

RFDS Description

The optional RFDS is a Field Replaceable Unit (FRU) used to perform RF tests of the site from the CBSC or from the LMF. The RFDS contains the following elements:

- Antenna Select Unit (ASU)
- FWT Interface Card (FWTIC)
- Subscriber Unit Assembly (SUA)

For complete information regarding the RFDS, refer to the CDMA RFDS Hardware Installation manual (Motorola part no. 6864113A93) CDMA RFDS User's Guide (Motorola part no. 6864113A37), and the CDMA LMF Operator's Guide (Motorola part no. 6864113A21).

RFDS Parameter Settings

The `bts-#.cdf` file includes RFDS parameter settings that must match the installed RFDS equipment. The paragraphs below describe the editable parameters and their defaults. Table 3-38 explains how to edit the parameter settings.

- **RfdsEquip** – valid inputs are 0 through 2.
 - 0 = (default) RFDS is not equipped
 - 1 = Non-Cobra/Patzer box RFDS
 - 2 = Cobra RFDS
- **TsuEquip** – valid inputs are 0 or 1
 - 0 = (default) TSU not equipped
 - 1 = TSU is equipped in the system
- **MC1...4** – valid inputs are 0 or 1
 - 0 = (default) Not equipped
 - 1 = Multicouplers equipped in RFDS system
(9600 system RFDS only)
- **Asu1/2Equip** – valid inputs are 0 or 1
 - 0 = (default) Not equipped
 - 1 = Equipped
- **TestOrigDN** – valid inputs are "" (default) or a numerical string up to 15 characters. (This is the phone number the RFDS dials when originating a call. A dummy number needs to be set up by the switch, and is to be used in this field.)

NOTE

Any text editor may be used to open the `bts-#.cdf` file to verify, view, or modify data.

Table 3-38: RFDS Parameter Settings

Step	Action
	<p>* IMPORTANT Log out of the BTS prior to performing this procedure.</p>
1	<p>Using a text editor, verify the following fields are set correctly in the <code>bts-#.cdf</code> file (1 = GLI based RFDS; 2 = Cobra RFDS).</p> <p>EXAMPLE:</p> <pre>RfdsEquip = 2 TsuEquip = 1 MC1Equip = 0 MC2Equip = 0 MC3Equip = 0 MC4Equip = 0 Asu1Equip = 1 Asu2Equip = 0 (1 if system is non-duplexed) TestOrigDN = '123456789'</pre> <p>NOTE The above is an example of the <code>bts-#.cdf</code> file that should have been generated by the OMC and copied to the LMF. These fields will have been set by the OMC if the RFDSPARM database is modified for the RFDS.</p>
2	<p>Save and/or quit the editor. If any changes were made to these fields data will need to be downloaded to the GLI2 (see Step 3, otherwise proceed to Step 4).</p>
3	<p>To download to the GLI2, click on the Device menu and select the Download Data menu item (<i>selected devices do not change color when data is downloaded</i>). A status report window is displayed showing status of the download. Click <i>OK</i> to close the status report window.</p> <p>! CAUTION After downloading data to the GLI2 the RFDS LED will slowly begin flashing red and green for approximately 2–3 minutes. DO NOT attempt to perform any functions with the RFDS until the LED remains green.</p>
4	<p>Status the RFDS TSU. A status report is displayed showing the software version number for the TSIC and SUA.</p> <p>* IMPORTANT If the LMF yields an error message, check the following:</p> <ul style="list-style-type: none"> • Ensure AMR cable is correctly connected from the BTS to the RFDS. • Verify RFDS has power. • Verify RFDS status LED is green. • Verify fields in the <code>bts-#.cdf</code> file are correct (see Step 1). • Status the GLI2 and ensure the device is communicating (via Ethernet) with the LMF, and the device is in the proper state (INS).

3

RFDS TSU NAM Programming

The NAM (number assignment module) information needs to be programmed into the TSU before it can receive and process test calls, or be used for any type of RFDS test. The RFDS TSU NAM must be programmed with the appropriate system parameters and phone number during hardware installation. The TSU phone and TSU MSI must be recorded for each BTS used for OMC–R RFDS software configuration.

NOTE

The user will only need to program the NAM for the initial install of the RFDS.

Explanation of Parameters used when Programming the TSU NAM

Table 3-39 defines the parameters used when editing the tsu.nam file.

Table 3-39: Definition of Parameters	
Access Overload Code Slot Index System ID Network ID	These parameters are obtained from the switch.
Primary Channel A Primary Channel B Secondary Channel A Secondary Channel B	These parameters are the channels which are to be used in operation of the system.
Lock Code Security Code Service Level Station Class Mark	Do <i>NOT</i> change.
IMSI MCC IMSI 11 12	These fields are obtained at the OMC using the following command: OMC000>disp bts-# imsi If the fields are blank, replace the IMSI fields in the NAM file to 0, otherwise use the values displayed by the OMC.
MIN Phone Number	These fields are the phone number assigned to the mobile. The ESN and MIN must be entered into the switch as well. NOTE: This field is different from the TODN field in the bts-#.cdf file. The MIN is the phone number of the RFDS subscriber, and the TODN is the number the subscriber calls.

Valid NAM Ranges

Table 3-40 provides the valid NAM field ranges. If any of the fields are missing or out-of-range, the RFDS will error out.

Table 3-40: Valid NAM Field Ranges

NAM Field Name	Valid Range	
	Minimum	Maximum
Access Overload Code	0	15
Slot Index	0	7
System ID	0	32767
Network ID	0	32767
Primary Channel A	25	1175
Primary Channel B	25	1175
Secondary Channel A	25	1175
Secondary Channel B	25	1175
Lock Code	0	999
Security Code	0	999999
Service Level	0	7
Station Class Mark	0	255
IMSI 11 12	0	99
IMSI MCC	0	999
MIN Phone Number	N/A	N/A

Measuring Directional Coupler Loss

Use the following procedure to calibrate directional couplers associated with RFDS installation. The procedure involves measuring the forward port loss and the antenna port loss to find the directional coupler loss.

Prerequisites

- RFDS installed

Table 3-41: Measuring Directional Coupler Loss

Step	Action
1	Connect the test set or power meter to the BTS Coupled (forward) port of the directional coupler.
2	Login to the BTS.
3	Select the BBX .
4	Select Device>Key XCVR . The BBX window appears.
5	In the XCVR Gain field, enter the following value: <i>20</i> Verify that the XCVR Carrier and Channel fields are correct and that the Use BLO box is checked. Click OK .
6	The status report window appears. Click OK .
7	Observe the power reading and record the value measured at the BTS Coupled (forward) port. The value should be between -34 and -27 dBm. If the reading is not within these values, adjust the value in the XCVR Gain field until the value is approximately 30 dBm.
8	Select the BBX .
9	Select Device>Dekey XCVR . The status report window appears verifying the action has passed (the XCVR is no longer keyed up). Click OK
10	Disconnect the antenna cable from the ANT port.
11	Disconnect the test set cable from the BTS Coupled (forward) port and connect it to the ANT (antenna) port.
12	Select the BBX .
13	Select Device>Key XCVR . The BBX window appears.
14	In the XCVR Gain field, ensure the value entered is the same as used for the recorded value in the forward port portion of the procedure. (Note that a value of 20 was used in step 5.) Verify that the XCVR Carrier and Channel fields are correct and that the Use BLO box is checked. Click OK .
15	The status report window appears. Click OK .

... continued on next page

Table 3-41: Measuring Directional Coupler Loss

Step	Action								
16	Observe the power reading and record the value measured at the ANT (antenna) port.								
17	Select the BBX.								
18	Select Device>Dekey XCVR . The status report window appears verifying the action has passed (the XCVR is no longer keyed up). Click OK .								
19	<p>Take the value of the Forward test and subtract the Antenna port value from it to get the directional coupler loss. For example:</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: right; padding-right: 20px;">-28.7</td> <td style="text-align: right;">-31.6</td> </tr> <tr> <td style="text-align: right;">- 1.9</td> <td style="text-align: right;">- - 1.2</td> </tr> <tr> <td style="text-align: right;">-----</td> <td style="text-align: right;">-----</td> </tr> <tr> <td style="text-align: right;">-30.6dBm</td> <td style="text-align: right;">-30.4dBm</td> </tr> </table>	-28.7	-31.6	- 1.9	- - 1.2	-----	-----	-30.6dBm	-30.4dBm
-28.7	-31.6								
- 1.9	- - 1.2								
-----	-----								
-30.6dBm	-30.4dBm								
20	Label the directional coupler results for in-service calibration reference.								

3

Set Antenna Map Data

The antenna map data must be entered manually if an RFDS is installed. Antenna map data does not have to be entered if an RFDS is not installed. The antenna map data is only used for RFDS tests and is required if a RFDS is installed.

Prerequisite

- Logged into the BTS

Table 3-42: Set Antenna Map Data

Step	Action
1	Click on the Util menu.
2	Select Edit >Antenna Map >TX or RX . A data entry pop-up window will appear.
3	Enter/edit values as required for each carrier. NOTE Refer to the Util >Edit-antenna map LMF help screen for antenna map examples.
4	Click on the Save button to save displayed values.
5	Click on the Dismiss button to exit the window. Values that were entered/changed after the Save button was used will not be saved. NOTE Entered values will be used by the LMF as soon as they are saved. You do not have to logout and login.

Set RFDS Configuration Data

If an RFDS is installed the RFDS configuration data must be manually entered.

Prerequisite

- Logged into the BTS

IMPORTANT

The entered **antenna#** index numbers must correspond to the **antenna#** index numbers used in the antenna maps.

Table 3-43: Set RFDS Configuration Data

Step	Action
1	Click on the Util menu.
2	Select Edit >RFDS Configuration >TX or RX . A data entry pop-up window will appear.
3	Click on the Add Row button to add a new antenna number. Then click in the other columns and enter the desired data.
4	To edit existing values click in the data box to be changed and change the value. NOTE Refer to the Util >Edit-RFDS Configuration LMF help screen for RFDS configuration data examples.
5	To delete a row, click on the row and then click on the Delete Row button.
6	Click on the Save button to save displayed values.
7	Click on the Dismiss button to exit the window. Values that were entered/changed after the Save button was used will not be saved. NOTE Entered values will be used by the LMF as soon as they are saved. You do not have to logout and login.

RFDS Calibration

The RFDS Calibration option is used to calibrate the RFDS TX and RX paths. For a TX antenna path calibration the BTS XCVR is keyed at a pre-determined power level and the BTS power output level is measured by the RFDS. The power level is then measured at the TX antenna directional coupler by the power measuring test equipment item being used (power meter or analyzer). The difference (offset) between the power level at the RFDS and the power level at the TX antenna directional coupler is used as the TX RFDS calibration offset value.

For an RX antenna path calibration the RFDS is keyed at a pre-determined power level and the power input level is measured by the BTS XCVR. A CDMA signal at the same power level measured by the BTS XCVR is then injected at the RX antenna directional coupler by the CDMA communications analyzer. The difference (offset) between the RFDS keyed power level and power level measured at the BTS XCVR is the RFDS RX calibration offset value.

The TX and RX RFDS calibration offset values are written to the CAL file.

Prerequisites

- BBX2s are in INS_TEST
- Cable calibration has been performed
- TX calibration has been performed and BLO has been downloaded for the BTS
- Test equipment has been connected correctly for a TX calibration
- Test equipment has been selected and calibrated

Table 3-44: RFDS Calibration

Step	Action
1	Select the RFDS tab.
2	Click on the RFDS menu.
3	Click on the RFDS Calibration menu item
4	Select the appropriate direction (TX/RX) in the Direction pick list
5	Enter the appropriate channel number(s) in the Channels box. Separate the channel numbers with a comma or a dash if more than one channel number is entered (e.g., 247,585,742 or 385–395 for through).
6	Select the appropriate carrier(s) in the Carriers pick list (use the Shift or Ctrl key to select multiple carriers).
7	Select the appropriate RX branch (Both, Main, or Diversity) in the RX Branch pick list.
8	Select the appropriate baud rate (1=9600, 2=14400) in the Rate Set pick list.
9	Click on the OK button. A status report window is displayed, followed by a Directions pop-up window.
10	Follow the cable connection directions as they are displayed. Test results are displayed in the status report window.
11	Click on the OK button to close the status report window.
12	Click on the BTS tab.
13	Click on the MGLI .
14	<p>Download the CAL file which has been updated with the RFDS offset data to the selected GLI device by clicking on Device>Download Data from the tab menu bar and pulldown.</p> <p>NOTE The MGLI automatically transfers the RFDS offset data from the CAL file to the RFDS.</p>

3

Program TSU NAM

Follow the procedure in Table 3-45 to program the TSU NAM. The NAM must be programmed before it can receive and process test calls, or be used for any type of RFDS test.

Prerequisites

- MGLI is INS.
- TSU is powered up and has a code load.

Table 3-45: Program NAM Procedure

Step	Action
1	Select the RFDS tab.
2	Select the TSU tab.
3	Click on the TSU menu.
4	Click on the Program TSU NAM menu item.
5	Enter the appropriate information in the boxes (see Table 3-39 and Table 3-40) .
6	Click on the OK button to display the status report.
7	Click on the OK button to close the status report window.

Alarms Testing

Alarm Verification

The alarms testing should be performed at a convenient point in the optimization/ATP process, since the LMF is necessary to ensure that the RF cabinet is receiving the appropriate alarms from the power cabinet.

The SC 4812ET is capable of concurrently monitoring 10 customer defined input signals and four customer defined outputs, which interface to the 50-pin punchblock. All alarms are defaulted to “Not Equipped” during ATP testing. Testing of these inputs is achieved by triggering the alarms and monitoring the LMF for state-transition messages from the active MGLI2.

All customer alarms are routed through the 50 pair punchblock located in the I/O compartment at the back of the frame. Testing is best accomplished by using a specialized connector that interfaces to the 50-pair punchblock. This connector is wired so that customer return 1 (2 for the B side) is connected to every input, CDI 0 through CDI 17.

