MR98 Series Backpressure Regulators, Relief and Differential Relief Valves

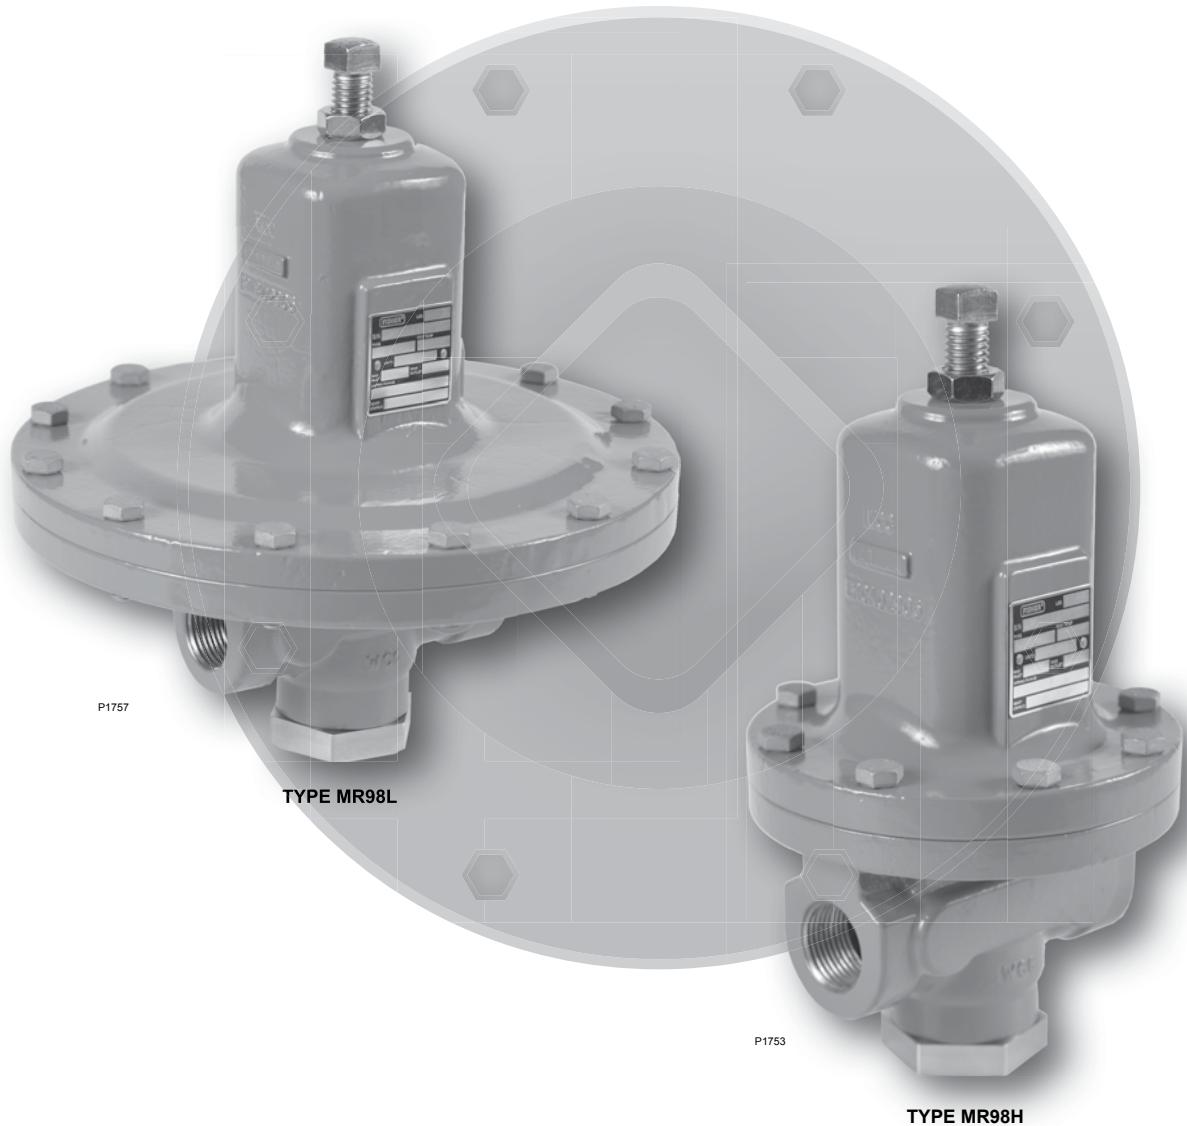

Figure 1. Typical MR98 Series Backpressure Regulators, Relief and Differential Relief Valves

MR98 Series

Specifications

This section lists the specifications for the MR98 Series regulators. Factory specification such as type, maximum inlet pressure, maximum temperature, maximum outlet pressure, spring range, orifice size and seat material are stamped on the nameplate fastened on the regulator at the factory.

Available Constructions

Type MR98L: Direct-operated low pressure backpressure regulator/relief valve with 2 to 38 psig / 0.14 to 2.6 bar set pressure range

Type MR98H: Direct-operated high pressure backpressure regulator/relief valve with 5 to 200 psig / 0.34 to 13.8 bar set pressure range

Type MR98HH: Direct-operated high pressure backpressure/relief valve with 150 to 375 psig / 10.3 to 25.9 bar set pressure range

Type MR98LD: Pressure-loaded low pressure differential pressure relief valve with 2 to 38 psi / 0.14 to 2.6 bar set pressure range

Type MR98HD: Pressure-loaded high pressure differential pressure relief valve with 5 to 200 psi / 0.34 to 13.8 bar set pressure range

Type MR98HHD: Pressure-operated high pressure backpressure/relief valve with 150 to 375 psi / 10.3 to 25.9 bar differential set pressure range

Body and Orifice Sizes

1/4 NPT: 0.284 in. / 7.22 mm

1/2 in. / DN 15: 0.416 in. / 10.56 mm

3/4 and 1 in. / DN 20 and 25:

0.631 in. / 16.02 mm

1-1/2 and 2 in. / DN 40 and 50:

1.142 in. / 29 mm

Maximum Spring Case Loading Pressure for Types MR98LD, MR98HD and MR98HHD (Spring Setting Plus Loading Pressure)⁽¹⁾⁽²⁾

Type MR98LD Spring Case

Gray Cast Iron: 50 psig / 3.4 bar

Steel or Stainless steel: 125 psig / 8.6 bar

Type MR98HD Spring Case

Gray Cast Iron: 250 psig / 17.2 bar

Steel or Stainless steel: 300 psig / 20.7 bar

Type MR98HHD Spring Case

Steel or Stainless steel: 300 psig / 20.7 bar

Maximum Inlet and Outlet Pressure Rating

Approximate Weights

MR98H Series:

1/4 NPT: 5 lbs / 2.3 kg

1/2 in. / DN 15: 10 lbs / 4.5 kg

3/4 and 1 in. / DN 20 and 25: 22 lbs / 10 kg

1-1/2 and 2 in. / DN 40 and 50: 55 lbs / 25 kg

MR98L Series:

1/4 NPT: 7 lbs / 3.2 kg

1/2 in. / DN 15: 15 lbs / 6.8 kg

3/4 and 1 in. / DN 20 and 25: 35 lbs / 16 kg

1. The pressure/temperature limits in this Instruction Manual and any applicable standard limitation should not be exceeded.

2. Temperature and/or the body end connection may decrease these maximum pressures.

3. Pressure and/or the body end connection may decrease these maximum temperatures.

WARNING

Failure to follow these instructions or to properly install and maintain this equipment could result in an explosion, fire and/or chemical contamination causing property damage and personal injury or death.

Fisher® backpressure regulators, relief and differential relief valves must be installed, operated and maintained in accordance with federal, state and local codes, rules and regulations and Emerson Process Management Regulator Technologies, Inc. (Emerson™) instructions.

If a leak develops or if the outlet continually vents gas, service to the unit may be required. Failure to correct trouble could result in a hazardous condition. Only a qualified person shall install or service the unit.

Installation, operation and maintenance procedures performed by unqualified person may result in improper adjustment and unsafe operation. Either condition may result in equipment damage or personal injury. Call a qualified person when installing, operating and maintaining the MR98 Series backpressure regulators, relief and differential relief valves.

Product Description

The MR98 Series backpressure regulator, relief and differential relieve valve are suitable for liquid, gas, air and steam service. Typical applications include use in wash tanks, small heaters, fuel and oil lines, air supply systems, test fixtures and sterilizers.

Type MR98L—Direct-operated, backpressure regulator or relief valve with relief set pressure range from 2 to 38 psig / 0.14 to 2.6 bar in four ranges. Body sizes are available from 1/4 NPT to 1 in. / DN 25.

Type MR98H—Basically the same as the Type MR98L but permits higher relief set pressure ranges from 5 to 200 psig / 0.34 to 13.8 bar, in four ranges. Body sizes are available from 1/4 NPT to 2 in. / DN 50.

Type MR98HH—Provides relief with higher set pressure range from 150 to 375 psig / 10.3 to 25.9 bar. Body sizes are available in 1/4 NPT to 1 in. / DN 25 sizes.

Type MR98LD—Differential pressure relief valve with set pressure range from 2 to 38 psig / 0.14 to 2.6 bar. Body sizes are available from 1/4 NPT to 1 in. / DN 25.

Type MR98HD—Basically the same as Type MR98LD but permits higher differential relief set pressure from 5 to 200 psig / 0.34 to 13.8 bar. Body sizes are available from 1/4 NPT to 2 in. / DN 50.

Type MR98HHD—Differential pressure relief valve with higher set pressure range from 150 to 375 psi / 10.3 to 25.9 bar. Bodies are available in 1/4 NPT to 1 in. / DN 25 sizes.

Introduction

Scope of the Manual

This manual provides instructions for the installation, adjustment, maintenance and parts ordering information of MR98 Series backpressure regulators, relief and differential relief valves. Instructions and parts lists for other equipment mentioned in this Instruction Manual are found in separate manuals.

