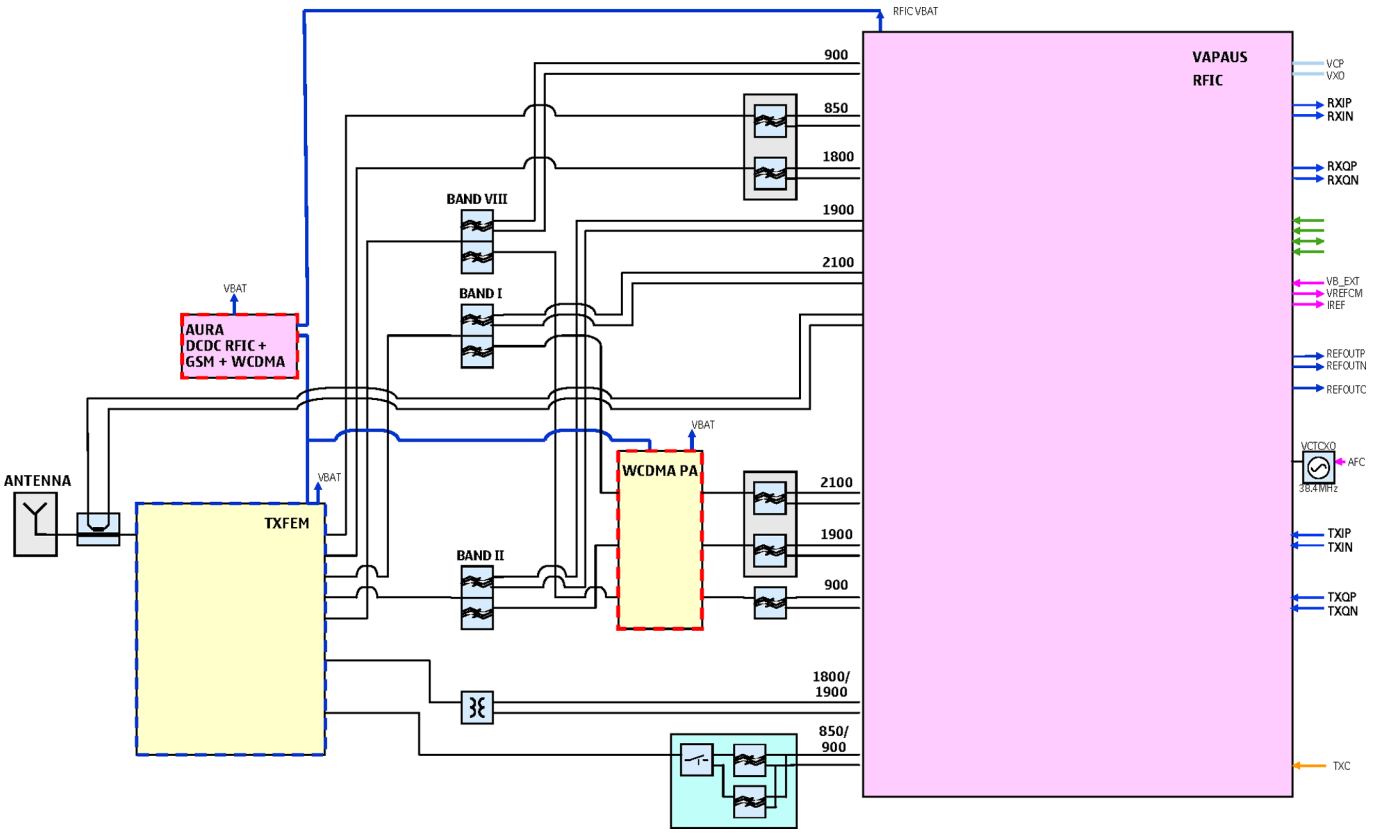

Figure 79 RF block diagram using RF ASIC N7500 (with WCDMA VIII/II/I)

Copyright © 2010 Nokia. All rights reserved.

