## ***IBIS-L system***

### **Image By Interferometric Survey - L**

---

## ***IBIS-L v.02.00 - User manual***

*Pisa, June 2010*

**KEY WORDS:** IBIS-L, RADAR, INTERFEROMETER, INSTALLATION, MAINTENANCE

**SUMMARY:** User and maintenance manual for the IBIS-L system. This document illustrates the installation procedure for the linear scanner and IBIS-L sensor and the acquisition start up procedure.

## DISCLAIMER

IDS WILL NOT BE HELD RESPONSIBLE FOR THE CONSEQUENCES OF AN IMPROPER USE OF THE EQUIPMENT AND/OR THE SOFTWARE.

THIS SOFTWARE MAY INCLUDE AUTOMATED DATA PROCESSING AND ANALYSIS TOOLS.

WHILE EVERY EFFORT IS MADE TO ENSURE THE ACCURACY OF THE INFORMATION PROVIDED BY THOSE TOOLS, THEY MUST NOT BE INTENDED AS A SUBSTITUTE FOR INTELLIGENT ANALYSIS; RATHER, THEY HAVE TO BE INTENDED AS AN ADVISOR AND THE USER MUST NOT COMPLETELY RELY ON THE RESULTS PROVIDED BY THEM TO GIVE THE COMPLETE ANSWER.

IDS INGEGNERIA DEI SISTEMI SPA ASSUMES NO LIABILITY FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES OR INJURIES CAUSED BY SUCH RELIANCE ON THE ACCURACY, RELIABILITY, OR TIMELESS OF THE INFORMATION PROVIDED BY THOSE TOOLS.

ANY PERSON OR ENTITY WHO RELIES ON INFORMATION OBTAINED FROM THE AUTOMATED DATA PROCESSING/ANALYSIS TOOLS ONLY, DOES SO AT HIS OR HER OWN RISK.

## SAFETY INFORMATION

### EC DECLARATION OF CONFORMITY

We,

IDS Ingegneria dei Sistemi SpA  
via Livornese, 1019, 56122 PISA (loc. S. Piero a Grado), ITALY

declare under our sole responsibility that the product

Short Range Device  
Model No(s): **IBIS-L X band**

To which this declaration relates is in conformity with the following standard(s) or other normative document(s)

Test	Standard
Radiated Emissions	ETSI EN 301 489-3 V.1.4.1 ETSI EN 301 489-01 V.1.6.1
Radiated Susceptibility	ETSI EN 301 489-3 V.1.4.1 ETSI EN 301 489-01 V.1.6.1
Electrostatic discharges (ESD)	ETSI EN 301 489-3 V.1.4.1 ETSI EN 301 489-01 V.1.6.1
Radio Requirements	ETSI EN 300.440-1 V.1.4.1 ETSI EN 300.440-2 V.1.2.1
Safety	CEI EN 60950-1:2004

Following the provisions of EC Council Directive(s) including the latest amendments and of the national legislation implementing these directives:

*1999/05/EEC R&TTE Directive*

Issued on: 2009, January the 30<sup>th</sup>

Signed by the manufacturer

Franco Bardelli:

Chief Executive Officer

### EC DECLARATION OF CONFORMITY

We,

Franco Bardelli:

Chief Executive Officer

Warning: this equipment is destined for use in industrial environments (Class A apparatus). In residential, commercial and light industry environments, this apparatus may generate radio interference: in this case, the user may be required to operate while taking appropriate countermeasures.

The apparatus is sensitive to the presence of external electromagnetic fields, which may reduce its performance.

### **IMPORTANT NOTE FOR THE US CUSTOMERS**

Model No.: **IBIS-KU**

FCC ID: **UFW-IBIS-KU**

This device complies with part 90 of the FCC Rules.

Caution: Any changes or modifications to this device not explicitly approved by manufacturer could void your authority to operate this equipment.

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum 20 cm between the radiator and your body. This transmitter must not be collocated or operating in conjunction with any other antenna or transmitter unless authorized to do so by the FCC.

Model No.: **IBIS-SU-STD , IBIS-SU-ADV**

FCC ID: **UFW-IBIS-SU-M**

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Caution: Any changes or modifications to this device not explicitly approved by manufacturer could void your authority to operate this equipment.

Model No.: **IBIS-LS**

FCC ID: **UFW-IBIS-LS**

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Caution: Any changes or modifications to this device not explicitly approved by manufacturer could void your authority to operate this equipment.

### IMPORTANT NOTE FOR THE CANADIAN CUSTOMERS

Model No.: **IBIS-KU**

IC ID: **8991A-IBISKU**

This device has been designed to operate with the antennas listed below, and having a maximum gain of 22 dB. Antennas not included in this list or having a gain greater than 22 dB are strictly prohibited for use with this device. The required antenna impedance is 50 ohms.

IBIS-ANT1-H38V18

IBIS-ANT2-H29V25

IBIS-ANT3-H17V15

IBIS-ANT4-H11V10

IBIS-ANT5-H12V39

IBIS-ANT6-H51V20

Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that permitted for successful communication.

## CLEANING INFORMATION

---

Before cleaning any external parts of the apparatus, make sure that all cables have been disconnected, including the power supply cable. If a damp cloth is used, make sure it is not too wet, to avoid any damage to the electrical components of the equipment. Wait until the equipment is totally dry before reconnecting the cables.

The IBIS-L should be cleaned periodically using a damp cloth.

Do not use solvents or abrasive detergents.

Do not apply liquid directly to the electrical contacts of the various connectors. If a specific spray is used to clean the PC TFT monitor, make sure it is not flammable; in any case, do not spray it directly on the screen, instead, spray it onto the cleaning cloth.

## BATTERIES REMOVAL INFORMATION

**NOTE:** Batteries must be recycled according to national regulations. Read carefully the warnings and information on the batteries.

### **Laptop Batteries:**

Manufacturer: PANASONIC

Type: Li-ion Ni

Characteristics: 10.65V 5.7Ah

Removal instructions:

1. turn off the laptop;
2. open the drawer marked with the battery symbol;
3. extract the battery pack by pulling the tab.

### **Radar batteries:**

Manufacturer:  
ENERSYS GENESIS  
EP

Type: rechargeable lead  
acid, non spillable  
batteries

Characteristics: 12V & 70Ah

Removal instructions:

1. open the front door of the power supply module;
2. disconnect the connectors (A);
3. open the retaining belt (B);
4. extract the batteries (C).

## RECICLYING

The crossed out wheeled bin symbol shown on the equipment indicates that the product must be recycled separately from other waste at the end of its useful life.

Separate waste disposal of this product at the end of its useful life will be organised and managed by IDS. When you decide to dispose of the equipment, contact IDS and follow the system that IDS has set up to permit the separate collection of the apparatus at its life end.

Adequate separate collection for its subsequent recycling, treatment and environmental friendly disposal contribute towards avoiding any unnecessary effects on the environment and to health and favour the reuse or recycling of the materials that make up the equipment. Unauthorised disposal of this product as unsorted waste by its possessor will lead to an administrative penalty foreseen by national regulations.

