IMPORTANT INFORMATION/UPDATING INSTRUCTIONS

To be able to continue using the existing loose-leaf repair instructions, simply print the following pages and insert them in the existing repair instructions:

**14-20, 26, 28-36, 37, 41, 42, 50, 51, 67, 72-77, 83, 121-126, 127, 134-136,
137, 151-153**

Remove page (s)	Replace by page (s)	Insert page (s)	after page
2-1 to 2-4	2-1C to 2-6C		
3-4	3-4C		
4-1 to 4-9	4-1C to 4-8C		
5-1	5-1C		
5-4	5-4C / 5-5C		
5-13 to 5-14	5-13C to 5-14C		
7-1	7-1C	7-5C to 7-10C	
9-1	9-1C	9-37C to 9-42C	
10-1	10-1C	10-6C to 10-8C	
11-1	11-1C	11-14C to 11-16C	

KTM REPAIR MANUAL IN LOOSE-LEAF FORM

STORING THE REPAIR MANUAL IN THE BINDER

- Put the index into the binder.
- Put the front page of the repair manual (210x297 mm) into the transparent pocket provided for this purpose on the outside of the binder.
- Put the spine label (170x45 mm) into the transparent pocket provided for this purpose on the spine of the binder.
- Put the summary list of contents (150x297 mm) into the transparent pocket provided for this purpose on the inside of the binder or insert this page on the beginning of the manual.
- Then insert the individual chapters of the manual between the sheets of the index according to the page number printed in the right bottom corner of each page.
 Example: page no. 3-5 3 = chapter 3 5 = page 5
 All pages with a page number that begins with the digit 3, for example, must be put under the index heading „Chapter 3“.
- Index sheets that have not been marked with a certain chapter are for your personal convenience. The respective headings can be entered in the list of contents.

Modification / Updating:
Technical Specification,
Periodic Maintenance Schedule, Wiring Diagrams

INTRODUCTION

This repair manual offers extensive repair-instructions and is an up-to-date version that describes the latest models of the series. However, the right to modifications in the interest of technical improvement is reserved without updating the current issue of this manual.

A description of general working modes common in work shops has not been included. Safety rules common in the work shop have also not been listed. We take it for granted that the repairs are made by qualified professionally trained mechanics.

Read through the repair manual before beginning with the repair work.

⚠ WARNING ⚠

**STRICT COMPLIANCE WITH THESE INSTRUCTIONS IS
ESSENTIAL TO AVOID DANGER TO LIFE AND LIMB.**

! CAUTION !

**NON-COMPLIANCE WITH THESE INSTRUCTIONS CAN LEAD TO
DAMAGE OF MOTORCYCLE COMPONENTS OR RENDER
MOTORCYCLES UNFIT FOR TRAFFIC !**

„NOTE“ POINTS OUT USEFUL TIPS.

Use only **ORIGINAL KTM SPARE PARTS** when replacing parts.

The KTM high performance engine is only able to meet user expectations if the maintenance work is performed regularly and professionally.

REG.NO. 12 100 6061

KTM Austria's certificate of achievement for its quality system ISO 9001 is the beginning of an ongoing total reengineered quality plan for a brighter tomorrow.

KTM Sportmotorcycle AG
5230 Mattighofen, Austria

REPLY FAX FOR REPAIR MANUALS

We have made every effort to make our repair manuals as accurate as possible but it is always possible for a mistake or two to creep in.

To keep improving the quality of our repair manuals, we request mechanics and shop foremen to assist us as follows:

If you find any errors or inaccuracies in one of our repair manual – whether these are technical errors, incorrect or unclear repair procedures, tool problems, missing technical data or torques, inaccurate or incorrect translations or wording, etc. – please enter the error(s) in the table below and fax the completed form to us at 0043/7742/6000/5349.

NOTE to table:

- Enter the complete item no. for the repair manual in column 1 (e.g.: **3.210.66-E**).
You will find the number on the cover page or in the left margin on each right page of the manual.
- Enter the corresponding page number in the repair manual (e.g.: **5-7c**) in column 2.
- Enter the current text (inaccurate or incomplete) in column 3 by quoting or describing the respective passage of the text. If your text deviates from the text contained in the repair manual, please write your text in German or English if possible.
- Enter the correct text in column 4.

Your corrections will be reviewed and incorporated in the next issue of our repair manual.

Item no. of repair manual	Page	Current text	Correct text

Additional suggestions, requests or comments on our Repair Manuals (in German or English):

INDEX

OPERATING RANGES OF THE CARBURETOR2-2
CARBURETOR ADJUSTMENT2-3
CHECKING OF THE SETTING OF THE TVC SYSTEM2-4
BLEEDING OF THE HYDRAULIC CLUTCH2-4
SPECIAL TOOLS - ENGINE2-5
CLEANING2-6
STORAGE2-6

OPERATING RANGES OF THE CARBURETOR

mixture too lean:
not enough fuel in proportion to air

mixture too rich:
too much fuel in proportion to air

Idling range A

Operation with closed throttle valve. This range is influenced by the position of the air control screw ❶ and the idle adjusting screw ❷. Only make adjustments when the engine is hot.

To this end, slightly increase the idling speed of the engine by means of the idle adjusting screw. Turning it clockwise produces a higher idling speed and turning the screw counterclockwise produces a lower idling speed. Create a round and stable engine speed using the air control screw (basic position of the air control screw = open by 1.5 turns). Then adjust to the normal idling speed by means of the idle adjusting screw.

Opening up B

Engine behavior when the throttle opens. The idle jet and the shape of the throttle valve influences this range. If, despite good idling-speed and part-throttle setting, the engine sputters and smokes when the throttle is fully opened and develops its full power not smoothly but suddenly at high engine speeds, the mixture to the carburetor will be too rich, the fuel level too high or the float needle is leaking.

Part-throttle range C

Operation with partly open throttle valve. This range is only influenced by the jet needle (shape and position). The optimum part-throttle setting is controlled by the idling setting in the lower range and by the main jet in the upper range. If the engine runs on a four-stroke cycle or with reduced power when it is accelerated with the throttle partly open, the jet needle must be lowered by one notch. If then the engine pings, especially when accelerating under full power at maximum engine revs, the jet needle should be raised.

If these faults should occur at the lower end of the part throttle range at a four-stroke running, make the idling range leaner; if the engine pings, adjust the idling range richer.

Full throttle range D

Operation with the throttle fully open (flat out). This range is influenced by the main jet and the jet needle. If the porcelain of the new spark plug is found to have a very bright or white coating or if the engine rings, after a short distance of riding flat out, a larger main jet is required. If the porcelain is dark brown or black with soot the main jet must be replaced by a smaller one.

Carburetor adjustment

Basic information on the original carburetor setting

The original carburetor setting was adapted for an altitude of approx. 500 meters (1600 ft.) above sea level, and the ambient temperature of approx. 20° C (68° F), mainly for off-road use and central European premium-grade fuel (ROZ 95 MOZ). Mixing ratio 2-stroke motor oil : super fuel 1:40 – 1:60.

Basic information on a change of the carburetor setting

Always start out from the original carburetor setting. Essential requirements are a clean air filter system, air-tight exhaust system and an intact carburetor. Experience has shown that adjusting the main jet, the idling jet and the jet needle is sufficient and that changes of other parts of the carburetor will not greatly affect engine performance.

RULE OF THUMB:

high altitude or high temperatures → choose leaner carburetor adjustment
 low altitude or low temperatures → choose richer carburetor adjustment

WARNING

- ONLY USE PREMIUM-GRADE GASOLINE ROZ 95 MIXED WITH HIGH-GRADE TWO-STROKE ENGINE OIL. OTHER TYPES OF GASOLINE CAN CAUSE ENGINE FAILURE, AND USE OF SAME WILL VOID YOUR WARRANTY.
- ONLY USE HIGH-GRADE 2-STROKE ENGINE OIL OF KNOWN BRANDS.
- NOT ENOUGH OIL OR LOW-GRADE OIL CAN CAUSE EROSION OF THE PISTON. USING TOO MUCH OIL, THE ENGINE CAN START SMOKING AND FOUL THE SPARK PLUG.
- IN THE CASE OF A LEANER ADJUSTMENT OF THE CARBURETOR PROCEED CAUTIOUSLY. ALWAYS REDUCE THE JET SIZE IN STEPS OF ONE NUMBER TO AVOID OVERHEATING AND PISTON SEIZURE.

NOTE: If despite a changed adjustment the engine does not run properly, look for mechanical faults and check the ignition system.

Basic information on carburetor wear

As a result of engine vibrations, throttle valve, jet needle, and needle jet are subjected to increased wear. This wear may cause carburetor malfunction (e.g., overly rich mixture). Therefore, these parts should be replaced after 10000 kilometers (6000 miles).

jet needle	throttle valve open	effect
N 85 A		
N 85 B	0 - 1/4	⊖
N 85 C	0 - 1/4	⊖⊖
N 85 D	0 - 1/4	⊖⊖⊖
N 85 E	0 - 1/4	⊖⊖⊖⊖
NOZ C		
NOZ D	0 - 1/4	⊖
NOZ E	0 - 1/4	⊖⊖
NOZ F	0 - 1/4	⊖⊖⊖
NOZ G	0 - 1/4	⊖⊖⊖⊖
NOZ H	0 - 1/4	⊖⊖⊖⊖⊖
NOZ I	0 - 1/4	⊖⊖⊖⊖⊖⊖
NOZ J	0 - 1/4	⊖⊖⊖⊖⊖⊖⊖
N3CG		
N3CH	0 - 1/4	⊖
N3CW	0 - 1/4	⊖⊖

Explanation - Example

Compared to the needle N 85 A, the jet needle N 85 C is two steps leaner in the range from the closed position of the throttle to 1/4 throttle. Otherwise, there are not differences.

N 85 C	0 - 1/4	⊖⊖
---------------	---------	----

CAUTION

WHEN CHANGING THE JET NEEDLE, MAKE SURE THAT YOU USE THE CORRECT NEEDLE TYPE (N 85 ,NOZ OR N3). THE TECHNICAL DATASHEET TELLS YOU WHICH JET NEEDLE CAN BE USED FOR WHICH MODEL.

Checking the setting of the TVC system

The function of the TVC system is checked with the engine running. This test checks the start of advance and the end of advance.

- For this, remove the left control cover.
- Connect a rev counter (either to the ignition cable or to the blue/white cable in the electronics box, depending on the rev counter design).
- Start engine, accelerate gently and observe when the TVC system starts to advance (tooth segment creeps upwards).

	start of advance	end of advance
250 Model 1999	5400 U/min	7550 U/min
250 from Modell 2000 on	5000 U/min	7000 U/min
300 up to Modell 2000	5300 U/min	7750 U/min
300 from Modell 2001 on	5900 U/min	7750 U/min
380	5200 U/min	7200 U/min

- If necessary, turn the adjusting screw ❶.

NOTE: Twisting the adjusting screw in delays the commencement of adjustment by the TVC system, twisting the adjusting screw out means that the TVC system will perform the adjustment earlier.

Bleeding of the hydraulic clutch

- Take off cover together with rubber bellows.
- At the slave cylinder of the clutch, remove the bleeder nipple ❷. In its place, mount the bleeder syringe ❸ which is filled with SAE 10 hydraulic oil.

- Refill oil, until oil is discharged from the bore ❹ of the master cylinder in a bubble-free state. Make sure that the oil does not overflow.

! CAUTION !

- HAVING COMPLETED THE BLEEDING PROCEDURE, YOU HAVE TO VERIFY THAT THE OIL LEVEL IN THE MASTER CYLINDER IS CORRECT.
- KTM USES BIODEGRADABLE HYDRAULIC OIL FOR THE HYDRAULIC CLUTCH CONTROL. NEVER MIX BIODEGRADABLE HYDRAULIC OILS WITH MINERAL OILS.
- ALWAYS USE BIODEGRADABLE HYDRAULIC OIL SAE 10 TO FILL UP THE MASTER CYLINDER. NEVER REFILL WITH MINERAL HYDRAULIC OIL OR BRAKE FLUID.

SPECIAL TOOLS – ENGINE 250 / 300 / 380

CLEANING

Clean your motorcycle regularly in order to maintain the beauty of its plastic surfaces.

The best manner would be to use warm water that has been mixed with a normal brand-name washing detergent and a sponge. The hard dirt can be removed before washing with the help of a soft water jet.

CAUTION

NEVER CLEAN YOUR MOTORCYCLE WITH A HIGH-PRESSURED CLEANER OR A HIGH-PRESSURED WATER JET. THE WATER COULD OTHERWISE RUN INTO THE ELECTRICAL COMPONENTS, CONNECTORS, SHEATHED CABLES, BEARINGS, CARBURETOR, ETC. AND CAUSE DISTURBANCES OR LEAD TO A PREMATURE DESTRUCTION OF THESE PARTS.

