Chapter 1: Introduction

ManuScript is a simple, music-based programming language used to write plug-ins for Sibelius. ManuScript is based on Simkin, an embedded scripting language developed by Simon Whiteside, and has been extended by him and the rest of the Sibelius team ever since. (Simkin is a spooky pet name for Simon sometimes found in Victorian novels.) For more information on Simkin, and additional help on the language and syntax, visit the Simkin website at www.simkin.co.uk.

Rationale

Providing a plug-in language for Sibelius addresses several different issues:

- Music notation is complex and infinitely extensible, so some users will sometimes want to add to a music notation program to expand its possibilities with these new extensions.
- It is useful to allow frequently repeated operations (for example, opening a MIDI file and saving it as a score) to be automated, using a system of scripts or macros.

Certain more complex techniques used in composing or arranging music can be partly automated, but there are too many to include as standard features in Sibelius.

There were several conditions that we wanted to meet in deciding what language to use:

The language had to be simple, as we want normal users (not just seasoned programmers) to be able to use it.

We wanted plug-ins to be usable on any computer, as the use of computers running both Windows and Mac OS X is widespread in the music world.

We wanted the tools to program in the language to be supplied with Sibelius.

We wanted musical concepts (pitch, notes, bars) to be easily expressed in the language.

We wanted programs to be able to talk to Sibelius easily (to insert and retrieve information from scores).

We wanted simple dialog boxes and other user interface elements to be easily programmed.

C/C++, the world's "standard" programming language(s), were unsuitable as they are not easy for the non-specialist to use, they would need a separate compiler, and you would have to recompile for each different platform you wanted to support (and thus create multiple versions of each plug-in).

The language Java was more promising as it is relatively simple and can run on any platform without recompilation. However, we would still need to supply a compiler for people to use, and we could not express musical concepts in Java as directly as we could with a new language.

So we decided to create our own language that is interpreted so it can run on different platforms, integrated into Sibelius without any need for separate tools, and can be extended with new musical concepts at any time.

The Manuscript language that resulted is very simple. The syntax and many of the concepts will be familiar to programmers of C/C++ or Java. Built into the language are musical concepts (Score, Staff, Bar, Clef, NoteRest) that are instantly comprehensible.

Technical Support

Since the Manuscript language is more the province of our programmers than our technical support team (who are not, in the main, programmers), we can't provide detailed technical help on it, any more than Oracle will help you with Java programming. This document and the sample plug-ins should give you a good idea of how to do some simple programming fairly quickly.

We would welcome any useful plug-ins you write – please contact us at www.sibelius.com/plugins and we may put them on our web site; if we want to distribute the plug-in with Sibelius itself, we'll pay you for it.

Mailing list for plug-in developers

There is a growing community of plug-in developers working with Manuscript, and they can be an invaluable source of help when writing new plug-ins. To subscribe, go to <http://avid-listsrv1.avid.com/mail-man/listinfo/plugin-dev>.

System Requirements and Compatibility Information

Avid can only assure compatibility and provide support for hardware and software it has tested and approved.

For complete system requirements and a list of qualified computers, operating systems, hard drives, and third-party devices, visit: www.avid.com/compatibility.

Conventions Used in Sibelius Documentation

Sibelius documentation uses the following conventions to indicate menu choices, keyboard commands, and mouse commands:

Convention	Action
File > Save	Choose Save from the File tab
Control+N	Hold down the Control key and press the N key
Control-click	Hold down the Control key and click the mouse button
Right-click	Click with the right mouse button

The names of Commands, Options, and Settings that appear on-screen are in a different font.

The following symbols are used to highlight important information:

 *User Tips are helpful hints for getting the most from your Sibelius system.*

 *Important Notices include information that could affect data or the performance of your Sibelius system.*

 *Shortcuts show you useful keyboard or mouse shortcuts.*

 *Cross References point to related sections in this guide and other Avid documentation.*

Chapter 2: Sibelius Manuscript Language Tutorial

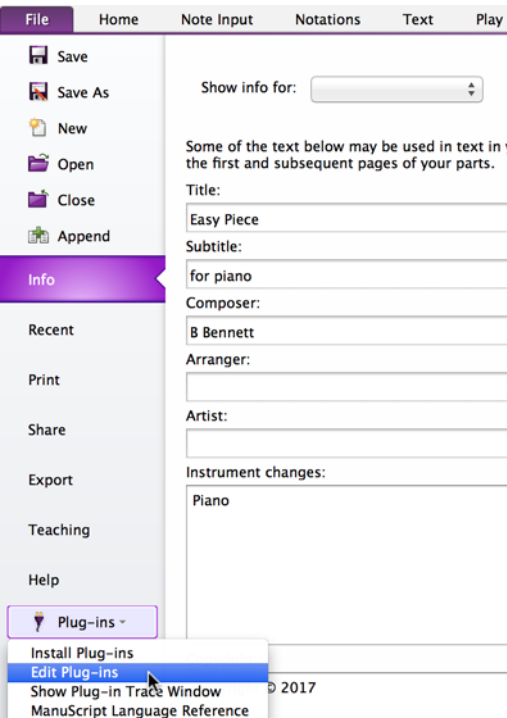

Edit Plug-ins

A Simple Plug-in

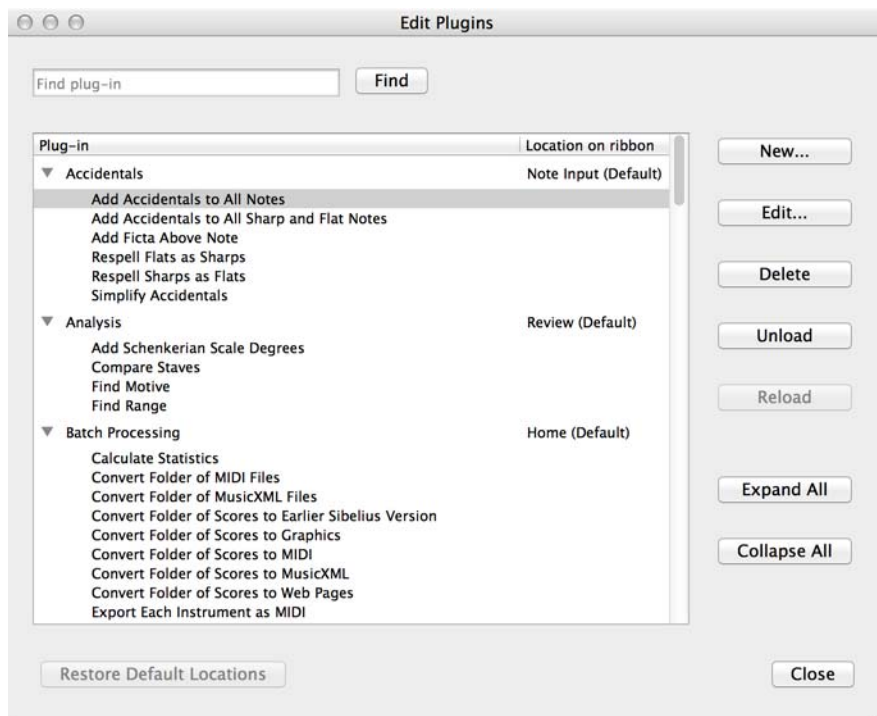

Let's start a simple plug-in. You are assumed to have some basic experience of programming (such as BASIC or C), so you're already familiar with ideas like variables, loops, and so on.

To create a new Sibelius plug-in:

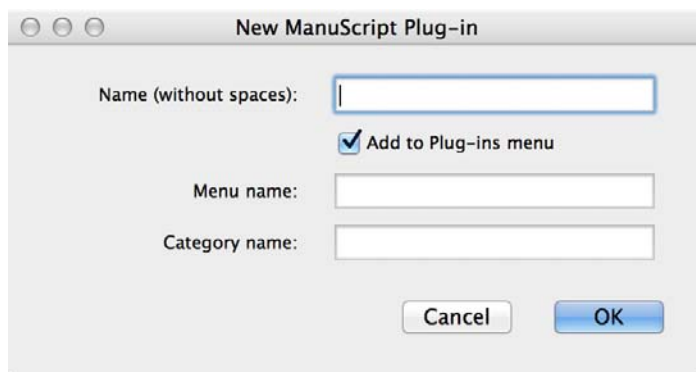

- 1 Start Sibelius and open or create a new score.
- 2 Choose File > Plug-ins > Edit Plug-ins.

3 The following dialog appears:

4 Click New.

5 You are asked to type the internal name of your plug-in (used as the plug-in's filename), the name that should appear on the menu and the name of the category in which the plug-in should appear, which will determine which ribbon tab it appears on.

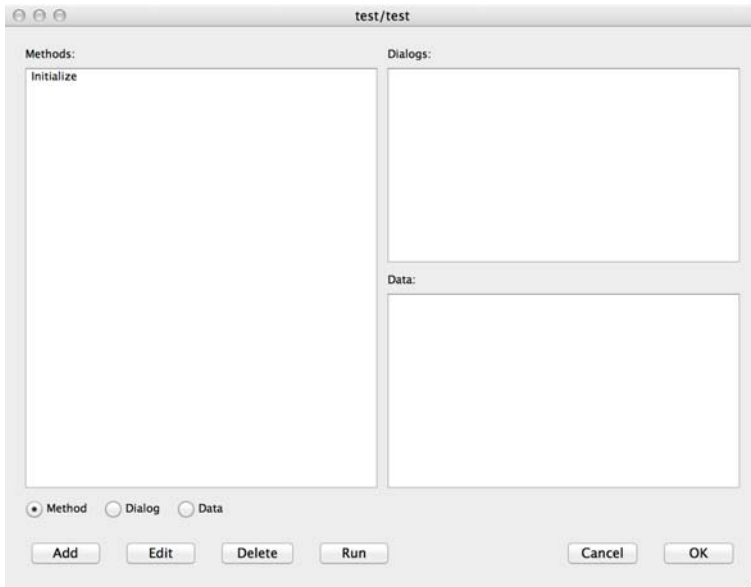

The reason for having two separate names for plug-ins is that filenames may be no longer than 31 characters on Macs running Mac OS 9 (which is only significant if you intend your plug-in to be used with versions of Sibeli.us prior to Sibeli.us 4), but the menu names can be as long as you like.

- 6 Type Test as the internal name, Test plug-in as the menu name and Tests as the category name, then click OK.
- 7 You'll see Test (user copy) added to the list in the Edit Plug-ins dialog under a new Tests branch of the tree view. Click Close. This shows the folder in which the plug-in is located (Tests, which Sibeli.us has created for you), the filename of the plug-in (minus the standard .plg file extension), and (user copy) tells you that this plug-in is located in your user application data folder, not the Sibeli.us program folder or application package itself.
- 8 If you look in the Home > Plug-ins gallery again you'll see a Tests category, with a Test plug-in underneath it.
- 9 Choose Home > Plug-ins > Tests > Test and the plug-in will run. You may first be prompted that you cannot undo plug-ins, in which case click Yes to continue (and you may wish to switch on the Don't say this again option so that you're not bothered by this warning in future.) What does our new Test plug-in do? It just pops up a dialog which says Test (whenever you start a new plug-in, Sibeli.us automatically generates in a one-line program to do this). You'll also notice a window appear with a button that says Stop Plug-in, which appears whenever you run any plug-in, and which can be useful if you need to get out of a plug-in you're working on that is (say) trapped in an infinite loop.
- 10 Click OK on the dialog and the plug-in stops.

Three Types of Information

Let's look at what's in the plug-in so far. Choose File > Plug-ins > Edit Plug-ins again, then select Tests/Test (user copy) from the list and click Edit (or simply double-click the plug-in's name to edit it). You'll see a dialog showing the three types of information that can make up a plug-in:

- **Methods:** Methods are similar to procedures, functions, or routines in some other languages.
- **Dialogs:** The layout of any special dialogs you design for your plug-in.
- **Data:** Data are variables whose value is remembered between running the plug-in. You can only store strings in these variables, so they're useful for things like user-visible strings that can be displayed when the plug-in runs. For a more sophisticated approach to global variables, Manuscript provides custom user properties for all objects—see "Edit Plug-ins" on page 5.

Methods

The actual program consists of the methods. As you can see, plug-ins normally have at least two methods, which are created automatically for you when you create a new plug-in:

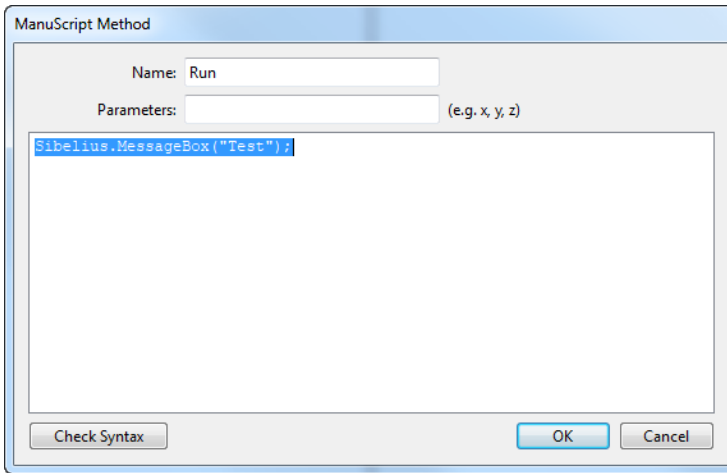

Initialize

This method is called automatically whenever you start up Sibelius. Normally it does nothing more than add the name of the plug-in to the Plug-ins menu, although if you look at some of the supplied plug-ins you'll notice that it's sometimes also used to set default values for data variables.

Run

This is called when you run the plug-in, you'll be startled to hear (it's like `main()` in C/C++ and Java). In other words, when you choose Home > Plug-ins > Tests > Test, the plug-in's Run method is called. If you write any other methods, you have to call them from the Run method—otherwise how can they ever do anything?

Click on Run, then click Edit (or you can just double-click Run to edit it). This shows a dialog where you can edit the Run method:

In the top field you can edit the name; in the next field you can edit the parameters (the variables where values passed to the method are stored); and below is the code itself:

```
Sibelius.MessageBox("Test");
```

This calls a method **MessageBox** which pops up the dialog box that says Test when you run the plug-in. Notice that the method name is followed by a list of parameters in parentheses. In this case there's only one parameter: because it is a string (that is, text) it is in double quotes. Notice also that the statement ends in a semicolon, as in C/C++ and Java. If you forget to type a semicolon, you'll get an error when the plug-in runs.

What is the role of the word Sibelius in **Sibelius.MessageBox**? In fact it's a variable representing the Sibelius program; the statement is telling Sibelius to pop up the message box (C++ and Java programmers will recognize that this variable refers to an "object"). If this hurts your brain, we'll go into it later.

Editing the Code

Now try amending the code slightly. You can edit the code just like in a word processor, using the mouse and arrow keys, and you can also use Ctrl+X/C/V or ⌘X/C/V for cut, copy and paste respectively. If you right-click (Windows) or Control-click (Mac) you get a menu with these basic editing operations on them too.

Change the code to this:

```
x = 1;  
x = x + 1;  
Sibelius.MessageBox("1 + 1 = " & x);
```

You can check this makes sense (or, at least, some kind of sense) by clicking the Check Syntax button. If there are any blatant mistakes (e.g. missing semicolons) you will be notified where they are.

Then close the dialogs by clicking OK, OK again then Close. Run your amended plug-in from the Plug-ins menu and a message box with the answer `1 + 1 = 2` should appear.

How does it work? The first two lines should be obvious. The last line uses `&` to stick two strings together. You cannot use `+` as this works only for numbers (if you try it in the example above, you will get an interesting answer!).

One pitfall: try changing the second line to:

```
x += 1;
```

Then click Check syntax. You will encounter an error: this syntax (and the syntax `x++`) is allowed in various languages but not in Manuscript. You have to do `x = x+1;`.

Where Plug-ins are Stored

Plug-ins supplied with Sibelius are stored in folders buried deep within the Sibelius program folder on Windows, and inside the application package (or “bundle”) on Mac. It is not intended that end users should add extra plug-ins to these locations themselves, as we have provided a per-user location for plug-ins to be installed instead. When you create a new plug-in or edit an existing one, the new or modified plug-in will be saved into the per-user location (rather than modifying or adding to the plug-ins in the program folder or bundle):

- On Windows, additional plug-ins are stored at `C:\Users\username\AppData\Roaming\Avid\Sibelius\Plugins`.
- On Mac, additional plug-ins are stored in subfolders at `/Users/username/Library/Application Support/Avid/Sibelius/Plugins`.

This is worth knowing if you want to give a plug-in to someone else. The plug-ins appear in subfolders which correspond to the categories in which they appear in the various Plug-ins galleries. The filename of the plug-in itself is the plug-in’s internal name plus the `.plg` extension, such as `Test.plg`.

(Sibelius includes an automatic plug-in installer, which you can access via `File > Plug-ins Install Plug-ins`. This makes it easy to download and install plug-ins from the Sibelius web site.)

Line Breaks and Comments

As with C/C++ and Java, you can put new lines wherever you like (except in the middle of words), as long as you remember to put a semicolon after every statement. You can put several statements on one line, or put one statement on several lines.

You can add comments to your program, again like C/C++ and Java. Anything after `//` is ignored to the end of the line. Anything between `/*` and `*/` is ignored, whether just part of a line or several lines:

```
// comment lasts to the end of the line  
/* you can put  
several lines of comments here  
*/
```

For instance:

```
Sibelius.MessageBox("Hi!"); // print the active score
```

or:

```
Sibelius /* this contains the application */ .MessageBox("Hi!");
```

Variables

x in the Test plug-in is a variable. In ManuScript a variable can be any sequence of letters, digits or `_` (underscore), as long as it does not start with a digit.

A variable can contain an integer (whole number), a floating point number, a string (text) or an object (such as a note)—more about objects in a moment. Unlike most languages, in ManuScript a variable can contain any type of data—you do not have to declare what type you want. Thus you can store a number in a variable, then store some text instead, then an object.

Try this:

```
x = 56; x = x+1;
Sibelius.MessageBox(x); // prints '57' in a dialog box
x = "now this is text"; // the number it held is lost
Sibelius.MessageBox(x); // prints 'now this is text' in a dialog
x = Sibelius.ActiveScore; // now it contains a score
Sibelius.MessageBox(x); // prints nothing in a dialog
```

Variables that are declared within a ManuScript method are local to that method; in other words, they cannot be used by other methods in the same plug-in. Global Data variables defined using the plug-in editor can be accessed by all methods in the plug-in, and their values are preserved over successive uses of the plug-in.

A quick aside about strings in ManuScript is in order at this point. Like many programming languages, ManuScript strings uses the back-slash `\` as an “escape character” to represent certain special things. To include a single quote character in your strings, use `\'`, and to include a new line you should use `\n`. Because of this, to include the backslash itself in a ManuScript string one has to write `\\`.

Converting Between Numbers, Text, and Objects

Notice that the method **MessageBox** is expecting to be sent some text to display. If you give it a number instead (as in the first call to **MessageBox** above) the number is converted to text. If you give it an object (such as a score), no text is produced.

Similarly, if a calculation is expecting a number but is given some text, the text will be converted to a number:

```
x = 1 + "1"; // the + means numbers are expected
Sibelius.MessageBox(x); // displays '2'
```

If the text doesn't start with a number (or if the variable contains an object instead of text), it is treated as 0:

```
x = 1 + "fred";
Sibelius.MessageBox(x); // displays '1'
```

Loops

“for” and “while”

ManuScript has a **while** loop which repeatedly executes a block of code until a certain expression becomes True. Create a new plug-in called Potato. This is going to amuse one and all by writing the words of the well-known song “1 potato, 2 potato, 3 potato, 4.” Type in the following for the Run method of the new plug-in:

```
x = 1;
while (x<5)
{
    text = x & " potato,";
    Sibelius.MessageBox(text);
    x = x+1;
}
```

Run it. It should display “1 potato,” “2 potato,” “3 potato,” “4 potato,” which is a start, though annoyingly you have to click OK after each message.

The **while** statement is followed by a condition in () parentheses, then a block of statements in { } braces (you don’t need a semicolon after the final } brace). While the condition is true, the block is executed. Unlike some other languages, the braces are compulsory (you can’t omit them if they only contain one statement). Moreover, each block must contain at least one statement.

In this example you can see that we are testing the value of **x** at the start of the loop, and increasing the value at the end. This common construct could be expressed more concisely in ManuScript by using a **for** loop. The above example could also be written as follows:

```
for x = 1 to 5
{
    text = x & " potato,";
    Sibelius.MessageBox(text);
}
```

Here, the variable **x** is stepped from the first value (1) up to the end value (5), stopping one step before the final value. By default, the “step” used is 1, but we could have used (say) 2 by using the syntax **for x = 1 to 5 step 2**, which would then print only “1 potato” and “3 potato”!

Notice the use of **&** to add strings. Because a string is expected on either side, the value of **x** is turned into a string.

Notice also we’ve used the Tab key to indent the statements inside the loop. This is a good habit to get into as it makes the structure clearer. If you have loops inside loops you should indent the inner loops even more.

The if statement

Now we can add an **if** statement so that the last phrase is just “4,” not “4 potato”:

```
x = 1;
while (x<5)
{
    if(x=4)
    {
        text = x & ".";
    }
    else
    {
        text = x & " potato,";
    }
    Sibelius.MessageBox(text);
    x = x+1;
}
```

The rule for if takes the form **if (condition) {statements}**. You can also optionally add **else {statements}**, which is executed if the condition is false. As with **while**, the parentheses and braces are compulsory, though you can make the program shorter by putting braces on the same line as other statements:

```
x = 1;
while (x<5)
{
    if(x=4) {
        text = x & ".";
    } else {
        text = x & " potato,";
    }
    Sibelius.MessageBox(text);
    x = x+1;
}
```

The position of braces is entirely a matter of taste.

Now let's make this plug-in really cool. We can build up the four messages in a variable called `text`, and only display it at the end, saving valuable wear on your mouse button. We can also switch round the `if` and `else` blocks to show off the use of `not`. Finally, we return to the `for` syntax we looked at earlier.

```
text = ""; // start with no text
for x = 1 to 5
{
    if (not(x=4)) {
        text = text & x & " potato, "; // add some text
    } else {
        text = text & x & "."; // add no. 4
    }
}
Sibelius.MessageBox(text); // finally display it
```

Arithmetic

We've been using `+` without comment, so here's a complete list of the available arithmetic operators:

<code>a + b</code>	add
<code>a - b</code>	subtract
<code>a * b</code>	multiply
<code>a / b</code>	divide
<code>a % b</code>	remainder
<code>-a</code>	negate
<code>a)</code>	evaluate first

ManuScript evaluates operators strictly from left-to-right, unlike many other languages; so `2+3*4` evaluates to 20, not 14 as you might expect. To get the answer 14, you'd have to write `2+(3*4)`.

ManuScript also supports floating point numbers, so whereas in some early versions `3/2` would work out as 1, it now evaluates to 1.5. Conversion from floating point numbers to integers is achieved with the `RoundUp(expr)`, `RoundDown(expr)`, and `Round(expr)` functions, which can be applied to any expression.

Objects

Now we come to the neatest aspect of object-oriented languages like Manuscript, C++ or Java, which sets them apart from traditional languages like BASIC, Fortran and C. Variables in traditional languages can hold only certain types of data: integers, floating point numbers, strings and so on. Each type of data has particular operations you can do to it: numbers can be multiplied and divided, for instance; strings can be added together, converted to and from numbers, searched for in other strings, and so on. But if your program deals with more complex types of data, such as dates (which in principle you could compare using =, < and >, convert to and from strings, and even subtract) you are left to fend for yourself.

Object-oriented languages can deal with more complex types of data directly. Thus in the Manuscript language you can set a variable, let's say **thischord**, to be a chord in your score, and (say) add more notes to it:

```
thischord.AddNote(60); // adds middle C (note no. 60)
thischord.AddNote(64); // adds E (note no. 64)
```

If this seems magic, it's just analogous to the kind of things you can do to strings in BASIC, where there are very special operations which apply to text only:

```
A$ = "1"
A$ = A$ + " potato, ":          REM add strings
X = ASC(A$):                   REM get first letter code
```

In Manuscript you can set a variable to be a chord, a note in a chord, a bar, a staff or even a whole score, and do things to it. Why would you possibly want to set a variable to be a whole score? So you can save it or add an instrument to it, for instance.

Objects in Action

We'll have a look at how music is represented in Manuscript in a moment, but for a little taster, let's plunge straight in and adapt Potato to create a score:

```
x = 1;
text = ""; // start with no text
while (x<5)
{
    if (not(x=4)) {
        text = text & x & " potato, "; // add some text
    } else {
        text = text & x & "."; // add no. 4
    }
    x = x+1;
}
Sibelius.New(); // create a new score
newscore = Sibelius.ActiveScore; // put it in a variable
newscore.CreateInstrument("Piano");
staff = newscore.NthStaff(1); // get top staff
bar = staff.NthBar(1); // get bar 1 of this staff
bar.AddText(0,text,"Technique"); // use Technique text style
```

This creates a score with a Piano, and types our potato text in bar 1 as Technique text.

The code uses the period (.) several times, always in the form **variable.variable** or **variable.method()**. This shows that the variable before the period has to contain an object.

If there's a variable name after the period, we're getting one of the object's sub-variables (called "fields" or "member variables" in some languages). For instance, if **n** is a variable containing a note, then **n.Pitch** is a number representing its MIDI pitch (60 for middle C), and **n.Name** is a string describing its pitch ("C4" for middle C). The variables available for each type of object are listed later.

If there's a method name after the period (followed by () parentheses), one of the methods allowed for this type of object is called. Typically a method called in this way will either change the object or return a value. For instance, if **s** is a variable containing a score, then **s.CreateInstrument("Flute")** adds a flute (changing the score), but **s.NthStaff(1)** returns a value, namely an object containing the first staff.

Let's look at the new code in detail. There is a pre-defined variable called **Sibelius**, which contains an object representing the Sibelius program itself. We've already seen the method **Sibelius.MessageBox()**. The method call **Sibelius.New()** tells Sibelius to create a new score. Now we want to do something to this score, so we have to put it in a variable.

Fortunately, when you create a new score it becomes active (i.e. its title bar highlights and any other scores become inactive), so we can just ask Sibelius for the active score and put it in a variable:

```
newscore = Sibelius.ActiveScore
```

Then we can tell the score to create a **Piano**: **newscore.CreateInstrument("Piano")**. But to add some text to the score you have to understand how the layout is represented.

Representation of a Score

A score is treated as a hierarchy: each score contains 0 or more staves; each staff contains bars (though every staff contains the same number of bars); and each bar contains "bar objects." Clefs, text and chords are all different types of bar objects.

To add a bar object (i.e. an object which belongs to a bar), such as some text, to a score:

- 1 Specify which staff you want (and put it in a variable): **staff = newscore.NthStaff(1)**.
- 2 Specify which bar in that staff you want (and put it in a variable): **bar = staff.NthBar(1)**; finally you tell the bar to add the text: **bar.AddText(0,text,"Technique")**.
- 3 Specify the name (or index number – see Text styles on page 141) of the text style to use (and it has to be a staff text style, because we're adding the text to a staff).

Notice that bars and staves are numbered from 1 upwards; in the case of bars, this is irrespective of any bar number changes that are in the score, so the numbering is always unambiguous. In the case of staves, the top staff is no.1, and all staves are counted, even if they're hidden. Thus a particular staff has the same number wherever it appears in the score.

The **AddText** method for bars is documented later, but the first parameter it takes is a rhythmic position in the bar. Each note in a bar has a rhythmic position that indicates where it is (at the start, one quarter after the start, etc.), but the same is true for all other objects in bars. This shows where the object is attached to, which in the case of Technique text is also where the left hand side of the text goes. Thus to put our text at the start of the bar, we used the value 0. To put the text a quarter note after the start of the bar, use 256 (the units are 1024th notes, so a quarter is 256 units – but don't think about this too hard):

```
bar.AddText(256,text,"Technique");
```

To avoid having to use obscure numbers like 256 in your program, there are predefined variables representing different note values (which are listed later), so you could write:

```
bar.AddText(Quarter,text,"Technique");
```

or to be quaint you could use the British equivalent:

```
bar.AddText(Crotchet,text,"Technique");
```

For a dotted quarter, instead of using 384 you can use another predefined variable:

```
bar.AddText(DottedQuarter,text,"Technique");
```

or add two variables:

```
bar.AddText(Quarter+Eighth,text,"Technique");
```

This is much clearer than using numbers.

The System Staff

As you know from using Sibelius, some objects don't apply to a single staff but to all staves. These include titles, tempo text, rehearsal marks and special barlines; you can tell they apply to all staves because (for instance) they get shown in all the instrumental parts.

All these objects are actually stored in a hidden staff, called the system staff. You can think of it as an invisible staff which is always above the other staves in a system. The system staff is divided into bars in the same way as the normal staves. So to add the title "Potato" to our score we'd need the following code in our plug-in:

```
sys = newscore.SystemStaff; // system staff is a variable
bar = sys.NthBar(1);
bar.AddText(0,"POTATO SONG","Subtitle");
```

As you can see, **SystemStaff** is a variable you can get directly from the score. Remember that you have to use a system text style (here I've used Subtitle) when putting text in a bar in the system staff. A staff text style like Technique won't work. Also, you have to specify a bar and position in the bar; this may seem slightly superfluous for text centered on the page as titles are (though in reality even this kind of page-aligned text is always attached to a bar), but for Tempo and Metronome mark text they are obviously required.

Representation of Notes, Rests, Chords, and Other Musical Items

Sibelius represents rests, notes and chords in a consistent way. A rest has no noteheads, a note has 1 notehead and a chord has 2 or more noteheads. This introduces an extra hierarchy: most of the squiggles you see in a score are actually a special type of **Bar** object that can contain even smaller things (namely, noteheads). There's no overall name for something which can be a rest, note or chord, so we've invented the pretty name **NoteRest**. A **NoteRest** with 0, 1 or 2 noteheads is what you normally call a rest, a note or a chord, respectively.

If **n** is a variable containing a **NoteRest**, there is a variable **n.NoteCount** which contains the number of notes, and **n.Duration** which is the note-value in 1/256ths of a quarter. You can also get **n.Highest** and **n.Lowest** which contain the highest and lowest notes (assuming **n.NoteCount** isn't 0). If you set **lownote = n.Lowest**, you can then find out things about the lowest note, such as **lownote.Pitch** (a number) and **lownote.Name** (a string). Complete details about all these methods and variables may be found in Chapter 3, "Reference."

Other musical objects, such as clefs, lines, lyrics and key signatures have corresponding objects in ManuScript, which again have various variables and methods available. For example, if you have a **Line** variable **ln**, then **ln.EndPosition** gives the rhythmic position at which the line ends.

The "for each" Loop

It's a common requirement for a loop to do some operation to every staff in a score, or every bar in a staff, or every **Bar** object in a bar, or every note in a **NoteRest**. There are other more complex requirements which are still common, such as doing an operation to every **Bar** object in a score in chronological order, or to every **Bar** object in a multiple selection. ManuScript has a for each loop that can achieve each of these in a single statement.

The simplest form of for each is like this:

```
thisscore = Sibelius.ActiveScore;
for each s in thisscore // sets s to each staff in turn
{ // ...do something with s
}
```

Here, since **thisscore** is a variable containing a score, the variable **s** is set to be each staff in **thisscore** in turn. This is because staves are the type of object at the next hierarchical level of objects (see "Hierarchy of Objects" on page 47).

For each staff in the score, the statements in **{ }** braces are executed.

Score objects contain staves, as we have seen, but they can also contain a **Selection** object, e.g. if the user has selected a passage of music before running the plug-in. The **Selection** object is a special case: it is never returned by a **for each** loop, because there is only a single **Selection** object; if you use the **Selection** object in a **for each** loop, by default it will return **Bar** objects (not Staves, Bars or anything else!).

Let's take another example, this time for notes in a `NoteRest`:

```
noterest = bar.NthBarObject(1);
for each n in noterest // sets n to each note in turn
{
    Sibelius.MessageBox("Pitch is " & n.Name);
}
```

`n` is set to each note of the chord in turn, and its note name is displayed. This works because Notes are the next object down the hierarchy after `NoteRests`. If the `NoteRest` is, in fact, a rest (rather than a note or chord), the loop will never be executed – you don't have to check this separately.

The same form of loop will get the bars from a staff or system staff, and the `Bar` objects from a bar. These loops are often nested, so you can, for instance, get several bars from several staves.

This first form of the `for each` loop got a sequence of objects from an object in the next level of the hierarchy of objects. The second form of the `for each` loop lets you skip levels of the hierarchy, by specifying what type of object you want to get. This saves a lot of nested loops:

```
thisscore = Sibelius.ActiveScore;
for each NoteRest n in thisscore
{
    n.AddNote(60); // add middle C
}
```

By specifying `NoteRest` after `for each`, Sibelius knows to produce each `NoteRest` in each bar in each staff in the score; otherwise it would just produce each staff in the score, because a `Staff` object is the type of object at the next hierarchical level of objects. The `NoteRests` are produced in a useful order, namely from the top to the bottom staff, then from left to right through the bars. This is chronological order. If you want a different order (say, all the `NoteRests` in the first bar in every staff, then all the `NoteRests` in the second bar in every staff, and so on) you'll have to use nested loops.

So here's some useful code that doubles every note in the score in octaves:

```
score = Sibelius.ActiveScore;
for each NoteRest chord in score
{
    if(not(chord.NoteCount = 0)) // ignore rests
    {
        note = chord.Highest; // add above the top note
        chord.AddNote(note.Pitch+12); // 12 is no. of half-steps
        (semitones)
    }
}
```

It could easily be amended to double in octaves only in certain bars or staves, only if the notes have a certain pitch or duration, and so on.

This kind of loop is also very useful in conjunction with the user's current selection. This selection can be obtained from a variable containing a **Score** object as follows:

```
selection = score.Selection;
```

We can then test whether it's a passage selection, and if so we can look at (say) all the bars in the selection by means of a **for each** loop:

```
if (selection.IsPassage)
{
    for each Bar b in selection
    {
        // do something with this bar
        ...
    }
}
```

Be aware that you can not add or remove items from bars during iterating. The example of adding notes to chords above is fine because you are modifying an existing item (in this case a **NoteRest**), but it's not safe to add or remove entire items, and if you try to do so, your plug-in will abort with an error. However, it's very useful to add or remove items from bars, so you need to do that in a separate **for** loop, after first collecting the items you want to operate on into a **ManuScript** array, something like this:

```
num = 0;
for each obj in selection
{
    if (IsObject(obj))
    {
        n = "obj" & num;
        @n = obj;
        num = num + 1;
    }
}
selection.Clear();
for i = 0 to num
{
    n = "obj" & i;
    obj = @n; // get an object from the pseudo array
    obj.Select();
}
```

The **@n** in this example is the array. To find out more about arrays, read on.

