Using TFTP Server to Update DeviceMaster firmware

Disable the DeviceMaster drivers in the PC as this will prevent conflicts between the driver and this procedure. In Driver Management Console right click the DeviceMaster and select 'Disable'' from the pop-up menu

Required Files

Download from Comtrol the Firmware files needed or as recommended by Comtrol Tech Support.

PortVision DX <u>ftp://ftp.comtrol.com/contribs/devicemaster/driver-packages/previous/PortVision_DX_3.05.msi</u>

Bootloader: <u>ftp://ftp.comtrol.com/dev_mstr/rts/software/bootloader/</u> (bootloader-x.xx.cmtl)

SocketServer firmware for socket communications: <u>ftp://ftp.comtrol.com/dev_mstr/rts/software/socketserver/</u> (socketserver-x.xx.cmtl)

Please note: SocketServer and NS-Link have been incorporated into a single file with the new extension of .cmtl. By default, once loaded, the file will show SocketServer in both the web page and PortVision DX until a driver begins communication with this particular DeviceMaster. Once a driver establishes communications, the firmware will immediately indicate that it is NS-Link without the driver having to upload that firmware to the DeviceMaster or the DeviceMaster being rebooted as in the past. If SocketServer does not change to NS-Link, then a driver loaded in the PC is NOT in communication with the DeviceMaster.

Download from Comtrol the appropriate version of the Tftpdxx server:

32bit system: <u>ftp://ftp.comtrol.com/contribs/utilities/3rd_party_utils_free/tftp_server/tftpd32.452.zip</u> 64bit system: <u>ftp://ftp.comtrol.com/contribs/utilities/3rd_party_utils_free/tftp_server/tftpd64.452.zip</u> You may use another TFTP server or software should you already have one. These instructions will use the freeware version that, for your convenience, are available from the Comtrol site above or from the vendor at: <u>http://tftpd32.jounin.net/tftpd32_download.html</u>

Chapter 2 (page3): <u>Install and Setup the TFTP Server</u> Chapter 3 (page4): <u>Set the BootLoader Timeout</u> Chapter 4 (page6): <u>Upload the Firmware</u> Chapter 5 (page8): <u>Confirm the success of the update</u>

Install and Setup the TFTP Server

(<u>Return to Chapter List</u>)

Create a directory to extract the tftpdxx.452.zip to.

In this example we will create a directory in the 'C' drive root called TFTP. In the TFTP folder create a sub folder called 'files'.

Extract the tftpdxx.452.zip to the C:\TFTP directory. There is no install or setup to run. Once extracted, run the tftp32(64).exe file. It should look something like this showing the directory that it is running from and the IP address assigned to the PC. In this example that is C:\tftp and the Server interface 192.168.2.10.

🏘 Tftpd64 by Ph. Jounin	- 🗆 🗙 🏘 Browse For Folder	×
Current Directory	Browse Show Dir total timeouts PerfLogs Program Files Program Files (x86) Python27 Files Eolder: files	^
About Settings	Help Make New Folder OK Cance	ei:

Click on the Browse button and browse to the 'files' sub folder created earlier.

Now select the appropriate network interface.

<u>A</u> bout		Settings			<u>H</u> elp	

Select the option showing the IP Address of your PC.

Copy the SocketServer and Bootloader files to the $C:\TFTP\files$ directory. You will need to rename the extension on the files from .cmtl to .zip. Once the files are renamed, extract the files from the .zip to the c:\tftp\files folder. When you click on "Show Dir" you will see the files listed like this.

🏘 Tftpd64: directory			×
bootloader-4.22.bin bootloader-4.22.nxbin bootloader-4.22.zip socketserver-10.14.bin socketserver-10.14.nxbin socketserver-10.14.zip	9/8/2016 189524 9/8/2016 905631 10/25/2016 5/26/20161304116 5/26/20161001684 10/25/2016	604754 1187029	
Close	Сору	Explorer	

You will have 2 SocketServer files and 2 Bootloader files unzipped - Note the extensions of .bin and .nxbin. The .bin file will be used with DeviceMasters having an ARM processor. The .nxbin file will be used with the newer DeviceMaster models with the NXP processor.

