2.1 OPERATING ENVIRONMENT

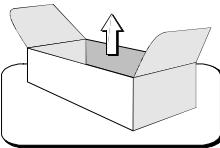

You can install the apparatus in a standard component rack or on a suitable surface such as a bench or desk. In any case, the area should be as clean and well-ventilated as possible. Always allow for at least 2 cm of clearance under the unit for ventilation. If you set the apparatus on a flat surface, install spacers on the bottom cover plate. If you install the apparatus in a rack, provide adequate clearance above and below. Do not locate the apparatus directly above a hot piece of equipment.

2.2 PRELIMINARY OPERATIONS

Correct installation of the equipment is important for maximum performance and reliability. Antenna and earth connections must be installed with the greatest care. The equipment adjustment isn't need, because the unit is completely adjusted by our technical staff. This is the installation procedure:

1. connect the power supply cable of the transmitter to the auxiliary socket on the rear panel of the amplifier;
2. connect the power supply cable of the amplifier to the electric network (230VAC). If there is the Isolator Transformer, the amplifier is provided with cable and plug;
3. connect the exciter / antenna cable to the RF IN and RF OUT on the rear panel of the amplifier.

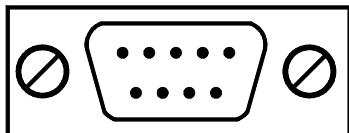

When the apparatus is put within a combined system it is directly connected to the input splitting and output combining systems.

Before fully powering the apparatus, check that the output connections of the coaxial cable to the antenna system are working.

In order to this it is possible to check the indication of the reflected power at low power levels. Only if the SWR indication on the display is 0, the output power can be slowly increased. At maximum output power, some watts might be shown as reflected power.

2.3 TELEMEASURING SOCKET CONNECTIONS

The following table summarizes the Telemeasuring pin connections.

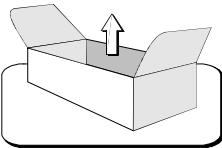

DB9 Socket

| Nº Pin | SYGNAL TYPE | IN/OUT | FUNCTION |
|--------|-------------|--------------|------------------|
| 1 | Ground | | |
| 2 | Logical | Input | 5V= On - 0V= Off |
| 3 | Analog | Output | Dir Power |
| 4 | Analog | Output | Ref Power |
| 5 | Analog | Output | Unbalancing |
| 6 | Analog | Output | Temperature |
| 7 | Analog | Output Alarm | 5V= On - 0V= Off |
| 8 | N.C. | | |
| 9 | N.C. | | |

2.4 RS232 AND RS485 SOCKET CONNECTIONS

The connector DB25 may be configured as RS232 or RS485 socket, depending on the position of the jumpers on the board. In case it is used as RS232 socket, the jumpers JP3, JP4, JP5 and JP6 have to be positioned towards the serigraphy “RS232”. If the jumpers JP1 and JP2 are placed in “N” position, the following configuration is obtained:

| PIN | 2 | 3 | 5 | 6 | 7 | 8 | 20 |
|-----------|-----|-----|-----|-----|-----|-----|-----|
| FUNCTIONS | RxD | TxD | RTS | 12V | GND | 12V | 12V |

If the jumpers JP1 and JP2 are put in “M” position, the following configuration will be obtained:

| PIN | 2 | 3 | 4 | 5 | 6 | 7 | 20 |
|-----------|-----|-----|-----|-----|-----|-----|-----|
| FUNCTIONS | TxD | RxD | RTS | CTS | 12V | GND | 12V |

In order to use the connector as RS485 socket, the jumper JP3, JP4, JP5 and JP6 have to be positioned towards the serigraphy “RS485”. In this way, the following configuration will be obtained:

| PIN | 2 | 3 | 4 | 5 | 6 | 7 | 20 |
|-----------|-----|-----|-----|-----|-----|-----|-----|
| FUNCTIONS | Rx+ | RX- | TX- | TX+ | 12V | GND | 12V |

2.5 SCH0005AR1 CALIBRATION PROCEDURE

WARNING: this procedure is very delicate, so be **VERY CAREFUL** in order to avoid damaging the equipment !!!

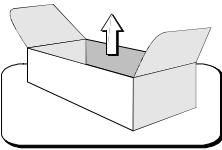

First of all turn on the equipment with the correct antenna connection, and then perform the following steps:

- *Power supply voltages and currents calibration*

Measure with a tester the voltage Vdr1 on the power supply of the first driver transistor without loading the power supply (this can be done by disconnecting the six supply wires from the RF power modules). Verify that it is 29V. Then take the *calibration load* (consisting of five $47\Omega/20W$ resistors connected in parallel) and connect it between the positive power supply terminal (corresponding to Vdr1) and ground. Turn the trimmer R1 until you read on the display Vdr1 equal to the value measured before with the tester. Then turn the trimmer R22 until you read on the display Idr1 = 3.1A.

Repeat the procedure above for the power supply of the second driver stage: measure with the tester the voltage Vdr2 and turn the trimmer R3 and R27 until you read on the display the correct values.

Measure with a tester the voltage V1 on the power supply of the first final power transistor. Verify that it is

around 32V. Then take the *calibration load* and connect it between the positive power supply terminal (corresponding to V1) and ground. Turn the trimmer R5 until you read on the display V1 equal to the value measured before with the tester. Then turn the trimmer R33 until you read on the display Idr1 = 3.4A.

Repeat the procedure above for the power supplies of the remaining three power transistors: measure with the tester the voltages V2-V3-V4 and turn the trimmers R7-R9-R11 until you read on the display the correct values measured.

To calibrate the remaining currents readings, you have to connect the calibration load to the other three power supplies (not all together, but one at a time!) and then turn the trimmers R39-R45-R51 until you read on the display I2=I3=I4= 3.4A.