Indirection, Sparse Arrays, and User Properties

Indirection

If you put the `@` character before a string variable name, then the value of the variable is used as the name of a variable or method. For instance:

```
var="Name";
x = @var; // sets x to the contents of the variable Name
mymethod="Show";
@mymethod(); // calls the method Show
```

This has many advanced uses, though if taken to excess it can cause the brain to hurt. For instance, you can use `@` to simulate “unlimited” arrays. If `name` is a variable containing the string `"x1"`, then `@name` is equivalent to using the variable `x1` directly. Thus:

```
i = 10;
name = "x" & i;
@name = 0;
```

sets variable `x10` to 0. The last two lines are equivalent to `x[i] = 0`; in the C language. This has many uses; however, you’ll also want to consider using the built-in arrays (and hash tables), which are documented below.

Sparse Arrays

The method described above can be used to create “fake” arrays through indirection, though this is a little fiddly. Manuscript also provides Javascript-style sparse arrays, which can store anything that can be stored in a Manuscript variable, including references to objects. Like a variable, storing a reference to an object in a sparse array will preserve the lifetime of that object (because objects are reference counted), but the underlying object in Sibelius may become invalid if (say) a Score is modified.

To create a sparse array in Manuscript, use the built-in method **CreateSparseArray**(*a1,a2,a3,a4...an*). You can create an empty array simply by passing in no variables to the **CreateSparseArray** method.

Sparse arrays provide a read/write variable called `Length` that returns or sets the length of the array: when you set `Length` to a number greater than the present size of the array, the array is padded with null values; if you set `Length` to a number smaller than the present size of the array, any values beyond this number are removed.

To push one or more values to the end of the array, use the method **Push**(*a1, a2, ... an*). To remove and return the last element of an array, use the method **Pop**().

An example of how to use a sparse array:

```
array = CreateSparseArray(4,5,6);
array[10] = 19; // creates 11th element of array, intervening elements are null
array.Length = 20; // extends array to 20 elements, new elements are all null
```

Sparse arrays by their nature may not have values in every array element. To return a new sparse array containing only the populated indices of the original sparse array (i.e. those that are not null), use the array's **ValidIndices** variable. For example, using the above sparse array:

```
array2 = array.ValidIndices; // will contain values 0, 1, 2, 10 and 19
return array[array2[0]]; // returns the first populated element of array
```

You can compare two sparse arrays for equality, e.g.:

```
if (array = array2) {
    // do something
}
```

To access the end of an array, it's convenient to use negative indices; e.g. **array[-1]** returns the last element, **array[-2]** returns the penultimate element, and so on. It's not possible to access elements before the start of the array, so if you do e.g. **array[-100]** on a six element array, you will get **array[0]** returned.

Some things to remember when using sparse arrays:

- Sparse arrays use a zero-based index.
- Elements that have not been initialized are null, and do not cause an error when referenced.
- Assigning to an index beyond the current length increases the Length to one greater than the index assigned to.
- If an array contains references to objects, whether the arrays are equal or not depends on the implementation of equality for those objects.

User Properties

All Manuscript objects other than those listed below, including objects created by Sibelius, can have user properties attached to them, allowing for convenient storage of extra data, encapsulation of several items of data within a single object, and returning more than one value from a method, among other things.

To create a new user property, use the following syntax:

```
object._property:property_name = value;
```

where **object** is the name of the object, **property_name** is the desired user property name, and value is the value to be assigned to the new user property. User properties are read/write and can be accessed as **object.property_name**.

To get a sparse array containing the names of all the user properties belonging to an object, you can do e.g.:

```
names = object._propertyNames;
```

Here is an example of creating a user property:

```
nr = bar.NoteRest;  
nr._property:original = true;  
if (nr.original = true) {  
    // do something  
}
```

Some things to remember when using user properties:

- If you attempt to get or set a user property that has not yet been created, your plug-in will exit with a run-time error.
- To check whether or not a user property has been created without causing a run-time error, use the notation **object._property:property_name**, which will be null if no matching user property has been created yet.
- User properties cannot be created or accessed for normal data types (e.g. strings, integers, etc.), the global **Sibelius** object, old-style Manuscript arrays created by **CreateArray()**, old-style hashes created by **CreateHash()**, and **null**.
- User properties that conflict with an existing property name cannot be accessed as **object.property_name** (though they can be accessed using the **._property:** notation).
- User properties belong to a particular Manuscript object and disappear when that object's lifetime ends. To stop an object dying, you can (for example) store it in a sparse array, but be aware that its contents may become invalid if (say) the underlying score changes.

Dictionary

Dictionary is a programmer extensible object, simply allowing the use of user properties as above with convenient construction. It also has methods allowing the use of arbitrarily named user properties, and can also have methods in plug-ins attached to it allowing the creation of encapsulated user objects (i.e. objects with variables and methods attached to them).

To create a dictionary, use the built-in function **CreateDictionary(name1, value1, name2, value2, ... nameN, valueN)**. This creates a dictionary containing user properties called *name1*, *name2*, *nameN* with values *value1*, *value2*, *valueN* respectively.

A dictionary can contain named data items (like a **struct** in languages like C++), or data that is indexed by string, so that you can use strings to look items up within it.

The values in a dictionary can be accessed using square bracket notation, so you can use a dictionary like a hash table, e.g.:

```
test = CreateDictionary("fruit",apple,"vegetable",potato);  
test["fruit"] = banana;  
test["meat"] = lamb;
```

You can even put other objects, e.g. sparse arrays, inside dictionaries, e.g.

```
test2 = CreateDictionary("fruit",  
    CreateSparseArray(apple,banana,orange));
```

You can access the user properties within a dictionary using the `._property:` notation, e.g.:

```
return test2._property:fruit;
```

which would return the array specified above. Even more direct, you can access user properties in a dictionary as if they were variables or methods, like this:

```
test2.fruit;
```

which would also return the array specified above. You can also return more than one value from any Manuscript method using a dictionary, e.g.:

```
getChord()  
value = CreateDictionary("a", aNote, "b", anotherNote);  
return value;  
//... in another method somewhere  
chord = getChord();  
trace(chord.a);  
trace(chord.b);
```

which returns two values, **a** and **b**, which you can access via e.g. **chord.a** and **chord.b**.

You can compare two dictionaries for equality, e.g.:

```
if (test2 = test3) {  
  // do something  
}
```

Whether or not dictionaries containing objects evaluate as equal depends on the implementation of equality for those objects.

If you're comfortable with programming in general, you may find it useful to be able to add methods to dictionaries, particularly if you are writing code designed to act as a library for other methods or plug-ins to call. Writing code in this way provides a degree of encapsulation and can make it easy for client code to use your library.

To add a method to a dictionary, call the dictionary's `SetMethod()` method, e.g.:

```
pluginmethod "(obj,x,y) {  
  // a method that does something to obj  
}"  
test4 = CreateDictionary();  
test4.SetMethod("doSomething",Self,"pluginmethod");  
test4.doSomething(3,4);  
  // call pluginmethod within the current plug-in, passing in  
  // test4 (obj in the method above) and 3 (x in the method  
  // above) and 4 (y in the method above)
```

In the example above, **doSomething** is the name of the method belonging to the dictionary, **Self** tells the plug-in that the method is defined in the same plug-in, and **pluginmethod** is the name of a method elsewhere in the plug-in (shown at the top of the example).

To return a sparse array containing the names of the methods belonging to a dictionary, use the dictionary's **GetMethodNames()** method. You can also check the existence of a particular method using the dictionary's **MethodExists()** method. Use the dictionary's **CallMethod()** method to call a specific method, where the name of the method is the first parameter, and any parameters to be passed to the specified method follow.

For example:

```
array = test4.GetMethodNames(); // create sparse array containing
method names
first_method_name = array[0]; // sets first_method_name to name of
first method
methodfound = test4.MethodExists("doSomething"); // returns True
in this case;
test4.CallMethod("doSomething",5,6);
```

Everything you put into a dictionary is a user property, so all of the methods outlined in User properties above can be used on data in dictionaries too.

Using User Properties as Global Variables

You can store **SparseArray** and **Dictionary** objects, and indeed any other object, as user properties of the **Plugin** object itself. In the example below, **Self** is the object that corresponds to the running plug-in, and a user property **globalData** is assigned to the plug-in, containing a **Dictionary**:

```
Self._property:globalData = CreateDictionary(1,2,3,4);
// globalData and Self.globalData can be used interchangeably
trace(globalData);
trace(Self.globalData);
```

User properties assigned to the plug-in are persistent between invocations. Take care to ensure that these user properties are created before you attempt to use them, otherwise your plug-in will abort with a run-time error. Using the **_property:property_name** syntax never causes run-time errors, but direct references to **property_name** force a runtime error if **property_name** hasn't been created yet.

The example below shows how to test the existence of a specific user property, **globalCounter**, initialize it to 0 if it is not found, then increment it by 1 every time the plug-in runs:

```
// Test the persistence of user properties
if (Self._property:globalCounter = null) {
    Self._property:globalCounter = 0;
}
globalCounter = globalCounter + 1;
// this number increases by one every time the plug-in is run
trace(globalCounter);
trace(Self.globalData);
```

If you store a reference to a musical object in a user property that is assigned to the plug-in, there is an increased danger of that reference becoming invalid due to the score being closed or edited, etc. Use the **IsValid()** method to validate such data before using it.

User properties of plug-ins will be inaccessible (except by using the `_property:property_name` syntax) if there is an existing global variable of the same name.

Watch Out for Recursive Cycles!

Be careful not to create recursive cycles using arrays, user properties and dictionaries. When you use, say, an array in a dictionary, you are not creating a copy of the array or its values, but a reference to the original array: dictionaries and arrays are objects, not values. As a result, you could write something where an array contains a dictionary that itself refers to the original array: this will lead to Sibelius crashing. So be careful!

Other Things to Look Out For

The Parallel 5ths and 8ves plug-in illustrates having several methods in a plug-in, which we haven't needed so far. The Proof-read plug-in illustrates that one plug-in can call another – it doesn't do much itself except call the CheckPizzicato, CheckSuspectClefs, CheckRepeats and CheckHarpPedaling plug-ins. Thus you can build up meta-plug-ins that use libraries of others. Cool!

(You object-oriented programmers should be informed that this works because, of course, each plug-in is an object with the same powers as the objects in a score, so each one can use the methods and variables of the others.)

Dialog Editor

For more complicated plug-ins than the ones we've been looking at so far, it can be useful to prompt the user for various settings and options. This may be achieved by using Manuscript's simple built-in dialog editor. Dialogs can be created in the same way as methods and data variables in the plug-in editor.

Showing a Dialog in a Plug-In

To show a dialog from a Manuscript method, we use the built-in call

```
Sibelius.ShowDialog(dialogName, Self);
```

where **dialogName** is the name of the dialog we wish to show, and **Self** is a “special” variable referring to this plug-in (telling Sibelius to whom the dialog belongs). Control will only be returned to the method once the dialog has been closed by the user.

Creating or Editing a Dialog

To create a new dialog, choose the Dialog radio button at the bottom of the window that lists methods, data and dialogs, and click Add. To edit an existing dialog, select it from the Dialogs list box at the top right-hand corner of the window, and click Edit.

The dialog form will then appear, along with a long thin “palette” of available controls, as follows:

To create a new control, just drag and drop it from the palette onto the dialog.

Dialog Properties

With no controls selected, either double-click on a blank part of the dialog (or right-click, and then choose Properties) to access the dialog’s Properties dialog, which allows you to specify:

- Name: the value of `dialogName` for the **Sibelius.ShowDialog()** method call (see Showing a dialog in a plug-in above).
- Title: the name of the dialog as it appears in its title bar.
- Size: the Width and Height (measured in somewhat arbitrary dialog units); you can also set the size of the dialog by resizing it directly when editing it.
- Position: the X and Y position that the dialog should open at by default.

Laying Out Controls

The dialog editor includes a number of simple options for producing a pleasing layout:

- To select a control, either click it or hit Tab to select the next control in the creation order (Shift-Tab selects the previous control).
- To nudge a selected control, use the arrow keys.
- To align controls, select them using Command-click (Mac) or Control-click (Windows), then use e.g. Command+Left Arrow (Mac) or Control+Left Arrow (Windows) to align all of the selected controls with the left-hand edge of the left-most control, or Command+Up Arrow (Mac) or Control+Up Arrow (Windows) to align all of the selected controls with the top edge of the top-most control.
- To space controls evenly, select them using Command-click (Mac) or Control-click (Windows), then use e.g. Command+Option+Option+Down Arrow (Mac) or Control+Alt+Shift+Down Arrow (Windows) to space the

controls evenly in the distance between the top edge of the top-most and the bottom edge of the bottom-most controls, or Command+Option+Option+Left Arrow (Mac) or Control+Alt+Shift+Left Arrow (Windows) to space the controls evenly in the distance between the left-hand edge of the left-most and the right-hand edge of the right-most controls. Once controls are spaced evenly, you can increase or decrease the space between them proportionally by typing Command+Option+Option+Up, Down, Right, Left Arrow keys (Mac) or Control+Alt+Shift+Up, Down, Right, Left Arrow keys (Windows) as appropriate.

You can optionally display a grid to aid with alignment. Right-click on a blank part of the dialog and choose Grid from the context menu to see a dialog with settings for the grid:

Switch on Show grid to show the grid in the editor. Choose between Dots or Lines, and specify the Opacity of the grid display by adjusting the slider. Switch on Snap to grid to enable control snapping as you drag them with the mouse. Although a control that you nudge with the keyboard will not snap to the grid, one side of its selection outline will flash when it comes into alignment with the grid in either the horizontal or vertical directions.

Undo and Redo

You can undo and redo everything you have done while editing a dialog using Command+Z (Mac) or Control+Z (Windows) to undo and Command+Y (Mac) or Control+Y (Windows) to redo.

Testing the Dialog

To test the dialog within the editor, right-click a blank part of the dialog and choose **Test** from the context menu, or type the shortcut Command+T (Mac) or Control+T (Windows). To finish testing and return to the editor, press Esc or click any control whose properties are set to close the dialog (e.g. an OK or Cancel button, if you have created one).

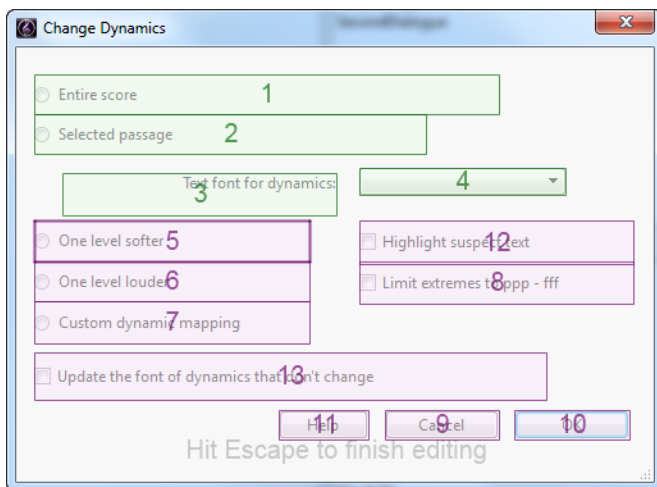

Saving Changes

To save the changes to the dialog, click the close button in the dialog's title bar. If there are any unsaved changes, Sibelius prompts you to save the changes.

Set Creation Order

If you have done any programming in other languages that allow you to edit dialogs, you will probably be familiar with the concept of *tab order*, which refers to the order in which controls are given the focus when the user repeatedly hits the Tab key to cycle through them. ManuScript has a similar concept called *creation order*, so named because the order in which the controls in a dialog are created affects not only the tab order but also some other subtle things (including radio button grouping – see “Radio Buttons” on page 31).

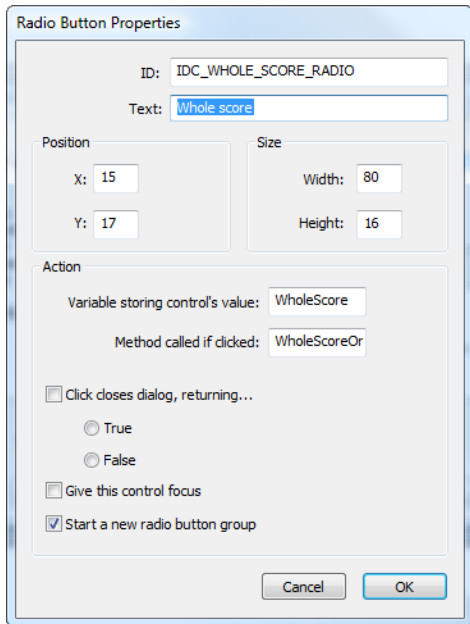

To set the creation order of controls in your plug-in’s dialog, right-click on a blank part of the dialog and choose Set Creation Order from the context menu. A special display appears overlaid on the controls in your dialog, like this:

To set the creation order, simply click on each control in order. If you make a mistake, press Command (Mac) or Control (Windows) and click on the last control whose order is correct to restart the sequence from that point, then release Command (Mac) or Control (Windows) and resume clicking on the remaining controls. Once you’re done, press Esc to finish editing the creation order.

Control Properties

Every control that you create also has a Properties dialog, which can be accessed by double-clicking a selected control, by right-clicking and choosing Properties from the context menu, or by pressing Command+Return (Mac) or Control+Return (Windows). The dialog for a radio button control, for example, is shown below:

With a control selected, the properties window varies depending on the type of the control, but most of the options are common to all controls, and these are as follows:

- ID: an internal string that identifies the control; Sibelius generates this for you automatically, but you can change it if you like
- Text: the text appearing in the control
- Position (X, Y): where the control appears in the dialog, in coordinates relative to the top left-hand corner
- Size (width, height): the size of the control
- Variable storing control's value: the Manuscript Data variable that will correspond to the value of this control when the plug-in is run
- Method called when clicked: the Manuscript method that should be called whenever the user clicks on this control (leave blank if you don't need to know about users clicking on the control)
- Click closes dialog: select this option if you want the dialog to be closed whenever the user clicks on this control. The additional options Returning True / False specify the value that the **Sibelius.ShowDialog** method should return when the window is closed in this way.
- Give this control focus: select this option if the "input focus" should be given to this control when the dialog is opened, i.e. if this should be the control to which the user's keyboard applies when the dialog is opened. Mainly useful for editable text controls.

Other options vary according to the type of control selected.

Combo Boxes and List Boxes

Combo boxes and list boxes have an additional property; you can set a variable from which the control's list of values should be taken. Like the value storing the control's current value, this should be a global Data variable. However, in this instance they have a rather special format, to specify a *list* of strings rather than simply a single string. Look at the variable `_ComboItems` in Add String Fingering for an example – it looks like this:

```
_ComboItems
{
    "1"
    "2"
    "3"
    "4"
    "1 and 3"
    "2 and 4"
}
```

List boxes have one further property, which is to determine whether they should allow a single selection or multiple selections. The return value from a combo box or a single-selection list box is a single string. If a list box is set to allow multiple selections, the selection is returned as an array of strings.

Radio Buttons

Radio buttons also have an additional property that allows one to specify groups of radio buttons in plug-in dialogs. When the user clicks on a radio button in a group, only the other radio buttons belonging to that group are deselected; any others in the dialog are left as they are. This is extremely useful for more complicated dialogs.

To specify a radio group, pick one control from each group that represents the first button of the group, and for these controls ensure that the checkbox *Start a new radio group* is selected in the control's Properties dialog. Then set the creation order of the controls (see “Set Creation Order” on page 29). A radio button group is defined as being all the radio buttons created between two buttons that have the *Start a new radio group* flag set (or between one of these buttons and the end of the dialog). So to make the radio groups work properly, ensure that each group is created sequentially in order, with the button at the start of the group created first, and then all the rest of the radios in that group. To finish, click the *Set Creation Order* menu item again to deactivate this mode.

Static Text

Static text controls additionally allow you to determine whether the text should be aligned to the Left (useful for explanatory text) or to the Right (useful for text associated with a specific control to its right, such as an edit control, checkbox or combo box).

Buttons

In most plug-in dialogs, you will want the OK button to be the default button for the dialog, such that if the user presses Return or Enter on their keyboard, the dialog is confirmed, and closes. Likewise, you will want the Cancel button to respond to the user hitting Esc on their keyboard, closing the dialog without making any changes.

For OK buttons, or other buttons that should confirm the dialog, switch on the Default button for dialog checkbox in the button's Properties dialog. Each dialog should only have one default button. You will also normally set Click closes dialog, returning to True. Depending on the other controls in your dialog, you may additionally want to check Give this control focus; if you have one or more edit controls in the dialog, you should probably set Give this control focus on the first of those controls instead.

Cancel buttons, by contrast, should normally only have Click closes dialog, returning set to False.

Debugging Plug-ins

When developing any computer program, it's all too easy to introduce minor (and not so minor!) mistakes, or bugs. Manuscript performs its own internal error checking at all times, and you'll find that if you try to access a non-existent method or variable on an object, or make a syntax error, or attempt to add or remove bars or items from bars while iterating over them, the plug-in will throw an error and open the plug-in editor window at the line that generated the error.

As Manuscript is a simple, lightweight system, there is no special purpose debugger, but there are a handful of tools provided to help you debug your plug-ins.

Undo

One good technique for finding problems in your plug-ins is to set Sibelius's undo buffer to a very small size, or to disable it altogether (by dragging the slider on the Other page of File > Preferences to its leftmost position). In the unlikely event that Manuscript does not throw an error when you perform an illegal operation (e.g. adding or deleting an object while iterating over a bar), reducing the undo buffer to its smallest possible size will expose the problem right away – though be warned, the result of such a problem may be that Sibelius will crash.

Plug-in Trace Window

The trace window can be shown by choosing Plug-ins > Plug-in Trace Window. A special Manuscript command, **trace(string)**, will print the specified string in the trace window. This is useful to keep an eye on what your plug-in is doing at particular points. These commands can then be removed when you've finished debugging. Another useful feature of the trace window is function call tracing. When this is turned on, the log will show which functions are being called by plug-ins.

One potential pitfall with the **trace(string)** approach to debugging is that the built-in hash table and array objects discussed earlier aren't strings, and so can't be output to the trace window. To avoid this problem, both of these objects have a corresponding method called **WriteToString()**, which returns a string representing the

whole structure of the array or hash at that point. So we could trace the current value of an array variable as follows:

```
trace("array variable = " & array.ToString());
```

Checking the Validity of Objects

One of the common problems that you might encounter when writing complex plug-ins is that the object you are trying to operate on is no longer valid (e.g. it has already been deleted). You can enable error checking – either for all objects, or for individual objects – that will cause your plug-in to throw an error if an object is no longer valid.

To enable error checking, use the Manuscript command **ValidationChecking**(*enable* [, *object1* [, *object2* [...]]), and set the Boolean parameter *enable* to **true**. If *enable* is the only parameter, validation checking is enabled for all types of objects, and all plug-ins. If you supply one or more object parameters (e.g. **Tuplet**, **Score**, **BarObject**, etc.), only those objects will be checked, and only in the currently running plug-in. You should ensure **ValidationChecking** is set to false before you give your plug-ins to anybody else to use.

You can also use the special method **IsValid()** to determine whether an object is valid: it will return false if the object in question no longer exists. **GetValidationError**(*object*) returns an empty string if there is no error, or returns a string if an error has occurred, use **trace(GetValidationError(*score*))**; to trace any validation error returned by a **Score** object to the trace window.

Stopping the Plug-in

If you want to force your plug-in to stop on a particular error condition, use **StopPlugin**([*message*]), which will stop your plug-in, display the optional message in an alert box, and open the plug-in editor at the line of code reached.

You can also use **ExitPlugin()**, which exits the plug-in cleanly without dropping into the plug-in editor.

Storing and Retrieving Preferences

In Sibelius 4 or later, you can use **Preferences.plg**, contributed by Hans-Christoph Wirth, to store and retrieve user-set preferences for your plug-ins.

How Does it Work?

Preferences.plg stores its data in a text file in the user's application data folder. Strings are accessed as associated pairs of a *key* (the name of the string) and a *value* (the contents of the string). The value can also be an array of strings, if required.

Initializing the Database

```
errorcode = Open(pluginname,featureset) ;
```

Open the library and lock for exclusive access by the calling plug-in. The calling plug-in is identified with the string *pluginname*. It is recommended that this string equals the unique Sibelius menu name of the calling plug-in.

Parameter *featureset* is the version of the feature set requested by the calling plug-in. The version of the feature set is currently 020000. Each library release shows in its initial dialog a list of supported feature sets. The call to **Open ()** will fail and show a user message if you request an unsupported feature set. If you should want to prevent this user information (and probably setup your own information dialog), use **CheckFeatureSet ()** first.

After **Open ()** the scope is undefined, such that you can access only global variables until the first call to **SwitchScope ()**.

Return value: **Open ()** returns zero or a positive value on success. A negative result indicates that there was a fatal error and the database has not been opened.

- **-2** other error
- **-1** library does not support requested feature set
- **0** no common preferences database found
- **1** no preferences found for current plug-in
- **2** preferences for current plug-in loaded

In case of errors (e.g. if the database file is unreadable), **Open ()** offers the user an option to recover from the error condition. Only if this fails too will an error code be returned to the calling plug-in.

```
errorcode = CheckFeatureSet(featureset) ;
```

Check silently if the library supports the requested feature set.

Return value: **CheckFeatureSet ()** returns zero or a positive value on success. A negative value indicates that the requested feature set is not supported by this version.

```
errorcode = Close();
```

Release the exclusive access lock to the library. If there were any changes since the last call to **Open ()** or **Write ()**, dump the data changes back to disk (probably creating a new score, if there was none present).

Return value: **Close ()** returns zero or a positive value on success. A negative result indicates that there was a fatal error and the database has not been written.

```
errorcode = CloseWithoutWrite();
```

Release the exclusive access lock to the library, discarding any changes performed since last call to **Open ()** or **Write ()**.

Return value: **CloseWithoutWrite()** returns zero or a positive value on success. A negative result indicates that there was a fatal error, namely that the database was not open at the moment.

```
errorcode = Write(dirty);
```

Force writing the data back to disk immediately. Keep library locked and open. If *dirty* equals 0, the write only takes place if the data has been changed. If *dirty* is positive, the common preferences score is unconditionally forced to be rewritten from scratch.

Return value: **Write()** returns zero or a positive value on success. A negative result indicates that there was a fatal error and the database has not been written.

Accessing Data

```
index = SetKey(keyname, value);
```

Store a string *value* under the name *keyname* in the database, overwriting any previously stored keys or arrays of the same *keyname*.

If *keyname* has been declared as a local key, the key is stored within the current scope and does not affect similar keys in other scopes. It is an error to call **SetKey()** for local keys if the scope is undefined.

Return value: **SetKey()** returns zero or a positive value on success, and a negative value upon error.

```
errorcode = SetArray(keyname, array, size);
```

Store an *array* of strings under the name *keyname* in the database, overwriting any previously stored keys or arrays of the same *keyname*. *size* specifies the number of elements in the array. A *size* of **-1** is replaced with the natural size of the array, i.e., **array.NumChildren**.

If *keyname* has been declared as a local key, the array is stored within the current scope and does not affect similar keys in other scopes. It is an error to call **SetArray()** for local keys if the scope is undefined.

Return value: **SetArray()** returns zero or a positive value on success, and a negative value upon error.

```
value = GetKey(keyname);
```

Retrieve the value of key *keyname* from the database. It is an error to call **GetKey()** on an identifier which had been stored the last time using **SetArray()**. For local keys, the value is retrieved from the current scope which must not be undefined.

Return value: The value of the key or **Preferences.VOID** if no key of that name found.

```
size = GetArray(keyname, myarray);
```

Retrieve the string array stored under name *keyname* from the database. It is an error to call **GetArray()** on an identifier which has been stored the last time by **SetKey()**. For local arrays, the value is retrieved from the current scope which must not be undefined.

You must ensure before the call that *myarray* is of Manuscript's array type (i.e., created with **CreateArray()**).

Return value: size equals the number of retrieved elements or **-1** if the array was not found. Note that size might be smaller than **myarray.NumChildren**, because there is currently no way to reduce the size of an already defined array.

```
size = GetListOfIds(myarray);
```

Fill the array *myarray* with a list of all known Ids in the current score (or in the global scope, if undefined). Before you call this method, ensure that *myarray* is of Manuscript's array type (i.e. created with **CreateArray()**).

Return value: returns the size of the list, which might be smaller than the natural size of the array, **myarray.Numchildren**.

```
index = UnsetId(keyname);
```

Erase the contents stored with an identifier (there is no distinction between keys and arrays here). If the key is declared as local, it is erased only from the local scope which must not be undefined.

Return value: The return value is zero or positive if the key has been unset. A negative return value means that a key of that name has not been found (which is not an error condition).

```
RemoveId(keyname);
```

Erase all contents stored in the database with an identifier (there is no distinction between keys and arrays here). If the key is declared as local, it is erased from all local scopes.

Return value: The return value is always zero.

```
RemoveAllIds();
```

Erase everything related to the current plug-in.

Return value: the return value is always zero.

Commands for Local Variables

errorcode = DeclareIdAsLocal(keyname);

Declare an identifier as a local key. Subsequent calls to **Set...** and **Get...** operations will be performed in the scope which is set at that time. The local state is stored in the database and can be undone by a call to **DeclareIdAsGlobal** or **RemoveId**.

Return value: Non-negative on success, negative on error.

size = GetListOfLocalIds(myarray);

Fill the array *myarray* with a list of all Ids declared as local. Before you call this method, ensure that *myarray* is of Manuscript's array type (i.e. created with **CreateArray()**).

Return value: Returns the size of the list, which might be smaller than the natural size of the array, **myarray.NumChildren**.

errorcode = SwitchScope(scopename);

Select scope *scopename*. If scope *scopename* has never been selected before, it is newly created and initialized with no local variables. Subsequent **Set...** and **Get...** operations for keys declared as local will be performed in scope *scopename*, while access to global keys is still possible.

The call **SwitchScope("")** selects the undefined scope which does not allow access of any local variables.

Return value: Non-negative on success, negative on error.

errorcode = RemoveScope();

Erase all local keys and arrays from the current scope and delete the current scope from the list of known scopes. It is an error to call **RemoveScope()** if the current scope is undefined. After the call, the database remains in the undefined scope.

errorcode = RemoveAllScopes();

Erase all local keys and arrays from all scopes and delete all scopes from the list of known scopes. After the call, the database remains in the undefined scope. Note that this call does retain the information which Ids are local (see **DeclareIdAsLocal()**).

Return value: Non-negative on success.

string = GetCurrentScope();

Retrieve the name of the currently active scope, or the empty string if the database is in undefined scope.

Return value: Returns a string.

```
size = GetListOfScopes(myarray);
```

Fill the array *myarray* with a list of all known scope names. You must ensure before the call that *myarray* is of Manuscript's array type (i.e., created with **CreateArray()**).

Return value: Returns the size of the list, which might be smaller than the natural size of the array, **myarray.NumChildren**.

Miscellaneous

```
Trace(tracelevel);
```

Select level of tracing for the library. Useful levels are: **0** for no trace, **10** for sparse trace, **20** for medium trace, **30** for full trace. This command can also be run when the library is not open, to specify the tracing level for the **Open()** call itself.

```
TraceData();
```

Writes a full dump of the data stored currently in **ThisData** array to the trace window. This is the full data belonging to the current plug-in. **TraceData()** always traces the data, regardless of the current trace level selected.

```
filename = GetFilename();
```

Return the full filename of the preferences database (including path).

```
Editor();
```

Invoke the interactive plug-in editor. This method must not be called while the database is open. Direct calls to **Editor()** from plug-ins are deprecated, since the end-user of your plug-in will probably not expect to be able to edit (and destroy) the saved preferences of all plug-ins at this stage.

Basic Example

Suppose you have a plug-in called *myplugin* and would like to save some dialog settings in a preferences file such that these settings are persistent over several Sibelius sessions and computer reboots. Your dialog may contain two checkboxes and a list box. Let **DialogDontAskAgain** and **DialogSpeedMode** be the global variables holding the status of the checkboxes, respectively, and let **DialogJobList** hold the contents of the list box item.

The work with the database can be reduced to four steps:

- 1 Open the database and retrieve initial data. At begin of your plug-in, e.g. right at top of your **Run()** method, you have to add some code to initialize the database. You probably also want to initialize your global keys based on the information currently stored in the database. See below for a detailed example. (Depending on your program, you might have to define **prefOpen** as a global variable in order to prevent trying to access an unopened database in future.)

```
// At first define hard coded plug-in defaults, in case that the
// plug-in
// is called for the first time. If anything else fails, these
// defaults
// will be in effect.
DialogDontAskAgain = 0;
DialogSpeedMode = 0;
DialogJobList = CreateArray();
DialogJobList[0] = "first job";
DialogJobList[1] = "second job";
// Attempt to open the database
prefOpen = Preferences.Open( "myplugin", "020000" );
if( prefOpen >= 0 ) {
    // Database successfully opened. So we can try to load the
    // information stored last time.
    // It's a good idea to work with a private version scheme, in
    // order
    // to avoid problems in the future when the plug-in is developed
    // further, but the database still contains the old keys. In our
    // example, we propose that the above mentioned keys are present
    // if "version" key is present and has a value of "1".
    version = Preferences.GetKey( "Version" );
    switch( version ) {
        case( "1" ) {
            // Now overwrite the above set defaults with the information
            // stored
            // in the database.
            DialogDontAskAgain = Preferences.GetKey( "DontAskAgain" );
            DialogSpeedMode = Preferences.GetKey( "SpeedMode" );
            Preferences.GetArray( "JobList", DialogJobList );
        }
        default {
            // handle other versions/unset version gracefully here ...
        }
    }
}
```

- 2 Work with the data. After the initialization step, you can and should work with global variables **DialogDontAskAgain**, **DialogSpeedMode**, and **DialogJobList** as you are used to: read from

them to base control flow decisions on their setting, write to them (mostly from within your own dialogs) to set new user preferences.

- 3 Write data back to the database. To make any changes persistent, you must tell the database the new values to be written to the hard disk. See below for a detailed example. According to taste, you can execute these lines each time the settings are changed, or only once, at the end of your plug-in.

```
if( prefOpen >= 0 ) {  
    Preferences.SetKey( "Version", "1" );  
    Preferences.SetKey( "DontAskAgain", DialogDontAskAgain );  
    Preferences.SetKey( "SpeedMode", DialogSpeedMode );  
    Preferences.SetArray( "JobList", DialogJobList, -1 );  
}
```

- 4 Close the database. In any case, you must release the lock to the library on exit of your plug-in. This writes data actually back to disk, and enables other plug-ins to access the shared database later. To do this, use:

```
Preferences.Close();
```

Chapter 3: Reference

Syntax

Here is an informal run-down of the syntax of Manuscript.