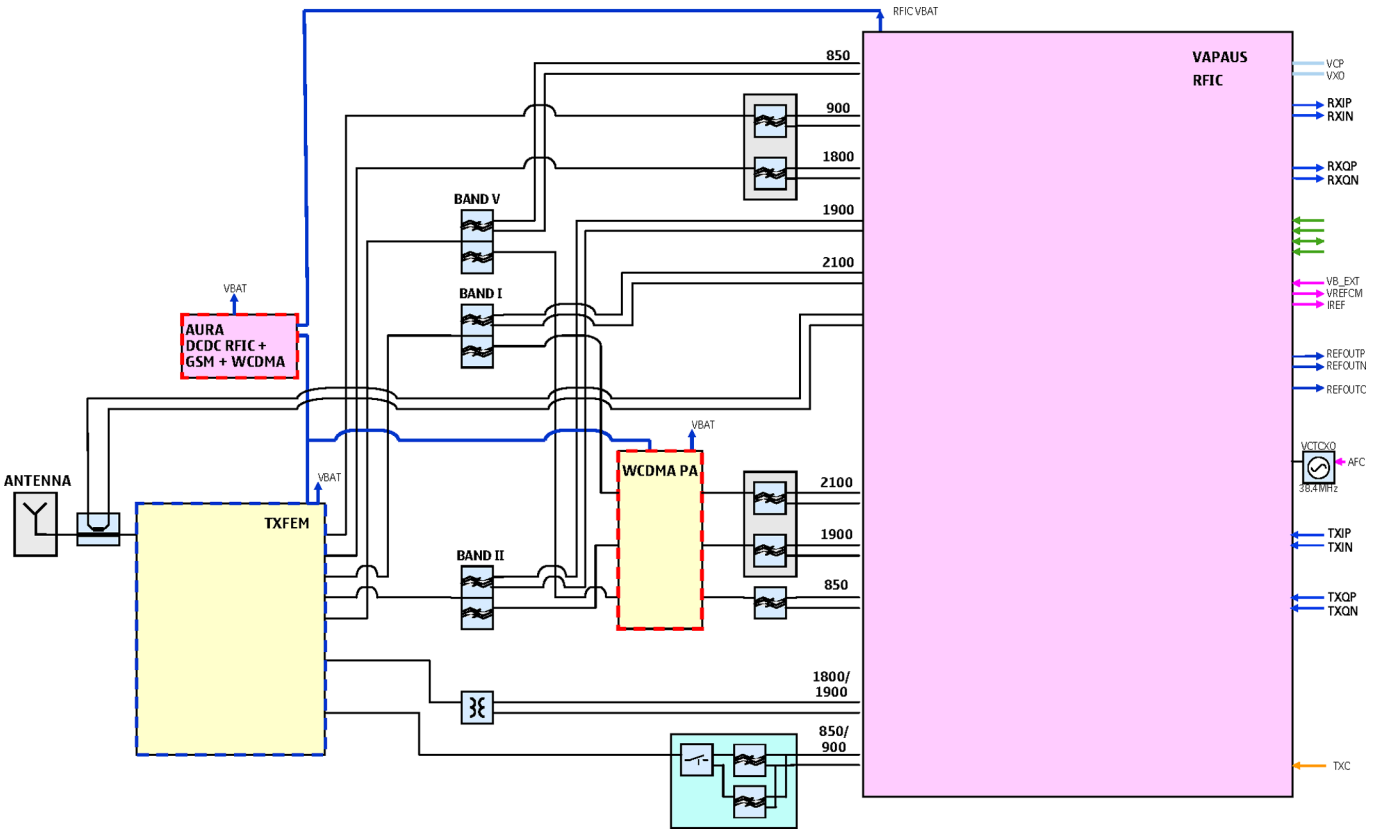

Figure 80 RF block diagram using RF ASIC N7500 (with WCDMA V/II/I)

The RF block diagram uses RF ASIC N7500 that performs the RF back-end functions of receive and transmit function of the cellular transceiver.

Receiver (RX)

An analogue signal is received by the phone's antenna. The signal is converted to a digital signal and is then transferred further to the baseband (eg. to the earpiece).

The receiver functions are implemented in the RF ASIC.

Signals with different frequencies take different paths, therefore being handled by different components. The principle of GSM and WCDMA is the same.

Transmitter (TX)

The digital baseband signal (eg. from the microphone) is converted to an analogue signal, which is then amplified and transmitted from the antenna. The frequency of this signal can be tuned to match the bandwith of the system in use (eg. GSM900).

The transmitter functions are implemented in the RF ASIC.

Even though the GSM and WCDMA signals are sent via different components, the principles of the transmission is the same.

(This page left intentionally blank.)

Copyright © 2010 Nokia. All rights reserved.

