RoHS

- This product does not contain any hazardous substances prohibited by the RoHS Directive.

WARNING

- You are requested to use RoHS compliant parts for maintenance or repair.
- You are requested to use lead-free solder.
(This product has been manufactured using lead-free solder. Be sure to follow the warning given on page 2 when carrying out repair work.)

CAUTION : Danger of explosion if battery is incorrectly replaced.

Replace only with the same or equivalent type recommended by the manufacturer.

Discard used batteries according to the manufacturer's instructions.

NOTE : 1. Parts order must contain model number, part number, and description.
2. Substitute parts may be supplied as the service parts.
3. N. S. P. : Not available as service parts.

Design and specification are subject to change without notice.

PRODUCT SAFETY NOTICE

The components designated by a symbol (\triangle) in this schematic diagram designates components whose value are of special significance to product safety. Should any component designated by a symbol need to be replaced, use only the part designated in the Parts List. Do not deviate from the resistance, wattage, and voltage ratings shown.

WARNING

Do not use solder containing lead.

This product has been manufactured using lead-free solder in order to help preserve the environment.

Because of this, be sure to use lead-free solder when carrying out repair work, and never use solder containing lead.

Lead-free solder has a melting point that is 30 - 40°C (86 - 104°F) higher than solder containing lead, and moreover it does not contain lead which attaches easily to other metals. As a result, it does not melt as easily as solder containing lead, and soldering will be more difficult even if the temperature of the soldering iron is increased.

The extra difficulty in soldering means that soldering time will increase and damage to the components or the circuit board may easily occur.

Because of this, you should use a soldering iron and solder that satisfy the following conditions when carrying out repair work.

Soldering iron

Use a soldering iron which is 70 W or equivalent, and which lets you adjust the tip temperature up to 450°C (842°F). It should also have as good temperature recovery characteristics as possible.

Set the temperature to 350°C (662°F) or less for chip components, to 380°C (716°F) for lead wires and similar, and to 420°C (788°F) when installing and removing shield plates.

The tip of the soldering iron should have a C-cut shape or a driver shape so that it can contact the circuit board as flat or in a line as much as possible.

Solder

Use solder with the metal content and composition ratio by weight given in the table below. Do not use solders which do not meet these conditions.

Metal content	Tin (Sn)	Silver (Ag)	Copper (Cu)
Composition ratio by weight	96.5 %	3.0 %	0.5 %

Lead-free solder is available for purchase as a service tool.

Use the following part number when ordering:

Part name: Lead-free solder with resin (0.5 mm dia., 500 g)

Part number: VJ8-0270

Note:

If replacing existing solder containing lead with lead-free solder in the soldered parts of products that have been manufactured up until now, remove all of the existing solder at those parts before applying the lead-free solder.

1. OUTLINE OF CIRCUIT DESCRIPTION

1-1. CMOS CIRCUIT DESCRIPTION

1. IC Configuration

The CMOS peripheral circuit block basically consists of the following ICs.

IC911 (MT9N001I125TC)

CMOS imager

CDS, AGC, ADC built-in

H driver, V driver, serial communication circuit built-in

2. IC911 (CMOS)

[Structure]

The electric charges which are generated when each pixel is optically converted are in turn converted into signal voltages by the FD amplifier, and they are then transmitted by the built-in H driver and V driver. The signals are sampled and amplified by the CDS and PGA circuits at the point they are output, and then they are AD converted and output. The output uses the 12 bit parallel interface.

1/2.3-inch positive pixel array CMOS-type fixed imaging element

Effective pixels 3488 (H) X 2616 (V)

1-2. CP1 and VF1 CIRCUIT DESCRIPTION

1. Circuit Description

1-1. Digital clamp

The optical black section of the extracts averaged values from the subsequent data to make the black level of the output data uniform for each line. The optical black section averaged value for each line is taken as the sum of the value for the previous line multiplied by the coefficient k and the value for the current line multiplied by the coefficient 1-k.

1-2. Signal processor

1. γ correction circuit

This circuit performs (gamma) correction in order to maintain a linear relationship between the light input to the camera and the light output from the picture screen.

2. Color generation circuit

This circuit converts the image sensor into RGB signals.

3. Matrix circuit

This circuit generates the Y signals, R-Y signals and B-Y signals from the RGB signals.

4. Horizontal and vertical aperture circuit

This circuit is used generate the aperture signal.

1-3. AE/AWB and AF computing circuit

The AE/AWB carries out computation based on a 64-segment screen, and the AF carries out computations based on a 6-segment screen.

1-4. SDRAM controller

This circuit outputs address, RAS, CAS and CS data for controlling the SDRAM. It also refreshes the SDRAM.

1-5. Communication control

1. SIO

This is the interface for the 8-bit microprocessor.

2. PIO/PWM/SIO for LCD

8-bit parallel input and output makes it possible to switch between individual input/output and PWM input/output.

1-6. Digital encorder

It generates chroma signal from color difference signal.

2. Outline of Operation

When the shutter opens, the reset signals (ASIC and CPU) and the serial signals ("take a picture" commands) from the 8-bit microprocessor are input and operation starts.