A method consists of a list of statements of the following kinds:

Block	<pre>{statements } for example: { a = 4; }</pre>
While	<pre>while { expression } block for example: while (i < 3) { Sibelius.MessageBox(i); i = i + 1; }</pre>

Switch	<pre>switch (test-expression) { case (case-expression-1) block [case (case-expression-2) block] ... [default block]</pre> <p>The switch statement consists of a “test” expression, multiple case statements and an optional default statement. If the value of test-expression matches one of the case-expressions, then the statement block following the matching case statement will be executed. If none of the case statements match, then the statement block following the default statement will be executed. For example:</p> <pre>switch (note.Accidental) { case (DoubleSharp) { Sibelius.MessageBox("Double sharp"); } case (DoubleFlat) { Sibelius.MessageBox("Double flat"); } default { Sibelius.MessageBox("No double"); } }</pre>
if else	<pre>if (expression) block [else block]</pre> <p>for example:</p> <pre>if (found) { Application.ShowFindResults(found); } else { Application.NotFindResults(); }</pre>
for each	<pre>for each variable in expression block</pre> <p>This sets variable to each of the sub-objects within the object given by the expression. Normally there is only one type of sub-object that the object can contain. For instance, a Note Rest (such as a chord) can only contain Note objects. However, if more than one type of sub-object is possible you can specify the type:</p> <pre>for each Type variable in expression block</pre> <p>for example:</p> <pre>for each NoteRest n in thisstaff { n.AddNote(60); // add middle C }</pre>

for	for <i>variable</i> = <i>value</i> to <i>value</i> [step <i>value</i>] <i>block</i> <p>The variable is stepped from the first value up to or down to the end value by the step value. It stops one step before the final value. So, for example:</p> <pre> for x=1 to note.NoteCount { ... } </pre> <p>works correctly.</p>
assignment	<i>variable</i> = <i>expression</i> ; <p>for example:</p> <pre> <i>value</i> = <i>value</i> + 1; </pre> <p>or</p> <pre> <i>variable</i>.<i>variable</i> = <i>expression</i> ; </pre> <p>for example:</p> <pre> Question.CurrentAnswer=True; </pre>
method call	<i>variable</i> . <i>identifier</i> (<i>comma-separated expressions</i>) ; <p>for example:</p> <pre> thisbar.AddText(0,"Mozart","text.system.composer") ; </pre>
self method call	<i>identifier</i> (<i>comma-separated expressions</i>) ; <p>Calls a method in this plug-in, for example:</p> <pre> CheckIntervals() ; </pre>
return	return <i>expression</i> ; <p>Returns a value from a plug-in method, given by the expression. If a method doesn't contain a return statement, then a "null" value is returned (either the number zero, an empty string, or the null object described below).</p>

Expressions

Here are the operators, literals and other beasts you're allowed in expressions.

Self	<p>This is a keyword referring to the plug-in owning the method. You can pass yourself to other methods, for example:</p> <pre> other.Introduce(Self); </pre>
null	<p>This is a literal object meaning "nothing."</p>
Identifier	<p>This is the name of a variable or method (letters, digits or underscore, not starting with a digit) you can precede the identifier with @ to provide indirection; the identifier is then taken to be a string variable whose value is used as the name of a variable or method.</p>
member variable	<p><i>variable</i>.<i>variable</i></p> <p>This accesses a variable in another object.</p>

integer	<p>for example:</p> <p>. 1, 100, -1</p>
floating point number	<p>for example:</p> <p>1.5, 3.15, -1.8</p> <p>Text in double quotes, for example: "some text." For strings that are rendered by Sibelius as part of the score, i.e. the contents of some text object, there is a small but useful formatting language allowing one to specify how the text should appear. These "styled strings" contain commands to control the text style. All commands start and end with a backslash (\) The full list of available styling commands is as follows:</p> <p>\n\ New paragraph</p> <p>\N\ New line</p> <p>\B\ Bold on</p> <p>\b\ Bold off</p> <p>\I\ Italic on</p> <p>\i\ Italic off</p> <p>\U\ Underline on</p> <p>\u\ Underline off</p> <p>\fArial Black\ Font change to Arial Black (for example)</p> <p>\ctext.character.musictext\ Character style change to Music text (for example)</p> <p>\f_\ Font change to text style's default font, including removing any active character styles</p> <p>\s123\ Size change to 123 (units are 1/32nds of a space, not points)</p> <p>\v\ Vertical scale in percent</p> <p>\h\ Horizontal scale in percent</p> <p>\t\ Tracking (absolute) in 1/32nds of a space</p> <p>\p\ Baseline adjustment: use normal, sub (for subscript) or super (for superscript)</p> <p>\\$keyword\ Substitutes a string from the Score Info dialog (see below)</p> <p>A consequence of this syntax is that backslashes themselves are represented by \\, to avoid conflicting with the above commands.</p> <p>The substitution command \\$keyword\ supports the following keywords: Title, Composer, Arranger, Lyricist, MoreInfo, Artist, Copy-right, Publisher and PartName.</p> <p>Each of these correspond to a field in the File > Score Info dialog.</p>
string	<p>not expression</p>
not	<p>Logically negates an expression, for example:</p> <p>not (x=0)</p> <p><i>expression and expression</i></p>
and	<p>Logical and, for example:</p> <p>FoxFound and BadgerFound</p> <p><i>expression or expression</i></p>
or	<p>Logical or, for example:</p> <p>FoxFound or BadgerFound</p> <p><i>expression = expression</i></p>
equality	<p>Equality test, for example:</p> <p>Name="Clock"</p>

	<i>expression - expression</i>
subtract	Subtraction, for example: 12-1 <i>expression + expression</i>
add	Addition, for example: 12+1 <i>-expression</i>
minus	Inversion, for example: -1 <i>expression & expression</i>
concatenation	Add two strings, for example: Name = "Fred" & "Bloggs"; // 'Fred Bloggs' You can't use + as this would attempt to add two numbers, and sometimes succeed (!). For instance: x = "2" + "2"; // same as x = 4 <i>(expression)</i>
subexpression	For grouping expressions and enforcing precedence, e.g. (4+1)*5 variable.identifier(commma-separated expressions);
method call	for example: x = monkey.CountBananas(); <i>Identifier(commma-separated expressions);</i>
self method call	Calls a method in this plug-in, for example: x = CountBananas();

Operators

Condition Operators

You can put any expressions in parentheses after an **if** or **while** statement, but typically they will contain conditions such as = and <. The available conditions are very simple:

a = b	equals (for numbers, text or objects)
a < b	less than (for numbers)
a > b	greater than (for numbers)
c and d	both are true
c or d	either are true
not c	inverts a condition, e.g. not (x=4)
<=	less than or equal to
>=	greater than or equal to
!=	not equal to

Use = to compare for equality, not == as found in C/C++ and Java.

Arithmetic

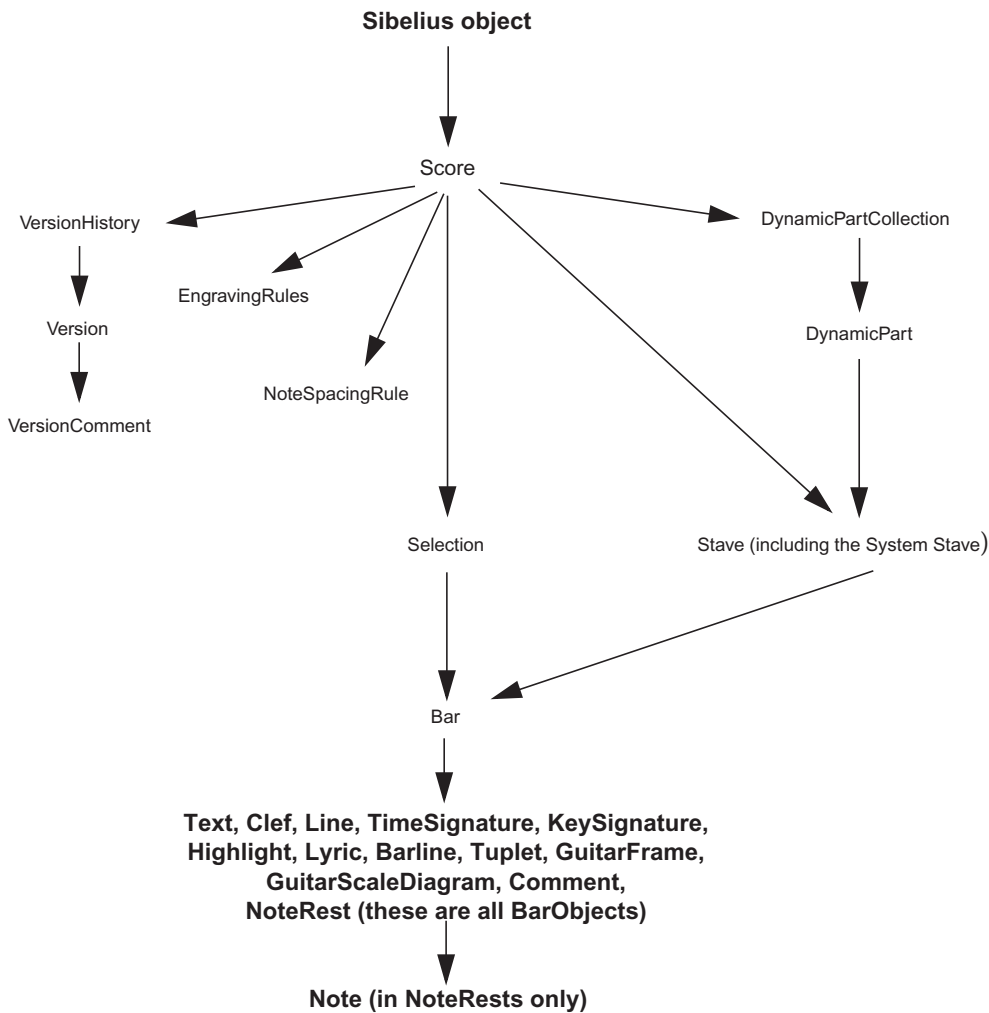

a + b	add
a - b	subtract
a * b	multiply
a / b	divide
a % b	remainder
-a	negate
(a)	evaluate first

ManuScript will evaluate expressions from left to right, so that **2+3*4** is 20, not 14 as you might expect. To avoid problems with evaluation order, use parentheses to make the order of evaluation explicit. To get the answer 14, you'd have to write **2+(3*4)**.

ManuScript also now supports floating point numbers, so whereas in previous versions **3/2** would work out as 1, it now evaluates to 1.5. Conversion from floating point numbers to integers is achieved with the **RoundUp(expr)**, **RoundDown(expr)** and **Round(expr)** functions, which can be applied to any expression.

Chapter 4: Object Reference

Hierarchy of Objects

All Objects

Methods

AddToPluginsMenu("menu text", "function name")

Adds a new menu item to the Plug-ins menu. When the menu item is selected the given function is called. This is normally only used by plug-ins themselves. This method may only be called once per plug-in (that is each plug-in may only add one item to the Plug-ins menu); subsequent method calls will be ignored.

Asc(*expression*)

Returns the ASCII value of a given character (the expression should be a string of length 1).

CharAt(*expression*, *position*)

Returns the character from the expression at the given (zero-based) position, for example **CharAt**("Potato", 3) would give "a."

Chr(*expression*)

Returns a character (as a string) with the given ASCII value. This can be used for inserting double quotes (") into strings with **Chr**(34).

CreateArray()

Returns a new array object.

CreateHash()

Returns a new hash-table object.

GetValidationError(*object*)

Returns the validation error, if any, of the specified *object*. Useful to pass validation errors to the plug-in trace window.

ExitPlugin()

Exits the plug-in cleanly without dropping into the plug-in editor

IsObject(*expression*)

Returns 1 (or **True**) if expression evaluates to an object rather than a null, boolean, string, or any number.

(Not to be confused with the **IsPassage** variable of **Selection** objects!)

IsValid(*object*)

Returns 1 (or **True**) if the object is valid, returns 0 (or **False**) if the object no longer exists (that is has been deleted).

JoinStrings(*expression*, *delimiter*)

Joins together (concatenates) an array of strings into a single string, separated by the string delimiter.

Length(*expression*)

Gives the number of characters in the value of the expression.

Round(*expression*)

Returns the nearest integer to the value of the expression, for example **Round**(1.5) would be “2” and **Round**(1.3) would be “1.”

RoundDown(*expression*)

Returns the nearest integer less than the value of the expression, for example **RoundDown**(1.5) would be “1.”

RoundUp(*expression*)

Returns the nearest integer greater than the value of the expression, for example **RoundUp**(1.5) would be “2.”

SplitString(*expression*, [*delimiter*], [*trimEmpty*])

Splits a string into an array of strings, using the given delimiter. The delimiter can be a single character or a string containing several characters – for instance “.,” would treat either a comma or full stop as a delimiter. The default delimiter is the space character. If the *trimEmpty* parameter is **True** then this will ignore multiple delimiters (which would otherwise produce some empty strings in the array). The default value of *trimEmpty* is **False**.

```
s=':a:b:c';  
bits=SplitString(s,':', false);  
// bits[0] = ''; bits[1] = 'a'; bits[2] = 'b' ...  
s='a b c';  
bits=SplitString(s,' ', true);  
// bits[0] = 'a'; bits[1]='b' ...
```

StopPlugin(*[message]*)

Stops the plug-in, and shows the optional *message* in an alert box. Opens the plug-in editor at the line of code reached.

Substring(*expression*, *start*, [*length*])

This returns a substring of the expression starting from the given start position (zero-based) up to the end of the expression, for example **Substring**("Potato",2) would give “tato”. When used with the optional length parameter, Substring returns a substring of the of the expression starting from the given start position (zero-based) of the given length, for example **Substring**("Potato",2,2) would give “ta”.

Trace(*expression*)

Sends a piece of text to be shown in the plug-in trace window, for example **Trace**("Here 's a trace");

ValidationChecking(*enable*[, *object1*[, *object2*]...])

If *enable* is the only parameter, validation checking is enabled for all types of objects, and across all plug-ins. If you supply one or more *object* parameters (such as **Tuplet**, **Score**, **BarObject**, and so on), only those objects will be checked, and only in the currently running plug-in. You should ensure **ValidationChecking** is set to **false** before you give your plug-ins to anybody else to use.

User Properties

All objects (except for the **Sibelius** object, old-style Manuscript arrays created using **CreateArray**(), old-style Manuscript hashes created using **CreateHash**(), and **null**) can also have user properties assigned to them.

Accessibility

Accessed from the **Sibelius** object.

Methods

None.

Variables

ScoreDescription

Returns **true** if Sibelius's built-in score description functionality is enabled (read/write).

Bar

A Bar contains **BarObject** objects.

for each variable in produces the **BarObjects** in the bar

for each type variable in produces the **BarObjects** of the specified type in the bar

Methods

AddBarNumber(*new bar number*[,*format*[,*extra_text*[,*prepend*[,*skip this bar*]]]])

Adds a bar number change to the start of this bar. *new bar number* should be the desired external bar number. The optional *format* parameter takes one of the three pre-defined constants that define the bar number format; see “Global Constants” on page 156. The optional *extra_text* parameter takes a string that will be added after the numeric part of the bar number, unless the optional boolean parameter *prepend* is **True**, in which case the *extra_text* is added before the numeric part of the bar number. If the optional *skip this bar* parameter is **True**, the bar number change is created with the Don't increment bar number option set. Returns the **BarNumber** object created.

AddChordSymbolFromPitches(*position*,*pitches*[,*instrument style*])

Adds a chord symbol from the given array of *pitches* at the specified *position*. The optional *instrument style* parameter operates the same as in the **AddGuitarFrame** method (see above). If the method is unable to create a chord symbol, the method returns null; otherwise it returns the **GuitarFrame** object created.

AddClef(*pos*,*concert pitch clef*[,*transposed pitch clef*])

Adds a clef to the staff at the specified position. *concert pitch clef* determines the clef style when **Notes > Transposing Score** is switched off; the optional *transposed pitch clef* parameter determines the clef style when this is switched on. Clef styles should be an identifier like “clef.treble”; for a complete list of available clef styles, see “Clef Styles” on page 164. Alternatively you can give the name of a clef style, such as “Treble,” but bear in mind that this may not work in non-English versions of Sibelius. Returns the **Clef** object created.

AddComment(*sr*,*text*[,*color*[,*maximized*]])

Adds a comment at the specified *sr* position in the current bar, displaying the specified *text*. The optional *color* parameter allows you to specify the color of the comment that is created (if not specified, the comment is created with its default color), and the optional *maximized* Boolean parameter allows you to set the comment to be minimized (if not specified, the comment is created maximized by default). If you want to specify the *maximized* parameter without specifying a particular color, set *color* to **-1**.

AddCommentWithName(*sr*,*text*,*username*[,*color*[,*maximized*]])

Adds a comment that will display a given *username* at the specified *sr* position in the current bar, displaying the specified *text*. The optional *color* parameter allows you to specify the color of the comment that is created (if not specified, the comment is created with its default color), and the optional *maximized* Boolean parameter allows you to set the comment to be minimized (if not specified, the comment is created maximized by default). If you want to specify the *maximized* parameter without specifying a particular color, set *color* to **-1**.

AddGraphic(*file name*,*pos*[,*below staff*[,*x displacement*[,*y displacement*[,*size ratio*]]]])

Adds a graphic above or below the bar at a given position. If *below staff* is **True**, Sibelius will position the graphic below the staff to which it is attached, otherwise it will go above (the default). You may additionally displace the graphic from its default position by specifying *x*- and *y displacements*. These should be expressed in millimeters, the latter defining an offset from the top or bottom line of the staff, as appropriate. By default, the graphic will be created 5mm away from the staff. To adjust the size of the graphic, you may set a floating point number for its *size ratio*. When set to 1.0 (the default), the graphic will be created with a height equal to that of the staff to which it is attached. A value of 0.5 would therefore halve its size, and 2.0 double it. The graphic may be rescaled to a maximum of five times the height of its parent staff. This function returns **True** if successful, otherwise **False**.

AddGraphicToBlankPage(*file name*,*nth page*,*x offset*,*y offset*[,*size ratio*])

Adds a graphic to a blank page belonging to the current bar. *nth page* specifies the particular blank page you would like the graphic to, starting from 1. The *x offset* and *y offset* parameters are floating point values relative to the size of the page the graphic is being added to. For example, an *x offset* of 0.0 would position the graphic at the very left of the page; 0.5 in the center. You may specify the size of the graphic by specifying a value for *size ratio*. This defaults to 1.0, which has the same effect as creating a graphic in Sibelius manually using **Create > Graphic**. (As with **AddGraphic**, 0.5 would halve its size, and 2.0 double it.) The graphic may be rescaled to a maximum of five times its initial size. This function returns **True** if successful, otherwise **False**.

AddGuitarFrame(*position*, *chord name*[, *instrument style*[, *fingerings*]])

Adds a chord symbol for the given *chord name* to the bar. The optional *instrument style* parameter should refer to an existing instrument type that uses tab, and should be specified by identifier; see “Instrument Types” on page 165. If *instrument style* is not specified, Sibelius will create a chord symbol that will optionally display a chord diagram using the default tab tuning associated with the instrument type used by the staff to which the chord symbol will be attached. The *position* is in 1/256th quarters from the start of the bar. The optional *fingerings* parameter gives the fingerings string to display above (or below) the guitar frame, if supplied. If the method is unable to create a chord symbol, the method returns null; otherwise it returns the **GuitarFrame** object created.

AddInstrumentChange(*pos*, *styleID*[, *add_clef*[, *show_text*[, *text_label*[, *show_warning*[, *warning_label*,
[*full_instrument_name*[, *short_instrument_name*]]]]]])

Adds an instrument change to the bar at the specified position. *styleID* is the string representing the instrument type to change to (see “Instrument Types” on page 165 for a list). The optional boolean parameter *add_clef*, **True** if not specified, determines whether Sibelius will add a clef change at the same position as the instrument change if required (that is if the clef of the new instrument is different to that of the existing instrument). *show_text* is an optional boolean parameter, **True** if not specified, determining whether or not the text label attached to the instrument change should be created shown (the default) or hidden. *text_label* is an optional string parameter; if specified, Sibelius will use this string instead of the default string (the new instrument’s long name). *show_warning* is an optional boolean parameter, **True** if not specified, determining whether or not Sibelius should create a text object (using the Instrument change staff text style) above the last note preceding the instrument change, announcing the instrument change and giving the player time to pick up the new instrument. *warning_label* is an optional string parameter; if specified, Sibelius will use this string instead of the default string (the word “To” followed by the new instrument’s short name). You can also override the names Sibelius will give the instruments on subsequent systems. If a null string is passed to either *full_instrument_name* or *short_instrument_name* (or if the arguments are omitted), the instrument names will remain unchanged. Returns the **InstrumentChange** object created.

AddKeySignatureFromText(*pos*, *key name*, *major key*[, *add double barline*[, *hidden*[, *one staff only*]])

Adds a key signature to the bar. The key signature is specified by text name, such as “Cb” or “C#”. The third parameter is a Boolean flag indicating if the key is major (or minor). Unless the fourth parameter is set to **False**, a double barline will ordinarily be created alongside the key signature change. You may additionally hide the key signature change by setting *hidden* to **True**, and make the change of key appear on the bar’s parent staff only with the *one staff only* flag. Returns the **KeySignature** object created.

AddKeySignature(*pos*, *num sharps*, *major key*[, *add double barline*[, *hidden*[, *one staff only*]])

Adds a key signature to the bar. The key signature is specified by number of sharps (+1 to +7), flats (–1 to –7), no accidentals (0) or atonal (–8). The third parameter is a Boolean flag indicating if the key is major (or minor). Unless the fourth parameter is set to **False**, a double barline will ordinarily be created alongside the key signature change. You may additionally hide the key signature change by setting *hidden* to **True**, and make the change of key appear on the bar’s parent staff only with the *one staff only* flag. Returns the **KeySignature** object created.

AddLine(*pos*, *duration*, *line style*[, *dx*[, *dy*[, *voicenum*[, *hidden*]]]])

Adds a line to the bar. The line style can be an identifier such as “line.staff.hairpin.crescendo” or a name, such as “Crescendo”. For a complete list of line style identifiers that can be used in any Sibelius score, see “Line Styles” on page 160. Style identifiers are to be preferred to named line styles as they will work across all language versions of Sibelius. Returns the **Line** object created, which may be one of a number of types depending on the Line style used.

AddLiveTempoTapPoint(*position*)

Adds a Live Tempo tap point at the rhythmic position specified by *position*, in 1/256th quarters from the start of the bar.

AddLyric(*position*, *duration*, *text*[, *syllable type* [, *number of notes*, *voicenum*]]])

This method adds a lyric to the bar. The position is in 1/256th quarters from the start of the bar, and the duration is in 1/256th quarter units. The two optional parameters allow you to specify whether the lyric is at the end of a word (value is “1”, and is the normal value) or at the start or middle of a word (value is “0”), and how many notes the lyric extends beneath (default value 1). You can also optionally specify the voice in which the lyric should be created; if *voicenum* is 0 or not specified, the lyric is created in all voices. Returns the **LyricItem** object created.

AddNote(*pos*, *sounding pitch*, *duration*, [*tied* [, *voice*[, *diatonic pitch*[, *string number*]]]])

Adds a note to staff, adding to an existing NoteRest if already at this position (in which case the duration is ignored); otherwise creates a new NoteRest. Will add a new bar if necessary at the end of the staff. The position is in 1/256th quarters from the start of the bar. The optional tied parameter should be **True** if you want the note to be tied. Voice 1 is assumed unless the optional voice parameter (with a value of 1, 2, 3 or 4) is specified. You can also set the diatonic pitch, that is the number of the “note name” to which this note corresponds, 7 per octave (35 = middle C, 36 = D, 37 = E and so on). If a diatonic pitch of zero is given, a suitable diatonic pitch will be calculated from the MIDI pitch. The optional *string number* parameter gives a string number for this note, which is only meaningful if the note is on a tablature stave. If this parameter is not supplied then a default string number is calculated based on the current tablature stave type and the guitar tab fingering options (specified on the **Notes** page of File > Preferences). Returns the **Note** object created (to get the NoteRest containing the note, use **Note.ParentNoteRest**).

AddPageNumber([*blank page offset*])

Creates and returns a page number change at the end of the bar. Due to the nature of adding a page number change, a page break will also be created at the end of the bar. Therefore, the page number change will actually be placed at the start of the *next* bar. The desired properties of the page number change can be set by calling the appropriate methods on the **Page Number Change** object returned.

The *blank page offset* flag allows you to create page number changes on blank pages. If a **BarObject** is followed by one or more blank pages, each blank page may also have a page number change of its own. If unspecified, the page number change will be created on the next available page (whether it contains music or not) after the bar, otherwise the user may specify a 1-based offset which refers to the *n*th blank page after the bar itself.

AddPageNumberAtStartOfBar ()

Creates and returns a page number change at the start of the bar. This is useful for adding a page number change at the very start of the score, that is to change the initial page number, by using this method on the first bar of the score. If used on a bar later in the score, it will create the page number change at the end of the previous bar, but unlike the **AddPageNumber** method, it will not force a page break, so in general the **AddPageNumber** method is recommended.

AddRehearsalMark ([consecutive[, mark[, new prefix and suffix[, prefix[, suffix[, override defaults]]]]))

Adds a rehearsal mark above the bar. If no parameters have been specified, the rehearsal mark will inherit the properties of the previous rehearsal mark in the score, incrementing accordingly. Optionally, the appearance of the rehearsal mark may be overridden. If *consecutive* is **False**, Sibelius will not continue the numbering of the new rehearsal marks consecutively, but allow the user to set a new *mark*. A *mark* may be expressed as a number of a string. For example both 5 and “e” are both valid and equivalent values. If *new prefix and suffix* is **True**, the values set for *prefix* and *suffix* will be applied to the new rehearsal mark. The final parameter, *override defaults*, is a Boolean defaulting to **False** whose purpose it is to mimic the behavior of the option with the same name in the Rehearsal Mark dialog in Sibelius.

AddSpecialBarline (barline type[, pos])

Adds a special barline to a given position in a bar; see “Global Constants” on page 156. If no position has been specified, start repeat barlines will snap to the start of the bar by default. All other special barline types will snap to the end.

AddSymbol (pos, symbol index or name)

Adds a symbol to the bar at the specified position. If the second parameter is a number, this is taken to be an index into the global list of symbols, corresponding to the symbol’s position in the **Create > Symbol** dialog in Sibelius (counting left-to-right, top-to-bottom from zero in the top-left hand corner). Some useful symbols have pre-defined constants; see “Global Constants” on page 156. There are also constants defined for the start of each group in the **Create > Symbol** dialog, so that to access the 8va symbol, for example, you can use the index **OctaveSymbols + 2**.

It’s better to use indices rather than names, because the names will be different across the various language versions of Sibelius. Returns the **Symbol** object created, or **null** if no symbol can be added to the score.

AddText (pos, text, style[, voicenum])

Adds the text at the given position, using the given text style. A staff text style must be used for a normal staff, and a system text style for a system staff. The styles should be an identifier of the form “text.staff.expression”; for a complete list of text styles present in all scores, see “Text Styles” on page 158. Alternatively you can give the name of a text style, such as “Expression”, but be aware that this may not work in non-English versions of Sibelius. You can also optionally specify the voice in which the lyric should be created; if *voicenum* is 0 or not specified, the text object is created in all voices. Returns the **Text** object created.

AddTextToBlankPage (xPos, yPos, text, style, pageOffset)

Adds the *text* at the given position, using the given text *style*. A blank page text style must be used; you cannot add staff text or system text to a blank page. *style* takes a style ID, using the form “text.blankpage.title”; for a complete list of text styles present in all scores, see “Text Styles” on page 158. *xPos* and *yPos* are the absolute

position on the page. *pageOffset* takes a positive number for a blank page following a special page break (the first blank page is **1**), and negative for a blank page preceding the first bar of the score (the blank page immediately before the first bar is **-1**, the one before that **-2**, and so on). Returns the **Text** object created.

To add text to a blank page, first create the special page break using the **Bar.BreakType** variable, and set the number of blank pages using **Bar.NumBlankPages** or **Bar.NumBlankPagesBefore**. Then use **Bar.AddTextToBlankPage**.

AddTimeSignature(*top, bottom, allow cautionary, rewrite music[, use symbol]*)

Returns an error string (which will be empty if there was no error) which if not empty should be shown to the user. The first two parameters are the top and bottom of the new time signature. The third tells Sibelius whether to display cautionary time signatures from this time signature. If *rewrite music* is **True** then all the bars after the inserted the time signature will be rewritten. You can also create common time and alla breve time signatures. If you're creating a time signature in 4/4 or 2/2, set *use symbol* to **True** and Sibelius will replace the numbers of the time signature with their symbolic equivalent.

AddTimeSignatureReturnObject(*top, bottom, allow cautionary, rewrite music[, use symbol]*)

As above, but returns the time signature object created, or null if unsuccessful.

AddTuplet(*pos, voice, left, right, unit[, style[, bracket[, fullDuration]]]*)

Adds a tuplet to a bar at a given position. The *left* and *right* parameters specify the ratio of the tuplet, for example 3 (left) in the time of 2 (right). The *unit* parameter specifies the note value (in 1/256th quarters) on which the tuplet should be based. For example, if you wish to create an eighth note (quaver) triplet group, you would use the value 128. The optional *style* and *bracket* parameters take one of the pre-defined constants that affect the visual appearance of the created tuplet; see "Global Constants" on page 156. If *fullDuration* is true, the bracket of the tuplet will span the entire duration of the tuplet. Returns the **Tuplet** object created.

N.B.: If **AddTuplet()** has been given illegal parameters, it will not be able to create a valid **Tuplet** object. Therefore, you should test for inequality of the returned **Tuplet** object with *null* before attempting to use it.

Bar[*array element*]

Returns the nth item in the bar (counting from 0) for example **Bar[0]**

Clear(*[voice number]*)

Clears a bar of all its items, leaving only a bar rest. If a particular voice number is specified, only the items in that voice will be removed.

ClearNotesAndModifiers(*[voice number]*)

Clears a bar of all its notes, rests, tuplets and slurs, replacing them with a single bar rest. If a particular voice number is specified, only the items in that voice will be removed.

Delete()

Deletes and removes an entire bar from a score. This, by definition, will affect all the staves in the score.

DeletePageNumber ([*blank page offset*])

Deletes the page number change at the end of the bar, or if there are one or more blank pages after the bar, any page number change that occurs on any of those blank pages. If *blank page offset* is unspecified, the page number change on the first page after the bar will be deleted.

GetClefAt (*pos*)

Returns a **Clef** object corresponding to the current clef at the specified rhythmic position.

GetKeySignatureAt (*pos*)

Returns a **KeySignature** object corresponding to the current clef at the specified rhythmic position.

GetInstrumentTypeAt (*pos*)

Returns an **InstrumentType** object representing the instrument type used by the bar at the specified rhythmic position.

GetPageNumber ([*blank page offset*])

Returns the page number change object at the end of the bar, or if the bar contains no page number change, null. As with **AddPageNumber**, you may get the page number change from any of the blank pages that follow the bar by specifying a valid *blank page offset*.

InsertBarRest (*voice number* [, *rest type*])

Inserts a bar rest into the bar, but only if the bar is void of any NoteRests (or an existing bar rest) using the same *voice number*. The optional *rest type* parameter allows you to specify the type of bar rest or repeat bar to be created, defined by the constants **WholeBarRest** (the default if rest type is not specified), **BreveBarRest**, **OneBarRepeat**, **TwoBarRepeat** and **FourBarRepeat**. Returns True if successful.

NthBarObject (*n*)

Returns the nth object in the bar, counting from 0.

RemoveLiveTempoTapPoint (*position*)

Removes a Live Tempo tap point at the rhythmic position specified by *position*, in 1/256th quarters from the start of the bar.

ResetSpaceAroundBar (*above* , *below*

) Does the equivalent of Layout > Reset Space Above Staff and/or Reset Space Below Staff for the given bar. Set *above* to **True** to reset the space above the staff, and *below* to **True** to reset the space below the staff.

Respace ()

Respaces the notes in this bar.

Variables

BarNumber

The bar number of this bar. This is the internal bar number, which always runs consecutively from 1 (read only).

BarObjectCount

The number of objects in the bar (read only).

BreakType

The break at the end of this bar, given by the constants **MiddleOfSystem**, **EndOfSystem**, **MiddleOfPage**, **EndOfPage**, **NotEndOfSystem**, **EndOfSystemOrPage** or **SpecialPageBreak**. To learn the correspondence between these constants and the menu in the Bars panel of the Properties window, see the discussion in “Global Constants” on page 156.

When you set the break at the end of a bar to be **SpecialPageBreak**, Sibelius will add one blank page after the break. You can then adjust the number of pages by setting the value of either **Bar.NumBlankPages** or **Bar.NumBlankPagesBefore**, or tell Sibelius to restart the music on the next left or right page with **Bar.MusicRestartsOnPage**.

ExternalBarNumber

This has been deprecated as of Sibelius 5, because it can only return a number, and bar numbers that appear in the score may now include text. Use **ExternalBarNumberString** instead, which returns the external bar number of this bar, taking into account bar number changes in the score (read only). Note that you cannot pass this bar number to any of the other Manuscript accessors; they all operate with the internal bar number instead.

ExternalBarNumberString

The external bar number of this bar as a string, taking into account bar number changes and bar number format changes (read only). Note that you cannot pass this bar number to any of the other Manuscript accessors; they all operate with the internal bar number instead.

GapAfter

Sets the gap (in spaces) after the bar (read/write)

GapBefore

Sets the gap (in spaces) before the bar (read/write).

InMultirest

Returns one of four global constants describing if and/or where the bar falls in a multirest (read only). The constants are **NoMultirest**, **StartsMultirest**, **EndsMultirest** and **MidMultirest**; see “Global Constants” on page 156.

Length

The rhythmic length (read only).

MusicRestartsOnPage

Tells Sibelius to restart the music on the next left or right page after a special page break, and can only be set if **BreakType** is **SpecialPageBreak**. This variable may be set to only *two* of the global special page break constants: **MusicRestartsOnNextLeftPage** or **MusicRestartsOnNextRightPage** (write only).

NthBarInSystem

Returns the position of the bar in the system, relative to the first bar on the system (bar 0) (read only).

NumBlankPages

The number of blank pages following the bar containing a special page break.

NumBlankPagesBefore

The number of blank pages preceding the bar containing a special page break. This value only has an effect if a special page break exists in bar 1.

OnHiddenStave

Returns **True** if the bar is currently hidden by way of **Hide Empty Staves** (read only).