## **WARRANTY CERTIFICATE CONDITIONS**

- 1) IDS Ingegneria dei Sistemi S.p.A, hereinafter referred to as IDS, warrants hardware/software products for a period of 12 months from the delivery date to the original customer;
- 2) The delivery date is certified by the “Warranty Registration Form”;
- 3) IDS’s hardware products will be free from defects in materials workmanship under normal use and service;
- 4) IDS’s obligation is limited to repairing or replacing parts or equipment which are returned to IDS, without alteration or further damage, and which in IDS s judgment, were defective or became defective during normal use;
- 5) IDS’ software will have to be installed on a PC according to the requirement of the IDS hardware ( see IDS User’s Guide the Software Data Acquisition);
- 6) IDS’ s software products designed by IDS for use for IDS hardware products are warranted not to fail to execute their programming instructions due to defects during the warranty period, provided they are properly installed on IDS hardware products. IDS does not warrant if the IDS software will be used and operated in hardware and software combinations not selected by IDS;
- 7) IDS does not assumes any liability for any direct, indirect, special, incidental or consequential damages or injuries caused by proper or improper operation of its equipment whether defective or not defective;
- 8) This software may include automated data processing and analysis tools. While every effort is made to ensure the accuracy of the information provided by those tools, they must not be intended as a substitute for intelligent analysis; rather, they have to be intended as an advisor and the user must not completely rely on the results provided by them to give the complete answer. IDS assumes no liability for any direct, indirect special, incidental or consequential damages or injuries caused by such reliance on the accuracy, reliability, or timeliness of the information provided by those tools. Any person or entity who relies on information obtained from the automated data processing/analysis tools only, does so at his or her own risk;
- 9) IDS’s warranty does not extend and shall not apply to:
  - a) Products which have been repaired or altered by other than IDS personnel;
  - b) Products which have been subjected to misuse, neglect, accident or improper installation;
  - c) Products in which have been installed Hardware/Software accessories not supplied by IDS and/or without any approval by IDS;
  - d) Products which have been connected to equipment different from the ones supplied by IDS (except the PC data Logger which must conform to IDS specifications;
  - e) Products which have been damaged by natural disaster or calamities.
- 10) Before returning any equipment to IDS , you have to contact the IDS Customer Care Office that will authorize you to return the material to be repaired;
- 11) Once the parts/equipment to be repaired arrive to IDS, IDS may inspect the defective products to verify they are eligible for repair or replacement. All packing must be saved for inspection purpose in order to assist IDS to understand the cause of the defects. IDS, will not be obliged to repair, or replace for products returned as defective but damaged from abuse, misuse, negligence , accident loss or damage in transit;
- 12) The final clients, is responsible for ensuring the defective products returned to be properly packaged;
- 13) The above warranty are sole and exclusive, and no other warranty, whether written or oral, is expressed or implied.

## **1. INTRODUCTION**

This document describes the IBIS-L system (Image By Interferometric Survey -L), with particular reference to the concepts the user should learn before starting to use this device. Therefore we recommend to read the entire document before starting up the system.

If technical assistance is required, please use the contact numbers provided on page 3 of this manual.

### **1.1 Aim**

Reading this document will provide the operator with all the necessary knowledge to install and maintain the IBIS-L system. In particular, it provides a step by step procedure for installation of the system, information for the safe use of the system and instructions for general maintenance.

### **1.2 Field of application**

This document applies to the installation of the IBIS system in -L configuration and its use in the field for monitoring of quasi static phenomena.

### **1.3 Authorisation for use – national restriction**

#### *European countries*

IBIS-L system has been classified from the CEPT Administrations as SRD – Short Range Device - i.e. a device that doesn't cause interference to other systems operating in the same frequency band. IBIS-L has so been included (as Ground Based SAR) in the ERC/REC 70-03 that defines the SRD equipment.

#### *For Ku band system*

In the meanwhile that all the European countries update their national frequency allocation table applying the new recommendation, currently the use of IBIS-L system outside a laboratory can be still subject to authorisation by the Competent Ministry of the country where the system should be used. Please refer to the Competent Ministry of the country where the system should be used to know whether there is still the need of an authorisation or not.

#### *For X band system*

Almost all the European countries have applied the ERC/REC 70-03 for the X band system. Please refer to the Competent Ministry of the country where the system should be used to know if there are some limitations in the use of X band IBIS-L equipment or not.

## **1.4 CE Marking**

This equipment is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

**CE 0648** Ⓢ

The full Declaration of Conformity can be found either on the CD or a separate document included with this product.

This is a Class A product. In a domestic environment it may cause radio interference, in which case the user may be required to take adequate measures.

## **1.5 Acronyms and Definitions**

### **1.5.1 Acronyms**

<b>DEM</b>	Digital Elevation Model
<b>IBIS</b>	Image By Interferometric Survey
<b>SAR</b>	Synthetic Aperture Radar
<b>SF-CW</b>	Stepped Frequencies - Continuous Wave

### **1.5.2 Definitions**

Range Bin	area of resolution in distance used in the IBIS-S system.
Pixel	area of resolution used in the IBIS-L system.
Radial displacement	displacement of the range bin or the pixel along the direction joining the Range bin or pixel to the IBIS system i.e. along the LOS – Line of Sight.

## **2. OVERVIEW**

This manual describes the operations that the user must perform to set up and use the IBIS-L system.

### **2.1 How to use this manual**

This manual consists of the following chapters:

- Chapter 1 - Introduction
- Chapter 2 - Overview
- Chapter 3 - IBIS-L system hardware configuration
- Chapter 4 - IBIS-L system installation procedure
- Chapter 5 - First start up
- Chapter 6 - Useful Tips
- Chapter 7 - Maintenance
- Appendix A - Technical specifications
- Appendix B - Elements of radar technology

### **2.2 General description**

The IBIS-L system is designed to remotely measure slow displacements with an accuracy as great as a tenth of a millimetre. The IBIS-L system is particularly suitable for terrain and structural monitoring applications, with the aim of detecting quasi-static displacements over long time periods.

The performance of the IBIS-L system depends on the type of configuration used and on the operative measurement conditions (above all related to the reflectivity of the area under investigation); however, the best performance characteristics can be defined as follows:

For Ku band system:

- Maximum operational distance: 4000m;
- Image resolution in distance: 0.75m;
- Angular resolution: 4.3mrad;
- Accuracy in measuring displacements in the viewing direction: 0.1 mm (for points with a good reflectivity - SNR>50dB – and depending on the impact of atmospheric variation on the measure).

For X band system:

- Maximum operational distance: 4000m;
- Image resolution in distance: 1.5m;
- Angular resolution: 7.1mrad.
- Accuracy in measuring displacements in the viewing direction: 0.1 mm (for points with a good reflectivity - SNR>50dB – and depending on the impact of atmospheric variation on the measure).

The time required for instrument installation is about 2h.

The instrument has been specifically conceived for outdoor use and is equipped with an installation system designed to guarantee high precision when repositioning it at a later date. This is important to enable measurements to be performed over time without needing to leave the instrument on-site.

The IBIS-L system offers the following advantages over currently available monitoring systems (GPS, extensometers):

- Permits the operator to perform remote monitoring of the area (remote sensing), without the need to access the area to install sensors or optical targets;
- Supplies a continuous displacement map of the entire area. The IBIS-L system simultaneously measures all the displacements of the entire area illuminated by the antenna beam, which can cover as much as hundreds of thousands of square meters;
- Directly measure the displacements of the territory of interest in near real time;
- It can be used both day and night and in almost all weather conditions;
- It doesn't require the continuous presence of an operator and can be controlled by wireless connection.

This possibility of also performing long distance monitoring, with no need to install sensors means that investigations can be performed even when:

- the area of interest is not accessible;
- the area of interest is particularly large and therefore would require many in situ sensors;

In addition, when the monitoring activity is required to assure people's safety in emergency situations, the possibility of performing remote monitoring may be essential for protecting lives.

Fig. 2.1 shows the composition of IBIS-L system. The main components are:

- Sensor module: this generates, transmits and receives the electromagnetic signal. The sensor module is installed on the linear scanner: movement of the sensor on the linear scanner permits the use of the SAR technique to obtain a two dimensional image of the scenario. This module has a USB interface for connection with the control PC and an interface to the positioning module;
- Linear Scanner, consisting of a 2.5 metre long aluminium track, along which a slide is moved under the control of a step by step motor;
- The control PC, installed with the system management software. This is used to configure the acquisition parameters, manage measurements and view the results in real time;
- Power supply: this supplies power to the system through a battery unit or connection to an external energy supply.

A detailed description of each component is reported in paragraph 3.

**Fig. 2.1 – Instrument installed at the Chies d’Alpago to monitor the Tessina valley landslide (BL)**

## 2.3 Pack contents

**IBIS-L box:** wooden container with transportation handles, (size 2750x600x580 (width [cm] x length [cm] x height [cm]) and total weight when fully packed 107 kg). This box contains materials listed in Tab. 2.1.

