Topic: Using Fields in Civil 3D Written by: Leo Lavayen, ISD Tech. Date: December 23, 2008

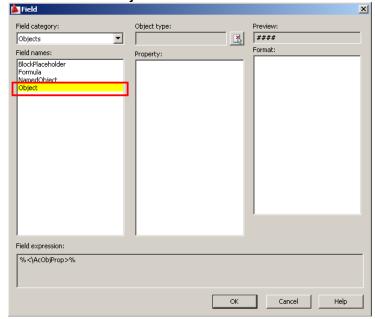

Using fields in M-text is a good way of keeping track of objects, specifically Assemblies. After an Assembly has been created (with or with out attached subassemblies) we can create a field.

1. Start up the **FIELD** command.

2. In the Field Category drop down, select Objects.

3. In the filtered Field Names list select Object

4. Then select the Assembly from the screen by using the select button.

5. Once the Object (assembly) has been selected choose what need to be displayed, in this case Name

6. Then exit out by clicking **OK**, you will be prompted to select a location on the screen for the field. The created field will be M-text and uses the current AutoCAD text style.