CRITICAL NOTE: YOU WILL HAVE TO KNOW WHICH PROCESSOR YOUR DeviceMaster HAS! Installing the incorrect Firmware into your DeviceMaster, may cause it to become totally unusable in which case it would have to be returned to Comtrol to be corrected, and there WILL BE charges for this as it is not a warranty repair. If in doubt, do not proceed further.

The TFTP Server is now ready for use.

As files are being transferred from the TFTP server to the DeviceMaster, you should see something like this:

socketserver-10.14.	bin to 192.168.2.42	×						
	1304116 70272 Bytes/se	c

For Help, press F1 Scan Result	s 1 1 Ready

Right click on the DeviceMaster in the Device List Pane.

Telnet / SSH Settings

Leave the default settings and click the OK button.

Select Telnet / SSH Session from the menu.

B	192.168.2.42 - PuTTY	-	×
Password:			
			\sim

When prompted for a password, press enter as there is no default password.

At the dm> prompt enter "timeout 45" (without quotes) and press Enter. It should echo back 'Timeout 45 seconds' and go back to the dm> prompt.

Which Processor (CPU) is installed?

(Return to Chapter List)

Now we need to determine the type of CPU installed in this DeviceMaster. This will be used to determine which Firmware files will be used with the DeviceMaster.

Here is how to determine your processor type:

(If you are not still telnet into the DeviceMaster from the previous step, then telnet back into the DeviceMaster) At the dm> enter "reset" (without quotes) and press the Enter key. This will reboot the DeviceMaster. Back into PortVision DX and again Right Click on the DeviceMaster and select Telnet / SSH Session Leave the defaults and click OK.

Now you should now be at a RedBoot> prompt.

	P 192.168.2.42 - PuTTY	-	×
	ver		\sim

	**		
	** Comtrol DeviceMaster Bootloader 4.22		
	** Platform: Comtrol DeviceMaster (ARM 7TDMI) ** RedBoot(tm) environment - built <u>11:21:21:25, Sep</u> 8 2016		
	** Portions Copyright (C) 2000, Red Hat, Inc.		
	** Portions Copyright (C) Comtrol Corp.		
	**		

	RAM: 0x00000000-0x007c0000 [0x00000000-0x007b0000 available]		
Ī	RedBoot>		
	Reabool>		
			\sim

The second line of text shows ** Platform: Comtrol DeviceMaster (ARM 7TDMI) Note only one line of RAM values shown. This is the ARM processor.

The second line of text shows ** Platform: Comtrol DeviceMaster (Cortex-M3) Note the four lines of RAM values shown. This is the NXP Processor.

TFTP Firmware updates must be done from the RedBoot> prompt and you are ready to proceed.

CRITICAL NOTE: YOU WILL HAVE TO KNOW WHICH PROCESSOR YOUR DeviceMaster HAS!

Installing the incorrect Firmware into your DeviceMaster, may cause it to become totally unusable in which case it would have to be returned to Comtrol to be corrected, and there WILL BE charges for this as it is not a warranty repair. If in doubt, do not proceed further.

You must be at a "RedBoot" prompt for the remaining steps.

For an ARM processor (note the file extension)	
C:\TFTP\files\bootloader-4.22.bin	(Arm Processor Bootloader Firmware)
C:\TFTP\files\socketserver-10.14.bin	(Arm Processor SocketServer Firmware)
For the NXP Processor (note the file extension)	
C:\TFTP\files\bootloader-4.22.nxbin	(NXP Processor Bootloader Firmware)
C:\TFTP\files\socketserver-10.14.nxbin	(NXP Processor SocketServer Firmware)

Now that we know the type of Processor and the names of the files that will be used, we can update the Firmware.

ARM Processor

(Return to Chapter List)

For the ARM processor use the command:

load -r -b 0 -h <TFTP-Server_IP_Addr> <Firmware_File_Name> <TFTP-Server_IP_Addr> is the IP Address of the PC running the TFTP server application. <Firmware FileName> is the name of the firmware copied to the c:\TFTP\files directory.