**Fig. 2.2 – IBIS-L box**

	<p>Linear scanner</p>
	<p>Elevation pointing system</p>
	<p>Positioning template complete with 3 threaded bars with knobs and a spacer</p>
	<p>3 DEM elements</p>

**Tab. 2.1 – Contents of the IBIS-L box**

**IBIS-L case:** black trolley case with wheels size 55x80x30 cm and total weight when packed of 40 kg. This case contains the following list of materials:

**Fig. 2.3 – IBIS-L case**

	<p>Optical telescope</p>
	<p>A pair of antennas, each with 4 fixing screws.</p>
	<p>1 Panasonic CF19 PC (the original PC packaging complete with guarantees and software licenses is provided separately)</p>
	<p>1 mains power supply cable for the PC</p>
	<p>1 USB cable to connect the IBIS-L sensor to the power supply module (3m)</p>

	<p>1 power supply cable to connect the power supply module to the IBIS-L sensor (3m)</p>
	<p>1 IBIS-L Manual; 1 IBIS-L Controller Manual</p>
	<p>6 spherical thrust bearings (each bearing consisting of two parts) 6 disc springs</p>
	<p>3 long M16 threaded studs each with two nuts and 2 washers</p>
	<p>2 short threaded M16 studs each with 2 nuts and 2 washers</p>
	<p>3 base washers with M16 hole</p>
	<p>Positioning fork complete with:</p> <ul style="list-style-type: none"><li>• M8Anti-veering screw (right);</li><li>• M8 nut and M8 washer for anti-veering screws;</li></ul>

	<ul style="list-style-type: none"><li>• M10 Support screw (left);</li><li>• M10 nut and M10 washer for support screw</li></ul>
	Plate with spherical lodging

**Tab. 2.2 – Contents of the IBIS-L case**

**Cardboard Box** with dimensions 80x60x100 cm and total weight of 89kg containing the power supply module and its mains power supply cables (Fig. 2.4).

**Fig. 2.4 – Power supply module**

### **3. IBIS-L SYSTEM HARDWARE CONFIGURATION**

This section of the manual provides a detailed description of the components making up IBIS-L system:

- Par. 3.1 IBIS sensor;
- Par. 3.2 IBIS antennas;
- Par. 3.3 IBIS linear scanner;
- Par. 3.4 Installation kit;
- Par. 3.5 IBIS-PS power supply module;
- Par. 3.6 Control and acquisition PC;
- Par. 3.7 Set of IBIS-C KIT connection cables.

#### **3.1 IBIS sensor**

The radar sensor is the unit containing all the parts for the generation, transmission, reception and acquisition of the radar signal. The sensor is shown in Fig. 3.1 and can be seen as a yellow box with dimensions 375x270x115 mm.

**Fig. 3.1 – IBIS sensor**

The IBIS sensor has the following interfaces (see Fig. 3.2 and Fig. 3.3):

- **1 USB B type connector** at the back of the sensor;
- **A 12 pole connector** for power supply;
- **2 flanges** for installation of the antennas on the front of the box.
- **1 dovetail guide** on the top of the box to hold the optical telescope (see par. 4.2).
- **1 threaded screw hole** on the bottom of the sensor, required to fix the sensor to the tripod (for use in IBIS-S configuration).
- **4 clasps** on the bottom of the sensor.

**Fig. 3.2 – Back (a) and front (b) view of the sensor**

**Fig. 3.3 – Bottom view of sensor**

## 3.2 Antennas

### 3.2.1 Ku band system antennas

The Ku band IBIS-L system is provided with two identical IBIS-H20 antennas operating in vertical polarisation and characterised by a maximum gain of 20dBi. The amplitude characteristics of the antenna main lobe at -3 dB and -10 dB are provided in Tab. 3.1 and its vertical and horizontal patterns are shown in Fig. 3.4 and Fig. 3.5. For further details see appendix B.1 .

IBIS-H20	HORIZONTAL PLANE	VERTICAL PLANE
-3 dB	17°	15°
-10 dB	34°	45°

**Tab. 3.1 – Width of the main lobes of the IBIS-H20 antennas at -3 dB and -10 dB**

**Fig. 3.4 – IBIS-H20 vertical plane pattern**

**Fig. 3.5 – IBIS-H20 horizontal plane pattern**

The sensor is fitted with two flanges, each with four filleted holes for the installation of the pair of antennas (see par. 4.2).

**Fig. 3.6 – IBIS-H20 antenna**

If desired as an optional or a substitution, the IBIS-H20 antennas can be replaced by a pair of three other antennas whose characteristics are reported below:

IBIS-H23 antennas (Type 1) having the following characteristics:

- Maximum gain of 23.5 dBi;
- Horizontal antenna beam width at -3dB: 11deg.
- Vertical antenna beam width at -3dB: 10deg.

IBIS-H15 antennas (Type 3) having the following characteristics:

- Maximum gain of 15 dBi;
- Horizontal antenna beam width at -3dB: 29deg.
- Vertical antenna beam width at -3dB: 25deg.

IBIS-H13 antennas (Type 4) having the following characteristics:

- Maximum gain of 13.5 dBi;
- Horizontal antenna beam width at -3dB: 38deg.

- Vertical antenna beam width at -3dB: 18deg.

Figure from Fig. 3.7 to Fig. 3.12 show the vertical and horizontal patterns of antenna Type 1, 3 and 4 and Tab. 3.2 summarizes the information for the all four antenna types.

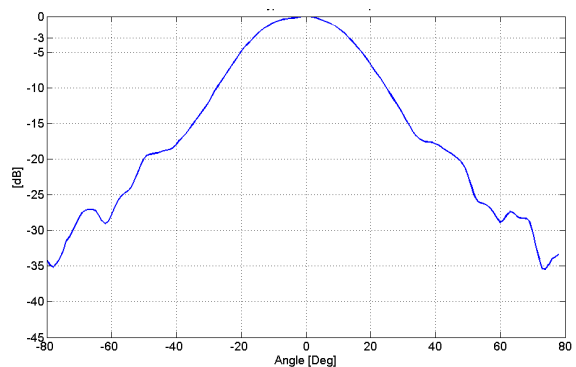

**Fig. 3.7 – IBIS-H23 vertical plane pattern**

**Fig. 3.8 – IBIS-H15 horizontal plane pattern**

**Fig. 3.9 – IBIS-H15 vertical plane pattern**

**Fig. 3.10 – IBIS-H15 horizontal plane pattern**

**Fig. 3.11 – IBIS-H13 vertical plane pattern**

**Fig. 3.12 – IBIS-H13 horizontal plane pattern**

Antenna Type	Gain	Elevation	Azimuth
	[dBi]	[deg]	[deg]
<b>1 - IBIS-H23</b>			
-3 dB azimuth beamwidth	23,5	10	11
-10 dB azimuth beamwidth		30	23
<b>2 - IBISH20</b>			
-3 dB azimuth beamwidth	20	15	17
-10 dB azimuth beamwidth		45	34
<b>3 - IBIS-H15</b>			
-3 dB azimuth beamwidth	15	25	29
-10 dB azimuth beamwidth		49	53
<b>4 - IBISH13</b>			
-3 dB azimuth beamwidth	13,5	18	38
-10 dB azimuth beamwidth		30	70

**Tab. 3.2 – Ku band Antennas characteristics**

### 3.2.2 X band system antennas

The X band IBIS-L system is provided with two identical antennas operating in vertical polarisation and characterised by a maximum gain of 21dBi. The amplitude characteristics of the antenna main lobe at -3 dB and -10 dB are provided in Tab. 3.3 and its vertical and horizontal patterns are shown in Fig. 3.13 and Fig. 3.14. For further details see appendix B.1 .

X band antenna	HORIZONTAL PLANE	VERTICAL PLANE
-3 dB	15°	15°
-10 dB	27°	25°

**Tab. 3.3 – Width of the main lobes of the X band antennas at -3 dB and -10 dB**

**Fig. 3.13 –X band antenna vertical plane pattern**

**Fig. 3.14 – X band antenna horizontal plane pattern**

The sensor is fitted with two flanges, each with four filleted holes for the installation of the pair of antennas (see par. 4.2).

### 3.3 Linear Scanner

The linear scanner (Fig. 3.15) consists of:

- A 2.5 m long track covered with aluminium sheeting;
- A trolley moved along the track by a step by step motor with a maximum displacement of 2 m;
- An elevation pointing system to be installed on the trolley.

The elevation pointing system is the support for the IBIS sensor and permits the main beam of the antenna to be orientated in elevation towards the area to be observed.

**Fig. 3.15 – Installed linear scanner**

Two mobile connectors link the sliding trolley to the sensor, while the panel at the back of the linear scanner has the following interfaces:

- A five pin power supply connector;
- A B type USB connector;

to be connected to the power supply unit using the two cables which are part of the IBIS-C KIT.

**Fig. 3.16 – Back of linear scanner**

Next to these connectors on the panel, there are three green LEDs which, when lighted, indicate that the power supply is connected to the trolley positioning sensors, the step by step motor and the IBIS sensor.

The linear scanner is used to move the sensor in along the track orthogonally to the irradiating direction (antenna axis). The trolley is moved in steps for a total effective length of 2 m. There is a waiting period between two successive steps equal to the functioning time of the IBIS sensor.