- Before cleaning with water, plug the exhaust pipe to prevent water ingress.
- You should use normal brand-name detergents to clean the motorcycle. Especially dirty parts should also be cleaned with the help of a paint brush.
- After the motorcycle has been rinsed with a soft water jet, it should be dried by air pressure and a cloth. Then take a short drive until the engine has reached the working temperature and also use the brakes. By warming these components, the residual water can evaporate from inaccessible parts of the engine and the brakes.
- Slide back the protective covers on the handlebar-mounted instruments so that any water that may have seeped into this part of the motorcycle is allowed to evaporate.
- After the motorcycle has cooled down, oil and grease all the gliding bearing parts. Treat the chain with a chain spray.
- To prevent failures in the electric system, you should treat the ignition lock, the emergency OFF switch, the short circuit button, the light switch and the socket connectors with contact spray.

CONSERVATION FOR WINTER OPERATION

In the event that the motorcycle is also used in winter and on roads where one has to expect salt spraying, you will have to take precautions against the aggressive road salt.

- clean the motorcycle thoroughly and let it dry after each ride
- treat the engine, carburetor, swing arm, and all other bare or galvanized parts (except for brake discs) with a wax-based anti-corrosion agent.

WARNING

KEEP THE ANTI-CORROSION AGENT FROM GETTING INTO CONTACT WITH THE BRAKE DISCS, OTHERWISE THIS WILL SIGNIFICANTLY REDUCE THE BRAKING POWER.

CAUTION

AFTER RIDES ON SALTED ROADS, CLEAN MOTORCYCLE THOROUGHLY WITH COLD WATER AND LET IT DRY WELL.

STORAGE

Should you wish to make a pause over a longer space of time, please observe the following instructions:

- Clean motorcycle thoroughly (see chapter: CLEANING)
- Change engine oil (old engine oil contains aggressive contaminants).
- Check antifreeze and amount of cooling liquid.
- Let the engine warm up again, close fuel cock and wait until the engine dies off by itself. In this way the carburetor jets are prevented from becoming resin- clogged by the old fuel.
- Remove spark plug and fill in approx. 5 ccm of engine oil into the cylinder through the opening. Actuate kick-starter 10 times in order to distribute the oil onto the cylinder walls and mount the spark plug.
- Let fuel flow out of tank into an appropriate container.
- Correct tire pressure.
- Lubricate bearing points of the control levers, footrests, etc. as well as the chain.
- The storage place should be dry and not be subjected to too big temperature fluctuations.
- Cover the motorcycle with an air permeated tarp or blanket. Do not use non airtight materials as a possible humidity might not be able to escape and thereby cause corrosion.

CAUTION

IT WOULD BE VERY BAD TO LET THE ENGINE RUN FOR A SHORT TIME DURING THE STORAGE PERIOD. THE ENGINE WOULD NOT GET WARMED UP ENOUGH AND THE THUS DEVELOPED STEAM WOULD CONDENSE DURING THE COMBUSTION PROCESS AND CAUSE THE VALVES AND EXHAUST TO RUST.

USE AFTER A PERIOD OF STORAGE

- Fill up the tank with fresh fuel.
- Check the motorcycle as before each start (see driving instructions)
- Take a short, careful test ride first.

NOTE: Before you put your motorcycle away for the winter, you should check all parts for their function and wear. Should any service jobs, repairs, or any refitting be necessary, you should have them carried out during the off-season (lower workload at mechanics' shops). This way, you can avoid the long waiting times at your shop at the beginning of the next biking season.

REMOVING AND REFITTING ENGINE 3

INDEX

REMOVING THE ENGINE	3-2
REFITTING THE ENGINE	3-4

Dismounting the engine

- Clean motorcycle thoroughly.
- Prop up motorcycle on an appropriate stand.
- Remove seat, right side paneling, and tank with spoilers.

- Dismount exhaust system.

- Drain coolant, and disconnect radiator hoses from engine.
- Dismount engine strut ❶.
- Disconnect plug-and-socket connector of ignition system and spark-plug connector.

- Remove sprocket cover ❷ and chain.

- Remove footbrake cylinder cover ❸.
- Disengage and remove spring ❹.

- Loosen the 3 screws, and remove intermediate flange chamber **1** of KTC system together with O-ring.
- Remove engine fastening screw **2**.
- Remove cable ties and loose the cable of ignition from frame.

- Loosen both hose clamps, and pull carburetor out of carburetor connection boot and intake flange.

- Remove transmission-oil drain plug **3** together with sealing ring, and drain the transmission oil.
- Remove the 2 screws **4**, and dismount clutch slave cylinder.

! CAUTION !

DO NOT ACTUATE THE CLUTCH LEVER WITH THE CLUTCH SLAVE CYLINDER DISMOUNTED.

- Remove engine fastening screw **5**.
- Remove hexagon nut of swingarm pivot **6**.
- Remove swingarm pivot, and pull swing arm backward out of the frame so as to make lifting the engine out of the frame easier.
- Lift engine out of frame.

NOTE: Cylinder head and cylinder can be dismounted even if the engine remains mounted. Likewise, work on clutch, primary drive, gearshift mechanism, and ignition system can be carried out.

Refitting the engine

- To install the engine, reverse the steps for removing the engine.

Filling in of transmission oil:

- Remove the plug ① and top up with engine oil 15W-50 (i. e. MOTOREX TOP SPEED 4T).

- In order to check the transmission oil level the control screw ② on the clutch cover is to be removed. Oil should just barely escape from the inspection opening when the motorcycle is in an upright position.

! CAUTION !

TRANSMISSION AND CLUTCH WILL BE SUBJECT TO AXCESSIVE WEAR AND TEAR, IF YOU USE TOO LITTLE OR LOW GRADE OIL. USE ONLY HIGH-GRADE OIL (I.E. MOTOREX TOP SPEED 4T).

Filling in of cooling liquid:

- Make sure that the drain screw ③ is fastened.
- Pour approx. 0.50 litres (0.13 US gallons) coolant into the system.

40% coolant : 60% water

- Remove the screw ④ on the right radiator and tilt the motorcycle to the right approx. 30 degree angle.
- Now add cooling liquid until it emerges free of bubbles at the right radiator. Then immediately mount the screw so that no more air can enter the right radiator.
- Return the motorcycle to its original position and top up the left radiator until the coolant can be seen approx. 10 mm (0.4 in) above the radiator fins.

DISASSEMBLING THE ENGINE

4

INDEX

DRAINING GEAR OIL4-2
DISMOUNTING OF SPROCKET AND SHIFT LEVER4-2
DISMOUNTING OF CYLINDER HEAD, CYLINDER AND PISTON4-2
DISMOUNTING OF CLUTCH COVER4-3
DISMOUNTING OF PRESSURE CAP AND CLUTCH DISCS4-4
DISMOUNTING OF THE PRIMARY DRIVE4-4
DISMOUNTING OF KICKSTARTER4-5
DISMOUNTING OF THE SHIFT LOCK4-5
DISMOUNTING OF IGNITION COVER4-5
DISMOUNTING OF THE IGNITION (KOKUSAN)4-6
DISMOUNTING OF THE IGNITION (SEM)4-6
DISMOUNTING OF INTAKE FLANGE AND REED VALVE HOUSING4-7
PARTING OF ENGINE HOUSING HALVES4-7
DISMOUNTING OF GEARSHIFT MECHANISM AND TRANSMISSION4-7
DISMOUNTING OF THE CRANKSHAFT4-8

- Cleaning the engine thoroughly.
- Clamp the engine into the workstand.
- Remove the kickstarter together with the distance bushing behind.

Draining gear oil

NOTE: The transmission oil should already be drained when the engine is dismantled. Otherwise, the transmission oil will leak out of the drive shaft following the removal of the slave cylinder of the clutch.

- Unscrew plug ①, allowing oil to drain.

Dismounting of sprocket and shift lever

- Remove circlip ② from countershaft using circlip pliers. Slide off engine sprocket, distance bushing and O-ring.
- Undo the screw ③ and remove the shift lever.
- Pull out the clutch push rod ④ from drive shaft.

Dismounting of cylinder head, cylinder and piston

- Unscrew the 6 collar screws ⑤ and remove cylinder head and the two O-rings.

- Undo the screws ⑥ and remove the left control cover together with the gasket.

- Undo the screws ❶ and remove the right control cover.

- Remove the securing clip of the ball socket ❷ and unhook the ball socket ❸ from the adjusting lever.
- Remove gasket of the control cover.

- Remove the 4 collar nuts ❹ on cylinder base and remove cylinder.

- Cover the crankcase.
- Place piston on wooden jig and remove both piston pin locking pins.
- Expel piston pin from piston without exerting undue force. Use a suitable mandrel if necessary.
- Remove piston and piston pin needle-bearing from conrod eye.
- Remove the cylinder base gaskets.

! CAUTION !

THE PISTON PIN MUST NEVER BE FORCED OUT WITH A PUNCH. THIS WOULD DAMAGE THE CONROD BEARING.

Dismounting of clutch cover

- Remove collar screws and clutch cover including gasket.

NOTE: The water pump cover ❸, the outer cover ❹ and the cover lid ❺ do not need to be removed. The water pump and the centrifugal timer remain in the clutch cover.

Dismounting of pressure cap and clutch discs

- Loosen collar screws **1** in diagonally opposite sequence to prevent wedging of discs as springs expand.
- Remove collar screws, springs and spring retainers.

- Take pressure cap and disc package out of outer clutch hub.
- Take thrust bearing **2** off the drive shaft.

Dismounting of the primary drive

- Block the primary gear with the gear wheel segment **3** (see illustration).
- Undo the hexagon nut (LH thread) and remove it together with the detent edged ring.

- Release the lock washer of the inner clutch hub.
- Connect clutch holder **4** to inner clutch hub and loosen hexagon nut (see illustration).
- Remove clutch holder.
- Remove inner clutch hub and outer clutch hub together with bearing from main shaft.

- Pulling the primary gear **5** and the distance bushing **6** off the crankshaft.

NOTE: The primary gear and the outer clutch hub belong together. Always replace both together!

Dismounting of kickstarter

- Remove circlip ① and kickstarter intermediate gear.
- Carefully release collar screw ② kickstarter spring is tensioned, release tension on kickstarter spring and unhook spring hanger.

!

CAUTION

!

CAREFULLY RELEASE THE KICKSTARTER SPRING! DANGER OF INJURY!

- Take the complete kickstarter shaft out of the housing.
- Take care of the stop disc, which could stay in the housing.

Dismounting of the shift lock

- Press the sliding plate ③ back with a screw driver so it no longer engages with the driver for the shaft roller, at the same time remove shift shaft from the housing.

NOTE: Watch the stop disc which remains in the housing.

- Remove allen head screw ④ and take driver for roller ⑤ and locking piece ⑥ from the shift roller.

NOTE: From model 2002 driver for roller ⑤ and locking piece ⑥ are made of aluminium.

NOTE: Disassemble locating lever only if the engine case must be replaced.

- Remove screw ⑦ and locking lever with spring and bush.

Dismounting of ignition cover

- Undo the 5 screws and remove the ignition cover together with the gasket.

Dismounting of the ignition (Kokusan)

- Hold the flywheel with the holding spanner ❶ and undo the collar nut.

- Put the protection cover on the crankshaft thread, twist in the flywheel extractor and remove the flywheel.

- Undo the 3 screws ❷ and remove the stator together with the base plate.

Dismounting of the ignition (SEM)

- Hold the flywheel with the special tool and undo the collar nut.
- Place protective cap on crankshaft thread.
- Twist in the flywheel extractor and remove the flywheel.

- Loosen the 3 collar screws ❸, and take base plate with stator out of the casing.

Dismounting of intake flange and reed valve housing

- Remove the 5 collar screws ❶.
- Remove intake flange and reed valve housing.

Parting of engine housing halves

- Top ignition-gear upwards and remove all 11 housing screws.
- Loosen the 2 engine fixtures on the engine work stand.

- Lift left-hand housing half with suitable tools by on the bosses provided, or part with a few light plastic mallet blows against the countershaft from the right-hand housing half.

! CAUTION !

LEVERING APART WITH A SCREW DRIVER OR SIMILAR TOOL MUST BE AVOIDED, SINCE THE SEAL FACES ARE EASILY DAMAGED.

NOTE: Watch gear shaft stop discs ❷ to prevent them sticking to inside of housing.

Dismounting of gearshift mechanism and transmission

- Take the two stop discs ❷ off the transmission shafts.
- Pull the 2 pressure springs ❸ out of the shift rails.

- Pull out the shift rails and swing the shift forks aside.
- Pull the shift roller out of the bearing seat.
- Remove the shift forks.

NOTE: During disassembly, watch out for the shift rollers ❶ on the driving pins of the shift forks. They may remain in the shift roller. Although the counter shaft shift forks are identical they should be refitted in the same position as before if reused. Therefore mark accordingly upon removal.

- Remove the 2 pressure springs ❷ from the engine case.

- Pull the drive shaft together with the countershaft out of the bearing seats.

- Remove 1st-gear idler gear ❸ with needle cage and the two stop discs from the engine case.

Dismounting the crankshaft

- Pull crankshaft from the bearing seat (if necessary, use a plastic hammer and tap carefully on the crankshaft journal).