OnNthPage

Returns the zero-based page number on which the bar occurs in the current part (read only).

OnNthPageExternal

Returns a string containing the external page number (which is the page number displayed in the score) of the page in which the bar occurs.

OnNthSystem

Returns the zero-based system number (relative to its parent page) in which the bar occurs (read only).

ParentStaff

The staff containing this bar (read only).

SectionEnd

Corresponds to the **Section end** checkbox on the **Bars** panel of Properties (read/write).

Selected

Returns **True** if the entire bar is currently selected (read only).

SpecialPageBreakType

Returns the type of the special page break; see the documentation for the Special page break types in “Global Constants” on page 156 (read only).

SplitMultirest

When **True**, a multirest intersecting the bar in question will be split (read/write).

Time

The time at which the bar starts in the score in milliseconds (read only).

Barline

Accessed from a **Barlines** object.

Methods

None.

Variables

BottomStave

Returns the **Staff** object at which the barline ends, relative to the current part.

BottomStaveNum

Returns the number of the bottom staff included in the barline, relative to the current part.

TopStave

Returns the **Staff** object at which the barline starts, relative to the current part.

TopStaveNum

Returns the number of the top staff included in the barline, relative to the current part.

Barlines

Accessed from a **Score** Object. Corresponds to the barline groupings in the score.

for each *barline* **in** iterates through all the barlines in the list, for example:

```
s = Sibelius.ActiveScore;
barlines = s.Barlines;
for each barline in barlines {
    // do something with barlines here
}
```

Array access [*int n*] returns the *n*th barline in the list, or null if the barline does not exist.

Methods

AddBarline(*top staff number*, *bottom staff number*)

Creates a new bar line inclusively spanning the staff numbers (relative to the current part) supplied. Returns the new **Barline** object created, or null if it fails.

ClearAll()

Removes all the barlines from the score.

DeleteNthBarline(*index*)

Removes a given barline identified by *index* from the score.

Variables

NumChildren

Returns the number of unique barlines in the score (read only).

BarObject

BarObjects include **Clef**, **Line**, **NoteRest**, and **Text** objects. All the methods and variables below apply to all specific types of **BarObject**—they are listed here instead of separately for each type. (To object-oriented programmers, the NoteRest, Clef and those types are derived from the base class **BarObject**.)

Methods

Delete()

Deletes an item from the score. This will completely remove text objects, clefs, lines and so on from the score; however, when a NoteRest is deleted, it will be converted into a rest of similar duration. To delete multiple items from a bar, see “Deleting Multiple Objects from a Bar” on page 64.

Deselect()

Removes the object from the selection list of the parent score. If the selection is currently a passage selection, it is first changed to a multiple selection before the object is deselected. Returns **True** if the object is successfully removed from the selection.

FreezeMagneticLayoutPositions()

Does the same as selecting an object and choosing Layout > Freeze Magnetic Layout Positions, that explicitly sets the object’s **Dx/Dy** to the position produced by Magnetic Layout, then disables Magnetic Layout for that object.

GetIsInVoice(*voicenum*)

Returns **True** if the object is in the *voicenum* specified.

GetPlayedOnNthPass(*n*)

Returns **True** if the object is set to play back the *n*th time.

NextItem([*voice*, *item type*])

Returns the next item in the parent bar of the current item, or null if no item exists. If no arguments have been supplied, the very next item in the bar will be returned, regardless of its voice number and item type. You may additionally specify the voice number of the object you're looking for (1 to 4, or 0 for any voice number), and the item's type. Note that an item will only be returned if it exists in the same bar as the source item. By way of example, to find the next crescendo line in voice 2, you would type something along the lines of: **hairpin = item.NextItem(2, "CrescendoLine");**

PreviousItem([*voice*, *item type*])

As above, but searches backwards.

RemoveVoice(*voicenum*)

Removes the object from the specified *voicenum*, leaving the object in all remaining voices.

ResetPosition([*horizontal*, *vertical*])

Performs Layout > Reset Position on the object. If you supply no parameters, this method will reset both the horizontal and vertical position of the object. If either or both of the optional Boolean parameters *horizontal* or *vertical* is set to **True**, you can reset the position of the object either horizontally or vertically independently if required.

ResetDesign()

Performs Layout > Reset Design on the object.

Select()

Appends the object to the selection list of the parent score. A multiple selection consisting of any number of individual objects can be built up by repeatedly calling **Select** on each object you wish to add to the list. Note that calling **Select** on a **BarObject** will first clear any existing passage selection.

SetAllVoices()

Sets the object to be in all voices. This has no effect on some types of object, such as NoteRests.

SetVoice(*voicenum*[, *clear other voices*])

Sets the object to be in voice *voicenum*, optionally removing the object from all other voices if the Boolean parameter *clear other voices* is **True**.

ShowInAll()

Shows the object in the full score, and in all relevant parts; equivalent to Edit > Hide or Show > Show In All.

ShowInParts()

Hides the object in the full score, and shows it in all relevant parts; equivalent to **Edit > Hide** or **Show > Show In Parts**.

ShowInScore()

Hides the object in all relevant parts, and shows it in the full score; equivalent to **Edit > Hide** or **Show > Show In Score**.

SetPlayedOnNthPass(*n*, *do play*)

Tells Sibelius whether or not the object should play back the *n*th time.

TimeOnNthPass(*n*)

Returns the time at which the object occurs in the score in milliseconds on the *n*th pass through the score, where *n* is an integer specifying the pass (specify **1** for the first pass through the score), or returns **-1** in the case of an error (because the specified value of *n* is out of range).

Variables

CanBeInMultipleVoices

Returns **True** if the object can be in more than one voice (read-only).

Color

The color of this **BarObject** (read/write). The color value is in 24-bit RGB format, with bits 0–7 representing blue, bits 8–15 green, bits 16–23 red and bits 24–31 ignored. Since Manuscript has no bitwise arithmetic, these values can be a little hard to manipulate; you may find the individual accessors for the red, green and blue components to be more useful (see below).

ColorAlpha

The alpha channel component of the color of this **BarObject**, in the range 0–255 (read/write).

ColorRed

The red component of the color of this **BarObject**, in the range 0–255 (read/write).

ColorGreen

The green component of the color of this **BarObject**, in the range 0–255 (read/write).

ColorBlue

The blue component of the color of this **BarObject**, in the range 0–255 (read/write).

CueSize

True if the object is cue-size in the current part or score, and **False** if the object is normal size (read/write).

CurrentTempo

Returns the tempo, in bpm, at the location of the object in the score (read only).

DrawOrder

Returns the layer at which the object is currently drawn. When used to set the layer of an object, values from **1** (meaning the bottom layer) to **32** (meaning the highest layer) can be used; **0** is a special value that tells Sibelius to use the default layer for that type of object (read/write).

Dx

The horizontal graphic offset of the object from the position implied by the **Position** field, in units of 1/32 spaces (read/write).

Dy

The vertical graphic offset of the object from the center staff line, in units of 1/32 spaces, positive going upwards (read/write).

HasCustomDrawOrder

Returns **True** if the object is set to a layer other than its default layer (read only).

Hidden

True if the object is hidden in the current part or score, and **False** if the object is shown (read/write).

OnNthBlankPage

Returns 0 if the object occurs on a page of music, otherwise a number from 1 upwards indicating the *n*th blank page of the bar on which the object occurs (read only).

ParentBar

The Bar containing this **BarObject** (read only).

Position

Rhythmic position of the object in the bar (read only).

Selected

Returns **True** if the object is currently selected (read only).

Time

The time at which the object occurs in the score in milliseconds; if the score contains repeats, this will always return the time as if for the first pass through the score (read only). Returns **-1** in the case of an error.

Type

A string describing the type of object, such as “NoteRest,” “Clef.” This is useful when hunting for a specific type of object in a bar. See “GuitarScaleDiagram” on page 85 for the possible values (read only).

UsesMagneticLayout

Returns

True if the object is positioned by Magnetic Layout. Returns **False** if the object is set not to be taken into account by Magnetic Layout. To set whether or not an object should use Magnetic Layout, use one of the global constants **AlwaysDodge** (equivalent to **Edit > Magnetic Layout > n**), **SuppressDodge** (**Edit ▶ Magnetic Layout > Off**) or **DefaultDodge** (**Edit > Magnetic Layout > Default**) (read/write).

UsesMagneticLayoutSettingOverridden

Returns **True** if the object has had its Magnetic Layout settings overridden; otherwise **False**.

VoiceNumber

Is **0** if the item belongs to more than one voice (a lot of items belong to more than one voice) and **1** to **4** for items that belong to voices 1 to 4 (read only).

Voices

Returns or sets Sibelius's internal bit field that represents the voices to which an object belongs; useful for copying the voices used by a given object (read/write).

Deleting Multiple Objects from a Bar

If you wish to delete multiple objects from a bar, you should first build up a list of items to delete, then iterate over the list deleting each object in turn. It is not sufficient to simply delete the objects from the bar as you iterate over them, as this may cause the iterator to go out of sync. Therefore, code to delete all tuplets from a bar should look something like this:

```
counter = 0;
for each Tuplet tup in bar {
    name = "tuplet" & counter;
    @name = tup;
    counter = counter + 1;
}

// Delete objects in reverse order
while(counter > 0) {
    counter = counter - 1;
    name = "tuplet" & counter;
    tup = @name;
    tup.Delete();
}
```

BarRest

Derived from a **BarObject** object.

Methods

None.

Variables

PauseType

Returns the type of fermata (pause), if any, on the bar rest. Returns one of the constants **PauseTypeNone** (0), **PauseTypeSquare** (1), **PauseTypeRound** (2), **PauseTypeTriangular** (3) (read/write).

RestType

Returns the type of bar rest via one of the constants **WholeBarRest** (0), **BreveBarRest** (1), **OneBarRepeat** (2), **TwoBarRepeat** (3), **FourBarRepeat** (4) (read only). To create a bar rest of a particular type, use **bar.InsertBarRest()** (see above).

Bracket

Accessed from a **BracketsAndBraces** object.

Methods

None.

Variables

BottomStave

Returns the **Staff** object at which the bracket ends, relative to the current part.

BottomStaveNum

Returns the number of the bottom staff included in the bracket, relative to the current part.

BracketType

Returns the type of the bracket: **BracketFull**, **BracketBrace** or **BracketSub**.

TopStave

Returns the **Staff** object at which the bracket starts, relative to the current part.

TopStaffNum

Returns the number of the top staff included in the bracket, relative to the current part.

Brackets and Braces

Accessed from a **Score** object. Describes the brackets (which may be brackets, sub-brackets or braces) present in the score.

for each *bracket* **in** iterates through all the brackets in the list.

Array access [*int n*] returns the *n*th bracket in the list, or null if the bracket does not exist.

Methods

AddBracket(*type*, *top staff number*, *bottom staff number*)

Creates a bracket of a given *type*, spanning the range of staves specified between *top staff number* and *bottom staff number* inclusive, and returns the new **Bracket** object. The staff numbers are relative to the current part view. Values for *type* are **BracketFull** (0), **BracketBrace** (1) and **BracketSub** (2).

ClearAll()

Removes all existing brackets, sub-brackets and braces from the current part, and returns the number of brackets removed.

DeleteNthBracket(*n*)

Deletes the *n*th bracket from the current part, and returns True if successful.

Variables

NumChildren

Returns the number of child brackets, sub-brackets and braces in the list.

Clef

Derived from a **BarObject**.

Methods

None.

Variables

ClefStyle

The name of this clef, which may be different depending on the state of **Notes ▶ Transposing Score** (read only).

ConcertClefStyleId

The concert pitch identifier of the style of this clef (read only).

ConcertClefStyle

The concert pitch name of this clef (read only).

StyleId

The identifier of the style of this clef, which may be different depending on whether or not **Notes ▶ Transposing Score** is switched on. This can be passed to the **Bar.AddClef** method to create a clef of this style (read only).

TransposingClefStyle

The transposing score name of this clef (read only).

TransposingClefStyleId

The transposing score identifier of the style of this clef (read only).

Comment

Derived from a **BarObject**.

Methods

None; create via **BarObject**.

Variables

Maximized

Returns **True** if the comment is maximized, otherwise returns **False** (read/write).

Text

Returns the text of the comment (read/write).

TextWithFormatting

Returns an array containing the various changes of font or style (if any) within the comment's text in a new element (read only). For example, "This text is \B\bold\b\, and this is \I\italic\i\" would return an array with eight elements containing the following data:

```
arr[0] = "This text is "  
arr[1] = "\B\  
arr[2] = "bold"  
arr[3] = "\b\  
arr[4] = ", and this is "  
arr[5] = "\I\  
arr[6] = "italic"  
arr[7] = "\i\"
```

TextWithFormattingAsString

The comment's text including any changes of font or style (read only).

TimeStamp

Returns a **DateTime** object corresponding to the date the comment was created or last edited (read only).

UserName

Returns the username of the user who created or last edited the comment (read only).

ComponentList

An array that is obtained from **Sibelius.HouseStyles** or **Sibelius.ManuscriptPapers**. It can be used in a **for each** loop or as an array with the **[n]** operator to access each **Component** object:

Methods

None.

Variables

NumChildren

Number of plug-ins (read only).

Component

This represents a Sibelius “component,” namely a house style or a manuscript paper. Examples:

```
// Create a new score using the first manuscript paper
papers=Sibelius.ManuscriptPapers;
score=Sibelius.New(papers[0]);
// Apply the first house style to the new score
styles=Sibelius.HouseStyles;
score.pplyStyle(styles[0], "ALLSTYLES");
```

Methods

None.

Variables

Name

The name of the component (read only).

DateTime

This object returns information about the current date and time.

Methods

None.

Variables

Seconds

Returns the number of seconds from the time in a date (read only).

Minutes

Returns the number of minutes from the time in a date (read only).

Hours

Returns the number of hours from the time in a date (read only).

DayOfMonth

Returns the nth day on the month, 1-based (read only).

Month

Returns the nth month of the year, 1-based (read only).

Year

Returns the year (read only).

NthDayOfWeek

Returns the nth day of the week, 0-based (read only).

NthDayOfYear

Returns the nth day of the year, 0-based (read only).

LongDate

Returns the date in a human-readable format, for example: 1st May 2008 (read only).

ShortDate

Returns the date in a human-readable format, for example: 01/05/2008 (read only).

LongDateAndTime

Returns the date and time in a human-readable format, for example: 1st May 2008 14:07 (read only).

ShortDateAndTime

Returns the date and time in a human-readable format, for example: 01/05/2008 14:07 (read only).

TimeWithSeconds

Returns the time in a human-readable format, for example: 14:07 (read only).

TimeWithoutSeconds

Returns the time in a human-readable format, for example: 14:07:23 (read only).

Dictionary

To create a dictionary, use the built-in function **CreateDictionary**(*name1*, *value1*, *name2*, *value2*, ... *nameN*, *valueN*). This creates a dictionary containing user properties called *name1*, *name2*, *nameN* with values *value1*, *value2*, *valueN* respectively.

To iterate over dictionaries:

- 1 To iterate over element values in **Dictionary** objects, use **for each *n* in Dictionary** or **for each Value *n* in Dictionary**.
- 2 To iterate over element names in **Dictionary** objects, use **for each Name *n* in Dictionary**.
- 3 To iterate over **value.name** pairs in **Dictionary** objects, use **for each Pair *n* in Dictionary**; this returns a new **Dictionary** object: *n.Name* is the element name, *n.Value* is the element value.

Methods

CallMethod(*methodname*,*param1*,*param2*,...*paramN*)

Calls the specified method *methodname* in the dictionary, passing in any other values that are required for the method as further parameters.

GetMethodNames()

Returns a sparse array containing the names of the methods belonging to a dictionary.

GetPropertyNames()

Returns a sparse array of the names of all the user properties in the dictionary (same as **_propertyNames**).

MethodExists(*methodname*)

Returns **True** if the specified method *methodname* exists in the dictionary.

PropertyExists(*propertyname*)

Returns **True** if the specified user property *propertyname* exists in the dictionary.

SetMethod(*methodname*,**Self**,*method*)

Binds a method to the dictionary. *methodname* is the name by which you want to access the method via the dictionary, **Self** refers to the plug-in in which the method is found, and *method* is the name of the method itself, found elsewhere in the plug-in.

Variables

None.

Converting Old-Style Hash Tables to Dictionaries

The **Dictionary** object is, among other things, a replacement for the old **Hash** object, which was a simple hash table object. You are recommended to use the new **Dictionary** object instead of the old **Hash** object in your plug-ins, but if you have an existing plug-in in which old-style hashes are used, you can convert them to Dictionaries as follows:

Hash.ConvertToDictionary()

Returns a new **Dictionary** object, populated with strings converted from the old-style Hash.

DocumentSetup

Accessed from a **Score** object, **DocumentSetup** corresponds to the settings in Layout ▶ Document Setup.

When you first access the **DocumentSetup** object, the units default to millimeters; if you want to use another unit of measurement, set **DocumentSetup.Units** before you set any of the other values. This will not, however, change the units displayed in Layout ▶ Document Setup; to do that, set **DocumentSetup.UnitsInDocumentSetupDialog**.

Be careful also that if you set **DocumentSetup.PageSize** after setting **DocumentSetup.PageWidth** or **DocumentSetup.PageHeight**, the page size specified will override any custom height/width you may have just set: so set the page size before you then adjust the width or height of the page.

Methods

None.

Variables

AboveTopStaveGap

Returns or sets the top staff margin on each page in the units specified by the **Units** variable (read/write).

AboveTopStaveGapAfterFirstPage

Returns or sets the top staff margin on pages after the first page in the units specified by the **Units** variable (read/write). To set this, first set **FirstPageHasUniqueVerticalStaveMargins** to **True**.

BelowBottomStaveGap

Returns or sets the bottom staff margin on each page in the units specified by the **Units** variable (read/write). To set this, first set **FirstPageHasUniqueVerticalStaveMargins** to **True**.

BelowBottomStaveGapAfterFirstPage

Returns or sets the bottom staff margin on each page after the first page in the units specified by the **Units** variable (read/write).

FirstPageHasUniqueVerticalStaveMargins

Returns **True** if the After first page checkbox is switched on in Document Setup, specifying that the first page of the score has different top and bottom staff margins to subsequent pages; otherwise returns **False** (read/write).

Orientation

Returns or sets the current page orientation. Values are **OrientationPortrait** (0) and **OrientationLandscape** (1). If you change the orientation, this will swap the **PageTopMargin** and **PageBottomMargin** values with the **PageLeftMargin** and **PageRightMargin** values, to reflect the change in orientation (read/write).

PageHeight

Returns or sets the height of a page in the units specified by the **Units** variable (read/write).

PageSize

Returns or sets the current page size. Values are listed in “PageSize Values” on page 200. If you attempt to set **PageSize** to **PageSizeCustom**, Sibelius will do nothing; to set a custom page size, set **PageWidth** and **PageHeight** individually. Setting any default **PageSize** value will also change the **PageWidth** and **PageHeight** values (read/write).

PageWidth

Returns or sets the width of a page in the units specified by the **Units** variable (read/write).

MarginType

Returns or sets the current page margin type. Values are **PageMarginsSame** (0), **PageMarginsMirrored** (1), **PageMarginsDifferent** (2) (read/write).

PageBottomMargin

Returns or sets the bottom page margin in the units specified by the **Units** variable (read/write).

PageLeftMargin

Returns or sets the left page margin in the units specified by the **Units** variable (read/write).

PageRightMargin

Returns or sets the right page margin in the units specified by the **Units** variable (read/write).

PageTopMargin

Returns or sets the top page margin in the units specified by the **Units** variable (read/write).

RightPageLeftMargin

Returns or sets the left page margin for right-hand pages in the units specified by the **Units** variable (read/write). Setting this value automatically sets **MarginType** to **PageMarginsDifferent**.

RightPageRightMargin

Returns or sets the right page margin for right-hand pages in the units specified by the **Units** variable (read/write). Setting this value automatically sets **MarginType** to **PageMarginsDifferent**.

StaffLeftMarginFullNames

Returns or sets the margin to the left of staves showing full instrument names in the units specified by the **Units** variable (read/write).

StaffLeftMarginNoNames

Returns or sets the margin to the left of staves showing no instrument names in the units specified by the **Units** variable (read/write).

StaffLeftMarginShortNames

Returns or sets the margin to the left of staves showing short instrument names in the units specified by the **Units** variable (read/write).

StaffSize

Returns or sets the staff size in the units specified by the **Units** variable (read/write).

Units

Returns or sets the units of measurement for all of the relevant variables of the **DocumentSetup** object. Always returns 0 (millimeters). Values are **DocumentSetupUnitsmm** (0), **DocumentSetupUnitsInches** (1), **DocumentSetupUnitsPoints** (2) (read/write).

UnitsInDocumentSetupDialog

Returns or sets the units of measurement currently shown in the Layout ► Document Setup dialog. Values are as for **Units**.

DynamicPartCollection

Accessed from a **Score** object. **DynamicPartCollection** contains **DynamicPart** objects.

The **DynamicPartCollection** object always contains the full score as the first entry, whether or not any dynamic parts exist. The **DynamicPart** objects are returned in the order in which they were created (the last part returned is the most-recently created one). For scores in which dynamic parts were generated automatically, the parts will normally be returned in top to bottom score order.

The edit context for Manuscript is stored in the score itself which means that Manuscript can only ever access one part at a time – the “current” **DynamicPart** for that **Score** object. This is irrespective of the number of score windows open for a score, which dynamic parts are open, and even if the user has managed to create two different Manuscript **Score** objects referring to the same Sibelius score.

It is inadvisable to modify Staves, Bars, or any BarObjects that do not exist on Staves in **Score.Current-DynamicPart**. Doing so will create part overrides for part-specific properties of these objects which will be invisible until those Staves are added to the part. **DynamicPart.IncludesStaff()** can be used to test if a **DynamicPart** contains a particular **Staff** object.

Both **DynamicPartCollection** and **DynamicPart** refer to an underlying Score and part(s) and will generate errors if the Score and/or part(s) are no longer valid (for example, if a **DynamicPart** has been deleted). **DynamicPart** are never “re-used.” For example, if you delete a **DynamicPart** and create a new **DynamicPart**, the old Manuscript **DynamicPart** object will not refer to the newly-created **DynamicPart**.

for each variable in iterates through all valid **DynamicPart** objects for the Score, always starting first with the full score. Adding or deleting parts while iterating will have undefined results, and is not recommended.

Array access *[int n]* returns the *n*th part (0 is always the full score), or null if the part does not exist.

Methods

CreateDefaultParts()

Creates the default set of dynamic parts, as created automatically by Sibelius when clicking the **New Part** button in the Parts window. This method does nothing and returns **False** if the Score has no staves.

CreatePartFromStaff(*staff*)

Creates a dynamic part from the specified **Staff** object, if valid. Returns the new **DynamicPart** object for success, or null for failure.

DeletePart(*dynamic part*)

Deletes the specified part, if it's valid. Returns **True** for success, **False** for failure. This method fails if the specified dynamic part is the currently active part for the Score, or is the full score, or refers to a different Score.

Variables

NumChildren

Returns the number of **DynamicPart** objects for the Score returned by iteration (read only).

DynamicPart

Accessed from a **DynamicPartCollection** object.

for each variable in returns the **Staff** objects in the dynamic part, in top to bottom order. Warning: this can return a Staff that is not included in **Score.CurrentDynamicPart**.

Methods

AddStaffToPart(*staff*)

Adds the specified *staff* to the bottom of the dynamic part. Returns **False** for failure. This method will cause an error if it is called on the full score, or if attempting to add a staff that is already present in the part or a staff from a different score.

DeleteStaffFromPart(*staff*)

Deletes the specified *staff* from the dynamic part. Returns **False** for failure. This method will cause an error if called on the full score, or if attempting to delete a staff that is not present in the part, or if deleting the last staff in a part, or attempting to delete a part from a different score.

IncludesStaff(*staff*)

Returns **True** if the specified *staff* is contained in this dynamic part.

Variables

IsFullScore

Returns **True** if this is the full score (read only).

IsSelectedInPartsWindow

Returns **True** if the part is selected in the Parts window (read only).

StaveCount

Returns the number of staves in the part (read only).

ParentScore

Returns the **Score** object containing this dynamic part (read only).

EngravingRules

Accessed via the **Score** object. Corresponds to selected settings in the House Style > Engraving Rules dialog.

Methods

None.

Variables

AdjustTranspositionIfKeySigWraps

Returns **True** if Sibelius will adjust note spelling for transposing instruments in extreme keys, **False** otherwise; corresponds to the Adjust note spelling in transposing instruments in remote keys option on the Clefs and Key Signatures page (read/write).

BarlineWidth

Returns or sets the width of normal barlines in spaces, from the Barlines page (read/write).

BeamThickness

Returns or sets the thickness of beams in spaces, from the Beams and Stems page (read/write).

CautionaryNaturalsInKeySignatures

Returns **True** if key changes will show cautionary naturals; **False** otherwise, from the Clefs and Key Signatures page (read/write).

CueNoteScale

Returns or sets the percentage by which cue-sized notes are scaled relative to normal-sized notes, from the **Notes and Tremolos** page (read/write).

DashedBarlineWidth

Returns or sets the width of dashed barlines in spaces, from the **Barlines** page (read/write).

DoubleBarlineSeparation

Returns or sets the distance between the two lines in double barlines in spaces, from the **Barlines** page (read/write).

DoubleBarlineWidth

Returns or sets the width of double barlines in spaces, from the **Barlines** page (read/write).

DoubleTremoloStyle

Returns or sets the style used for double tremolos in the score, from the **Notes and Tremolos** page; values are **DoubleTremolosTouchingStems** (0), **DoubleTremolosBetweenStems** (1), **DoubleTremolosOuterTremoloTouchingStems** (2) (read/write).

ExtraSpacesAboveForSystemObjectPositions

Returns or sets the n extra spaces above for System Object Positions value on the **Staves** page (read/write).

ExtraSpacesBelowVocalStaves

Returns or sets the n extra spaces below vocal staves (for lyrics) value on the **Staves** page (read/write).

ExtraSpaceBetweenGroupsOfStaves

Returns or sets the n extra spaces between groups of staves value on the **Staves** page (read/write).

FinalBarlineSeparation

Returns or sets the distance between the two lines in final barlines in spaces, from the **Barlines** page (read/write).

FinalBarlineWidth

Returns or sets the width of the thick line of final barlines in spaces, from the **Barlines** page (read/write).

GraceNoteScale

Returns or sets the percentage by which grace notes are scaled relative to normal notes, from the **Notes and Tremolos** page (read/write).

InstrumentNamesFirstSystem

Corresponding to the option for instrument names on the first system on the **Instruments** page; values are **InstrumentNamesFull** (0), **InstrumentNamesShort** (1), **InstrumentNamesNone** (2) (read/write).

InstrumentNamesNewSections

Corresponding to the option for instrument names at the start of new sections on the Instruments page; values are **InstrumentNamesFull** (0), **InstrumentNamesShort** (1), **InstrumentNamesNone** (2) (read/write).

InstrumentNamesSubsequentSystems

Corresponding to the option for instrument names on subsequent systems on the Instruments page; values are **InstrumentNamesFull** (0), **InstrumentNamesShort** (1), **InstrumentNamesNone** (2) (read/write).

JustifyGrandStaveInstruments

Returns **True** if Justify both staves of grand staff instruments on the Staves page is switched on, otherwise **False** (read/write).

JustifyMultiStaveInstruments

Returns **True** if Justify all staves of multi-staff instruments on the Staves page is switched on, otherwise **False** (read/write).

LegerLineThickness

Returns or sets the thickness of leger lines in spaces, from the Notes and Tremolos page (read/write).

RespellRemoteKeysInTransposingScore

Returns **True** if Sibelius will choose the equivalent key signature with one fewer flat or sharp for transposing instruments; **False** otherwise, corresponding to the option Respell remote key signatures in transposing score on the Clefs and Key Signatures page (read/write).

ShowNameOfPrevailingInstrumentChangeAtStartOfSystems

Returns **True** if Sibelius will update the instrument name at the start of each system to reflect the current instrument change, **False** otherwise; corresponds to the Change instrument names at start of system after instrument changes option on the Instruments page (read/write).

SlurMiddleThickness

Returns or sets the default thickness of the middle of slurs in spaces, from the Slurs page (read/write).

SlurOutlineWidth

Returns or sets the thickness of slur ends in spaces, from the Slurs page (read/write).

SmallStaffSizeScale

Returns or sets the percentage by which small staves are scaled relative to normal-sized staves, from the Staves page (read/write).

SpacesBetweenStaves

Returns or sets the *n* spaces between staves value on the Staves page (read/write).

SpacesBetweenSystems

Returns or sets the n spaces between systems value on the **Staves** page (read/write).

StaffJustificationPercentage

Returns or sets the Justify staves when page is at least $n\%$ full value on the **Staves** page (read/write).

StaffLineWidth

Returns or sets the width of a staff line in spaces, from the **Staves** page (read/write).

StemThickness

Returns or sets the thickness of stems in spaces, from the **Beams and Stems** page (read/write).

TieMiddleThickness

Returns or sets the thickness of the middle of ties in spaces, from the **Ties 1** page (read/write).

TieOutlineWidth

Returns or sets the thickness of tie ends in spaces, from the **Ties 1** page (read/write).

File

Retrievable using **for each** on a folder.

Methods

Delete()

Deletes a file, returning **True** if successful.

Rename(newFileName)

Renames a file, returning **True** if successful.

Variables

CreationDate

Returns the file's creation date and time as a **DateTime** object, in local time (read only).

CreationDateAndTime

A string giving the date and time the file was last modified in GMT (read only).

ModificationDate

Returns the file's modification date and time as a **DateTime** object, in local time (read only).

Name

The complete pathname of the file, no extension (read only).

NameWithExt

The complete pathname of the file, with extension (read only).

NameNoPath

Just the name of the file, no extension (read only).

Path

Returns just the path to the file (read only).

Type

A string giving the name of the type of the object; **File** for file objects (read only).

Folder

Retrievable from methods of the Sibelius object.

for each *variable* **in** produces the Sibelius files in the folder, as **File** objects

for each *type variable* **in** produces the files of *type* in the folder, where *type* is a Windows extension.

Useful values are SIB (Sibelius files), MID (MIDI files) or OPT (PhotoScore files), because they can all be opened directly by Sibelius. On the Macintosh files of the corresponding Mac OS Type are also returned (so, for example, **for each MID f** will return all files whose names end in .MID, and all files of type “Midi”).

Both these statements return subfolders recursively.

Methods

FileCount (*Type*)

Returns the number of files of type *Type* in the folder. As above, useful values are SIB, MID or OPT.

Variables

FileCount

The number of Sibelius files in the folder (read only).

FileCountAllTypes

The number of files of all types in the folder (read only).

Name

The name of the folder (read only).

Type

A string giving the name of the type of the object; Folder for folder objects (read only).

GuitarFrame

Derived from a **BarObject**. This refers to chord symbols as created by Create > Chord Symbol, whether or not they show a guitar chord diagram (guitar frame), but is called GuitarFrame in Manuscript for historical reasons.

Methods

CopyOutSuffixes()

Returns an array containing a list of the suffix elements present in the chord. If the chord symbol is an unrecognised chord type, the array returned will be empty. The values that can be returned in the array are as follows:

halfdim	dim
add6/9	6/9
sus2/4	aug
omit5	alt
omit3	b13
maj13	#11
add13	13
maj11	11
dim13	#9
dim11	b9
maj9	b6
add9	#5
maj7	b5
dim9	#4
dim7	nc
sus9	9
sus4	7
add4	6
sus2	5
add2	m
maj	/

GetChromaticPitchesOfChordInClosePosition(*consider root*)

Returns an array containing the chromatic pitches of the notes in the chord, assuming a voicing in close position. If *consider root* is **True** (it defaults to **False**), the pitches returned will be offset according to the chromatic value of the root note on which the chord is based.

GetEndStringForNthBarre(*barreNum*)

Returns the string number on which the *nth* barré ends.

GetPitchOfNthString(*stringNum*)

Returns the pitch of the given (open) string *stringNum*, as a MIDI pitch.

GetPositionOfFingerForNthBarre(*barreNum*)

Returns the fret position that the *nth* barré occupies.

GetPositionOfFingerOnNthString(*stringNum*)

Returns the position of the black dot representing the finger position on a given string *stringNum*, relative to the top of the frame. A return value of 0 means the string is open (that is a hollow circle appears at the top of the diagram), and -1 means that the string is not played (that is an X appears at the top of the diagram). Used in conjunction with **GetPitchOfNthString**(), you can calculate the resulting pitch of each string.

GetStartStringForNthBarre(*barreNum*)

Returns the string number from which the *nth* barré begins.

IsNthStringPartOfBarre(*stringNum*)

Returns **True** if the given string is part of a barré.

NthStringHasClosedMarkingAtNut(*nth string*)

Returns **True** if there's an X marking at the top or left of the specified string.

NthStringHasOpenMarkingAtNut(*nth string*)

Returns **True** if there's an O marking at the top or left of the specified string.

Variables

BassAsString

The note name of the chord symbol's altered bass note (for example: "F").

ChordNameAsStyledString

The name of the chord represented by this chord symbol as it appears in the score, for example: "Cm^7" (read only).

ChordNameAsPlainText

The name of the chord represented by this chord symbol as it appears when editing the chord symbol, so that in its plain text representation, for example: “Cmmaj7” (read only).

ChromaticRoot

The chromatic pitch (C = 0, B = 11) of the chord symbol’s root note (read only).

ChromaticBass

The chromatic pitch (C = 0, B = 11) of the chord symbol’s altered bass note (read only).

DiatonicRoot

The diatonic pitch, that is the number of the “note name” to which this note corresponds, 7 per octave (0 = C, 1 = D, 2 = E and so on), of the chord symbol’s root note (read only).

DiatonicBass

The diatonic pitch, that is the number of the “note name” to which this note corresponds, 7 per octave (0 = C, 1 = D, 2 = E and so on), of the chord symbol’s altered bass note (read only).

Fingerings

The fingerings string for this chord. This is a textual string with as many characters as the guitar frame has strings (for example, six for standard guitars). Each character corresponds to a guitar string. Use to denote that a string has no fingering.

FrameIsVisible

True if the chord symbol is currently showing a guitar chord diagram (read only).

Horizontal

True if the guitar chord diagram is horizontally orientated, **False** if it is vertically orientated (read/write).

LowestVisibleFret

The number of the top fret shown in the guitar chord diagram; setting the special value **-1** resets the lowest visible fret to the default for that chord diagram (read/write).

NumBarresInChord

The number of unique barrés in the guitar chord diagram (read only).

NumberOfFrets

The number of frets in the guitar chord diagram, that is the number of horizontal lines; setting the special value **-1** resets the number of frets to the default for that chord diagram (read/write).