For long-term monitoring the instrument must be positioned on a stable solid horizontal base with minimum dimensions of 2000mm x 800mm x 200mm (length, width and thickness), i.e. a concrete base. These measurements have been established to guarantee the necessary robustness and permit the inclination of the linear scanner as required.

The system for fixing the linear scanner to the ground has been designed to allow it to be accurately repositioned quickly and easily. In case of slow movements this means the instrument can be used at intervals, over a period of several months, without having to leave it positioned outdoors for the entire period. It is important to underline that the expected movement between two discontinuous acquisitions has to be smaller than  $\lambda/4$ , that is 4.3mm for Ku band system and 7.14mm for X band system, to not encounter in displacement measurement ambiguity.

The basic fixture system consists of:

- Three support points (Fig. 3.17) positioned on three studs that fix the plane the module will slide over.
- A reference sphere positioned under the track and inserted into a specific housing, and which, when joined to the plane, forms an axis of rotation passing through the centre of the sphere and normal to the plane.
- A positioning fork providing a buffer to block rotation with respect to the rotation axis centred on the sphere.
- A screw opposite the buffer to block the module at the buffer point.

**Fig. 3.17 – Frontal view of the system for fixing the linear scanner with details of (a) the positioning fork, (b) housing of the sphere with the sphere inserted and (c) the two support studs**

### 3.4 Installation kit

The installation kit consists of a template for positioning and drilling holes in the base (Fig. 3.18) together with a spacer and elements for anchoring the linear scanner as shown in Fig. 3.19.

**Fig. 3.18 – View of the drilling and positioning template with spacer**

6 spherical thrust bearings consisting of two parts and 6 disc springs

3 long M16 nuts, 6 bolts and 6 washers

2 short M16 nuts, 4 bolts and 4 washers

3 base M16 washers

1 positioning fork;

1 spherical housing

**Fig. 3.19 – Elements for anchoring the linear scanner**

The entire system has been studied to be able to accurately reposition the equipment even after a long period of time has elapsed. For this reason, once installed, the anchoring

elements must remain installed at the measurement site since they are the basis of the positioning reference.

For this reason, when the instrument is dismantled, we recommend you to protect the anchoring elements with a wooden casing fixed to the base structure with plugs and screws to avoid them being accidentally damaged or exposed to extreme weather conditions.

A complete description of the installation procedure is given in par. 4.1

### **3.5 Power supply module**

The power supply module supplies electric power to the system, in detail its function is to:

- Receive power from the mains electricity or from a generator set;
- Charge the pair of batteries required to guarantee continuous power supply even in the case of a blackout;
- Distribute power and signal to the linear scanner and IBIS-L sensor.

It is a box with dimensions 560x600x840 mm, with two handles, two wheels for ease of movement and three doors fitted with locks. Fig. 3.20 provides two views of the power supply module.

**Fig. 3.20 – Front (left) and back (right) view of the power supply module. Note the handles, two wheels and three lockable doors**

When the power supply unit is delivered, the handles are folded downwards to reduce bulk and risk of damage during transportation. To reposition the handles proceed as follows for both handles (following the procedure shown in sequence in Fig. 3.22):

1. completely unscrew the top screw on the handle blocking mechanism and loosen the lower screw;
2. rotate the handle anticlockwise until it is positioned upright;
3. reinsert and screw in the previously removed screw
4. tighten both screws.

When transporting the module, the handles should always be folded down following the procedure below:

1. loosen the lower screw of the handle blocking mechanism
2. completely unscrew the top screw on the handle blocking;
3. rotate the handle clockwise (towards the front of the module) until it touches the wheels;
4. reinsert and screw in the previously removed screw;
5. tighten both screws.

**Fig. 3.21 - Sequence for unfolding the power supply unit handles**

Opening the top door of the power supply module accesses the housing and work space for the control and data acquisition PC and the power supply electric switchboard (see Fig. 3.22). The PC workspace is fitted with:

- A Velcro strap to block the PC;
- A power supply cable for the PC
- A USB cable to connect the PC to the linear scanner and then to the IBIS sensor.

The cable connecting the power supply module to the mains electricity is located underneath this top door

**Fig. 3.22 –The notebook PC table**

The electric distribution area contains all the system power switches (Fig. 3.22 ). From left to right we can see:

1. the input fuse from the photovoltaic network;
2. the sensor power supply switch with spy light that illuminates when the sensor is powered;
3. the linear scanner power supply switch with corresponding spy light;
4. the PC power supply switch;
5. the external power supply source switch (24 V DC) with corresponding spy light;
6. the battery warning light which illuminates when the battery power is low;
7. the battery charge indicator that:
  - a. shows the charge level of the battery by flashing one of the LEDs when the battery is being charged or all the switches are off;
  - b. shows the charge level of the battery by keeping one of the LEDs lit when the battery is powering one of the instruments but is not being charged;
8. the battery fuse;
9. the switch that controls the power supply input with corresponding spy light and fuse.

**Fig. 3.23 - The power supply module switchboard**

The door on the front of the power supply unit provides access to the battery area containing a pair of 12 V/70 Ah batteries. The back door gives access to the connector area, which contains the following connections from left to right:

- the mains AC input (220V or 110V depending on customer request);
- the photovoltaic input, needing an input greater than 24V for battery recharger with a maximum current of 10A;
- the external auxiliary output at 24V;
- the 5 pole output to the linear scanner;
- the A type USB connection output;
- a screw to link the external box (chassis) of the power supply module to the ground.

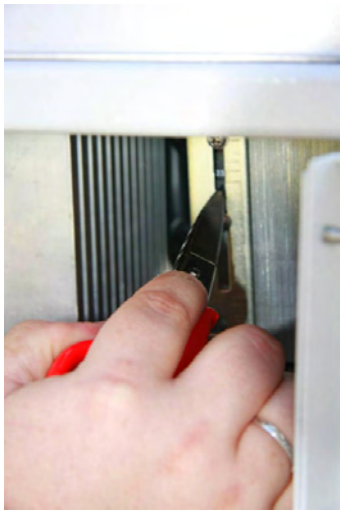

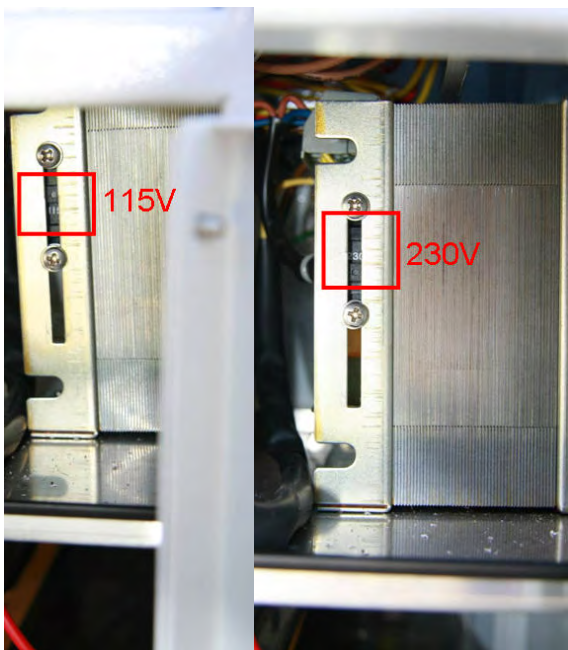

**Fig. 3.24 - (a) battery housing area, (b) power supply module connector area with the ground screw highlighted**

The input voltage must be regulated to correspond to the voltage available on site. This is done by setting the control on the transformer found behind the front panel as shown in the following pictures.

	<b>WARNING: ADJUST THE TRANSFORMER VOLTAGE SETTING IT TO THE VOLTAGE AVAILABLE ON SITE <i>BEFORE</i> CONNECTING THE APPARATUS TO THE MAINS SUPPLY</b>
--	---

	<ol style="list-style-type: none"><li>1. Make sure you disconnect the power supply module from the mains supply before starting the following procedure.</li><li>2. Open the front panel. The transformer is located in the top right corner.</li></ol>
--	---

	<p>3. Use an insulated tool to move the switch and select the correct input voltage value.</p>
	<p>4. Verify that the label on the transformer indicates the desired voltage. Voltage can be set to 230 V or 115 V.</p>

**Tab. 3.4 – Procedure for setting the voltage.**

### **3.6 Control and acquisition PC**

The IBIS-L system uses a notebook PC, model PANASONIC CF-19 (Fig. 3.25 ) to control the sensor. The PC is supplied with windows XP and the **IBIS-L Controller v. 02.00.002** control and data acquisition software pre-installed.

