

## 1. Product Overview

The TYZS15 is a low-power embedded Zigbee module developed by Hangzhou Tuya Information Technology Co., Ltd. The module consists of a EFR32 highly integrated wireless RF processor chip and a small number of peripheral devices. It has a built-in 802.15.4 PHY/MAC Zigbee network protocol and a large number of library functions. The TYZS15 embeds a low-power 32-bit ARM Cortex-M4 core, 512KByte Flash program memory, 64KB RAM data memory, and a wealth of peripheral resources.

The TYZS15 is a FreeRTOS platform that gathers all Zigbee MAC and TCP/IP libraries into one place. It enables users to build on the product and develop embedded Zigbee products that suit their individual needs.

### 1.1 Features

A built-in low-power 32-bit ARM Cortex-M4 processor with a DSP instruction set and a floating point unit that doubles as an application processor

Supports main frequency of 38.4MHz

Wide operating voltage: 1.8V-3.8V

Peripherals: 3×PWMs 1×UART , 1×nRST,1×JLINK

Zigbee operating characteristics:

- Supports 802.15.4 MAC/PHY
- Operating channels 11 to 26@2.405-2.480GHz, air-interface rate 250Kbps
- Built-in DC-DC circuit for maximum power efficiency
- 63uA/MHz operating power consumption; 1.4 uA sleep current
- Active net pairing with terminal devices
- Monopole antenna
- Operating temperature: -40°C to105°C
- Supports hardware encryption and supports AES 128/256

### 1.2 Primary application fields

- ◇ Smart buildings
- ◇ Smart homes/appliances
- ◇ Smart plugs, smart lighting
- ◇ Industrial wireless control
- ◇ Health and measurements
- ◇ Asset tracking

## 2. Module interfaces

### 2.1 Package dimensions

The TYZS15 has 2 rows of pins with a 2mm gap and a total of 6 external pins.

TYZS15 dimensions: 8.55mm (W) x 12.75mm (L) x 2.0mm (H)

**2.2 Pin definition**

Interface pins are defined as shown in Table 1:

**Table 1, TYZS15 interface pins description**

Pin number	Symbol	IQ type	Function
1	ANT	I	Radio frequency (rf), the bonding pad is used for welding antenna rf mouth, the welding plate is used for welding the antenna
2	GND	p	Module reference, to ensure good grounding.
3	PWM1	-	Do lamp drivers/GPIO use mouth, corresponding to the 732 IC PC10 pi
4	PWM3	I/O	Do lamp drivers/GPIO use mouth, corresponding to the 732 IC PB15 pi
5	PWM2	I/O	Do lamp drivers/GPIO use mouth, corresponding to the 732 IC PB11 pi
6	VCC	p	Module power supply pins (typical power supply voltage: 3.3 V)
TP1	SWDIO	I/O	Buffer JLINK SWDIO pin.In normal application to do GPIO
TP2	SWCLK	P	Buffer JLINK SWDIO pin.In normal application to do GPIO
TP3	TXD	I/O	UART0_RXD, serial port to receive the corresponding IC PA0.
TP4	RXD	I/O	UART0_RXD, serial port to receive the corresponding IC PA1.
TP5	NRST	I/O	Low power module is reset to live at ordinary times, high level under normal condition

Description: P indicates the power pin; I/O indicates the input/output pin;

nRST is only the module hardware reset pin; it cannot clear Zigbee net-pairing information.

**2.3 Test point definition**

Test pins are defined in Table 2:

Table 2, TYZS15 test pins description

Pin number	Symbol	IO type	Function
TP3/TP4	RXD/TXD	I/O	For module production testing

Description: This test pin is bottom PAD and is not recommended for use.

