I. Application

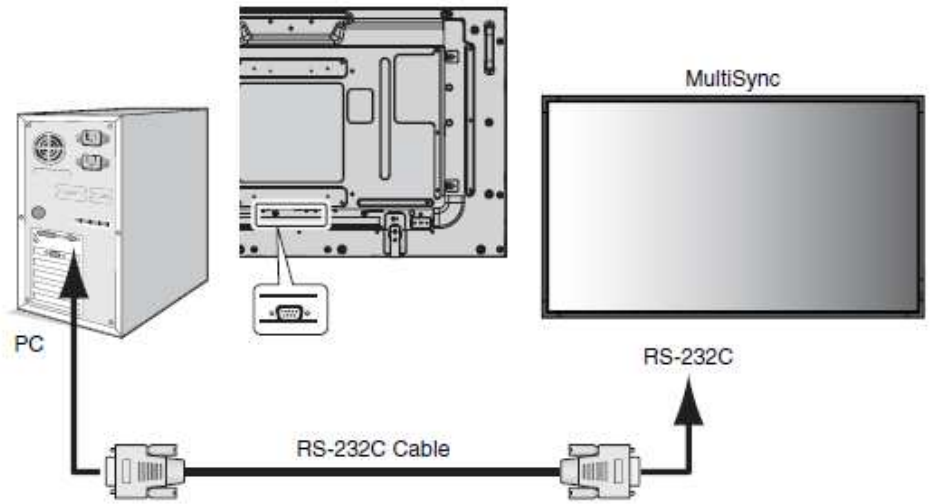
This document defines the communications method for control of the NEC LCD monitor, MultiSync X841UHD, X981UHD, X651UHD when using an external controller.

II. Preparation

2. Connectors and wiring

2.1 RS-232C Remote control

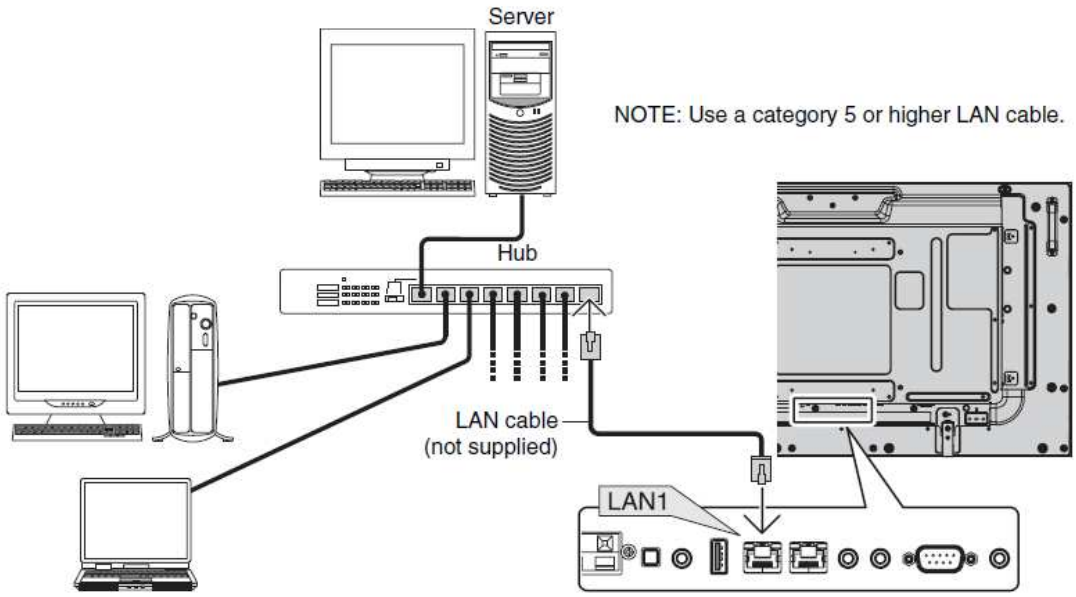
Connector: 9-pin D-Sub
Cable: Cross (reversed) cable or null modem cable



(Please refer "Controlling the LCD monitor via RS-232C Remote control" on User's manual.)