- Remove O-ring from crankshaft.
- Clean all parts and check for wear, replace if necessary.

NOTE: When an engine is completely overhauled it is recommended that all gaskets, shaft seal rings and O-rings are renewed.

TRANSMISSION5-15
ASSEMBLY MAINSHAFT5-15
ASSEMBLY COUNTERSHAFT5-16
KICKSTARTER5-17
ASSEMBLE OF KICKSTARTER SHAFT5-17

Engine housing

NOTE: Read through the following section before commencing work. Then determine the assembly sequence so that the engine housing halves only need to be heated up once before replacing the bearings.

Having first removed the dowels, in order to expel the bearings or remove them with light mallet blows, the housing halves must be placed on a suitably large plane surface, supporting the whole of the sealing surface without damaging it. A wooden panel is best used as a base.

Bearings or shaft seal rings should not be hammered into their seats. If no suitable press is available, use a suitable mandrel and hammer them in with great care. Cold bearings will practically drop into their seats at an engine housing temperature of approx. 150° C.

After cooling, should the bearings fail to lock in the bore, they are bound to rotate after warming. In that event the housing must be replaced.

Working on the right-hand housing half

- Remove all shaft seal rings and use an oven to heat the casing half to approx. 150°C.

Grooved ball bearing of crankshaft ①

Press old grooved ball-bearing inwards. Press in new ball bearing to the stop. The open side of the ball cage must be towards the bottom (outside) of the case.

Grooved ball bearing of main shaft ②

Press in new ball bearing from inside up to the stop.

! CAUTION !

DO NOT USE FORCE WHEN PRESSING THE GROOVED BALL BEARING AGAINST THE RETAINING BRACKET ③ TO AVOID A BENDING OF THE BRACKET, WHICH WOULD RESULT IN EXCESSIVE AXIAL PLAY OF THE MAINSHAFT.

Grooved ball bearing of countershaft ④

Press in new grooved ball bearing from downward to the stop. The open side of the ball cage must be face inwards.

Grooved ball bearing of the shift roller ⑤

Remove retaining screws ① and press bearing inwards. Press in new ball bearing from inside to the stop and secure retaining screws with Loctite 243.

Needle bushing of the shift shaft ⑥

Press old needle bushing inwards, press in new needle bushing flush from the outside.

Grooved ball bearing of centrifugal timer ⑦

The bearings usually fall out of their seat of their own accord by knocking the housing half on a plane piece of wood when the housing has a temperature of 150° C. If necessary use a 6 mm internal bearing extractor and guide hammer (see illustration). Press in new grooved ball bearing to the stop.

Bearing bolt kickstarter intermediate gear ⑧

Experience has shown that it is never necessary to replace the bearing bolt. It is not recommended to mount a used bearing bolt in a new housing half, as it is practically impossible to remove it without causing damage.

Kickstarter release plate ⑨

When replacing the release plate, secure the flat-head screws with Loctite 243.

Crankshaft seal ring ⑩

Press in new shaft seal ring from the outside, with sealing lip facing inward, until flush.

Stop screw kickstarter ⑪

When mounting the stop screw, it must be secured with Loctite 243. Do not forget new copper seal ring.

Retaining bracket ⑬

When replacing the retaining bracket, the two collar screws are to be secured with Loctite 243.

- Finally check clear passage of the crankshaft ball bearing lubrication bore ⑬.

Working on the left-hand housing half

- Remove all shaft seal rings and use an oven to heat the casing half to approx. 150°C.

Crankshaft roller bearing ①

Press old roller bearing inwards, press in new ball bearing to the stop with the open side of ball cage downwards (outside). The inner ring on the crankshaft must also be renewed (see paragraph about crankshaft).

Needle bearing of drive shaft ②

Press old grooved ball bearing inward, press new grooved ball bearing from the inside up to the stop.

Grooved ball bearing of countershaft ③

Press old ball bearing inwards, press in new ball bearing to the stop from inside.

Grooved ball bearing of shift roller ④

Ball bearing falls out of its seat of its own accord when housing half has been heated to approx. 150° C.
If necessary, knock housing half on a plane piece of wood. Press in new grooved ball bearing to the stop.

Needle bushing of shift shaft ⑤

Remove shaft seal ring and press old needle bushing inwards. Press in new needle bushing from the outside to the collar ①.

Crankshaft seal ring ⑥

Press in new crankshaft seal ring from the outside, with sealing lip facing inwards. The seal ring is 1 mm (0.04 in) lower than the upper edge of the collar (see sketch).

Counter shaft seal ring ⑦

Press in the new shaft seal ring, until it is flush with machined surface.

Shift shaft seal ring ⑧

Press in the new shaft seal ring, until it is flush with machined surface.

When housing half has cooled off, check to see that the bearings are tight.

- Finally check clear passage of the crankshaft roller bearing lubrication bore ⑨.

Crankshaft

- When replacing the roller bearing, the inner crankshaft ring must also be renewed.
- Heat special tool 584.29.037.040 on a heating pad up to approx. 150°C and slip it on the inner ring immediately. Press the special tool together tightly so as to obtain a good heat transfer and pull the inner ring off the crankshaft.
- To mount the new inner ring, heat the special tool again to approx. 150°C, engage the inner ring and slip it on the crankshaft journal immediately.

! CAUTION !

NEVER CLAMP THE CRANKSHAFT WITH A STUD OR WEB IN THE VICE, AND NEVER TRY TO KNOCK THE BEARING INNER RING FREE. THE CRANKSHAFT WEBS MAY BE COMPRESSED AND THE CONROD PLUG AND BEARING MAY BE DAMAGED, THEREBY MAKING THE CRANKSHAFT UNUSABLE.

NOTE: Distance adjustment of the main bearings is not requested.

Crankshaft webs – measure outer dimension

Crankshaft webs – measure outer dimension with a sliding caliper as illustrated.

Crankshaft webs – outer dimension = 60 mm ± 0.05 mm

Piston

If a used piston is to remain in service then the following should be checked:

1. Piston running surface: Check for pressure marks (seizing marks) minor friction marks can be removed with a fine abrasive stick.
2. Piston ring grooves: The piston rings must not get jammed in the grooves. For cleaning the grooves, use an old piston ring or abrasive paper (grain size 400).
3. The piston ring locating pins must be firmly seated in the piston and must not be worn out.
4. Check piston rings for wear and check end gap.

Piston ring end gap

- Insert piston ring into the cylinder and adjust. Piston ring must be approx. 10 mm (1/2 inch) from top of cylinder.
- The end gap **B** can now be checked with a feeler gauge.

Piston ring end gap: max. 0.40 mm (0.015 in)

NOTE: If the end gap is greater check piston and cylinder for wear. If piston and cylinder wear are within the permitted tolerance limits, replace the piston ring.

Checking cylinder for wear

Measure diameter of cylinder approx. 10 mm (0.4 in.) below top of cylinder edge. Check diameter in several corresponding places to see if cylinder is worn oval.

Engine	Cylinder Ø	Piston size
250	67,500 - 67,512	1
	67,513 - 67,525	2
300	72,000 - 72,012	1
	72,013 - 72,025	2
380	78,000 - 78,012	1
	78,013 - 78,025	2
250 <small>starting with the 2000 mod</small>	66,340 - 66,350	1
	66,351 - 66,360	2
300 <small>starting with the 2000 mod</small>	71,940 - 71,950	1
	71,951 - 71,960	2

Recoated cylinder

NOTE: If the cylinder diameter is larger than e.g. 66.360 mm the cylinder must be regenerated or replaced.

For reconditioning of the old cylinder all exhaust control components must be removed. The intermediate flange ❶ remains with the cylinder. The piston size is stamped into the bottom of the piston.

Nikasil coating of cylinder

Nikasil is the brand name for a cylinder coating process, developed by the piston manufacturer Mahle. The name is derived from the two materials used in this process - a nickel layer into which the particularly hard silicon carbide is inbedded.

The main advantages of the Nikasil coating are:

- excellent heat dissipation and thus better power output
- low wear
- low weight of the cylinder.

NOTE: The worn coating can be regenerated at low cost provided that the cylinders running surface is flawless.

Cylinder exhaust control system

Dismantle and clean all exhaust control components, check for signs of wear and damage.

Control rollers ❶ – Check clearance of bearings. Remove oil-derived deposits. Check toothing of control rollers for signs of wear.

Gear segments ❷ – Check toothing of gear segments and control rollers for signs of wear.

Bearing sleeves ❸ – Check bearing sleeves of the control flap for play and easy operation.

Control flap ❹ – Clean the control flap. The control flap must not graze inside the exhaust port.

Silicon O-rings ❺, ❸ + ❹ – Check silicon O-rings of control flap and control rollers for signs of wear. Renew if necessary.

Cylinder preassembly

- Mount silicon O-rings (16x2 mm) ❺ on control rollers and grease.
- Place control rollers ❶ in cylinder and mount retaining brackets ❸; secure flat-head screws ❷ with Loctite 243.

- Mount and grease silicon O-rings (15x1,50 mm) ⑨ on control flap and grease.
- Slightly grease the bearing sleeves ③ and plug them on the control flap.
- Mount toothed segments ② (the toothed segment with the cylindrical pin has to be mounted on the right side).
- On the right-hand side, mount bearing bushing ⑩ with collar outside, adjusting lever ⑪ with ball head on outside, overload spring ⑫ with short leg on outside and spring sleeve ⑬ to control flap.
- Coat allan head screw ⑭ with Loctite 243 and screw up about 5 revolutions, hook the short leg of the overload spring on to the cylinder pin (see illustration) and tighten the allan head screw.
- On the left side, mount the stop plate ⑧. Apply Loctite 243 to the threads of the two screws ⑯ + ⑰, and mount them.
- Turn control rollers ① in cylinder in such a way that ports are completely open and no edges protrude.

- Place preassembled control flap in cylinder, engage gear segments in control rollers in such a manner that, when the control flap is open (pivoted right to the top), the markings of the gear segments and the gear rollers coincide. Please check that the two control rollers do not block the cross-section of the port when the control flap is open.
- Coat sealing surface thinly with silicon and mount intermediate flange ⑯ with 4 O-rings (11,3x2,4 mm).
- Mount exhaust flange ⑰ and spring hangers. If you are dealing with a throttled version, do not forget the exhaust throttle.
- Finally check smooth running of exhaust control system.

NOTE: It must be possible to push adjusting lever ⑪ further upwards against the spring force.

Art No 3206004 - E

Exhaust control, clutch cover

- Remove screws 1 and take off the bearing support.
- Take cup tappet 2, adjusting spring 3 and auxiliary spring 4 out of the clutch cover.
- Take off water pump cover, remove allen head screw 6 and take off water pump wheel 7.
- The centrifugal timer 8 can be pulled out of the bearing.
- Clean all parts and check for signs of wear.

Check play and easy operatability of the adjusting lever in the bearing 9.

Check pin A of adjusting lever for wear.

Check linkage ball heads 10 for clearance.

Remove circlip 11 and check axial bearings 12 and washers for signs of wear.

If the water pump shaft seal ring 13 is replaced, it should be coated with Loctite 243 on the outside.

Check grooved ball bearing 14 for clearance.

Preassembly of clutch cover

- Grease water pump shaft seal ring 13 and mount centrifugal timer 8.
- Fit adjusting spring 3, auxiliary spring 4 and cup tappet 2 in the clutch cover.
- Fit bearing support with control lever and linkage. Secure both screws 1 with Loctite 243.
- Mount water pump wheel 7, coat screw 6 with Loctite 243 and mount with washer.
- Mount dowels of the water pump cover.
- Position gasket and fix water pump cover with 5 collar screws. The two screws mounted at the dowels must each be provided with one copper gasket.

Repair manual KTM 250 / 300 / 380

Reed valve housing, intake flange

NOTE: Reed paddles ❶ gradually lose tension through operation, resulting in power loss. Damaged or worn reed paddles must be replaced. If the reed sealing surfaces ❷ of the reed valve housing are also damaged, replace the complete reed valve housing.

! CAUTION !

SECURE ALL SCREWS OF THE REED VALVE HOUSING WITH LOCTITE 243.

Velocity insert ❸

Check for firm mounting and for signs of damage.

Intake flange ❹

Check for cracks and other signs of damage.

Clutch

Thrust bearing ❶ check for wear

Push rod ❷ Check for wear. Minimum length: 199 mm (new: 199.80 mm)

Clutch springs ❸

New spring length 42,5 mm / 1.7 in (new 43 mm / 1.73 in). Replace all 6 springs if applicable.

9 Lining discs ❹

Minimum thickness 2.60 mm (0.102 in) / new disc 2.70 mm (0.106 in). Discs must be plane; there must be minimum spacing of 13.50 mm (0.531 in) between starting surfaces.

8 Steel discs ❺

Must be plane, check for mechanical damage.

Inner clutch hub ❻

Check contact surfaces of steel discs on the inner clutch hub, maximum 0.50 mm (0.02 in) indentations.

Pressure cap ❼

Check contact surfaces ❶ between lining disc and pressure cap for signs of mechanical damage and score marks.