- Temperature calibration

Measure with a tester the voltage of the OUT pin of the integrated temperature sensor mounted on the heat dissipating element. Than perform the operation explained in this example:

- voltage measured (for example) = 2.93V
- fixed number = 2.73
- perform subtraction: $2.93 - 2.73 = 0.20$

If you get a result of 0.20, it means that the temperature is 20°C, so you have to turn the trimmer R102 until you read TEMP = 20°C.

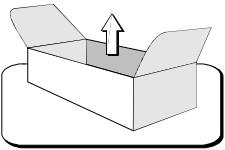

- Forward power calibration

Disconnect the antenna and connect a wattmeter (with a suitable dummy load!) to the antenna connector. Put the cover on the amplifier module and then give power to the equipment until you read 1000W on the wattmeter. Then turn the trimmer R96 until you read FWD = 1000W (approximately).

- Reflected power calibration

To perform the reflected power calibration just disconnect the REF SMB (J6) and the FWD SMB (J7) connectors from the control board and connect the forward power reading cable to J6 (REF). Give 50W of forward power to the equipment and turn the R97 trimmer until you read on the display REF = 50W.

Note: When you have completed this calibration be sure to restore the original connections on the control board!

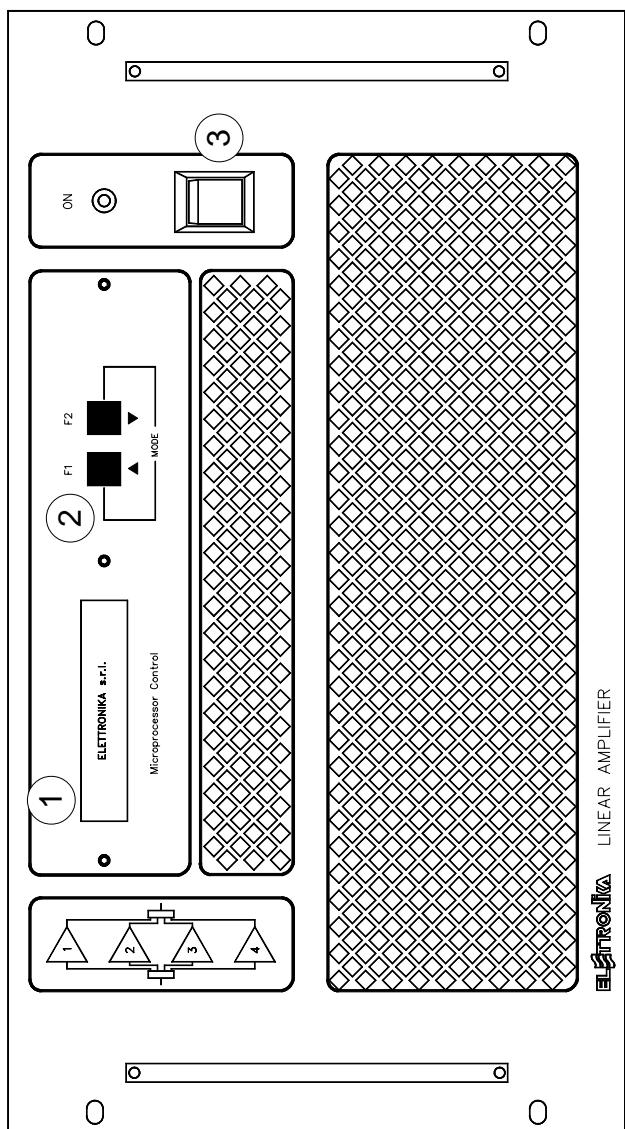

To ensure the best reliability for the board operations it is advisable that you turn the unused trimmers (those corresponding to the unused readings connectors) counterclockwise until they reach the zero position (you will hear a click).

2.6 PREVENTIVE MAINTENANCE

To ensure maximum performance and minimum repair trouble, we strongly recommend you to follow the below stated headlines for preventive maintenance:

1. check antenna installation and ground connection at regular intervals;
2. keep your apparatus clean and dry externally: this will ensure continuous functioning of the front panel controls;
3. if the apparatus has not been used for a long period of time combined with exposure to extreme environmental conditions, open the unit and make a visual inspection.
Remove salt, water or ice with a moist cloth before turning the apparatus on. Check that the cooling fans are running freely.
4. for general maintenance and top performance, call an authorized service technician to give the apparatus and the complete antenna/earth connection installation a general check every 12-18 months;
5. check at regular intervals that the air intake located on the front panel is free of dust. If there is visible dust, remove it by means of a soft brush.

DESCRIPTION

(Stand-alone configuration)