Alarm Reporting Display

The Alarm Monitor window can be displayed to list alarms that occur after the window is displayed. To access the Alarm Monitor window, select **Util>Alarm Monitor**.

The following buttons are included.

- The **Options** button allows for a severity level (**Warning**, **Minor**, and **Major**) selection. The default is all levels. To change the level of alarms reported click on the **Options** button and highlight the desired alarm level(s). To select multiple levels press the Ctrl key (for individual selections) or Shift key (for a range of selections) while clicking on the desired levels.
- The **Pause** button can be used to pause/stop the display of alarms. When the **Pause** button is clicked the name of the button changes to **Continue**. When the **Continue** button is click the display of alarms will continue. Alarms that occur between the time the **Pause** button is clicked and the **Continue** button is clicked will not be displayed.
- The **Clear** button can be used to clear the Alarm Monitor display. New alarms that occur after the **Clear** button is clicked will be displayed.
- The **Dismiss** button is used to dismiss/close the Alarm Monitor display.

Alarms Testing – continued

Heat Exchanger Alarm Test

Table 3-46 gives instructions on testing the Heat Exchanger alarm.

Table 3-46: Heat Exchanger Alarm	
Step	Action
1	Turn circuit breaker “B” of the Heat Exchanger circuit breakers OFF. This will generate a Heat Exchanger alarm, ensure that the LMF reports the correct alarm condition in the RF Cabinet.
2	Alarm condition will be reported as BTS Relay #25 – “Heat Exchanger Alarm” makes contact.
3	Turn the circuit breaker “B” ON. Ensure that the alarm condition is now removed. NOTE The Heat Exchanger will go through the Start Up sequence.

Door Alarm

Table 3-47 gives instructions on testing the door alarms.

Table 3-47: Door Alarm	
Step	Action
1	Close all doors on the power cabinet. Ensure that no alarms are reported on the LMF.
2	Individually open and then close each power supply cabinet door. Ensure that the LMF reports an alarm when each door is opened.
3	Alarm condition will be reported as BTS Relay #27 “Door Alarm” makes contact.

AC Fail Alarm

Table 3-48 gives instructions on testing the AC Fail Alarm.

Table 3-48: AC Fail Alarm	
Step	Action
1	NOTE The batteries should have a stable charge before performing this test. Turn the Main AC breaker on the power cabinet OFF. The LMF should report an alarm on an AC Fail (Rectifier Fail, Minor Alarm & Major Alarm) condition.
2	Alarm condition will be reported as BTS Relay #23, BTS # 21, BTS # 24 and BTS Relay # 29 “AC Fail Alarm” makes contact respectively.
3	Turn the Main AC breaker on the power cabinet ON. The AC Fail alarm should clear.

Minor Alarm

Table 3-49 gives instructions on testing minor alarm.

Table 3-49: Minor Alarm	
Step	Action
1	Turn the Temperature Compensation Panel (TCP) power switch OFF. This will generate a minor alarm. Verify that the minor alarm LED (amber) is illuminated on the Meter Alarm Panel and the LMF reports this minor alarm.
2	Alarm condition will be reported as BTS Relay #24 “Minor Alarm” makes contact.
3	Turn the TCP power switch ON. The alarm condition should clear.

Rectifier Alarms

The following series of tests are for single rectifier modules in a multiple rectifier system. The systems include a three rectifier and a six rectifier system.

Single Rectifier Failure (Three Rectifier System)

Table 3-50 gives instructions on testing single rectifier failure or minor alarm in a **three (3) rectifier system**.

Table 3-50: Single Rectifier Fail or Minor Alarm	
Step	Action
1	Remove a single rectifier module and place it into the unused rectifier shelf #2.
2	Turn the AC breaker OFF, for this 2nd shelf.
3	Verify that a rectifier fail alarm is generated. The single rectifier module will illuminate two (2) RED fail LED (DC and Power), and the Meter Alarm Panel and LMF will also indicate a minor alarm and rectifier fail status. The RECTIFIER FAIL LED will illuminate.
4	Check that the LMF reports both of these alarm conditions. NOTE Alarm conditions reported as BTS #24 and BTS #21 , contacts respectively.
5	Turn the AC breaker for the 2nd shelf ON and verify that Rectifier Fail and minor alarm conditions clear on the Meter Alarm Panel and LMF.

Multiple Rectifier Failure

Table 3-51 gives instructions on testing multiple rectifier failure or major alarm in a **three (3) rectifier system**.

Alarms Testing – continued

Table 3-51: Multiple Rectifier Failure or Major Alarm	
Step	Action
1	With the rectifier module still in the unused shelf position from Table 3-50 test procedures, turn the AC breaker for the 1st shelf OFF.
2	Verify that a rectifier alarm is generated. Each of the two rectifier modules will illuminate two (2) RED fail LED (DC and Power), and the Meter Alarm Panel and LMF will indicate a major alarm (Rectifier Fail and Major Alarm). The RECTIFIER FAIL LED will illuminate.
3	Verify that the LMF reports both alarm conditions. (BTS #29, BTS #21, and BTS #24)
4	Turn the AC breaker for the 1st shelf ON. Verify that all alarms have cleared.
5	Return the rectifier module to its original location. This completes the alarm test on the power cabinet.

Single Rectifier Failure (Six Rectifier System)

Table 3-52 gives instructions on testing single rectifier failure or minor alarm in a **six (6) rectifier system**.

Table 3-52: Single Rectifier Fail or Minor Alarm	
Step	Action
1	Remove two(2) rectifier modules from shelf #2.
2	Turn the AC breaker OFF, for shelf #2.
3	Verify that a rectifier fail alarm is generated. The single rectifier module will illuminate two (2) RED fail LED (DC and Power), and the Meter Alarm Panel and LMF will also indicate a minor alarm and rectifier fail status. The RECTIFIER FAIL LED will illuminate.
4	Check that the LMF reports both of these alarm conditions. (BTS #24 and BTS #21)
5	Turn the AC breaker for this shelf ON and verify that Rectifier Fail and Minor Alarm conditions have cleared.

Multiple Rectifier Failure (Six Rectifier System)

Table 3-53 gives instructions on testing multiple rectifier failure or major alarm in a **six (6) rectifier system**.

Table 3-53: Multiple Rectifier Failure or Major Alarm	
Step	Action
1	Replace one rectifier module previously removed and turn the AC breaker for this shelf, OFF.
2	Verify that a rectifier alarm is generated. Each of the two rectifier modules will illuminate a RED fail LED, and the Meter Alarm Panel will indicate a major alarm (Rectifier Fail, Major and Minor Alarm). The RECTIFIER FAIL LED will illuminate.

... continued on next page

Alarms Testing – continued

Table 3-53: Multiple Rectifier Failure or Major Alarm

Step	Action
3	Verify that the LMF reports both alarm conditions. (BTS #29)
4	Turn the AC breaker for this shelf ON. Verify that all alarms have cleared.
5	Return all rectifier module to their original location. This completes the rectifier alarm tests on the power cabinet.

3

Battery Over Temperature Alarm (Optional)

CAUTION

Use special care to avoid damaging insulation on cables, or damaging battery cases when using a power heat gun.

Table 3-54 gives instructions on testing the battery over temperature alarm system.

Table 3-54: Battery Over Temperature Alarm

Step	Action
1	Use a low powered heat gun and gently heat the battery over temperature sensor (see location in Figure 3-15). Do Not hold the hot air gun closer than three (3) inches to the sensor. This will avoid burning the cable insulation.
2	When the sensor is heated to approximately 50° C, a battery Over Temperature alarm is generated. NOTE An audible click will sound as K1 contact engage and K2 contacts disengage.
3	Visually inspect the K1 and K2 relays to verify state changes. The LMF should be displaying correct alarms. (BTS #22)
4	Verify that the CHARGE DISABLE LED (amber) on the Meter Alarm Panel and the BATTERY MAIN LED (green) are both illuminated.
5	Switch the hot air gun to cool. Cool the sensor until the K1 and K2 contact return to normal position (K1 open and K2 closed). Use the LMF verify that all alarms have cleared.

Figure 3-15: Battery Overtemperature Sensor

-  Buss Bar
-  6 AWG Cables
-  Battery Overtemp Sensor
-  Negative Temperature Compensation Sensor

FW00408

Rectifier Over Temperature Alarm

NOTE

This is the J8 on the rear of the Meter Alarm Panel itself, this is not connector J8 on the connector bulkhead at the rear of the cabinet.

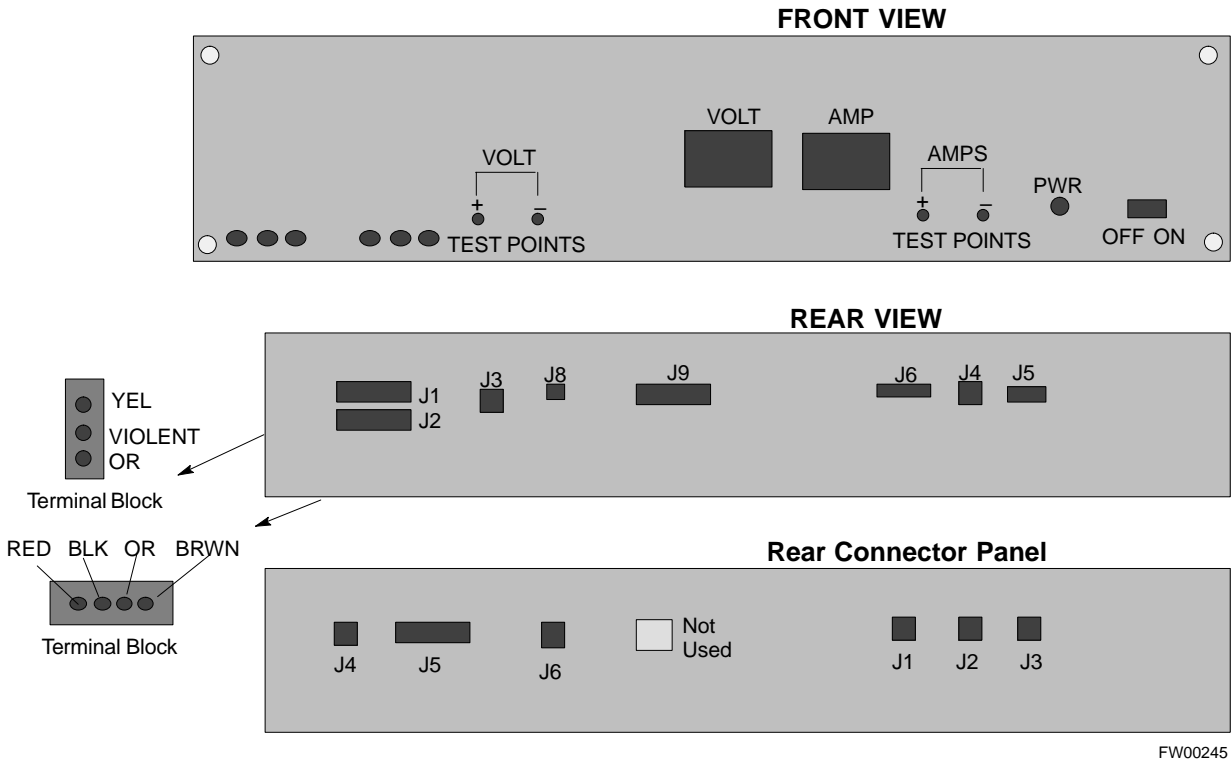

Table 3-55 gives instructions on testing the battery over temperature alarm system.

Table 3-55: Rectifier Over Temperature Alarm

Step	Action
1	Remove the J8 link on the rear of the Meter Alarm Panel (see Figure 3-16 for J8 location). NOTE This is the J8 on the rear of the Meter Alarm Panel itself, this is not connector J8 on the connector bulkhead at the rear of the cabinet.
2	Verify that RECTIFIER OVERTEMP LED (red) is illuminated. Contacts on K1 and K2 change states (K1 now closed and K2 open).
3	Verify that the LMF has reported an alarm condition. (BTS #26)
4	Reinstall J8 connector and verify that all alarm conditions have cleared. K1 and K2 should now be in their normal states (K1 open and K2 closed).
5	This completes the system tests of the SC 4812ET power cabinet.

Alarms Testing – continued

Figure 3-16: Location of Connector J8 on the Meter Alarm Panel

Before Leaving the site

Table 3-56 gives instructions on what to check before leaving the site.

Step	Action
1	Verify that ALL battery circuit breakers (for occupied shelves) are CLOSED (pushed in).
2	Verify that the Heat Exchanger is running.
3	Verify that the Meter Alarm Panel and TCP modules are switched ON.
4	Verify that the Battery Test Switch on the Meter Alarm Panel is in the OFF position.
5	Verify that no alarm conditions are being reported (with all doors closed).

Automated Acceptance Test Procedures – Overview

Introduction

The Automated Acceptance Test Procedure (ATP) allows Motorola Cellular Field Engineers (CFEs) to run automated acceptance tests on all equipped BTS subsystem devices using the Local Maintenance Facility (LMF) and supported test equipment per the current Cell Site Data File (CDF) assignment.

The results of these tests (at the option of the operator) are written to a file that can be printed. All tests are controlled via the LMF platform using the GPIB interface, therefore, only recommended test equipment supported by the LMF can be used.

This chapter describes the tests run from the GUI environment, which is the recommended method. The GUI provides the advantages of simplifying the LMF user interface, reducing the potential for miskeying commands and associated parameters, and speeding up the execution of complex operations involving multiple command strings. If you feel the command line interface (CLI) will provide additional insight into the progress of ATPs and problems that could possibly be encountered, refer to *LMF CLI Commands, R15.X (68P09251A59)*.

IMPORTANT

Before using the LMF, use an editor to view the "CAVEATS" section in the "readme.txt" file in the c:\wlmf folder for any applicable information.

The ATP test is to be performed on out-of-service sectors *only*.

DO NOT substitute test equipment with other models not supported by the LMF.