The picture data from CMOS passes through the A/D and CDS, and is then input to the ASIC as digital data. The AF, AE, AWB, shutter, and AGC value are computed from this data, and three exposures are made to obtain the optimum picture. The data which has already been stored in the SDRAM is read by the CPU and color generation is carried out. Each pixel is interpolated from the surrounding data as being either R, G, and B primary color data to produce R, G and B data. At this time, correction of the lens distortion which is a characteristic of wide-angle lenses is carried out. After AWB and γ processing are carried out, a matrix is generated and aperture correction is carried out for the Y signal, and the data is then compressed by JPEG and is then written to card memory (SD card).

When the data is to be output to an external device, it is taken data from the memory and output via the USB I/F. When played back on the LCD and monitor, data is transferred from memory to the SDRAM, and the image is then elongated so that it is displayed over the SDRAM display area.

3. LCD Block

The LCD display circuit is located on the CP1 board and VF1 board, and consists of components such as a power circuit and VCOM control circuit.

The signals from the ASIC are 8-bit digital signals, that is input to the LCD directly. The 8-bit digital signals are converted to RGB signals inside the LCD driver circuit. The LCD is input signals from ASIC directly to the LCD, and function such as image quality are controlled.

In addition, the timing pulses for signals other than the video signals are also input from the ASIC directory to the LCD.

4. Lens drive block

4-1. Focus drive

The 16-bit serial data signals (LENS_SD) and (LENS_SCLK and LENS_EN) which are output from the ASIC (IC101) are used to drive (FOCUS A +, FOCUS A -, FOCUS B + and FOCUS B -) by the motor driver IC (IC951), and are then used to microstep-drive the stepping motor for focusing operation. Detection of the standard focusing positions is carried out by the ASIC detecting the signal (F_SENSE) from the photointerruptor inside the lens block.

4-2. Zoom drive

The 16-bit serial data signals (LENS_SD) and (LENS_SCLK and LENS_EN) which are output from the ASIC (IC101) are used to drive (ZOOM A +, ZOOM A -, ZOOM B + and ZOOM B -) by the motor driver IC (IC951), and are then used to microstep-drive the stepping motor for zooming operation. Detection of the standard zooming positions is carried out by the ASIC detecting the signal (Z_SENSE) from the photointerruptor inside the lens block.

4-3. ND filter

The ND filter drive signals (NDON and NDOFF) which are output from the ASIC (IC101) are used to drive (ND + and ND -) by the motor driver (IC951), and then the ND filter is inserted into and removed from the beam path.

4-4. Iris drive

The drive method is a galvanometer type without braking coil. The output from the Hall sensor inside the lens is amplified by the Hall amplifier circuit inside the IC971 lens drive IC, and the difference between the current and target aperture determined by the resulting output and the exposure amount output from the ASIC (IC101) is input to the servo amplifier circuit (IC971) to keep the aperture automatically controlled to the target aperture. The lens aperture control signal is output from IC971 and is input to lens drive IN6B of IC951. IC951 functions as the driver for driving the lens.

4-5. Shutter drive

Reverse voltage is applied to the above aperture drive coil to operate the shutter. When the shutter operates, the OC_EN and OC_CONT signals are maintained at a high level, it is input to IN6B of IC951 with low level.

At the same time the SHUTTER + signal that is output from the ASIC (IC101) becomes high (input to IN6A of IC951) and the shutter operates. IC951 functions as the driver for driving the lens.

5. Video Clip Recording and Playback

5-1. Recording

The signal from the camera block is input to IC101 (ASIC). The data that is input to the ASIC is input to SDRAM, and converts this data to encoded MPEG4 data, after which it is written in sequence onto the SD card as streaming data. At this time, the audio signals that are input to the built-in microphone are converted into digital data by the audio CODEC IC of IC183, and they are then input to ASIC. The audio data is then encoded (AAC), and then it is written in sequence onto the SD card together as streaming data with the image signals described above.

5-2. Playback

The data is read from the SD card, and the encoded data is decoded into image data where it is displayed by the LCD or on a TV monitor. At the same time, the audio data is also decoded, and is input to IC183 as digital data. D/A conversion is carried out at IC183, and the sound is then output to the speaker or to the LINE OUT terminal or the headphone.

6. Audio CODEC Circuit (IC183)

The audio signals from the microphone are converted into 16-bit digital data. AD conversion is carried out at a maximum sampling frequency of 48 kHz.

During audio playback, the 16-bit digital data is converted into analog signals and these drive headphone through the speaker or line out system and headphone amplifier. DA conversion is carried out at a maximum sampling frequency of 48 kHz.

1-3. PWA POWER CIRCUIT DESCRIPTION

1. Outline

This is the main power circuit, and is comprised of the following blocks.

Switching controller (IC501)

Motor system power output (L5301)

Digital 3.25 V power output (L5002)

Digital and CMOS 1.8 V power output (L5003)

Backlight power output (Q5007, L5007)

Digital 1 V power output (IC502, L5004)

CMOS analog 2.8 V power output (IC503, L5005)

2. Switching Controller (IC501)

This is the basic circuit which is necessary for controlling the power supply for a PWM-type switching regulator, and is provided with seven built-in channels, only CH1 (motor system), CH2 (digital 3.25 V), CH3 (digital 1.8 V) and CH7 (backlight) are used.

Each power supply output is received, and the PWM duty is varied so that each one is maintained at the correct voltage setting level.

Feedback for the backlight power (CH7) is provided to the both ends voltage of resistance so that regular current can be controlled to be current that was setting.

2-1. Short-circuit protection circuit

If output is short-circuited for the length of time determined by the condenser which is connected to Pin (A6) of IC501, all output is turned off. To reset, momentarily set the control signal (P ON) to repeat control, or temporarily disconnect the input power supply.

