Product: Civil 3D 2009
Topic: Save Layouts in a Different Drawing
Written by: Heather Nagel, Civil Technical Engineer
Date: January 5, 2009

To save memory, it may be beneficial to save your layouts created from Plan Production in another drawing. You have two options, to save all layouts in one drawing, or to save a specified number of layouts in multiple drawings. It is recommended that if you have more than 10 layouts, to use the second option. Any more than 10 layouts in each drawing may result in performance problems. In the Create Sheets Wizard, you have the option to choose whether the layouts created with stay in the current drawing, or placed in one other drawing, or in multiple drawings. When choosing the place layouts in another drawing, the source drawing becomes an external reference in the layouts drawing. Any updates made to the source drawing will automatically update the layouts drawing.
