

Aruba AP-175 Outdoor Access Point

Installation Guide

The Aruba AP-175 is a resilient, environmentally hardened, outdoor rated, dual-radio, dual-band IEEE 802.11 a/b/g/n wireless access point. This outdoor access point is part of Aruba's comprehensive wireless network solution. The AP-175 works only in conjunction with an Aruba controller and each AP can be centrally managed, configured, and upgraded through the controller.

There are three versions of the AP-175, which mainly differ in the way they receive power.

- AP-175P: PoE+ powered (802.3at)
- AP-175AC: AC powered (100 - 240 VAC)
- AP-175DC: DC powered (12 - 48 VDC)

The AP-175AC/DC can function as a Power Sourcing Equipment (PSE) device by providing power through its Ethernet port in compliance with the IEEE 802.3af standard.

Guide Overview

- "[AP-175 Hardware Overview](#)" on page 2 provides a detailed hardware overview of the three AP-175 models.
- "[Outdoor Planning and Deployment Considerations](#)" on page 5 provides key questions to ask and items to consider when deploying an outdoor wireless network.
- "[Installing the AP-175](#)" on page 9 describes the multi-step process for a successful installation and deployment of an AP-175.
- "[Safety and Regulatory Compliance](#)" on page 15 provides an overview of safety and regulatory compliance information.

AP-175 Operations

- Wireless access point (IEEE 802.11 a/b/g/n)
- Wireless air monitor (IEEE 802.11 a/b/g/n)
- Enterprise mesh point
- Enterprise mesh portal
- Protocol-independent networking functionality
- AP-175P: IEEE 802.3at Power over Ethernet+ (PoE+) compatible
- AP-175AC and AP-175DC: IEEE 802.3af Power Sourcing Equipment (PSE) device

Package Contents

- AP-175 Access Point
- AP-175 Mounting Bracket
- Solar Shield
- Pole Anchors x 2
- M4 x 16 bolts, flat washers, and spring washers x4 (These bolts are attached to the solar shield)
- M6 x 30 bolts, flat washers, and spring washers x2
- M4 x 12 bolt, external-tooth washer, and OT copper lug x1
- M8 x 110 bolt, flat washers, spring washers, and nuts x4
- Installation Guide

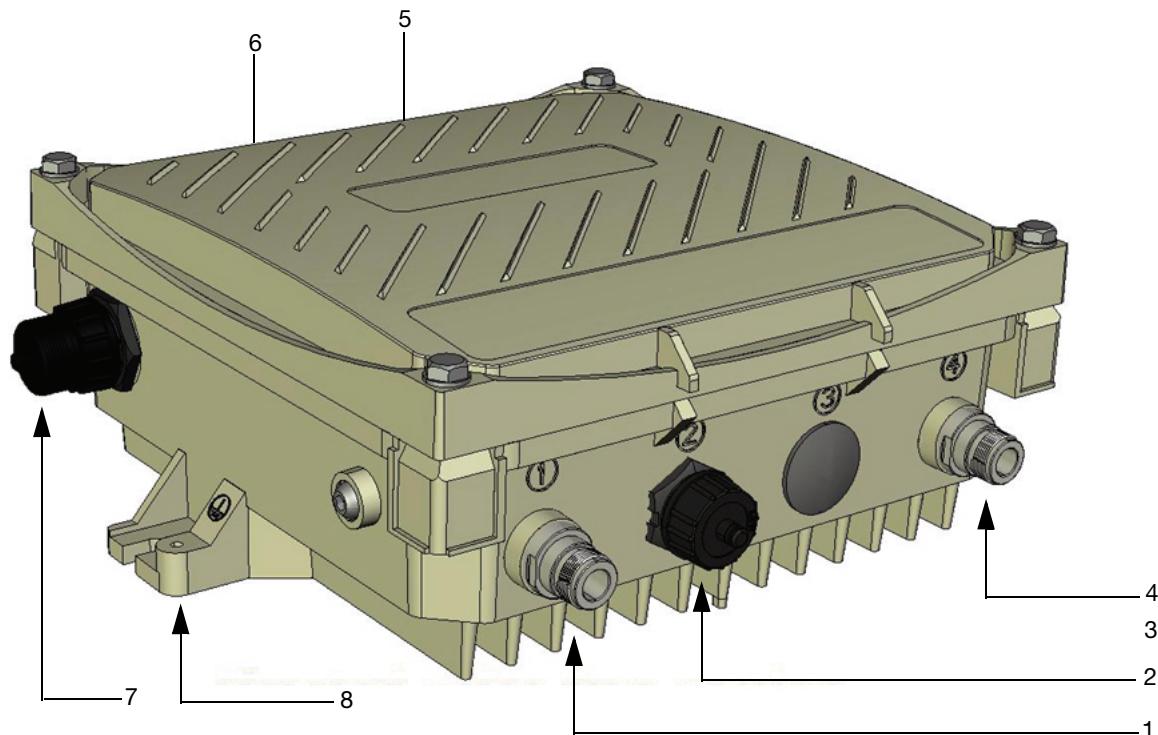

Inform your supplier if there are any incorrect, missing, or damaged parts. If possible, retain the carton, including the original packing materials. Use these materials to repack and return the unit to the supplier if needed.

AP-175 Hardware Overview

The following section describes the hardware features of the AP-175.