3. Motor System Power Output

BOOST 5 V is output. Feedback for the 5.0 V output is provided to the switching controller (Pin (B7) of IC501) so that PWM control can be carried out.

4. Digital 3.25 V Power Output

VDD3 is output. Feedback for the VDD3 is provided to the switching controller (Pin (F3) of IC501) so that PWM control can be carried out.

5. Digital 1.8 V and CMOS 1.8 V Power Output

VDD 1.8 and CMOS 1.8 V are output. Feedback for the 1.8 V is provided to the switching controller (Pin (C3) of IC501) so that PWM control to be carried out.

6. Backlight Power Supply output

Regular current is being transmitted to LED for LCD backlight. Feedback for the both ends voltage of resistance that is being positioned to in series LED are provided to the switching controller (Pin (C4) of IC501) so that PWM control to be carried out.

7. Digital 1 V Power Output

VDD 1.0 is output. Feedback for the VDD 1.0 is provided to the switching controller (Pin (11) of IC502) so that PWM control to be carried out.

8. CMOS Analog 2.8 V Power Output

VAA 2.8 is output. Feedback for the VAA 2.8 is provided to the switching controller (Pin (3) of IC503) so that PWM control to be carried out.

1-4. ST1 STROBE CIRCUIT DESCRIPTION

1. Charging Circuit

When UNREG power is supplied to the charge circuit and the CHG signal from microprocessor becomes High (3.3 V), the charging circuit starts operating and the main electrolytic capacitor is charged with high-voltage direct current.

However, when the CHG signal is Low (0 V), the charging circuit does not operate.

1-1. Charge switch

When the CHG signal switches to Hi, IC541 starts charging operation.

1-2. Power supply filter

C5401 constitutes the power supply filter. They smooth out ripples in the current which accompany the switching of the oscillation transformer.

1-3. Oscillation circuit

This circuit generates an AC voltage (pulse) in order to increase the UNREG power supply voltage when drops in current occur. This circuit generates a drive pulse with a frequency of approximately 200-300 kHz, and drive the oscillation transformer.

1-4. Oscillation transformer

The low-voltage alternating current which is generated by the oscillation control circuit is converted to a high-voltage alternating current by the oscillation transformer.

1-5. Rectifier circuit

The high-voltage alternating current which is generated at the secondary side of T5401 is rectified to produce a high-voltage direct current and is accumulated at electrolytic capacitor C5412.

1-6. Charge monitoring circuit

The functions programmed in the IC541 monitor oscillations and estimate the charging voltage. If the voltage exceeds the rated value, charging automatically stops. Then, the ZCHG_DONE signal is changed to Lo output and a "charging stopped" signal is sent to the microcomputer.

2. Light Emission Circuit

When FLCLT signal is input from the ASIC, the stroboscope emits light.

2-1. Emission control circuit

When the FLCLT signal is input to the emission control circuit, Q5402 switches on and preparation is made to the light emitting. Moreover, when a FLCLT signal becomes Lo, the stroboscope stops emitting light.

2-2. Trigger circuit

The Q5402 is turned ON by the FLCLT signal and light emission preparation is preformed. Simultaneously, high voltage pulses of several kV are emitted from the trigger coil and applied to the light emitter.

2-3. Light emitting element

When the high-voltage pulse from the trigger circuit is applied to the light emitting part, current flows to the light emitting element and light is emitted.

Beware of electric shocks.

1-5. SYA CIRCUIT DESCRIPTION

1. Configuration and Functions

For the overall configuration of the SYA block, refer to the block diagram. The SYA block centers around a 8-bit microprocessor (IC301), and controls camera system condition (mode).

The 8-bit microprocessor handles the following functions.

1. Operation key input, 2. Clock control and backup, 3. Power ON/OFF, 4. Strobe charge control

Pin	Signal	I/O	Outline
1	SCK	O	Serial data clock output
2	CARD	I	SD card detection (L= SD card)
3	BACKUP_CTL	O	Backup battery charge control (L= charge)
4	CHG_DONE	I	Strobo condensor charge done detection (H → L= charge done)
5	HOT LINE	I	Hot line request from ASIC
6	TEST_MODE	I	Test mode terminal (L= starting up test mode)
7	NOT USED	O	-
8	NOT USED	O	-
9	VDD2	-	VDD
10	VSS2	-	GND
11	RED_LED	O	Red LED (H= lighting)
12	GREEN_LED (G)	O	Green LED (H= lighting)
13	NAND RESET	O	OneNAND flash reset (L= reset)
14	KEY_POWER	I	Key input POWER (L=input)
15	BL ON	O	LCD backlight ON/OFF single (H= backlight ON)
16	NOT USED	O	-
17	MAIN RESET	O	System reset (MRST)
18	PLEN	O	ASIC PLL ON/OFF control
19	UTX	I	Debugger terminal
20	MR_PANEL_OPEN	I	LCD panel open/close detection (H= panel open)
21	USB_DET	I	USB connection detection (L= connection)
22	COMREQ	I	Command request input
23	KEY_WIDE	I	Key input WIDE (L= input)
24	KEY_1st	I	Key input 1st SHUTTER (L= input)
25	KEY_PLAY	I	Key input PLAY (L= input)
26	BOOT	O	BOOT output
27	ST_CHG	O	Strobo charge control (H= charge)
28	SW3.2 ON	O	SW 3.2 power ON/OFF signal (L= ON)
29	KEY_DOWN	I	Key input DOWN (L= input)
30	KEY_MENU	I	Key input MENU (L= input)
31	KEY_UP	I	Key input UP (L= input)
32	KEY_RIGHT	I	Key input RIGHT (L= input)
33	KEY_SET	I	Key input SET (L= input)
34	KEY_VREC	I	Keyscan VREC (L= input)
35	VSS3	-	GND
36	VDD3	-	VDD
37	RDSEL	I/O	Debugger terminal
38	CLK (SFW)	I/O	Debugger terminal
39	DATA0 (SFW)	I/O	Debugger terminal
40	P ON	O	D/D converter 1.8 V/3.3 V ON/OFF signal (H= ON)
41	P ON2	O	D/D converter 1.0 V ON/OFF signal (H= ON)
42	KEY_TELE	I	Key input TELE (L= input)