**Fig. 3.25 – Panasonic CF-19 PC**

The supplied PC has the following characteristics:

- **Intel U2400 core duo** processor;
- 100 Mb/s Ethernet card;
- **RAM 512 MB** memory ;
- max monitor resolution 1024x768 pixels;
- max number of colours 16.777.216 colours;
- **Windows XP Professional** operative system;
- HDD 80 GB, shock-proof (mounted on gel support or equivalent);
- Protection from atmospheric agents (conforms to IP54).
- No communication software such as Firewall, WiFi or antivirus must be installed to avoid any conflict with the IBIS Controller v. 1.0 software;

**NOTE:** IDS takes no responsibility for malfunctioning if there is a functional conflict between its software and any software installed on the notebook PC by the user. IDS does not guarantee that the performance of its equipment will be maintained using a configuration different to that recommended.

The PC is supplied with a mains adapter (220V)

### **3.7 Connection cable kit**

The IBISL-C KIT contains three cables:

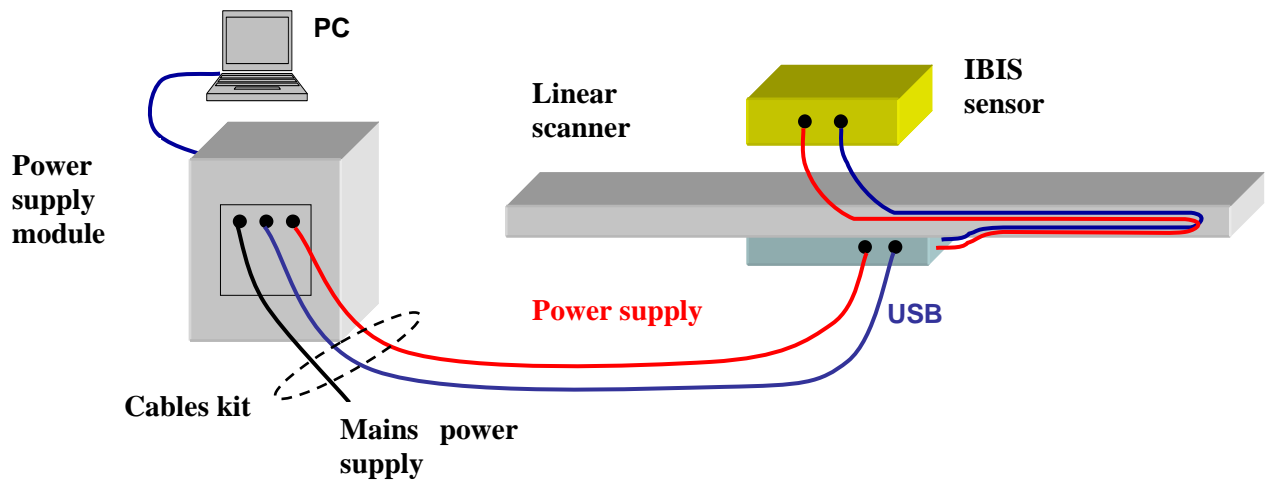

- A 3 m long USB cable to connect the power supply module with the linear scanner;
- A 3 m long power supply and signal cable to connect the power supply module to the linear scanner;
- A mains power supply cable

and two plugs:

- one plug for the output towards an external auxiliary;
- one plug for input from a photovoltaic panel;

It is left to the user to choose the appropriate length of cable and type of plug for the other end of the cable suitable for the specific operational requirements.

**Fig. 3.26 – Schematic diagram of connections**

## **4. IBIS-L SYSTEM INSTALLATION PROCEDURE**

Installation of the IBIS-L system requires about 2 hours work to install plus the time required to build the base and the setting time for the two component resin used to fix the studs (about 30 minutes at 25°C). The procedure can be broken down into two parts:

1. Installation of the linear scanner;
2. Installation of the IBIS-L sensor and connection of the modules.

After these two procedures have been described, the procedure for dismantling the equipment from the measurement site is given in Par. 4.3.

### **4.1 Installation of the linear scanner**

The procedure starts with an initial inspection of the site, during which the location for the installation must be established, and finishes with the installation of the linear scanner.

Note that when re-positioning the module on a pre-existing installation site, only the small group of operations indicated in par 4.1.3 are required, which relate to the setting up of the linear scanner.

#### **4.1.1 Material required**

The following material is required to install the linear scanner:

1. **a solid and stable base** in concrete or other non-conductive material that is sufficiently wide, flat and horizontal; minimum dimensions: 2000mm x 800mm x 200mm (length, width, thickness) (see Par.6.1);
2. **IBIS-L box** containing the linear scanner;
3. **IBIS-L trolley case** complete with anchoring elements;
4. spirit level (not supplied);
5. carpentry tools (not supplied) including:
  - a. hammer drill;
  - b. set of three masonry drill bits  $\varnothing$  8,  $\varnothing$  14 e  $\varnothing$  18 mm and two metal bits  $\varnothing$  20 and  $\varnothing$  22 (see par. 6.1);
  - c. two 24mm spanners;
  - d. spray, pencil or marker pen to mark the holes;
  - e. compressed air cylinder to clean debris from the holes made in the base;
  - f. water repellent silicon grease;
  - g. water repellent silicon oil;
  - h. two component resin with dispensing spout and cartridge gun.

**NOTE:** IDS supplies the kit for the first installation. If multiple installations are to be made, a kit must be acquired for each successive installation.

1. lay the case on a flat surface, open the six clasps and remove the cover;

**Fig. 4.1 - Opened IBIS-L box**

2. remove the template from the case, lifting it by the two black handles;
3. unscrew the three wing nuts that fix the track and remove the washers (Fig. 4.2);
4. remove the track using the handles at each end;

**Fig. 4.2 – wing nuts fixing the linear scanner**

5. the pointing system is now visible inside the box, the DEM spacers and the template spacer (Fig. 4.3 );

**Fig. 4.3 – (a) pointing system, (b) DEM spacers (c) template spacer**

6. unscrew the two screws fixing the elevation pointing system and remove the washers. The entire sequence from point 6 to 8 is shown in Fig. 4.3
7. remove the wooden insert the wing nut were fixed to, lifting it and rotating it slightly towards the outside of the case
8. remove the elevation pointing system, first rotating it, lifting just the part facing it, then sliding it horizontally;
9. unscrew the wing nuts fixing the template spacer and remove the template;

If the DEM spacers are necessary, continue as follows

10. unscrew the two wing nuts that fix the spacers and extract the two screws;
11. now extract the DEM spacers.

**Fig. 4.4 – Sequence for removing the elevation pointing system**

In order to avoid losing the fixing wing nuts and washers, reinsert the washers and screw back the wing nuts onto the filleted studs.

To reassemble the box, perform the following steps

1. unscrew all the wing nuts and remove all the washers;
2. insert the DEM spacers onto their studs, making sure the black knobs are pointing towards the centre of the case as shown in Fig. 4.3 (b);
3. insert the two washers onto the studs and screw on the wing nuts;
4. insert spacer onto its two studs;
5. fix it by inserting the two washers and screwing the two wing nuts;

6. block the elevation positioning system at the 5<sup>th</sup> holes counting from the antenna side in such a way that 5 holes protrude from the back of the pointing system (where the black knobs are located) (see Fig. 4.3 (a) and Fig. 4.4);
7. orientate the black knobs towards the centre of the box (see Fig. 4.3 (a));
8. tilt the pointing system, lifting the part facing the centre of the box;
9. keeping it tilted, insert the part facing the outside of the box under the protruding part of the case, being careful to centre it well and completely insert it;
10. rotate the pointing system until it is positioned on the bottom of the case;
11. position the wooden insert on its studs, keeping it slightly tilted towards the outside of the case;
12. insert the two washes and wing nuts onto the insert studs and tighten them;
13. insert the linear scanner into the case on its three studs (ensure that the linear scanner trolley is positioned on the middle of the back panel of the linear scanner);
14. insert the three washers and wing nuts and tighten;
15. completely screw in the three template studs;
16. insert the template in the three holes provided;
17. close the box with its lid;
18. secure the box with the six clasps.