Figure 1 AP-175 Overview

- | | | | |
|---|--|---|-----------------------------|
| 1 | Antenna Interface (Radio 1) | 5 | Antenna Interface (Radio 0) |
| 2 | USB Console Interface | 6 | Antenna Interface (Radio 1) |
| 3 | Reserved (AP-175P) or
Power Interface (AP-175AC and AP-175DC) | 7 | Ethernet Interface (PoE) |
| 4 | Antenna Interface (Radio 0) | 8 | Grounding Point |

Antenna Interface

The AP-175 requires the use of detachable outdoor-rated antennas. Select the correct antenna type to support the required frequency band (2.4 or 5 GHz) and the desired coverage pattern.

The AP-175 is equipped with four, female N-type antenna interfaces; two on the top of the AP and two on the bottom. The interfaces are grouped into diversity pairs, one pair is marked R0 (Radio 0) and the other pair marked as R1 (Radio 1). R0 supports the 5 GHz frequency band and R1 supports the 2.4 GHz radio band.

USB Console Interface

A USB serial console port is provided for connection to a terminal, allowing direct local management. Use the following setting to access the terminal:

Table 1 *Console Settings*

Baud Rate	Data Bits	Parity	Stop Bits	Flow Control
9600	8	None	1	None

Power Interface

The type of power interface on your AP-175 depends on which model you have purchased.

- AP-175P: This version does not include a power interface since it is only powered by PoE+ (802.3at).
- AP-175AC: 1x AC power connector
- AP-175DC: 1x DC power connector

Ethernet Interface

The AP-175 is equipped with a 10/100/1000Base-T Gigabit Ethernet port for wired network connectivity. On the AP-175P, this port also supports IEEE 802.3at Power over Ethernet (PoE), accepting 48 VDC as a standards-defined powered device (PD) from a power sourcing equipment (PSE) device, such as a PoE midspan injector. Inversely, the AP-175AC and AP-175DC can act as a PSE device to provide IEEE802.3af PoE power to devices connected to the Ethernet port.

Grounding Point

Always remember to protect your AP-175 by installing grounding lines. The ground connection must be complete before connecting power to the AP-175 enclosure. Ensure that the resistance is less than 5 ohm between the ground termination point and the grounding tier.

LED Status Indicators

The AP-175 include visual indicators for power, link, and radio status. Additionally, each radio has a four-LED array that indicates received signal strength (RSSI).

The RSSI LED indicators represent varying degrees in the RSSI level. The absence of a signal is indicated by no LED response, and full signal strength is indicated when all four LEDs are active and lit.

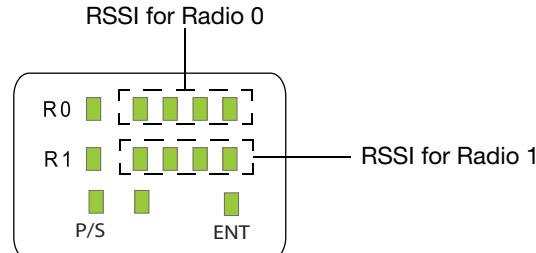

Figure 2 LED Layout

Table 2 lists the meanings of the LEDs on the AP-175 outdoor access points.

Table 2 AP-175 LED Status Indicators

LED	Function	Indicator	Status
P/S	AP Power/Ready Status	Off	No power to AP
		Blinking	Device booting, not ready
		On	Device ready
ENT	LAN/Network Link Status	Off	Ethernet link unavailable
		On (Amber)	10/100 Mbs Ethernet link negotiated
		On (Green)	1000 Mbs Ethernet link negotiated
		Blinking	Traffic on Ethernet link
R0	Radio 0 Status	Off	Radio 0 disabled
		On (Amber)	Radio 0 enabled in WLAN mode
		Blinking	Air Monitor (AM) mode
R1	Radio 1 Status	Off	Radio 1 disabled
		On (Blue)	Radio 1 enabled in WLAN mode
		Blinking	Air Monitor (AM) mode
RSSI (Radio 0)	RSSI Level for Radio 0	Off	RSSI disabled/no signal
		4 Step Progressive Bars (Red) 25/50/75/100%	Each bar represents a progressive increase in signal strength, with 4 bars representing maximum signal strength (100%). Minimum data rate: One lit LEDs Maximum data rate: Four lit LEDs
RSSI (Radio 1)	RSSI Level for Radio 1	Off	RSSI disabled/no signal
		4 Step Progressive Bars (Blue) 25/50/75/100%	Each bar represents a progressive increase in signal strength, with 4 bars representing maximum signal strength (100%). Minimum data rate: One lit LEDs Maximum data rate: Four lit LEDs

Outdoor Planning and Deployment Considerations

Prior to deploying an outdoor wireless network, the environment must be evaluated to plan for a successful Aruba WLAN deployment. Successfully evaluating the environment enables the proper selection of Aruba APs and antennas and assists in the determination of their placement for optimal RF coverage. This process is considered WLAN or RF planning and Aruba's system engineers can assist in the outdoor planning process.