See next page →

43	KEY_LEFT	I	Key input LEFT (L= input)
44	HINJI	I	LCD panel rotation detection (L= panel inversion)
45	NOT USED	O	-
46	NOT USED	O	-
47	NOT USED	O	-
48	NOT USED	O	-
49	BAT_OFF	I	Battery OFF detection (L= battery OFF)
50	SREQ	I/O	Serial communication request signal
51	FRAME_VALID	I	CMOS_V signal
52	KEY_2ND	I	Key input 2nd SHUTTER (L= input)
53	RESET	I	Microprocessor reset input (L= reset)
54	XCIN	I	Sub clock oscillation terminal (32.768 kHz)
55	XCOU	O	Sub clock oscillation terminal (32.768 kHz)
56	VSS1	-	GND
57	XIN	I	Main clock oscillation terminal (4 MHz)
58	XOUT	O	Main clock oscillation terminal (4 MHz)
59	VDD1	-	VDD
60	UNREG SY	I	Camera power voltage input
61	AV_JACK	I	AV JACK connection detection (L= connection)
62	TH_TEMP	I	Camera temperature detection
63	SO	O	Serial data output
64	SI	I	Serial data input

Table 5-1. 8-bit Microprocessor Port Specification

2. Internal Communication Bus

The SYA block carries out overall control of camera operation by detecting the input from the keyboard and the condition of the camera circuits. The 8-bit microprocessor reads the signals from each sensor element as input data and outputs this data to the camera circuits (ASIC) or to the LCD display device as operation mode setting data. Fig. 5-1 shows the internal communication between the 8-bit microprocessor, ASIC and SPARC lite circuits.

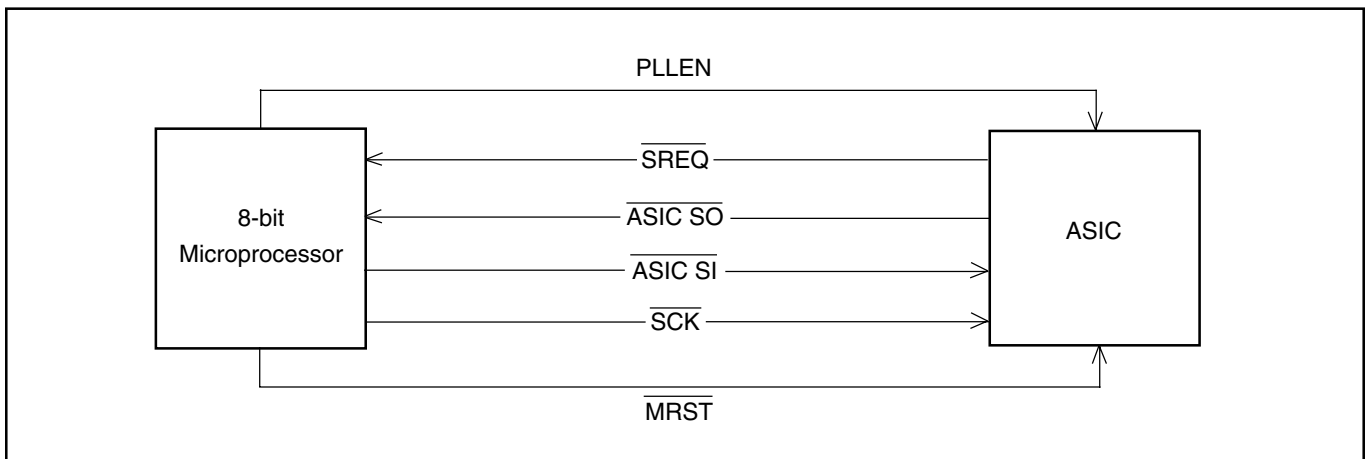

Fig. 5-1 Internal Bus Communication System

3. Power Supply Control

The 8-bit microprocessor controls the power supply for the overall system.

The following is a description of how the power supply is turned on and off. When the battery is attached, a regulated 3.2 V (power off: 2.4 V) voltage is normally input to the 8-bit microprocessor (IC301) by IC302, so that clock counting and key scanning is carried out even when the power switch is turned off, so that the camera can start up again. When the battery is removed, the 8-bit microprocessor operates in sleep mode using the backup battery. At this time, the 8-bit microprocessor only carries out clock counting, and waits in standby for the battery to be attached again. When a switch is operated, the 8-bit microprocessor supplies power to the system as required.