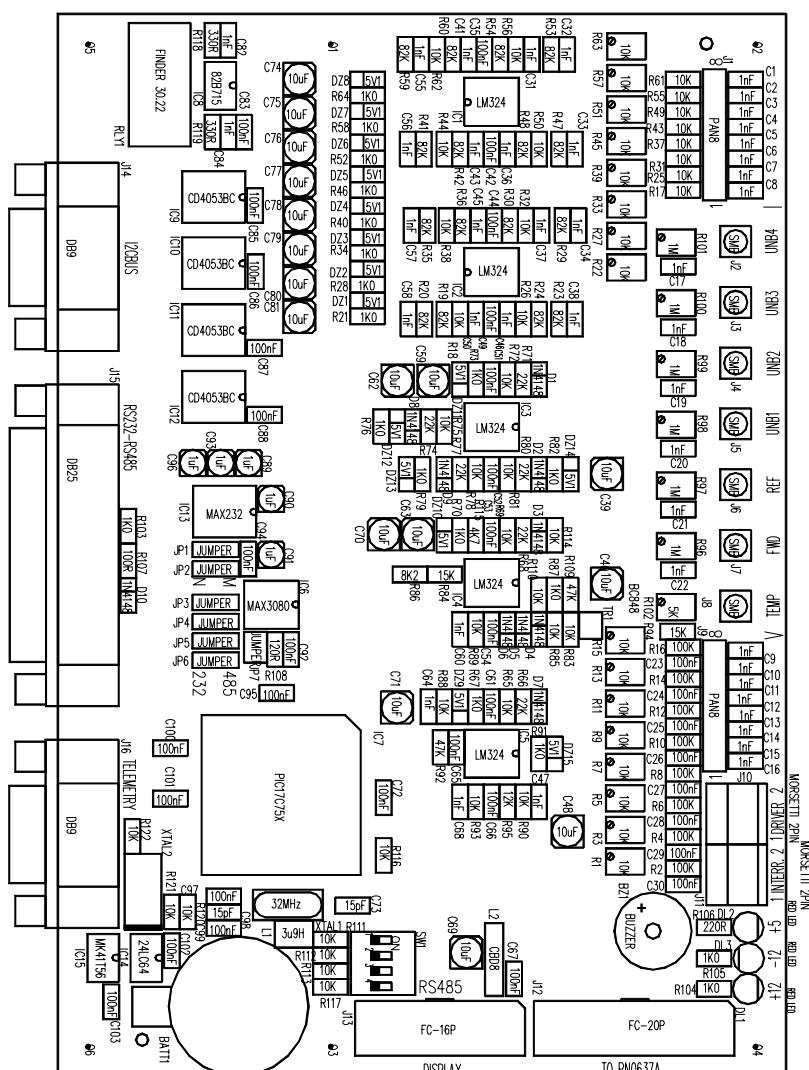

The SCH0005AR1 board is a microprocessor-based board designed to perform all the control functions inside the amplifier module.

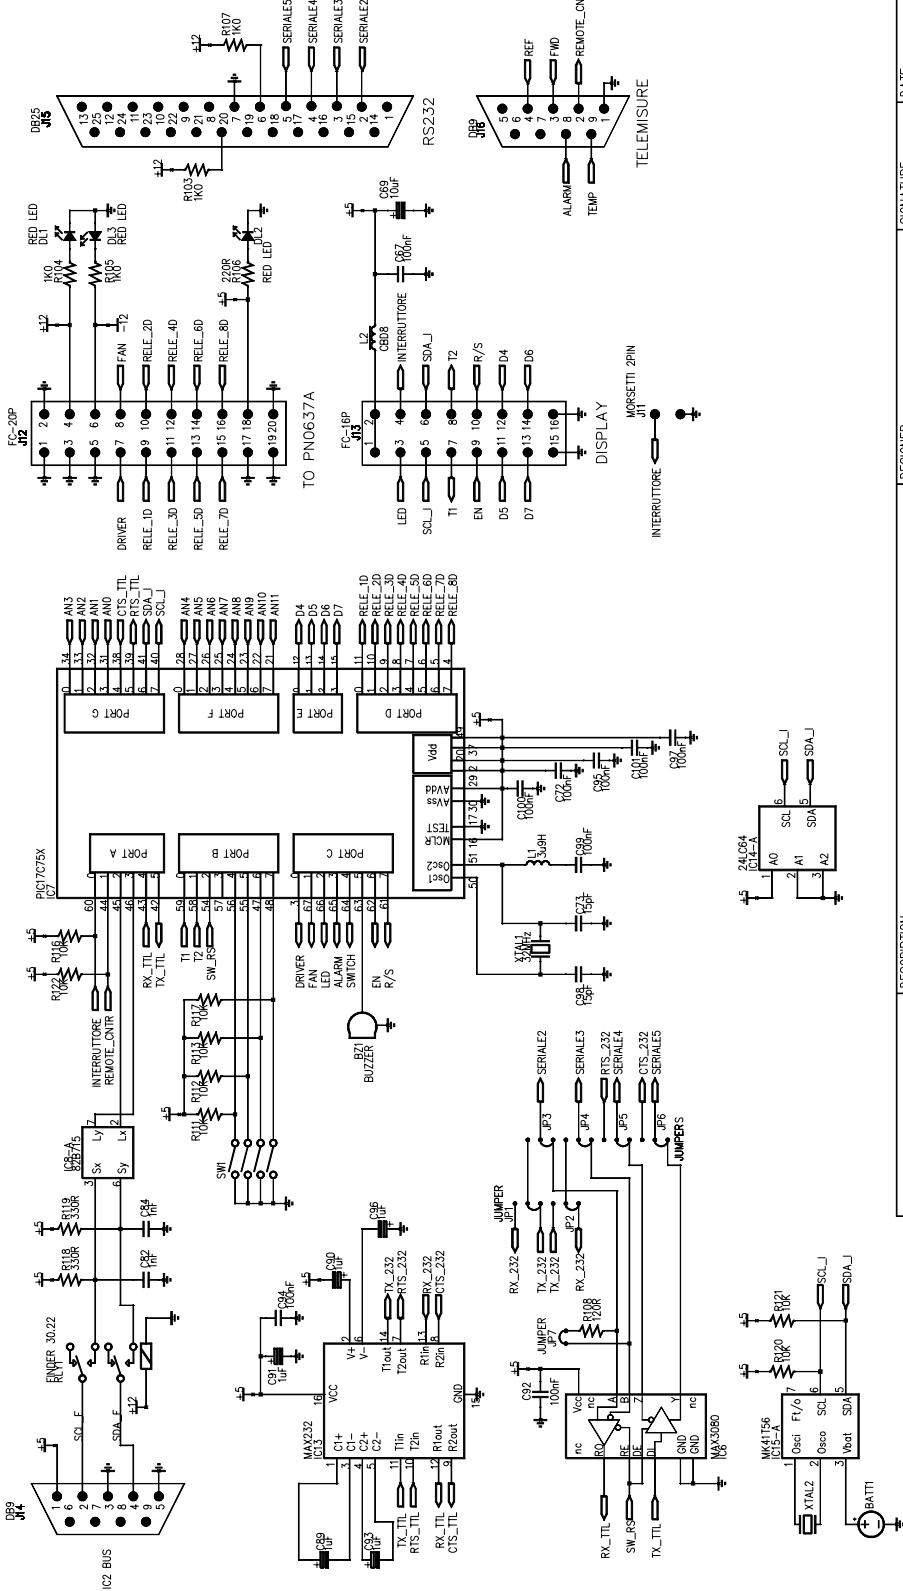

Both RF and power supply parameters are continuously monitored in order to guarantee optimal performance in every working environment.