Outer clutch hub ⓸

Check start surfaces of clutch discs on for wear. If indentations exceed 0.50 mm (0.02 in), replace outer clutch hub (see below).

Check inner ring ❾ and needle cage ❿ for wear.

Replace outer clutch hub

- Drill open the clutch rivets 11 in area of retaining bracket 12 and remove parts.
- Check 8 absorbing elements 13 for signs of mechanical damage, replace all 8 where applicable.

! CAUTION !

THE ABSORBING ELEMENTS ARE WIDER THAN THE PRIMARY GEAR CROWN. TO ENSURE THAT THE OUTER CLUTCH HUB 6 AND RETAINING BRACKET ARE POSITIONED DIRECTLY ON THE PRIMARY GEAR CROWN 14, THE PARTS MUST BE HELD IN POSITION UNDER TENSION WITH THE CLUTCH RIVETTING TOOL 7 WHILE RIVETING.

Shift mechanism

Shift forks ①

Check shift fork blades ④ and shift roller driving pin ⑤ for signs of wear.

Shift roller ②

Check shift grooves for wear.

Check position of shift roller in grooved ball bearings ③.

Slide plate ④

Check slide plate at meshing points ⑥ for wear.

Check return surface ① for wear (renew, if strongly notched).

Check that guide pin ⑤ is securely fixed and check for wear.

Sliding guides

Check sliding guides (excess between guide pin and shift quadrant not to be more than 0.7 mm / 0.03 in).

Grooved ball bearings ③

Check grooved ball bearings for easy movement.

Shift mechanism

Assemble shift mechanism (see below) and check free play between slide plate ④ and shift quadrant ⑤. Free play should be 0.40 - 0.80 mm (0.016 - 0.032 in).

Preassembly of shift shaft

- Fix shift shaft in vice at shorter end (use covered clamps).
- Mount slide plate ④ with guide pins downwards, hook guide pins into shift quadrant ⑤.
- Mount pressure spring ⑥.
- Slide on spring guide ⑦, slide on return spring ⑧ with offset end upwards over the spring guide and lift offset end over bolt ⑨ (see illustration).
- Mount the stop disc ⑩ (14x30x1 mm).

Ignition (Kokusan)

General information

The measurements described below will only reveal severe problems. Coil short circuits leading to weak ignition sparks or low generator output, respectively, can only be detected with the help of an ignition test bench. In the case of malfunction always check the cables and the plug and socket connections of the ignition system first.

Make sure to select the correct measuring range when performing measurements.

Spark plug

- Set the electrode distance.

Electrode distance: 0.60 mm (0.024 in)

Insulator

Check for cracks and fissures.

! CAUTION !

ALWAYS USE A SPARK PLUG WITH RESISTOR. OTHERWISE PROBLEMS CAN OCCUR IN THE CDI UNIT.

Check stator and pulse generator (Kokusan)

Use an ohmmeter to perform the following measurements:

Ignition	Measure	Cable colours	Resistance
2K-1	Pulser coil	red – green	100 Ω \pm 15%
	Exciter	black/red – red/white	24 Ω \pm 15%
2K-2	Pulser coil	red – green	100 Ω \pm 15%
	Exciter	black/red – red/white	24 Ω \pm 15%
	Charge coil	ground – yellow	0,74 Ω \pm 15%
2K-3	Pulser coil	red – green	100 Ω \pm 15%
	Exciter	black/red – red/white	12.7 Ω \pm 15%
	Charge coil	ground – yellow	0.65 Ω \pm 15%
		white – yellow	0.16 Ω \pm 15%
2K-4	Pulser coil	red – green	100 Ω \pm 15%
	Exciter	black/red – red/white	24 Ω \pm 15%
	Charge coil	yellow – yellow	0.65 Ω \pm 15%

NOTE: The measuring must be performed at a temperature of 20° C. Otherwise significant deviations must be expected.

Replace the stator if the measured values deviate significantly from the setpoint values.

Ignition (SEM)

General information

The measurements described below will only reveal severe problems. Coil short circuits leading to weak ignition sparks or low generator output, respectively, can only be detected with the help of an ignition test bench. In the case of malfunction always check the cables and the plug and socket connections of the ignition system first. Make sure to select the correct measuring range when performing measurements.

Spark plug

- Set the electrode distance.

Electrode distance: 0.60 mm (0.024 in)

Insulator

Check for cracks and fissures.

! CAUTION !

ALWAYS USE A SPARK PLUG WITH RESISTOR. OTHERWISE PROBLEMS CAN OCCUR IN THE CDI UNIT.

Check stator (SEM)

Perform the following measurements with an ohmmeter.

+ Pole	- Pole	Resistance
black	red	1,7 kΩ
black	green	165 Ω ± 20 Ω
green	red	1,7 kΩ
yellow	yellow	1,0 Ω

NOTE: The measuring must be performed at a temperature of 20° C. Otherwise significant deviations must be expected. Replace the stator if the measured values deviate significantly from the setpoint values.

Transmission

Secure mainshaft or countershaft in the vice (using soft jaw-covers).

Remove gears and check the following for wear:

- Needle bearing
- Mainshaft and countershaft pivot points including idler gears
- Shift dogs and gear wheels
- Tooth faces of all gears
- Tooth profile of mainshaft and countershaft and corresponding gears
- Easy operation of gear-change

Carefully clean components and replace damaged components.

NOTE: Always place circlips with sharp edge facing the components secured, ensuring that they are not overexpanded (use special pliers).

Check that after any repair of the transmission, circlips should axially not move more than 0.20 mm (0.006 in) and must not seize between stop discs.

Assembly mainshaft

- Fix mainshaft in vice with toothed end upwards (use covered clamps).
- Oil all parts before assembly.
- Mount the split needle cage ① on mainshaft, push 5th idler gear ② over it with collar downwards.
- Place internally toothed stop disc ③ (22.4x25.7x32.0x1.5 mm) in position and mount circlip ④ (25x1.64 mm) with sharp edge upwards.
- Place 3rd sliding gear ⑤ in position with shift groove downwards, mount circlip ⑥ (25x1.64 mm) with sharp edge downwards and internally toothed stop disc ⑦ (22.4x25.7x32.0x1.5 mm)
- Mount the split needle cage ⑧, 4th idler gear ⑨ with shift dogs downwards 2nd gear ⑩ with collar downwards and stop disc ⑪ (20.2x33x1.5 mm).
- Finally check all gears for easy running.

Transmission

Secure mainshaft or countershaft in the vice (using soft jaw-covers).

Remove gears and check the following for wear:

- Needle bearing
- Mainshaft and countershaft pivot points including idler gears
- Shift dogs and gear wheels
- Tooth faces of all gears
- Tooth profile of mainshaft and countershaft and corresponding gears
- Easy operation of gear-change

Carefully clean components and replace damaged components.

NOTE: Always place circlips with sharp edge facing the components secured, ensuring that they are not overexpanded (use special pliers).

Check that after any repair of the transmission, circlips should axially not move more than 0.20 mm (0.006 in) and must not seize between stop discs.

Assembly countershaft

- Fix countershaft in vice with toothed end (use covered clamps).
- Oil all parts before assembly.
- Push stop disc ① (26x40x1,5 mm) onto countershaft.
- Mount 3rd idler gear ② with shift dog recesses upwards and circlip ③ (25x2 mm) with sharp edge upwards.
- Mount 5th sliding gear ④ with shift groove downwards, stop disc ⑤ (22,2x33x1,5 mm), needle cage ⑥, 1st free gear ⑦ with shift dog recesses downwards and stop disc ⑧ (17,2x34x1,5 mm) with collar upwards on the countershaft.
- Remove countershaft from vice and fix again with toothed end upwards.
- Mount 4th sliding gear ⑨ with shift dog upwards, stop disc ⑩ (28,2x40x1,5 mm), needle cage ⑪, 2nd idler gear ⑫ with shift dog recesses downwards and stop disc ⑬ (25,7x40x1,5 mm).
- Finally check all gears for easy running.

Kickstarter

Starter gear ①
Check clearance of starter gear.

Starter intermediate gear ②
Check clearance of starter intermediate gear.

Locking pawl ③
Check for signs of wear and damage.

Kickstarter shaft ④
Check for signs of wear and damage.

For changing the locking pawl, press bearing needle ⑨ out of the kickstarter shaft.

Assemble of kickstarter shaft

- Fix the kickstarter shaft ④ in a vice with the toothed end upwards (use covered vice clamps).
- Mount ratchet spring ⑤ on kickstarter shaft as shown in the illustration.
- Place needle cage ⑥ in position, push starter gear ① over it, pressing locking pawl ③ inwards so that starter gear passes smoothly over it.
- Hook legs of the starter spring ⑦ into driving hub ⑧, push both together on the starter shaft, hook starter spring leg into kickstarter shaft bore ④.
- Release kickstarter shaft, and fix stop disc ⑩ with a small amount of grease on the kickstarter shaft.

ASSEMBLING THE ENGINE

MOUNTING REED VALVE HOUSING AND INTAKE FLANGE6-9
MOUNTING ENGINE SPROCKET6-10
MOUNTING THE IGNITION (KOKUSAN)6-10
MOUNTING THE IGNITION (SEM)6-11
ADJUSTING IGNITION POINT (SEM)6-11
MOUNTING IGNITION COVER6-11
MOUNTING STARTING LEVER AND SHIFT LEVER6-11

- Secure the right-hand housing half in the engine work stand.

Crankshaft

- Insert crankshaft from above through grooved ball bearing and push carefully as far as stop.

! CAUTION !

WHEN PUSHING IN CRANKSHAFT, MAKE SURE CONROD IS FACING CYLINDER.

Transmission

- Grease the driving pins of the shift forks and mount the shift rollers ①.
- Fix the lower stop disc on the countershaft with a small amount of grease.
- Mount drive shaft together with countershaft, and insert them into the bearings as far as they will go.

- Shift fork ② with driving pin ① in the middle belongs to the mainshaft.
- Mount the two other shift forks ③ at the countershaft, using the marks applied before disassembly for better orientation.

! CAUTION !

USED SHIFT FORKS SHOULD BE MOUNTED IN THE SAME SLIDING GEAR AS BEFORE. WATCH AT THE MARKINGS FROM DISMANTLING.

- Attach the shift forks to the sliding gears, and insert shift roller into the grooved ball bearing.
- Attach the shift forks to the shift roller.

! CAUTION !

WHEN ATTACHING THE SHIFT FORKS, MAKE SURE THAT THE SHIFT DRUMS DO NOT SLIDE OFF THE SHIFT FORKS.

- Fix the 4 pressure springs **1** with ample amounts of grease in the gearshift rails.

- Oil gearshift rails and insert them into the gearshift forks (short gearshift rail toward drive shaft). Insert gearshift rails into the casing bores as far as they will go.

NOTE: It must now be possible to gently turn gear shafts.

- Slide stop disc **2** (20.2x 33x1.5 mm) on the drive shaft, and stop disc **3** (25.7x40 x1.5 mm) on the countershaft.

Assembling the engine housing

- Remove engine fastener from engine work stand.
- Check that both dowels are in proper place in right-hand housing and that transmission shaft stop discs have been mounted.
- Apply light coat of grease to sealing surfaces of the housing and position new gasket.
- Grease shaft seal rings in left-hand half and place left-hand half in position.
- Position screws and tighten with 8 Nm (6 ft.lb).
- Gently knock crankshaft with plastic hammer and check easy running of shafts.
- Fix engine in work stand.

Mounting shift mechanism

- Place locating spring with bent leg upwards into engine housing.
- Insert collar sleeve into spring with collar upwards.
- Coat collar screw ① with Loctite 243.
- Insert locating lever ② with roll upwards and fix all parts with collar screw.
- Hook locking spring ③ to lever. The other end of the retaining spring must abut the casing nose ④.

- Mount roller locking device ④ (plastic part) to shift roller. Ensure that the flat parts are not in the middle. Pull locking lever from shift roller.
- Mount driver for shift roller ⑤.
- Coat allen head screw ⑥ with Loctite 243 and mount.

NOTE: From model 2002 on driver for roller ⑤ and locking piece ④ are made of aluminium.

- Grease assembled shift shaft and push into bearings together with stop disc until slide plate contacts driver for shaft roller.
- Now squeeze, and push shift shaft in to the stop.
- Check that legs of return spring surround both left and right side of housing nose ①.
- Mount the foot shift lever and shift through all gears. When shifting through the gears, turn the countershaft. Then remove the foot shift lever.

Mounting kickstarter

- Place spacing washer on the stop face and place preassembled kickstarter shaft in bearing bore in such a way that the locking pawl is outside the release plate.

NOTE: If the kickstarter shaft is mounted correctly, the visible end of the starter spring must point forward (see photo).

- Hook spring hanger ⑦ to starter spring, coat screw ⑨ with Loctite 243, tighten starter spring approx. 90° clock-wise and fix spring pawl with allen head screw.
- Adjust starter spring so that the distance to the kickstarter shaft is the same all around.
- Place starter intermediate gear ⑧ with the high collar (see sketch) showing towards the engine casing on to the bearing.
- Slip on stop disc (17.2x25x1 mm) and mount circlip with the sharp edge showing upwards.