NumberOfStrings

The number of strings in the guitar chord diagram, for example, the number of vertical lines (read only).

NumPitchesInClosePosition

The number of unique pitches in the chord, assuming a voicing in close position with no duplicates.

Recognized

Returns **True** if the chord symbol is a specific recognized chord type, and **False** otherwise, that is if the chord symbol is shown in red in the score because Sibelius is unable to parse the user's input (read only).

RootAsString

The note name of the chord symbol's root (for example, "C#").

ScaleFactor

The scale factor of the guitar chord diagram (as adjustable via the **Scale** parameter on the **General** panel of Properties), expressed as a percentage (read/write).

ShowFingerings

Set to **True** if the fingerings string should be displayed, **False** otherwise (read only).

SuffixText

The suffix part of the chord symbol as it appears in the score, or an empty string if the chord isn't recognized (read only).

TextIsVisible

True if the chord symbol is currently showing a text chord symbol (read only).

TransposingChromaticRoot

Returns the chromatic pitch of the root note for the specified chord symbol as if the score is shown at transposed pitch, but regardless of whether or not **Notes ▶ Transposing Score** is switched on.

TransposingChromaticBass

Returns the chromatic pitch of the altered bass note for the specified chord symbol, if present, as if the score is shown at transposed pitch, but regardless of whether or not **Notes > Transposing Score** is switched on.

TransposingDiatonicRoot

Returns the diatonic pitch of the root note for the specified chord symbol as if the score is shown at transposed pitch, but regardless of whether or not **Notes > Transposing Score** is switched on.

TransposingDiatonicBass

Returns the diatonic pitch of the altered bass note for the specified chord symbol, if present, as if the score is shown at transposed pitch, but regardless of whether or not **Notes > Transposing Score** is switched on.

TransposingRootAsString

Returns a string representing the pitch of the root note for the specified chord symbol as if the score is shown at transposed pitch, but regardless of whether or not **Notes > Transposing Score** is switched on.

TransposingBassAsString

Returns a string representing the pitch of the altered bass note for the specified chord symbol, if present, as if the score is shown at transposed pitch, but regardless of whether or not **Notes > Transposing Score** is switched on.

VisibleComponents

The visible parts of the chord symbol, that is whether it displays a text chord symbol only (**TextOnly**), a guitar chord diagram only (**FrameOnly**), both a text chord symbol and a guitar chord diagram (**FrameAndText**), or whether or not the chord symbol shows a guitar chord diagram based on the type of instrument to which it is attached (**InstrumentDependent**) (read/write).

GuitarScaleDiagram

Derived from a **BarObject**. This refers to guitar scale diagrams as created by **Create ▶ Guitar Scale Diagram**.

Methods

GetDotFingeringsOnNthString(*nth string*)

Returns an array of strings containing the text that has been entered on the dots on a given string.

GetDotSymbolsOnNthString(*nth string*)

Returns an array of values describing the appearance of each of the dots on a given string. The possible values are **DotStyleCircle**, **DotStyleFilledCircle**, **DotStyleSquare**, **DotStyleFilledSquare**, **DotStyleDiamond**, and **DotStyleFilledDiamond**.

GetPitchesOfDotsOnNthString(*nth string*)

Returns an array containing the pitches of all the dots on a given string, in ascending order of pitch.

GetPitchOfNthString(*stringNum*)

Returns the pitch of the given (open) string *stringNum*, as a MIDI pitch.

Variables

Fingerings

The fingerings string for this scale diagram. This is a textual string with as many characters as the scale diagram has strings (for example, six for standard guitars). Each character corresponds to a guitar string. Use **–** to denote that a string has no fingering.

Horizontal

True if the guitar scale diagram is horizontally orientated, **False** if it is vertically orientated (read/write).

LowestVisibleFret

The number of the top fret shown in the guitar scale diagram; setting the special value **-1** resets the lowest visible fret to the default for that scale diagram (read/write).

NumberOfFrets

The number of frets in the guitar scale diagram, for example, the number of horizontal lines; setting the special value **-1** resets the number of frets to the default for that scale diagram (read/write).

NumberOfStrings

The number of strings in the guitar scale diagram, for example, the number of vertical lines (read only).

Root

Returns the chromatic pitch ($C = 0$) of the scale's root note (read only).

ScaleFactor

The scale factor of the guitar scale diagram (as adjustable via the **Scale** parameter on the **General** panel of Properties), expressed as a percentage (read/write).

ScaleType

Returns the type of the guitar scale diagram, as specified in the list of “GuitarScaleDiagram Type Values” on page 198 (read only).

ShowFingerings

Set to **True** if the fingerings string should be displayed, **False** otherwise (read only).

HitPointList

Retrievable as the **HitPoints** variable of a score. It can be used in a **for each** loop or as an array with the **[n]** operator—this gives access to a **HitPoint** object. The **HitPoint** objects are stored in time order, so be careful if you remove or modify the time of the objects inside a loop. If you want to change the times of all the hit points by the same value then use the **ShiftTimes** function.

Methods

Clear()

Removes all hit points from the score.

CreateHitPoint(timeMs,label)

Creates a hit point in the score at the given time (specified in milliseconds) with a specified string label. Returns the index in the **HitPointList** at which the new hit point was created.

Remove(*index*)

Removes the given hit point number.

ShiftTimes(*timeMs*)

Adds the given time (in milliseconds) onto all the hit points. If the time is negative then this is subtracted from all the hit points.

Variables

NumChildren

Number of hit points (read only).

HitPoint

Individual element of the **HitPointList** object.

Methods

None.

Variables

Bar

The bar in which this hit point occurs (read only).

Label

The name of the hit point (read/write).

Position

The position within the bar at which this hit point occurs (read only).

Time

The time of the hit point in milliseconds. Note that changing this value may change the position of the hit point in the HitPointList (read/write).

InstrumentChange

Derived from a **BarObject**. Provides information about any instrument changes that may exist in the score.

Methods

None.

Variables

StyleIdword

Returns the style ID of the new instrument; see “Instrument Types” on page 165 (read only).

TextLabel

Returns the text that appears above the staff containing the instrument change in the score (read only).

InstrumentTypeList

Contains a list of **InstrumentType** objects common to a given score.

for each *type variable* **in** returns each instrument type in the list, in alphabetical order by the instrument type’s style ID.

Array access *[int n]* returns the *n*th instrument type, in the same order as using a **for each** iterator, or null if the instrument type does not exist.

Methods

None.

Variables

NumChildren

Returns the number of unique instrument types in the list (read only).

InstrumentType

Provides information about an individual instrument type.

Methods

Clone()

Makes an exact copy of an existing instrument type.

PitchOfNthString(string num)

Returns the pitch of a given string in a tablature staff, with string number 0 being the lowest string on the instrument.

Variables

Balance

Returns the instrument's default balance, in the range **0–100** (read only).

Category

Returns an index representing the category of the staff type belonging to this instrument type; **0** = pitched; **1** = percussion; **2** = tablature (read only).

ChromaticTransposition

Returns the number of half-steps (semitones) describing the transposition of transposing instruments; such as for B-flat Clarinet, this returns **-2** (read/write).

ChromaticTranspositionInScore

Returns the number of half-steps (semitones) describing the transposition of transposing instruments in a score shown at concert pitch. Typically this is only used by instruments that transpose by octaves, so this will return, for example, **12** for piccolo or **-12** for guitars (read only).

ComfortableRangeHigh

Returns the highest comfortable note (MIDI pitch) of the instrument (read only).

ComfortableRangeLow

Returns the lowest comfortable note (MIDI pitch) of the instrument (read only).

ConcertClefStyleId

Returns the style ID of the normal clef style of the instrument (read only).

DefaultSoundId

Returns the default sound ID used by the instrument (read only).

DiatonicTransposition

Returns the number of diatonic steps describing the transposition of transposing instruments; such as for B-flat Clarinet, this returns **-1** (read/write).

DiatonicTranspositionInScore

Returns the number of diatonic steps describing the transposition of transposing instruments in a score shown at concert pitch (read only).

DialogName

Returns the name of the instrument as displayed in the **Create ► Instruments** dialog in Sibelius (read/write).

FullName

Returns the name of the instrument as visible on systems showing full instrument names (read only).

HasBracket

Returns **True** if the instrument has a bracket (read only).

HasKeySignatureOrTuning

Returns **True** if the instrument type has the Key signature / Tuning checkbox switched on in the Edit Staff Type dialog.

InstrumentTypeForChordDiagrams

Returns the style ID of the tab instrument type that determines the tuning used for chord diagrams shown for this instrument, that is corresponding to the Tab instrument to use for string tunings in the New/Edit Instrument dialogs.

IsVocal

Returns **True** if the instrument type used has the Vocal staff option switched on, meaning that, for example, the default positions of dynamics should be above the staff rather than below (read only).

NumStaveLines

Returns the number of staff lines in the staff (read only).

NumStrings

Returns the number of strings in a tablature staff (read only).

OtherClefStyleId

Returns the style ID of the clef style of the second staff of grand staff instruments, piano for example (read only).

Pan

Returns the instrument's default pan setting, in the range **-127** (hard left) to **127** (hard right) (read only).

ProfessionalRangeHigh

Returns the highest playable note (MIDI pitch) of the instrument for a professional player (read only).

ProfessionalRangeLow

Returns the lowest playable note (MIDI pitch) of the instrument for a professional player (read only).

ShortName

Returns the name of the instrument as visible on systems showing short instrument names (read only).

StyleId

Returns the style ID of the instrument; see “Global Constants” on page 156 (read only).

TransposingClefStyleId

Returns the style ID of the clef to be used when **Notes > Transposing Score** is switched on (read only).

KeySignature

Derived from a **BarObject**.

Methods

None.

Variables

AsText

The name of the key signature as a string (read only).

IsOneStaffOnly

True if this key signature belongs to one staff only (read only).

Major

True if this key signature is a major key (read only).

Sharps

The number of sharps (positive) or flats (negative) in this key signature (read only).

Line

Anything you can create from the **Create > Line** dialog is a **Line** object, such as **CrescendoLine**, **DiminuendoLine**, and so on. These objects are derived from a **BarObject**.

Methods

None.

Variables

Duration

The total duration of the line, in 1/256th quarters (read/write).

EndBarNumber

The bar number in which the line ends (read only).

EndPosition

The position within the final bar at which the line ends (read only).

RhDx

The horizontal graphic offset of the right-hand side of the line, in units of 1/32 spaces (read/write).

RhDy

The vertical graphic offset of the right-hand side of the line from the center staff line, in units of 1/32 spaces, positive going upwards (read/write).

StyleId

The identifier of the line style associated with this line (read only).

StyleAsText

The name of the line style associated with this line (read only).

LyricItem

Derived from a **BarObject**

Methods

None.

Variables

The total duration of the lyric line, in 1/256th quarters (see “Line” on page 91) (read/write).

NumNotes

Gives the number of notes occupied by this lyric item (read/write). Note that changing this value will not automatically change the length of the lyric line; you also need to set the lyric line’s **Duration** variable to the correct length.

StyleAsText

The text style name (read/write).

StyleId

he identifier of the text style of this lyric (read/write).

SyllableType

An integer indicating whether the lyric is the end of a word (**EndOfWord**) or the start or middle of one (**MiddleOfWord**) (read/write). This affects how the lyric is justified, and the appearance of hyphens that follow it. **EndOfWord** and **MiddleOfWord** are global constants; see “SyllableTypes for LyricItems” on page 193.

Text

The text as a string (read/write).

NoteRest

Derived from a **BarObject**. A **NoteRest** contains **Note** objects, stored in order of increasing diatonic pitch.

for each *variable in* returns the notes in the NoteRest.

Methods

AddAcciaccaturaBefore(*sounding pitch* , [*duration* [, *tied* [, *voice* [, *diatonic pitch* [, *string number* [, *force stem dir*]]]]])

Adds a grace note with a slash on its stem (acciaccatura) before a given NoteRest. The duration should be specified as normal, for example, 128 would create a grace note with one beam/flag. The optional *tied* parameter should be **True** if you want the note to be tied. Voice 1 is assumed unless the optional *voice* parameter (with a value of 1, 2, 3 or 4) is specified. If *force stem dir* is set to **True** (the default), stems of graces notes in voices 1 and 3 will always point upwards, and stems of notes in voices 2 and 4, downwards. You can also set the diatonic pitch, that is the number of the “note name” to which this note corresponds, 7 per octave (35 = middle C, 36 = D, 37 = E and so on). If a diatonic pitch of zero is given then a suitable diatonic pitch will be calculated from the MIDI pitch. The optional string number parameter gives a string number for this note, which is only meaningful if the note is on a tablature stave. If this parameter is not supplied then a default string number is calculated based on the current tablature stave type and the guitar tab fingering options (specified on the **Note Input** page of **File > Preferences**). Returns the **Note** object created (to get the NoteRest containing the note, use **Note.ParentNoteRest**).

Note that adding a grace note before a NoteRest will *always* create an additional grace note, just to the left of the note/rest to which it is attached. If you wish to create grace notes with more than one pitch, you should call **AddNote** on the object returned.

AddAppoggiaturaBefore(*sounding pitch* , [*duration* [, *tied* [, *voice* [, *diatonic pitch* [, *string number* [, *force stem dir*]]]]])

Identical to **AddAcciaccaturaBefore**, only no slash is added to the note’s stem.

AddNote(*pitch* [, *tied* [, *diatonic pitch* [, *string number*]]])

Adds a note with the given MIDI pitch (60 = middle C), for example to create a chord. The optional second parameter specifies whether or not this note is tied (True or False). The optional third parameter gives a diatonic pitch, which is the number of the ‘note name’ to which this note corresponds, 7 per octave (35 = middle C, 36 = D, 37 = E etc.). If this parameter is 0 then a default diatonic pitch will be calculated from the MIDI pitch. The optional fourth parameter gives a string number for this note, which is only meaningful if the note is on a tablature stave. If this parameter is not supplied then a default string number is calculated based on the current tablature stave type and the guitar tab fingering options (specified on the **Notes** page of **File > Preferences**). Returns the **Note** object created.

Delete()

Deletes all the notes in the **NoteRest**, converting the entire chord into a rest of similar duration.

FlipStem()

Flips the stem of this **NoteRest**—this acts as a toggle.

GetArticulation(articulation number)

Returns **True** or **False** depending on whether the given articulation is currently set on this note. The valid articulation numbers are defined in “Articulations” on page 192.

NoteRest[array element]

Returns the *n*th note in the chord, in order of increasing diatonic pitch (counting from 0). For example, **NoteRest[0]** returns the lowest note (in terms of diatonic pitch—see **AddNote** below).

RemoveNote(note)

Removes the specified **Note** object.

SetArticulation(articulation number, set)

If *set* is **True**, turns on the given articulation; otherwise turns it off. The valid articulation numbers are defined in “Articulations” on page 192.

Transpose(degree, interval type[, keep double accs])

Transposes the entire **NoteRest** up or down by a specified *degree* and *interval type*. To transpose up, use positive values for *degree*; to transpose down, use negative values. Note that degrees are 0-based, so 0 is equal to a unison, 1 to a second and so on. For descriptions of the various available interval types, see “Global Constants” on page 156. By default, Sibelius will transpose using double sharps and flats where necessary, but this behavior may be suppressed by setting the *keep double accs* flag to **False**.

For help in calculating the interval and degree required for a particular transposition, see the documentation for the **Sibelius.CalculateInterval** and **Sibelius.CalculateDegree** methods.

Variables

ArpeggioDx

The horizontal offset of the arpeggio line on the **NoteRest** (read/write), in units of 1/32nd of a space (the distance between two adjacent staff lines).

ArpeggioType

The type of note-attached arpeggio line present on the **NoteRest**. Values are **ArpeggioTypeNone**, **ArpeggioTypeNormal**, **ArpeggioTypeUp**, **ArpeggioTypeDown** (read/write).

ArpeggioTopDy

The vertical offset of the top of the note-attached arpeggio line on the **NoteRest** (read/write), in units of 1/32nd of a space.

ArpeggioBottomDy

The vertical offset of the bottom of the note-attached arpeggio line on the NoteRest (read/write), in units of 1/32nd of a space.

ArpeggioHidden

Returns **True** if the note-attached arpeggio line on the NoteRest is hidden (read/write).

Articulations

Lets you copy a set of articulations from one NoteRest to another (read/write), for example:

```
destNr.Articulations = sourceNr.Articulations;
```

Beam

Takes values **StartBeam**, **ContinueBeam**, **NoBeam** and **SingleBeam**. (see “Global Constants” on page 156 for details). These correspond to the keys 7, 8, * (/ on Mac) and / (* on Mac) on the third (F9) Keypad layout.

DoubleTremolos

Gives the number of double tremolo strokes starting at this note, in the range 0–7. Means nothing for rests. To create a double tremolo between two successive notes, ensure they have the same duration and set the **DoubleTremolos** of the first one (read/write).

Duration

The duration of the note rest (read only).

FallDx

The horizontal offset of a fall, if present on the NoteRest (read/write), in units of 1/32nd of a space.

FallType

\The type of note-attached fall present on the NoteRest. Values are **FallTypeNone**, **FallTypeNormal** and **FallTypeDoit** (read/write)

FeatheredBeamType

Returns one of three values, based on whether a note is set to produce a feathered beam. Values are **FeatheredBeamNone** (0), **FeatheredBeamAccel** (1) and **FeatheredBeamRit** (2) (read/write).

GraceNote

True if it’s a grace note (read only).

HasStemlet

Returns **True** if the note is showing a stemlet, according either to the state of the Use stemlets on beamed rests option on the Beams and Stems page of Engraving Rules or the stemlet button on the Keypad (read only).

Highest

The highest **Note** object in the chord (read only).

IsAcciaccatura

True if it's an acciaccatura, that is. a grace note with a slash through its stem (read only).

IsAppoggiatura

True if it's an appoggiatura, that is a grace note without a slash through its stem (read only).

Lowest

The lowest **Note** object in the chord (read only).

NoteCount

The number of notes in the chord (read only).

ParentTupletIfAny

If the **NoteRest** intersects a tuplet, the innermost **Tuplet** object at that point in the score is returned. Otherwise, *null* is returned (read only).

PositionInTuplet

Returns the position of the **NoteRest** relative to the duration and scale-factor of its parent tuplet. If the **NoteRest** does not intersect a tuplet, its position within the parent **Bar** is returned as usual (read only).

RestPosition

The vertical position of a rest (read/write).

ScoopDx

The horizontal offset of a scoop or plop, if present on the **NoteRest** (read/write), in units of 1/32nd of a space.

ScoopType

The type of note-attached scoop present on the **NoteRest**. Values are **ScoopTypeNone**, **ScoopTypeNormal**, **ScoopTypePlop** (read/write).

StemFlipped

True if the stem is flipped (read only).

StemletType

Provides information about whether the **NoteRest** is set to display a stemlet using the options on the Keypad. Returns either **StemletCustomOff** (in which case the **NoteRest** definitely does not show a stemlet), **StemletCustomOn** (in which case the **NoteRest** definitely *does* show a stemlet), or **StemletUseDefault** (in which case you should use the read-only variable **HasStemlet** to determine whether the **NoteRest** currently shows a stemlet) (read/write).

Stemweight

Returns the stem weight of a note, taking beams into account (read only). For an unbeamed note, this is the sum of the stave positions of all the notes in the `NoteRest`, where the stave position of the middle line is zero and the position increases as you move up the stave and decreases as you move downwards. For a beamed note, it is the sum of all the stem weights of the `NoteRests` under the beam (treated as though they were unbeamed).

There are some special cases. If a note has its stem direction forced due to voicing, then the stem weight will be one of the global constants `StemweightUp` or `StemweightDown`. If a note has its stem direction forced due to the “flip” flag being set, the stem weight will be either `StemweightFlipUp` or `StemweightFlipDown`. Finally, cross-stave notes have stem weight equal to `StemweightCross`.

If the stem weight is less than zero, the stem will point up, otherwise it will point down.

SingleTremolos

Gives the number of tremolo strokes on the stem of this note, in the range -1 (for “z on stem”) to 7. Means nothing for rests (read/write).

Note

Only found in `NoteRests`. Correspond to individual noteheads.

Methods

`Delete()`

Removes a single note from a chord.

`Transpose(degree, interval type[, keep double accs])`

Transposes and returns a single **Note** object up or down by a specified *degree* and *interval type**. To transpose up, use positive values for *degree*; to transpose down, use negative values. Note that degrees are 0-based, so 0 is equal to a unison, 1 to a second and so on. For descriptions of the various available interval types, see “Global Constants” on page 156. By default, Sibelius will transpose using double sharps and flats where necessary, but this behavior may be suppressed by setting the *keep double accs* flag to `False`. For help in calculating the interval and degree required for a particular transposition, see the documentation for the `Sibelius.CalculateInterval` and `Sibelius.CalculateDegree` methods.

* N.B.: Individual note objects cannot be transposed diatonically.

Variables

`Accidental`

The accidental, for which global constants such as `Sharp`, `Flat` and so on are defined; see “Global Constants” on page 156 (read only).

AccidentalStyle

The style of the accidental (read/write). This can be any of following four global constants: **NormalAcc**, **HiddenAcc**, **CautionaryAcc** (which forces an accidental to appear always) and **BracketedAcc** (which forces the accidental to be drawn inside brackets).

Bracketed

The bracketed state of the note, as shown on the F9 layout of the Keypad (read/write).

Color

The color of this Note (read/write). The color value is in 24-bit RGB format, with bits 0–7 representing blue, bits 8–15 green, bits 16–23 red and bits 24–31 ignored. Since Manuscript has no bitwise arithmetic, these values can be a little hard to manipulate; you may find the individual accessors for the red, green and blue components to be more useful (see below).

When all Notes in a given NoteRest are the same color, then that color is also promoted to the parent NoteRest itself. This allows backwards compatibility with versions of Sibelius prior to 8.3 that did not support the individual coloring of Notes. Coloring of NoteRest-attached objects, such as articulations and rhythm dots is not supported.

ColorAlpha

The alpha channel component of the color of this Note, in the range 0–255 (read/write).

ColorRed

The red component of the color of this Note, in the range 0–255 (read/write).

ColorGreen

The green component of the color of this Note, in the range 0–255 (read/write).

ColorBlue

The blue component of the color of this Note, in the range 0–255 (read/write).

DiatonicPitch

The diatonic pitch of the note, that is the number of the “note name” to which this note corresponds, 7 per octave (35 = middle C, 36 = D, 37 = E and so on). (read/write)

If Note.DiatonicPitch is changed from the full score (not a dynamic part), the written pitch and spelling of any accidental is changed in both the full score and the part (where there is no difference in spelling). If changed from a part, Sibelius respells any accidental in the part only, leaving the full score unchanged. In both cases, while there may be a difference in written pitch, Sibelius guarantees that there is never a difference in the sounding pitch of a note between a part and the full score.

IsAccidentalVisible

Returns **True** if the accidental on the note is visible, which is the equivalent of whether or not the corresponding button on the Keypad is illuminated for that note (read only).

Name

The pitch of the note as a string (read only).

NoteStyle

The index of the notehead style of this Note (read/write). The styles correspond to those accessible from the **Notes** panel of the Properties window in Sibelius; see “Note Style Names” on page 191 for a complete list of the defined NoteStyles.

NoteStyleName

The name of the notehead style of this Note (read/write). If an attempt is made to apply a non-existent style name, the note in question will retain its current notehead.

OriginalDeltaSr

The Live start position of this notehead (in 1/256th quarters), as shown in the **Playback** panel of Properties (read/write). This value can be positive or negative, indicating that the note is moved forwards or backwards.

OriginalDuration

The Live duration of this notehead (in 1/256th quarters), as shown in the **Playback** panel of Properties (read/write).

OriginalVelocity

The Live velocity of this notehead (in MIDI volume units, 0–127), as shown in the **Playback** panel of Properties (read/write). Note that the word “original” refers to the fact that this data is preserved from the original performance if the score was imported from a MIDI file or input via Flexi-time. For further details on this value, and the ones following below, read the **Live Playback** section in Sibelius Reference.

ParentNoteRest

The **NoteRest** object that holds this note (read only).

Pitch

The MIDI pitch of the note, in semitones, 60 = middle C (read only).

Slide

Is **True** if the note has a slide, **False** otherwise (read/write).

SlideStyleId

The slide line style state of the note, allowing you to attach/detach glissandi and other lines to a note (read/write).

The following Line styles are available by default (as seen in the Inspector):

```
line.staff.gliss.straight
```

```
line.staff.gliss.wavy
```

```
line.staff.plain
```

```
line.staff.port.straight
```

You can define and assign additional custom Line styles not based on the available default Line styles. For Examples:

```
// Add/set a note slide style  
note.SlideStyleId = "line.staff.gliss.straight";  
  
// Log a note slide style to the plug-in trace window  
Trace(note.SlideStyleId);  
  
// Using a custom line style  
note.SlideStyleId = "line.staff.gliss.straight.user.0000001";
```

StringNum

The string number of this note, only defined if the note is on a tablature stave. If no string is specified, reading this value will give -1. Strings are numbered starting at 0 for the bottom string and increasing upwards (read only).

Tied

Is **True** if the note is tied to the following note (read/write).

WrittenAccidental

The accidental, taking transposition into account (read only).

WrittenDiatonicPitch

The written diatonic pitch of the note, taking transposition into account if **Score.TransposingScore** is **True** (35 = middle C).

WrittenName

The written pitch of the note as a string (taking transposition into account) (read only).

WrittenPitch

The written MIDI pitch of the note, taking transposition into account if **Score.TransposingScore** is **True** (60 = middle C) (read only).

UseOriginalDeltaSrForPlayback

Is **True** if the Live start position of this Note should be used for Live Playback. Corresponds to the Live start position checkbox in the Playback panel of the Properties window.

UseOriginalDurationForPlayback

Is **True** if the Live duration of this Note should be used for Live Playback. Corresponds to the Live duration checkbox in the Playback panel of the Properties window.

UseOriginalVelocityForPlayback

Is **True** if the Live velocity of this Note should be used for Live Playback. Corresponds to the Live velocity checkbox in the Playback panel of the Properties window.

NoteSpacingRule

Provides access to the settings from the Appearance > House Style > Note Spacing Rule dialog. Obtained by way of the **Score** object, for example:

```
nsr = Sibelius.ActiveScore.NoteSpacingRule;
```

Methods

None.

Variables

The following variables are listed in the same order as the options to which they correspond in the Note Spacing Rule dialog.

FixedBarRestWidth

The width of an empty bar if the Fixed empty bar width *n* spaces radio button is chosen (read/write). This value is only used if **DetermineEmptyBarWidthBySrLength** is **False**.

DetermineEmptyBarWidthBySrLength

Returns **True** if Empty bar width is determined by time signature is chosen, otherwise **False** (read/write).

StartOfBarGap

The value of Before first note in bar *n* spaces (read/write).

MinimumDurationSpace

The value of Short notes *n* spaces (read/write).

SpaceForSixteenth

The value of 16th note (semiquaver) *n* spaces (read/write).

SpaceForEighth

The value of 8th note (quaver) n spaces (read/write).

SpaceForQuarter

The value of Quarter note (crotchet) n spaces (read/write).

SpaceForHalf

The value of Half note (minim) n spaces (read/write).

SpaceForWhole

The value of Whole note (semibreve) n spaces (read/write).

SpaceForDoubleWhole

The value of Double whole note (breve) n spaces (read/write).

AllowSpaceForVoiceConflicts

Returns **True** if Allow extra space for colliding voices is switched on, otherwise **False** (read/write).

SpaceAroundGraceNote

The value of Space around grace notes n spaces (read/write).

ExtraSpaceAfterLastGraceNote

The value of Extra space after last grace note n spaces (read/write).

IncludeChordSymbols

Returns **True** if Allow space for chord symbols is switched on, otherwise **False** (read/write).

ExtraSpaceBetweenGuitarFrames

The value of Minimum gap between chord symbols n spaces (read/write).

MinSpaceAroundNote

The value of Around noteheads (and dots) n spaces (read/write).

MinSpaceBeforeAccidental

The value of Before accidentals n spaces (read/write).

MinSpaceBeforeArpeggio

The value of Before arpeggio n spaces (read/write).

MinSpaceAfterHook

The value of After tails with stems up n spaces (read/write).

MinSpaceAroundLegerLine

The value of Around leger lines n spaces (read/write).

MinSpaceAtStartOfBar

The value of After start of bar n spaces (read/write).

MinSpaceAtEndOfBar

The value of Before end of bar n spaces (read/write).

MinTieSpacing

The value of Min space (tie above/below note) n spaces (read/write).

MinTieSpacingChords

The value of Min space (tie between notes) n spaces (read/write).

IncludeLyrics

Returns **True** if Allow space for lyrics is switched on, otherwise **False** (read/write).

AllowFirstLyricOverhang

Returns **True** if Allow first lyric to overhang barline is switched on, otherwise **False** (read/write).

AllowSpaceForHyphen

Returns **True** if Allow extra space for hyphens is switched on, otherwise **False** (read/write).

SpaceBetweenLyrics

The value of Minimum gap between lyrics n spaces (read/write).

PageNumberChange

Provides access to get and set the attributes of a page number change at the end of a bar or on a blank page.

Methods

SetFormatChangeOnly (*format change only*)

If *format change only* is **True**, this has the same effect as switching *off* the **New page number** check box on the **Page Number Change** dialog in Sibelius. The page numbering will therefore continue counting consecutively, but it's possible to (for example) hide a group of page numbers and restore visibility at a later point on the score without having to keep track of the previous page numbers.

SetHideOrShow(*page number visibility*)

Takes one of the three **Page number visibility** global constants to determine the visibility of the initial page number change and its subsequent pages; see “Global Constants” on page 156.

SetPageNumber(*page number*)

Takes an integral number specifying the new number you wish to assign to the page.

SetPageNumberFormat(*format*)

Takes one of the four **Page number format** global constants to change the format used to display the page number change; see “Global Constants” on page 156.

Variables

BarNumber

Returns the bar number expressed as an integer (read only).

HideOrShow

Returns one of the three **Page number visibility** global constants; see “Global Constants” on page 156 (read only).

PageNumber

Returns the page number expressed as an integer. For example, page x when using Roman numerals would be 10, or 24 with alphabetics (read only).

PageNumberAsString

Returns the page number change as visible on the corresponding page in Sibelius (read only).

PageNumberBlankPageOffset

Returns the blank page offset of the page number change, or 0 if there are no blank pages following the bar containing the page number change (read only).

PageNumberFormat

Returns one of four **Page number format** global constants describing the format of the page number change; see “Global Constants” on page 156 (read only).

PluginList

An array that is obtained from `Sibelius.Plugins`. It can be used in a `for each` loop or as an array with the `[n]` operator to access each `Plugin` object.

Methods

Contains(*pluginName*)

Returns **True** if a plug-in with the given name is installed. This can be used to query whether a plug-in is installed before you try to call it.

Variables

NumChildren

Number of plug-ins (read only).

Plugin

This represents an installed plug-in. Typical usage:

```
for each p in Sibelius.Plugins
{
    trace("Plugin: " & p.Name);
}
```

Methods

The following methods are intended to allow you to check the existence of specific methods, data and dialogs in plug-ins, which allows you to check in advance that calling a method in another plug-in will succeed, and fail gracefully if the method is not found:

MethodExists(*method*)

Returns **True** if the specified *method* exists in the current **Plugin** object.

DataExists(*data*)

Returns

True if the specified *data* exists in the current **Plugin** object.

DialogExists(*dialog*)

Returns **True** if the specified *dialog* exists in the current **Plugin** object.

Variables

File

The **File** object corresponding to the file that the plug-in was loaded from (read only).

Name

The name of the plug-in (read only).

RehearsalMark

Derived from a **BarObject** and found in the system staff only. RehearsalMarks have an internal numbering and a visible text representation, both of which can be read from *ManuScript*.

Methods

None.

Variables

Mark

The internal number of this rehearsal mark. By default rehearsal marks are consecutive (with the first one numbered zero), but the user can also create marks with specific numbers.

MarkAsText

The textual representation of this rehearsal mark as drawn in the score. This is determined by the *House Style* ▶ *Engraving Rules* options, and can take various forms (numerical or alphabetical).

Score

You can obtain the **Score** object by way of the *Sibelius* object, for example:

```
score = Sibelius.ActiveScore;
```

A *Score* contains one *System Staff* and one or more **Staff** objects.

for each *variable in* returns each staff in the score or the current dynamic part in turn (not the system staff).

for each *type variable in* returns the objects in the score in chronological order, from the top staff to the bottom staff (for simultaneous objects) and then from left to right (again, not including the system staff).

Methods

AddBars(*n*)

Adds *n* bars to the end of the score.

ApplyStyle(*style file*, "style", [*style ID*])

Imports named styles from the given house style file (.lib) into the score. The style file parameter can either be a full path to the file, or just the name of one of the styles that appears in the House Style ► Import House Style dialog. You can import as many “style” elements as you like in the same method. Style names are as follows:

HOUSE, TEXT, SYMBOLS, LINES, NOTEHEADS, CLEFS, DICTIONARY, SPACINGRULE, DEFAULTPARTAPPEARANCE, INSTRUMENTSANDENSEMBLES, MAGNETICLAYOUTOPTIONS
or **ALLSTYLES**.

For instance:

```
score2.ApplyStyle("C:\NewStyle.lib", "HOUSE", "TEXT");
```

Note that the constant **HOUSE** refers, for historical reasons, only to those options in the House Style > Engraving Rules and Layout > Document Setup dialogs, not the entire house style. To import the entire House Style, use the **ALLSTYLES** constant.

ClefStyleId(*clef style name*)

Returns the identifier of the clef style with the given name, or the empty string if there is no such clef style.

CreateInstrument(*style ID*[, *change names* [, [*full name* [, [*short name*]]]])

Creates a new instrument, given the *style ID* of the instrument type required (see “Instrument Types” on page 165). If you want to supply the instrument names to be used in the score, set the optional *change names* parameter to **True**, then supply strings for the *full name* and *short name*. Returns **True** if the instrument was created successfully and **False** if the instrument type could not be found.

CreateInstrumentAtBottom(*style ID*[, *change names* [, [*full name* [, [*short name*]]]])

Behaves the same way as **CreateInstrument**, only the new instrument is always created below all other instruments that currently exist in the score. This can be useful when programmatically copying a list of staves/instruments from one score to another, as you can guarantee the ordering of the staves will be the same in both scores.

CreateInstrumentAtBottomReturnStave(*style ID*[, *change names* [, [*full name* [, [*short name*]]]])

As above, but returns the **Staff** object created, or null if unsuccessful.

CreateInstrumentAtTop(*style ID*[, *change names* [, [*full name* [, [*short name*]]]])

Behaves in exactly the same way as **CreateInstrumentAtBottom**, only the new instrument is always created above all other instruments that currently exist in the score.