MR98 Series

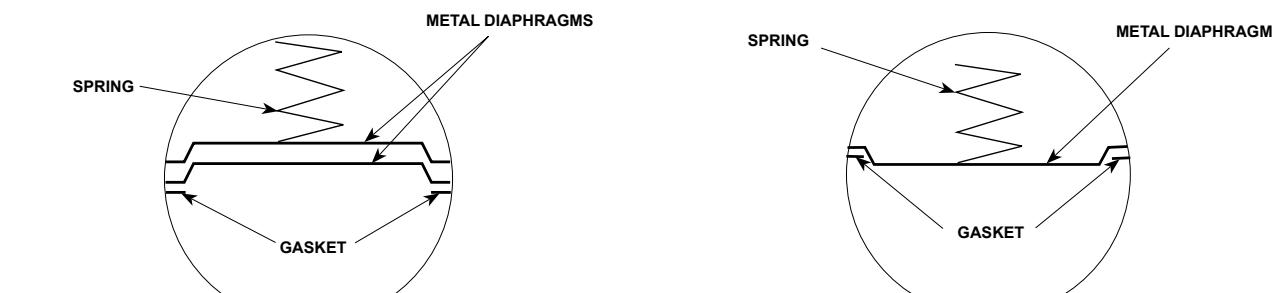

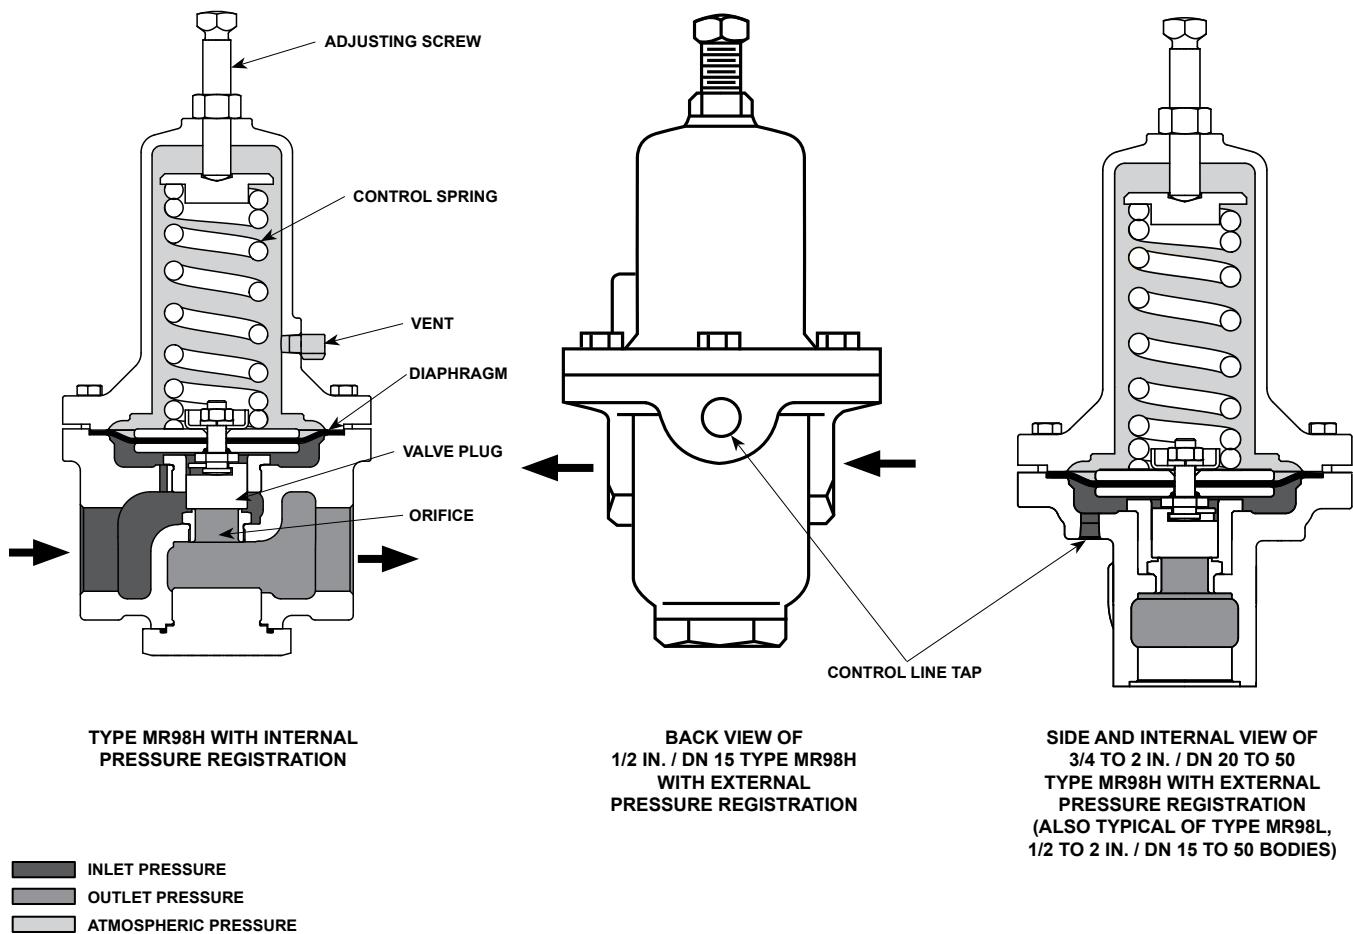

Figure 2. MR98 Series Operational Schematics

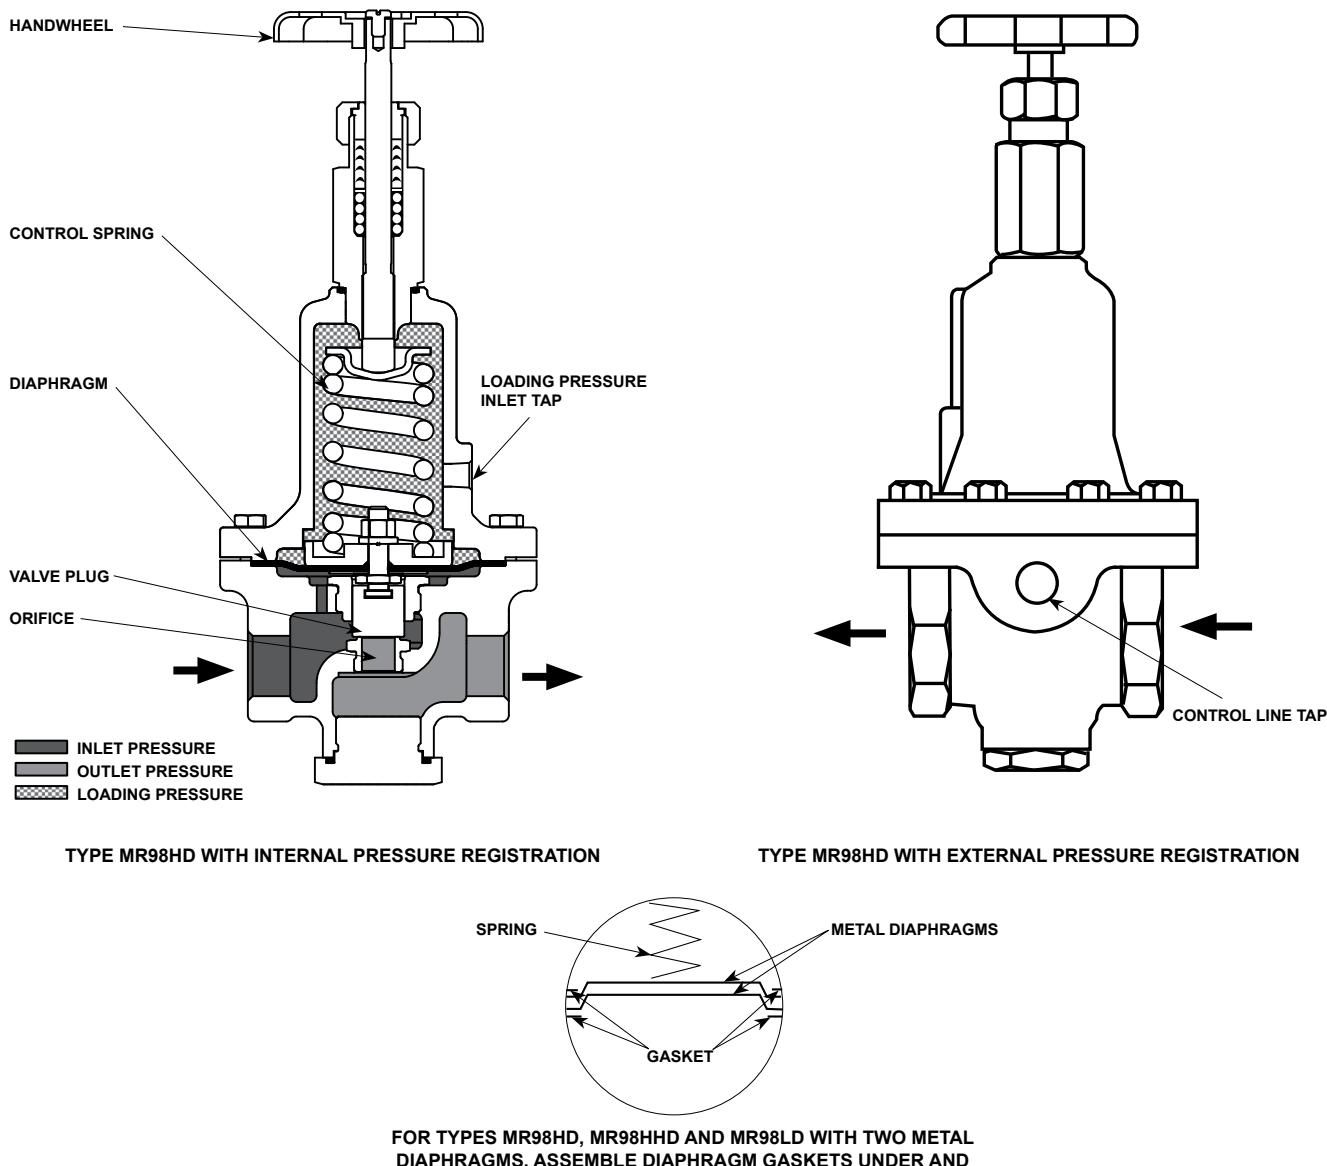

Figure 2. MR98 Series Operational Schematics (continued)

Principle of Operation

Relief or backpressure valves respond to changes in upstream pressure. Pressure changes register under the diaphragm (see Figure 2) through a registration hole in the valve body or through an external control line. When the pressure increases above the spring setting, the pressure underneath the diaphragm overcomes the spring compression. This causes the valve plug to move away from the orifice. The flow path through the valve is open and excess pressure is vented. When upstream pressure drops below setpoint, the valve closes.

Differential relief valves are used to maintain a differential pressure between the controlled pressure and loading pressure of a system. The spring setting determines the differential.

The differential relief valve responds to both controlled pressure and loading pressure and opens or closes as these pressures change. If the loading pressure increases, pressure on the upper side of the diaphragm increases. The valve plug moves closer to the orifice and restricts the flow through the relief valve. When loading pressure decreases, pressure on the upper side of the diaphragm decreases. This allows the valve plug to move away from the orifice and allow more flow through the differential relief valve (to atmosphere or back into the system). The differential relief valve opens and closes in response to changes in the controlled pressure. In this way, the differential pressure between the controlled and uncontrolled pressures is maintained.

1. All springs may be backed off to 0 psig / 0 bar. However, highest capacities and best performances are obtained by using these springs in their recommended ranges.