To remove the parts from the IBIS-L case, proceed as follows:

1. sit the case on the ground, open the 7 clasps and lift of the cover;

**Fig. 4.5 – IBIS-L case**

2. after removing the protective layer , you can see:
  - a. 1 anchoring element;
  - b. 1 optical telescope;
  - c. 1 USB cable and one power supply cable for the sensor;
  - d. 2 locks;

If the system has been purchased in both S and L configuration, the anchoring elements are provided in a separate box.

**Fig. 4.6 – IBIS-L case - internal view**

3. remove the Panasonic PC, the optical telescope , the USB cable and power supply cable for the sensor;
4. at this point the following parts are visible :
  - a. 1 pair of H20 antennas (or optional H15 antennas);
  - b. 1 mains electricity power transformer for the PC;
  - c. 1 IBIS-L sensor.

**Fig. 4.7 – IBIS-L case - internal view**

**Fig. 4.8 – View of the template placed on the base**

#### 4.1.2 Preparing the anchor points for the linear scanner

This section describes the sequence of operations to be performed to set up the linear scanner anchoring elements

1. position the three template height regulating screws as low as possible (see Fig. 4.8 );
2. mount the optical view finder on the template;
3. place the template on the base;

**NOTE:** The instrument observation direction is perpendicular to the template axis; the correct observation direction is when standing looking at the template, you have two regulation screws to your left and a single screw to your right (see Fig.4.2).

4. use the optical telescope to point at the scenario to be monitored, orientating the template on the base surface. When choosing the area to be monitored, take the width of the antenna beam into consideration (see par. 3.2);
5. use the spirit level to make sure the template is perfectly horizontal by turning the handles of the three threaded screws, making sure you do not raise the template too far from the surface of the base;
6. mark the position of the 5 large holes ( $\varnothing 16$  mm) present on the template onto the base;
7. remove the template and drill 18 mm holes for the studs to a depth of about 11 cm, carefully clean the holes with compressed air. Be careful to keep the drill vertical to avoid the need to widen the holes later;
8. mount the spacer, screwing it to the two smallest holes present on the central plate of the template (Fig. 4.9);
9. mount the three long studs, inserting them into the three holes at the ends of the template with the nut and lock nut and insert the washers (Fig. 4.9), controlling that the stud protrudes from the upper nut by about at approximately 4cm;

**Fig. 4.9 – Mounting the studs on the template, detail of the central plate with the spacer and its two studs**

10. mount the two shorter studs on the spacer with the nut, lock nut and M16 washer (Fig. 4.9) so they protrude from below the template the same distance as the other three studs (all 5 studs must touch the ground at the same time);
11. minimising the protrudance of the three regulating screws, replace the template with these studs onto the base, inserting the studs into the previously drilled holes and ensuring that all the studs enter easily into the holes without any obstacles;
12. move the studs fixed to the template in and out of the holes on the base several times to ensure that they enter well to the correct depth (widen the diameter of the holes if necessary);
13. use the template regulating screws to fix the height position of the studs so that they penetrate about 7-8 cm inside the respective holes;
14. place the template in the exact position and level it using the three regulating screws;
15. remove the template from the base, keeping all the studs and screws attached to it;

**Fig. 4.10 – Resin injection operation**

16. inject enough resin into each hole to block the studs (Fig. 4.10 );

**NOTE:** the resin is malleable for about 5 minutes before setting at summer temperatures, so the time between the moment of the first injection to the insertion of the studs into the resin filled holes must be less than this to avoid the need to drill new holes.

17. insert the studs, still attached to the template, into the holes making sure that the position coincides with that previously measured;
18. wait for the resin to dry completely (for the time required, read the instructions on the tube), then remove the 5 nuts and the M16 washers that keep the studs fixed to the template and lift off the template (the base should now be left with the five studs with 5 nuts and 5 M16 washers).

#### 4.1.3 Mounting the linear scanner

The following sequence of operations describes the installation of the linear scanner onto the anchoring elements:

1. mount the two base washers on the two closely positioned studs (Fig. 4.11);

**Fig. 4.11 – Mounting the base washers**

2. fix the positioning fork on the other stud on the opposite side of the base, positioning it with the axis of the two screws perpendicular to the direction of the axis of the template;
3. screw the third base washer above the positioning fork (Fig. 4.12);

**Fig. 4.12 – The correctly installed positioning fork**

4. mount the concave part (black color) of the three spherical thrust bearings onto the three washers and lubricate them with the water-repellent silicon oil;
5. mount the convex part (white colour) of the three spherical thrust bearings (Fig. 4.13);

**Fig. 4.13 – Sequence for mounting the spherical thrust bearings**

6. insert the plate with the spherical housing onto the two short central studs, sitting it on the washers and the two nuts already screwed onto the stud;

**Fig. 4.14 – Mounting the fixing plate to the spherical housing**

7. grease the spherical housing with silicon waterproof grease;
8. place the track on the three spherical thrust bearings, making sure that the sphere is properly positioned in its housing;
9. level and position the track by regulating the base washers and the spherical housing plate;
10. regulate the height of the spherical housing plate so that the sphere is positioned in its housing a little further than its maximum circumference (Fig. 4.15) but without touching the bottom;
11. check the spherical housing is level, it is easier to perform this operation after removing the linear scanner;
12. tighten the spherical housing plate tighten the nuts against the base washers, making sure that the three washers do not rotate thus losing the position obtained previously , and that the fork is in the correct position, perpendicular to the axis of the track.

(WARNING: IN ORDER TO CONSERVE THE REFERENCE POSITION, THE POSITION OF THE BASE WASHERS AND THE SPHERICAL HOUSING FIXED AT THIS POINT MUST NOT BE MODIFIED FROM NOW ON)

**Fig. 4.15 – Contact between the spherical housing and the sphere. Left shows the correct position, centre shows the sphere position too high, right shows the sphere touching the bottom of the housing**

**NOTE:** be especially careful when mounting the positioning sphere, which is fundamental when repositioning the instrument. The spherical housing is countersunk to make the insertion of the sphere easier, so the maximum circumference of the sphere should pass this countersinking without touching the bottom of the spherical housing, to ensure the reference is high precision. Regulate the height of the spherical housing plate until this is achieved.

13. reposition the linear scanner on the three studs;
14. block the positioning fork M10 buffer screw with the lock nut and M10 washer, taking care that the stud remains in the centre of the flange hole to permit the track to elongate/contract due to thermal excursions. Use a marker pen (or a little resin or wax) to mark the position of the nut with respect to the positioning fork so as to have a reference for repositioning the linear scanner, since the nut cannot be moved after it has been fixed;

15. hand tighten the M8 anti veering screw and lock it with an M8 washer and lock nut so that it keeps the linear scanner flange fixed, without there being any play between the two screws, but keeping it free to slide for any elongation/contraction due to thermal excursions undergone while the instrument is positioned at the measurement site;
16. place the three remaining spherical thrust bearings, convex side uppermost, onto the three external studs (the ones that have the track supports inserted), lubricate them with the water repellent silicon grease and position the concave parts of each one on top of them (Fig. 4.16);
17. now insert two disc springs and an M16 washer on each of these studs (Fig. 4.16);
18. screw on the M16 fixing nuts to these three studs and hand tighten them, being careful not to tighten them too much (the disc springs must remain a little open) (Fig. 4.16).

**Fig. 4.16 – Steps 16 to 18**

The suspension function provided by the spherical thrust bearings maintains the support horizontal and compensates for any deviation of the position of the studs from the axis with respect to the horizontal plane of the track, while the springs keep the track fixed to the supports while permitting it to undergo normal expansion.

When the linear scanner is reinstalled onto an existing installation site, the operations to be performed are those described in points 4, 5, 8 and then from points 15 to 18 of this paragraph. The module to be repositioned must simply be placed on the spherical thrust bearings and then fixed with the M16 nuts and the M8 screw, without touching the position of the base washers.

## **4.2 Installation of the IBIS sensor and module connection**

After having installed linear scanner, the IBIS sensor can be installed on the trolley. To do this, the following operations must be performed in sequence:

1. loosen the two knobs on the trolley dovetail guides sufficiently to permit the insertion of the elevation pointing system (the sequence of points 1 to 3 is shown in Fig. 4.17);
2. keeping the pointing system tilted downwards, align the two front pairs of dovetail guides then rotate the elevation pointing system resting it on the trolley (loosen further the knobs if it does not completely rest on the trolley);
3. tighten the two knobs;

**Fig. 4.17 - positioning the elevation pointing system onto the linear scanner**

If the DEM spacers are required, these should be inserted between the trolley and the elevation pointing system as indicated in Fig. 4.18 (b), following the same sequence described for the elevation positioning system (points 1-3).