The 8-bit microprocessor first set the P ON signal at pin (40) and the P ON2 signal at pin (41) to high, and then turns on the DC/DC converter. After this, low signal is output from pin (17) so that the ASIC is set to the reset condition. After this these pins set to high, and set to active condition. Once it is completed, the ASIC returns to the reset condition, all DC/DC converters are turned off and the power supply to the whole system is halted.

		ASIC, memory	CMOS	8 bit CPU
Power voltage		3.3 V 1.0 V 1.8 V	2.8 V (A) 2.8 V (D), 1.8 V (D)	3.2 V
Power OFF		OFF	OFF	32KHz
CAMERA	Power switch ON - Auto power OFF	OFF	OFF	32KHz
	LCD finder	ON	ON	4 MHz
Play back		ON	OFF	4 MHz

Table 5-2. Camera Mode

Note) 4 MHz = Main clock operation, 32 kHz = Sub clock operation

2. DISASSEMBLY

2-1. REMOVAL OF ST1 BOARD, LENS AND CP1 BOARD

1. Screw 1.7 x 6
2. Open the cover battery.
3. Screw 1.7 x 4.5
4. Three screws 1.7 x 6
5. Two screws 1.7 x 4.5

3. ELECTRICAL ADJUSTMENT

3-1. Table for Servicing Tools

Ref. No.	Name	Number	Part code
J-1	Pattern box	1	VJ8-0190
J-2	Calibration software	1	
J-3	Chroma meter	1	VJ8-0192
J-4	Spare lump (pattern box)	1	VJ8-0191
J-5	Discharge jig	1	VJ8-0188
J-6	Collimator	1	VJ8-0260
J-7	Spare lump (collimator)	1	VJ8-0282
J-8	Siemens star chart	1	

Download the calibration software and the firmware from the following URL.

<http://www.digital-sanyo.com/overseas/service/>

Place the DscCalDi.exe file, camapi32.dll file and QrCodeInfo.dll file together into a folder of your choice.

3-2. Equipment

1. PC (IBM®-compatible PC, Windows 2000 or XP or Vista)

3-3. Adjustment Items and Order

1. Lens Adjustment (Infinity)
2. Lens Adjustment (1m)
3. AWB Adjustment
4. CCD White Point Defect Detect Adjustment
5. CCD Black Point And White Point Defect Detect Adjustment In Lighted

Note: If the lens, CCD and board and changing the part, it is necessary to adjust again. Item 1-5 adjustments should be carried out in sequence.

3-4. Setup

1. System requirements

- Windows 2000 or XP or Vista
- IBM®-compatible PC with pentium processor
- USB port
- 40 MB RAM
- Hard disk drive with at least 15 MB available
- VGA or SVGA monitor with at least 256-color display

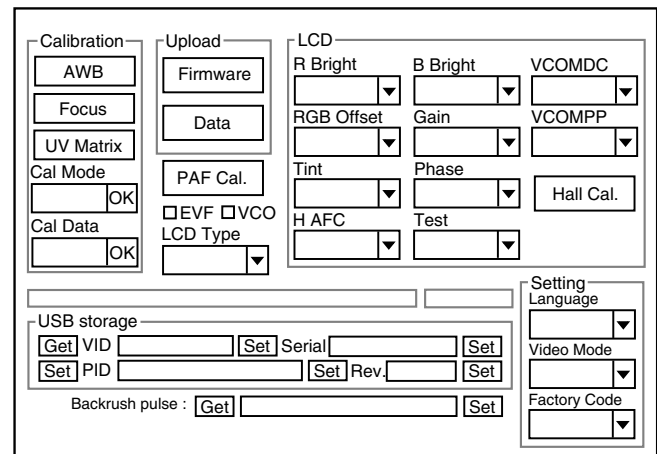

2. Installing USB driver

Install the USB driver with camera or connection kit for PC.

3. Pattern box

Turn on the switch and wait for 30 minutes for aging to take place before using Color Pure. It is used after adjusting the chroma meter (VJ8-0192) adjust color temperature to 3100 ± 20 K and luminosity to 900 ± 20 cd/m². Be careful of handling the lump and its circumference are high temperature during use and after power off for a while.

4. Computer screen during adjustment

3-5. Connecting the camera to the computer

This camera requires a DC adaptor (sold separately) in order to use an AC adaptor.

1. Insert the DC adaptor to the camera.
2. Insert the AC adaptor's cable to DC terminal of the DC adaptor.
3. Line up the arrow on the cable connector with the notch on the camera's USB port. Insert the connector.
4. Locate a USB port on your computer.
5. If "USB CONNECTION" is displayed, choose the "COMPUTER", and press the SET button. Next, choose the "CARD READER", and press the SET button.

3-6. The adjustment item which is necessary in part exchange

	Lens Adjustment (Infinity)	Lens Adjustment (1 m)	AWB Adjustment	CCD White Point Defect Detect Adjustment	CCD Black Point And White Point Defect Detect Adjustment In Lighted	Factory Cord Setting	Language Setting	USB storage information registration	Reset Setting
COMPL PWB CP-1	○	○	○	○	○	○	△	○	○
COMPL PWB VF-1									
COMPL PWB ST-1									
COMPL PWB TB-1									
ASSY, FLEXIBLE PWB COMP3	○	○	○	○	○				
LENS	○	○	○						

○ : Be sure to carry out the necessary adjustments after replacing the unit.

△ : Adjustment is possible from the menu setting screen of the camera and by using the calibration software.