MR98 Series

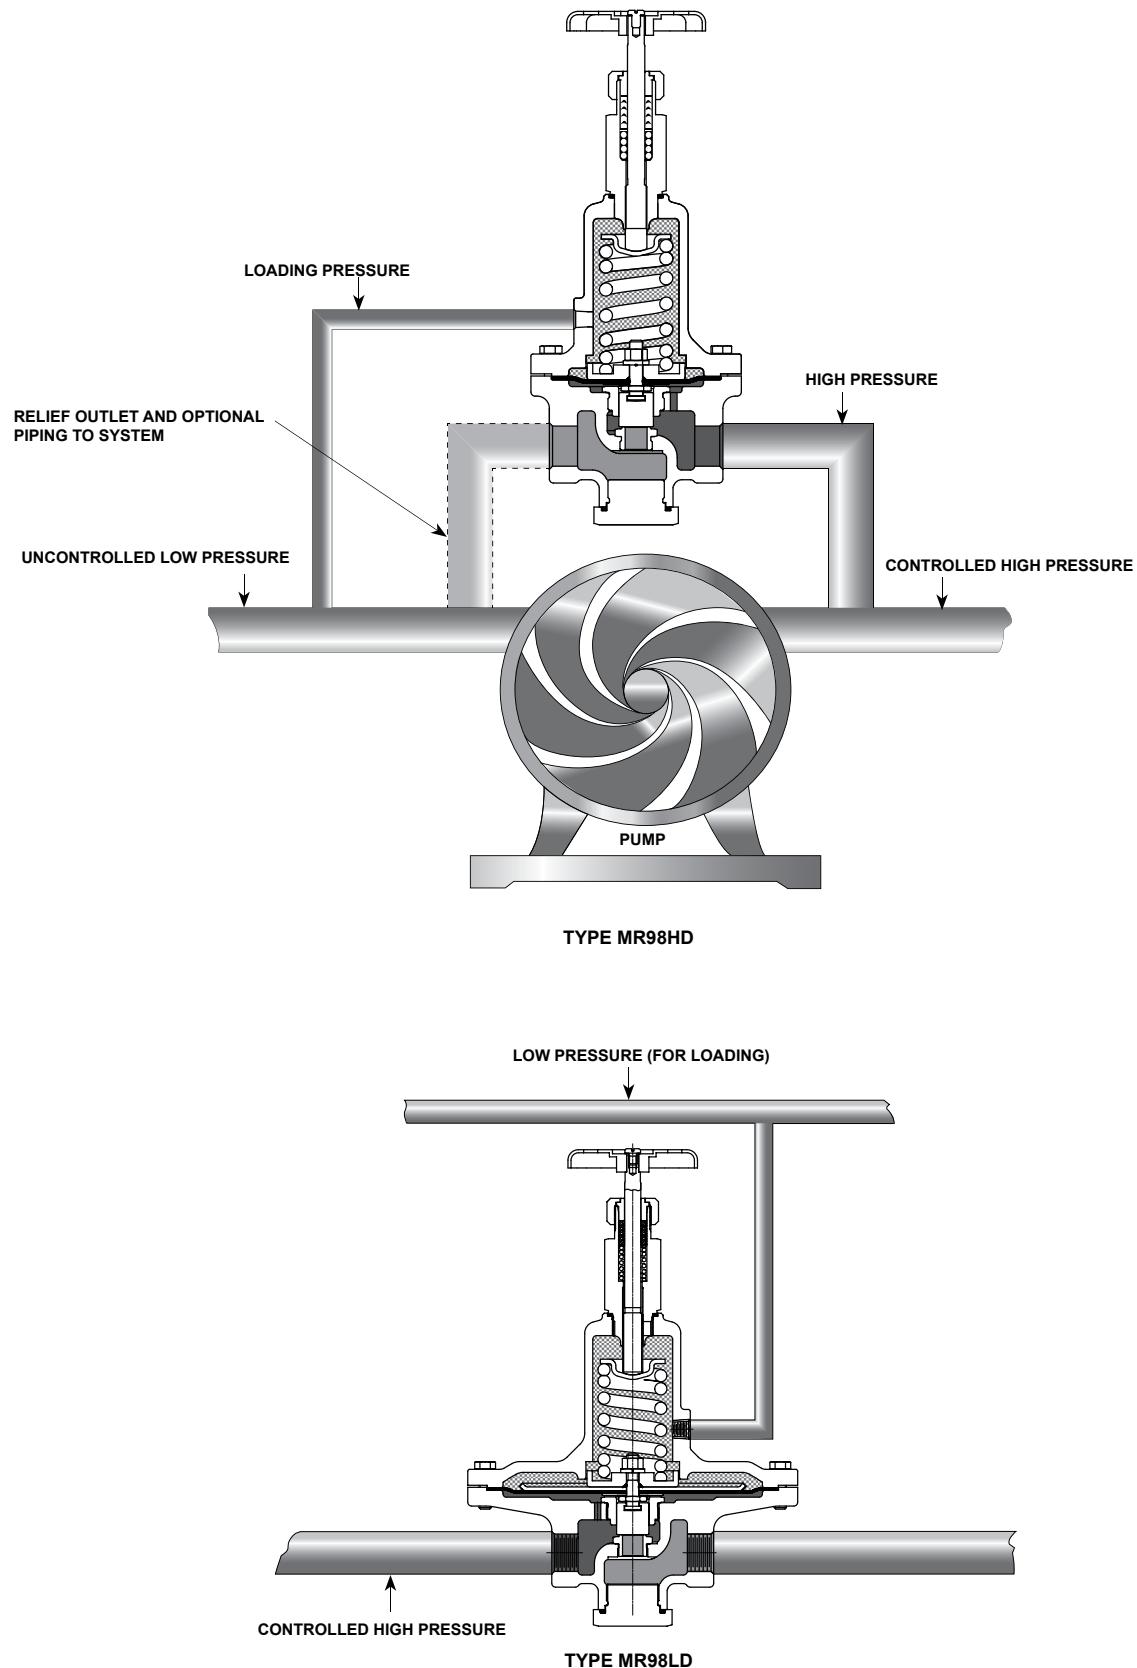

Figure 3. Installation Schematics for Types MR98LD and MR98HD Relief Valves

Installation

WARNING

Personal injury or system damage may result if this backpressure regulator, relief or differential relief valve is installed where service conditions could exceed the limits given on the Specifications section and/or regulator nameplate.

Additionally, physical damage to the backpressure regulator or relief valve may result in personal injury or property damage due to escaping of accumulated gas. To avoid such injury and damage, install the backpressure regulator or relief valve in a safe location.

Under enclosed conditions or indoors, escaping gas may accumulate and be an explosion hazard. In this case, the vent should be piped outdoors.

For regulator constructions with a spring case vent, the vent should be kept open to permit free flow of gas to the atmosphere. Protect openings against entrance of rain, snow, insects or any other foreign material that may plug the spring case vent or vent line.

Before installing the regulator:

- Unpack the backpressure regulator or relief valve and remove the protective shipping plugs from the end connections of the body and the pressure connection in the spring case.
- Check the backpressure regulator or relief valve and make sure it has not been damaged or collected foreign material during shipping.
- Remove any debris or dirt in the tubing and the pipeline.
- Apply pipe compound to the external pipe thread for NPT bodies or use appropriate gaskets for flanged bodies.
- Make sure gas flow through the backpressure regulator or relief valve is in the same direction as the arrow on the body.
- For a differential relief valve, the design of the valve isolates the diaphragm and pressure loading spring case from the main flow stream.