**Fig. 4.18 – Correctly installed elevation pointing system (a) without and (b) with the DEM spacers**

4. use the same procedure to position the IBIS sensor onto the elevation pointing system, making sure that the connection flanges are positioned on the side labelled “antenna side” on the linear scanner and the pointing system;
5. mount the optical view finder onto its guide located on the lid of sensor and lock it on with its screws (the label on the optical telescope should point in the viewing direction);
6. mount the two IBIS antennas onto the IBIS sensor, using the supplied screw (4 for each antenna);
7. unscrew the elevation pointing system fixing nuts and rotate the sensor until it is pointing in the desired direction using the optical telescope;
8. tighten the fixing nuts again in the hole nearest to the desired position;
9. remove the optical telescope from the sensor;
10. remove the protective caps from the IBIS-L sensor and linear scanner connectors;

**Fig. 4.19 - Left and centre: detail of the IBIS sensor connector. Right: two protective caps for the connectors**

11. connect the power supply cable and the USB cable that are fixed to the trolley of the linear scanner to the appropriate connectors on the IBIS sensor, being careful to insert them fully and completely tighten the external ring to ensure the connections are waterproof;
12. locate the power supply module close to the linear scanner and connect the linear scanner to the power supply;
13. connect the power supply module to the linear scanner with the USB cable and the power supply cable from the IBIS-L C KIT, making sure that the external ring on each connector is fully tightened (Fig. 4.20);
14. position the PC in the upper section of the power supply module, fixing it with the Velcro harness system;
15. connect the PC power supply cable provided in the power supply module to the appropriate socket in the PC.

In Fig. 4.21 the fully installed IBIS-L system is shown.

**NOTE:** for safety of the operators, remember to connect the equipment to the ground using the reference screw available in the rear side of the power supply module.

**Fig. 4.20 – Connections between IBIS sensor - linear scanner –power supply module -PC**

**Fig. 4.21 – Fully installed IBIS-L system**

### ***4.3 Dismantling the measurement site***

The following procedure should be followed to remove the instrument from the measurement site:

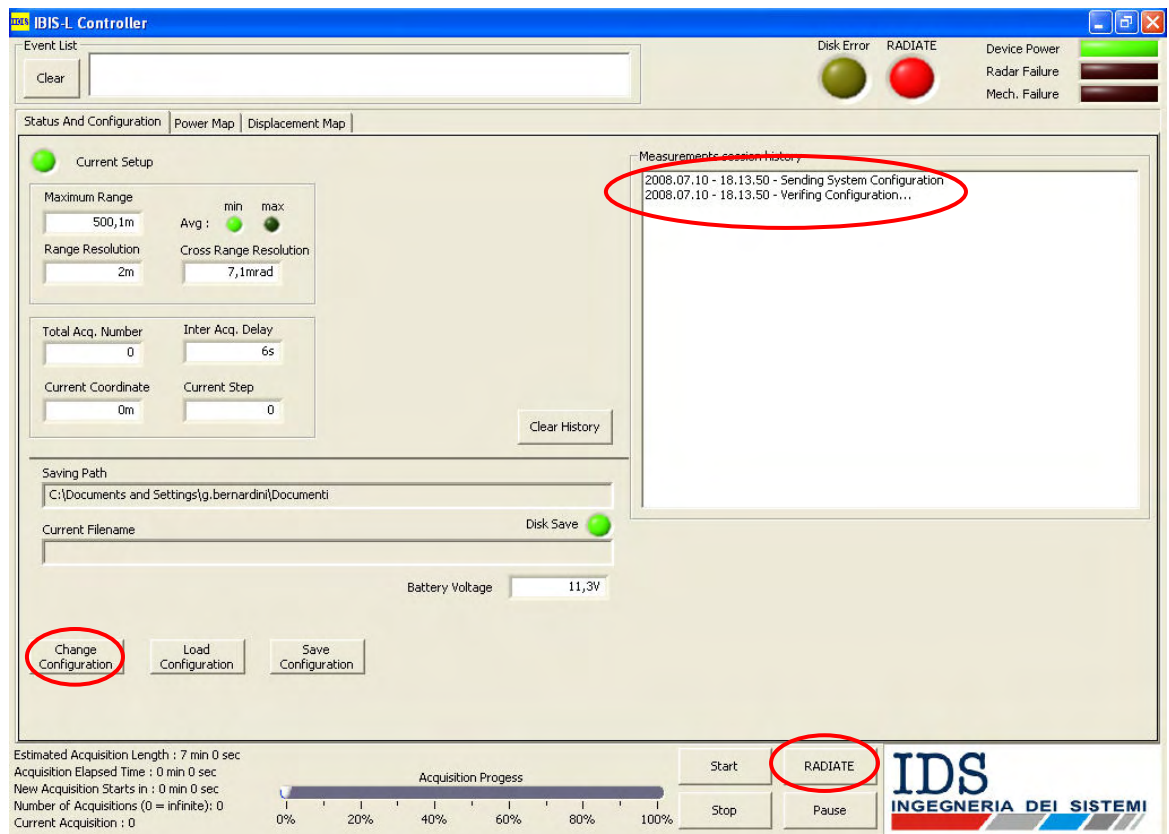

1. disconnect the cables connecting the IBIS sensor to the linear scanner, unscrewing the rings and pulling them out from the sensor connectors;
2. disconnect the cables connecting the linear scanner to the power supply module, unscrewing them then pulling them out;
3. screw the protective caps onto the two IBIS connectors and the two flexible linear scanner connectors;
4. unscrew the knobs on the dovetail guides;
5. remove the IBIS sensor and place it in the case;
6. remove the trolley, loosening the four knobs that block the dovetail guides that fix it to the linear scanner and position it in its space in the IBIS-L box;
7. tighten the knobs back onto the dovetail guides to endure they are not lost or damaged during transportation;
8. unscrew the three M16 nuts mounted on the studs at the two ends of the module;
9. remove the washers, disc springs and spherical thrust bearings from the three studs;
10. unscrew the M8 lock nuts and the nuts to free the linear scanner;
11. replace all the DEM spacers back into the IBIS-L box as described in par. 4.1.1;
12. lift the linear scanner and place it in the IBIS-L box;
13. close the case after checking all parts have been packed and wing nuts tightened;
14. replace all cables, the optical telescope and the antennas in the IBIS-L trolley case.

## 5. FIRST START UP

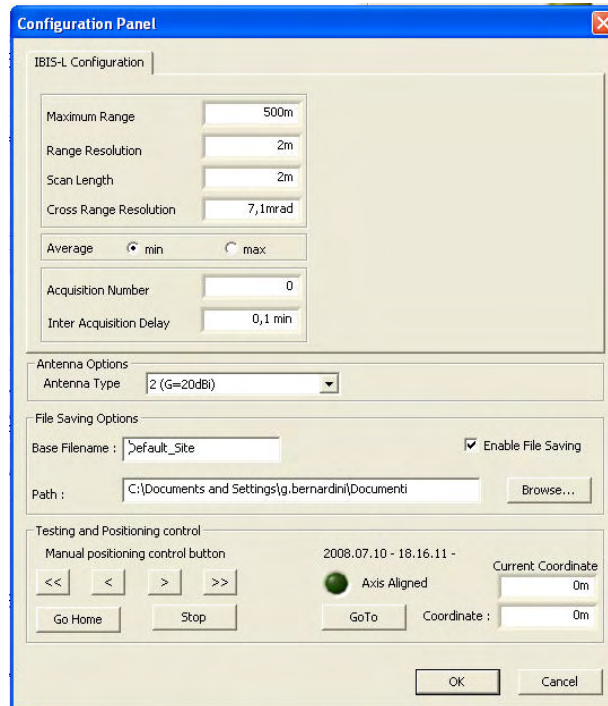

Once the instrument has been installed according to instructions, it is ready for use. The following list describes the operations requires to start up and use IBIS-L:

1. if necessary, connect the power supply module to an external power supply using the cable supplied in the upper area of the power supply module and switch on the switch that controls input from mains (*external AC input*). This mode avoids using the charged batteries.
2. start up the control ad acquisition PC;
3. switch on the three switches on the power supply module that control :
  - a. the sensor (*sensor power supply*);
  - b. linear scanner (*linear scanner power supply*);
  - c. pc power supply (*Lap Top PC*);
4. connect the USB connector in the upper area of the power supply module to the PC (it is always best to connect it after having switched on all the equipment to avoid any possible recognition problems of the USB device by the operative system);
5. start the IBIS-L Controller v. 02.00.002 program clicking on the desktop icon;

**Fig. 5.1 - Opening window of the control and acquisition software**

6. once started, the program performs a rapid check up of the peripherals and is ready for use (the *measurement session history* panel displays the “**verifying configuration**” message);
7. to check the correct functioning of the apparatus, click the *Change Configuration* button and from the *Configuration Panel* that opens. Try to move the sensor along the track using the buttons located in the bottom left of the window (<<, <, >, >> and STOP). Then press the *go home* command, which returns the sensor to the centre of the linear scanner;

**Fig. 5.2 – The configuration panel**

8. once the sensor Homing operation is completes, press OK;
9. check that the system has accepted the configuration (the “**Configuration Changed**” message appears in the *Measurement’s Session History* panel).