### 3. Electrical parameters

#### 3.1 Absolute electrical parameters

Table 3, Absolute parameters

Parameters	Description	Minimum value	Maximum value	Unit
Ts	Storage temperature	-50	150	°C
VCC	Input voltage	-0.3	3.8	V
Electrostatic discharge voltage (human-body model)	TAMB-25°C	-	2.5	KV
Electrostatic discharge voltage (machine model)	TAMB-25°C	-	0.5	KV

#### 3.2 Operating conditions

Table 4, Normal operating conditions

Parameters	Description	Minimum value	Typical value	Maximum value	Unit
Ta	Operating temperature	-40	-	105	°C
VCC	Operating voltage	1.8	3.3	3.8	V
VIL	IO low input	-0.3	-	VCC*0.25	V
VIH	IO high input	VCC*0.75	-	VCC	V
VOL	IO low output	-	-	VCC*0.1	V
VoH	IO high output	VCC*0.8	-	VCC	V
Imax	IO drive current	-	-	12	mA

#### 3.3 Zigbee TX power consumption

Table 5, Power consumption during continuous TX

Symbol	Rate	Transmission power	Typical value	Unit
IRF	250Kbps	+8.99dBm	118	mA
IRF	250Kbps	+8.58dBm	32	mA
IRF	250Kbps	+7.96dBm	17	mA

Note: When testing the above data, continuous transmission duty cycle=100%.

### 3.4 The Zigbee RX power consumption

Table 6, Power consumption during continuous RX

Symbol	Rate	Typical value	Unit
IRF	250Kbps	8	mA

Note: When UART is active, the RX mode current is 14mA.

### 3.5 Power consumption when operating

Table 7, TYZS15 operating current

Operation mode	Operating condition, Ta=25°C	Average value	Maximum value	Unit
Quick configuration	Module in quick configuration state	12	40	mA
Network connection state	Connected to a network	1	3	mA
Deep sleep mode	Deep sleep mode and retains 64KB Flash	1.4	3	uA

## 4. RF Characteristics

### 4.1 Basic RF characteristics

Table 8, Basic RF characteristics

Parameter	Description
Operating frequency	2.405to 2.480GHz
Physical layer standard	IEEE 802.15.4
Data transfer rate	250Kbps
Antenna type	Monopole antenna
Line of sight	>120m

## 4.2 Zigbee Output performance

Table 9, Continuous TX performance

Parameter	Minimum value	Typical value	Maximum value	Unit
Maximum output	-	+8.99	-	dBm
Minimum output	-	+7.96	-	dBm
Output power adjustment step	-	-	-	dB
Frequency error	-15	-	+15	ppm
Output adjacent channel suppression		-32		dBc

## 4.3 Zigbee RX sensitivity

Table 10, RX Sensitivity

Parameter	Minimum value	Typical value	Maximum value	Unit
PER<10%, RX sensitivity, 250Kbps@OQPSK	-	-101	-	dBm

## 5. Antenna signal

### 5.1 Antenna type

Monopole antenna

### 5.2 Antenna interference reduction

To optimize Zigbee performance of the wireless module in combination with the Monopole antenna, it is recommended to keep the antenna at least 15mm from other metal parts.

The user PCB board should not be routed around the antenna area and should not be covered with copper to avoid affecting the antenna radiation performance. It is recommended that the adapter board antenna area be hollowed out.

## 6. Packaging information and production guide

### 6.1 Production Guide

The storage conditions for the module after it has been shipped are as follows:

1. The moisture resistant bag must be stored at a temperature below 30°C, and under a relative humidity below 85%.
2. The shelf life of dry packed products is six months following the packaged date.

Important information

1. All line workers must wear anti-static wrist straps and anti-static clothing throughout the entire production process.
2. It is strictly prohibited to allow a module to come into contact with water or other contaminants during operations.

### 6.2 Recommended furnace temperature curve

Refer to IPC/JEDEC standard ; Peak Temperature : <math>< 250^{\circ}\text{C}</math> ; Number of Times :  $\leq 2$  times ;

## Regulatory Module Integration Instructions

### 2.2 List of applicable FCC rules

This device complies with part 15.247 of the FCC Rules.

### 2.3 Summarize the specific operational use conditions

This module can be used in household electrical appliances as well as lighting equipments. The input voltage to the module should be nominally 1.8~3.8 V<sub>DC</sub>, typical value 3.3V<sub>DC</sub> and the ambient temperature of the module should not exceed 105°C.

This module using only one kind of antennas with maximum gain is 1.0 dBi. Other antenna arrangement is not covered by this certification.

The antenna is not field replaceable. If the antenna needs to be changed, the certification should be re-applied.