NOTE

Refer to Chapter 3 for detailed information on test set connections for calibrating equipment, cables and other test set components, if required.

Customer requirements determine which ATP tests to are to be performed and the field engineer selects the appropriate ATP tests to run.

The tests can be run individually or as one of the following groups:

- **All TX:** TX tests verify the performance of the BTS transmit line up. These include the GLI2, MCC, BBX2, and CIO cards, the LPAs and passive components including splitters, combiners, bandpass filter, and RF cables.

. . . continued on next page

- **All RX:** RX tests verify the performance of the BTS receiver line up. These includes the MPC (for starter frames), EMPC (for expansion frames), CIO, BBX2, MCC, and GLI2 cards and the passive components including RX filter (starter frame only), and RF cables.
- **All TX/RX:** Executes all the TX and RX tests.
- **Full Optimization:** Executes the TX calibration, download BLO, and TX audit before running all of the TX and RX tests.

ATP Tests Prerequisites

Before attempting to run *any* ATP tests, ensure the following:

- BTS has been optimized and calibrated (see Chapter 3).
- LMF is logged into the BTS
- CSMs, GLI2s, BBX2s, MCCs and TSU (if the RFDS is installed) have correct code load and data load
- Primary CSM and GLI2 are INS_ACT
- MCCs are INS_ACT
- BBX2s are OOS-RAM
- BBX2s are calibrated and BLOs are downloaded
- Test cables are calibrated
- Test equipment is selected
- Test equipment is connected for ATP tests
- Test equipment has been warmed up 60 minutes and calibrated
- GPIB is on

WARNING

Before the FER is run, be sure that all LPAs are turned OFF (circuit breakers pulled) or that all transmitter ports are properly terminated.

All transmit ports must be properly terminated for all ATP tests.

Failure to observe these warnings may result in bodily injury or equipment damage.

TX/RX OUT Connections

IMPORTANT

Many of the acceptance test procedures require taking measurements at the **TX OUT** (BTS/RFDS) connector. At sites with RFDS, all measurements are through the RFDS directional coupler **TX OUT** connector.

ATP Test Procedure

There are three different ATP testing options that can be performed to completely test a BTS. Depending on your requirements, one of the following ATP testing options should be run.

Table 4-1 provides the procedure to execute an ATP test. To completely test a BTS, run the ATP tests according to one of the following ATP testing options.

ATP Testing Option 1

- **All TX/RX** test

ATP Testing Option 2

- **All TX** test
- **All RX** test

ATP Testing Option 3

- **TX Mask** test
- **Rho** test
- **Pilot Time Offset** test
- **Code Domain Power** test
- **FER** test

NOTE

The Full Optimization test can be run if you want the TX path calibrated before all the TX and RX tests are run.

IMPORTANT

If manual testing has been performed with the HP analyzer, remove the manual control/system memory card from the card slot and set the **IO CONFIG** to the **Talk & Listen** mode before starting the automated testing.

Individual Acceptance Tests

The following individual ATP tests can be used to verify the results of specific tests:

Spectral Purity TX Mask

This test verifies that the transmitted CDMA carrier waveform, generated on each sector, meets the transmit spectral mask specification with respect to the assigned CDF file values.

Waveform Quality (rho)

This test verifies that the transmitted Pilot channel element digital waveform quality (rho) exceeds the minimum specified value in ANSI-J STD-019. “Rho” represents the correlation between actual and perfect CDMA modulation spectrum. A rho value of 1.0000 represents 100% (or perfect correlation).

Pilot Time Offset

The Pilot Time Offset is the difference between the CDMA analyzer measurement interval (based on the BTS system time reference) and the incoming block of transmitted data from the BTS (Pilot only, Pilot Gain = 262, PN Offset = 0).

Code Domain Power

This test verifies code domain power levels, which have been set for all ODD numbered Walsh channels, using the OCNS command. This is done by verifying that the ratio of PILOT divided by OCNS is equal to **10.2 ± 2 dB**, and, that the noise floor of all EVEN numbered “OFF” Walsh channels measures **≤ -27 dB**.

Frame Error Rate

The Frame Error Rate (FER) test verifies RX operation of the entire CDMA Reverse Link using all equipped MCCs assigned to all respective sector/antennas. The test verifies the BTS sensitivity on all traffic channel elements currently configured on all equipped MCCs at an RF input level of -119 dBm (or -116 dBm if using TMPC). Follow the procedure in Table 4-1 to perform any ATP test.

NOTE

The **STOP** button can be used to stop the testing process.

Table 4-1: ATP Test Procedure

Step	Action
1	Select the BBX2(s) and MCC(s) to be tested.
2	From the Tests menu, select the desired test.
3	Select the appropriate carrier(s) (carrier – bts# – sector# – carrier#) displayed in the Channels/Carrier pick list. To select multiple items, hold down the <Shift> or <Ctrl> key while making the selections.
4	Type the appropriate channel number in the Carrier n Channels box. The default channel number displayed is determined by the CdmaChans[n] number in the cbcs-n.cdf file for the BTS.
5	Click OK .
6	Follow the cable connection directions as they are displayed.
7	Click Save Results or Dismiss to close the status report window. If Dismiss is used the test results will not be saved in the test report file.

TX Spectral Purity Transmit Mask Acceptance Test

Background: Tx Mask Test

This test verifies the spectral purity of each BBX2 carrier keyed up at a specific frequency, *per the current CDF file assignment*. All tests are performed using the external calibrated test set, controlled by the same command. All measurements are through the appropriate **TX OUT** (BTS/RFDS) connector.

The Pilot Gain is set to 541 for each antenna and all channel elements from the MCCs are forward-link disabled. The BBX2 is keyed up, using both `bbxlvl` and bay level offsets, to generate a CDMA carrier (with pilot channel element only). BBX2 power output is set to obtain +40 dBm as measured at the **TX OUT** connector (on either the BTS or RFDS directional coupler).

NOTE

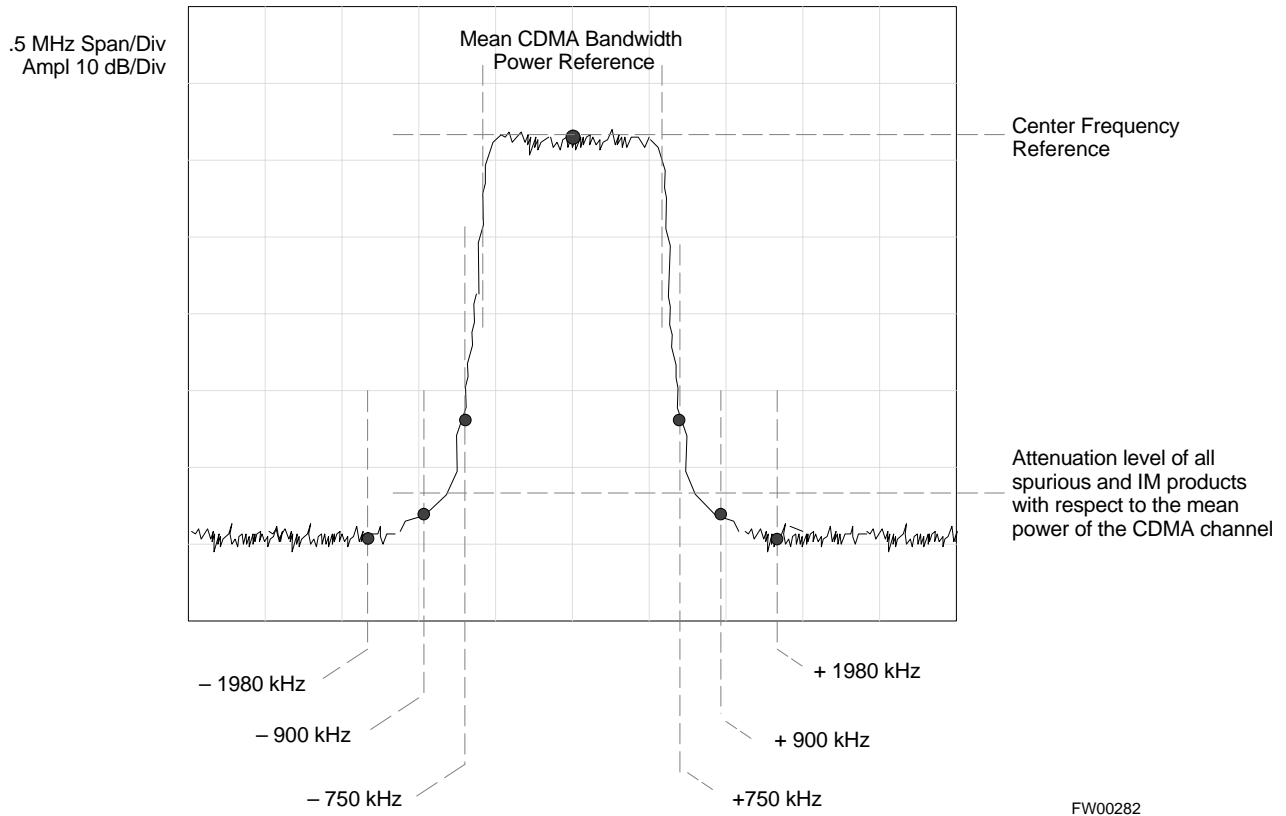

TX output power is set to +40 dBm by setting BTS power level to +33.5 dBm to compensate for 6.5 dB increase from pilot gain set to 541.

The calibrated communications test set measures and returns the attenuation level of all spurious and IM products in a 30 kHz resolution bandwidth with respect to the mean power of the CDMA channel, measured in a 1.23 MHz bandwidth, in dB, verifying that results meet system tolerances at the following test points:

- 1.9 GHz
 - at least **-45 dB @ + 900 kHz** from center frequency
 - at least **-45 dB @ - 900 kHz** from center frequency
- 800 MHz:
 - at least **-45 dB @ + 750 kHz** from center frequency
 - at least **-45 dB @ - 750 kHz** from center frequency
 - at least **-60 dB @ - 1980 kHz** from center frequency
 - at least **-60 dB @ - 1980 kHz** from center frequency

The BBX2 then de-keys, and, if selected, the MCC is re-configured to assign the applicable redundant BBX2 to the current TX antenna path under test. The test is then repeated.

Figure 4-1: TX Mask Verification Spectrum Analyzer Display

4

TX Waveform Quality (rho) Acceptance Test

Background: Rho Test

This test verifies the transmitted Pilot channel element digital waveform quality of each BBX2 carrier keyed up at a specific frequency *per the current CDF file assignment*. All tests are performed using the external calibrated test set controlled by the same command. All measurements are via the appropriate **TX OUT** (BTS/RFDS) connector.

The Pilot Gain is set to 262 for each antenna, and all channel elements from the MCCs will be forward link disabled. The BBX2 is keyed up using both `bbxlvl` and bay level offsets, to generate a CDMA carrier (with pilot channel element only, Walsh code 0). BBX2 power output is set to 40 dBm as measured at the **TX OUT** connector (on either the BTS or RFDS directional coupler).

The calibrated communications test set measures and returns the Pilot channel element digital waveform quality (rho) in dB, verifying that result meets system tolerances Waveform quality (rho) should be ≥ 0.912 (**-0.4 dB**).

The BBX2 then de-keys and the applicable redundant BBX2 is assigned to the current TX antenna path under test. The test is then repeated.

The LMF Tests menu list item, **Rho**, performs the waveform quality test for a XCVR(s). All measurements are made through the appropriate TX output connector using the calibrated TX cable setup.

TX Pilot Time Offset Acceptance Test

Background: Pilot Offset Acceptance Test

This test verifies the transmitted Pilot channel element Pilot Time Offset of each BBX2 carrier keyed up at a specific frequency *per the current CDF file assignment*. All tests are performed using the external calibrated test set controlled by the same command. All measurements will be via the appropriate **TX OUT** (BTS/RFDS) connector.

The Pilot Gain is set to 262 for each antenna and all TCH elements from the MCCs are forward link disabled. The BBX is keyed up using both `bbxlvl` and bay level offsets to generate a CDMA carrier (with pilot channel element only, Walsh code 0). BBX power output is set to 40 dBm as measured at the **TX OUT** connector (on either the BTS or RFDS directional coupler).

The calibrated communications test set measures and returns the Pilot Time Offset in uS, verifying results meet system tolerances: Pilot Time Offset should be within $\leq 3 \mu\text{s}$ of the target PT Offset (0 μs).

The BBX2 then de-keys, and the applicable redundant BBX2 is assigned to the current TX antenna path under test. The test is then repeated.

TX Code Domain Power Acceptance Test

Background: Code Domain Power Test

This test verifies the Code Domain Power/Noise of each BBX2 carrier keyed up at a specific frequency *per the current CDF file assignment*. All tests are performed using the external calibrated test set controlled by the same command. All measurements are via the appropriate **TX OUT** (BTS/RFDS) connector.

For each sector/antenna under test, the Pilot Gain is set to 262 and all MCC channel elements under test are configured to generate Orthogonal Channel Noise Source (OCNS) on different odd Walsh codes, and are assigned a full-rate gain of 81. The maximum number of MCC/CEs to be tested at any one time is 32 (32 odd Walsh codes). If more than 32 CEs exist, then multiple sets of measurements are made, so all channel elements are verified on all sectors.