Scale Requirements

The potentially immense scale of outdoor deployments requires consideration of factors that may not be as important in a typical indoor deployment:

- Range (distance): Range or distance between APs must be taken into account during the planning phase. Available AP mounting locations are often far less flexible in an outdoor environment. Regardless of these outdoor restrictions, the desired goal is to achieve results similar to an indoor deployment: a “dense” RF deployment that supports advanced Aruba features, such as ARM, efficient client roaming, and failover.
- Elevation: Proper consideration and planning for elevation differences between APs (AP to AP) and AP to Client can be *critical* to success. To plan for these differences in elevation, it is important to understand the 3D coverage pattern provided by the antennas that will be deployed in the environment.
- Non-Fixed Considerations: The RF environment might change on a day to day basis. Keep non-fixed items, such as shipping containers, vehicles, and future building construction, in mind when planning for an outdoor deployment.

Identifying Known RF Absorbers/Reflectors/Interferences Sources

Identifying known RF absorbers/reflectors/interference sources while out in the field during the installation phase is critical. Even though outdoor environments consist of fewer RF absorbers/reflectors/interference sources compared to indoor environments, ensure that these sources are identified and taken into consideration when installing and mounting an AP to its fixed outdoor location.

RF Absorbers

- Cement/Concrete
- Natural Items: Trees/vegetation
- Brick

RF Reflectors

- Metal Objects: Roof-installed air-conditioning equipment, chain link fences (depending on aperture size), other wire fences, or water pipes

RF Interference Sources

- Other 802.11a/b/g/n or broadband access equipment operating nearby
- Industrial RF welding equipment or other Industrial, Scientific and Medical (ISM) equipment that utilizes RF to heat or alter the physical properties of materials
- Military, Commercial Aviation or Weather Radar Systems

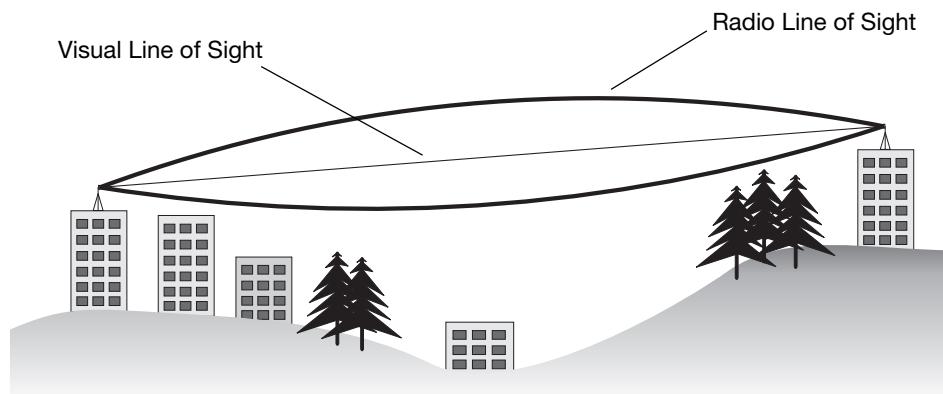

Line of Sight (Radio Path Planning)

A wireless bridge or mesh link requires a “radio line of sight” between the two antennas for optimum performance. The concept of radio line of sight involves the area along a link through which the bulk of the

radio signal power travels. This area is known as the first Fresnel Zone of the radio link. For a radio link, no object (including the ground) must intrude within 60% of the first Fresnel Zone.

[Figure 3](#) illustrates the concept of a good radio line of sight.

Figure 3 Line of Sight

If there are obstacles in the radio path, there may still be a radio link but the quality and strength of the signal will be affected. Calculating the maximum clearance from objects on a path is important as it directly affects the decision on antenna placement and height. It is especially critical for long-distance links, where the radio signal could easily be lost.

When planning the radio path for a wireless bridge or mesh link, consider these factors:

- Avoid any partial line of sight between the antennas
- Be cautious of trees or other foliage that may be near the path, or may grow and obstruct the path.
- Be sure there is enough clearance from buildings and that no building construction may eventually block the path.
- For very long distance links, the curvature of the earth (20 cm per km) may need to be considered in the calculation of relative heights.
- Check the topology of the land between the antennas using topographical maps, aerial photos, or even satellite image data (software packages are available that may include this information for your area)
- Avoid a path that may incur temporary blockage due to the movement of cars, trains, or aircraft.

Antenna Height

A reliable wireless bridge or mesh link is usually best achieved by mounting the antennas at each end high enough for a clear radio line of sight between them. The minimum height required depends on the distance of the link, obstacles that may be in the path, topology of the terrain, and the curvature of the earth (for links over 3 miles).

For long-distance links, the AP may have to be mounted on masts or poles that are tall enough to attain the minimum required clearance. Use the following table to estimate the required minimum clearance above the ground or path obstruction (for 5 GHz bridge links).