At this point, the instrument can be used following the instructions provided in the IBIS-L Controller software manual.

## 6. USEFUL TIPS

### 6.1 Installation

The successful outcome of a measurement campaign starts from the initial inspection survey: the first main aim of the inspection survey is to establish the exact position of the base that the linear scanner will be installed onto.

The characteristics of a good position are to:

- be in the direction of the displacement to be measured;
- have sufficient space to operate safely and to have room for the linear scanner, the power supply module and the operators;
- be easily accessible for the transportation of material (remember that the packing case weighs 107 kg and is bulky to move);
- have an external power supply. If this is impossible, a power generator must be supplied;

**NOTE:**  the IBIS-L system does not include an electrical energy generating system. In fact the power supply unit can only store energy in its batteries and is not fitted with a 220 V output, (for a percussion drill for example). The choice of power supply system is left to the user, who will have to consider the energy absorbed by the instruments to be used.

During the inspection survey, it is also useful to perform a GPS measurement of the position the instrument will have, and of the area to be monitored, obtain maps, including 3D maps or DEM of the area and ensure that all necessary permits have been obtained for the construction of the base and monitoring the area of interest. It is always recommended to inform the competent authorities.

It is recommended to check sufficiently in advance that the contents of the case have been properly loaded to avoid any damage during transportation, ensure that the power supply module batteries have been fully charged (see par 3.5) and arrange a suitable means of transport capable of containing all the necessary material. A list of this material is given in paragraph 4.1.

Remember that subsequent installations after the first one require a new set of anchoring elements for the linear scanner.

Installation requires the work of at least two or three people and at least one must be capable of using a percussion drill.

The recommended size for the base is 2000mm x 800mm x 200mm; in reality, this is the minimum size that provides sufficient space to correctly orientate the linear scanner and to provide a sufficiently robust concrete base. For ease of installation and use, the base should have a height of about 600 - 700 mm.

The orientation of the linear scanner should be chosen considering the scenario to be measured and the width of the antenna beam, to make sure that the entire scenario falls inside the instrument's field of vision.

## **6.2 Use**

When you want to download data directly from the PC onto an external USB HD, the control program has to be paused (we recommend you pause the system when the trolley is positioned in the centre of the track, waiting to perform a new acquisition), then download the data and restart the acquisition. If you have to disconnect the USB connector from the apparatus, the program will signal a missing device error and you will have to shut down and restart the software.

When the apparatus is functioning, ensure that nobody can pass or stand in front of the IBIS sensor to avoid ruining the acquisition. Also make sure that there is no vegetation high enough to block the electromagnetic waves.

## **6.3 Dismantling**

When dismantling the measurement site, carefully check exactly what is to be removed and accurately place the pieces to be stored in the packing cases.

In addition, make sure the elements that remain on the site for a subsequent measurement campaign are sufficiently protected. For this reason, we recommend you cover the elements with a wooden box, to be fixed to the base using plugs and screws, and that you lubricate the spherical housing well with water repellent silicon grease.

## **7. MAINTENANCE**

Maintenance of the module can be divided into three sections:

- Maintenance of the module base;
- Maintenance of the movement system;
- General maintenance of the module.

### **7.1 Maintenance of the module base**

While the apparatus is functioning, the spherical thrust bearings must be kept clean and lubricated with water repellent silicon grease. Depending on the environmental conditions (dust, water, material deposited by the wind, etc.) these parts must be dismantled, cleaned and lubricated every two months. Each time the module has to be installed, the spherical housing and the sphere must be cleaned and lubricated with water-repellent silicon grease.

### **7.2 Maintenance of the movement system**

The motor, the speed reducer and all moving parts apart from the trolley wheels do not require maintenance since they have been designed to have life long lubrication. Even though the trolley wheels and the tracks are protected by a cover, they may become dirty due to material deposited by atmospheric agents. For this reason, they should be cleaned and lubricated with water-repellent silicon oil at least once every two months and any time deposits are found (due to unforeseeable events, which may occur after many months or even after a few weeks, therefore we recommend you control the state of the instrument as often as possible).

### **7.3 General maintenance of the module**

General maintenance of the module is foreseen after every two years of operation. We recommend this should be performed by specialised personnel at the constructor's site

Time between maintenance check ups	Maintenance action
2 months	Clean and lubricate the spherical thrust bearings; Clean and lubricate the trolley wheels and track.
2 years	General maintenance performed by specialised personnel authorised by IDS.

**Tab. 7.1 – Summary table of ordinary maintenance actions**

## **Appendix A - TECHNICAL SPECIFICATIONS**

### **A.1 Linear scanner**

<b>Power supply</b>	24 Vdc
<b>Power Consumption</b>	average: 20 W peak: 40 W
<b>Dimensions</b>	width 2550 mm length 400 mm height 520 mm
<b>Weight</b>	54 kg

### **A.2 IBIS sensor**

<b>Ku band system</b>	
Frequency band	17.1 – 17.3 GHz
Maximum EIRP power	26dBm
<b>X band system</b>	
Frequency band	10.5 – 10.6 GHz
Maximum EIRP power	27dBm
<b>Power supply</b>	9-36 Vdc
<b>Power Consumption</b>	average: 27 W
<b>Dimensions</b>	width 375 mm length 270 mm height 115 mm
<b>Weight</b>	10 kg

### **A.3 Power supply module**

<b>Battery charger input</b>	195 - 264 Vac, 50 Hz, 200W or 98-132 Vac, 50Hz, 200W
<b>Photovoltaic input</b>	24 Vdc, 10 A
<b>External auxiliary output</b>	24 Vdc, 10 A
<b>IBIS sensor output</b>	24 Vdc, 2 A
<b>Linear scanner output</b>	24 Vdc, 1 A
<b>Batteries</b>	- number: 2 - single battery: 12 Vdc, 70 Ah

	- autonomy: 24 hours (with continuous functioning)
<b>Dimensions</b>	width 560 mm length 600 mm height 840 mm
<b>Weight</b>	89 kg

#### ***A.4 Panasonic CF-19 Notebook PC***

<b>Power supply</b>	16 Vdc or 220Vac
<b>Power Consumption</b>	average: 11 W (when the battery is charged)
<b>Dimensions</b>	width 270 mm length 220 mm height 55 mm
<b>Weight</b>	2.2 kg

## **Appendix B - ELEMENTS OF RADAR TECHNOLOGY**

### **B.1 Antenna beam**

The term *antenna main lobe (or beam)* is intended as the angular area within which the antenna concentrates most of the power it is supplied with.

The main lobe of an antenna can be schematically represented as a truncated cone with an elliptic base, where the cone vertex is positioned in correspondence with the antenna. The base of the cone is elliptical since antennas typically have lobes with different angular amplitudes in the elevation (V) and azimuth (H) planes.

**Fig. B. 1 – Schematic diagram of the antenna beam**

The following parameters are normally defined to quantify the antenna beam amplitude:

- The beam at -3dB: angular area within which antenna gain is more than 50% of the maximum gain ( $-3 \text{ dB} = 10 \cdot \log_{10}(0,5)$ ).
- The beam at -10 by: angular area within which gain is more than 10% of the maximum gain ( $-10 \text{ dB} = 10 \cdot \log_{10}(0,1)$ ).

From an applicative point of view, this means that the sensor must be pointed so that the scenario of interest falls inside the antenna beam, preferably at -3dB. Therefore the distance at which the instrument should be positioned and its inclination should be chosen as a function of the antenna beam being used.

**Fig. B. 2 – Area of the scenario covered by the antenna beam main lobe.**