CreateInstrumentAtTopReturnStave(*style ID*[, *change names* [, [*full name* [, [*short name*]]]])

As above, but returns the **Staff** object created, or null if unsuccessful.

CreateInstrumentReturnStave(*style ID*[, *change names* , ["full name" , ["short name"]]])

Like **CreateInstrument**, but returns the **Staff** object created, or null if unsuccessful. Note that if the instrument being created contains more than one staff (such as piano or harp), the top stave of the instrument in question will be returned.

ExportPartsAsPDF(*filename*[, *single file*[, *part IDs*[, *include score*]])

Exports one dynamic part, a selection of dynamic parts, or all dynamic parts in PDF format, either concatenated into a single file, or as separate files. The *filename* parameter should be a complete path. It may contain the following tokens, which Sibelius will expand automatically to generate a complete filename:

%f = Score filename

%t = Score title (as specified in the Title field in File > Info)

%p = Part name (as specified in the Part name field in File > Info)

%n = Part number

%o = Total number of parts

%d = Date (format YYYY-MM-DD)

%h = Time (format HHMM)

The Boolean parameter *single file* specifies whether the chosen parts should be extracted into separate PDF files or concatenated into a single PDF file. This parameter defaults to **True** if not specified.

To specify which parts to export, create a sparse array of part IDs, and pass this in as the third parameter, *part IDs*. For example:

```
s = Sibelius.ActiveScore;
partsToExport = CreateSparseArray();
parts = s.DynamicParts;
firstNPartsToExport = 2;
i = 0;
for each part in parts {
    if (i <= firstNPartsToExport) { // <= because the first "part" in
the
        //DynamicPartsCollection is the full score.
        partsToExport.Push(part);
    }
    i = i + 1;
}
s.ExportPartsAsPDF("c:\\%f - %p.pdf", true, partsToExport);
```

To export all parts, pass in 0 instead of a sparse array.

The final optional Boolean parameter, *include score*, defaults to **False**. If set to **True**, the full score will also be exported along with the parts.

ExportScoreAsPDF(*filename*)

Exports the full score as a PDF, with the specified *filename*, which should be a complete path. The *filename* parameter may use the same tokens as the **ExportPartsAsPDF**() method—see above.

ExtractParts(*[show_dialogs[,parts path[,open parts]]]*)

Extracts parts from the score. The first optional Boolean parameter can be **False**, in which case the parts are extracted without showing an options dialog. The second optional parameter specifies a folder into which to extract the parts (must end with a trailing folder separator). The third optional Boolean parameter, which defaults to **True**, specifies whether the extracted parts should be opened immediately, or simply saved.

FreezeMagneticLayoutPositions()

Does the same as selecting the whole score and choosing **Layout > Magnetic Layout > Freeze Positions**, which explicitly sets the **Dx/Dy** of every object to the position produced by Magnetic Layout, then disables Magnetic Layout for each object.

GetLocationTime(*bar number[,position[,pass]]*)

Returns the time of a given bar (by passing in its *bar number*) and optional *position* within that bar in the score in milliseconds. If the score contains repeats, the value returned will always be the time on the first pass through the score, but you can supply the optional *pass* parameter to specify a particular pass in the repeat structure. If the bar and position are not valid, the return value will be **-1**.

GetVersions()

Returns the score's **VersionHistory** object (see "VersionHistory" on page 153).

HideEmptyStaves(*startStaveNum,endStaveNum,startBarNum,endBarNum*)

Hides any empty staves between *startStaveNum* and *endStaveNum*, from *startBarNum* to *endBarNum*. Both the staff numbers and bar numbers are 1-based, and refer to the active part.

InsertBars(*n,barNum[,length]*)

Inserts *n* bars before bar number *barNum*. If no *length* has been specified, the bar will be created with the correct length according to the current time signature. However, irregular bars may also be created by specifying a value for *length*.

InternalPageNumToExternalPageNum(*pagenum*)

Returns a string containing the external page number of the given internal page number *pagenum*.

LineStyleId(*line style name*)

Returns the identifier of the line style with the given name, or the empty string if there is no such line style.

NoteStyleIndex(*notehead style name*)

Returns the index of the note style with the given name, or **-1** if there is no such note style.

NthStaff(*staff index from 1*)

Returns the *n*th staff of the score or the current dynamic part.

OptimizeStaffSpacing (*from staff number* [, *to staff number* [, *from bar* [, *to bar*]]])

Does the equivalent of Layout > Optimize Staff Spacing for the given range of staves or a whole score. *from staff number* must be specified; if *to staff number* is not specified, Sibelius will optimize the distances between *from staff number* and the bottom staff in the score; if *from bar* is not specified, Sibelius sets it to 1; if *to bar* is not specified, Sibelius sets it to the last bar of the score.

PlayLiveTempo (*play*)

Switches Play > Live Tempo on or off; set *play* to **True** to switch it on, or **False** to switch it off.

RemoveAllHighlights ()

Removes all highlights in this score.

RemoveVideo ()

Removes an attached video from the score.

RenameTextStyle ("old name", "new name")

Renames a text style to a new name.

Save (*filename*)

Saves the score, overwriting any previous file with the same name.

SaveAs (*filename*, *type* [, *use_defaults* [, *foldername*]])

Saves the score in a specified format, overwriting any previous file with the same name. The optional argument *use_defaults* only applies to graphics files, and specifies whether or not the default settings are to be used. When set to **False**, the Export Graphics dialog will appear and allow the user to make any necessary adjustments. The optional *foldername* specifies the folder in which the file is to be saved, and will create the specified folder if it does not exist. The *foldername* parameter must not end with a path separator (which is “\” on Windows).

The possible values for *type* are:

SIBL	Sibelius format (current version)
EMF	EMF
BMP	Windows bitmap
PICT	PICT format
PDF	PDF format
PNG	PNG format
Midi	MIDI format
TIFF	TIFF format
XML	Uncompressed MusicXML
MXL	Compressed MusicXML

So, to save a file using the current Sibelius file format, you would write **score.SaveAs ("file-name.sib", "SIBL");**

SaveAsAudio(*filename*[, *include all staves*[, *play from start*]])

Creates a WAV file (PC) or AIFF file (Mac) of the score, using Sibelius's File ▶ Export ▶ Audio feature. If *include all staves* is **True** (the default), Sibelius will first clear any existing selection from the score so every instrument will be recorded; only selected staves will otherwise be exported. When *play from start* is **True** (also the default), Sibelius will record the entire score from beginning to end, otherwise from the current position of the playback line. Note that **SaveAsAudio** will only have an effect if the user's current playback configuration consists of solely VST and/or AU devices. The function returns **True** if successful, otherwise **False** (including if the user clicks **Cancel** during export).

SaveAsSibelius2(*filename*[, *foldername*])

Saves the score in Sibelius 2 format, overwriting any previous file with the same name. The optional *foldername* specifies the folder in which the file is to be saved. Note that saving as Sibelius 2 may alter some aspects of the score; see Sibelius Reference for full details.

SaveAsSibelius3(*filename*[, *foldername*])

Saves the score in Sibelius 3 format. See documentation for **SaveAsSibelius2** above.

SaveAsSibelius4(*filename*[, *foldername*])

Saves the score in Sibelius 4 format. See documentation for **SaveAsSibelius2** above.

SaveAsSibelius5(*filename*[, *foldername*])

Saves the score in Sibelius 5 format. See documentation for **SaveAsSibelius2** above.

SaveAsSibelius6(*filename*[, *foldername*])

Saves the score in Sibelius 6 format. See documentation for **SaveAsSibelius2** above.

SaveAsSibelius7(*filename*[, *foldername*])

Saves the score in Sibelius 7 format. See documentation for **SaveAsSibelius2** above.

SaveCopyAs(*filename*[, *foldername*])

Saves a copy of the score in the current version's format without updating the existing score's file name in Sibelius.

SetPlaybackPos(*bar number*, *sr*)

Sets the position of the playback line to a given *bar number* and rhythmic (*sr*) position.

ShowEmptyStaves(*startStaveNum*, *endStaveNum*, *startBarNum*, *endBarNum*)

Shows any empty staves currently hidden using Layout ▶ Hiding Staves ▶ Hide Empty Staves between *startStaveNum* and *endStaveNum*, from *startBarNum* to *endBarNum*. Both the staff numbers and bar numbers are 1-based, and refer to the active part.

StaveTypeId(*stave type name*)

Returns the identifier of the stave type with the given name, or the empty string if there is no such stave type.

SystemCount(*page num*)

The number of systems on a page (the first page of the score is page 1).

SymbolExists(*symbol*)

Returns **True** if the symbol index or name *symbol* is found in the score, otherwise **False**.

SymbolIndex(*symbol name*)

Returns the index of the symbol with the given name, or **-1** if there is no such symbol.

TextStyleId(*text style name*)

Returns the identifier of the text style with the given name, or the empty string if there is no such text style.

ViewLiveTempo(*view*)

Switches View > Live Tempo on or off; set *view* to **True** to switch it on, or **False** to switch it off.

Variables

Arranger

Arranger of score from File > Score Info (read/write).

Artist

Artist of score from File > Score Info (read/write)

Barlines

Returns a **Barlines** object containing information about the barline groupings in the score (read only).

BarPlaybackOrder

Returns a sparse array containing a list of integers that describes the order in which the bars will be played, according to the repeat structure of the score or the settings in Play > Interpretation > Repeats. To set the order in which bars should be played, pass in a sparse array containing a list of integers describing the order in which bars should be played back. To return to the score's automatically-determined playback order, pass in **null** (read/write).

BarPlaybackOrderString

Returns a string describing the order in which the bars will be played, according to the repeat structure of the score. The string uses the same format as the read-out in Play > Interpretation > Repeats, for example, "1–8, 1–5,9–12". To set the order in which bars should be played, pass in a string of the appropriate format. To return the score's automatically-determined playback order, pass in **null** (read/write).

BracketsAndBraces

Returns a **BracketsAndBraces** object containing information about the brackets and braces in the score (read only).

Composer

Composer of score from File > Score Info (read/write).

ComposerDates

Value of Composer's dates from File > Score Info (read/write).

Copyist

Copyist of score from File > Score Info (read/write).

Copyright

Copyright of score from File > Score Info (read/write).

CurrentDynamicPart

Returns or sets the current **DynamicPart** object for the Score (read/write). Sibelius will not automatically display the new part: use **Sibelius.ShowDynamicPart()** to change the displayed part.

CurrentPlaybackPosBar

Returns the bar number in which the playback line is currently located.

CurrentPlaybackPosSr

Returns the rhythmic position within the bar at which the playback line is currently located.

Dedication

Dedication of score from File > Score Info (read/write).

DocumentSetup

Returns a **DocumentSetup** object representing the settings in Layout > Document Setup (read only).

DynamicParts

Returns a **DynamicPartCollection** object representing the dynamic parts present in the Score. This object will always stay up to date, even if parts are added or deleted (read only).

EnableScorchPrinting

Corresponds to the Allow printing and saving checkbox in the Export Scorch Web Page dialog (read/write).

EngravingRules

Returns an **EngravingRules** object corresponding to selected settings in the House Style> Engraving Rules dialog (read only).

FileName

The filename for the score (read only).

FocusOnStaves

is **True** if View > Focus on Staves is switched on (read/write). See also **Staff.ShowInFocusOnStaves**.

HitPoints

The **HitPointList** object for the score (read/write).

InstrumentChanges

Value of Instrument changes from File > Score Info (read/write).

InstrumentTypes

Returns an **InstrumentTypeList** containing the score's instrument types, on which one may execute a **for each** loop to get information about each instrument type within the score.

IsDynamicPart

Returns **True** if the current active score view is a part (read only).

LiveMode

Is **True** (1) if Play > Live Playback is on (read/write).

Lyricist

Lyricist of score from File > Score Info (read/write).

MagneticLayoutEnabled

Returns **True** if the current score has Layout > Magnetic Layout switched on (read/write).

MainMusicFontName

Returns the name of the font specified as the Main music font (such as “Opus” or “Reprise”) in House Style > Edit All Fonts (read/write).

MainTextFontName

Returns the name of the font specified as the Main text font (such as “Times New Roman” or “Arial”) in House Style > Edit All Fonts (read/write).

MusicTextFontName

Returns the name of the font specified as the Music text font (such as “Opus Text” or “Reprise Text”) in House Style > Edit All Fonts (read/write).

NumberOfPrintCopies

The number of copies to be printed (read/write).

OpusNumber

Opus number of score from File > Score Info (read/write).

OriginalProgramVersion

The version of Sibelius in which this score was originally created, as an integer in the following format:

(major version) * 1000 + (minor version) * 100 + (revision) * 10. So Sibelius at the time of this writing would be 8.3.1 would be returned as **8310**.

OtherInformation

More information concerning the score from File > Score Info (read/write).

PageCount

The number of pages in the score (read only).

PartName

Value of Part Name from File > Score Info (read/write).

Publisher

Publisher of score from File > Score Info (read/write).

Redraw

Set this to **True** (1) to make the score redraw after each change to it, **False** (0) to disallow redrawing (write only).

ScoreDuration

The duration of the score in milliseconds (read only).

ScoreEndTime

The duration of the score, plus the score start time (see above), in milliseconds (read only).

ScoreHeight

Height of a page in the score, in millimeters (read only).

ScoreStartTime

The value of Timecode of first bar, from Play > Video and Time > Timecode and Duration, in milliseconds (read only).

ScoreWidth

Width of a page in the score, in millimeters (read only).

Selection

The **Selection** object for the score, which is a list of selected objects (read only).

ShowMultiRests

Is **True** (1) if Layout > Show Multirests is on (read/write).

StaffCount

The number of staves in the score (read only).

StaffHeight

Staff height, in millimeters (read only).

Subtitle

Subtitle of score (read/write).

SystemCount

The number of systems in the score (read only).

SystemObjectPositions

Returns a **SystemObjectPositions** object corresponding to the settings in House Style > System Object Positions for the score (read only).

SystemStaff

The **SystemStaff** object for the score (read only).

Title

Title of score from File ▶ Score Info (read/write).

TransposingScore

Is **True** (1) if Notes > Transposing Score is on (read/write).

UsingManualBarPlayOrder

Returns **True** if Manual repeats playback is chosen in Play > Interpretation > Repeats, otherwise **False** (read only).

YearOfComposition

Value of Year of composition from File > Score Info (read/write).

Selection

for each *variable in* returns every **BarObject** (which is an object within a bar) in the selection.

for each *type variable* in produces each object of *type* in the selection. Note that if the selection is a system selection (which is surrounded by a double purple box in Sibelius) then objects in the system staff will be returned in such a loop.

Methods

Clear()

Removes any existing selection(s) from the current active score.

ClipboardContainsData([*clipboard Id*])

Returns **True** if the given clipboard contains data. As with the **Copy** and **Paste** methods, 0 (or no arguments) refers to Sibelius's internal clipboard, and all other numeric values will interrogate the temporary clipboard with the matching ID.

Copy([*clipboard Id*])

Copies the music within the current selection to Sibelius's internal clipboard or a Manuscript-specific temporary clipboard, which goes out of scope along with the **Selection** object itself. If no *clipboard Id* is specified, or if it is set to 0, the selection will be copied to Sibelius's internal clipboard. Any other numeric value you pass in will store the data in a temporary clipboard adopting the ID you specify. Used in conjunction with **Paste** or **PasteToPosition** (see below).

Delete([*remove staves*])

Deletes the music currently selected in the active score. Akin to making a selection manually in Sibelius and hitting **Delete**. If *remove staves* is omitted or set to **True**, Sibelius will completely remove any wholly selected staves from the score. If you wish Sibelius to simply hide such staves instead, set this flag to **False**.

ExcludeStaff(*staff number*)

If a passage selection already exists in the current active score, an individual staff may be removed from the selection using this method.

HideSelectedEmptyStaves()

If the current selection contains staves that are empty, they will be hidden (equivalent to selecting a passage and choosing **Layout > Hiding Staves > Hide Empty Staves**).

IncludeStaff(*staff number*)

If a passage selection already exists in the current active score, a non-consecutive staff may be added to the selection using this method.

Paste([*clipboard Id* [, *reset positions*]])

Pastes the music from a given clipboard to the start of the selection in the current active score. If no *clipboard Id* is specified, or if it is set to 0, the data will be pasted from Sibelius's internal clipboard. Any other numeric value you pass in will take the data from a temporary clipboard you must have previously created with a call to **Copy** (see above). Returns **True** if successful.

If *reset positions* is **False**, the positions of any objects that have been moved by the user in the source selection will be retained in the copy. This is the default behavior. If you wish Sibelius to reset objects to their default positions, set this flag to **True**. This can be useful when copying one or more single objects (which is a non-passage selection).

Note that pasting into a score using this method will overwrite any existing music. Only one copy of the music will ever be made, so if your selection happens to span more bars or staves than is necessary, the data will *not* be duplicated to fill the entire selection area.

PasteToPosition(*stave num*, *bar num*, *position* [, *clipboard Id* [, *reset positions*]])

Pastes the music from a given clipboard to a specific location in the current active score. The optional parameters and pasting behavior works in the same way as calls to **Paste**.

RestoreSelection()

Restores the selection previously recorded with a call to **StoreCurrentSelection**. Usefully called at the end of a plug-in to restore the initial selection.

SelectPassage(*start barNum* [, *end barNum* [, *top staveNum* [, *bottom staveNum* [, *start pos* [, *end pos*]]]]])

Programmatically makes a passage selection around a given area of the current active score. When no *end barNum* is given, only the *start barNum* will be selected. If neither a *top-* nor *bottom staveNum* has been specified, every stave in the score will be selected, whereas if only a *top staveNum* has been supplied, only that one staff will be selected. Sibelius will begin the selection from the start of the first bar if no *start pos* has been given, similarly completing the selection at the end of the final bar if no *end pos* has been supplied.

NB: The *start pos* and *end pos* you supply may be altered by Manuscript: Sibelius requires a passage selection to begin and end at a NoteRest if it doesn't encompass the entire bar.

SelectSystemPassage(*start barNum* [, *end barNum* [, *start pos* [, *end pos*]]])

Programmatically makes a system selection around a given area of the current active score. When no *end barNum* is given, only the *start barNum* will be selected. Sibelius will begin the selection from the start of the first bar if no *start pos* has been given, similarly completing the selection at the end of the final bar if no *end pos* has been supplied.

NB: The *start pos* and *end pos* you supply may be altered by Manuscript: Sibelius requires a passage selection to begin and end at a NoteRest if it doesn't encompass the entire bar.

StoreCurrentSelection()

Stores the current selection in the active score internally. Can be retrieved with a call to **RestoreSelection** (see below). Usefully called at the start of a plug-in to store the initial selection.

Transpose(*degree*, *interval type*[, *keep double accs*[, *transpose keys*]])

Transposes the currently selected music up or down by a specified *degree* and *interval type*. To transpose up, use positive values for *degree*; to transpose down, use negative values. Note that degrees are 0-based, so 0 is equal to a unison, 1 to a second and so on. For descriptions of the various available interval types, see “Global Constants” on page 156. By default, Sibelius will transpose using double sharps and flats where necessary, but this behavior may be suppressed by setting the *keep double accs* flag to **False**. Sibelius will also transpose any key signatures within the selection by default, but can be overridden by setting the fourth parameter to **False**.

For help in calculating the interval and degree required for a particular transposition, see the documentation for the **Sibelius.CalculateInterval** and **Sibelius.CalculateDegree** methods.

Variables

BottomStaff

The number of the bottom staff of a passage (read only).

FirstBarNumber

The internal bar number of the first bar of a passage (read only).

FirstBarNumberString

The external bar number (including any bar number format changes) of the first bar of a passage (read only).

FirstBarSr

The position of the start of the passage selection in the first bar (read only).

IsPassage

True if the selection represents a passage, as opposed to a multiple selection (read only).

IsSystemPassage

True if the selection includes the system staff (read only).

LastBarNumber

The internal bar number of the last bar of a passage (read only).

LastBarNumberString

The external bar number (including any bar number format changes) of the last bar of a passage (read only).

LastBarSr

The position of the end of the passage selection in the last bar (read only).

TopStaff

The number of the top staff of a passage (read only).

Copying Entire Bars

Copying passages from one location in a score to another—or even from one score to another—is very simple. Here is an example function demonstrating how one might go about achieving this:

```
CopyBar(scoreSrc, barFirstSrc, barLastSrc, scoreDest, barFirst-
Dest,
        barLastDest) // This is the function signature

{
    sel = scoreSrc.Selection;
    sel.SelectPassage(barFirstSrc.BarNumber, barLastSrc.BarNumber,
        barFirstSrc.ParentStaff.StaffNum,
        barLastSrc.ParentStaff.StaffNum);

    sel.Copy(0);
    selDest = scoreDest.Selection;
    selDest.SelectPassage(barFirstDest.BarNumber, barLastDest.Bar-
Number,
        barFirstDest.ParentStaff.StaffNum,
        barLastDest.ParentStaff.StaffNum);

    selDest.Paste(0);
}
```

Note that you may use any temporary clipboard or Sibelius's own internal clipboard if the source and destination locations are in the same score, however you can only use Sibelius's internal clipboard if the data is being transferred between two individual scores. This is because the temporary clipboards belong to the **Selection** object itself.

Copying Multiple Selections from One Bar to Another

Using a combination of the **BarObject**'s **Select** method and the **Selection** object's **Copy** and **PasteToPosition** methods, it is possible to copy an individual or multiple selection from one location in a score to another. Bear in mind that **Paste** will always paste the material to the very start of the selection, so if you're copying a selection that doesn't start at the very beginning of a bar, you'll have to store the position of the first item and pass it to **PasteToPosition** when you later come to paste the music to another bar.

This example code below copies all items from position 256 or later from one bar to another. It is assumed that **sourceBar** is a valid **BarObject**, and **destStaffNum** and **destBarNum** contain the destination staff number and bar number respectively:

```
sel = Sibelius.ActiveScore.Selection; // Get a Selection object for
this score
sel.Clear(); // Clear the current selection
clipboardToUse = 1; // This clipboard ID we're going to use
copyFromPos = 256; // Copy all objects from this point in the
source bar
posToCopyTo = 0; // Variable used to store the position of the
first object copied
for each obj in sourceBar { // Iterate over all objects in the bar
    if (obj.Position >= copyFromPos) { // Ignore objects before the
start threshold
        obj.Select(); // Select each relevant object in turn
        if (posToCopyTo = 0) {
            posToCopyTo = obj.Position; // Remember the position of the
first item
        }
    }
}
sel.Copy(clipboardToUse); // Copy the objects we've selected to the
clipboard

sel.PasteToPosition(destStaffNum, destBarNum, posToCopyTo, clip-
boardToUse); // And paste them to the destination bar at the rele-
vant offset
```

Sibelius

There is a predefined variable that represents the Sibelius program. You can use the Sibelius object to open scores, close scores, display dialogs or (most commonly) to get currently open **Score** objects.

for each *variable in* returns each open score.

Methods

AppendLineToFile(*filename*,*text*[,*use_unicode*])

Appends a line of text to the file specified (adds line feed). See comment for **AppendTextFile** above for explanation of the *use_unicode* parameter. Returns **True** if successful.

AppendLineToRTFFile(filename, text)

Appends a line of text to the file specified. Times New Roman 12pt is used, unless you specify a change of formatting. To change formatting, use the following backslash expressions:

\B bold on

\I italic on

\U underline on

\n new line

\b bold off

\i italic off

\u underline off

\fontname change to given font name (for example **\fArial** to switch to Arial)

\spoints set the font size to a specific point size (for example **\s16** to set the font to 16pts).

Note the difference in meaning of **\s** in the context of adding data to an RTF file, versus its use in the context of styling text directly within Sibelius (see “Syntax” on page 41 following).

AppendTextFile(filename, text[, use_unicode])

Appends text to the file specified. If the optional Boolean parameter *use_unicode* is **True**, then the string specified will be exported in Unicode format; if this parameter is **False** then it will be converted to 8-bit Latin-1 before being added to the text file. This parameter is **True** by default. Returns **True** if successful.

CalculateDegree(source pitch, dest pitch, upward interval)

Takes two note names in the form of a string (for example C, G#, Bb, Fx or Ebb) and a boolean that should be **True** if the interval you’re wishing to calculate is upward. Returns a 0-based number describing the degree between the two notes.

For example, **CalculateDegree("C#", "G", False)** would return 3.

CalculateInterval(source pitch, dest pitch, upward interval)

Takes two note names in the form of a string (for example C, G#, Bb, Fx or Ebb) and a boolean that should be **True** if the interval you’re wishing to calculate is upward. Returns a number representing an Interval Type (see “Global Constants” on page 156). You can use the value returned in calls to **NoteRest.Transpose** and **Selection.Transpose**.

For example, **CalculateInterval("Bb", "G#", True)** would return **IntervalAugmented**.

Close(show dialogs)

Closes the current score or part view; if the current view is the last tab in the current window, the window will therefore also be closed. If the optional Boolean parameter is **True** then warning dialogs may be shown about saving the active score, and if it is **False** then no warnings are shown (and the score will not be saved).

CloseAllWindows(*show dialogs*)

Closes all open document windows. If the optional Boolean parameter is **True** then warning dialogs may be shown about saving any unsaved scores, and if it is **False** then no warnings are shown (and the scores will not be saved).

CloseDialog(*dialogName*, *pluginName*, *returnValue*)

Closes the dialog *dialogName* belonging to the plug-in *pluginName* (normally this should be set to **self**), returning the Boolean value *returnValue*, which can be set to **True** (1) or **False** (0). Normally you do not need to use this method to close a dialog, as you can set buttons (typically with labels like OK or Cancel) to close the dialog and return a value, but if you want greater control over when a dialog is closed, this method provides it.

CloseWindow(*show dialogs*)

Closes the current window (that closes all of the open tabs in the current window). If the optional Boolean parameter is **True** then warning dialogs may be shown about saving the score, and if it is **False** then no warnings are shown (and the score will not be saved).

CreateFolder(*foldername*)

Creates the folder of specified *foldername*; returns the **Folder** object created if successful, or null if it fails.

CreateProgressDialog(*caption*, *min value*, *max value*)

Creates the progress dialog, which shows a slider during a long operation.

CreateRTFFile(*filename*)

Creates the Rich Text Format (RTF) file specified. Any existing file with the same name is destroyed. Returns **True** if successful.

CreateTextFile(*filename*)

Creates the plain text file specified. Any existing file with the same name is destroyed. Returns **True** if successful.

DestroyProgressDialog()

Destroys the progress dialog.

EnableControlById(*plugin*, *dialog*, *controlID*, *enable*)

Dynamically enables or disables a given control on a plug-in dialog: *plug-in* is a **Plugin** object, for example **Self**; *dialog* is a **Dialog** object, and therefore should not be passed in quotation marks; *controlID* is the string corresponding to the control to be enabled or disabled; and *enable* is a Boolean parameter, which enables the control when set to **True** and disables the control when set to **False**.

EnableNthControl(*nth control, enable*)

Dynamically enables or disables a given control on a plug-in dialog. Can be called either before a dialog has been displayed (in which case the operation will apply to the next dialog you show), or while a dialog is already visible (in which case the operation will affect the top-most currently visible dialog).

Note that, using this method, controls can only be identified according to their order upon creation; for this reason, you are strongly recommended to use **EnableControlById**() instead. To find out the creation order, open the appropriate dialog in the plug-in editor, right click on the dialog's client area and choose **Set Creation Order** from the contextual menu that appears. Note that *nth control* expects a 0-based number, unlike the display given by **Set Creation Order**. By default, all controls will be enabled; to disable any given control, set *enable* to **false**.

FileExists(*filename*)

Returns **True** if a file exists or **False** if it doesn't.

FolderExists(*foldername*)

Returns **True** if a folder exists or **False** if it doesn't.

GetDocumentsFolder()

Returns the user's My Documents (Windows) or Documents (Mac) folder.

GetElapsedCentiSeconds(*timer number*)

Returns the time since **ResetStopWatch** was called for the given stop watch, in 100ths of a second.

GetElapsedMilliSeconds(*timer number*)

Returns the time since **ResetStopWatch** was called for the given stop watch, in 1000ths of a second.

GetElapsedSeconds(*timer number*)

Returns the time since **ResetStopWatch** was called for the given stop watch in seconds.

GetFile(*file path*)

Returns a new **File** object representing a file path for example **file=Sibelius.GetFile("c:\\on-ion\\foo.txt")**;

GetFolder(*file path*)

Returns a new **Folder** object representing a file path for example **folder=Sibelius.GetFolder("c:\\")**;

GetNotesForChord(*chord name*)

Returns a Manuscript array giving the MIDI pitches corresponding to the named chord symbol.

GetNotesForGuitarChord(*chord name*)

Returns a **ManuScript** array giving the MIDI pitches and string numbers corresponding to the named guitar chord, using the most suitable fingering according to the user's preferences. Strings are numbered starting at 0 for the bottom string and increasing upwards. The array returned has twice as many entries as the number of notes in the chord, because the pitches and string numbers are interleaved thus:

```
array[0] = MIDI pitch for note 0  
array[1] = string number for note 0  
array[2] = MIDI pitch for note 1  
array[3] = string number for note 1  
...
```

GetScoresFolder()

Returns a new **Folder** object representing the default **Scores** folder (as defined on the **Files** page of **File ▶ Preferences**).

GetSyllabifier()

Returns a new **Syllabifier** object, providing access to Sibelius's internal syllabification engine.

GetUserApplicationDataFolder()

Returns the user's **Application Data** (Windows) or **Application Support** (Mac) folder.

GoToEnd()

Moves the playback line to the end of the score.

GoToStart()

Moves the playback line to the start of the score.

IsDynamicPartOpen(*dynamic part*)

Returns **True** if the specified part and its corresponding **Score** is valid and is visible in a **Score** window within Sibelius.

IsFontFamilyInstalled(*font name*)

Returns **True** if a font with the name *font name* exists on the system, otherwise **False**.

LaunchApplication(*path*[,*parameters*[,*hide*]])

Launches an external application specified via its *path*, which must be a complete path to the application to be launched. You can optionally pass in a sparse array of *parameters* (or a string if you want to pass in only a single parameter); omit this or set it to **null** to pass no parameters to the launched application. To prevent the launched application from gaining the focus once it is launched, set the optional *hide* parameter to **True**; if unspecified, this defaults to **False**, so the launched application will gain the focus.

LiveTempoTap()

Equivalent to tapping a beat during Live Tempo recording.

MakeSafeFileName(filename)

Returns a “safe” version of filename. The function removes characters that are illegal on Windows or Unix, and truncates the name to 31 characters so it will be viewable on Mac OS 9.

MessageBox(string)

Shows a message box with the string and an OK button.

MoveActiveViewToBar(bar number[,position])

Brings a given internal bar number into view. Has the same effect as **Go to Bar** in Sibelius. An optional position within the bar may also be specified, but if omitted, the very start of the bar will be brought into view.

MoveActiveViewToSelection([start of selection])

Brings the object(s) currently selected into view. If *start of selection* is **False**, the end of the selection will be brought into view. If the optional argument is **True** or omitted, the start of the selection will be visible. Has the same effect as **Shift + Home/End** in Sibelius.

New([manuscript paper])

Creates and shows a new score. If the optional parameter manuscript paper is not supplied, Sibelius will create a blank score; manuscript paper should be the filename of the manuscript paper you want to create, minus its .sib file extension, optionally including the name of the category (subfolder) in which it is located, for example both "**String orchestra**" and "**Orchestral/String orchestra**" will work. Returns the score object corresponding to the new score.

NthScore(score index from 0)

Returns the *n*th open score (zero-based), or null if the specified index is not valid.

Open(filename [,quiet])

Opens and displays the given file. Filename must include its extension, for example **Song.sib**. If the optional boolean parameter *quiet* is set to **True**, then no error messages or dialogs will be displayed, even if the file could not be opened for some reason. Returns **True** if the file is opened successfully, **False** otherwise.

Play()

Plays the current score, from the current position of the playback line.

PlayFromSelection()

Plays from the current selection.

PlayFromStart()

Plays from the start of the score.

PrependScreenreaderText(*string*)

Prepends *string* to the default screen reader description.

Print(*number of copies*[, *dynamic part*[, *showdialog*]])

Prints the specified number of copies of the current score or dynamic part using default settings. If *number of copies* is missing or a negative number, then the default number of copies for the score or part is printed, and if set to 0 no printing occurs. The optional *dynamic part* parameter must be a valid object of the active Score (this does not affect or use **Score.CurrentDynamicPart** for the Score printed); if it is not supplied, the active Score is printed instead. Returns **True** for success, **False** for failure. The second optional parameter, *showdialog*, is a Boolean: if set to **True**, Sibelius will show the Print dialog, and if not specified or set to **False**, Sibelius will not show the dialog.

PrintAllDynamicParts(*[score]*)

Prints the default number of copies of all dynamic parts, but does not print the full score. Prints the currently-active Score if the optional *score* parameter is not passed in. Returns **True** for success, **False** for failure.

RandomNumber()

Returns a random number.

RandomSeed(*start number*)

Restarts the random number sequence from the given number.

RandomSeedTime()

Restarts the random number sequence based on the current time.

RefreshDialog()

Refreshes the data being displayed by any controls on the currently active plug-in dialog. For example, if a text object gets its string from a global variable and the value stored in this global variable has changed whilst the dialog is visible, calling **RefreshDialog** will update the text object on the dialog accordingly. Returns **True** if successful.

ResetStopWatch(*timer number*)

Resets the given stop watch. *timer number* must be an integer greater than 0.

ReadTextFile(*filename*, [*unicode*])

Reads the given filename into an array of strings, one per line. If the *unicode* parameter is true, the file is treated as Unicode, otherwise it is treated as ANSI (that is 8-bit) text, which is the default.

The resulting array can be used in two ways:

```
lines = Sibelius.ReadTextFile("file.txt");
for each l in lines {
    trace(l);
}
```

or:

```
lines = Sibelius.ReadTextFile("file.txt");
for i=0 to lines.NumChildren {
    trace(lines[i]);
}
```

ScreenreaderText(*string*)

Replaces Sibelius's default screen reader description with *string*.

SelectFileToOpen(*caption, file, initial_dir, default extension, default type, default type description*)

Shows a dialog prompting the user to select a file to open. All parameters are optional. The method returns a file object describing the selection. For example:

```
file=Sibelius.SelectFileToOpen("Save
Score","*.sib","c:\","sib","SIBE","Sibelius File");
```

Note that the *initial_dir* parameter has no effect on Mac, because it is unsupported by Mac OS X.

SelectFileToSave(*caption, file, initial_dir, default extension, default type, default type description*)

Shows a dialog prompting the user to select a file to save to. All parameters are optional. The method returns a **File** object describing the selection. File types and extensions:

Description	Type	Extension
EMF graphics	"EMF"	emf
Windows bitmap	"BMP"	bmp
Macintosh PICT bitmap	"PICT"	pict
Sibelius score	"SIBE"	sib
MIDI file	"Midi"	mid
House style file	"SIBS"	lib
PhotoScore file	"SCMS"	opt
Web page	"TEXT"	html
TIFF graphics	"TIFF"	tif
PNG graphics	"PNG"	png

Note that the *initial_dir* parameter has no effect on Mac, because it is unsupported by Mac OS X.

SelectFolder([*caption*])

Allows the user to select a folder and returns a **Folder** object. The optional string parameter *caption* sets the caption of the dialog that appears.

SetCurrentScoreViewType(*view type*)

Allows plug-ins to switch between Panorama and normal view; values are **ViewTypePage** (0) and **ViewTypePanorama** (1).

SetFocusToControl(*pluginName*, *dialogName*, *controlID*)

Sets the focus on a specific control in a plug-in dialog. *pluginName* will normally be set to **self**, *dialogName* is the name of the dialog in which the control is found, and *controlID* is the ID of the control to receive the focus, which must be specified in quotation marks.

ShowDialog(*dialogName*, *pluginName*)

Shows a dialog *dialogName* from a dialog description and sends messages and values to the given **Plugin** object *pluginName* (normally set to **Self**). Returns the value **True** (1) or **False** (0) depending on which button you clicked to close the dialog (typically OK or Cancel).

ShowDynamicPart(*dynamic part*[, *newWindow*])

Shows the specified dynamic part. The second optional Boolean parameter *newWindow* allows you to specify whether the part should open in a new tab (specify **False**, the default) or a new window (specify **True**). Returns **True** if the specified part can be shown, **False** otherwise. Can be used to bring a Score to the front by way of **Sibelius.ShowDynamicPart(Score.CurrentDynamicPart)**.

ShowTraceWindow()

Shows the Plug-in Trace Window, or forces it to the front if it is already shown but currently behind another window.

optartLiveTempoRecording()

Starts recording Live Tempo; equivalent to choosing Play > Record Live Tempo

StopLiveTempoRecording()

Stops recording Live Tempo.

Stop()

Stops the current score from playing.

UpdateProgressDialog(*progress pos*, *status message*)

Returns 0 if the user clicked Cancel.

YesNoMessageBox(*string*)

Shows a message box with Yes and No buttons. Returns **True** if Yes is chosen, else **False**.

Variables

ActiveScore

Is the active **Score** object (read/write). Setting **Sibelius.ActiveScore** makes active the current dynamic part (which may be the full score rather than a part) of the score. If that window is not currently shown, a new window may be created according to the user's preferences. Returns null if it fails to make the specified score or part active.

ApplicationLanguage

Returns the language of the version of Sibelius currently running, always in English—such as **English**, **German**, **French** and so on. (read only)

ApplicationLanguageIsoString

Returns the two-letter ISO 3166 identifier of the language in which Sibelius is currently running, such as **en**, **de**, **fr**, and so on (read only).

CurrentTime

Returns a string containing the current time in the format hh:mm:ss, based on your own computer's locale (read only).

CurrentDateShort

Returns a string containing the current date in the format dd/mm/yyyy, based on your own computer's locale (read only).

CurrentDateLong

Returns a string containing the current date in the format dd MM yyyy, based on your own computer's locale (read only).

CurrentDate

Returns the current date and time as a **DateTime** object in local time (read only).

FontFamilies

Returns a sparse array of strings containing the names of all the available font families on the system (read only).

HouseStyles

The list of house styles available, as a **ComponentList**.

LocalizedApplicationLanguage

Returns the language in which Sibelius is currently running, in the localized language, for example it returns **Deutsch** when running in German (read only).

ManuscriptPapers

The list of manuscript papers available, as a **ComponentList**.

OSVersionString

The current operating system in which the plug-in is running, as one of the following strings:

Windows 95	Mac OS X
Windows 98	Mac OS X Jaguar
Windows ME	Mac OS X Panther
Windows NT 3.x	Mac OS X Tiger
Windows NT 4	Mac OS X Leopard
Windows 2000	Mac OS X Snow Leopard
Windows XP	Mac OS X Lion
Windows Vista	Mac OS X Mountain Lion
Windows 7	
Windows 8	

If the operating system is unrecognized, the variable returns **Unknown system version**.

PathSeparator

Returns the current path separator character (which is “\” on Windows, “/” on Mac).

Plugins

The list of plug-ins installed. See the documentation for the **Plugin** object

Playing

Is **True** if a score is currently being played (read only).

ProgramVersion

The current version of Sibelius in which the plug-in is running, as an integer in the following format
(major version) * 1000 + (minor version) * 100 + (revision) * 10
So Sibelius 3.1.3 would be returned as **3130**.

ScoreCount

Is the number of scores being edited (read only).

SuppressDefaultScreenreaderText

Set to **True** to suppress the default score description for screen readers for blind and visually impaired users (read/write).

ViewHighlights

Is **True** if View > Highlights is switched on (read/write).

ViewNoteVelocities

Is **True** if View > Live Playback Velocities is switched on (read/write).

ViewNoteColors

The current View > Note Colors setting used (read/write).

Description	Value
None	0
Notes out of Range	1
Pitch Spectrum	2
Voice Colors	3

SoundInfo

The **SoundInfo** object contains information about the playback of a given staff.

To get the **SoundInfo** object for a staff, use for example:

```
staff = Sibelius.ActivateScore.NthStaff(1);  
soundinfo = staff.SoundInfoAtPosition(1,0,0);
```

The **SoundInfo** object can be moved around the staff once you have created it, and it will return information about the sound IDs in use throughout the staff.

Methods

Clone()

Returns a new **SoundInfo** object using the same credentials as the object on which the method is called.

CreateAt([barNumber],[position],[nthRepeat]])

Returns a new **SoundInfo** object at the specified *bar number*, at the specified rhythmic *position* in the bar (for example **256** for the second quarter note position), as if played through at the *nth repeat* (for example **2** for the second repeat). If no *bar number* is specified, the information returned will refer to bar 1. If no *position* is specified, the information will refer to the start of the bar. If *nth repeat* is not specified, the information returned will refer to the first pass through the score.

MoveTo([barNumber],[position],[nthRepeat]])

Uses the same parameters as **CreateAt()**. Allows the caller to move the existing **SoundInfo** object to an entirely new location on the current staff.

MoveToNext()

Moves to the next sound change event. If there are no more changes, it returns **false** and doesn't move.

MoveToPrevious()

Moves to the previous sound change event. If there are no changes before, it returns **false** and doesn't move.

Variables

ActualSoundId

The actual sound ID at the current location (read only).

BarNum

Returns the current location's bar number (read only).

IsDrumStave

Returns **true** if the current location is on a drum staff (read only).

NthRepeat

Returns or sets the *n*th repeat (or pass) of the current location's bar (read/write).

NumTimesBarPlayed

The number of times the bar at the current location is played (read only).

PatchName

The name of the patch in use at the current location (read only).

Position

Returns or sets the current location's position within the bar (read/write).

RequestedSoundId

The requested sound ID at the current location (read only).

SoundChangeIndex

The current index in the bar play sequence. This allows differentiation between different identical sound changes (read only).

SoundSetName

Returns the name of the sound set in use at the current location (read only).

StaveNum

Returns the 1-based stave number (read only)

SparseArray

To create a sparse array, use the built-in method **CreateSparseArray**(*a1*, *a2*, *a3*, *a4*...*an*).

for each allows you to iterate over the contents of a sparse array.

Methods

Concat(*array1*, *array2* ... *arrayN*)

Concatenate zero or more sparse arrays to this one, and return it as a one-level deep copy (so if a sparse array contains other arrays, for example, then the new sparse array will contain references to those arrays, not copies of them). This method does not modify the original sparse array.

Join(*[separator]*)

Returns the array as a string, with each populated element separated by the optional *separator*. If you don't specify *separator*, the default separator is a comma.

Push(*value1*, *value2*, *value3* ... *valueN*)

Pushes one or more values to the end of the array.

Pop()

Returns the last element of the array, and removes it from the array.

Reverse()

Reverses the sparse array in place, modifying the sparse array being operated on. The reversed array only populates the elements needed to create the reversed array.

Slice(*start*[, *end*])

Returns a new sparse array of the elements starting from *start* and up to, but not including, the optional *end*. *start* and *end* can be negative indices referring to offsets from the end of the array.

Variables

Length

Returns or sets the length of the array (read/write).

ValidIndices

Returns a sparse array containing only the populated indices of the original sparse array, that is those that are not null.

Converting Old-style Arrays to New Sparse Arrays

The **SparseArray** object is a replacement for the old **Array** object, which was a more limited kind of array that could only hold strings and integers, but no other kind of objects. You are recommended to use the new **SparseArray** object for all arrays in your plug-ins, but if you have an existing plug-in in which old-style Arrays are used, you can convert them to **SparseArrays** as follows:

Array.ConvertToSparseArray()

Returns a new **SparseArray** object, populated with strings converted from the old-style Array.

SpecialBarline

Derived from a **Bar** object, these can only be found in system staves.

Methods

None.

Variables

BarlineType

The name of the type of special barline, expressed as a string.

BarlineInternalType

The type of the barline, expressed as a numeric ID which maps to one of the **SpecialBarline** global constants (see “Global Constants” on page 156).

Staff

These can be normal staves or the system staff. The system staff contains objects that apply to all staves, such as **SpecialBarlines** and text using a system text style.

A Staff contains **Bar** objects.

for each *variable in* returns each object in the staff.

for each *type variable* in returns each item of *type* in the staff in chronological order (that is in order of rhythmic position in each bar).

Methods

AddClef(*pos*, *concert pitch clef* [, *transposed pitch clef*])

Adds a clef to the staff at the specified position. *concert pitch clef* determines the clef style when Notes ▶ Transposing Score is switched off; the optional *transposed pitch clef* parameter determines the clef style when this is switched on. Clef styles should be an identifier like “clef.treble”; for a complete list of available clef styles, see “Clef Styles” on page 164. Alternatively you can give the name of a clef style, such as “Treble,” but bear in mind that this may not work in non-English versions of Sibelius.

AddLine(*pos*, *duration*, *line style* [, *dx* [, *dy* [, *voicenum* [, *hidden*]]]])

Adds a line to staff (please see the documentation in **Bar** object below).

AddNote(*pos*, *sounding pitch*, *duration* [, *tied* [, *voice* [, *diatonic pitch* [, *string number*]]]])

Adds a note to staff, adding to an existing NoteRest if already at this position (in which case the duration is ignored); otherwise creates a new NoteRest. Will add a new bar if necessary at the end of the staff. The position is

in 1/256th quarters from the start of the score. The optional *tied* parameter should be **True** if you want the note to be tied. Voice 1 is assumed unless the optional *voice* parameter (with a value of 1, 2, 3 or 4) is specified. You can also set the diatonic pitch, that is the number of the “note name” to which this note corresponds, 7 per octave (35 = middle C, 36 = D, 37 = E and so on). If a diatonic pitch of zero is given then a suitable diatonic pitch will be calculated from the MIDI pitch. The optional string number parameter gives a string number for this note, which is only meaningful if the note is on a tablature stave. If this parameter is not supplied then a default string number is calculated based on the current tablature stave type and the guitar tab fingering options (specified on the Note Input page of File > Preferences). Returns the **Note** object created (to get the NoteRest containing the note, use **Note.ParentNoteRest**).

When adding very short notes to tuplets, Sibelius may be unable to find a legal place for the note in the bar. Should this happen, Sibelius will return null. You should therefore check for a valid object if there is any likelihood that this situation may arise in your code.

N.B.: If you add a note to a score that intersects an existing tuplet, Sibelius will try to snap the note to the closest sensible place within that tuplet. However, you are advised to use *Tuplet.AddNote()* for this purpose as it is void of any ambiguity.

AddStaffAbove(*ossia*, [*start bar number*[, *end bar number*[, *start pos*[, *end pos*]]]])

Adds a new staff above the staff. Set *ossia* to **True** to create an ossia (small) staff. The other, optional parameters determine where the staff should be visible: if you do not specify a *start bar number*, the staff will be visible from the start of the score; if you do not specify an *end bar number*, the staff will be visible to the end of the score. If you specify a start and/or end bar number, the staff will be hidden outside that range by way of an instrument change to the No instrument (hidden) instrument type. *start pos* and *end pos* represent the rhythmic position within the *start bar number* and *end bar number* respectively, and if not specified, *start pos* will default to the start of the bar, and *end pos* will default to the end of the bar. Returns the staff created, or null if the call fails.

AddStaffBelow(*ossia*, [*start bar number*[, *end bar number*[, *start pos*[, *end pos*]]]])

Adds a new staff below the staff. See **AddStaffAbove**() above for details.

AddSymbol(*pos*, *symbol index or name*)

Adds a symbol to staff (please see the documentation in **Bar** object below).

CurrentKeySignature(*bar number*)

Returns a **KeySignature** valid at the bar number passed.

NthBar(*n*)

Returns the *n*th bar in the staff, counting from 1.

ResetSpaceAroundStaff(*above*, *below*[, *from bar*[, *to bar*]])

Does the equivalent of Layout > Reset Space Above Staff and/or Reset Space Below Staff for the given range of bars in a staff. Set *above* to **True** to reset the space above the staff, and *below* to **True** to reset the space below the staff. If *from bar* is not specified, Sibelius sets it to 1; if *to bar* is not specified, Sibelius sets it to the last bar of the score.

SetSound(*styleID* [, *set SoundStage*])

Changes the initial playback sound of this staff to be the default sound for the given default instrument *styleID*. For a complete list of default instrument style IDs in Sibelius, see “Instrument Types” on page 165. If the optional Boolean parameter is set to **False**, then the SoundStage information (volume, pan and distance) for this staff will be unchanged. If it is omitted or set to **True**, then the SoundStage information will be set to the default for the new sound.

SetSoundID(*soundID*)

Changes the initial playback sound of this staff to the given *soundID*.

SoundIDAtPosition([*bar number* , [*position* , [*nth repeat*]])

Returns a new **SoundInfo** object at the specified *bar number*, at the specified rhythmic *position* in the bar (for example **256** for the second quarter note position), as if played through at the *nth repeat* (for example **2** for the second repeat). If no *bar number* is specified, the information returned will refer to bar 1. If no *position* is specified, the information will refer to the start of the bar. If *nth repeat* is not specified, the information returned will refer to the first pass through the score.

Staff[*array element*]

Returns the *nth* bar (counting from 1) for example **Staff[1]**.

Variables

BankHigh

Controls MIDI controller 0, used to select the “coarse” bank number for this stave, and corresponding to the Mixer control of the same name. The range is 0–127, or –1 if you don’t want to send this controller message at the start of playback. Note that not all MIDI devices support multiple banks (read/write).

BankLow

Controls MIDI controller 32, used to select the “fine” bank number for this stave, and corresponding to the Mixer control of the same name. The range is 0–127, or –1 if you don’t want to send this controller message at the start of playback. Note that not all MIDI devices support multiple banks (read/write).

BarCount

Number of bars in the staff (read only).

Channel

The MIDI channel number of this staff, numbered 1–16 (read/write).

Distance

The reverb “distance” of this staff, corresponding to the control of the same name in the Mixer. This is a percentage, used to scale the overall reverb settings from the Performance dialog (read/write).

FullInstrumentName

Gives the full instrument name of the staff, empty for an unnamed staff (read/write).

FullInstrumentNameWithFormatting

Gives the full instrument name of the staff including any changes of font or style, if any (read/write).

NumStavesInSameInstrument

The number of staves belonging to the default instrument from which this staff was created (read only).

InitialClefStyle

The name of the initial clef on a staff, depending on the state of Notes > Transposing Score (read only).

InitialClefStyleId

The style identifier of the initial clef on a staff, depending on the state of Notes > Transposing Score (read only).

InitialInstrumentType

Returns an **InstrumentType** object for the instrument type at the start of the staff.

InitialKeySignature

Returns the **KeySignature** object at the start of this staff (read only).

InitialStyleId

Returns the style identifier of the staff (read only). To create an instrument from such an ID, pass the style as the first argument to **Score.CreateInstrument**. For a complete list of all the default instrument names in Sibelius, see “Instrument Types” on page 165.

InstrumentName

Gives the full instrument name of the staff in the form that is displayed on the Instruments and Staves dialog in Sibelius (read only). For an unnamed stave, this will be “[Piano]” for example, where Piano is the default instrument name of the stave (see below). To get the internal name (which will be empty for unnamed staves), use the read/write variables **FullInstrumentName** or **ShortInstrumentName** instead.

IsSystemStaff

True or **False** depending on whether this staff is a system staff or not (read only).

IsVocalStaff

Returns **True** if the instrument type used by the staff has the **Vocal staff** option switched on, meaning that the default positions of dynamics should be above the staff rather than below (read only).

MuteMode

Specifies whether or not this staff will play back. Corresponds to the mute button in the Mixer. The supported values are defined as global constants (see “Global Constants” on page 156) and are **Muted**, **HalfMuted** and **NotMuted** (read/write).

Pan

The MIDI stereo panning position of this staff (corresponding to the pan control in the Mixer). Permissible values are -100 to 100, with positive values being to the right and negative to the left (read/write).

ParentScore

Returns the staff’s parent **Score** object (read only).

ShortInstrumentName

Gives the short instrument name of the staff, empty for an unnamed staff (read/write).

ShortInstrumentNameWithFormatting

Gives the short instrument name of the staff including any changes of font or style, if any (read/write).

ShowInFocusOnStaves

If **True** then this staff will be shown when **Layout > Focus on Staves** is switched on (see also **Score.FocusOnStaves**). This variable cannot be set to **False** unless it is also **True** for at least one other staff in the score (read/write).

Solo

True or **False** depending on whether this staff plays back in “solo” mode, corresponding to the Mixer button of the same name (read/write).

SoundIdOverrideIfAny

Returns a string containing the sound ID override set in the mixer for the staff. If no override has been set, an empty string is returned (read only).

Small

True if the staff is small (such as an ossia staff), **False** if it is normal sized (read/write).

StaffNum

Returns the number of this stave, counting from 1 at the top of the currently-viewed part. Returns 0 for **SystemStaff** objects (read only).

Volume

The overall MIDI volume of this staff, corresponding to its fader in the Mixer. Permissible values are 0–127 (read/write).

Syllabifier

Acts as a wrapper around Sibelius’s internal Syllabification engine, exposing its functionality to Manuscript.

Methods

AbbreviateUsingApostrophe(*useApostrophe*)

When the **abbreviate** flag is set to **True** when calling **Syllabify**, Sibelius will replace vowels that have been combined with the previous syllable with an apostrophe if this option is switched on—for example *Vege-ta-bles* vs *Veg'-ta-bles*. Calling this method will cause the syllabification engine to recalculate its result if necessary.

GetNthSyllable(*n*)

Once a string has been syllabified by calling the **Syllabify** method, you can use this method to return each individual syllable as a string

NthSyllableEndsWord(*n*)

Once a string has been syllabified by calling the **Syllabify** method, you can use this method to find out whether each syllable occurs at the end of a word

Syllabify(*textToSyllabify*[, *language*[, *abbreviate* = *False*]])

Breaks a string down into its syllabic components, returning the number of syllables in the resultant syllabification, or 0 if an error has occurred. The rules of the specified language will be used, and you may legally supply either a language ID, or the localized language name. To get the individual syllables, you should call the **GetNthSyllable** and **NthSyllableEndsWord** methods documented below.

If the **language** argument is omitted, Sibelius will attempt to automatically identify the language of the text. If this is not possible, or if an unrecognised language ID or name has been supplied, 0 will be returned.

When **abbreviate** is **True**, each ambiguous word in the string will be syllabified using the minimal number of syllables. For example, syllabifying “Everybody likes vegetables” would return “Eve-ry-bod-y likes vege-ta-bles” with this flag set to **True**, otherwise “E-ve-ry-bod-y likes veg-e-ta-bles”.

Variables

AbbreviateUsingApostrophe

Returns **True/False** depending on whether the syllabification engine is set to abbreviate combined syllables with an apostrophe (read only – call method with same name for write access)

AvailableLanguageIds

Returns an array containing a list of the available syllabification languages as three-letter non-translatable IDs – such as **ENG** (English), **GER** (German), **LAT** (Latin). These IDs are identical in all localized versions of Sibelius (read only)

AvailableLanguages

Returns an array containing a list of the available syllabification languages as localized strings (read only)

NumberOfSyllables

Returns the number of syllables in the hyphenated string generated by calling the **Syllabify** method (read only)

SyllabifiedString

Returns the resultant hyphenated string generated by calling the **Syllabify** method (read only)

SymbolItem and SystemSymbolItem

Derived from a **BarObject**. For system symbols (such as symbols belonging to the system staff, retrieved with **for each** on the **SystemStaff** object), the type of symbol objects is **SystemSymbolItem**, not **SymbolItem**.

Methods

None.

Variables

Index

The index of this symbol in the list of symbols. This corresponds to its position in the **Create ▶ Symbol** dialog, counting from zero left-to-right and top-to-bottom (read only).

Name

The name of this symbol. May be translated in non-English language versions of Sibelius (read only).

Size

The draw size of the symbol, corresponding to the four available options in the Symbols dialog in Sibelius. The four available values are **NormalSize**, **CueSize**, **GraceNoteSize** and **CueGraceNoteSize**, all defined as global constants (read/write).

SystemObjectPositions

Accessed from a **Score** object. Corresponds to the settings in House Style ► System Object Positions.

Methods

GetNthStaffShowsSystemObjects(*staffNum*)

Returns **True** if the given staff number *staffNum* (relative to the current part) is showing system objects above it, otherwise **False**.

SetNthStaffShowsSystemObjects(*staffNum*, *show*)

Tells the staff with the given staff number *staffNum* (relative to the current part) either to show or not show system objects above it. This will have no effect if you pass in the top staff in the part, or if the maximum number of staves allowed to show system objects has already been met.

Clear([*removeBelowBottomStaff*])

Allows you to clear all the system object positions (apart from the compulsory one above the top staff) in a single operation; set the optional Boolean parameter *removeBelowBottomStaff* to **True** to also clear the **Below** bottom staff system object position.

Variables

NumStavesShowingSystemObjects

Returns the current number of staves showing system object positions (read only)

ShowSystemObjectsBelowBottomStaff

Returns **True** if system objects should show below the bottom staff, otherwise **False** (read/write).

SystemStaff, Staff, Selection, Bar and, all BarObject-derived Objects

Variables

IsALine

Returns true if the object is a line object. (Note that this is a variable, not a method, unlike the **IsObject**() method for all objects.)

Type

A string giving the name of the type of an object. The strings for the first 4 types above are **"SystemStave"**, **"Stave"**, **"MusicSelectionList"**, and **"Bar"**. Note that this variable is also a member of all objects that occur in bars.

SystemStaff

There is one **SystemStaff** object per score. The **SystemStaff** contains objects which apply to all staves, such as Special Barlines and text using a system text style. Unlike normal staves, the **SystemStaff** does not appear in the score itself. As such, most of the variables and methods supported for **Staff** objects are not available on a **SystemStaff**. Those that are supported by **SystemStaff** are as follows.

Methods

CurrentKeySignature(*bar number*)

Returns a **KeySignature** valid at the bar number passed.

CurrentTimeSignature(*bar number*)

Returns a **TimeSignature** valid at the bar number passed.

NthBar(*n*)

Returns the *n*th bar in the staff, counting from 1.

SystemStaff[*array element*]

Returns the *n*th bar (counting from 1) for example **SystemStaff**[1].

Variables

BarCount

Number of bars in the staff (read only).

InitialKeySignature

Returns the **KeySignature** object at the start of this staff (read only).

IsSystemStaff

Returns **True** for a **SystemStaff** (read only).

Text and SystemTextItem

Derived from a **BarObject**. For system text (such as text belonging to the system staff, retrieved with **for each** on the **SystemStaff** object), the type of text objects is **SystemTextItem**, not **Text**.

Methods

None.

Variables

JumpAtEndOfBar

Returns **True** if the system text object has Jump at bar end (in the **Playback** panel of the Inspector) set, otherwise **False**. Always returns **False** for staff text objects (read/write).

StyleAsText

The text style name (read/write).

StyleId

The identifier of the text style of this piece of text (read/write).

Text

The text as a string (read/write).

TextWithFormatting

Returns an array containing the various changes of font or style (if any) within the string in a new element (read only). For example, "This text is \B\bold\b\, and this is \I\italic\i\" would return an array with eight elements containing the following data:

```
arr[0] = "This text is "  
arr[1] = "\B\  
arr[2] = "bold"  
arr[3] = "\b\  
arr[4] = ", and this is "  
arr[5] = "\I\  
arr[6] = "italic"  
arr[7] = "\i\"
```

TextWithFormattingAsString

The text including any changes of font or style (read only).

TimeSignature

Derived from a **BarObject**.

Methods

None.

Variables

AllowCautionary

Returns **True** if the time signature is set to show a cautionary at the end of the previous system, if it occurs at the start of a system (read/write).

Denominator

The time signature's bottom number (read only).

Numerator

The time signature's top number (read only).

Text

The time signature as text. You can use this to detect common time and *alla breve* time signatures by comparing it to the global constants **CommonTimeString** and **AllaBreveTimeString**, which define the Unicode characters used by these symbols. Other time signatures will be of the form “4\n4” (read only).

TreeNode

These are used internally by Manuscript to implement arrays and hashes (returned with the **CreateArray** and **CreateHash** methods), and to represent global data (defined in the plug-in editor). Each **TreeNode** can contain a label, a piece of data and a list of “children,” which are also **TreeNodes**. Normally, any access to a **TreeNode** object will access the data that is held, so that you don't need to know anything about them, but there are also some extra variables and methods that may be useful in some circumstances. These can be called on any array, hash or global variable, and on any member of such a structure.

Methods

WriteToString

Returns a string that represents the structure of this **TreeNode** object. In this representation, the data of a **TreeNode** is surrounded by double quotes and the label is not. Note that a label need not be defined. Any children of the **TreeNode** (also **TreeNode** objects themselves) are contained within curly braces { and }. To obtain child **TreeNodes**, use the normal array operator, as described in the documentation for arrays and hashes.

Variables

Label

The label of this **TreeNode**.

NumChildren

The number of child **TreeNodes** belonging to this **TreeNode** object.

Tuplet

Derived from a **BarObject**.

Methods

AddNestedTuplet(*posInTuplet*, *left*, *right*, *unit*[, *style*[, *bracket*[, *fullDuration*]]])

Nests a new tuplet bracket within an existing tuplet at a position relative to the duration and scale-factor of the existing tuplet. The *left* and *right* parameters specify the ratio of the new tuplet, for example 3 (left) in the time of 2 (right). The *unit* parameter specifies the note value (in 1/256th quarters) on which the tuplet should be based. For example, if you wish to create an eighth note (quaver) triplet group, you would use the value 128. The optional *style* and *bracket* parameters take one of the pre-defined constants that affect the visual appearance of the created tuplet; see “Global Constants” on page 156. If *fullDuration* is true, the bracket of the tuplet will span the entire duration of the tuplet. Returns the **Tuplet** object created.

NB: If **AddNestedTuplet**() has been given illegal parameters, it will not be able to create a valid **Tuplet** object. Therefore, you should test for inequality of the returned **Tuplet** object with *null* before attempting to use it.

AddNote(*posInTuplet*, *pitch*, *duration*[, *tied*[, *diatonic pitch*[, *string number*]]])

Adds a note to an existing tuplet, adopting the same voice number as used by the tuplet itself. Please note that *posInTuplet* is relative to the duration and scale-factor of the tuplet bracket itself. Therefore, if you wanted to add a quarter note/crotchet to the second beat of a quarter note/crotchet triplet, you would simply use the value 256 – not 341!

utils.SplitTuplet(*tuplet*, *splitpoint*)

Split the **Tuplet** object *tuplet* at the specified *splitpoint*, which is a number in relation to the tuplet’s parent bar. It then splits a nest of tuplets at that point in the bar. This method is provided by the *utils.plg*—see “Utils” on page 147.

Variables

Bracket

The bracket type of the tuplet (such as. none, auto; see “Global Constants” on page 156).

FullDuration

True if the bracket of the tuplet spans its entire duration.

Left

The left side of the tuplet, for example 3 in 3:2 (read only).

ParentTupletIfAny

If the tuplet intersects a tuplet, the innermost **Tuplet** object at that point in the score is returned. Otherwise, *null* is returned (read only).

PlayedDuration

The true rhythmic duration of the tuplet, for example for quarter-note (crotchet) triplet this would be the duration of a minim (read only).

PositionInTuplet

Returns the position of the tuplet relative to the duration and scale-factor of its parent tuplet. If the tuplet does not intersect a tuplet, its position within the parent Bar is returned as usual (read only).

Right

The right side of the tuplet, for example 2 in 3:2 (read only).

Style

The style of the tuplet (for example, number, ratio, ratio + note; see “Global Constants” on page 156).

Text

The text shown above the tuplet (read only).

Unit

The unit used for the tuplet, for example 256 for a triplet of quarter notes (read only).

Utils

Sibelius installs a plug-in called `utils.plg` that contains a set of useful and common methods that can be called directly by other plug-ins. It is not intended to be run as a plug-in in its own right, so does not appear in the Plug-ins menu.

Methods

The methods available via `utils.plg` are as follows:

`utils.AbsoluteValue(value)`

Returns the absolute value of a number, that is its numerical value without regard to its sign.

`utils.AddFractions(x,y)`

Adds two fractions *x* and *y*, passed in as Manuscript arrays. Returns an array with the result of the addition.

`utils.BinaryString(x)`

Returns a binary string (such as “101010”) equivalent to the number *x*.

`utils.bwAND(x, y)`

Equivalent to the C++ bitwise AND (&) operator. For example, `utils.bwAND(129,1)` is equal to 1.

utils.bwOR(*x*, *y*)

Equivalent to the C++ bitwise inclusive OR (`|`) operator. For example, **utils.bwOR(64,4)** is equal to **68**.

utils.bwXOR(*x*, *y*)

Equivalent to the C++ bitwise exclusive XOR (`^`) operator. For example, **utils.bwXOR(4,6)** is equal to **2**.

utils.CapableOfDeletion()

Returns **True** if the object can be deleted using **Delete()**, which is determined by checking Sibelius's version number.

utils.CaseInsensitiveComparison(*s1*, *s2*)

Returns **True** if the two strings *s1* and *s2* match, ignoring case.

utils.CastToBool(*x*)

Returns the variable *x* explicitly cast as a Boolean.

utils.CastToInt(*x*)

Returns the variable *x* explicitly cast as an integer.

utils.CastToStr(*x*)

Returns the variable *x* explicitly cast as a string.

utils.CombineArraysOfBool(*arr1*, *arr2*)

Concatenates two arrays containing Boolean values and returns the result.

utils.CombineArraysOfInt(*arr1*, *arr2*)

Concatenates two arrays containing integral values and returns the result.

utils.CombineArraysOfString(*arr1*, *arr2*)

Concatenates two arrays containing string values and returns the result.

utils.CopyTextFile(*source*, *dest*)

Copies an existing text file from one location to another, returning **True** if successful.

utils.CreateArrayBlanket(*value*, *size*)

Returns an array with *size* elements, each containing a blanket value specified by the first parameter.

utils.DeleteStaff(*score*, *nth staff*, *retain selection*)

Deletes an entire staff and its content from a given score, returning **True** if successful. If *retain selection* is **True**, Sibelius will ensure any item(s) that were selected prior to the staff's deletion are still selected.

utils.DenaryValue(*x*)

Returns a number in base 10 equivalent to binary number *x*, which must be provided as a string.

utils.DivideFractions(*x*,*y*)

Divides fraction *x* by fraction *y*, passed in as Manuscript arrays. Returns an array with the result of the division.

utils.ExtractFileName(*filename*)

Returns just the filename portion of a string *filename* containing both a path and a filename.

utils.Format(*str*, [*val1*, *val2*, *val3* ...])