Mount primary drive and clutch

- Grease crankshaft seal ring.
- Put the oiled O-ring (25x1.50 mm) onto the crankshaft and mount the distance bushing with the chamfer facing the crank web.
- Insert woodruff key into crankshaft.
- Place primary gear **1** onto crankshaft with collar downwards.
- Put the inner ring onto the main shaft with the collar facing downwards, then mount the oiled needle cage **2**.

- Mount outer clutch hub and stop disc **3**.

- Apply Loctite 243 to the thread of the main shaft.
- Mount inner clutch hub, new lock washer and hexagon nut to main shaft.
- Position clutch holder **4** and tighten hexagon nut with 100 Nm (74 ft.lb.).
- Remove the clutch holder and secure the hexagon nut by bending both brackets of the lock washer upwards.

- Apply Loctite 243 to thread of the crankshaft.
- Fit locking washer and hexagon nut (left hand thread) by hand.
- Block primary drive with gear segment **5** and tighten primary gear hexagon nut with 150 Nm (110 ft.lb.).
- Remove gear segment and check easy running of primary drive by turning crankshaft.

Mounting clutch discs and pressure cap

- Oil the thrust bearing ①, and slide it over the drive shaft.

- Oil lining discs before mounting.
- Beginning with one lining disc, mount alternately 9 lining discs ($\neq 2.70$ mm / 0.10 in) and 8 intermediate discs ($\neq 1.20$ mm / 0.047 in), with a lining disc forming the final layer upwards.
- Place pressure cap into position; fit clutch springs, spring retainer and collar screws.
- Tighten the collar screws crosswise. Do not apply more than 6 Nm (4.5 ft.lb.) to prevent damaging of the threads in the inner clutch hub.

Mounting clutch cover

- Check whether both dowels are mounted in clutch cover or engine housing.
- Grease kickstarter shaft seal ring and position clutch cover gasket.
- Secure gasket with a little grease.
- Carefully position preassembled clutch cover and press into place, turning crankshaft so that centrifugal timer can engage in the primary gear.
- Fit collar screws (see sketch for screw lengths) and tighten with 8 Nm (6 ft.lb.).
- Then check easy running of all shafts.

NOTE: If the clutch cover cannot be mounted, verify whether or not the kickstarter spring has been positioned correctly.

Mounting piston and cylinder

- Before assembly, oil all parts thoroughly at the sliding points.
- Insert needle bearing in conrod eye, mount piston (arrow on piston head shows direction for exhaust duct).
- Mount piston pin and wire circlips with open side showing downwards (see sketch).
- Mount cylinder base gaskets.
- Place piston on selfmade wooden stand and position piston ring.

- Place on preassembled cylinder, remove wooden stand and tighten cylinder down crosswise, using two nuts.

Adjusting dimension „X“

Dimension „X“ is the dimension from upper edge of piston to upper edge of cylinder with cylinder under low tension and piston in TDC position. The dimension „X“ should be adjusted extremely carefully by inserting cylinder base gaskets of suitable thicknesses.

! CAUTION !

IF THE DIMENSION „X“ IS TOO LARGE, THE COMPRESSION RATIO WILL BE REDUCED AND THE ENGINE LOOSES POWER. ON THE OTHER HAND, IF THE DIMENSION „X“ IS TOO SMALL, THE ENGINE WILL PING AND OVERHEAT.

- Set the piston to TDC, and apply a sliding gage or straight-edge to the cylinder. Now, check the distance between the piston's upper edge and the sliding gage. This distance should be from 0 mm to 0.10 mm at the most. It can be corrected, if necessary, by adding or removing of cylinder-base gaskets.

! CAUTION !

THE PISTON MUST NOT PROTRUDE BEYOND THE CYLINDER'S UPPER EDGE.

$$\text{Dimension „X“} = 0 \text{ mm} + 0,1 \text{ mm}$$

- Mount the 2 remaining collar nuts at the cylinder base, and tighten each of the 4 collar nuts to 35 Nm (27 ft.lb.).

Adjusting control flap (dimension "Z")

Note: Dimension "Z" is the distance from the lower edge of the control flap to the upper edge of the cylinder, as measured in the centre of the exhaust port.

250 Model 1999	: 48,0 mm	+0,2 / -0,6 mm
250 Model 2000	: 50,5 mm	+0,2 / -0,6 mm
250 ab Model 2001	: 49,5 mm	+0,2 / -0,6 mm
300	: 46,0 mm	+0,2 / -0,6 mm
380	: 50,5 mm	+0,2 / -0,6 mm

- Undo the screws of the stop plate (left side of the cylinder) **1** and **2** and apply Loctite 243 to the threads. Then mount both screws but do not tighten them yet.
- Set preselected value on depth gauge and fix.
- Swivel control flap upwards and hold depth gauge into cylinder as shown in the illustration.
- Control flap must rest against depth gauge.

- Allow bump plate **3** to rest against retaining bracket **4**.
- Secure bump plate fastening screws **1** and **2**.
- Remove depth gauge.
- Having tightened the screws **1** + **2**, you have to check the dimension "Z" again and correct it, if necessary.

- Press linkage of control flap **5** down-wards as far as stop and press ball socket **6** onto ball of adjusting lever.

When pressing ball socket do not:

- pull the linkage too far up (max. 1 mm / 0.04 in).
- swivel control flap upwards.

- Adjust linkage length if necessary.
- To do so, loosen counter nut **7** and turn ball socket accordingly.
- Retighten counter nut.

- Once adjustments are completed, remove ball socket once again and fit gasket for control cover.
- Refit ball socket and fit safety device **8**.

Mounting steering covers

- Mount the right-hand control cover ①, and fix it with 3 screws.

- Place gasket in position and fix left-hand steering cover ② on cylinder.

Mounting cylinder head

- Clean cylinder and cylinder head sealing surface, place O-rings in grooves.
- Mount cylinder head with water nozzle on the exhaust side.

- Oil the collar nuts at threads and contact faces.
- Mount the collar screws with new copper gaskets and tighten them crosswise, taking three turns to achieve the total tightening torque of 35 Nm (25 ft.lb.).
- In first stage, only tighten until slight resistance is felt.

Mounting reed valve housing and intake flange

- Place reed valve housing with velocity insert in inlet duct and fix intake flange with the 5 collar screws.

Mounting engine sprocket

- Lubricate O-ring **1** with oil and slide over counter shaft.
- Slide distance bushing **2** in position so that O-ring is in correct position.

- Slide sprocket onto the countershaft with the collar facing inward, and fix it with the circlip **3** (sharp edge facing outward).

Mounting the ignition (Kokusan)

- Insert the woodruff key into the crankshaft.
- Apply Loctite 243 to 3 screws **4** and fix the stator (do not yet tighten the 3 screws all the way).

- Turn stator such that the mark **A** on the stator coincides with the mark in the casing, and tighten the 3 screws of the stator.
- At engines with ignition type 2K-4 the marking **C** must coincide with the marking on the stator.
- At engines with all other ignitions (not SEM) the marking **B** must coincide with the marking on the stator.

- Mount the rotor.
- Mount the detent edged ring and the nut.
- Hold the rotor with the holding spanner and tighten the nut with 60 Nm (45 ft.lb.).

Mounting the ignition (SEM)

- Insert woodruff key into crankshaft.
- Apply Loctite 243 to the threads of the 3 screws ②.
- Mount base plate ① together with stator, and tighten the 3 screws.
- Mount the cable guide ③ into the cutaway portion of the casing.
- Mount the rotor.
- Mount the detent edged ring and the nut.
- Hold the rotor with the holding spanner and tighten the nut with 60 Nm (45 ft.lb.).

Adjusting ignition point (SEM)

- Make sure that the stator can be turned on the intermediate plate. Otherwise, loosen the 3 screws ④.
- Mount flywheel.
- Screw dial gauge into spark plug thread.
- Place adjusting pin ⑤ in flywheel bore ("91") 2 mm (0.08 in) and turn flywheel until pin slots into recess ⑥ in stator.
- Turn flywheel and stator jointly to TDC.
- Turn dial gauge scale to 0 and turn flywheel with stator clockwise accordingly to preignition.

Ignition point:

- Carefully remove flywheel to prevent further turning of stator.
- Tighten the three stator cylinder screws.
- Mount flywheel and tighten collar nut with 60 Nm (45 ft.lb.).
- Check ignition point once more.
- Remove dial gauge and fit spark plug with OR.

Mounting ignition cover

- Put on a new gasket, and fix the ignition cover by means of the 5 screws.

Mounting starting lever and shift lever

- Push distance bushing onto kickstarter shaft and mount kickstarter.
- Mount shift lever.
- Operate the kickstarter a few times and check if the engine turns freely.
- Oil the push rod, and insert it into the drive shaft.

NOTE: The transmission oil should be filled in only after the engine has been mounted. Otherwise, a part of the transmission oil would leak out through the drive shaft.

STATIC IGNITION VALUES 250 - 380 SX, EXC7-5
 STATIC GENERATOR VALUES 250 - 380 EXC7-7
 STATIC IGNITION AND GENERATOR VALUES 250 MXC, EXC (USA) . .7-9

Art No 3206004 -E

Repair manual 250 / 300 / 380

Checking the voltage regulator-rectifier (Shindengen)

- Start the engine and switch on the low beam.
- Connect a voltmeter to the two terminals of the capacitor (red/white cable = positive, brown cable = negative).
- Accelerate the engine to a speed of 5000 r.p.m. and read off the voltage.

Nominal value: 14.0 – 15.0 V

In the case of a significant deviation from the nominal value:

- Check the capacitor
- Check the connector between the stator and the voltage regulator-rectifier and the connector between the voltage regulator-rectifier and the cable tree.
- Check the stator.
- Replace the voltage regulator-rectifier.

Checking the voltage regulator (Kokusan)

A defect voltage regulator can cause different kinds of trouble:

- No voltage in the circuit
In this case, the voltage regulator must be disconnected at idle speed. The voltage regulator is defect if the power consumers now work properly. If the power consumers are still not supplied with power, the switch, the wiring harness or the ignition system must be checked for defects.
- Excessive voltage in the circuit
The bulbs burn out. In this case the voltage regulator must be replaced.

Checking the voltage regulator (Tympanium)

NOTE: The voltage regulators are connected downstream of the switches. One of the voltage regulators regulates only the brake light circuit, the other regulates the circuit for the head light, the tail light, the speedometer illumination and the horn.

A defect voltage regulator can cause different kinds of trouble:

- No voltage in the circuit
In this case, the voltage regulator must be disconnected at idle speed. The voltage regulator is defect if the power consumers now work properly. If the power consumers are still not supplied with power, the switch, the wiring harness or the ignition system must be checked for defects.
- Excessive voltage in the circuit
The bulbs burn out.
Connect a voltmeter (yellow cable = positive, brown cable = negative) to check the voltage. Start the engine and switch on the power consumers.

At an engine speed of 3000 r.p.m, the voltage regulator must supply a voltage of 12.0 - 14.0 V A.C. At higher engine speeds, the limit of 14.0 V should not be exceeded either.

If the reading significantly deviates from the nominal value, replace the voltage regulator.

Checking the capacitor

- Discharge the capacitor by bridging the two terminals with a screwdriver and remove.
- Connect the negative pole of a 12V battery with the negative terminal of the capacitor. The connection between the positive pole of the battery and the positive terminal of the capacitor (marked +) is made with a test lamp ❶.
- When the power circuit is closed, the test lamp must begin to light up. As capacitor charging increases, the brightness of the test lamp must decrease.
- The test lamp must go out after 0,5-2 seconds (depending on the lamp capacity).
- If the test lamp does not go out or does not light up at all, the capacitor is faulty.

Ignition coil (SEM)

As this ignition coil uses electronic components, you are advised not to use conventional measuring instruments. An accurate function test can only be carried out on an ignition test bench.

Ignition coil (Kokusan)

- Disconnect all cables and remove the spark plug connector.
- Use an ohmmeter to measure the following values.

NOTE: The indicated setpoint values correspond to a temperature of 20° C.

Replace the ignition coil if the measured values deviate significantly from the setpoint values.

Measurement	Cable colours	Resistance
Primary coil	blue/white – ground	0,425 - 0,575 Ω
Secondary coil	blue/white – ignition wire	10,8 - 16,2 kΩ

CDI unit

Check the cables and plug and socket connections of the CDI unit ❷. The CDI unit function can only be checked on an ignition test bench.

! CAUTION !
NEVER USE A COMMERCIAL MEASURING DEVICE TO CHECK THE CDI UNIT. COMMERCIAL MEASURING DEVICES CAN DESTROY HIGHLY SENSITIVE ELECTRONIC COMPONENTS.

Checking the voltage regulator

- Start the engine and switch on the low beam.
- Connect a voltmeter to the two terminals of the capacitor.
- Accelerate the engine to a speed of 5000 r.p.m. and read off the voltage.