The higher pressure is measured inside the body through a registration hole on the inlet side of the body or through the external control line. If loading pressure is required, connect the loading pressure line to the 1/4 NPT connection in the spring case. If loading pressure is not required, vent this connection to the atmosphere.

Overpressure Protection

WARNING

Overpressuring any portion of this equipment may result in equipment damage, leaks in the relief valve/backpressure regulator or personal injury due to bursting of pressure-containing parts.

Relief, differential relief or backpressure ranges are from 2 to 375 psig / 0.14 to 25.9 bar. The individual spring range of your valve is stamped on the nameplate.

Maximum inlet pressure depend upon body materials and temperatures. See Specifications section or the maximum inlet pressure of the valve and the maximum spring case loading pressures stamped on the nameplate of Types MR98LD, MR98HD and MR98HHD. The valve should be inspected for damage after any overpressure condition.

Vents and Relief Valve Outlet

WARNING

If using an MR98 Series backpressure regulator, relief or differential relief valve on hazardous or flammable gas service, personal injury and property damage could occur due to fire or explosion of vented gas that may have accumulated.

To prevent such injury or damage, provide piping or tubing to vent the gas to a safe, well-ventilated area. All vents should be kept open to permit free flow of gas to the atmosphere. Protect openings against entrance of rain, snow, insects or any other foreign material that may plug the vent or vent line.

1. The pressure/temperature limits in this Instruction Manual and any applicable standard limitation should not be exceeded.

2. Temperature, trim material and/or the body end connection may decrease these maximum pressures.

3. Maximum inlet pressure equals set pressure plus build-up.

Table 5. Temperature Capabilities⁽¹⁾⁽²⁾

MATERIAL	TEMPERATURE RANGE
Elastomer Part	
Nitrile (NBR)	-40 to 180°F / -40 to 82°C
Neoprene (CR)	-40 to 180°F / -40 to 82°C
Fluorocarbon (FKM)	0 to 300°F / -18 to 149°C, Limited to 200°F / 93°C for hot water
Ethylenepropylene (EPDM)	20 to 275°F / -7 to 135°C
Perfluoroelastomer (FFKM)	0 to 425°F / -18 to 218°C
PTFE Diaphragm protector	-40 to 400°F / -40 to 204°C
Body Material	
Gray Cast iron	-20 to 406°F / -29 to 208°C
WCC Steel ⁽³⁾	-20 to 450°F / -29 to 232°C
LCC Steel ⁽³⁾	-40 to 450°F / -40 to 232°C
Stainless steel ⁽³⁾ , Monel® or Hastelloy® C	-40 to 450°F / -40 to 232°C

1. The pressure/temperature limits in this Instruction Manual and any applicable standard limitation should not be exceeded.

2. Pressure and/or the body end connection may decrease these maximum temperatures.

3. Meets API 614 requirements (with stainless steel trim).

Table 6. Torque Specifications

BODY SIZE		SPRING CASE BOLTS ⁽¹⁾		ORIFICE		VALVE PLUG GUIDE		BOTTOM PLUG	
In.	DN	Ft-Lbs	N·m	Ft-Lbs	N·m	Ft-Lbs	N·m	Ft-Lbs	N·m
1/4	---	6 to 8	8 to 11	6 to 8	8 to 11	40 to 50	53 to 68	50 to 58	68 to 79
1/2	15	10 to 13	13 to 18	34 to 38	46 to 51	70 to 90	94 to 122	75 to 90	102 to 122
3/4 and 1	20 and 25	24 to 30	33 to 41	50 to 60	68 to 81	85 to 100	115 to 136	100 to 125	136 to 169
1-1/2 and 2	40 and 50	40 to 50	54 to 68	180 to 200	244 to 271	125 to 150	169 to 203	170 to 200	230 to 271

1. Reduce spring case bolt's torque by 30% when using Ethylenepropylene (EPDM) diaphragms.

Hastelloy® C is a mark owned by Haynes International, Inc.
Monel® is a mark owned by Special Metals Corporation.

If remote venting is necessary, an optional tapped vent in the spring case is available. Install remote vent lines in the spring case and outlet openings. The vent lines must have the largest practical diameter and be as short as possible with a minimum number of bends or elbows. Install the vent line according to applicable federal, state and local codes and regulations.

Startup

Note

The Specifications section and Table 4 show the maximum inlet and the differential pressures for specific constructions. Use pressure gauges to monitor inlet pressure, outlet pressure and any loading pressure during startup.

Key numbers are shown in Figures 4 through 10.

1. Check that proper installation is completed and downstream equipment has been properly adjusted.
2. Make sure all block and vent valves are closed.
3. Decompress the control spring by turning the adjusting screw (for Types MR98L, MR98H and MR98HH) or handwheel (for Types MR98LD, MR98HD and MR98HHD) counterclockwise.
4. Slowly open the valves in the following order:
 - a. Loading supply and control line valve(s), if used
 - b. Inlet block valve
 - c. Outlet block valve
5. Set the regulator to the desired set pressure according to the Adjustment procedure.

Adjustment

Each unit is factory set for the pressure setting specified on the order or at the mid-point of the spring range. The allowable spring range is stamped on the nameplate. If a pressure setting beyond the indicated range is required, replace with the appropriate spring. Be sure to label the regulator/valve to indicate the new pressure range.

Always use a pressure gauge to monitor pressure when making adjustments.

All MR98 Series regulator springs can be backed off to zero pressure. Recommended set pressure ranges available, maximum inlet pressures and temperatures and color codes of the respective springs are shown in the Specifications section and Table 3.

Types MR98L, MR98H and MR98HH

1. Loosen the jam nut (key 17, Figures 4, 6, 7 and 10).
2. To increase the set pressure or pressure setting, turn the adjusting screw (key 15) clockwise. Turn the adjusting screw counterclockwise to decrease the set pressure or pressure setting.
3. Tighten the jam nut (key 17).