2.2 LAN control

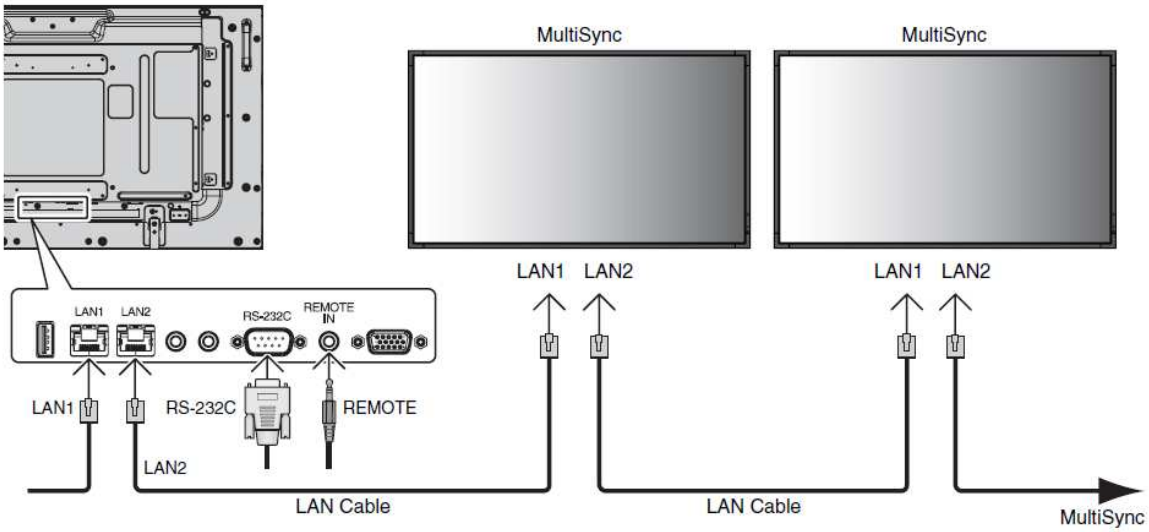
Connector: RJ-45 10/100 BASE-T
Cable: Category 5 or higher LAN cable



2.3 Multi Monitors Connection

You can control multiple monitors by using RS-232C, REMOTE IN or LAN daisy-chain connection.

Main Monitor		Sub Monitors	
Connector		Connector	
IN	OUT	IN	OUT
RS-232C	LAN2	LAN1	LAN2
REMOTE IN			
LAN1			



(Please refer "Controlling the LCD monitor via LAN control" on User's manual.)

In this connection, a command is transmitted to the connected MultiSync on the following environment.

1. AUTO ID function is performed on Main Monitor.
   (Please refer "MULTI DISPLAY of OSD (On-Screen-Display) Controls" on User's manual.)
2. Destination byte of Command Header is "MONITOR ID = ALL", "GROUP ID" or "MONITOR ID of Sub Monitor".
   (Please refer section 4.1.)

III. Communication specification

3. Communication Parameter

3.1 RS-232C Remote control

(1) Communication system	Asynchronous
(2) Interface	RS-232C
(3) Baud rate	9600bps
(4) Data length	8bits
(5) Parity	None
(6) Stop bit	1 bit
(7) Communication code	ASCII

3.2 LAN control

(4) IP address	(Default) Automatic setup * If you need to change, Please refer "Network settings" on User's manual.
(5) Port No.	7142 (Fixed)

(Note)
The monitor will disconnect the connection if no packet data is received for 15 minutes.
And the controller (PC) has to re-connect to control the monitor again, after 15 minutes or more.

3.3 Communication timing

The controller should wait for a reply packet before the next command is sent.
(Note)
When the following commands are sent, a controller should wait for specified period after receiving the reply command before sending the next command.

- Power On, Power Off: 15 seconds
- Input, PIP Input, Auto Setup, Factory Reset: 10 seconds