The board checks the power supply voltages and currents, the working temperature of the power modules, the forward and the reflected RF power of the amplifier.

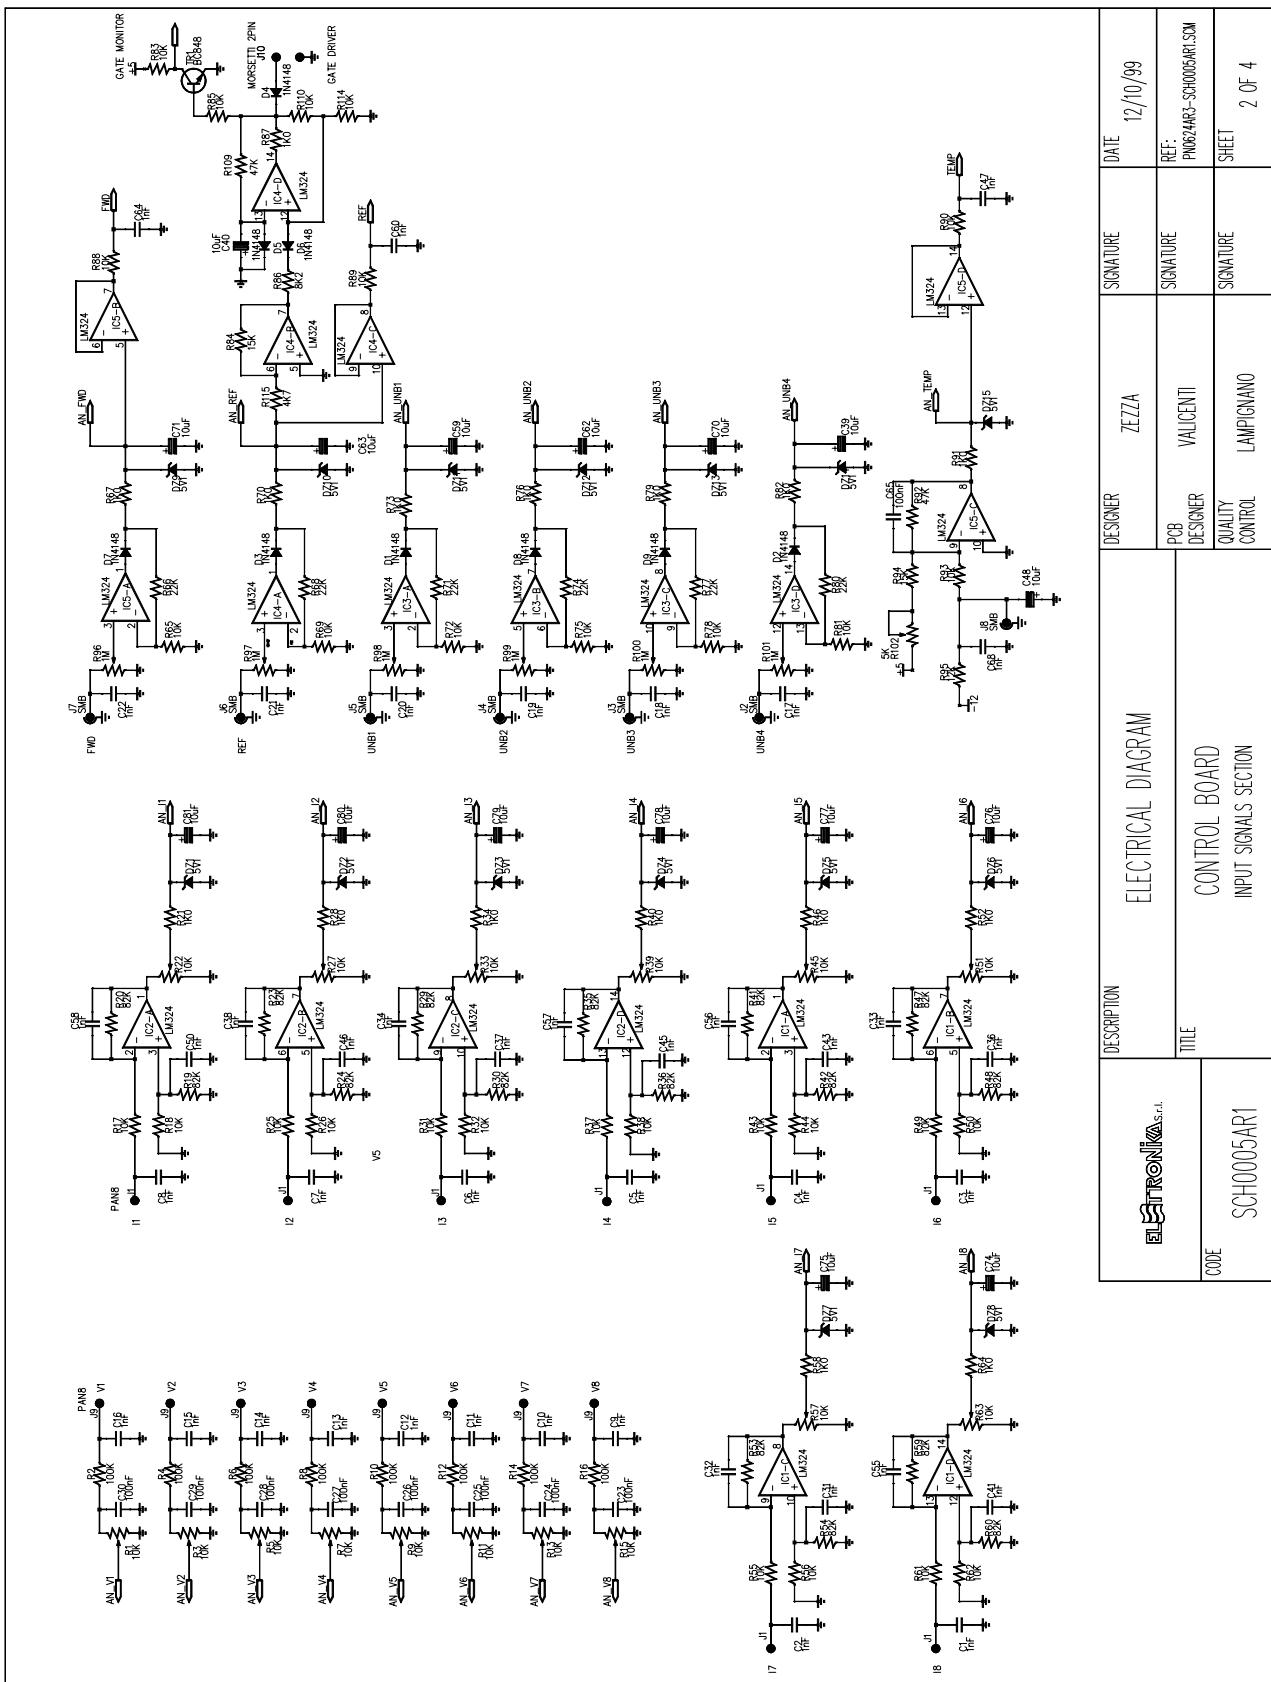

Various alarm conditions can be detected by the board due to possible electrical failures during normal operation of the amplifier module.

The board automatically turns off the amplifier or part of it when abnormal parameters are detected and restores the initial working conditions if all