3-7. Updating the firmware

Check the firmware version immediately after the CP1 board has been replaced. If an old version is being used, interference and errors in operation may also occur. If an old version is being used, update it with a newer version.

Refer to 3-13. Firmware uploading procedure. (Page 21)

3-8. Adjust Specifications

1. Lens Adjustment (Infinity)

Preparation:

POWER switch: ON

If using a ready-made collimator, set to infinity.

Note:

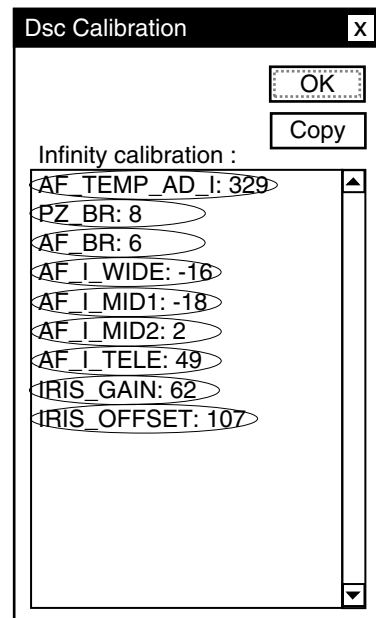

Do not vibrate during the adjustment.

The temperature of the camera should be allowed to reach room temperature before adjusting the focus. If any slight increases or decreases in room temperature occur, wait until the temperature of the camera reaches room temperature before carrying out adjustment.

Adjustment method:

1. Set the camera so that it becomes center of the siemens star chart in the collimator (zoom wide and tele). (Set a distance of 0.5-1.0 cm between camera lens and collimator lens when zoom tele edge. Do not touch the each lens.)
2. Double-click on the DscCalDi.exe.
3. Select "Infinity Cal." on the LCD "Test", and click the "Yes".
4. Lens infinity adjustment value will appear on the screen.
5. Click the OK.

2. Lens Adjustment (1m) is carried out after this adjustment.

Adjustment value determination is effectuated using below values.

The adjustment values fulfill the conditions below, they are determined as within specifications.

Adjustment value determination

AF_TEMP_AD_I: ATADI

ATADI: adjustment value of focus temperature A/D
($0 < ATADI < 1023$)

PZ_BR: PBR

PBR: adjustment value of zoom backrush pulse
($0 \leq PBR \leq 10$)

AF_BR: ABR

ABR: adjustment value of focus backrush pulse
($0 \leq ABR \leq 10$)

AF_I_WIDE: ZIW

ZIW: infinity adjustment value of focus at zoom position wide ($-40 \leq ZIW \leq 40$)

AF_I_MID1: ZIM1

ZIM1: infinity adjustment value of focus at zoom position middle1 ($-70 \leq ZIM1 \leq 70$)

AF_I_MID2: ZIM2

ZIM2: infinity adjustment value of focus at zoom position middle2 ($-58 \leq ZIM2 \leq 82$)

AF_I_TELE: ZIT

ZIT: infinity adjustment value of focus at zoom position tele ($-41 \leq ZIT \leq 99$)

IRIS_GAIN: g

g: adjustment value of gain ($0 \leq g \leq 255$)

IRIS_OFFSET: o

o: adjustment value of offset ($0 \leq o \leq 255$)

2. Lens Adjustment (1m)

Preparation:

POWER switch: ON

Adjustment condition:

Siemens star chart (A3)

Fluorescent light illumination with no flicker (incandescent light cannot be used.)

Illumination above the subject should be $700 \text{ lux} \pm 10\%$.

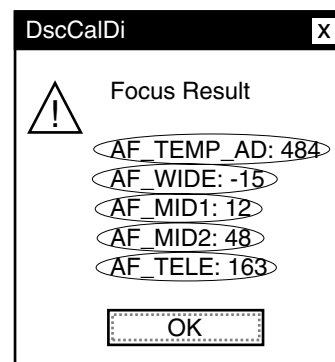

Note:

Do not vibrate during the adjustment.

The temperature of the camera should be allowed to reach room temperature before adjusting the focus. If any slight increases or decreases in room temperature occur, wait until the temperature of the camera reaches room temperature before carrying out adjustment.

Adjustment method:

1. Set the siemens star chart 100 ± 0.5 cm from lens surface (zoom wide position) so that it becomes center of the screen (zoom wide and tele). Set the camera and the chart in a straight, and do not put optical systems (mirror and conversion lens etc.)
2. Double-click on the DscCalDi.exe.
3. Click the "Focus", and Click the "Yes".
4. Lens adjustment value will appear on the screen.
5. Click the OK.

Adjustment value determination is effectuated using below values.

The adjustment values fulfill the conditions below, they are determined as within specifications.