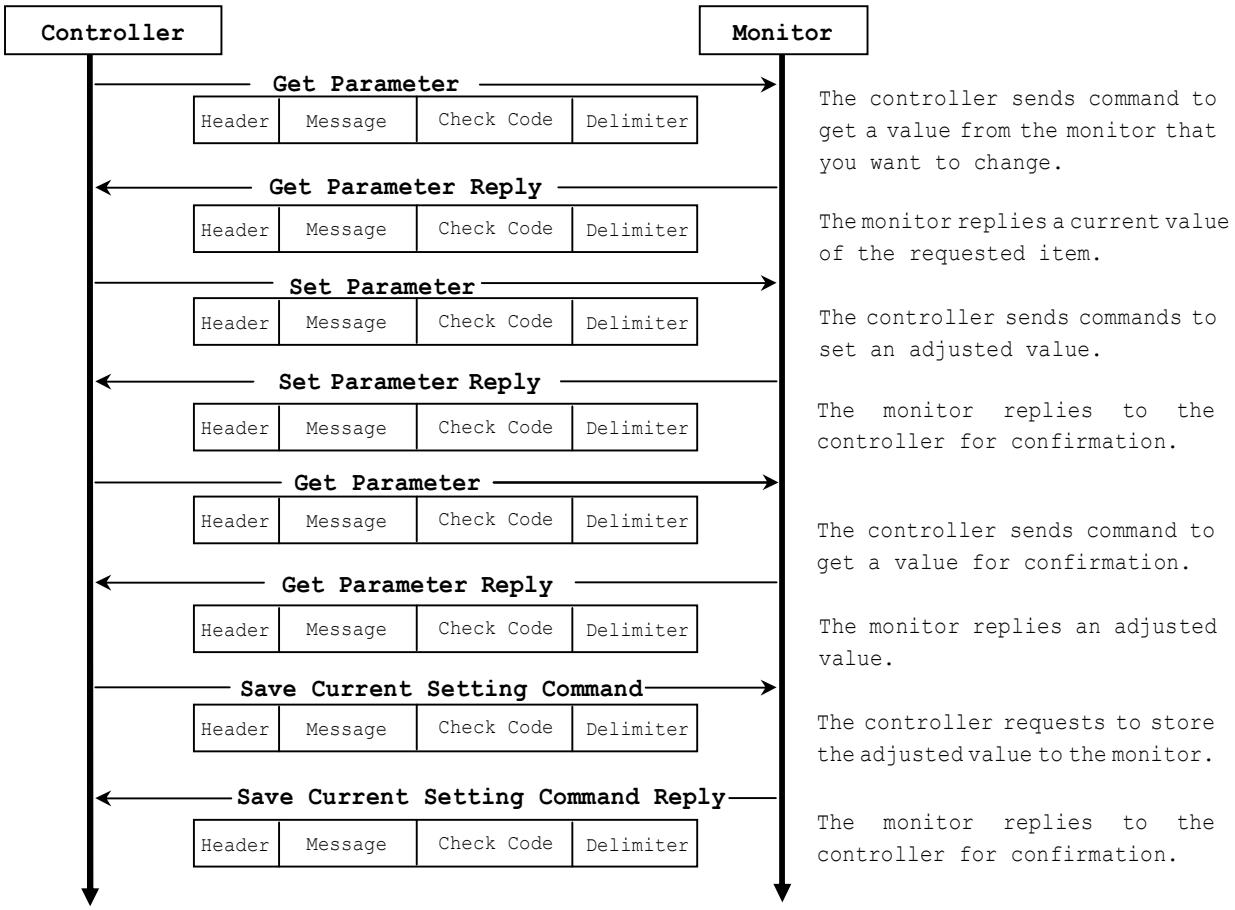
4. Communication Format

Header	Message	Check Code	Delimiter

The command packet consists of four parts, Header, Message, Check code and Delimiter.

Recommended sequence of a typical procedure to control a monitor is as follows,
[A controller and a monitor, two-way communication composition figure]

■ For the general command (see the part "6.3. Operation Code (OP code) Table")



■ For the special command (see the part 7 to 23. and 5.5.2)

13. Security Lock

13.1 Security Lock Control

This command sets the condition of security lock function to "LOCK" or "UNLOCK".

If security pass codes 1st to 4th are matched with monitor resisted pass codes, then this command is executed, and reply no error status and a new condition.
If codes aren't matched with them then setting isn't changed, and reply error status and a current condition.
If the monitor receives this command while waiting for Pass codes inputs, then it only checks Pass cords (and releases image muting if Pass codes are OK) and doesn't apply "EN" parameter.

- The password data is encoded as the following procedure.
  Ex.) In the case of password data "1234"
  Step1: Password data is handled as character code.
  Example:
  "1234" -> 31h 32h 33h 34h (ASCII)
  Step2: The hexadecimal value of each original character is encoded as two ASCII characters representing the hex value.
  Example:
  31h 32h 33h 34h -> '3'-'1'-'3'-'2'-'3'-'3'-'3'-'4'
  Step3: Password data is handled as character code once again.
  Example:
  '3'-'1'-'3'-'2'-'3'-'3'-'3'-'4' -> 33h 31h 33h 32h 33h 33h 33h 34h (ASCII)