Table 3 Antenna Minimum Height and Clearance Requirements

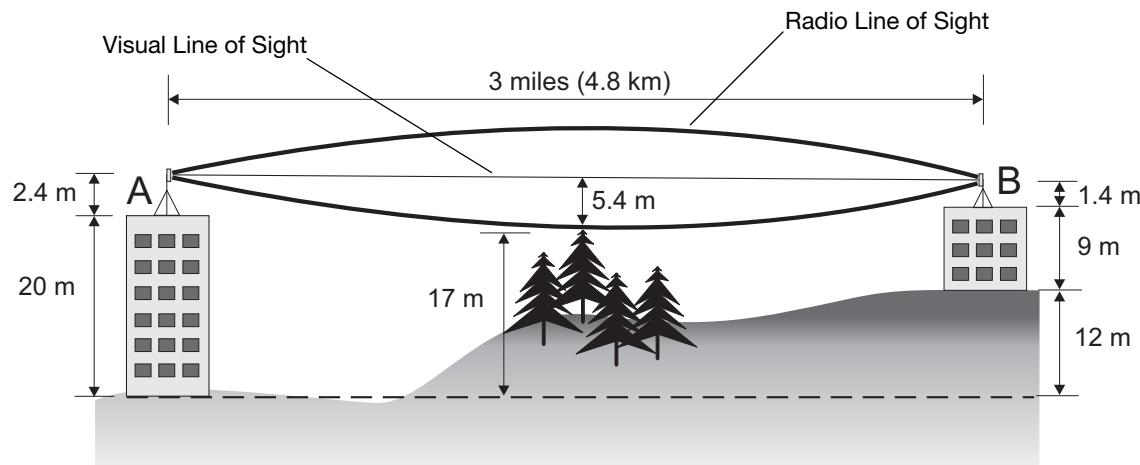

Total Link Distance	Max Clearance for 60% of First Fresnel Zone at 5.8 GHz	Approximate Clearance for Earth Curvature	Total Clearance Required at Mid-point of Link
0.25 mile (0.402 km)	4.6 ft (1.4 m)	0.007 ft (0.002 m)	4.6 ft (1.4 m)
0.5 mile (0.805 km)	6.2 ft (1.9 m)	0.03 ft (0.010 m)	6.2 ft (1.9 m)

Table 3 Antenna Minimum Height and Clearance Requirements

Total Link Distance	Max Clearance for 60% of First Fresnel Zone at 5.8 GHz	Approximate Clearance for Earth Curvature	Total Clearance Required at Mid-point of Link
1 mile (1.6 km)	8.9 ft (2.7 m)	0.13 ft (0.04 m)	8.9 ft (2.7 m)
2 miles (3.2 km)	12.5 ft (3.8 m)	0.5 ft (0.15 m)	13.1 ft (4.0 m)
3 miles (4.8 km)	15.4 ft (4.7 m)	1.0 ft (0.3 m)	16.4 ft (5.0 m)
4 miles (6.4 km)	17.7 ft (5.4 m)	2.0 ft (0.6 m)	19.7 ft (6.0 m)
5 miles (8 km)	20 ft (6.1 m)	3.0 ft (0.9 m)	23 ft (7.0 m)
7 miles (11.3 km)	23.6 ft (7.2 m)	6.2 ft (1.9 m)	30 ft (9.1 m)
9 miles (14.5 km)	27 ft (8.2 m)	10.2 ft (3.1 m)	37 ft (11.3 m)
12 miles (19.3 km)	30.8 ft (9.4 m)	18.0 ft (5.5 m)	49 ft (14.9 m)
15 miles (24.1 km)	34.4 ft (10.5 m)	28.0 ft (8.5 m)	62.7 ft (19.1 m)

To avoid any obstruction along the path, the height of the object must be added to the minimum clearance required for a clear radio line of sight. Consider the following simple example, illustrated in [Figure 4](#).

Figure 4 Antenna Height and Line of Sight

A wireless bridge or mesh link is deployed to connect building A to building B, which is located three miles (4.8 km) away. Mid-way between the two buildings is a small tree-covered hill. From the above table it can be seen that for a three-mile link, the object clearance required at the mid-point is 5.3 m (17.4 ft). The tree tops on the hill are at an elevation of 17 m (56 ft), so the antennas at each end of the link need to be at least 22.3 m (73 ft) high. Building A is six stories high, or 20 m (66 ft), so a 2.3 m (7.5 ft) mast or pole must be constructed on its roof to achieve the required antenna height. Building B is only three stories high, or 9 m (30 ft), but is located at an elevation that is 12 m (39 ft) higher than building A. To mount an antenna at the required height on building B, a mast or pole of 1.3 m (4.3 ft) is needed.

Never construct a radio mast, pole, or tower near overhead power lines.

Local regulations may limit or prevent construction of a high radio mast or tower. If your wireless bridge or mesh link requires a high radio mast or tower, consult a professional contractor for advice.

Antenna Position and Orientation

Once the required antenna height has been determined, other factors affecting the precise position of the wireless bridge or mesh link must be considered:

- Be sure there are no other radio antennas within 2 m (6 ft) of the wireless bridge or mesh link. These include other WiFi radio antennas.
- Place the wireless bridge or mesh link away from power and telephone lines.
- Avoid placing the wireless bridge or mesh link too close to any metallic reflective surfaces, such as roof-installed air-conditioning equipment, tinted windows, wire fences, or water pipes. Ensure that there is at least 5 feet clearance from such objects.
- The wireless bridge or mesh link antennas at both ends of the link must be positioned with the same polarization direction, either horizontal or vertical. Proper alignment helps to maximize throughput.

Radio Interference

The avoidance of radio interference is an important part of wireless link planning. Interference is caused by other radio transmissions using the same or an adjacent channel frequency. You should first scan your proposed site using a spectrum analyzer to determine if there are any strong radio signals using the 802.11a/b/g channel frequencies. Always use a channel frequency that is furthest away from another signal.

If radio interference is still a problem with your wireless bridge or mesh link, changing the antenna direction may improve the situation.