Types MR98LD, MR98HD and MR98HHD

Turn the handwheel (key 38, Figures 5, 8 and 9) clockwise to increase differential pressure setting. Turn the handwheel counterclockwise to decrease the differential pressure setting.

Shutdown

Relief Valve

1. Close the upstream shutoff valve to the regulator inlet.
2. Close the downstream shutoff valve to the regulator outlet.
3. Slowly open the downstream vent valve to vent downstream pressure.
4. Leave the downstream vent valve open to vent inlet pressure and to release all remaining pressure in the regulator by opening the upstream vent valve or by turning the adjusting screw fully counterclockwise.

Differential Valve (Pressure-Loaded System)

1. Close the upstream shutoff valve to the regulator inlet.
2. Close the downstream shutoff valve to the regulator outlet.

WARNING

To avoid damage of internal parts from a pressure-loaded actuator, carefully vent the regulator spring case pressure prior to inlet pressure.

3. Vent the loading pressure slowly to release pressure in the spring case.

MR98 Series

Table 7. Number of Diaphragms Required

BODY SIZE	TYPE	SPRING RANGE	DIAPHRAGM MATERIAL	NUMBER OF DIAPHRAGM	
1/4 NPT	MR98L and MR98LD	All	Neoprene (CR)	1	
			Fluorocarbon (FKM)	2	
			Ethylenepropylene (EPDM)	2	
		2 to 7 psi / 0.1 to 0.5 bar	Metal	1	
	MR98H, MR98HH, MR98HD and MR98HHD	All	All except 2 to 7 psi / 0.1 to 0.5 bar	Metal	2
			Neoprene (CR)	1	
			Fluorocarbon (FKM)	2	
			Ethylenepropylene (EPDM)	2	
1/2 to 2 in. / DN 15 to 50	All	All	Metal	2	
			Neoprene (CR)	1	
			Fluorocarbon (FKM)	2	
			Ethylenepropylene (EPDM)	2	
			Metal	2	

4. Slowly open the downstream vent valve to vent downstream pressure.
5. Leave the downstream vent valve open to vent inlet pressure and to release all remaining pressure in the regulator by opening the upstream vent valve or by turning the adjusting screw fully counterclockwise.

Otherwise, the spring load or loading pressure could forcefully eject the spring case.

Relief valves or regulators that have been disassembled for repair must be tested for proper operation before being returned to service. Only parts manufactured by Emerson™ should be used for repairing Fisher® relief valves and regulators.

Due to normal wear or damage that may occur from external sources, this relief valve or backpressure regulator should be inspected and maintained periodically. The frequency of inspection and replacement of parts depends upon the severity of service conditions or the requirement of local, state and federal rules and regulations.

Backpressure Regulator

1. Close the upstream shutoff valve to the regulator inlet.
2. Close the downstream shutoff valve to the regulator outlet.
3. To avoid internal damage due to reverse pressurization of main valve components, bleed backpressure regulator inlet pressure first before bleeding outlet pressure.

Maintenance

WARNING

To avoid personal injury, property damage or equipment damage caused by sudden release of pressure or explosion of accumulated gas, do not attempt any maintenance or disassembly without first isolating the relief valve or regulator from system pressure and relieving all internal pressure from the relief valve or regulator.

To avoid possible personal injury from spring or pressure-loaded actuator, make sure that the adjusting screw is completely backed off or the spring case pressure is vented prior to disassembly.

Due to normal wear and damage that may occur from external sources, relief valve parts such as the O-rings, gaskets, diaphragm, orifice and valve plug should be inspected periodically and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions or the requirements of state and federal laws.

Instructions are given below for disassembly of the MR98 Series. These valves do not have to be removed from the pipeline to inspect internal parts. Suitable lubricants are indicated on the assembly drawings. Apply the recommended lubricants as the relief valve is being reassembled. Refer to Figures 4 to 10 while servicing the relief valve.

Flange Cap Screw Torque Inspection

Retorquing of spring case cap screws may be necessary for some MR98 Series regulators after a period of use. Retorque the cap screws as follows:

1. Shut down the relief valve or backpressure regulator. Refer to Shutdown section for the proper procedure.
2. Retighten the cap screws (key 16) in a crisscross pattern. See Table 6 for proper torque values.
3. Follow the Startup section to repressurize the relief valve or backpressure regulator.
4. Refer to the Disassembly to Replace Diaphragm and Seats section as needed.

Disassembly to Replace Diaphragm and Seats

CAUTION

Metal diaphragms have thin sharp edges. To avoid hand cuts, be careful when handling the diaphragm, particularly the diaphragm edge.

If the relief valve is leaking, the diaphragm may be ruptured or the seating surfaces nicked or scratched. Proceed as follows to inspect or replace the diaphragm, orifice and valve plug.

1. Shut down the backpressure regulator or relief valve. Refer to Shutdown section for the proper procedure.
2. **For Types MR98LD, MR98HD and MR98HHD:** Release all spring compression by turning the adjusting screw or handwheel (key 33 or 38) counterclockwise until it turns freely without resistance from the spring.
For Types MR98L, MR98H and MR98HH: Relieve the spring tension by loosening the jam nut (key 17) and turning the adjusting screw (key 15) counterclockwise.
3. Remove cap screws (key 16) and lift off the spring case (key 2), upper spring seat (key 9) and relief valve spring (key 11). Lift out the diaphragm unit which includes the lock nut (key 31), lock washer (key 28), pusher post (key 10), gasket (key 29), lower spring seat (key 8), diaphragm (key 12), diaphragm head (key 21 for Types MR98L and MR98LD, all body sizes and for Types MR98H and MR98HD, 1-1/2 and 2 in. / DN 40 and 50 body sizes), valve plug (key 4) and Type MR98HD has another washer (key 58) and an O-ring (key 45).
4. Check the orifice (key 3) for wear or damage. If it needs to be replaced, unscrew the valve plug guide (key 7) and then the orifice. The valve plug (key 4) can be removed by sliding it off of the pusher post (key 10).