the parameters return to allowed values. The board is also equipped with a serial port connector which, in a near future, will allow the remote control operation through a local PC or a modem connection.

DESCRIPTION

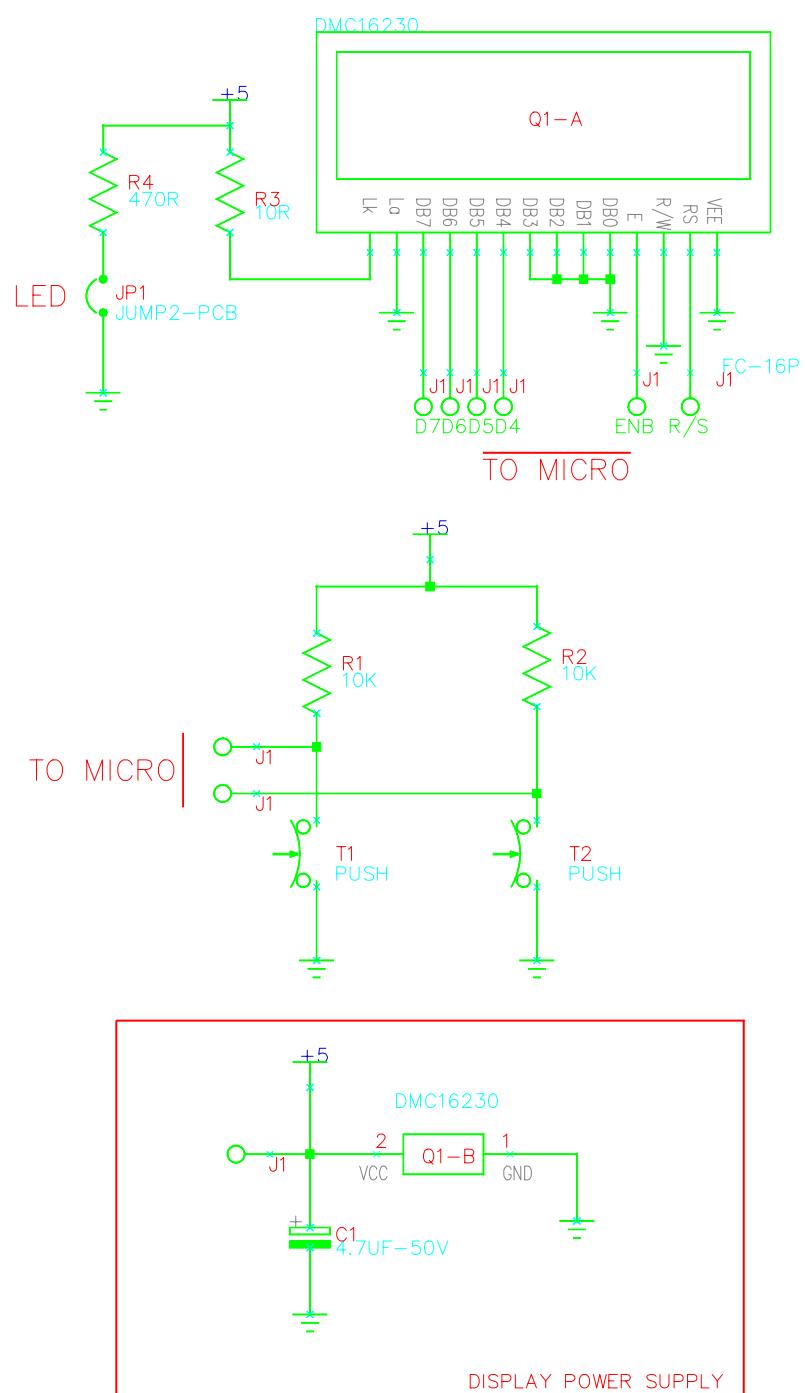

The display board, PN502, is used to display the main operating parameters of the amplifier module. The two keys on the right of the LCD display are used to scroll the list of parameters which can be displayed. These parameters are:

- | | |
|--------------------------------|---------------|
| 1. Temperature | (TEMP) |
| 2. Direct Power | (FWD PWR) |
| 3. Reflected Power | (REF PWR) |
| 4. Max 6 Power supply voltages | (V1...V6) |
| 5. Max 6 Power supply currents | (I1...I6) |
| 6. Max 4 Unbalancing powers | (UNB1...UNB4) |

Depending on the apparatus in which the board is, the parameters 4, 5 and 6 may be less than the ones listed. The first line of the display shows the type of amplifier or the number of the amplifier module, referring to the whole apparatus, if this is composed by more than one amplifier. It also shows alarm conditions, if any, inside the amplifier module. If the amplifier module is turned off by a protection device, the first line displays “AMPLIFIER OFF”.

DESCRIPTION

The 1000W output power PEP amplifier module has been realized by coupling four 250W Video power modules. A 4-way Wilkinson coupler, completely balanced by means of power resistors, has been used in output. This way an excellent de-coupling between the amplifier is obtained, as well as the possibility to work even with only one active module. The high extension of the IV/V UHF band and the presence of parasitic capabilities towards ground, along with the resistors, required an accurate design of the couple which has been possible thanks to the use of sophisticated simulation software. The module also has two 40W class A drivers realized with LDMOS technology, one for each couple of final modules.

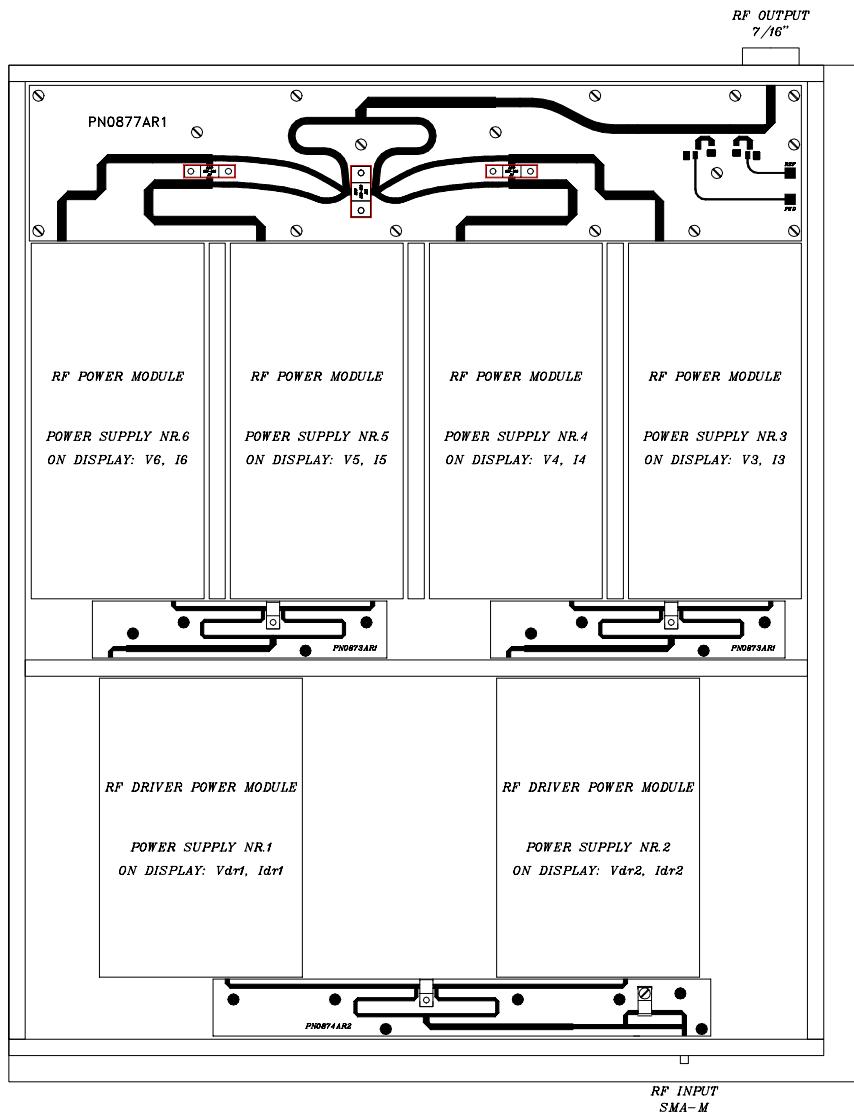

All the amplification chain is then realized LDMOS technology. The high gain of the output stages allows to drive them with class A drivers, thus giving the module high linearity characteristics, which can be especially appreciated in DVB-T applications. The module is completed by two directional couplers for the reading of Forward and Reflected power. Besides the by-pass capacitors by TUSONIX used on power supply allow an excellent de-coupling with RF stages.

Small signal gain with 5dB/div.

