- (2) Select "Properties" and "System Properties" box appears
- (3) Click on "Device Manager" tab

7 | Trouble Shooting

Problem: Software programs will not run with the drivers.

Solution:

1. Try running the software with standard VGA drivers supplied with the application program. Most software programs have standard IBM VGA drivers. If the program still does not work it may be a problem with the application software.
2. Removed all **TSR (Terminate and Stay Resident)** programs from your system (specifically in DOS system)and try the program again.

Problem: How do I get the latest drivers for the card?

Solution: You can check with the relative web site to download them.

Problem: When I boot the computer the display is not black. It is a different color , such as blue.

Solution:

Check the monitor connection. Generally blue, or other color screens are related to improper connections between the video card and monitor cable.

Problem: I am using a high resolution multi-frequency monitor. The vertical refresh rate is set for 140Hz using 1024x768 resolution. When going into Windows or other graphics applications , my display size shrinks quit a bit on the screen .

Solution:

Use a slower vertical refresh rate. The vertical refresh rate may be set too high for the monitor to support it. The monitor may be compensating for the high frequency rate by reducing the screen size.

Problem: After installation and restarting, Windows 95 informs me that display setting is still incorrect. What can I do?

There may be conflict between previous and current display drivers.
This is caused by not complete removal of previous display driver. Try the following steps to remove it:

Solution:

- (1) Use right button of mouse to click on "My Computer" icon on desktop.
- (2) Select "Properties" and "System Properties" box appears
- (3) Click on "Device Manager" tab
- (4) You will see a list of devices on your computer.
- (5) Open "Display adapters" in the list (double click it).
- (6) You will find two (or more) conflicted adapters listed here.
- (7) Remove all previous adapters by selecting them and press "Remove"
- (8) Close Device Manager and restart Windows 95.
- (9) Now display driver will work correctly.

5 Display Utility for Windows

CAUTION!

For maximum compatibility and flexibility, the PowerStrip can be loaded and unloaded dynamically, but note that many of the features it provides are only available while the PowerStrip is running.

The PowerStrip is a display control and desktop enhancement utility for Windows 95/NT, specially designed and optimized for use with your graphics accelerator. You should think of the PowerStrip as a kind of supplementary "device driver" which works in conjunction with your accelerator's display driver.

Installation

The PowerStrip is automatically installed when you use the Setup program under windows 95/NT (refer to Chapter 3-4). After you finish the installation, the About the PowerStrip dialog box will appear on the screen, then click "OK". Then click Programs | PowerStrip | PowerStrip (Figure 5-1) or double click on the "Monitor" | Show PowerStrip Configuration (Figure 5-2) icon in the System tray to show the PowerStrip Properties on your screen. (Figure 5-3)

Note: If you need the more information that is referred to the pstrip.doc file or on line help where locate at Programs | PowerStrip | Online Documentation. (Figure 5-1)

CAUTION !

- Before installing the video driver, make sure your Windows NT is installed in VGA mode and work fine.
- Before installing the video driver, please install the Windows NT service pack 3 package first (or please download these drivers from Microsoft web site), otherwise the PowerStrip Utility will not work correctly.

If you are running Windows NT, please note that drivers for NT are not compatible with earlier releases of NT, and vice versa. Consult your dealer, local user support groups or online services from time to time to ensure you have the latest release for the version of NT you are running.

To install the optimized display drivers for Windows NT, you must be running NT and follow Microsoft standard display driver installation procedure as documented in the NT user manual. Note the somewhat different installation procedures between NT and earlier release below.

SETUP DRIVER

1. Turn on your computer and start Windows NT.
2. Insert the Driver CD into your CD-ROM driver.
3. Type D:\CDSETUP [Enter] in the Run dialog box.
4. The PowerStrip Setup Wizard dialog box will appear on the screen, please follow the instruction to install.
5. In Display Properties, select **Settings | Display Type** and then click the [**Change**] button for Adapter Type.
6. When the Change Display dialog box appears on screen, click the [**Have Disk**] button and enter the path to the driver installation diskette (e.g., D:\winNT4). Click "OK".
7. Select the Correct VGA mode (e.g., Intel740 Video Accelerator), then click **OK** button to restart your computer.

Windows 95/NT Display Properties

Windows 95/NT allows you to select resolution, color depth, refresh frequency and font size using the standard Windows 95/NT Display Properties sheet, which can be accessed by right clicking anywhere on the Windows 95/NT desktop, and then selecting Properties from the pop-up menu that appears on screen.

OpenGL for Windows 95 and NT

The OpenGL Driver for Windows 95/NT is install at the same time as the installation of the Windows 95/NT drivers. See the Windows 95/NT installation instructions for further information.

3 Microsoft Windows 95/98 Drivers

CAUTION!

- Before installing the Display driver, make sure your Windows 95 is installed in VGA mode and work fine.
- Please install the DirectX before you want to play the MPEG Movie Player.

Installation of the Windows 95/98 drivers and utilities is a two-step procedure: (1) first install the Windows 95/98 Utilities using the Setup program, and then (2) install the Windows 95/98 drivers using standard Windows 95/98 procedures. Although we do not recommend this, you can install the display drivers for Windows 95/98 without installing the support files.

SETUP VGA MODE

Click the right mouse button anywhere on the Windows 95/98 desktop and select Properties from the pop-up menu that appears on screen. Select Settings | Change Display Type and then click the [Change] button for Adapter Type. 2 Hardware Installation

Insert your Graphic Card

Remove the cover for the slot you intend to use and save the screw for the mounting bracket. Then, pick up the Graphic card and position it over the expansion slot you've chosen. Push the card with firmly and evenly until it's fully seated in the slot. Replace the screw to secure the bracket of the Graphic card to the computer chassis.

Connect the monitor

Plug your monitor cable into the monitor connector on your Graphic card. Make sure the other end of the monitor cable is properly connected to your monitor.

Hardware Installation

CAUTION!

- Static electricity can severely damage electronic parts. Take these precautions:
- Before touching any electronic parts, drain the static electricity from your body. You can do this by touching the internal metal frame of your computer while it's unplugged.
 - Don't remove a card from the anti-static container it shipped in until you're ready to install it. When you remove a card from your computer, place it back in its container.
 - Don't let your clothes touch any electronic parts.
 - When handling a card, hold it by its edges, and avoid touching its circuitry.

Before You Begin

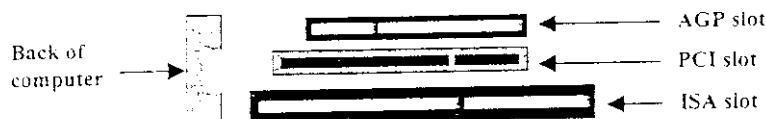

Before you proceed further, make sure your computer system meets the peripheral requirements and switch to the standard VGA display driver.

Prepare Your Computer for Installation

Prior to working on your computer, make sure the power of the computer and any related equipment is turned off.

Select a Vacant Expansion PCI (AGP) Slot

Most AGP (PCI) bus computers have a combination of AGP (PCI) and ISA expansion slots. AGP (PCI) are usually made with plastic of a contrasting brown color (beige color), and are shorter than other slots in your computer. Your system manual should identify the AGP (PCI) slots. Plugging your Graphic card into a non-AGP (PCI) slot could damage the card, your computer, or both.