A/D-converter	Analogue-to-digital converter
ADC	Analogue-to-digital converter
ALS	Ambient light sensor
ARM	Advanced RISC Machines
ASIC	Application Specific Integrated Circuit
ASIP	Application Specific Interface Protector
B2B	Board to board, connector between PWB and UI board
BA	Board Assembly
BB	Baseband
BCM2048	Bluetooth module made by BROADCOM
BSI	Battery Size Indicator
BT	Bluetooth
CBus	MCU controlled serial bus connected to UPP_WD2, UEME and Zocus
CCP	Compact Camera Port
CDMA	Code division multiple access
CMOS	Complimentary metal-oxide semiconductor circuit (low power consumption)
COG	Chip on Glass
CPU	Central Processing Unit
CSD	Circuit-switched data
CSR	Cambridge silicon radio
CSTN	Colour Super Twisted Nematic
CTSI	Clock Timing Sleep and interrupt block of Tiku
CW	Continuous wave
D/A-converter	Digital-to-analogue converter
DAC	Digital-to-analogue converter
DMA	Direct memory access
DP	Data Package
DPLL	Digital Phase Locked Loop
DSP	Digital Signal Processor
DTM	Dual Transfer Mode
DtoS	Differential to Single ended
EDGE	Enhanced data rates for global/GSM evolution
EGSM	Extended GSM
EM	Energy management
EMC	Electromagnetic compatibility
EMI	Electromagnetic interference

Copyright © 2010 Nokia. All rights reserved.

ESD	Electrostatic discharge
FCI	Functional cover interface
FPS	Flash Programming Tool
FR	Full rate
FSTN	Film compensated super twisted nematic
GMSK	Gaussian Minimum Shift Keying
GND	Ground, conductive mass
GPIB	General-purpose interface bus
GPRS	General Packet Radio Service
GSM	Group Special Mobile/Global System for Mobile communication
HSDPA	High-speed downlink packet access
HF	Hands free
HFCM	Handsfree Common
HS	Handset
HSCSD	High speed circuit switched data (data transmission connection faster than GSM)
HW	Hardware
I/O	Input/Output
IBAT	Battery current
IC	Integrated circuit
ICHAR	Charger current
IF	Interface
IHF	Integrated hands free
IMEI	International Mobile Equipment Identity
IR	Infrared
ISA	Intelligent software architecture
JPEG/JPG	Joint Photographic Experts Group
LCD	Liquid Crystal Display
LDO	Low Drop Out
LED	Light-emitting diode
LPRF	Low Power Radio Frequency
MCU	Micro Controller Unit (microprocessor)
MCU	Multiport control unit
MIC, mic	Microphone
MIDP	Mobile Information Device Profile
MIN	Mobile identification number
MIPS	Million instructions per second

Copyright © 2010 Nokia. All rights reserved.

MMS	Multimedia messaging service
NFC	Near field communication
NTC	Negative temperature coefficient, temperature sensitive resistor used as a temperature sensor
OMA	Object management architecture
OMAP	Operations, maintenance, and administration part
Opamp	Operational Amplifier
PA	Power amplifier
PDA	Pocket Data Application
PDA	Personal digital assistant
PDRAM	Program/Data RAM (on chip in Tiku)
Phoenix	Software tool of DCT4.x and BB5
PIM	Personal Information Management
PLL	Phase locked loop
PM	(Phone) Permanent memory
PUP	General Purpose IO (PIO), USARTS and Pulse Width Modulators
PURX	Power-up reset
PWB	Printed Wiring Board
PWM	Pulse width modulation
RC-filter	Resistance-Capacitance filter
RF	Radio Frequency
RFBUS	Serial control Bus For RF
RSS	Web content Syndication Format
RSSI	Receiving signal strength indicator
RST	Reset Switch
RTC	Real Time Clock (provides date and time)
RX	Radio Receiver
SAW filter	Surface Acoustic Wave filter
SDRAM	Synchronous Dynamic Random Access Memory
SID	Security ID
SIM	Subscriber Identity Module
SMPS	Switched Mode Power Supply
SNR	Signal-to-noise ratio
SPR	Standard Product requirements
SRAM	Static random access memory
STI	Serial Trace Interface

Copyright © 2010 Nokia. All rights reserved.

SW	Software
TCP/IP	Transmission control protocol/Internet protocol
TCXO	Temperature controlled Oscillator
TX	Radio Transmitter
UART	Universal asynchronous receiver/transmitter
UI	User Interface
UPnP	Universal Plug and Play
USB	Universal Serial Bus
VBAT	Battery voltage
VCHAR	Charger voltage
VCO	Voltage controlled oscillator
VCTCXO	Voltage Controlled Temperature Compensated Crystal Oscillator
VCXO	Voltage Controlled Crystal Oscillator
Vp-p	Peak-to-peak voltage
VSIM	SIM voltage
WCDMA	Wideband code division multiple access
WD	Watchdog
WLAN	Wireless local area network
XHTML	Extensible hypertext markup language