TECHNICAL CHARACTERISTICS

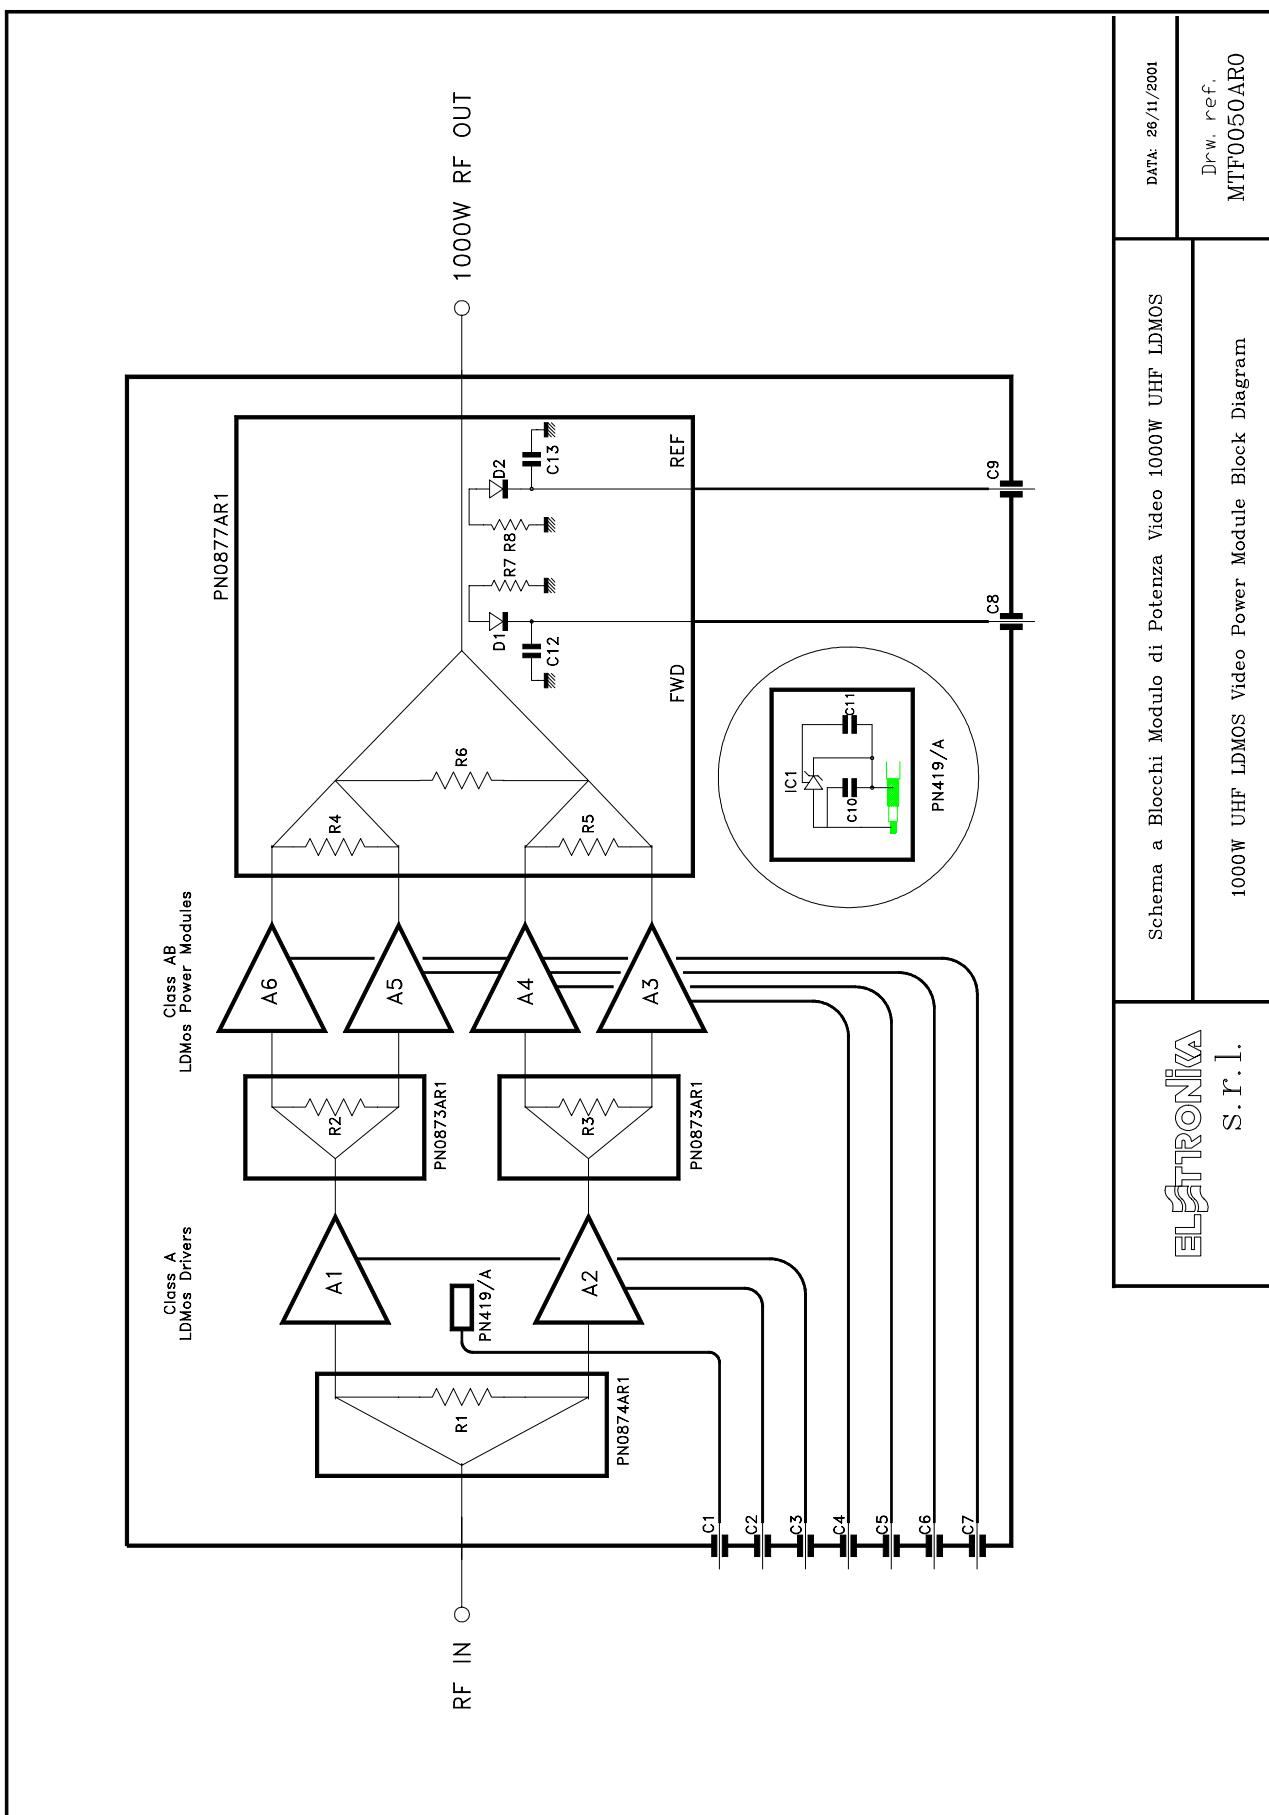

| | |
|------------------|--|
| Output power | 1000W Sync. Peak |
| Frequency | 470 - 860MHz |
| Input impedance | 50Ω |
| Input R.L. | 15dB min |
| Output impedance | 50Ω |
| Power Supply | 32V Power module and 29V Driver module |

4 SECTION BANDPASS FILTER WITH 2 NOTCH ELEMENTS - COMB-LINE STRUCTURE, INDUCTIVE COUPLING IRISES; CONSTANT BANDWIDTH WITH FINE REGULATION, VERY EASY TO TUNE - EXACT GENERALIZED CHEBISHEV DESIGN GIVING MAXIMUM SELECTIVITY AND MINIMUM GROUP DELAY VARIATION

**SPECIFICATIONS**

| | |
|----------------------------|--------------------|
| Frequency | 470 - 860MHz |
| Connectors | 7/16" |
| Power handling | 1200W CW |
| Insertion loss | 0.28dB Typ. @ V.C. |
| Return loss | 28dB |
| Operating temperature | -10° to +50°C |
| Bandwidth | 6 to 8MHz |
| Selectivity @V.C.-5.5/+11 | -50dB |
| Selectivity @V.C.-11/+16.5 | -35dB |
| Weight | 8kg |

TESTING AND CALIBRATION INSTRUCTIONS

The output filter Mod. CL4NL22 is made up by a 4-resonator band-pass section and two "notch" resonators. It can be adjusted on all the channels of the TV UHF band (470 ÷ 860MHz) and on all the world standards (intercarrier 4.5 - 6.5MHz). The pass-band section is made up by the group of the four resonators, while the two separate resonator are the notches. The filter is symmetrical, thus there is no difference between the upper and lower notch.

The band width is adjusted by changing the insertion of the lower Post Screws which are placed between the band-pass resonators; inserting the post screws it is increased. In order to perform this adjustment, loose the bolt of each post screws by means of a wrench n° 19. The first and third post screws have to be adjusted for the same protrusion from the body of the filter, while the middle one should usually be adjusted in a slightly different manner in order to obtain an equiripple response.

The input and output coupling, which can be reached by removing the protection cups, can be adjusted by means of the two lower Coupling Stubs next to the connectors. The adjustment is made by means of a flat wrench n° 18, taking into consideration that when the maximum coupling is obtained when the command cuts are parallel to the longer side of the filter, the minimum when they are orthogonal to it. The response symmetry is determined by the protrusion of the above mentioned stubs; these are set by loosening the relevant lower clamps by means of a tube wrench n° 16. The clamps, once tightened, also determine the friction of the ratio of the couplings.