Nominal value: 14.0 - 15.0 V

In the case of a significant deviation from the nominal value:

- Check the capacitor
- Check the connector between the stator and the voltage regulator-rectifier and between the voltage regulator and the cable tree.
- Check the stator.
- Replace the voltage regulator-rectifier.

Checking the voltage regulator

- Start the engine.
- Connect a voltmeter to the two terminals of the capacitor.
- Accelerate the engine to a speed of 5000 r.p.m. and read off the voltage.

Nominal value: 14.0 - 15.0 V

In the case of a significant deviation from the nominal value:

- Check the capacitor
- Check the connector between the stator and the voltage regulator-rectifier and between the voltage regulator and the cable tree.
- Check the stator.
- Replace the voltage regulator-rectifier.

Checking the capacitor

- Discharge the capacitor by bridging the two connections with a cable bridge and dismount it.
- Connect the negative pole of a 12V battery with the negative terminal of the capacitor. The connection between the positive pole of the battery and the positive terminal of the capacitor is made with a test lamp 1.
- When the power circuit is closed, the test lamp must light up briefly and return to its dark state after 1 second at the latest.
- If the test lamp does not go out or does not light up at all, the capacitor is faulty.

STATIC IGNITION VALUES 250-380 SX, EXC (KOKUSAN 2K-1, 2K-3, 2K-4)

Measuring conditions:

- cold engine
- seat and tank removed
- all connectors and the ground connection in a non-corroding condition, connectors tightly connected
- spark plug screwed out and spark plug connector attached to ground
- light switch turned off
- the gap between the rotor and pulse generator must be set to 0.75 mm
- kick the kick starter forcefully at least 5 times for each measurement

Static ignition values 250-380 SX, EXC (except 250 USA)

Check the **pulse generator** for an output signal – two-pin connector ① with green and red cable colors (also see circuit diagram on opposite page):

- Apply the red measuring lead of the peak voltage adapter to the green cable and the black measuring lead to the red cable, disconnect both connectors ① to disconnect the CDI unit ②

Multimeter display: 6 volts +/- 1 volt
(250 SX model 2000/2001: 5 volts +/- 1 volt)

- Same measurement with CDI unit connected

Multimeter display: 3 volts +/- 1 volt
(250 SX model 2000/2001: 9 volts +/- 1 volt)

Check the **generator charging coil** for ignition capacitor charge for output voltage – two-pin connector ③ with black/red and red/white cable colors (also see circuit diagram on opposite page):

- Apply the red measuring lead of the peak voltage adapter to the black/red cable and the black measuring lead to the red/white cable, disconnect connector ③ to disconnect the CDI unit ②

Multimeter display: 35 volts +/- 5 volts

- Same measurement with connectors CDI unit connected

Multimeter display: 200 volts +/- 10 volts

Check the **primary voltage output** ④ for ignition coil control (also see circuit diagram on opposite page) for output voltage (blue/white cable color):

- Apply the red measuring lead ⑥ of the peak voltage adapter to the black/white cable (ground) and the black measuring lead ⑤ to the blue/white cable, CDI unit ② and ignition coil ⑤ connected

Multimeter display: 200 volts +/- 10 volts

NOTE: the ignition coil does not need to be removed to measure.

Repair manual KTM 250 / 300 / 380

STATIC GENERATOR VALUES 250-380 EXC (KOKUSAN 2K-3)

Measuring conditions:

- cold engine
- seat and tank removed
- all connectors and the ground connection in a non-corroding condition, connectors tightly connected
- light switch turned off
- kick the kick starter forcefully at least 5 times for each measurement

Static generator values 250-380 EXC (except 250 USA)

Check the generator output **6** (also see circuit diagram on opposite page) for voltage between the following cable colors:

- between yellow and brown (ground), connector **7** disconnected

Multimeter display (250): 19 volts +/- 2 volts
(300-380): 15 volts +/- 1 volt

- between white and brown (ground), connector **8** disconnected

Multimeter display (250): 24 volts +/- 2 volts
(300-380): 19 volts +/- 1 volt

- Repeat both measurements with connector **7** and **8** connected. The measured values should be the same.

NOTE: the black measuring lead of the peak voltage adapter must be applied to the ground.

Check **regulator rectifier output voltage 9** (also see circuit diagram on opposite page) cable colors yellow/red, regulator rectifier **10** connected, capacitor **11** disconnected:

- between yellow/red and brown (ground)

Multimeter display: 14 volts +/- 1 volt

NOTE:

- the black measuring lead **5** of the peak voltage adapter must be applied to the ground.
- 300/380 USA corresponds to 300/380 EXC Europe but with less accessories (blinkers, horn, no capacitor installed). Features no rectification, only an over-voltage regulation.

STATIC IGNITION AND GENERATOR VALUES 250 MXC, EXC USA (KOKUSAN 2K-2)

Measuring conditions:

- cold engine
- seat and tank removed
- all connectors and the ground connection in a non-corroding condition, connectors tightly connected
- spark plug screwed out and spark plug connector attached to ground
- light switch turned off
- the gap between the rotor and pulse generator must be set to 0.75 mm
- kick the kick starter forcefully at least 5 times for each measurement

Static ignition values 250 MXC, EXC USA

Check the **pulse generator** for an output signal – two one-pin connectors **1** with green and red cable colors (also see circuit diagram on opposite page):

- Apply the red measuring lead of the peak voltage adapter to the green cable and the black measuring lead to the red cable, disconnect both connectors **1** to disconnect the CDI unit **2**

Multimeter display: 3.5 volts +/- 1 volt

- Same measurement with CDI unit connected

Multimeter display: 2 volts +/- 0.5 volt

Check the **generator charging coil** for ignition capacitor charge for output voltage – two-pin connector **3** with black/red and red/white cable colors (also see circuit diagram on opposite page)

- apply the red measuring lead of the peak voltage adapter to the black/red cable and the black measuring lead to the red/white cable, disconnect connector **3** to disconnect the CDI unit **2**

Multimeter display: 45 volts +/- 5 volts

- Same measurement with connectors CDI unit connected

Multimeter display: 220 volts +/- 10 volts

Check the **primary voltage output** **4** for ignition coil control (also see circuit diagram on opposite page) for output voltage (blue/white cable color):

- apply the red measuring lead **6** of the peak voltage adapter to the black/white cable (ground) and the black measuring lead **5** to the blue/white cable, CDI unit **2** and ignition coil **5** connected

Multimeter display: 210 volts +/- 10 volts

NOTE: the ignition coil does not need to be removed to measure.

Static generator values 250 MXC, EXC USA

Check the **generator output** **6** for the lighting system (also see circuit diagram on opposite page) for voltage:

- between yellow and brown (ground), connector disconnected

Multimeter display: 10.5 volts +/- 1 volt

INDEX

TROUBLE SHOOTING 250 - 3808-2
----------------------------------	------

TROUBLE SHOOTING

If you let the specified maintenance work on your motorcycle be carried out, disturbances can hardly be expected. Should an error occur nevertheless, we advise you to use the trouble shooting chart in order to find the cause of error.

TROUBLE	CAUSE	REMEDY
Engine fails to start	Operating error	Open fuel tap, switch o ignition, replenish fuel, do not use choke
	Fuel supply interrupted	Close fuel tap, loosen fuel hose at carburettor, lead into a basin and open fuel tap, – if fuel leaks out, clean carburettor – if no fuel leaks out, check tank ventilation, i.e. clean fuel tap
	Electrode distance too great	Reduce electrode distance (0.60 mm)
	Plug fouled by oil, wet or bridged	Clean spark plug or renew
	Ignition wire or spark plug connector damaged	Dismount spark plug, connect ignition cable, hold to ground (blank place on engine) and actuate kickstarter, a strong spark must be produced at the spark plug – If no spark is produced, loosen spark plug cap from ignition cable, hold about 5 mm from ground and actuate kickstarter – If a spark now occurs, replace spark plug cap – If no spark is produced, check ignition system
	Kill button wire or short-circuit switch faulty	Disconnect yellow-black coloured cable from CDI and check ignition spark. If the spark is O.K. repair defective part of cable, ignition lock or ignition switch
	Loose ignition cable connectors	Inspect cable connectors
	Spark too weak	Examine ignition system
Water in the carburetor and jets blocked	Dismantle and clean carburetor	
Engine without idle running	Idle adjusting screw out of adjustment	Readjust idle running or replace idle adjusting screw
	Ignition system damaged	Examine ignition system
	Wear	Overhaul engine
Engine has not enough power	Charred glass fiber yarn in silencer	Renew filling
	Air filter obstructed	Clean or renew airfilter
	Control flap does not work	Check control flap, joint rod and centrifugal timer
	Fuel supply partly interrupted or blocked	Blow through fuel pipe and clean carburetor
	Loss of compression through loose spark plug	Tighten spark plug
	Exhaust system damaged	Check exhaust system for damage
	Engine has not enough preignition	Check and adjust ignition

TROUBLE	CAUSE	REMEDY
Engine has not enough power	Reed paddles tensionless or damaged, surface of reed valve housing damaged Wear Electronical ignition timing faulty	Replace reed paddles or reed valve housing Overhaul engine Check ignition system
Engine revs not high and running with four stroke cycle	Carburetor overflows if level adjust too high, float needle seating is dirty or enlarged Loose carburetor jets	Clean carburetor, if necessary replace float needle and adjust level Tighten jets
High rpm misfiring	Incorrect heat range spark plug or low quality spark plug Incorrect or faulty spark plug connector Loose, corroded or non conductive ignition socket connector	Refer to technical data section Test and/or replace spark plug connectors correct type Check and seal with silicon
Engine splutters into the carburetor	Lack of fuel Spark plug with incorrect heat value (Ignition by incandescence) Engine takes air out of control	Clean fuel pipes, examine tank aeration and clean Fit correct spark plug Check intake flange and carburettor if firmly setted
Engine overheating	Insufficient liquid in cooling system Cooling system not or insufficiently bled Radiator fins clogged Frothing in cooling system Pinched or kinked water hoses Incorrect ignition timing because of loose stator bolts Incorrect dimension „X“	Top up coolant and bleed cooling system check cooling system for leaks Bleed cooling system (see operating instructions) Clean radiator fins with water jet Renew coolant using branded anti-freeze/anti-corrosive Replace with correct routed hoses Readjust to correct ignition timing specifications, secure screws properly with Loctite 243 Measure and adjust to correct specification
Emission of white smoke (steam)	Cylinder head or O-ring of cylinder head gasket leaks	Check cylinder head, replace O-ring
Excessive oil escapes from transmission breather tube	Excessive oil quantity in transmission Water pump shaft seal ring or right-hand crankshaft seal ring defect Silicon O-rings of control roller or of control flap leaks	Correct transmission oil level Replace shaft seal ring and change gear oil, check coolant Replace O-rings
All switched on lamps blown out	Voltage regulator faulty	Control connections of voltage regulator. Check voltage regulator

TECHNICAL DATA - ENGINE 250/300/380 SX / EXC 2000 (all models out of USA)

Engine	250 SX	250 EXC	300 EXC	380 SX	380 EXC
Design	Liquid-cooled single-cylinder two-stroke engine with KTM Twin Valve Control exhaust system and KTM Torque Chamber				
Piston displacement	249 ccm				
Bore / stroke	66.4 / 72 mm (2.62 / 2.84 in)				
Fuel	unleaded SUPER fuel, research octane no 95, mixed with high-grade two stroke oil (Shell Advance Racing X)				
Oil / gasoline ratio	1:40 – 1:60 when using high grade two stroke oil. When in doubt, please contact your importer or use 1:40 mix ratio to be on the safe side				
Crankshaft bearing	1 deep-groove ball bearing / 1 cylinder roller bearing				
Connecting rod bearing	needle bearing				
Piston pin bearing	needle bearing				
Piston	cast piston		forged piston		cast piston
Piston ring	one plain compression ring		two plain compression rings		
Dimension "X" (upper edge piston - upper edge cylinder)	0 + 0.1 mm (0 + 0.004 in)				
Ignition timing	2.0 mm (0.07 in) (17 °) BTDC				
Spark plug	NGK BR 8 ECM				
Electrode gap	0.6 mm (0.024 in)				
Dimension "Z" (height of the control flap)	50,5 mm (1.99 in)				
TVC start open	5000/min				
TVC fully open	7500/min				
Primary drive	straight cut spur gears, primary ratio 25:72				
Clutch	multiple disc clutch in oil bath, hydraulic operated (Shell HF-E15)				
Transmission	5 speed, claw actuated				
Gear ratio					
1 st Gear	15:29				
2 nd Gear	17:27				
3 rd Gear	19:25				
4 th Gear	21:23				
5 th Gear	23:21				
Gear lubrication	0,8 l engine oil 20W-40 (Shell Advance VSX4)				
available chain sprockets	13t / 14t / 15t for chain $\frac{5}{8}$ x $\frac{1}{4}$ "				
Coolant	1.3 litres, 40% anti freeze, 60% water, at least -25 °C (-13 °F)				
Ignition system	KOKUSAN 2K-3				
Generator output	12V 110W				
Carburetor	flat-slide carburetor, carburetor setting see table				
Air-filter	wet foam type air filter insert				