Adjustment value determination

AF_TEMP_AD: ATAD

ATAD: adjustment value of focus temperature A/D
($0 < ATAD < 1023$)

AF_WIDE: ZW

ZW: adjustment value of focus at zoom position wide
($-50 \leq ZW \leq 50$)

AF_MID1: ZM1

ZM1: adjustment value of focus at zoom position middle1
($-80 \leq ZM1 \leq 80$)

AF_MID2: ZM2

ZM2: adjustment value of focus at zoom position middle2
($-68 \leq ZM2 \leq 92$)

AF_TELE: ZT

ZT: adjustment value of focus at zoom position tele
($-51 \leq ZT \leq 109$)

3. AWB Adjustment

Preparation:

POWER switch: ON

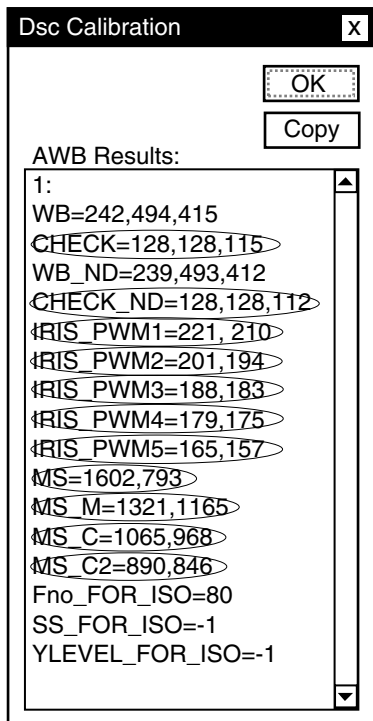

Setting of pattern box:

Color temperature: 3100 ± 20 (K)

Luminance: 900 ± 20 (cd/m²)

Adjusting method:

1. When setting the camera in place, set it to an angle so that nothing appears in any part of the color viewer except the white section. (Do not enter any light.)
2. Double-click on the DscCalDi.exe.
3. Click the AWB, and click the Yes.
4. AWB adjustment value will appear on the screen.
5. Click the OK.

Adjustment value determination is effectuated using the "CHECK", "CHECK_ND", "MS", "MS_M", "MS_C", "MS_C2", "IRIS_PWM1", "IRIS_PWM2", "IRIS_PWM3", "IRIS_PWM4" and "IRIS_PWM5" values. If

CHECK= wc0, wc1, wc2

CHECK_ND= wnc0, wnc1, wnc2

MS= ms1, ms2,

MS_M= ms3, ms4,

MS_C= ms5, ms6,

MS_C2= ms7, ms8,

IRIS_PWM1= s1, s2

IRIS_PWM2= s3, s4

IRIS_PWM3= s5, s6

IRIS_PWM4= s7, s8

IRIS_PWM5= s9, s10

the adjustment values fulfill the conditions below, they are determined as within specifications.

Adjustment value determination

wc0= 128 ± 2 , wc1= 128 ± 2 , wc2= 130 ± 40

wnc0= 128 ± 2 , wnc1= 128 ± 2 , wnc2= 130 ± 40

$1200 < ms1 < 4450$, $240 < ms2 < 2240$, $980 < ms3 < 2980$,

$820 < ms4 < 2820$, $700 < ms5 < 2700$, $570 < ms6 < 2570$,

$470 < ms7 < 2470$, $360 < ms8 < 2360$

$0 < s1 < 255$, $0 < s2 < 255$, $0 < s3 < 255$, $0 < s4 < 255$,

$0 < s5 < 255$, $0 < s6 < 255$, $0 < s7 < 255$, $0 < s8 < 255$,

$0 < s9 < 255$, $0 < s10 < 255$

$ms2 < ms8 < ms7 < ms6 < ms5 < ms4 < ms3 < ms1$

$s1 > s2 > s3 > s4 > s5 > s6 > s7 > s8 > s9 > s10$

Adjustment values other than the above are irrelevant.

4. CCD White Point Defect Detect Adjustment

Preparation:

POWER switch: ON

Adjustment method:

1. Double-click on the DscCalDi.exe.
2. Select "CCD Defect" on the LCD "Test", and click the "Yes".
3. After the adjustment is completed, OK will display.
4. Click the OK.

5. CCD Black Point And White Point Defect Detect Adjustment In Lighted

Preparation:

POWER switch: ON

Setting of pattern box:

Color temperature: 3100 ± 20 (K)

Luminance: 900 ± 20 (cd/m²)

Adjusting method:

1. Set the camera 0 cm from the pattern box. (Do not enter any light.)
2. Double-click on the DscCalDi.exe.
3. Select "CCD Black" on the LCD "Test", and click the "Yes".
4. After the adjustment is completed, the number of defect will appear.
5. Click the OK.

3-9. Factory Code Setting

1. Check the "Factory Code" display within the Setting group.
2. **For U.S.A., Canada and NTSC general area**
If "FC_SANYO_U" does not appear, click on the "▼" mark located on the right of the "Factory Code" display BOX and select "FC_SANYO_U".
3. **For Europe and PAL general area**
If "FC_SANYO_EX" does not appear, click on the "▼" mark located on the right of the "Factory Code" display BOX and select "FC_SANYO_EX".

3-10. Language Setting

1. Click on the "▼" mark located on the right of the "Language" display BOX.
2. Select language. (Default is English.)
3. End "DscCal" and remove the camera before turning the camera power OFF.

The screenshot shows a camera's menu interface with the following sections:

- Calibration:** AWB, Focus, UV Matrix, Cal Mode, Cal Data.
- Upload:** Firmware, Data, PAF Cal., EVF, VCO, LCD Type.
- LCD:** R Bright, B Bright, VCOMDC, RGB Offset, Gain, VCOMPP, Tint, Phase, Hall Cal., H AFC, Test.
- USB storage:** VID, Serial, PID, Rev.
- Backrush pulse:** (Get/Set)
- Setting Language:** Language, Video Mode, Factory Code.

3-11. Reset Setting

Carry out reset settings after replacing CP1 board.

1. Turn on the camera.
2. Press the MENU button.
3. Choose the Option menu.
4. Choose the RESET SETTINGS, and press the SET button.
5. Select RESET, and press the SET button.