The suggested calibration sequence os the following:

set the measuring instrument on

- C.G. = (P.V. + P.A.) / 2
- SPAN = INTERCARRIER * 5 (Es. 27,5MHz std. B/G)
- RESPONSE = 5dB/div.
- ADAPTATION = 10dB/div.

| Center Frequency [MHz=] | Coupling Stub [mm=] | Post Screw [mm=] |
|----------------------------|------------------------|---------------------|
| 474 | 2 | 6 |
| 570 | 16 | 15 |
| 666 | 29 | 17 |
| 762 | 38 | 17 |
| 858 | 40 | 17 |

-
- Set the coupling stubs and the post screws according to the indicative protrusion from their edge to the body of the filter listed in the table.
 - Tune the band-pass section on the wanted channel and load input and output correctly to obtain an optimal response. At this stage the tuning of the two notches have to be kept distant from one another. Adjust the band width to -35dB at the limits of the screen (Es. std. B/G: BW (-35dB) = 27,5MHz). The input and output couplings may affect the tuning of the resonators, as such they have to be adjusted in small steps, one after another. The equiripple response is obtained by adjusting the middle Post Screws.
 - Tune the two notches bringing them to the frequencies P.V.-INTERCARRIER and P.A.+INTERCARRIER. This will cause a change in the response and the adaptation of the band-pass. Correct the response by acting on the band-pass tuning.
 - Complete the calibration on both sides in this sequence: adjust the coupling, re-tune the notch in case it has moved and then the band-pass tuning. If needed, adjust the middle Post Screws to obtain the best equiripple adaptation. Perform this sequence in little steps trying to obtain the best adaptation.
 - Check the symmetry of the obtained response, and correct it if needed according to the following criterion: if the lower notch is more accentuated than the other one, insert the coupling stubs, otherwise, if the upper one is more accentuated, extract them.
 - Once the symmetry of the response has been corrected, complete the calibration as explained above.

Once the calibration has been completed, put again the protection cups on the coupling regulators.

| | |
|---|----------------------|
| Insertion loss @ P.V. (dB) | < -0.40 (typ. -0.32) |
| R.L. (from P.V.-0.75 to P.A.+0.25) (dB) | > 28 |

| | |
|---------------------------------------|------|
| Attenuation @ P.V. -INTERCARRIER (dB) | > 40 |
| Attenuation @ P.V. +INTERCARRIER (dB) | > 40 |