TIGHTENING TORQUES		
Flange bolts - cylinder-head	M 8	35 Nm (25 ft.lb)
Nuts-cylinder base	M 10	35 Nm (25 ft.lb)
Flywheel collar nut	M 12x1	60 Nm (44 ft.lb)
Nut for primary sprocket (LH thread)	M 18x1.5	Loctite 243 150 Nm (110 ft.lb)
Nut for inner clutch hub	M 18x1.5	Loctite 243 100 Nm (74 ft.lb)
Crankcase and cover bolts	M 6	8 Nm (6 ft.lb)
Swingarm pivot	M 14	100 Nm (74 ft.lb)
Flat head bolt release plate kickstarter	M 6x16	Loctite 648 19 Nm (14 ft.lb)
Other bolts	M 6	10 Nm (7 ft.lb)
	M 8	25 Nm (19 ft.lb)
	M 10	45 Nm (33 ft.lb)

TOLERANCES AND FITTING CLEARANCES			
Piston fitting clearance	0.05 mm (250)	0.06 mm (300)	0.08 mm (380)
Piston ring end gap	0.3–0.4 mm		
Connecting rod bearing - radial clearance	0.021–0.032 mm		
Transmission shafts end float	0.1–0.2 mm		
Clutch springs - length	Ø 2.5 new = 43 mm, minimum length = 42 mm		

GASKET THICKNESSES	
Crankcase	0.5 mm
Clutch cover	0.5 mm
Cylinder bottom gasket	as required
Available cylinder bottom gaskets	0.2/0.4/0.5/0.75 mm
Cylinder-head gasket	O-rings

TECHNICAL DATA - ENGINE 250/300/380 SX / EXC 2001 (all models out of USA)

Engine	250 SX	250 EXC	300 EXC	380 SX	380 EXC
Design	Liquid-cooled single-cylinder two-stroke engine with KTM Twin Valve Control exhaust system and KTM Torque Chamber				
Piston displacement	249 ccm		297 ccm	368 ccm	
Bore / stroke	66.4 / 72 mm (2.62 / 2.84 in)		72 / 73 mm (2.84 / 2.88 in)	78 / 77 mm (3 / 2.98 in)	
Fuel	unleaded SUPER fuel, research octane no 95, mixed with high-grade two stroke oil (Shell Advance Racing X)				
Oil / gasoline ratio	1:40 – 1:60 when using high grade two stroke oil. When in doubt, please contact your importer or use 1:40 mix ratio to be on the safe side				
Crankshaft bearing	1 deep-groove ball bearing / 1 cylinder roller bearing				
Connecting rod bearing	needle bearing				
Piston pin bearing	needle bearing				
Piston	cast piston		forged piston	cast piston	
Piston ring	one plain compression ring				
Dimension "X" (upper edge piston - upper edge cylinder)	two plain compression rings				
Ignition timing	1,9 mm (0,07 in) BTDC	2.4 mm (0.095 in) BTDC	2.43 mm (0.096 in) BTDC	2.6 mm (0.1 in) 17 ° BTDC	
Spark plug	NGK BR 8 ECM				
Electrode gap	0.6 mm (0.024 in)				
Dimension "Z" (height of the control flap)	49,5 mm (1.94 in)		46 mm (1.7 in)	50.5 mm (1.99 in)	
TVC start open	5000/min		5900/min	5200/min	
TVC fully open	7000/min		7750/min	7200/min	
Primary drive	straight cut spur gears, primary ratio 25:72				
Clutch	multiple disc clutch in oil bath, hydraulic operated (Shell HF-E15)				
Transmission	5 speed, claw actuated				
Gear ratio	15:29 17:27 19:25 21:23 23:21		15:29 18:26 19:24 21:23 23:21	15:29 18:26 19:22 21:20 23:18	
Gear lubrication	0.8 l engine oil 20W-40 (Shell Advance VSX4)		0.8 l gear oil 80W (Shell Gear EP 80)	0.8 l engine oil 20W-40 (Shell Advance VSX4)	
available chain sprockets	13t / 14t / 15t for chain $\frac{5}{8}$ x $\frac{1}{4}$ "				
Coolant	1.3 litres, 40% anti freeze, 60% water, at least -25 °C (-13 °F)				
Ignition system	KOKUSAN 2K-4		KOKUSAN 2K-3	KOKUSAN 2K-3	
Generator output	no generator		12V 110W	no generator	
Carburetor	flat-slide carburetor, carburetor setting see table				
Air-filter	wet foam type air filter insert

TECHNICAL DATA - ENGINE 250/300/380 SX / MXC / EXC 2002 (only USA)

Engine	250 SX	250 MXC/EXC	300 MXC/EXC	380 SX	380 MXC/EXC
Design	Liquid-cooled single-cylinder two-stroke engine with KTM Twin Valve Control exhaust system and KTM Torque Chamber				
Piston displacement	249 ccm	297 ccm	368 ccm		
Bore / stroke	66.4 / 72 mm (2.62 / 2.84 in)	72 / 73 mm (2.84 / 2.88 in)	78 / 77 mm (3 / 2.98 in)		
Fuel	unleaded SUPER fuel, research octane no 95, mixed with high-grade two stroke oil (Shell Advance Racing X)				
Oil / gasolin ratio	1:40 – 1:60 when using high grade two stroke oil. When in doubt, please contact your importer or use 1:40 mix ratio to be on the safe side				
Crankshaft bearing	1 deep-groove ball bearing / 1 cylinder roller bearing				
Connecting rod bearing	needle bearing				
Piston pin bearing	needle bearing				
Piston	cast piston		forged piston	cast piston	
Piston ring	one plain compression rings				
Dimension "X" <small>(upper edge piston - upper edge cylinder)</small>	0 +0.1 mm (0 + 0.004 in)				
Ignition timing	1,9 mm (0,07 in) BTDC		1,94 mm (0,08 in) BTDC		
Spark plug	NGK BR 8 ECM				
Electrode gap	0.6 mm (0.024 in)				
Dimension "Z" <small>(height of the control flap)</small>	49,5 mm (1.95 in)		46 mm (1.7 in)		
TVC start open	5000/min		5900/min		
TVC fully open	7000/min		7750/min		
Primary drive	straight cut spur gears, primary ratio 25:72		straight cut spur gears, primary ratio 26:72		
Clutch	multiple disc clutch in oil bath, hydraulic operated (Shell HF-E15)				
Transmission	5 speed, claw actuated				
Gear ratio		EXC	MXC	EXC	MXC
1 st Gear	15:29	15:29	15:29	15:29	15:29
2 nd Gear	17:27	18:26	17:27	18:26	18:26
3 rd Gear	19:25	19:22	19:25	19:24	19:24

TECHNICAL DATA - ENGINE 250/300 MXC / EXC 2003

	250 MXC/EXC	300 MXC/EXC
Engine	Liquid-cooled single-cylinder two-stroke engine with KTM Twin Valve Control exhaust system and KTM Torque Chamber	
Piston displacement	249 ccm	
Bore / stroke	66,4 / 72 mm (2.62 / 2.84 in)	
Fuel	unleaded SUPER fuel, research octane no 95, mixed with high-grade, two-stroke oil	
Oil / gasolino ratio	1:40 – 1:60 when using high grade, two-stroke oil. When in doubt, please contact your importer or use 1:40 mix ratio to be on the safe side	
Crankshaft bearing	1 deep-groove ball bearing / 1 cylinder roller bearing	
Connecting rod bearing	needle bearing	
Piston pin bearing	needle bearing	
Piston	cast piston	forged piston
Piston ring	two plain compression rings	
Dimension "X" <small>(upper edge piston, upper edge cylinder)</small>	0 + 0,1 mm (0 + 0.004 in)	
Ignition timing	1,9 mm vor OT	
Spark plug	NGK BR 7 ES	
Electrode gap	0,60 mm	
Dimension "Z" <small>(height of the control flap)</small>	49,5 mm (0.024 in)	
TVC start open	5000/min	
TVC fully open	7000/min	
Primary drive	straight cut spur gears, primary ratio 25:72	
Clutch	multiple disc clutch in oil bath, hydraulically operated (Shell HF-E15)	
Transmission	5 speed, claw actuated	
Gear ratio	EXC 15:29 18:26 19:22 21:20 23:18	MXC 15:29 18:26 19:22 21:20 23:18
1 st gear		
2 nd gear		
3 rd gear		
4 th gear		
5 th gear		
Gear lubrication	0,8 l engine oil 10W-40	
available chain sprockets	13Z / 14Z / 15Z for chain $\frac{5}{8} \times \frac{1}{4}$ "	
Coolant	1.3 liters, 40% antifreeze, 60% water, at least -25 °C (-13 °F)	
Ignition system	KOKUSAN 2K-3	
Generator output	12V 110W	
Ignition system USA (MXC)	KOKUSAN 2K-2	
Generator output	12V 40W	
Carburetor	flat-slide carburetor, carburetor setting see table	
Air-filter	wet foam type air filter insert	

TIGHTENING TORQUES		
Flange bolts - cylinder-head	M 8	35 Nm (25 ft.lb)
Nuts-cylinder base	M 10	35 Nm (25 ft.lb)
Flywheel collar nut	M 12x1	60 Nm (44 ft.lb)
Flat head screw release plate kickstarter	M 6x16	Loctite 648 19 Nm (14 ft.lb)
Nut for primary sprocket (LH thread)	M 18x1.5	Loctite 243 150 Nm (110 ft.lb)
Nut for inner clutch hub	M 18x1.5	Loctite 243 100 Nm (74 ft.lb)
Crankcase and cover bolts	M 6	8 Nm (6 ft.lb)
Swingarm pivot	M 14	100 Nm (74 ft.lb)
Other screws	M 6	10 Nm (7 ft.lb)
	M 8	25 Nm (19 ft.lb)
	M 10	45 Nm (33 ft.lb)

TOLERANCES AND FITTING CLEARANCES	
Piston fitting clearance	0.06 mm (250 / 300)
Piston ring end gap	0.3–0.4 mm
Connecting rod bearing - radial clearance	0.021–0.032 mm
Transmission shafts end float	0.1–0.2 mm
Clutch springs - length	Ø 2.5 minimum length = 42 mm, new = 43 mm
Crankshaft webs – outer dimension	60 mm ± 0,05 mm
Runout Crankshaft journal Crankshaft	max 0,06 (neu 0,03)

GASKET THICKNESSES	
Crankcase	0.5 mm
Clutch cover	0.5 mm
Cylinder bottom gasket	as required
Available cylinder bottom gaskets	0.2/0.4/0.5/0.75 mm
Cylinder-head gasket	O-rings

LUBRICATION AND MAINTENANCE SCHEDULE 250 - 38010-4

MODEL 2003

LUBRICATION AND MAINTENANCE SCHEDULE 250 - 30010-6

PERIODIC LUBRICATION AND MAINTENANCE SCHEDULE

125-380 6.98

**AT A REGULAR COMPETITION USE OF THE BIKE, THE 4000 KM (2500 MILES)
SERVICE IS TO BE DONE AFTER EVERY RACE**

	KTM rider		KTM dealer			
	before each start	after washing	1st service after 1000 km (600 miles) or 10 hours	after 2000 km (1250 miles) or 20 hours	after 4000 km (2500 miles) or once a year	at least once a year
Check transmission oil level	•					
Change transmission oil			•		•	•
Check spark plug and electrode gap				•	•	•
Change spark plug					•	
Functional testing of the exhaust control system						•
Check intake manifold for leaks and cracks	•				•	
Drain and clean carburetor float chamber		•			•	
Adjust idling			•		•	
Check breather hoses of engine case and gas tank for correct position without buckles			•			
Clean and check airfilter element, box and carburetor connection boot		•			•	•
Check chain, sprockets, guides and chain wear	•		•		•	
Clean and oil chain	•				•	
Check chain tension	•		•		•	
Check coolant level	•		•		•	
Check quality of antifreeze						•
Check cooling system for leaks - visual inspection	•		•		•	
Check exhaust system for cracks and leaks					•	
Replace glass fiber yarn of silencer					•	
Check of the exhaust suspension system					•	
Check brake fluid level front and rear	•		•		•	
Change brake fluid						•
Check thickness of disc brake pads	•				•	
Check brake discs					•	
Inspect condition and installation of front and rear brake hoses	•		•		•	
Check free travel and free movability of hand brake lever and foot brake lever	•		•		•	
Check the oil level in the master cylinder of the hydraulic clutch				•	•	
Change the oil of the hydraulic clutch						•
Check telescopic fork action	•				•	
Check telescopic fork for leaks					•	
Push up the protective bellows and remove the dirt; the drain holes must be free of obstructions		•	•	•	•	
Clean the dust scrubbers of the telescopic force		•		•	•	
Undo the bleeder screws at the fork legs					•	
Change oil of telescopic fork						•
Service telescopic fork completely						•
Check steering head bearing free play			•		•	
Clean and regrease steering head bearing					•	•
Check setting and damping of shock absorber	•				•	
Service shock absorber completely						•
Grease swingarm needle bearings (don't grease the pivot bearing for the shock absorber)						•
Check for even spoke tension and rim alignment	•		•		•	
Check wheel bearings	•				•	
Check tires for cuts and air pressure	•				•	
Check cables for damage and free movement	•				•	
Adjust and oil control cables		•	•		•	
Check electrical system	•		•		•	
Check battery holder and connections (CH, Singapore)					•	
Check adjustment of headlight					•	
Apply contact spray to light switches, flasher switches and ignition lock		•			•	
Check all bolts, nuts, screws and clamps for proper tightness	•		•		•	
Clean and lubricate control lever pivot points		•	•	•	•