Weather Conditions

When planning wireless bridge or mesh links, you must take into account any extreme weather conditions that are known to affect your location. Consider these factors:

- Temperature: The wireless bridge or mesh link is tested for normal operation in temperatures from - . Operating in temperatures outside of this range may cause the unit to fail.
- Wind Velocity: The wireless bridge or mesh link can operate in winds up to . You must consider the known maximum wind velocity and direction at the site and be sure that any supporting structure, such as a pole, mast, or tower, is built to withstand this force.
- Lightning: Rain: The wireless bridge or mesh link is weatherproofed against rain. However, it is recommended to apply weatherproof sealing tape around the Ethernet port and antenna connectors for extra protection. If moisture enters a connector, it may cause a degradation in performance or even a complete failure of the link.
- Snow and Ice: Falling snow, like rain, has no significant effect on the radio signal. However, a buildup of snow or ice on antennas may cause the link to fail. In this case, the snow or ice has to be cleared from the antennas to restore operation of the link.

An Aruba Lightning Arrestor, AP-LAR-1, must be installed on each antenna port for protection against lightning induced surges. Failure to use an AP-LAR-1 can void the warranty of an Aruba outdoor AP model and renders the AP susceptible to failure from lightning induced surges

Ethernet Cabling

When a suitable antenna location has been determined, you must plan a cable route from the wireless bridge or mesh link outdoors to a suitable power and/or network source.

Consider these points:

- The Ethernet cable length should never be longer than 90 m (295 ft).
- Determine a building entry point for the cable (if applicable).
- Determine if conduits, bracing, or other structures are required for safety or protection of the cable.
- For lightning protection at the power injector end of the cable, consider using a lightning arrestor immediately before the cable enters the building

Grounding

It is important that the wireless bridge or mesh link, cables, and any supporting structures are properly grounded. Each AP-175 access point includes a grounding screw for attaching a ground wire. Be sure that grounding is available and that it meets local and national electrical codes. Ground the access point first using the external ground stud on the unit before making any other connection.

Installing the AP-175

The AP-175 can be installed on a wall or attached to a pole. The following section describes how to attach the necessary hardware to the AP and how to mount the AP in the selected location.

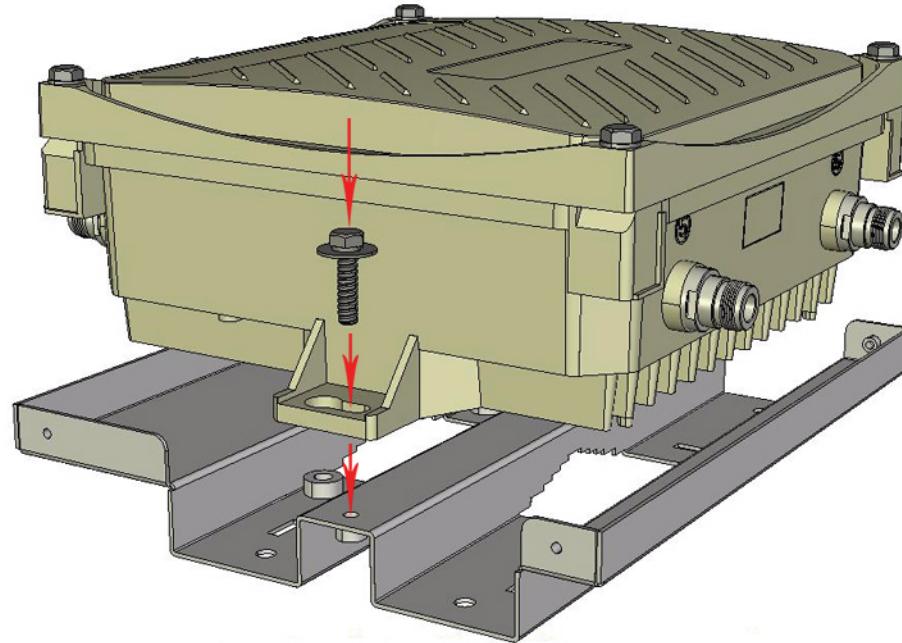

Selecting the Installation Site

- The site should be located within at least a 60% range of the 1st fresnel zone without obstacles to provide line of sight (LOS) transmission, increase coverage capacity, and minimize the number of necessary sites.
- If no LOS is secured, areas in non-line-of-sight (NLOS) areas could be covered as well, but the distance of coverage and area of coverage are decreased; more sites are needed to provide coverage for same area than in the LOS scenario.
- Interference must be considered in site selection. The new site should avoid known interference, unless the interference is controllable.
- Keep the AP-175 away from places that are susceptible to high temperature, dust, harmful gas, inflammable, explosive, electromagnetic interference (high power radar, radio station and transformer), unstable voltage, heavy vibration, or loud noise. In engineering design, the site should be selected according to the network planning and technical requirements of communications equipment, as well as the considerations such as climate, hydrology, geology, earthquake, electric power, and transportation.