Provides a simple means of replacing human-readable data types in a string. Each successive instance of **%s** in *str* is replaced with the value of the next remaining unused argument. for example **s = utils.Format("The %s brown %s jumps %s the lazy %s", "quick", "fox", "over", "dog");**

utils.FormatTime(*ms*)

Formats a time, given in milliseconds, to a human-readable string using the format mm'ss.Z (where z is centiseonds).

utils.FractionAsDecimal(*x*)

Returns the decimal equivalent of the fraction *x*, which is passed in as an array.

utils.FractionDenominator(*x*)

Returns the denominator of fraction *x*, which is passed in as an array.

utils.FractionNumerator(*x*)

Returns the numerator of fraction *x*, which is passed in as an array.

utils.GetAppDir()

Returns the path of the Sibelius executable as a string.

utils.GetArrayIndex(*arr*, *value*)

Returns the index of *value* in the array *arr*, or -1 if it doesn't exist in the array.

utils.GetBits(*x*)

Returns an array containing the list of powers of two whose cumulative sum equates to the value of *x*.

utils.GetGlobalApplicationDataDir()

Returns the path of the system's global application data area as a string.

utils.GetLocationTime(*score*, *barNum*, *position*)

Returns the precise time (in milliseconds) of a given location in a score. The position should be local to the start of the bar number you have supplied. Use the **utils** library to achieve this if your plug-in needs to be backwards compatible with Sibelius 4; otherwise call the **Score** object's function with the same name.

utils.GetMillisecondsFromTime(*time*)

If you pass in a time expressed in milliseconds (one minute being 60,000), this function returns the milliseconds portion of the number (in this case 60,000 modulus 1000 = 0).

utils.GetMinutesFromTime(*time*)

If you pass in a time expressed in milliseconds, this function returns the minutes portion of the number (for example if *time* = 120,262 milliseconds, this function returns 2).

utils.GetObjectTime(*score*, *obj*)

Returns the precise time (in milliseconds) that the object *obj* occurs from the start of a given score, taking into account tempo changes, performance markings and any other events in the score that have an effect on playback. Use this method to achieve this if your plug-in needs to be backwards compatible with Sibelius 4; otherwise use the **Time** property of the **BarObject** object whose time you wish to determine.

utils.GetPluginId(*plug-in*)

This enables you to identify a plug-in by entering the line of code **PluginUniqueID** = "*someUniqueId*"; in a plug-in's **Initialize** method. When you pass a **Plugin** object to this function, it scans the plug-in's code and returns its unique ID if it has one, otherwise an empty string.

utils.GetSibeliusPluginsFolder()

This is a wrapper around the deprecated **GetPluginsFolder**() function, and returns the path of the **Plugins** folder.

utils.GetSibMajorVersion()

Returns the major version number of Sibelius.

utils.GreatestCommonDivisor(*m*, *n*)

Returns the greatest common divisor of two non-zero integers, that is the largest positive integer that divides both numbers without remainder.

utils.IsInArray(*arr*, *value*)

Returns **True** if *value* exists in the array *arr*.

utils.IsNumeric(*str*[, *integer only*])

Returns **True** if the string *str* is numeric. Set the optional Boolean parameter *integer only* to **True** if you want the method to only return **True** if *str* is an integer (so that you can disallow floating point numbers).

utils.LowerCase(*str*)

Returns the ANSI string *str* in lowercase.

utils.MakeFraction(*x*,*y*)

Creates a fraction with *x* as the numerator and *y* as the denominator. The fraction is returned as a normal Manuscript array. (Manipulating fractions means you never have to worry about rounding errors.)

utils.max(*x*, *y*)

Returns the greater of two numbers.

utils.min(*x*, *y*)

Returns the lesser of two numbers.

utils.MultiplyFractions(*x*,*y*)

Multiplies fraction *y* by fraction *x*, passed in as Manuscript arrays. Returns an array with the result of the multiplication.

utils.PatternCount(*pattern*, *str*)

Returns the number of times the substring *pattern* exists in *str*.

utils.Pos(*subStr*, *str*)

Returns the zero-based position of the first instance of the sub-string *subStr* in *str*, or -1 if it isn't found.

utils.PosReverse(*subStr*, *str*)

Returns the zero-based position of the *last* instance of the sub-string *subStr* in *str*, or -1 if it isn't found.

utils.RaisePower(*x*,*y*)

Raises *x* to the *y*th power, where *y* is a positive integer.

utils.Replace(*inStr*, *toFind*, *replaceWith*, *replaceAll*)

Replaces a sub-string in a string with a new value. It looks for *toFind* in the string *inStr*, and if it finds it, replaces it with *replaceWith*. If the Boolean *replaceAll* is **False**, it only changes the first instance found; if it's **True**, it replaces all instances.

utils.ReverseArrayOfBool(*arr*)

Reverses the order of the elements in an array of Booleans.

utils.ReverseArrayOfInt(*arr*)

Reverses the order of the elements in an array of integers.

utils.ReverseArrayOfString(*arr*)

Reverses the order of the elements in an array of strings.

utils.RoundToNDecimalPlaces(*number*,*precision*)

Returns a string containing the *number* rounded to *precision* decimal places. The method handles the input as a string, in order to avoid rounding errors which would otherwise spoil results beyond the tenth decimal place or so.

utils.SetDefaultIfNotInArray(*value*, *arr*, *DefaultIndex*)

Scans the array *arr* for the value specified by the first parameter. *Value* is returned if it exists in the array, otherwise, *arr[DefaultIndex]*.

utils.shl(*x*, *y*)

Bitwise left-shift. Shifts the value *x* left by *y* bits. Equivalent to C++ << operator.

utils.shr(*x*, *y*)

Bitwise right-shift. Shifts the value *x* right by *y* bits. Equivalent to C++ >> operator.

utils.SortArray(*arr*,*show progress*)

Sorts the array *arr* using a case-insensitive alphabetic sort. Set *show progress* to **True** to see a progress bar while the sort is carried out, or set it to **False** if you don't want to see a progress bar.

utils.SortArrayCustom(*arr*,*show progress*,*plug-in name*,*method*)

Sorts the array *arr* using a custom sort order routine *method*, which must be passed into this method. *plug-in name* is the name of the plug-in that contains the sort order routine *method*. You can write your own sort order routine: it must be a method that takes two strings (*strA* and *strB*) and returns **1** or **0** based on the results of the comparison.

utils.SortArrayNumeric(*arr*,*show progress*)

Sorts the array *arr* in ascending numeric order. Set *show progress* to **True** to see a progress bar while the sort is carried out, or set it to **False** if you don't want to see a progress bar.

utils.SplitTuplet(*tuplet*,*splitpoint*)

Split the **Tuplet** object *tuplet* at the specified *splitpoint*, which is a number in relation to the tuple's parent bar. It then splits a nest of tuples at that point in the bar.

utils.StartComponentManager(*componentName*,*callbackFunc*)

Returns an array of filenames (strings) found on the system inside a folder with a given name, following the same rules of precedence as Sibelius's internal component manager. Files in the user's application data area take priority over those in the global application data area, followed lastly by those in the Sibelius's application directory itself.

callbackFunc should point to a function in the calling script that scans a supplied directory for files with a specific extension.

Such a function might look something like this:

```

GetFooFiles(dir) { // This is the function signature
    components = CreateArray();
    for each FOO file in dir {
        components[components.NumChildren] = file.NameWithExt;
    }
    return(components);
}

```

In the scenario above, the call to start the component manager would look like this (where “Foo Files” is the name of the directory containing your files):

```

files = utils.StartComponentManager("Foo Files", "myPlugin.Get-
FooFiles");

```

utils.SubtractFractions(*x*,*y*)

Subtracts fraction *y* from fraction *x*, passed in as Manuscript arrays. Returns an array with the result of the subtraction.

utils.UpperCase(*str*)

Returns the ANSI string *str* in uppercase.

VersionHistory

Each **Score** object has a **VersionHistory** object (obtained by way of the `score.GetVersions()` method), which in turn provides a list of **Version** objects. Each **Version** object represents a specific version, and also provides a list of **VersionComment** objects, which represent the per-version comments (as opposed to bar-attached comments, which are represented to Manuscript as **Comment** objects, derived from **BarObject** objects).

Methods

AddVersion([*name*],*comment*)]

Adds a new **Version** object and returns it if successful (or null if not), with an optional *name* and *comment* for the version.

DeleteNthVersion(*n*)

Deletes the *n*th **Version** object, returning **True** if successful.

GetNthVersion(*n*)

Returns the *n*th **Version** object.

Variables

NumChildren

Returns the number of versions in the score’s **VersionHistory** object.

Version

Accessed via a **Score** object's **VersionHistory** object.

Methods

AddComment (*text*)

Adds a new comment with the specified *text*, and returns the **VersionComment** object created.

Close ()

Closes all views of the version that are currently open in Sibelius, returning **True** if it has actually closed anything.

GetNthComment (*n*)

Gets the *n*th comment as a **VersionComment** object, or returns null if the index is out of range.

DeleteNthComment (*n*)

Deletes the *n*th comment, returning **True** if successful, or null if the index is out of range.

OpenAndReturnScore ()

Opens the specified version in Sibelius (if it's not already open) and returns its **Score** object.

Variables

EndDate

Returns a **DateTime** object representing the version's end date (read only). **IsOpen** returns **True** if the version is currently open in Sibelius (read only).

Name

Returns the name of the version (read/write).

NumComments

Returns the number of comments in the version (read only).

StartDate

Returns a **DateTime** object representing the version's start date (read only).

VersionComment

Accessed via **Version** objects.

Methods

None.

Variables

Text

Returns or changes the text of the comment, and this cannot be undone (read/write).

TimeStamp

Returns a **DateTime** object representing the time at which the comment was created.

UserName

Returns the name of the user who created the comment (read only).

Chapter 5: Global Constants

Global Constants

These are useful variables held internally within ManuScript and are accessible from any plug-in. They are called “constants” because you are encouraged not to change them.

Many of the constants are the names of note values, which you can use to specify a position in a bar easily. So instead of writing **320** you can write **Quarter+Sixteenth** or equally **Crotchet+Semiquaver**.

Truth Values

True	1
False	0

Measurements

Space	32
StaffHeight	128

Positions and Durations

Long	4096	Sixteenth	64
Breve	2048	Semiquaver	64
DottedBreve	3072	DottedSixteenth	96
Whole	1024	DottedSemiquaver	96
Semibreve	1024	ThirtySecond	32
DottedWhole	1536	Demisemiquaver	32
Half	512	DottedThirtySecond	48
Minim	512	DottedDemisemiquaver	48

DottedHalf	768	SixtyFourth	16
DottedMinim	768	Hemidemisemiquaver	16
Quarter	256	DottedSixtyFourth	24
Crotchet	256	DottedHemidemisemiquaver	24
DottedQuarter	384	OneHundredTwentyEighth	8
DottedCrotchet	384	Semihemidemisemiquaver	8
Eighth	128	DottedOneHundredTwentyEighth	12
Quaver	128	DottedSemihemidemisemiquaver	12
DottedEighth	192		
DottedQuaver	192		

Style Names

For the **ApplyStyle()** method of Score objects. Instead of the capitalized strings in quotes, you can use the equivalent variables in mixed upper and lower case. Note again that the constant **HOUSE** refers to the options in House Style > Engraving Rules and Layout > Document Setup only; to apply the entire House Style, use the **ALLSTYLES** constant.

House	“HOUSE”	Dictionary	“DICTIONARY”
Text	“TEXT”	SpacingRule	“SPACINGRULE”
Symbols	“SYMBOLS”	CustomChordNames	“CUSTOMCHORD-NAMES”
Lines	“LINES”	DefaultPartAppearance	“DEFAULTPARTAPPEARANCE”
Noteheads	“NOTEHEADS”	InstrumentsAndEnsembles	“INSTRUMENTSAN-ENSEMBLES”
Clefs	“CLEFS”	AllStyles	“ALLSTYLES”

Bar Number Formats

These constants can be used for the **format** argument of the **AddBarNumber** method.

BarNumberFormatNormal	0
BarNumberFormatNumberLetterLower	1
BarNumberFormatNumberLetterUpper	2

Text Styles

Here is a list of all the text style identifiers which are guaranteed to be present in any score in Sibelius. In previous versions of Manuscript text styles were identified by a numeric index; this usage has been deprecated but will continue to work for old plug-ins. New plug-ins should use the identifiers given below. For each style we first give the English name of the style and then the identifier.

Instrument names	“text.instrumentname”	Time signatures (one staff only)	“text.staff.timesig.onestaffonly”
1st and 2nd endings	“text.staff.1st_n_2nd_endings”	Tuplets	“text.staff.tuplets”
Auto page break warnings	“text.staff.autopagebreak.warnings”	Bar numbers	“text.system.barnumber”
Boxed text	“text.staff.boxed”	Metronome mark	“text.system.metronome”
Expression	“text.staff.expression”	Multirests (numbers)	“text.system.multirestnumbers”
Chord diagram fingering	“text.staff.fingering.chord_diagrams”	Composer	“text.system.page_aligned.composer”
Footnote	“text.staff.footnote”	Composer (on title page)	“text.system.page_aligned.composer.ontitlepage”
Block lyrics	“text.staff.lyrics.block”	Copyright	“text.system.page_aligned.copyright”
Multirests (tacet)	“text.staff.multirests.tacet”	Dedication	“text.system.page_aligned.dedication”

Plain text	“text.staff.plain”	Footer (inside edge)	“text.system.page_aligned.footer.inside”
Small text	“text.staff.small”	Footer (outside edge)	“text.system.page_aligned.footer.outside”
Chord symbol	“text.staff.space.chordsymbol”	Worksheet footer (first page, l)	“text.system.page_aligned.footer.worksheet.left”
Figured bass	“text.staff.space.figuredbass”	Header	“text.system.page_aligned.header”
Fingering	“text.staff.space.fingering”	Worksheet header (first page, l)	“text.system.page_aligned.header.worksheet.left”
Chord diagram fret	“text.staff.space.fretnumbers”	Worksheet header (first page, r)	“text.system.page_aligned.header.worksheet.right”
Lyrics above staff	“text.staff.space.hypen.lyrics.above”	Header (after first page)	“text.system.page_aligned.header_notp1”
Lyrics (chorus)	“text.staff.space.hypen.lyrics.chorus”	Header (after first page, inside edge)	“text.system.page_aligned.header_notp1.inside”
Lyrics line 1	“text.staff.space.hypen.lyrics.verse1”	Instrument name at top left	“text.system.page_aligned.instrname_topleft”
Lyrics line 2	“text.staff.space.hypen.lyrics.verse2”	Lyricist	“text.system.page_aligned.lyricist”
Lyrics line 3	“text.staff.space.hypen.lyrics.verse3”	Page numbers	“text.system.page_aligned.pagenumber”
Lyrics line 4	“text.staff.space.hypen.lyrics.verse4”	Subtitle	“text.system.page_aligned.subtitle”
Lyrics line 5	“text.staff.space.hypen.lyrics.verse5”	Title	“text.system.page_aligned.title”
Nashville chord numbers	“text.staff.space.nashvillechords”	Title (on title page)	“text.system.page_aligned.title_ontitlepage”

Common symbols	“text.staff.symbol.common”	Rehearsal mark	“text.system.rehearsalmarks”
Figured bass (extras)	“text.staff.symbol.figured.bass.extras”	Repeat (D.C./D.S./To Coda)	“text.system.repeat”
Note tails	“text.staff.symbol.noteflags”	Tempo	“text.system.tempo”
Special noteheads etc.	“text.staff.symbol.noteheads.special”	Timecode	“text.system.timecode”
Percussion instruments	“text.staff.symbol.percussion”	Duration at end of score	“text.system.timecode.duration”
Special symbols	“text.staff.symbol.special”	Hit points	“text.system.timecode.hit-points”
Tablature letters	“text.staff.tab.letters”	Time signatures (huge)	“text.system.timesig.huge”
Tablature numbers	“text.staff.tab.numbers”	Time signatures (large)	“text.system.timesig.large”
Technique	“text.staff.technique”	Time signatures	“text.system.timesig.normal”

Line Styles

Arpeggio	“line.staff.arpeggio”	Bracketed slur below	“line.staff.slur.down.bracketed”
Arpeggio down	“line.staff.arpeggio.down”	Dashed slur below	“line.staff.slur.down.dashed”
Arpeggio up	“line.staff.arpeggio.up”	Dotted slur below	“line.staff.slur.down.dotted”
Unused 2	“line.staff.arrow”	Slur above	“line.staff.slur.up”
Arrow	“line.staff.arrow.black.right”	Bracketed slur above	“line.staff.slur.up.bracketed”
Dashed arrow	“line.staff.arrow.black.right.dashed”	Dashed slur above	“line.staff.slur.up.dashed”

Double arrow	"line.staff.arrow.black.rig ht.left"	Dotted slur above	"line.staff.slur.up.dotted"
Vertical arrow (2)	"line.staff.arrow.black.ver tical"	String indicator above (1)	"line.staff.string.above.1"
White arrow	"line.staff.arrow.white.rig ht"	String indicator above (2)	"line.staff.string.above.2"
Dashed white arrow	"line.staff.arrow.white.rig ht.dashed"	String indicator above (3)	"line.staff.string.above.3"
Double white arrow	"line.staff.arrow.white.rig ht.left"	String indicator above (4)	"line.staff.string.above.4"
Vertical arrow	"line.staff.arrow.white.ver tical"	String indicator above (5)	"line.staff.string.above.5"
Beam	"line.staff.beam"	String indicator above (6)	"line.staff.string.above.6"
Guitar Bend	"line.staff.bend"	String indicator above (7)	"line.staff.string.above.7"
Guitar hold bend	"line.staff.bend.hold"	String indicator above (8)	"line.staff.string.above.8"
Box	"line.staff.box"	String indicator below (1)	"line.staff.string.below.1"
Bracket above	"line.staff.bracket.above"	String indicator below (2)	"line.staff.string.below.2"
Bracket above (end)	"line.staff.bracket.above.e nd"	String indicator below (3)	"line.staff.string.below.3"
Bracket above (start)	"line.staff.bracket.above.s tart"	String indicator below (4)	"line.staff.string.below.4"
Bracket below	"line.staff.bracket.below"	String indicator below (5)	"line.staff.string.below.5"
Bracket below (end)	"line.staff.bracket.below.e nd"	String indicator below (6)	"line.staff.string.below.6"
Bracket below (start)	"line.staff.bracket.below.s tart"	String indicator below (7)	"line.staff.string.below.7"
Vertical bracket	"line.staff.bracket.verti cal"	String indicator below (8)	"line.staff.string.below.8"

Vertical bracket 2	<code>"line.staff.bracket.vertical.2"</code>	Tie	<code>"line.staff.tie"</code>
Dashed line	<code>"line.staff.dashed"</code>	Trill	<code>"line.staff.trill"</code>
Vertical dashed line	<code>"line.staff.dashed.vertical"</code>	Tuplet	<code>"line.staff.tuplet"</code>
Dotted line	<code>"line.staff.dotted"</code>	Vertical line	<code>"line.staff.vertical"</code>
Glissando (straight)	<code>"line.staff.gliss.straight"</code>	Vibrato	<code>"line.staff.vibrato"</code>
Glissando (wavy)	<code>"line.staff.gliss.wavy"</code>	Guitar vibrato bar	<code>"line.staff.vibrato.bar"</code>
Guitar effect	<code>"line.staff.guitareffect"</code>	Wide vibrato	<code>"line.staff.vibrato.wide"</code>
Crescendo	<code>"line.staff.hairpin.crescendo"</code>	Dashed system line	<code>"line.system.dashed"</code>
Bracketed crescendo	<code>"line.staff.hairpin.crescendo.bracketed"</code>	Wide dashed system line	<code>"line.system.dashed.wide"</code>
Dashed crescendo	<code>"line.staff.hairpin.crescendo.dashed"</code>	1st ending	<code>"line.system.repeat.1st"</code>
Dotted crescendo	<code>"line.staff.hairpin.crescendo.dotted"</code>	1st and 2nd ending	<code>"line.system.repeat.1st_n_2nd"</code>
Crescendo from silence	<code>"line.staff.hairpin.crescendo.fromsilence"</code>	2nd ending	<code>"line.system.repeat.2nd"</code>
Diminuendo	<code>"line.staff.hairpin.diminuendo"</code>	2nd ending (closed)	<code>"line.system.repeat.2nd.closed"</code>
Bracketed diminuendo	<code>"line.staff.hairpin.diminuendo.bracketed"</code>	3rd ending	<code>"line.system.repeat.3rd"</code>
Dashed diminuendo	<code>"line.staff.hairpin.diminuendo.dashed"</code>	Repeat ending (closed)	<code>"line.system.repeat.closed"</code>
Dotted diminuendo	<code>"line.staff.hairpin.diminuendo.dotted"</code>	Repeat ending (open)	<code>"line.system.repeat.open"</code>
Diminuendo to silence	<code>"line.staff.hairpin.diminuendo.tosilence"</code>	Accel.	<code>"line.system.tempo.accel"</code>
Guitar artificial harmonic	<code>"line.staff.harmonic.artificial"</code>	Accel. (italic)	<code>"line.system.tempo.accel.italic"</code>
Guitar harp harmonic	<code>"line.staff.harmonic.harp"</code>	Accel. (italic, text only)	<code>"line.system.tempo.accel.italic.textonly"</code>

Guitar pinch harmonic	“line.staff.harmonic.pinch”	Molto accel.	“line.system.tempo.accel.molto”
Guitar touch harmonic	“line.staff.harmonic.touch”	Molto accel. (text only)	“line.system.tempo.accel.molto.textonly”
Guitar harmonics	“line.staff.harmonics”	Poco accel.	“line.system.tempo.accel.poco”
Hauptstimme	“line.staff.hauptstimme”	Poco accel. (text only)	“line.system.tempo.accel.poco.textonly”
Guitar let ring	“line.staff.letting”	Accel. (text only)	“line.system.tempo.accel.textonly”
Lyric line	“line.staff.lyric”	Tempo change (arrow right)	“line.system.tempo.arrowright”
Guitar palm mute	“line.staff.mute.palm”	Rall.	“line.system.tempo.rall”
Nebenstimme	“line.staff.nebenstimme”	Rall. (italic)	“line.system.tempo.rall.italic”
2 octaves down	“line.staff.octava.minus15”	Rall. (italic, text only)	“line.system.tempo.rall.italic.textonly”
Octave down	“line.staff.octava.minus8”	Molto rall.	“line.system.tempo.rall.molto”
2 octaves up	“line.staff.octava.plus15”	Molto rall. (text only)	“line.system.tempo.rall.molto.textonly”
Octave up	“line.staff.octava.plus8”	Poco rall.	“line.system.tempo.rall.poco”
Pedal	“line.staff.pedal”	Poco rall. (text only)	“line.system.tempo.rall.poco.textonly”
Pedal lift	“line.staff.pedal.lift”	Rall. (text only)	“line.system.tempo.rall.textonly”
Pedal lift again	“line.staff.pedal.lift.again”	Rit.	“line.system.tempo.rit”
Pedal lift finally	“line.staff.pedal.lift.finally”	Rit. (italic)	“line.system.tempo.rit.italic”

Pedal (no line)	"line.staff.pedal.noline"	Rit. (italic, text only)	"line.system.tempo.rit.italic.textonly"
Guitar pick scrape	"line.staff.pick.scrape"	Molto rit.	"line.system.tempo.rit.molto"
Line	"line.staff.plain"	Molto rit. (text only)	"line.system.tempo.rit.molto.textonly"
Portamento	"line.staff.port.straight"	Poco rit.	"line.system.tempo.rit.poco"
Guitar rake	"line.staff.rake"	Poco rit. (text only)	"line.system.tempo.rit.poco.textonly"
Guitar slide	"line.staff.slide"	Rit. (text only)	"line.system.tempo.rit.textonly"
Slur below	"line.staff.slur.down"		

Clef Styles

Here is a list of all the clef style identifiers that are guaranteed to be present in any score in Sibelius, for use with the `Stave.AddClef` method. For each style we first give the English name of the style, and then the identifier.

Alto	"clef.alto"	Small tab	"clef.tab.small"
Baritone C	"clef.baritone.c"	Small tab (taller)	"clef.tab.small.taller"
Baritone F	"clef.baritone.f"	Tab (taller)	"clef.tab.taller"
Bass	"clef.bass"	Tenor	"clef.tenor"
Bass down 8	"clef.bass.down.8"	Tenor down 8	"clef.tenor.down.8"
Bass up 15	"clef.bass.up.15"	Treble	"clef.treble"
Bass up 8	"clef.bass.up.8"	Treble down 8	"clef.treble.down.8"
Null	"clef.null"	Treble (down 8)	"clef.treble.down.8.bracketed"
Percussion	"clef.percussion"	Treble down 8 (old)	"clef.treble.down.8.old"
Percussion 2	"clef.percussion_2"	Treble up 15	"clef.treble.up.15"
Soprano	"clef.soprano"	Treble up 8	"clef.treble.up.8"

Mezzo-soprano	“clef.soprano.mezzo”	French violin	“clef.violin.french”
Tab	“clef.tab”	Sub-bass F	“clef.sub-bass.f”

Instrument Types

Here is a list of all the instrument type identifiers that are guaranteed to be present in any score in Sibelius. For each style we first give the English name of the style and then the identifier. Note that only the tablature stave types can be used with guitar frames; the rest are included for completeness.

Alp-Horn in F	instrument.brass.alp-horn.f
Alp-Horn in G	instrument.brass.alp-horn.g
Baritone Bugle in G	instrument.brass.bugle.baritone.g
Contrabass Bugle in G	instrument.brass.bugle.contrabass.g
Euphonium Bugle in G	instrument.brass.bugle.euphonium.g
Mellophone Bugle in G	instrument.brass.bugle.mellophone.g
Soprano Bugle in G	instrument.brass.bugle.soprano.g
Cimbasso in Bb	instrument.brass.cimbasso.bflat
Cimbasso in Eb	instrument.brass.cimbasso.eflat
Cimbasso in F	instrument.brass.cimbasso.f
Cornet in A	instrument.brass.cornet.a
Cornet in Bb	instrument.brass.cornet.bflat
Soprano Cornet in Eb	instrument.brass.cornet.soprano.eflat
Euphonium in Bb [treble clef]	instrument.brass.euphonium
Euphonium in Bb [bass clef, treble transp.]	instrument.brass.euphonium.bassclef
Euphonium in C [bass clef]	instrument.brass.euphonium.bassclef.bassclef
Euphonium in Bb [bass clef]	instrument.brass.euphonium.bflat.bassclef.bassclef
Flugelhorn	instrument.brass.flugelhorn
Horn in A [no key]	instrument.brass.horn.a.nokeysig
Horn in Ab alto [no key]	instrument.brass.horn.alto.aflat.nokeysig
Alto Horn in Eb	instrument.brass.horn.alto.eflat

Alto Horn in F	instrument.brass.horn.alto.f
Horn in B [no key]	instrument.brass.horn.b.nokeysig
Baritone in Bb [treble clef]	instrument.brass.horn.baritone
Baritone in C [treble clef]	instrument.brass.horn.baritone.2
Baritone in Bb [bass clef, treble transp.]	instrument.brass.horn.baritone.bassclef
Baritone in C [bass clef]	instrument.brass.horn.baritone.bassclef.bassclef
Bass in Bb	instrument.brass.horn.bass.bflat
Bass in Bb [bass clef, treble transp.]	instrument.brass.horn.bass.bflat.bassclef
Bass in C	instrument.brass.horn.bass.c
Bass in Eb	instrument.brass.horn.bass.eflat
Bass in Eb [bass clef, treble transp.]	instrument.brass.horn.bass.eflat.bassclef
A Basso Horn [no key]	instrument.brass.horn.basso.a.nokeysig
Bb Basso Horn [no key]	instrument.brass.horn.basso.bflat.nokeysig
C Basso Horn [no key]	instrument.brass.horn.basso.c.nokeysig
Horn in Bb [no key]	instrument.brass.horn.bflat.nokeysig
Horn in C [no key]	instrument.brass.horn.c.nokeysig
Horn in D [no key]	instrument.brass.horn.d.nokeysig
Horn in Db [no key]	instrument.brass.horn.dflat.nokeysig
Horn in E [no key]	instrument.brass.horn.e.nokeysig
Horn in Eb	instrument.brass.horn.eflat
Horn in Eb [no key]	instrument.brass.horn.eflat.nokeysig
Horn in F	instrument.brass.horn.f
Horn in F [bass clef]	instrument.brass.horn.f.bassclef
Horn in F [no key]	instrument.brass.horn.f.nokeysig
Horn in F# [no key]	instrument.brass.horn.fsharp.nokeysig
Horn in G [no key]	instrument.brass.horn.g.nokeysig
Tenor Horn	instrument.brass.horn.tenor

Mellophone in Eb	instrument.brass.mellophone.eflat
Mellophone in F	instrument.brass.mellophone.f
Mellophonium in Eb	instrument.brass.mellophonium.eflat
Mellophonium in F	instrument.brass.mellophonium.f
Ophicleide	instrument.brass.ophicleide
Brass	instrument.brass.section
Serpent	instrument.brass.serpent
Sousaphone in Bb	instrument.brass.sousaphone.bflat
Sousaphone in Eb	instrument.brass.sousaphone.eflat
Trombone	instrument.brass.trombone
Alto Trombone	instrument.brass.trombone.alto
Bass Trombone	instrument.brass.trombone.bass
Trombone in Bb [bass clef, treble transp.]	instrument.brass.trombone.bassclef.trebleclef

Tenor Saxophone	instrument.wind.saxophone.tenor
Tenor Saxophone [score sounds 8vb]	instrument.wind.saxophone.tenor.8vb-score
Tenor Saxophone [bass clef, treble transp.]	instrument.wind.saxophone.tenor.bassclef
Woodwind	instrument.wind.section
Shakuhachi	instrument.wind.shakuhachi
Tin Whistle	instrument.wind.whistle.tin

Beam Options

For the **Beam** variable of **NoteRest** objects.

NoBeam	1
StartBeam	2
ContinueBeam	3
SingleBeam	4

Bracket Types

For the **AddBracket()** method of **BracketList** objects, and the **BracketType** variable of **Bracket** objects.

BracketFull	0
BracketBrace	1
BracketSub	2

Breaks

These constants are used by the **SetBreakType()** method of Score objects.

MiddleOfSystem	1
EndOfSystem	2
MiddleOfPage	3
EndOfPage	4
NotEndOfSystem	5
EndOfSystemOrPage	6
Default	7
SpecialPageBreak	8

These constants correspond to the menu entries in the **Bars** panel of the Properties window in the following way:

MiddleOfSystem

Middle of system. The bar can only appear in the middle of a system, not at the end.

EndOfSystem

No menu entry; created by **Layout > Lock Format**. The bar can only appear at the end of a mid-page system, not the middle of a system or the end of a page.

MiddleOfPage

Middle of page. The bar can appear anywhere except at the end of a page.

EndOfPage

Page break. The bar can only appear at the end of a page.

NotEndOfSystem

No menu entry. The bar can appear anywhere except the end of a mid-page system.

EndOfSystemOrPage

System break. The bar can only appear at the end of a mid-page system or the end of a page.

Default

No break. The bar can appear anywhere.

Note that in older versions of Manuscript the constant **MiddleOfSystem** was called **NoBreak** and the constant **EndOfSystem** was called **SystemBreak**. These older names were confusing, because they implied a correlation with the similarly-named menu items in the Properties window that was not accurate. The old names

are still supported for old plug-ins, but should not be used for new plug-ins. For consistency, the old constant **PageBreak** has also been renamed **EndOfPage**, even though this did correlate correctly with the Properties window.

Accidentals

For the **Accidental** variable of Note objects.

DoubleSharp	2
Sharp	1
Natural	0
Flat	-1
DoubleFlat	-2

Note Style Names

For the **NoteStyle** variable of **Note** objects; these correspond to the noteheads available from the **Notes** panel of the Properties window in the manuscript papers that are supplied with Sibelius.

NormalNoteStyle	0	BackSlashedNoteStyle	12
CrossNoteStyle	1	ArrowDownNoteStyle	13
DiamondNoteStyle	2	ArrowUpNoteStyle	14
BeatWithoutStemNoteStyle	3	InvertedTriangleNoteStyle	15
BeatNoteStyle	4	ShapedNote1NoteStyle	16
CrossOrDiamondNoteStyle	5	ShapedNote2NoteStyle	17
BlackAndWhiteDiamondNoteStyle	6	ShapedNote3NoteStyle	18
HeadlessNoteStyle	7	ShapedNote4StemUpNoteStyle	19
StemlessNoteStyle	8	ShapedNote4StemDownNoteStyle	23
SilentNoteStyle	9	ShapedNote5NoteStyle	20
CueNoteStyle	10	ShapedNote6NoteStyle	21
SlashedNoteStyle	11	ShapedNote7NoteStyle	22

MuteMode Constants

These are the possible values of **Stave.MuteMode**:

Muted	0
HalfMuted	1
NotMuted	2

Articulations

Used with **Note.GetArticulation** and **Note.SetArticulation**.

Custom3Artic	15
TriPauseArtic	14
PauseArtic	13
SquarePauseArtic	12
Custom2Artic	11

Custom1Artic	0

SyllableTypes for LyricItems

Used in **LyricItem**.

MiddleOfWord	0
EndOfWord	1

Accidental Styles

As used by **Note.AccidentalStyle**.

NormalAcc	“0”
HiddenAcc	“1”
CautionaryAcc	“2”
BracketedAcc	“3”

Time Signature Strings

These define the unicode characters used to draw common time and alla breve time signatures, so that you can recognize these by comparison with **TimeSignature.Text**.

CommonTimeString

AllaBreveTimeString

Symbols

There are a lot of symbols in Sibelius. We’ve defined named constants for the indices of some of the most frequently used symbols, which can be passed to **Bar.AddSymbol**. For other symbols, you can work out the required index by “counting along” in the **Create > Symbol** dialog of Sibelius, or by using the method **Score.SymbolIndex**. To help with the “counting along,” we’ve defined a constant for the start of every group of symbols in the **Create > Symbol** dialog, and these are also given below. Then for example you can access the 8va symbol as **OctaveSymbols + 2**.

Common Symbol Indices	
SegnoSymbol	“1”
CodaSymbol	“2”
RepeatBeatSymbol	“5”
RepeatBarSymbol	“6”
RepeatTwoBarsSymbol	“7”

TrillSymbol	“32”
BracketedTrillSymbol	“33”

FeatheredBeamType Values

For the **FeatheredBeamType** variable of **NoteRest** objects.

FeatheredBeamNone	“0”
FeatheredBeamAccel	“1”
FeatheredBeamRit	“2”

Units Values

For the **DocumentSetup** object.

DocumentSetupUnitsmm	“0”
DocumentSetupUnitsInches	“1”
DocumentSetupUnitsPoints	“2”

Orientation Values

For the **Orientation** variable of **DocumentSetup** objects.

OrientationPortrait	“0”
OrientationLandscape	“1”

PageSize Values

For the **PageSize** variable of **DocumentSetup** objects.

PageSizeLetter	"0"
PageSizeTabloid	"1"
PageSizeA5	"2"
PageSizeB5	"3"
PageSizeA4	"4"
PageSizeB4	"5"
PageSizeA3	"6"
PageSizeUSBand	"7"

PageSizeExecutive	"11"
PageSizeQuarto	"12"
PageSizeConcert	"13"
PageSizeFolio	"14"
PageSizeLegal	"15"
PageSize9_5x12_5	"16"
PageSize10x13	"17"
PageSizeCustom	"18"

MarginType Values

For the **MarginType** variable of **DocumentSetup** objects.

PageMarginsSame	"0"
PageMarginsMirrored	"1"
PageMarginsDifferent	"2"

Tuplets

These define the constants that can be passed as a *style* parameter to `Bar.AddTuplet()` and `Tuplet.AddNestedTuplet()`.

TupletNoNumber	“0”
TupletLeft	“1”
TupletLeftRight	“2”
TupletLeftRightNote	“3”

These define the constants that can be passed as a *bracket* parameter:

TupletBracketOff	“0”
TupletBracketOn	“1”
TupletBracketAuto	“2”

SingleTremolos

For the **SingleTremolos** variable of `NoteRest` objects, the constants are numbers in the range 0 to 7, representing the number of tremolo beams on the stem of the note or chord. For a “z on stem” (for buzz rolls), use the value -1 or the constant **ZOnStem**.

DoubleTremolo Values

For the double tremolo style variables of **EngravingRules** objects.

DoubleTremolosTouchingStems	“0”
DoubleTremolosBetweenStems	“1”
DoubleTremolosOuterTremoloTouchingStems	“2”

Instrument Name Values

For the instrument name variables of `EngravingRules` objects.

InstrumentNamesFull	“0”
InstrumentNamesShort	“1”
InstrumentNamesNone	“2”

Types of Objects in a Bar

The **Type** field for objects in a bar can return one of the following values:

Clef, SpecialBarline, TimeSignature, KeySignature
Line, ArpeggioLine, Bend, CrescendoLine, DiminuendoLine, GlissandoLine,
OctavaLine, PedalLine, RepeatTimeLine, Slur, Trill, Box, BeamLine, Tuplet,
RitardLine, HighLight
LyricItem, Text, SystemTextItem, GuitarFrame, GuitarScaleDiagram,
RehearsalMark, InstrumentChange
BarRest, NoteRest, Graphic, Comment, Bracket, BarNumber
SymbolItem, SystemSymbolItem