Functional testing of the exhaust control system						•
Check intake manifold for leaks and cracks	•				•	
Drain and clean carburetor float chamber		•			•	
Adjust idling			•		•	
Check breather hoses of engine case and gas tank for correct position without buckles			•			
Clean and check airfilter element, box and carburetor connection boot		•			•	•
Check chain, sprockets, guides and chain wear	•		•		•	
Clean and oil chain	•				•	
Check chain tension	•		•		•	
Check coolant level	•		•		•	
Check quality of antifreeze						•
Check cooling system for leaks - visual inspection	•		•		•	
Check exhaust system for cracks and leaks					•	
Replace glass fiber yarn of silencer					•	•
Check of the exhaust suspension system	•				•	
Check brake fluid level front and rear	•		•		•	
Change brake fluid						•
Check thickness of disc brake pads	•				•	
Check brake disks for wear and wobbling					•	
Inspect condition and installation of front and rear brake hoses	•		•		•	
Check free travel and free movability of hand brake lever and foot brake lever	•		•		•	
Check the oil level in the master cylinder of the hydraulic clutch				•	•	
Change the oil of the hydraulic clutch						•
Check telescopic fork action	•				•	
Check telescopic fork for leaks					•	
Clean the dust scrabbers of the telescopic force		•		•	•	
Undo the bleeder screws at the fork legs					•	
Change oil of telescopic fork						•
Service telescopic fork completely						•
Check steering head bearing free play			•		•	
Clean and regrease steering head bearing					•	•
Check setting and damping of shock absorber	•				•	
Service shock absorber completely						•
Grease swingarm needle bearings (dont grease the pivot bearing for the shock absorber)						•
Check for even spoke tension and rim alignment	•		•		•	
Check wheel bearings	•				•	
Check tires for cuts and air pressure	•				•	
Check cables for damage and free movement	•				•	
Adjust and oil control cables		•	•		•	
Check electrical system	•		•		•	
Check adjustment of headlight					•	
Apply contact spray to light switches, flasher switches and emergency off switch		•			•	
Check all bolts, nuts, screws and clamps for proper tightness	•		•		•	
Clean and lubricate control lever pivot points		•	•	•	•	

PERIODIC MAINTENANCE SCHEDULE 2001/02

250/300/380 SX/MXC/EXC

A washed motorcycle can be checked more quickly which saves money!		1. service after 10 hours or 1000 kilometer	after 20 hours or 2000 kilometer	after 4000 kilometer or once a year	
ENGINE	Check gear box oil level		●		
	Change gear box oil	●		●	
	Check spark plugs, adjust distance between electrodes	●	●		
	Renew spark plugs			●	
CARBURETOR	Check the carburettor connection boot for cracks and leaks			●	
	Check idle speed setting	●		●	
	Check that vent hoses are not damaged or bent	●		●	
ADD-ON-PARTS	Check cooling system for leaks, check quantity of anti freeze	●		●	
	Check exhaust system for leaks and fitment			●	
	Check cables for damage, smooth operation, bends; adjust and lubricate	●		●	
	Check oil level of the clutch master cylinder	●	●	●	
	Clean air filter and filter box			●	
	Check electric wires for damage and bends			●	
	Check headlamp setting			●	
	Check function of electric systems (low-, high beam, break light, indicator, indicator lamps, speedometer illumination, horn, emergency OFF switch or button)	●		●	
	BRAKES	Check brake fluid level, lining thickness, break lining	●		●
		Check brake lines for damage and leaks	●		●
Check/adjust smooth operation and free travel of handbrake/foot brake lever		●		●	
Check tightness of brake system screws		●		●	
CHASSIS	Check shock absorber and fork for leaks and function	●		●	
	Clean fork dust bellows			●	
	Bleed fork legs			●	
	Check swing arm bearings			●	
	Check/adjust steering head bearings	●		●	
	Check tightness of all chassis screws (triple clamps, fork leg axle passage axle nuts and screws, swing arm bearings, shock absorber)	●		●	
WHEELS	Check spoke tension and rim joint			●	
	Check tyres and air pressure	●		●	
	Check chain, rear sprockets and chain guides for wear, fitment and tension	●		●	
	Lubricate chain	●		●	
	Check clearance of wheel bearings	●		●	

IMPORTANT RECOMMENDED MAINTENANCE WORK THAT CAN BE CARRIED OUT BY EXTRA ORDER

	at least once a year	every 2 years or 20000 km
Check function of exhaust control	●	
Complete maintenance of shock absorber	●	
Complete maintenance of fork		●
Clean and grease steering head bearings and gasket elements	●	
Clean and adjust carburetor	●	
Replace glass fibre yarn filling of the exhaust main silencer	●	
Treat electric contacts and switches with contact grease	●	
Change hydraulic clutch fluid	●	
Change break fluid	●	

**IF MOTORCYCLE IS USED FOR COMPETITION 4000KM SERVICE SHOULD BE CARRIED OUT AFTER EVERY RACE!
SERVICE INTERVALLS SHOULD NEVER BE EXCEED BY MORE THAN 5 HOURS OR 500 KM!
MAINTENANCE WORK DONE BY KTM AUTHORISED WORKSHOPS IS NOT A SUBSTITUTE OF CARE AND CHECKS DONE BY THE RIDER!**

IMPORTANT CHECKS AND MAINTENANCE TO BE CARRIED OUT BY THE RIDER

	Before each start	After every cleaning	For cross-country use	Once a year
Check gear box oil level	●			
Check brake fluid level	●			
Check brake pads for wear	●			
Check lights for function	●			
Check horn for function	●			
Lubricate and adjust cables and nipples		●		
Bleed fork legs regulary			●	
Remove and clean fork dust bellows regulary			●	
Clean and lubricate chain, check tension and adjust if necessary		●	●	
Clean air filter and filter box			●	
Check tires for pressure and wear	●			
Check cooling liquid level	●			
Check fuel lines for leaks	●			
Drain and clean float chamber		●		
Check all control elements for smooth operation	●			
Check brake performance	●	●		
Treat blank metal parts (with the exception of brake and exhaust systems) with wax-based anti corrosion agent		●		
Treat ignition and steering locks and light switches with contact spray		●		
Check tightness of screws, nuts and hose clamps regular				●

PERIODIC MAINTENANCE SCHEDULE 2003

250/300 MXC/EXC

A clean motorcycle can be checked more quickly which saves money!		1st service after 10 hours or 1000 kilometers	after 20 hours or 2000 kilometers	after 4000 kilometer or once a year
ENGINE	Check gear box oil level		●	
	Change gear box oil	●		●
	Check spark plugs, adjust distance between electrodes	●	●	
	Renew spark plugs			●
CARBURETOR	Check the carburetor connection boot for cracks and leaks			●
	Check idle speed setting	●		●
	Check that vent hoses are not damaged or bent	●		●
ADD-ON-PARTS	Check cooling system for leaks, check quantity of antifreeze	●		●
	Check exhaust system for leaks and fitment			●
	Check cables for damage, smooth operation, bends; adjust and lubricate	●		●
	Check oil level of the clutch master cylinder	●	●	●
	Clean air filter and filter box			●
	Check electric wires for damage and bends			●
	Check headlamp setting			●
	Check function of electric systems (low beam, high beam, break light, indicator, indicator lamps, speedometer illumination, horn, emergency OFF switch or button)	●		●
BRAKES	Check brake fluid level, lining thickness, brake lining	●		●
	Check brake lines for damage and leaks	●		●
	Check/adjust smooth operation and free travel of handbrake/foot brake lever	●		●
	Check tightness of brake system screws	●		●
CHASSIS	Check shock absorber and fork for leaks and function	●		●
	Clean dust bellows			●
	Bleed fork legs			●
	Check swing arm bearings			●
	Check/adjust steering head bearings	●		●
	Check tightness of all chassis screws (triple clamps, fork leg axle passage axle nuts and screws, swing arm bearings, shock absorber)	●		●
WHEELS	Check spoke tension and rim joint			●
	Check tires and air pressure	●		●
	Check chain, rear sprockets and chain guides for wear, fitment and tension	●		●
	Lubricate chain	●		●
	Check clearance of wheel bearings	●		●

IMPORTANT RECOMMENDED MAINTENANCE WORK THAT CAN BE CARRIED OUT BY EXTRA ORDER

	at least once a year	every 2 years or 20000 km
Check function of exhaust control	●	
Complete maintenance of shock absorber	●	
Complete maintenance of fork		●
Clean and grease steering head bearings and gasket elements	●	
Clean and adjust carburetor	●	
Replace glass fibre- yarn filling of the exhaust main silencer	●	
Treat electric contacts and switches with contact grease	●	
Change hydraulic clutch fluid	●	
Change break fluid	●	

**IF MOTORCYCLE IS USED FOR COMPETITION 4000KM SERVICE SHOULD BE CARRIED OUT AFTER EVERY RACE!
SERVICE INTERVALS SHOULD NEVER BE EXCEEDED BY MORE THAN 5 HOURS OR 500 KM!
MAINTENANCE WORK DONE BY KTM AUTHORISED WORKSHOPS IS NOT A SUBSTITUTE FOR CARE AND CHECKS DONE BY THE RIDER!**

IMPORTANT CHECKS AND MAINTENANCE TO BE CARRIED OUT BY THE RIDER

	Before each start	After every cleaning	For cross-country use	Once a year
Check gear box oil level	●			
Check brake fluid level	●			
Check brake pads for wear	●			
Check lights for function	●			
Check horn for function	●			
Lubricate and adjust cables and nipples		●		
Bleed fork legs regularly			●	
Remove and clean dust bellows regularly			●	
Clean and lubricate chain, check tension and adjust if necessary		●	●	
Clean air filter and filter box			●	
Check tires for pressure and wear	●			
Check cooling liquid level	●			
Check fuel lines for leaks	●			
Empty and clean float chamber		●		
Check all control elements for smooth operation	●			
Check brake performance	●	●		
Treat blank metal parts (with the exception of brake and exhaust systems) with wax-based anti corrosion agent		●		
Treat ignition and steering locks and light switches with contact spray		●		
Check tightness of screws, nuts and hose clamps regularly				●

**RECOMMENDED INSPECTION OF THE 250/300 EXC AND MXC ENGINE
USED FOR ENDURO COMPETITIONS BY YOUR KTM WORKSHOP
(ADDITIONAL ORDER FOR THE KTM WORKSHOP)**

	30 hours	45 hours	60 hours	90 hours	120 hours	135 hours
Check the reed-type intake valve for wear	●	●	●	●	●	●
Check the clutch shoes for wear	●	●	●	●	●	●
Check the length of the clutch springs	●	●	●	●	●	●
Check the cylinder and piston for wear	●	●	●	●	●	●
Check the exhaust control for proper functioning and smooth running	●	●	●	●	●	●
Check the eccentricity of the crankshaft journal	●	●	●	●	●	●
Check the radial clearance of the conrod bearings	●		●		●	
Check the radial clearance of the piston pin main bearing	●		●		●	
Check the crankshaft main bearing for wear	●		●		●	
Replace the crankshaft bearings and conrod bearings		●		●		●
Check the entire transmission including roller and bearings for wear		●		●		●

**RECOMMENDED INSPECTION OF THE 250/300 EXC AND MXC ENGINE
USED FOR HOBBY- ENDURO BY YOUR KTM WORKSHOP
(ADDITIONAL ORDER FOR THE KTM WORKSHOP)**

	60 hours	90 hours	120 hours	180 hours	240 hours	270 hours
Check the reed-type intake valve for wear	●	●	●	●	●	●
Check the clutch shoes for wear	●	●	●	●	●	●
Check the length of the clutch springs	●	●	●	●	●	●
Check the cylinder and piston for wear	●	●	●	●	●	●
Check the exhaust control for proper functioning and smooth running	●	●	●	●	●	●
Check the eccentricity of the crankshaft journal	●	●	●	●	●	●
Check the radial clearance of the conrod bearings	●		●		●	
Check the radial clearance of the piston pin main bearing	●		●		●	
Check the crankshaft main bearing for wear	●		●		●	
Replace the crankshaft bearings and conrod bearings		●		●		●
Check the entire transmission including roller and bearings for wear		●		●		●

NOTE: IF THE INSPECTION ESTABLISHES THAT PERMISSIBLE TOLERANCES ARE EXCEEDED, THE RESPECTIVE COMPONENTS MUST BE REPLACED.