Installing the AP-175 on a Pole

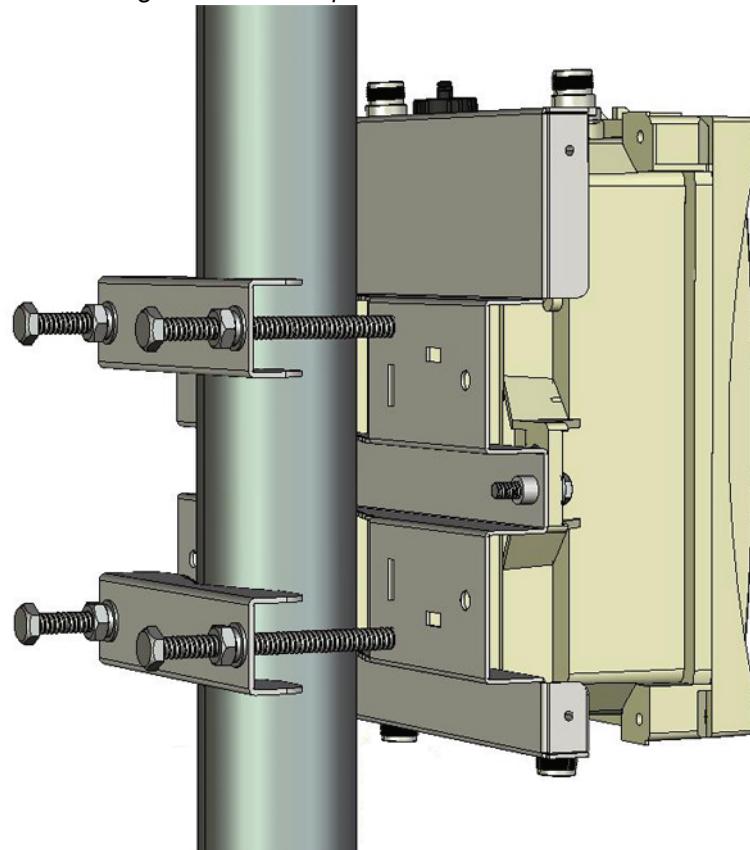

1. Attach the AP-175 on the mounting bracket using the two M6 x30 bolts (with flat and spring washers) on each side of the mounting bracket.

Figure 5 Attaching the mounting bracket to the AP

2. Attach the mounting bracket (with AP-175) on the pole using four M8 x110 bolts (with flat washers, spring washers and nuts) and the pair of pole anchors.

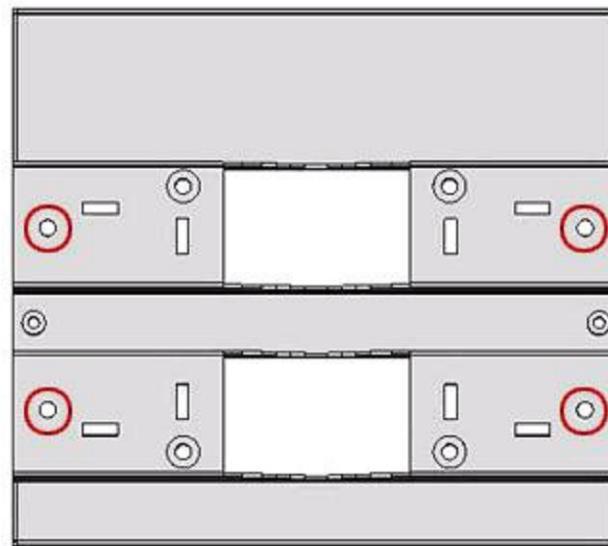

Figure 6 Attaching the mounting bracket to the pole

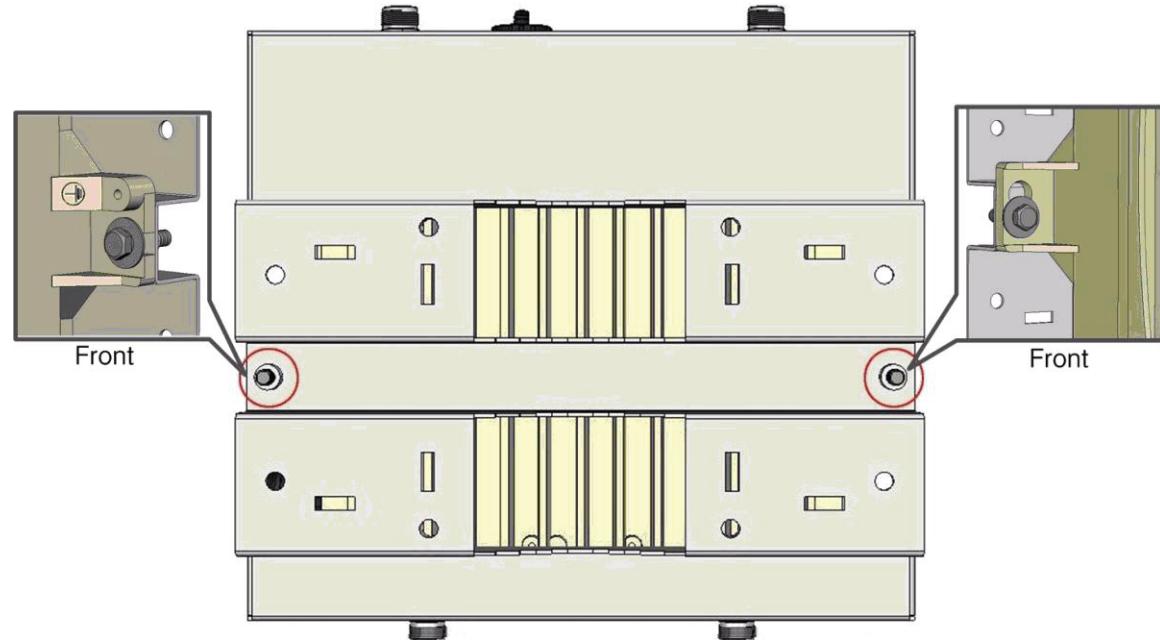

Installing the AP-175 on a Wall

1. Begin by marking the screw points on the wall in the location you have selected.
 - a. Put the mounting bracket on the installation position against the wall.
 - b. Mark four expansion screw holes on the wall.