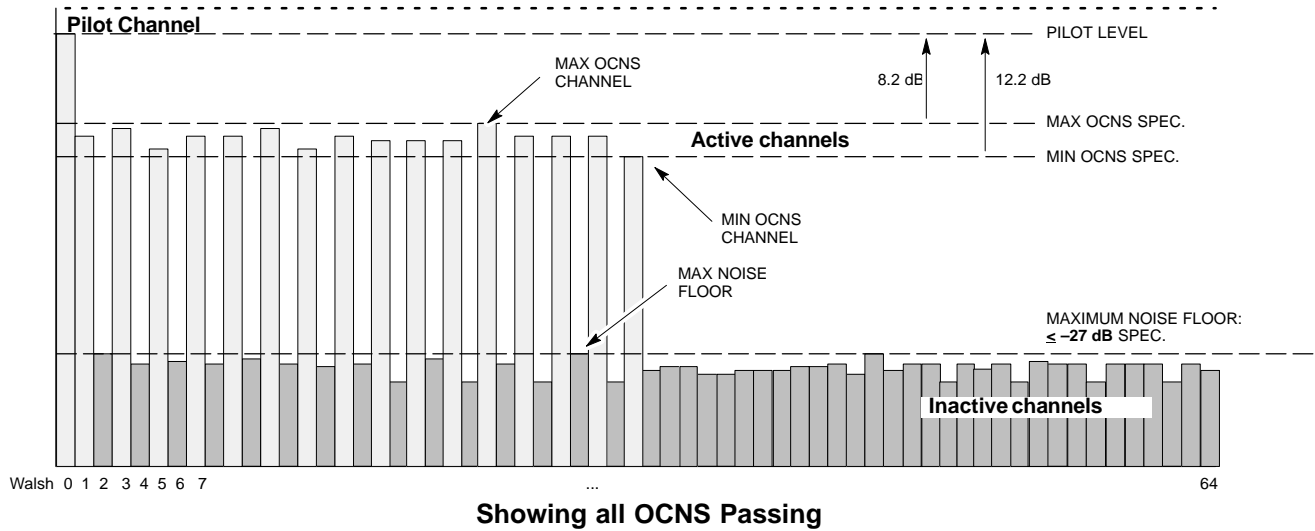

BBX2 power output is set to 40 dBm as measured at the **TX OUT** connector (on either the BTS or RFDS directional coupler).

Code domain power levels, which have been set for all ODD numbered Walsh channels, are verified using the OCNS command. This is done by verifying that Pilot Power (dBm) minus OCNS Power (dBm) is equal to **10.2 ± 2 dB** and that the noise floor of all “OFF” Walsh channels measures **≤ -27 dB** (with respect to total CDMA channel power).

The BBX2 then de-keys and, the applicable redundant BBX2 is assigned to the current TX antenna path under test. The test is then repeated. Upon completion of the test, OCNS is disabled on the specified MCC/CE.

TX Code Domain Power Acceptance Test – continued

Figure 4-2: Code Domain Power and Noise Floor Levels

FW00283

RX Frame Error Rate (FER) Acceptance Test

Background: FER Test

This test verifies the BTS Frame Error Rate (FER) on *all* traffic channel elements currently configured on *all* equipped MCCs (full rate at 1% FER) at an RF input level of -119 dBm [or -116 dBm if using Tower Top Amplifier (TMPC)]. All tests are performed using the external calibrated test set as the signal source controlled by the same command. All measurements will be via the LMF.

The pilot gain is set to 262 for each TX antenna and all channel elements from the MCCs are forward-link disabled. The BBX2 is keyed up using only `bbxlvl` level offsets, to generate a CDMA carrier (with pilot channel element only). BBX2 power output is set to -20 dBm as measured at the **TX OUT** connector (on either the BTS or RFDS directional coupler). The BBX2 must be keyed in order to enable the RX receive circuitry.

The LMF prompts the MCC/CE under test to measure all zero longcode and provide the FER report on the selected active MCC on the reverse link for both the main and diversity RX antenna paths, verifying the results meet the following specification: FER returned less than **1%** and total frames measured is **1500**.

All MCC/CEs selected are tested on the specified RX antenna path. The BBX then de-keys and, the applicable redundant BBX2 is assigned to the current RX antenna paths under test. The test is then repeated.

Generate an ATP Report

Background

Each time an ATP test is run, an ATP report is updated to include the results of the most recent ATP tests if the **Save Results** button is used to close the status report window. The ATP report *will not* be updated if the status reports window is closed with use of the **Dismiss** button.

ATP Report

A separate report is created for each BTS and includes the following for each test:

- Test name
- BBX number
- Channel number
- Carrier number
- Sector number
- Upper test limit
- Lower test limit
- Test result
- PASS or FAIL
- Description information (if applicable)
- Time stamp
- Details/Warning information (if applicable)

Follow the procedures in the Table 4-2 to view and create a printable file for the ATP report of a BTS.

Table 4-2: Generate an ATP Report

Step	Action
1	Click on the Login tab if it is not in the forefront.
2	Select the desired BTS from the Available Base Stations pick list.
3	Click on the Report button.
4	Sort the report if desired by clicking on a column heading.
5	Click on the Dismiss button if you do not want to create a printable file copy.
6	To create a printable file, select the desired file type in the picklist and then click on the Save button.

Chapter 5: Leaving the Site

Table of Contents

External Test Equipment Removal	5-1
Reset All Devices	5-1
Updating BTS CAL LMF Files in the CBSC	5-1
BTS Site Span Configuration Verification	5-3
Set BTS Site Span Configuration	5-4
Re-connect BTS T1 Spans and Integrated Frame Modem	5-6
LMF Removal	5-6
Reestablish OMC-R Control/ Verifying T1/E1	5-7

Prepare to Leave the Site

External Test Equipment Removal

Perform the procedure outlined in Table 5-1 to disconnect the test equipment and configure the BTS for active service.

Table 5-1: External Test Equipment Removal

Step	Action
1	Disconnect all external test equipment from all TX and RX connectors at the rear of the frame.
2	Reconnect and visually inspect all TX and RX antenna feed lines at the rear of the frame.

CAUTION

Verify all sector antenna feed lines are connected to the correct ports on the frame. Crossed antenna cables will cause system degradation of call processing.

Reset All Devices

Reset all devices by cycling power before leaving the site. The CBSC configuration data and code loads could be different from data and code on the LMF. By resetting all devices, the CBSC can load the proper data and code when the span is active again.

Updating BTS CAL LMF Files in the CBSC

Updated CAL file information is moved from the LMF Windows environment back to the CBSC which resides in a Unix environment. The procedures that follow detail how to move files from the Windows environment to the CBSC.

Copying CAL files from LMF to a Disk

Follow the procedures in Table 5-2 to copy CAL files from a LMF computer to a 3.5 diskette.

Table 5-2: Copy Files from LMF to a Diskette

Step	Action
1	Insert a disk into your Windows A drive.
	NOTE If your disk has not been formatted, format it using Windows. The disk must be DOS formatted before copying any files. Consult your Windows/DOS documentation or online helps on how to format diskettes.
2	Click on the Start button and launch the Windows Explorer program from your Programs menu list.

Table 5-2: Copy Files from LMF to a Diskette

Step	Action
3	Click on your C: drive.
4	Double Click on the wlmf folder.
5	Double Click on the CDMA folder.
6	Click on the bts-# folder for the calibration file you want to copy.
7	Drag the BTS-#.cal file to the 3-1/2 floppy (A:) icon on the top left of the screen and release the mouse button.
8	Continue step 6 and 7 until you have copied each file desired and close the Windows Explorer program by selecting Close from the File menu option.

Copying CAL files from diskette to the CBSC

Follow the procedures in Table 5-3 to copy CAL files from a diskette to the CBSC.

Table 5-3: Copy CAL Files From Diskette to the CBSC

Step	Action
1	Log into the CBSC workstation.
2	Place your diskette containing CAL file(s) in the CBSC workstation diskette drive.
3	Enter eject -q and press the Enter key.
4	Enter mount and press the Enter key. Verify that floppy/no_name is displayed. NOTE If the eject command has been previously entered, floppy/no_name will be appended with a <u>number</u> . Use the explicit floppy/no_name reference displayed.
5	Enter cd /floppy/no_name and press the Enter key.
6	Enter ls -lia and press the Enter key. Verify that the bts-#.cal file is on the disk.
7	Enter cd and press the Enter key.
8	Enter pwd and press the Enter key. Verify that you are in your home directory (/home/<name>).
9	Enter dos2unix /floppy/no_name/bts-#.cal bts-#.cal and press the Enter key (where # is the BTS number).
10	Enter ls -l *.cal and press the Enter key. Verify that the CAL file was successfully copied.
11	Enter eject and press the Enter key.
12	Remove the floppy disk from the workstation.

BTS Site Span Configuration Verification

Perform the procedure in Table 5-4 to verify the current Span Framing Format and Line Build Out (LBO) parameters. *ALL* MGLI2/SGLI2 boards in all C-CCP shelves that terminate a T1/E1 span should be verified.

Table 5-4: BTS Span Parameter Configuration

Step	Action
1	Connect a serial cable from the LMF COM1 port (via null modem board) to the front panel of the MGLI2 MMI port (see Figure 5-1).
2	<p>Start an MMI communication session with CSM-1 by using the Windows desktop shortcut icon.</p> <p>NOTE The LMF program must not be running when a Hyperterminal session is started if COM1 is being used for the MMI session.</p>
3	<p>Enter the following MMI command to display the current MGLI2/SGLI2 framing format and line code configuration (in bold type):</p> <p style="padding-left: 40px;">span view <cr></p> <p>Observe a display similar to the options shown below:</p> <pre>COMMAND ACCEPTED: span view The parameter in NVM is set to T1_2. The frame format in flash is set to use T1_2. Equalization: Span A - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span B - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span C - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span D - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span E - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span F - Default (0-131 feet for T1/J1, 120 Ohm for E1) Linkspeed: Default (56K for T1 D4 AMI, 64K otherwise) Currently, the link is running at the default rate The actual rate is 0</pre> <p>NOTE Defaults for span equalization are 0-131 feet for T1/J1 spans and 120 Ohm for E1. Default linkspeed is 56K for T1 D4 AMI spans and 64K for all other types. There is no need to change from defaults unless the OMC-R/CBSC span configuration requires it. If the current MGLI2/SGLI2 framing format and line code configuration does not display the correct choice, proceed to Table 5-5.</p>
4	Repeat steps 1 through 3 for all remaining GLIs.
5	Exit the GLI MMI session and HyperTerminal connection by selecting File from the connection window menu bar, and then Exit from the dropdown menu.

Figure 5-1: MGLI2/SGLI2 MMI Port Connection

5

Set BTS Site Span Configuration

Perform the procedure in Table 5-5 to configure the Span Framing Format and Line Build Out (LBO) parameters. *ALL* MGLI2/SGLI2 boards in all C-CCP shelves that terminate a T1/E1 span must be configured.

IMPORTANT

Perform the following procedure *ONLY* if span configurations loaded in the MGLI2/GLI2s do not match those in the OMCR/CBSC data base, *AND ONLY* when the exact configuration data is available. Loading incorrect span configuration data will render the site inoperable.

Table 5-5: Set BTS Span Parameter Configuration

Step	Action
1	If not already done, connect a serial cable from the LMF COM1 port (via null modem board) to the front panel of the MGLI2 MMI port (see Figure 5-1).
2	Start an MMI communication session with CSM-1 by using the Windows desktop shortcut icon (see Table 3-5 on page 3-14).
	NOTE The LMF program must not be running when a Hyperterminal session is started if COM1 is being used for the MMI session.

... continued on next page

Table 5-5: Set BTS Span Parameter Configuration

Step	Action
3	<p><i>If required only</i>, enter the following MMI command for each span line to set the BTS span parameters to match that of the physical spans <i>a–f</i> run to the site:</p> <p>span_config <option#1> <option#2> <option#3> <option#4> <option#5></p> <p><i>option#1</i> = the span to change (a – f)</p> <p><i>option#2</i> = the span type (0 – 8):</p> <ul style="list-style-type: none"> 0 – E1_1 (HDB3, CCS, CRC-4) 1 – E1_2 (HDB3, CCS) 2 – E1_3 (HDB3, CAS, CRC-4, TS16) 3 – E1_4 (HDB3, CAS, TS16) 4 – T1_1 (AMI, DS1 AT&T D4, without ZCS, 3 to 1 packing, Group 0 unusable) 5 – T1_2 (B8ZS, DS1 AT&T ESF, 4 to 1 packing, 64K link) 6 – J1_1 (B8ZS, J1 AT&T ESF, Japan CRC6, 4 to 1 packing) 7 – J1_2 (B8ZS, J1 AT&T ESF, US CRC6, 4 to 1 packing) 8 – T1_3 (AMI, DS1 AT&T D4, with ZCS, 3 to 1 packing, Group 0 unusable) <p><i>option#3</i> = the link speed (56 or 64) Kbps</p> <p><i>option#4</i> = the span equalization (0 – 7):</p> <ul style="list-style-type: none"> 0 – T1_6 (T1,J1:long haul) 1 – T1_4 (T1,J1:393–524 feet) 2 – T1_4 (T1,J1:131–262 feet) 3 – E1_75 (E1:75 Ohm) 4 – T1_4 (T1,J1:0–131 feet) 5 – T1_4 (T1,J1:524–655 feet) 6 – T1_4 (T1,J1:262–393 feet) 7 – E1_120 (E1:120 Ohm) <p><i>option#5</i> = the slot that has LAPD channel (0 – 31)</p> <p><i>Example for setting span configuration to E1_2, 64 Kbps, E1_120–Ohm, LAPD channel 1:</i></p> <pre>span_config a 1 64 7 1 . . span_config f 1 64 7 1</pre> <p><i>Example for setting span configuration to T1_2, 64 Kbps, T1_4 (0–131 feet), LAPD channel 0:</i></p> <pre>span_config a 5 64 4 0 . . span_config f 5 64 4 0</pre> <p>* IMPORTANT</p> <p>Make sure that spans <i>a–f</i> are set to the same span type and link speed. The equalization may be different for each individual span.</p> <p>After executing the span_config command, the affected MGLI2/SGLI2 board MUST be reset and re-loaded for changes to take effect.</p> <p>Although defaults are shown, always consult site specific documentation for span type and rate used at the site.</p>
4	Press the RESET button on the GLI2 for changes to take effect.

... continued on next page

Prepare to Leave the Site – continued

Table 5-5: Set BTS Span Parameter Configuration

Step	Action
5	This completes the site specific BTS Span setup for this GLI. Move the MMI cable to the next SGLI2 and repeat steps 1 and 4 for <i>ALL</i> MGLI2/SGLI2 boards.
6	Terminate the Hyperterm session and disconnect the LMF from the MGLI/SGLI.