3-12. The Compulsive boot starting method

1. Keep MENU button, SET button, and SHUTTER button depressed while switching on the power.
2. Connect the camera and the computer with USB cable.

3-13. Firmware uploading procedure

1. Uploading the firmware should be carried out if the version number (COMPL PWB XX-X) on the replacement circuit board is lower than the version of the distributed firmware. For XX-X, enter the name of the circuit board containing the firmware.
2. The firmware is distributed by e-mail in self-extracting archive format. Change the extension of the distributed file to .EXE and save it in your preferred folder.
3. When you double-click the saved file, the firmware (binary file) will be saved in the same folder.
4. The firmware must not be distributed without permission.

1. Overwriting firmware from the SD card

Preparation:

SD card: SD card with firmware rewritten into the root directory

Data: S214Nxxx.BIN (xxx: version)

Overwriting method:

1. Insert the above SD card.
2. Turn on the camera.
3. Set the REC/PLAY switch to the PLAY.
4. Press the MENU button.
5. Choose the Option menu.
6. Choose the FORMAT.
7. Toggle the SET button to the left for 2 seconds. FIRMWARE UPDATE will display.
8. Choose YES.
9. Press the SET button. Update is starting.

Note:

Do not turn off the camera's power or remove the SD card while the firmware is being updated.

The power will turn on automatically after the update is complete.

2. Overwriting firmware from the calibration software

Preparation:

PC with overwriting firmware copied to the preferred folder in the HD.

Data: S214Nxxx.BIN (xxx: version)

Overwriting method:

1. Connect the camera's USB/AV terminal to the computer's USB connector.
2. The USB Connection screen appears on the camera's LCD monitor. Choose the "COMPUTER", and press the SET button. Next, choose the "CARD READER", and press the SET button.
3. Double-click on the DscCalDi.exe.
4. Click the Firmware.
5. Choose the firmware file to use for overwriting, and click the Yes.
6. Update is starting. The message will appear, and choose OK.
7. After the update is complete, disconnect the USB cable and turn the camera's power off.

Note:

Do not turn off the camera's power while the firmware is being updated.

4. USB STORAGE INFORMATION REGISTRATION

USB storage data is important for when the camera is connected to a computer via a USB connection.

If there are any errors in the USB storage data, or if it has not been saved, the USB specification conditions will not be satisfied, so always check and save the USB storage data.

Preparation:

POWER switch: ON

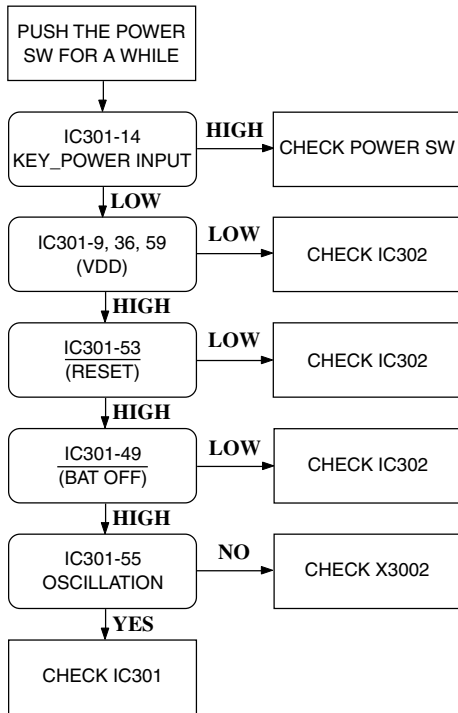

Adjustment method:

1. Connect the camera to a computer. (Refer to 3-5. Connecting the camera to the computer on the page 17.)
2. Double-click on the DscCalDi.exe.
3. Click on the Get button in the USB storage window and check the USB storage data.
 VID: SANYO
 PID: CG9
 Serial:
 Rev. : 1.00
4. Check the "Serial" in the above USB storage data. If the displayed value is different from the serial number printed on the base of the camera, enter the number on the base of the camera. Then click the Set button.
5. Next, check VID, PID and Rev. entries in the USB storage data. If any of them are different from the values in 3. above, make the changes and then click the corresponding Set button.

CABINET AND CHASSIS PARTS 2

Cabinet 2

ELECTRICAL PARTS

Note:

1. Materials of Capacitors and Resistors are abbreviated as follows ;

Resistors		Capacitors
MT-FILM	Metallized Film Resistor	MT-POLYEST Metallized Polyester Capacitor
MT-GLAZE	Metallized Glaze Resistor	MT-COMPO Metallized Composite Capacitor
OXIDE-MT	Oxide Metallized Film Resistor	TA-SOLID Tantalum Solid Capacitor
		AL-SOLID Aluminum Solid Capacitor
		NP-ELECT Non-Polarized Electrolytic Capacitor
		OS-SOLID Aluminum Solid Capacitors with Organic Semiconductive Electrolytic Capacitor
		DL-ELECT Double Layered Electrolytic Capacitor
		POS-SOLID Polymerized Organic Semiconductor Capacitor

2. Tolerance of Capacitor (10pF over) and Resistor are noted with follow symboles.

F1%	G2%	J5%	K10%
M20%	N30%	Z+80% ~ -20%		

3. Capacitors

U : μ F P : pF

4. Inductors

UH : μ H MH : mH

5. N.S.P. : Not available as service parts.