Figure 7 Position of the screw holes

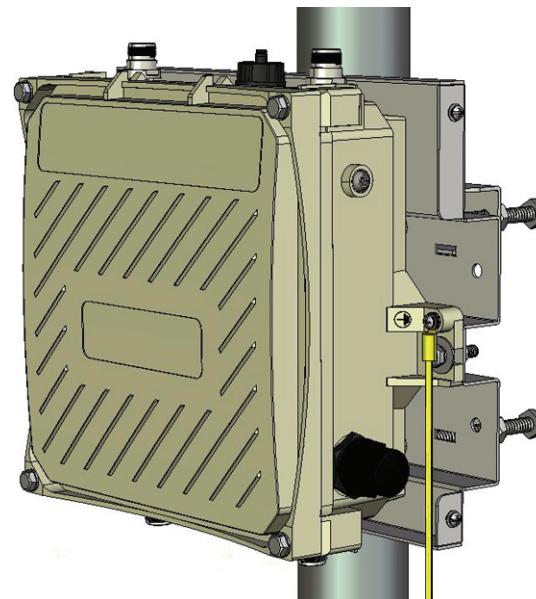

2. Use a drill to create four holes on the four markings you created in the previous step.
3. Install wall (masonry) anchors.
 - a. Insert a masonry anchor into each drilled hole.
 - b. Tap the flat end of the anchor with a rubber hammer until the anchor is flush with the wall surface.
4. Attach the mounting bracket to the wall.
 - a. Align the four holes in the mounting bracket with the anchors and insert four expansion screws through the installation holes into the anchors.
 - b. Adjust the position of the mounting bracket and tighten the expansion screws.
5. Attach the AP-175 to the mounting bracket by inserting the two M6 x30 bolts (with flat and spring washers) through the installation holes, and tighten the bolts.

Figure 8 Attaching the AP to the Mounting Bracket

Grounding the AP-175

The grounding must be completed before powering up the AP-175. The resistance of grounding wire should be less than 5 ohm and the grounding cable's cross-section area should be no less than 6 mm². The grounding hole is at the right side of the AP-175.

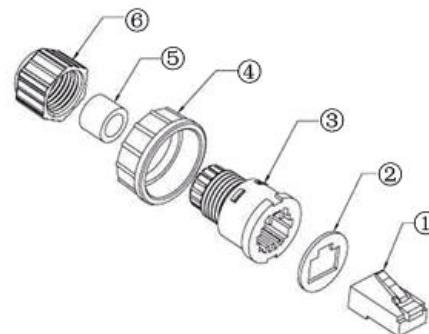

Figure 9 Grounding the AP-175

1. Peel the cover of one end of the grounding cable (green or yellow and green grounding cable with 6 mm² cross-section area) and place the bare grounding cable into the copper lug, and press firmly with the crimping pliers.
2. Fasten the copper lug to the grounding hole on the AP-175 with the M4 x12 bolt and external-tooth washer.

Connecting the Ethernet Cable

1. Remove the protective cap on the Ethernet interface.
2. Attach the waterproof Ethernet connector to the Ethernet cable.

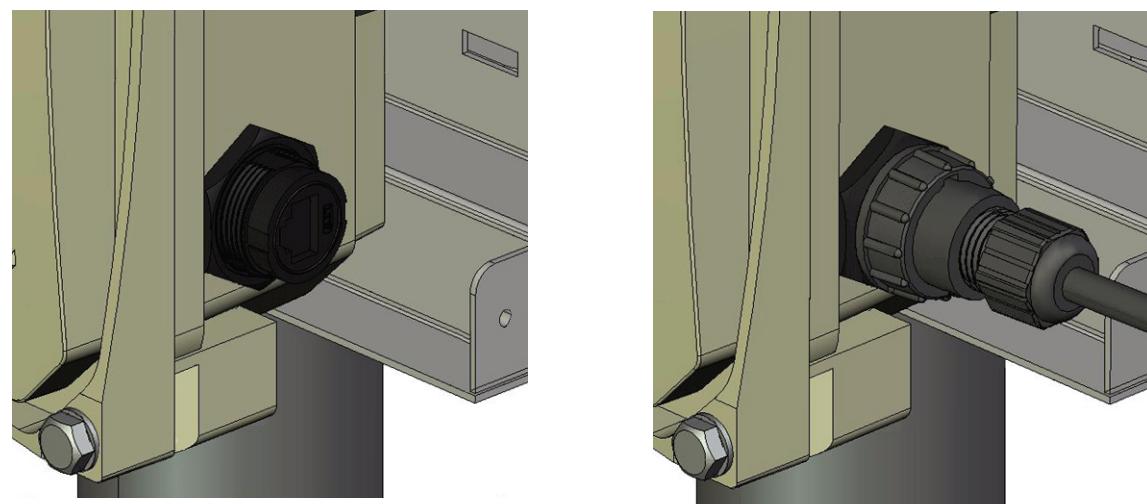

Figure 10 Waterproof Ethernet Connector Cover

- | | |
|----------------------------------|------------------|
| 1 Shielded RJ45 connector | 4 Locknut |
| 2 Gasket Mat | 5 Seal Ring |
| 3 Waterproof Connector Socket | 6 Sealing Nut |

3. Insert the ethernet cable connector into the Ethernet interface and hand-tighten the waterproof cover.
4. Water-proof the Ethernet cable connection with PVC insulation tape, adhesive tape, and a strap.