5. Place a small amount of sealant on the threads of the orifice (key 3) and valve plug guide (key 7) and reinstall these to the body (key 1). See Table 6 for torque specifications.
6. To replace the valve plug O-ring (key 53), remove the machine screw (key 24) and O-ring retainer (key 25) from the plug. Remove and replace the O-ring.
7. Separate the remainder of the diaphragm unit parts. Take the lock nut (key 31) off of the pusher post (key 10). Slide off the lock washer (key 28), lower spring seat (key 8), diaphragm head (key 21) for Types MR98L and MR98LD, all body sizes and for Types MR98H and MR98HD, 1-1/2 and 2 in. / DN 40 and 50 body sizes), diaphragm (key 12), washer (key 58) and gasket (key 29).
8. Slip the valve plug (key 4) onto the pusher post (key 10). Place a gasket (key 29) on the shaft of the pusher post over the threaded portion until it rests on the base of the post. If elastomer diaphragm (key 12) is used, place a metal washer (key 58) on top of the gasket. For Type MR98H, 1-1/2 to 2 in. / DN 40 to 50 with metal diaphragm, place another gasket on the shaft of the pusher post until it rests on the bottom diaphragm head (key 21), see Figure 7.

Note

If a metal diaphragm is to be replaced by an elastomer diaphragm or an elastomer diaphragm by a metal diaphragm, a new pusher post is required. Each diaphragm material requires a different pusher post length and make sure the proper number of metal or elastomer diaphragm that will be used is followed. Refer to the Parts List section or Table 7 for the correct number of diaphragm to be used.

9. See Figures 4 to 10. For the metal diaphragms (key 12), replace the large diaphragm gasket (key 19) on the surface of the body (key 1) that will support the diaphragms. There will be two diaphragms used per regulator, except for 1/4 NPT Types MR98L and MR98LD with 2 to 7 psi / 0.1 to 0.5 bar spring range, which use only one metal diaphragm. The raised surfaces of the metal diaphragms should be placed in the unit so that they are facing toward the assembler (toward the spring) except only when one diaphragm is being used then the raised surface should be facing down (towards the body) (see Figure 2). For elastomer diaphragms, the printed side should be facing upwards when installed.

MR98 Series

10. Slip the lower spring seat (key 8) and lock washer (key 28) back onto the pusher post (key 10). Lubricate the threads of the pusher post and tighten the pusher post lock nut (key 31) until the lock washer is flat and then turn the nut an additional 1/8 to 1/4 turn. Return the diaphragm (key 12), spring seat and pusher post assembly to the body (key 1).
11. Set the relief valve spring (key 11) in the lower spring seat and place the upper spring seat (key 9) on the spring.
12. Put the spring case (key 2) over the spring (key 11) and onto the body (key 1). Tighten the cap screws (key 16) finger tight only.
13. To ensure proper slack in the diaphragm (key 12), apply some spring compression by turning the adjusting screw (key 15) or handwheel (key 38) clockwise. Finish tightening the cap screws. See Table 6 for recommended torque values.

Replacement or Maintenance of Bottom Plug O-ring

If there is any external leakage from the bottom plug the bottom plug O-ring could be worn out or damaged. Proceed as follows to check and/or replace it.

1. Shut down the regulator. Refer to Shutdown section for the proper procedure.
2. Unscrew the bottom plug (key 5) from the body (key 1). Inspect the bottom plug seal (key 63) for damage. Replace the bottom plug seal if damage is noted. Lightly lubricate the bottom plug O-ring or graphite ring before installing it onto the bottom plug.
3. Reassemble the regulator in the reverse order of the above steps. When installing the bottom plug (key 5), coat the threads and sealing surface with anti-seize compound to ensure an adequate metal-to-metal seal. Reference Table 6 for proper torque values.

Disassembly to Replace Packing (For Types MR98LD, MR98HD and MR98HHD)

Leakage around the adjusting screw may be caused by worn packing in the stuffing box. To check the packing, perform the following procedures.

1. Before returning the upper spring case (key 2) to the body (key 1), replace the packing (key 36) in the packing/stuffing box (key 32).

2. Take out the machine screw (key 41) and lift off the washer (key 44) and handwheel (key 38).
3. Unscrew the packing/stuffing box (key 32). Unscrew the packing/stuffing box nut (key 35) and take it and the packing follower (key 34) off of the adjusting screw (key 33).
4. Unscrew and pull the adjusting screw (key 33) out through the bottom of the packing/stuffing box (key 32).
5. Pull out the packing (key 36) and replace it. Replace the packing/stuffing box gasket (key 37).
6. Reassemble the packing/stuffing box (key 32) unit by returning the adjusting screw (key 33) to the inside of the stuffing box. Slip the packing follower (key 34) onto the adjusting screw and into the stuffing box. Screw on the packing nut (key 35). See Table 6 for torque specifications.
7. Put the packing/stuffing box (key 32) onto the spring case (key 2). Set the handwheel (key 38) and washer (key 44) on the adjusting screw (key 33) and screw in the machine screw (key 41).
8. Set the spring (key 11) and upper spring seat (key 9) over the lower spring seat (key 8). Place the spring case (key 2) on the body (key 1), tightening the cap screws (key 16) finger-tight only.
9. To ensure proper slack in the diaphragm (key 12), apply some spring compression by turning the adjusting screw (key 15) or handwheel (key 38) clockwise. Tighten the cap screws (key 16).

Parts Ordering

When corresponding with your local Sales Office about this equipment, always reference the equipment serial number stamped on the nameplate.

When ordering replacement parts, specify the complete 11-character part number of each required part as found in the following parts list. Separate kits containing all recommended spare parts are available.

Note

In this parts list, parts marked NACE are intended for corrosion-resistant service as detailed in the NACE International Standard MR0175 and NACE MR0103.

Optional materials are available to meet ANSI/NACE MR0175/ISO 15156, please contact your local Sales Office for special ordering instructions.