### 2.4 Limited module procedures

This module can be used in lighting equipment, smart frontpanel, household electrical appliances. Normally host device should provide a power supply in range 1.8-3.8V, typically 3.3V for this module. The limited module manufacturer will reviews detailed test data or host designs prior to giving the host manufacturer approval.

### 2.5 Trace antenna designs

Not applicable

### 2.6 RF exposure considerations

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body. If the device built into a host as a portable usage, the additional RF exposure evaluation may be required as specified by § 2.1093.

## 2.7 Antennas

Module only contains one Monopole Antenna . No additional external connectors.

## 2.8 Label and compliance information

The outside of final products that contains this module device must display a label referring to the enclosed module. This exterior label can use wording such as: “Contains Transmitter Module FCC ID: 2ANDL-TYZS15 ”,or “Contains FCC ID:2ANDL-TYZS15 ”, Any similar wording that expresses the same meaning may be used.

## 2.9 Information on test modes and additional testing requirements

a) The modular transmitter has been fully tested by the module grantee on the required number of channels, modulation types, and modes, it should not be necessary for the host installer to re-test all the available transmitter modes or settings. It is recommended that the host product manufacturer, installing the modular transmitter, perform some investigative measurements to confirm that the resulting composite system does not exceed the spurious emissions limits or band edge limits (e.g., where a different antenna may be causing additional emissions).

b) The testing should check for emissions that may occur due to the intermixing of emissions with the other transmitters, digital circuitry, or due to physical properties of the host product (enclosure). This investigation is especially important when integrating multiple modular transmitters where the certification is based on testing each of them in a stand-alone configuration. It is important to note that host product manufacturers should not assume that because the modular transmitter is certified that they do not have any responsibility for final product compliance.

c) If the investigation indicates a compliance concern the host product manufacturer is obligated to mitigate the issue. Host products using a modular transmitter are subject to

all the applicable individual technical rules as well as to the general conditions of operation in Sections 15.5, 15.15, and 15.29 to not cause interference. The operator of

the host product will be obligated to stop operating the device until the interference has been corrected

Below are steps for on test modes :

```
plugin mfglib mfgenable 1          //1 presents enable
plugin mfglib start 0              //0 presents transmitting
plugin mfglib set-channel 11      // channel config, 11 presents carrier frequency 2405MHz,
26 presents carrier frequency 2480MHz
plugin mfglib stream start        //transmitting modulated zigbee waveform
plugin mfglib stream stop        //stop transmitting modulated zigbee waveform
```

## 2.10 Additional testing, Part 15 subpart B disclaimer

The final host / module combination need to be evaluated against the FCC Part 15B criteria for unintentional radiators in order to be properly authorized for operation as a Part 15 digital device.

The host integrator installing this module into their product must ensure that the final composite product complies with the FCC requirements by a technical assessment or evaluation to the FCC rules, including the transmitter operation and should refer to guidance in KDB 996369.

### Frequency spectrum to be investigated

For host products with certified modular transmitter, the frequency range of investigation of the composite system is specified by rule in Sections 15.33(a)(1) through (a)(3), or the range applicable to the digital device, as shown in Section 15.33(b)(1), whichever is the higher frequency range of investigation.

**Operating the host product**

When testing the host product, all the transmitters must be operating. The transmitters can be enabled by using publicly-available drivers and turned on, so the transmitters are active. In certain conditions it might be appropriate to use a technology-specific call box (test set) where accessory devices or drivers are not available.

When testing for emissions from the unintentional radiator, the transmitter shall be placed in the receive mode or idle mode, if possible. If receive mode only is not possible then, the radio shall be passive (preferred) and/or active scanning. In these cases, this would need to enable activity on the communication BUS (i.e., PCIe, SDIO, USB) to ensure the unintentional radiator circuitry is enabled. Testing laboratories may need to add attenuation or filters depending on the signal strength of any active beacons (if applicable) from the enabled radio(s). See ANSI C63.4, ANSI C63.10 and ANSI C63.26 for further general testing details.

The product under test is placed into a normal 'paired' mode with another ZigBee device, as per the normal intended use of the product (for example, transferring data).

**FCC Statement**

Any Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment. This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation