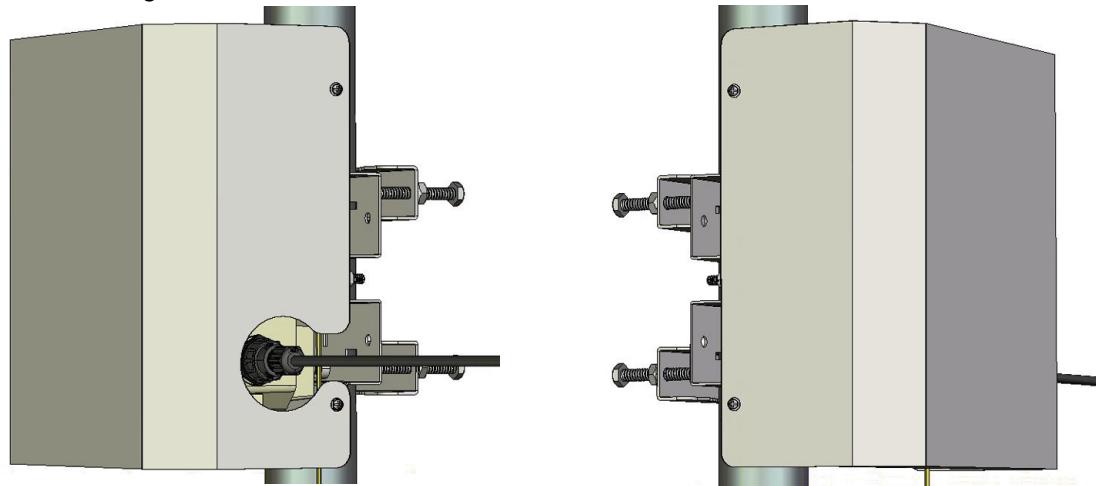

Figure 11 Connecting the Ethernet cable

Attaching the Solar Shield to the AP-175

Attach the solar shield to the AP-175 by using the four M4 x16 (with flat and spring washers).

Figure 12 Attaching the Solar Shield to the AP

Safety and Regulatory Compliance

Aruba Networks provides a multi-language document that contains country-specific restrictions and additional safety and regulatory information for all Aruba access points. This document can be viewed or downloaded from the following location: www.arubanetworks.com/safety_addendum

CAUTION

RF Radiation Exposure Statement: This equipment complies with FCC RF radiation exposure limits. This equipment should be installed and operated with a minimum distance of 13.78 inches (35 cm) between the radiator and your body for 2.4 GHz and 5 GHz operations. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter. When operated in the 5.15 to 5.25 GHz frequency range, this device is restricted to indoor use to reduce the potential for harmful interference with co-channel Mobile Satellite Systems.

Professional installation of antennas is required.

CAUTION

Aruba Access Points and the AP-LAR-1 lightning arrestor are required to be installed by a professional installer. The professional installer is responsible for ensuring that grounding is available and it meets applicable local and national electrical codes.

WARNING

Do not work on an AP and do not connect or disconnect cables during periods of lightning activity.

FCC Class B Device

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/ TV technician for help.

For a complete list of Country Specific Regulations please speak with your Aruba Representative.

Proper Disposal of Aruba Equipment

For the most current information about Global Environmental Compliance and Aruba products, see our website at www.arubanetworks.com.

Waste of Electrical and Electronic Equipment

Aruba products at end of life are subject to separate collection and treatment in the EU Member States, Norway, and Switzerland and therefore are marked with the symbol shown at the left (crossed-out wheelie bin). The treatment applied at end of life of these products in these countries shall comply with the applicable national laws of countries implementing Directive 2002/96EC on Waste of Electrical and Electronic Equipment (WEEE).

European Union RoHS

Aruba products also comply with the EU Restriction of Hazardous Substances Directive 2002/95/EC (RoHS). EU RoHS restricts the use of specific hazardous materials in the manufacture of electrical and electronic equipment. Specifically, restricted materials under the RoHS Directive are Lead (including Solder used in printed circuit assemblies), Cadmium, Mercury, Hexavalent Chromium, and Bromine. Some Aruba products are subject to the exemptions listed in RoHS Directive Annex 7 (Lead in solder used in printed circuit assemblies). Products and packaging will be marked with the "RoHS" label shown at the left indicating conformance to this Directive.

China RoHS

Aruba products also comply with China environmental declaration requirements and are labeled with the "EFUP 25" label shown at the left.

有毒有害物質聲明 Hazardous Materials Declaration						
部件名称 (Parts)	有毒有害物質或元素(Hazardous Substances)