Re-connect BTS T1 Spans and Integrated Frame Modem

Before leaving the site, connect any T1 span TELCO connectors which were removed to allow the LMF to control the BTS. Refer to Table 5-6.

Table 5-6: T1/E1 Span/IFM Connections

Step	Action
1	Connect the surge protectors on the 50-pin punch block for the spans.
2	Ensure that the CSU is powered ON .
3	Verify the span status.

5

LMF Removal

CAUTION

DO NOT power down the CDMA LMF without performing the procedure indicated below. Corrupted/lost data files may result, and in some cases, the CDMA LMF may lock up.

Follow the procedures in Table 5-7 to terminate the LMF session and remove the terminal.

Table 5-7: Terminate the LMF Session and Remove the LMF

Step	Action
1	From the CDMA window select File>Exit .
2	From the Windows Task Bar click Start>Shutdown . Click Yes when the Shut Down Windows message appears.
3	Disconnect the LMF terminal Ethernet connector from the BTS cabinet.
4	Disconnect the LMF serial port, the RS-232 to GPIB interface box, and the GPIB cables as required for equipment transport.

Prepare to Leave the Site – continued

Reestablish OMC-R Control/ Verifying T1/E1

IMPORTANT

After all activities at the site have been completed, including disconnecting the LMF, place a phone call to the OMC-R and request the BTS be placed under control of the OMC-R.

Basic Troubleshooting Overview

Overview

The information in this chapter addresses some of the scenarios likely to be encountered by Customer Field Engineering (CFE) team members. This troubleshooting guide was created as an interim reference document for use in the field. It provides basic “what to do if” basic troubleshooting suggestions when the BTS equipment does not perform per the procedure documented in the manual.

Comments are consolidated from inputs provided by CFEs in the field and information gained from experience in Motorola labs and classrooms.

Troubleshooting: Installation

Cannot Log into Cell-Site

Table 6-1: Login Failure Troubleshooting Procedure		
✓	Step	Action
	1	If MGLI2 LED is solid RED, it implies a hardware failure. Reset MGLI2 by re-seating it. If this persists, install RGLI2 card in MGLI2 slot and retry. A Red LED may also indicate no Ethernet termination at top of frame.
	2	Verify that T1 is disconnected at the Channel Signaling Unit (CSU). If T1 is still connected, verify the CBSC has disabled the BTS.
	3	Try 'ping'ing the MGLI2.
	4	Verify the LMF is connected to the Primary LMF port (LAN A) in front of the BTS.
	5	Verify the LMF was configured properly.
	6	Verify the BTS-LMF cable is RG-58 (flexible black cable of less than 2.5 feet length).
	7	Verify the Ethernet ports are terminated properly.
	8	Verify a T-adapter is <u>not</u> used on LMF side port if connected to the BTS front LMF primary port.
	9	Try connecting to the I/O panel (back of frame). Use Tri-Ax to BNC adapter at the LMF port for this connection.
	10	Re-boot the CDMA LMF and retry.
	11	Re-seat the MGLI2 and retry.
	12	Verify IP addresses are configured properly.

Cannot Communicate to Power Meter

Table 6-2: Troubleshooting a Power Meter Communication Failure		
✓	Step	Action
	1	Verify Power Meter is connected to LMF with GPIB adapter.
	2	Verify cable setup as specified in Chapter 3.
	3	Verify the GP-IB address of the Power Meter is set to 13. Refer to Test Equipment setup section of Chapter 3 for details.
	4	Verify that Com1 port is not used by another application.
	5	Verify that the communications analyzer is in Talk&Listen, not Control mode.

Cannot Communicate to Communications Analyzer

Table 6-3: Troubleshooting a Communications Analyzer Communication Failure		
	Step	Action
	1	Verify analyzer is connected to LMF with GPIB adapter.
	2	Verify cable setup.
	3	Verify the GPIB address is set to 18.
	4	Verify the GPIB adapter DIP switch settings are correct. Refer to Test Equipment setup section for details.
	5	Verify the GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', then power-cycle the GPIB Box and retry.
	6	If a Hyperterm window is open for MMI, close it.
	7	Verify the LMF GPIB address is set to 18
	8	Verify the analyzer is in Talk and Listen not Control mode.

Troubleshooting: Download

Table 6-4: Troubleshooting Code Download Failure		
✓	Step	Action
	1	Verify T1 is disconnected from the BTS at CSU.
	2	Verify LMF can communicate with the BTS device using the Status function.
	3	Communication to MGLI2 must first be established before trying to talk to any other BTS device. MGLI2 must be INS_ACT state (green).
	4	Verify the card is physically present in the cage and powered-up.
	5	If card LED is solid RED, it implies hardware failure. Reset card by re-seating it. If this persists, replace card from another slot & retry. NOTE The card can only be replaced by a card of the same type.
	6	Re-seat card and try again.
	7	If BBX2 reports a failure message and is OOS_RAM, the code load was OK. Status it.
	8	If the download portion completes and the reset portion fails, reset the device by selecting the device and reset.

Cannot Download DATA to Any Device (Card)

Table 6-5: Troubleshooting Data Download Failure		
✓	Step	Action
	1	Re-seat card and repeat code and data load procedure.
	2	Verify the ROM and RAM code loads are of the same release by statusing the card. Refer to Chapter 3, "Download the BTS" for more information.

Cannot ENABLE Device

Before a device can be enabled (placed in-service), it must be in the OOS_RAM state (yellow on the LMF) with data downloaded to the device. The color of the device on the LMF changes to green, once it is enabled.

The three states that devices can be displayed:

- Enabled (green, INS)
- Disabled (yellow, OOS_RAM)
- Reset (blue, OOS_ROM)

Table 6-6: Troubleshooting Device Enable (INS) Failure

✓	Step	Action
	1	Re-seat card and repeat code and data load procedure.
	2	If CSM cannot be enabled, verify the CDF file has correct latitude and longitude data for cell site location and GPS sync.
	3	Ensure primary CSM is in INS_ACT state. NOTE MCCs will not go INS without the CSM being INS.
	4	Verify 19.6608 MHz CSM clock; MCCs will not go INS otherwise.
	5	The BBX should not be enabled for ATP tests.
	6	If MCCs give “invalid or no system time,” verify the CSM is enabled.

LPA Errors

Table 6-7: LPA Errors

✓	Step	Action
	1	If LPAs continue to give alarms, even after cycling power at the circuit breakers, then connect an MMI cable to the LPA and set up a Hyperterminal connection. Enter ALARMS in the Hyperterminal window. The resulting LMF display may provide an indication of the problem. (Call Field Support for further assistance.)

Troubleshooting: Calibration

Bay Level Offset Calibration Failure

Table 6-8: Troubleshooting BLO Calibration Failure		
✓	Step	Action
	1	Verify the Power Meter is configured correctly (see the test equipment setup section) and connection is made to the proper TX port.
	2	Verify the parameters in the bts-#.cdf file are set correctly for the following bands: For 1900 MHz: BandClass=1; FreqBand=16 For 800 MHz: BandClass=0; FreqBand=8
	3	Verify that no LPA in the sector is in alarm state (flashing red LED). Reset the LPA by pulling the circuit breaker, and after 5 seconds, pushing back in.
	4	Re-calibrate the Power Meter and verify it is calibrated correctly with cal factors from sensor head.
	5	Verify GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', power-cycle (turn power off and on) the GPIB Box and retry.
	6	Verify sensor head is functioning properly by checking it with the 1 mW (0 dBm) Power Ref signal.
	7	If communication between the LMF and Power Meter is operational, the Meter display will show "RES :"
	8	Verify the combiner frequency is the same as the test freq/chan.

Calibration Audit Failure

Table 6-9: Troubleshooting Calibration Audit Failure		
✓	Step	Action
	1	Verify Power Meter is configured correctly (refer to the test equipment setup section of chapter 3).
	2	Re-calibrate the Power Meter and verify it is calibrated correctly with cal factors from sensor head.
	3	Verify that no LPA is in alarm state (rapidly flashing red LED). Reset the LPA by pulling the circuit breaker, and, after 5 seconds, pushing back in.
	4	Verify that no sensor head is functioning properly by checking it with the 1 mW (0 dBm) Power Ref signal.
	5	After calibration, the BLO data must be re-loaded to the BBX2s before auditing. Click on the BBX(s) and select Device>Download BLO Re-try the audit.
	6	Verify GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', power-cycle (turn power off and on) the GP-IB Box and retry.

Troubleshooting: Transmit ATP

Cannot Perform Txmask Measurement

Table 6-10: Troubleshooting TX Mask Measurement Failure		
✔	Step	Action
	1	Verify that TX audit passes for the BBX2(s).
	2	If performing manual measurement, verify analyzer setup.
	3	Verify that no LPA in the sector is in alarm state (flashing red LED). Re-set the LPA by pulling the circuit breaker, and, after 5 seconds, pushing it back in.

Cannot Perform Rho or Pilot Time Offset Measurement

Table 6-11: Troubleshooting Rho and Pilot Time Offset Measurement Failure		
✔	Step	Action
	1	Verify presence of RF signal by switching to spectrum analyzer screen.
	2	Verify PN offsets displayed on the analyzer is the same as the PN offset in the CDF file.
	3	Re-load MGLI2 data and repeat the test.
	4	If performing manual measurement, verify analyzer setup.
	5	Verify that no LPA in the sector is in alarm state (flashing red LED). Reset the LPA by pulling the circuit breaker, and, after 5 seconds, pushing back in.
	6	If Rho value is unstable and varies considerably (e.g. .95,.92,.93), this may indicate that the GPS is still phasing (i.e. trying to reach and maintain 0 freq. error). Go to the freq. bar in the upper right corner of the Rho meter and select Hz. Press <Shift-avg> and enter 10, to obtain an average Rho value. This is an indication the GPS has not stabilized before going <i>INS</i> and may need to be re-initialized.

Troubleshooting: Transmit ATP – continued

Cannot Perform Code Domain Power and Noise Floor Measurement

Table 6-12: Troubleshooting Code Domain Power and Noise Floor Measurement Failure		
✓	Step	Action
	1	Verify presence of RF signal by switching to spectrum analyzer screen.
	2	Verify PN offset displayed on analyzer is same as PN offset being used in the CDF file.
	3	Disable and re-enable MCC (one or more MCCs based on extent of failure).

Cannot Perform Carrier Measurement

Table 6-13: Troubleshooting Carrier Measurement Failure		
✓	Step	Action
	1	Perform the test manually, using the spread CDMA signal. Verify High Stability 10 MHz Rubidium Standard is warmed up (60 minutes) and properly connected to test set-up.

Troubleshooting: Receive ATP

Multi-FER Test Failure

Table 6-14: Troubleshooting Multi-FER Failure		
✓	Step	Action
	1	Verify test equipment set up is correct for a FER test.
	2	Verify test equipment is locked to 19.6608 and even second clocks. The yellow LED (REF UNLOCK) must be OFF.
	3	Verify MCCs have been loaded with data and are INS-ACT.
	4	Disable and re-enable the MCC (1 or more based on extent of failure).
	5	Disable, re-load code and data, and re-enable MCC (one or more MCCs based on extent of failure).
	6	Verify antenna connections to frame are correct based on the directions messages.

Troubleshooting: CSM Checklist

Problem Description

Many of the Clock Synchronization Manager (CSM) boards may be resolved in the field before sending the boards to the factory for repair. This section describes known CSM problems identified in field returns, some of which are field-repairable. Check these problems before returning suspect CSM boards.

Intermittent 19.6608 MHz Reference Clock/GPS Receiver Operation

If having any problems with CSM board kit numbers, SGLN1145 or SGLN4132, check the suffix with the kit number. If the kit has version “AB,” then replace with version “BC” or higher, and return model AB to the repair center.

No GPS Reference Source

Check the CSM boards for proper hardware configuration. CSM kit SGLN1145, in Slot 1, has an on-board GPS receiver; while kit SGLN4132, in Slot 2, does not have a GPS receiver. Any incorrectly configured board *must* be returned to the repair center. *Do not attempt to change hardware configuration in the field.* Also, verify the GPS antenna is not damaged and is installed per recommended guidelines.

Checksum Failure

The CSM could have corrupted data in its firmware resulting in a non-executable code. The problem is usually caused by either electrical disturbance, or interruption of data during a download. Attempt another download with no interruptions in the data transfer. Return CSM board back to repair center if the attempt to reload fails.

GPS Bad RX Message Type

This is believed to be caused by a later version of CSM software (3.5 or higher) being downloaded, via LMF, followed by an earlier version of CSM software (3.4 or lower), being downloaded from the CBSC. Download again with CSM software code 3.5 or higher. Return CSM board back to repair center if attempt to reload fails.

CSM Reference Source Configuration Error

This is caused by incorrect reference source configuration performed in the field by software download. CSM kit SGLN1145 and SGLN4132 must have proper reference sources configured (as shown below) to function correctly.

CSM Kit No.	Hardware Configuration	CSM Slot No.	Reference Source Configuration
SGLN1145	With GPS Receiver	1	Primary = Local GPS Backup = Either LFR or HSO
SGLN4132	Without GPS Receiver	2	Primary = Remote GPS Backup = Either LFR or HSO

Takes Too Long for CSM to Come INS

This may be caused by a delay in GPS acquisition. Check the accuracy flag status and/or current position. Refer to the GSM system time/GPS and LFR/HSO verification section in Chapter 3. At least 1 satellite should be visible and tracked for the “surveyed” mode and 4 satellites should be visible and tracked for the “estimated” mode. Also, verify correct base site position data used in “surveyed” mode.

C-CCP Backplane Troubleshooting

Introduction

The C-CCP backplane is a multi-layer board that interconnects all the C-CCP modules. The complexity of this board lends itself to possible improper diagnoses when problems occur.

Connector Functionality

The following connector overview describes the major types of backplane connectors along with the functionality of each. This will allow the Cellular Field Engineer (CFE) to:

- Determine which connector(s) is associated with a specific problem type.
- Allow the isolation of problems to a specific cable or connector.

Primary “A” and Redundant “B” ISB (Inter Shelf Bus) connectors

The 40 pin ISB connectors provide an interface bus from the master GLI2 to all other GLI2s in the modem frame. Its basic function is to provide clock synchronization from the master GLI2 to all other GLI2s in the frame.

The ISB is also provides the following functions:

- span line grooming when a single span is used for multiple cages.
- provide MMI connection to/from the master GLI2 to cell site modem.
- provide interface between GLI2s and the AMR (for reporting BTS alarms).

Span Line Connector

The span line input is an 8 pin RJ-45 connector that provides a primary and secondary (if used) span line interface to each GLI2 in the C-CCP shelf. The span line is used for MM/EMX switch control of the Master GLI2 and also all the BBX2 traffic.

Power Input (Return A, B, and C connectors)

Provides a +27 Volt input for use by the power supply modules.

Power Supply Module Interface

Each power supply module has a series of three different connectors to provide the needed inputs/outputs to the C-CCP backplane. These include a VCC/Ground input connector, a Harting style multiple pin interface, and a +15 V/Analog Ground output connector. The Transceiver Power Module converts 27/48 Volts to a regulated +15, +6.5, +5.0 Volts to be used by the C-CCP shelf cards.

GLI2 Connector

This connector consists of a Harting 4SU digital connector and a 6-conductor coaxial connector for RDM distribution. The connectors provide inputs/outputs for the GLI2s in the C-CCP backplane.

GLI2 Ethernet “A” and “B” Connections

These BNC connectors are located on the C–CCP backplane and routed to the GLI2 board. This interface provides all the control and data communications between the master GLI2 and the other GLI2, between gateways, and for the LMF on the LAN.

BBX2 Connector

Each BBX2 connector consists of a Harting 2SU/1SU digital connector and two 6–conductor coaxial connectors. These connectors provide DC, digital, and RF inputs/outputs for the BBX2s in the C–CCP backplane.

CIO Connectors

- RX RF antenna path signal inputs are routed through RX Tri–Filters (on the I/O plate), and via coaxial cables to the two MPC modules – the six “A” (main) signals go to one MPC; the six “B” (diversity) to the other. The MPC outputs the low–noise–amplified signals via the C–CCP backplane to the CIO where the signals are split and sent to the appropriate BBX2.
- A digital bus then routes the baseband signal through the BBX2, to the backplane, then on to the MCC24 slots.
- Digital TX antenna path signals originate at the MCC24s. Each output is routed from the MCC24 slot via the backplane appropriate BBX2.
- TX RF path signal originates from the BBX2, through the backplane to the CIO, through the CIO, and via multi–conductor coaxial cabling to the LPAs in the LPA shelf.

C–CCP Backplane Troubleshooting Procedure

The following table provides a standard procedure for troubleshooting problems that appear to be related to a defective C–CCP backplane. The table is broken down into possible problems and steps which should be taken in an attempt to find the root cause.

IMPORTANT

It is important to note that all steps be followed before replacing ANY C–CCP backplane.

Digital Control Problems

No GLI2 Control via LMF (all GLI2s)

Table 6-15: No GLI2 Control via LMF (all GLI2s)	
Step	Action
1	Check the ethernet for proper connection, damage, shorts, or opens.
2	Verify C-CCP backplane Shelf ID DIP switch is set correctly.
3	Visually check the master GLI2 connector (both board and backplane) for damage.
4	Replace the master GLI2 with a known good GLI2.

No GLI2 Control through Span Line Connection (All GLI2s)

Table 6-16: No GLI2 Control through Span Line Connection (Both GLI2s)	
Step	Action
1	Verify C-CCP backplane Shelf ID DIP switch is set correctly.
2	Verify that the BTS and GLI2s are correctly configured in the OMCR/CBSC data base.
3	Visually check the master GLI2 connector (both board and backplane) for damage.
4	Replace the master GLI2 with a known good GLI2.
5	Check the span line inputs from the top of the frame to the master GLI2 for proper connection and damage.

Table 6-17: MGLI2 Control Good – No Control over Co-located GLI2	
Step	Action
1	Verify that the BTS and GLI2s are correctly configured in the OMCR CBSC data base.
2	Check the ethernet for proper connection, damage, shorts, or opens.
3	Visually check all GLI2 connectors (both board and backplane) for damage.
4	Replace the remaining GLI2 with a known good GLI2.

No AMR Control (MGLI2 good)

Table 6-18: MGLI2 Control Good – No Control over AMR	
Step	Action
1	Visually check the master GLI2 connector (both board and backplane) for damage.
2	Replace the master GLI2 with a known good GLI2.
3	Replace the AMR with a known good AMR.

No BBX2 Control in the Shelf

Table 6-19: MGLI2 Control Good – No Control over Co-located GLI2s	
Step	Action
1	Visually check all GLI2 connectors (both board and backplane) for damage.
2	Replace the remaining GLI2 with a known good GLI2.
3	Visually check BBX2 connectors (both board and backplane) for damage.
4	Replace the BBX2 with a known good BBX2.

No (or Missing) Span Line Traffic

Table 6-20: BBX2 Control Good – No (or Missing) Span Line Traffic	
Step	Action
1	Visually check all GLI2 connectors (both board and backplane) for damage.
2	Replace the remaining GLI2 with a known good GLI2.
3	Visually check all span line distribution (both connectors and cables) for damage.
4	If the problem seems to be limited to 1 BBX2, replace the BBX2 with a known good BBX2.

No (or Missing) MCC24 Channel Elements

Table 6-21: No MCC24 Channel Elements	
Step	Action
1	Verify CEs on a co-located MCC24 (MccType=2)
2	If the problem seems to be limited to 1 MCC24, replace the MCC24 with a known good MCC24. <ul style="list-style-type: none"> – Check connectors (both board and backplane) for damage.
3	If no CEs on any MCC24: <ul style="list-style-type: none"> – Verify clock reference to CIO.

6

DC Power Problems

WARNING

Potentially lethal voltage and current levels are routed to the BTS equipment. This test must be carried out with a second person present, acting in a safety role. Remove all rings, jewelry, and wrist watches prior to beginning this test.

No DC Input Voltage to Power Supply Module

Table 6-22: No DC Input Voltage to Power Supply Module

Step	Action
1	Verify DC power is applied to the BTS frame. Verify there are no breakers tripped. * IMPORTANT If a breaker has tripped, remove all modules from the applicable shelf supplied by the breaker and attempt to reset it. <ul style="list-style-type: none"> – If breaker trips again, there is probably a cable or breaker problem within the frame. – If breaker does not trip, there is probably a defective module or sub-assembly within the shelf.
2	Verify that the C-CCP shelf breaker on the BTS frame breaker panel is functional.
3	Use a voltmeter to determine if the input voltage is being routed to the C-CCP backplane by measuring the DC voltage level on the PWR_IN cable. <ul style="list-style-type: none"> – If the voltage is not present, there is probably a cable or breaker problem within the frame. – If the voltage is present at the connector, reconnect and measure the level at the “VCC” power feed clip on the distribution backplane. If the voltage is correct at the power clip, inspect the clip for damage.
4	If everything appears to be correct, visually inspect the power supply module connectors.
5	Replace the power supply module with a known good module.
6	If steps 1 through 4 fail to indicate a problem, the C-CCP backplane failure (possibly an open trace) has occurred.

No DC Voltage (+5, +6.5, or +15 Volts) to a Specific GLI2, BBX2, or Switchboard

Table 6-23: No DC Input Voltage to any C-CCP Shelf Module	
Step	Action
1	Verify steps outlined in Table 6-22 have been performed.
2	Inspect the defective board/module (both board and backplane) connector for damage.
3	Replace suspect board/module with known good board/module.

TX and RX Signal Routing Problems

Table 6-24: No DC Input Voltage to any C-CCP Shelf Module	
Step	Action
1	Inspect all Harting Cable connectors and back-plane connectors for damage in all the affected board slots.
2	Perform steps outlined in the RF path troubleshooting flowchart in this manual.

RFDS – Fault Isolation

Introduction

The RFDS is used to perform Pre-Calibration Verification and Post-Calibration Audits which limit-check the RFDS-generate and reported receive levels of every path from the RFDS through the directional coupler coupled paths. In the event of test failure, refer to the following tables.

All tests fail

Table 6-25: RFDS Fault Isolation – All tests fail	
Step	Action
1	Check the calibration equipment for proper operation by manually setting the signal generator output attenuator to the lowest output power setting and connecting the output port to the spectrum analyzer rf input port.
2	Set the signal generator output attenuator to –90 dBm, and switch on the rf output. Verify that the spectrum analyzer can receive the signal, indicate the correct signal strength, (accounting for the cable insertion loss), and the approximate frequency.
3	Visually inspect RF cabling. Make sure each directional coupler forward and reflected port connects to the RFDS antenna select unit on the RFDS.
4	Check the wiring against the site documentation wiring diagram or the <i>BTS Site Installation</i> manual.
5	Verify RGLI and TSU have been downloaded.
6	Check to see that all RFDS boards show green on the front panel indicators. Visually check (both board and backplane) for damage.
7	Replace any boards that do not show green with known good boards one at a time in the following order. Re-test after each is replaced. <ul style="list-style-type: none">– RFDS ASU board.– RFDS Transceiver board.

All RX and TX paths fail

If every receive or transmit path fails, the problem most likely lies with the rf converter board or the transceiver board. Refer to the following table for fault isolation procedures.

Table 6-26: RFDS Fault Isolation – All RX and TX paths fail	
Step	Action
1	Visually check the master RF converter board (both board and backplane) for damage.
2	Replace the RF converter board with a known good RF converter board.
3	Visually check RXCVR TSU (both board and backplane) for damage.
4	Replace the TSU with a known good TSU.

All tests fail on a single antenna

If all path failures are on one antenna port, forward and/or reflected, make the following checks.

Table 6-27: RFDS Fault Isolation – All tests fail on single antenna path	
Step	Action
1	Visually inspect the site interface cabinet internal cabling to the suspect directional coupler antenna port.
2	Verify the forward and reflected ports connect to the correct RFDS antenna select unit positions on the RFDS backplane. Refer to the installation manual for details.
3	Visually check ASU connectors (both board and backplane) for damage.
4	Replace the ASU with a known good ASU.
5	Replace the RF cables between the affected directional coupler and RFDS. NOTE Externally route the cable to bypass suspect segment.

Module Front Panel LED Indicators and Connectors

Module Status Indicators

Each of the non-passive plug-in modules has a bi-color (green & red) LED status indicator located on the module front panel. The indicator is labeled PWR/ALM. If both colors are turned on, the indicator is yellow.

Each plug-in module, except for the fan module, has its own alarm (fault) detection circuitry that controls the state of the PWR/ALM LED.

The fan TACH signal of each fan module is monitored by the AMR. Based on the status of this signal the AMR controls the state of the PWR/ALM LED on the fan module.

LED Status Combinations for All Modules (except GLI2, CSM, BBX2, MCC24E, MCC8E)

PWR/ALM LED

The following list describes the states of the module status indicator.

- Solid GREEN – module operating in a normal (fault free) condition.
- Solid RED – module is operating in a fault (alarm) condition due to electrical hardware failure.

Note that a fault (alarm) indication may or may not be due to a complete module failure and normal service may or may not be reduced or interrupted.

DC/DC Converter LED Status Combinations

The PWR CNVTR has its own alarm (fault) detection circuitry that controls the state of the PWR/ALM LED.

PWR/ALM LED

The following list describes the states of the bi-color LED.

- Solid GREEN – module operating in a normal (fault free) condition.
- Solid RED – module is operating in a fault (alarm) condition due to electrical hardware problem.

CSM LED Status Combinations

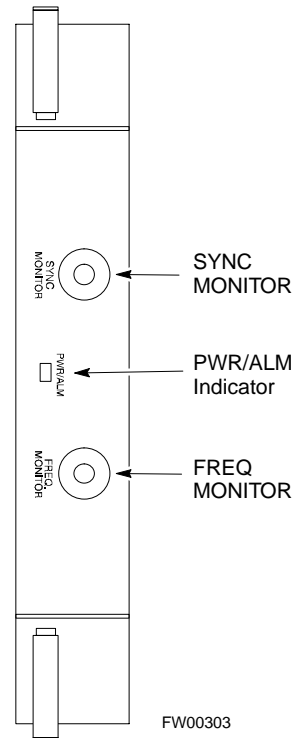

PWR/ALM LED

The CSMs include on-board alarm detection. Hardware and software/firmware alarms are indicated via the front panel indicators.

After the memory tests, the CSM loads OOS-RAM code from the Flash EPROM, if available. If not available, the OOS-ROM code is loaded from the Flash EPROM.

- Solid GREEN – module is INS_ACT or INS_STBY no alarm.
- Solid RED – Initial power up or module is operating in a fault (alarm) condition.
- Slowly Flashing GREEN – OOS_ROM no alarm.
- Long RED/Short GREEN – OOS_ROM alarm.
- Rapidly Flashing GREEN – OOS_RAM no alarm or INS_ACT in DUMB mode.
- Short RED/Short GREEN – OOS_RAM alarm.
- Long GREEN/Short RED – INS_ACT or INS_STBY alarm.
- Off – no DC power or on-board fuse is open.
- Solid YELLOW – After a reset, the CSMs begin to boot. During SRAM test and Flash EPROM code check, the LED is yellow. (If SRAM or Flash EPROM fail, the LED changes to a solid RED and the CSM attempts to reboot.)

Figure 6-1: CSM Front Panel Indicators & Monitor Ports

... continued on next page

FREQ Monitor Connector

A test port provided at the CSM front panel via a BNC receptacle allows monitoring of the 19.6608 MHz clock generated by the CSM. When both CSM 1 and CSM 2 are in an in-service (INS) condition, the CSM 2 clock signal frequency is the same as that output by CSM 1.

The clock is a sine wave signal with a minimum amplitude of +2 dBm (800 mVpp) into a 50 Ω load connected to this port.

SYNC Monitor Connector

A test port provided at the CSM front panel via a BNC receptacle allows monitoring of the “Even Second Tick” reference signal generated by the CSMs.

At this port, the reference signal is a TTL active high signal with a pulse width of 153 nanoseconds.

MMI Connector – Only accessible behind front panel. The RS-232 MMI port connector is intended to be used primarily in the development or factory environment, but may be used in the field for debug/maintenance purposes.

GLI2 LED Status Combinations

The GLI2 module has indicators, controls and connectors as described below and shown in Figure 6-2.

The indicators and controls consist of:

- Four LEDs
- One pushbutton

ACTIVE LED

Solid GREEN – GLI2 is active. This means that the GLI2 has shelf control and is providing control of the digital interfaces.

Off – GLI2 is not active (i.e., Standby). The mate GLI2 should be active.

MASTER LED

- Solid GREEN – GLI2 is Master (sometimes referred to as MGLI2).
- Off – GLI2 is non-master (i.e., Slave).

ALARM LED

- Solid RED – GLI2 is in a fault condition or in reset.
- While in reset transition, STATUS LED is OFF while GLI2 is performing ROM boot (about 12 seconds for normal boot).
- While in reset transition, STATUS LED is ON while GLI2 is performing RAM boot (about 4 seconds for normal boot).
- Off – No Alarm.

STATUS LED

- Flashing GREEN– GLI2 is in service (INS), in a stable operating condition.
- On – GLI2 is in OOS RAM state operating downloaded code.
- Off – GLI2 is in OOS ROM state operating boot code.

SPANS LED

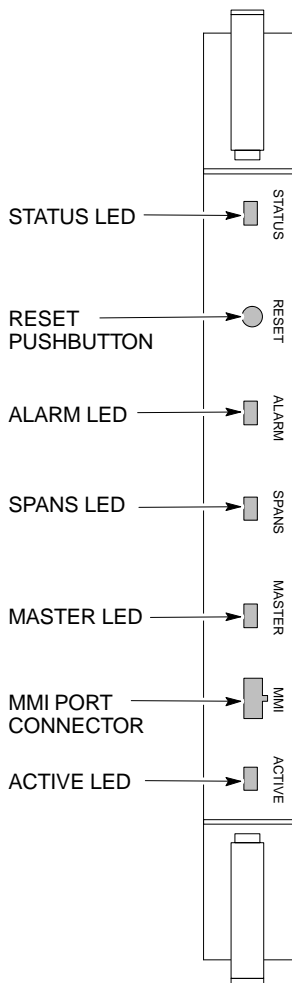

- Solid GREEN – Span line is connected and operating.
- Solid RED – Span line is disconnected or a fault condition exists.

GLI2 Pushbuttons and Connectors

RESET Pushbutton – Depressing the RESET pushbutton causes a partial reset of the CPU and a reset of all board devices. GLI2 will be placed in the OOS_ROM state

MMI Connector – The RS-232MMI port connector is intended to be used primarily in the development or factory environment but may be used in the field for debug/maintenance purposes.

Figure 6-2: GLI2 Front Panel Operating Indicators

LED	OPERATING STATUS
STATUS	OFF – operating normally ON – briefly during power-up when the Alarm LED turns OFF. SLOW GREEN – when the GLI2 is INS (in-service)
RESET	All functions on the GLI2 are reset when pressing and releasing the switch.
ALARM	OFF – operating normally ON – briefly during power-up when the Alarm LED turns OFF. SLOW GREEN – when the GLI2 is INS (in-service)
SPANS	OFF – card is powered down, in initialization, or in standby GREEN – operating normally YELLOW – one or more of the equipped initialized spans is receiving a remote alarm indication signal from the far end RED – one or more of the equipped initialized spans is in an alarm state
MASTER	The pair of GLI2 cards include a redundant status. The card in the top shelf is designated by hardware as the active card; the card in the bottom shelf is in the standby mode. ON – operating normally in active card OFF – operating normally in standby card
MMI PORT CONNECTOR	An RS-232, serial, asynchronous communications link for use as an MMI port. This port supports 300 baud, up to a maximum of 115,200 baud communications.
ACTIVE	Shows the operating status of the redundant cards. The redundant card toggles automatically if the active card is removed or fails ON – active card operating normally OFF – standby card operating normally

FW00225

BBX2 LED Status Combinations

PWR/ALM LED

The BBX module has its own alarm (fault) detection circuitry that controls the state of the PWR/ALM LED.

The following list describes the states of the bi-color LED:

- Solid GREEN – INS_ACT no alarm
- Solid RED Red – initializing or power-up alarm
- Slowly Flashing GREEN – OOS_ROM no alarm
- Long RED/Short GREEN – OOS_ROM alarm
- Rapidly Flashing GREEN – OOS_RAM no alarm
- Short RED/Short GREEN – OOS_RAM alarm
- Long GREEN/Short RED – INS_ACT alarm

MCC24/MCC8E LED Status Combinations

The MCC24/MCC8E module has LED indicators and connectors as described below. See Figure 6-3. Note that the figure does not show the connectors as they are concealed by the removable lens.

The LED indicators and their states are as follows:

PWR/ALM LED

- RED – fault on module

ACTIVE LED

- Off – module is inactive, off-line, or not processing traffic.
- Slowly Flashing GREEN – OOS_ROM no alarm.
- Rapidly Flashing Green – OOS_RAM no alarm.
- Solid GREEN – module is INS_ACT, on-line, processing traffic.

PWR/ALM and ACTIVE LEDs

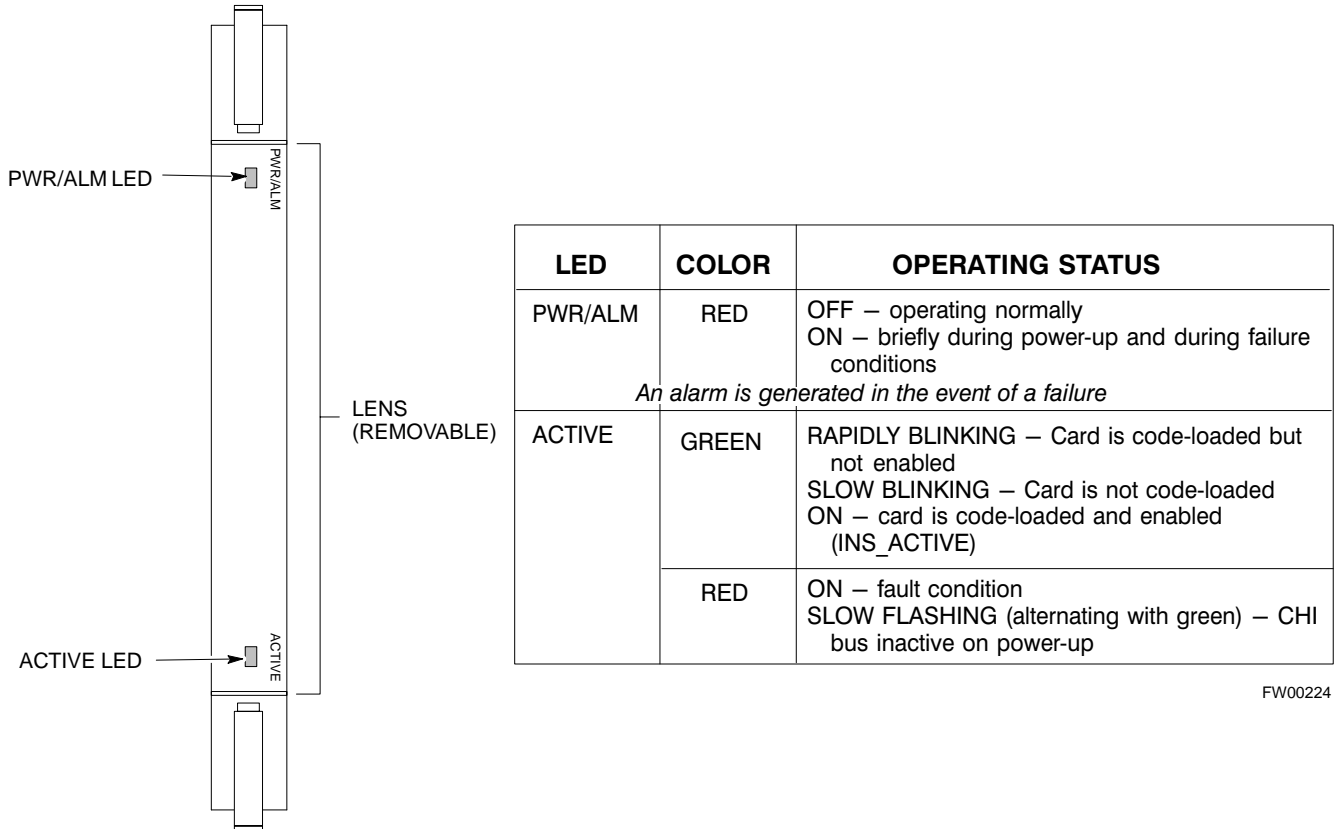

- Solid RED – module is powered but is in reset or the BCP is inactive.

MMI Connectors

- The RS-232 MMI port connector (four-pin) is intended to be used primarily in the development or factory environment but may be used in the field for debugging purposes.
- The RJ-11 ethernet port connector (eight-pin) is intended to be used primarily in the development environment but may be used in the field for high data rate debugging purposes.

. . . continued on next page

Figure 6-3: MCC24/8E Front Panel LEDs and LED Indicators

LPA Shelf LED Status Combinations

LPA Module LED

Each LPA module contains a bi-color LED just above the MMI connector on the ETIB module. Interpret this LED as follows:

- GREEN — LPA module is active and is reporting no alarms (Normal condition).
- Flashing GREEN/RED — LPA module is active but is reporting an low input power condition. If no BBX is keyed, this is normal and does not constitute a failure.
- Flashing RED — LPA is in alarm.

Basic Troubleshooting – Span Control Link

Span Problems (No Control Link)

Table 6-28: Troubleshooting Control Link Failure		
✓	Step	Action
	1	<p>Verify the span settings using the <code>span_view</code> command on the active master GLI2 MMI port. If these are set correctly, verify the <code>edlc</code> parameters using the <code>show</code> command. Any alarms conditions indicate that the span is not operating correctly.</p> <ul style="list-style-type: none">– Try looping back the span line from the DSX panel back to the Mobility Manager (MM) and verify that the looped signal is good.– Listen for control tone on appropriate timeslot from Base Site and MM.

Appendix B: FRU Optimization/ATP Test Matrix

Appendix Content

Appendix B: FRU Optimization/ATP Test Matrix	B-1
Usage & Background	B-1
Detailed Optimization/ATP Test Matrix	B-2

Appendix B: FRU Optimization/ATP Test Matrix

Usage & Background

Periodic maintenance of a site may also may mandate re-optimization of specific portions of the site. An outline of some basic guidelines is included in the following tables.

IMPORTANT

Re-optimization steps listed for any assembly detailed in the tables below must be performed *anytime* a RF cable associated with it is replaced.

BTS Frame

Table B-1: When RF Optimization Is required on the BTS	
Item Replaced	Optimize:
C-CCP Shelf	All sector TX and RX paths to all Combined CDMA Channel Processor (C-CCP) shelves.
Multicoupler/Preselector Card	The three or six affected sector RX paths for the C-CCP shelf in the BTS frames.
Preselector I/O	All sector RX paths.
BBX2 board	RX and TX paths of the affected C-CCP shelf / BBX2 board.
CIO Card	All RX and TX paths of the affected CDMA carrier.
Any LPA Module	The affected sector TX path.
LPA Backplane	The affected sector TX path.
LPA Filter	The affected sector TX path.

Ancillary Frame

Item Replaced	Optimize:
Directional Coupler	All affected sector RX and TX paths to all BTS frame shelves.
Site filter	All affected RX sector paths in all shelves in all BTS frames.
Any RFDS component or TSU.	The RFDS calibration RX & TX paths (MONFWD/GENFWD).

. . . continued on next page

B

Inter-frame Cabling

Optimization must be performed after the replacement of any RF cabling between BTS frames.

Table B-2: When to Optimize Inter-frame Cabling	
Item Replaced	Optimize:
Ancillary frame to BTS frame (RX) cables	The affected sector/antenna RX paths.
BTS frame to ancillary frame (TX) cables	The affected sector/antenna TX paths.

Detailed Optimization/ATP Test Matrix

Table B-3 outlines in more detail the tests that would need to be performed if one of the BTS components were to fail and be replaced. It is also assumed that all modules are placed OOS-ROM via the LMF until full redundancy of all applicable modules is implemented.

The following guidelines should also be noted when using this table.

IMPORTANT

Not every procedure required to bring the site back on line is indicated in Table B-3. It is meant to be used as a guideline ONLY. The table assumes that the user is familiar enough with the BTS Optimization/ATP procedure to understand which test equipment set ups, calibrations, and BTS site preparation will be required before performing the Table # procedures referenced.

Various passive BTS components (such as the TX and RX directional couplers, Preselector IO, CIO; etc.) only call for a TX or RX calibration audit to be performed in lieu of a full path calibration. If the RX or TX path calibration audit fails, the entire RF path calibration will need to be repeated. If the RF path calibration fails, further troubleshooting is warranted.

Whenever any C-CCP BACKPLANE is replaced, it is assumed that only power to the C-CCP shelf being replaced is turned off via the breaker supplying that shelf.

Whenever any DISTRIBUTION BACKPLANE is replaced it is assumed that the power to the entire RFM frame is removed and the Preselector I/O is replaced. The modem frame should be brought up as if it were a new installation.

NOTE

If any significant change in signal level results from any component being replaced in the RX or TX signal flow paths, it would be identified by re-running the RX and TX calibration audit command.

When the CIO is replaced, the C-CCP shelf remains powered up. The BBX2 boards may need to be removed, then re-installed into their original slots, and re-downloaded (code and BLO data). RX and TX calibration audits should then be performed.

Appendix C: BBX Gain Set Point vs. BTS Output Considerations

Appendix Content

Usage & Background	C-1
--------------------------	-----

Appendix C: BBX2 Gain Set Point vs. BTS Output Considerations

Usage & Background

Table C-1 outlines the relationship between the *total* of all code domain channel element gain settings (digital root sum of the squares) and the BBX2 Gain Set Point between 33.0 dBm and 44.0 dBm. The resultant RF output (as measured at the top of the BTS in dBm) is shown in the table. The table assumes that the BBX2 Bay Level Offset (BLO) values have been calculated.

As an illustration, consider a BBX2 keyed up to produce a CDMA carrier with only the Pilot channel (no MCCs forward link enabled). Pilot gain is set to 262. In this case, the BBX2 Gain Set Point is shown to correlate exactly to the actual RF output anywhere in the 33 to 44 dBm output range. (This is the level used to calibrate the BTS).

Table C-1: BBX2 Gain Set Point vs. Actual BTS Output (in dBm)

dBm↗ Gain↘	44	43	42	41	40	39	38	37	36	35	34	33

CDMA Operating Frequency Programming Information – North American PCS Bands

Introduction

Programming of each of the BTS BBX2 synthesizers is performed by the BTS GLIs via the CHI bus. This programming data determines the transmit and receive transceiver operating frequencies (channels) for each BBX2.

1900 MHz PCS Channels

Figure D-1 shows the valid channels for the North American PCS 1900 MHz frequency spectrum. There are 10 CDMA wireline or non-wireline band channels used in a CDMA system (unique per customer operating system).

Figure D-1: North America PCS Frequency Spectrum (CDMA Allocation)

FW00463

CDMA Operating Frequency Programming Information – North American Bands – continued

Calculating 1900 MHz Center Frequencies

Table D-1 shows selected 1900 MHz CDMA candidate operating channels, listed in both decimal and hexadecimal, and the corresponding transmit, and receive frequencies. Center frequencies (in MHz) for channels not shown in the table may be calculated as follows:

- $TX = 1930 + 0.05 * \text{Channel\#}$
Example: Channel 262
 $TX = 1930 + 0.05 * 262 = 1943.10 \text{ MHz}$
- $RX = TX - 80$
Example: Channel 262
 $RX = 1943.10 - 80 = 1863.10 \text{ MHz}$

Actual frequencies used depend on customer CDMA system frequency plan.

Each CDMA channel requires a 1.77 MHz frequency segment. The actual CDMA carrier is 1.23 MHz wide, with a 0.27 MHz guard band on both sides of the carrier.

Minimum frequency separation required between any CDMA carrier and the nearest NAMPS/AMPS carrier is 900 kHz (center-to-center).

800 MHz CDMA Channels

Figure D-2 shows the valid channels for the North American cellular telephone frequency spectrum. There are 10 CDMA wireline or non-wireline band channels used in a CDMA system (unique per customer operating system).

Figure D-2: North American Cellular Telephone System Frequency Spectrum (CDMA Allocation).

FW00402

Calculating 800 MHz Center Frequencies

Table D-2 shows selected 800 MHz CDMA candidate operating channels, listed in both decimal and hexadecimal, and the corresponding transmit, and receive frequencies. Center frequencies (in MHz) for channels not shown in the table may be calculated as follows:

- Channels 1–777
 $TX = 870 + 0.03 * \text{Channel\#}$
Example: Channel 262
 $TX = 870 + 0.03 * 262 = 877.86 \text{ MHz}$
- Channels 1013–1023
 $TX = 870 + 0.03 * (\text{Channel\#} - 1023)$
Example: Channel 1015
 $TX = 870 + 0.03 * (1015 - 1023) = 869.76 \text{ MHz}$
- $RX = TX - 45 \text{ MHz}$
Example: Channel 262
 $RX = 877.86 - 45 = 832.86 \text{ MHz}$

Table D-2: 800 MHz TX and RX Frequency vs. Channel

Appendix E: PN Offset Programming Information

PN Offset Background

All channel elements transmitted from a BTS in a particular 1.25 MHz CDMA channel are orthonogonally spread by 1 of 64 possible Walsh code functions; additionally, they are also spread by a quadrature pair of PN sequences unique to each sector.

Overall, the mobile uses this to differentiate multiple signals transmitted from the same BTS (and surrounding BTS) sectors, and to synchronize to the next strongest sector.

The PN offset per sector is stored on the BBX2s, where the corresponding I & Q registers reside.

The PN offset values are determined on a per BTS/per sector(antenna) basis as determined by the appropriate cdf file content. A breakdown of this information is found in Table E-1.

PN Offset Usage

There are three basic RF chip delays currently in use. It is important to determine what RF chip delay is valid to be able to test the BTS functionality. This can be done by ascertaining if the CDF file `FineTxAdj` value was set to “on” when the MCC was downloaded with “image data”. The `FineTxAdj` value is used to compensate for the processing delay (approximately 20 μ S) in the BTS using any type of mobile meeting IS-97 specifications.

Observe the following guidelines:

- If the `FineTxAdj` value in the cdf file is 101 (65 HEX), the `FineTxAdj` has not been set. The I and Q values from the 0 table MUST be used.

If the `FineTxAdj` value in the cdf file is 213 (D5 HEX), `FineTxAdj` has been set for the *14 chip table*.

- If the `FineTxAdj` value in the cdf file is 197 (C5 HEX), `FineTxAdj` has been set for the *13 chip table*.

IMPORTANT

CDF file I and Q values can be represented in DECIMAL or HEX. If using HEX, add 0x before the HEX value. If necessary, convert HEX values in Table E-1 to decimal before comparing them to cdf file I & Q value assignments.

. . . continued on next page

Appendix E: PN Offset Programming Information – continued

- If you are using a Qualcomm mobile, use the I and Q values from the 13 chip delay table.
- If you are using a mobile that does not have the 1 chip offset problem, (any mobile meeting the IS-97 specification), use the 14 chip delay table.

IMPORTANT

If the wrong I and Q values are used with the wrong `FineTxAdj` parameter, system timing problems will occur. This will cause the energy transmitted to be “smeared” over several Walsh codes (instead of the single Walsh code that it was assigned to), causing erratic operation. Evidence of smearing is usually identified by Walsh channels not at correct levels or present when not selected in the Code Domain Power Test.

Test Equipment Preparation

Purpose

This appendix provides information on setting up the HP8921 with PCS interface, the HP8935 and the Advantest R3465. The Cybertest test set doesn't require any setup.

HP8921A Test Equipment Connections

The following diagram depicts the rear panels of the HP 8921A test equipment as configured to perform automatic tests. All test equipment is controlled by the LMF via an IEEE-488/GPIB bus. The LMF expects each piece of test equipment to have a factory-set GPIB address (refer to Table F-4). If there is a communications problem between the LMF and any piece of test equipment, you should verify that the GPIB addresses have been set correctly and that the GPIB cables are firmly connected to the test equipment.

Figure F-1 shows the connections when **not using** an external 10 MHz Rubidium reference.

Table F-1: HP8921A/600 Communications Test Set Rear Panel Connections Without Rubidium

From Test Set:	To Interface:		Connector Type

Test Equipment Preparation – continued

HP8921A System Connectivity Test

Follow the steps outlined in Table F-3 to verify that the connections between the PCS Interface and the HP8921A are correct and cables are intact. The software also performs basic functionality checks of each instrument.

IMPORTANT

Disconnect other GPIB devices, especially system controllers, from the system before running the connectivity software.

Table F-3: System Connectivity

Step	Action
	* IMPORTANT – Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> .
1	Insert HP 83236A Manual Control/System card into memory card slot.
2	Press the [PRESET] pushbutton.
3	Press the Screen Control [TESTS] pushbutton to display the “Tests” Main Menu screen.
4	Position the cursor at Select Procedure Location and select it by pressing the cursor control knob. In the Choices selection box, select Card .
5	Position the cursor at Select Procedure Filename and select it by pressing the cursor control knob. In the Choices selection box, select SYS_CONN .
6	Position the cursor at RUN TEST and select it. The software will prompt you through the connectivity setup.
7	Do the following when the test is complete, <ul style="list-style-type: none">• position cursor on STOP TEST and select it• OR press the [K5] pushbutton.
8	To return to the main menu, press the [K5] pushbutton.
9	Press the [PRESET] pushbutton.

Test Equipment Preparation – continued

Setting HP8921A and HP83236A/B GPIB Address

Table F-4: Setting HP8921A GPIB Address

Step	Action
1	If you have not already done so, turn the HP8921A power on.
2	Verify that the GPIB addresses are set correctly. <ul style="list-style-type: none">• HP8921A HP-IB Adrs = 18, accessed by pushing LOCAL and selecting More and I/O Configure on the HP8921A/600. (Consult test equipment OEM documentation for additional info as required).• HP83236A (or B) PCS Interface GPIB address=19. Set dip switches as follows:<ul style="list-style-type: none">– A1=1, A2=1, A3=0, A4=0, A5=1, HP-IB/Ser = 1

Pretest Setup for HP8921A

Before the HP8921A CDMA analyzer is used for LMF controlled testing it must be set up correctly for automatic testing.

Table F-5: Pretest Setup for HP8921A

Step	Action
1	Unplug the memory card if it is plugged in.
2	Press the CURSOR CONTROL knob.
3	Position the cursor at IO CONFIG (under To Screen and More) and select it.
4	Select Mode and set for Talk&Lstn .

Pretest Setup for HP8935

Before the HP8935 CDMA analyzer is used for LMF controlled testing it must be set up correctly for automatic testing.

Table F-6: Pretest Setup for HP8935

Step	Action
1	Unplug the memory card if it is plugged in.
2	Press the Shift button and then press the I/O Config button.
3	Press the Push to Select knob.
4	Position the cursor at IO CONFIG and select it.
5	Select Mode and set for Talk&Lstn .

Advantest R3465 Connection

The following diagram depicts the rear panels of the Advantest test equipment as configured to perform automatic tests. All test equipment is controlled by the LMF via an IEEE-488/GPIB bus. The LMF expects each piece of test equipment to have a factory-set GPIB address (refer to Table F-7). If there is a communications problem between the LMF and any piece of test equipment, you should verify that the GPIB addresses have been set correctly and that the GPIB cables are firmly connected to the test equipment.

Figure F-3 shows the connections when **not using** an external 10 MHz Rubidium reference.

Figure F-3: Cable Connections for Test Set without 10 MHz Rubidium Standard

F

Figure F-4 shows the connections when **using** an external 10 MHz Rubidium reference.

Figure F-4: Cable Connections for Test Set with 10 MHz Rubidium Standard

Test Equipment Preparation – continued

R3465 GPIB Address & Clock setup

Table F-7 describes the steps to set the GPIB address and clock for the **Advantest R3465** equipment.

Table F-7: Advantest R3465 GPIB Address and Clock Setup	
Step	Action
1	Communications test set GPIB address= 18 (<i>perform the following to view/set as required</i>) Perform the following to set the standard parameters on the test set: <ul style="list-style-type: none">• Push the SHIFT then PRESET pushbutton (just below the CRT display).• Push the LCL pushbutton (CW in Measurement just below the CRT display)<ul style="list-style-type: none">– Push the GPIB and Others CRT menu key to view the current address.– <i>If required</i>, change GPIB address to 18 (<i>rotate the vernier knob to set, push the vernier knob to enter</i>)
2	Verify the current Date and Time in upper/right of the CRT display (<i>perform the following to set if required</i>) Communications test set GPIB address= 18 (<i>perform the following to view/set as required</i>) <ul style="list-style-type: none">• Push the Date/Time CRT menu key• <i>If required</i>, change to correct Date/Time (<i>rotate the vernier knob to select and set, push the vernier knob to enter</i>)• Push the SHIFT then PRESET pushbutton (just below the CRT display).

Pretest Setup for Advantest R3465

Before the Advantest R3465 analyzer is used for LMF controlled testing it must be set up correctly for automatic testing.

Table F-8: Pretest Setup for Advantest R346	
Step	Action
1	Press the SHIFT button so the LED next to it is illuminated.
2	Press the RESET button.

Manual Cable Calibration

Calibrating Test Cable Setup using HP PCS Interface (HP83236)

Table F-9 covers the procedure to calibrate the test equipment using the HP8921 Cellular Communications Analyzer equipped with the HP83236 PCS Interface.

NOTE

This calibration method *must be executed with great care*. Some losses are measured close to the minimum limit of the power meter sensor (−30 dBm).

Prerequisites

Ensure the following prerequisites have been met before proceeding:

- Test equipment to be calibrated has been connected correctly for cable calibration.
- Test equipment has been selected and calibrated.

Table F-9: Calibrating Test Cable Setup (using the HP PCS Interface)

Step	Action		
	NOTE Verify that GPIB controller is turned off.		
1	Insert HP83236 Manual Control System card into memory card slot.		
2	Press the Preset pushbutton.		
3	Under Screen Controls , press the TESTS pushbutton to display the TESTS (Main Menu) screen.		
4	Position the cursor at Select Procedure Location and select it. In the Choices selection box, select CARD .		
5	Position the cursor at Select Procedure Filename and select it. In the Choices selection box, select MANUAL .		
6	Position the cursor at RUN TEST and select it. HP must be in Control Mode Select YES .		
7	<table border="0" style="width: 100%;"> <tr> <td style="width: 50%; vertical-align: top;"> <p>If using HP 83236A: Set channel number=<chan#>:</p> <ul style="list-style-type: none"> – Position cursor at Channel Number and select it. – Enter the <i>chan#</i> using the numeric keypad; press [Enter] and the screen will go blank. – When the screen reappears, the <i>chan#</i> will be displayed on the channel number line. </td> <td style="width: 50%; vertical-align: top;"> <p>If using HP 83236B: Set channel frequency:</p> <ul style="list-style-type: none"> – Position cursor at Frequency Band and press Enter. – Select User Defined Frequency. – Go Back to Previous Menu. – Position the cursor to 83236 generator frequency and enter actual RX frequency. – Position the cursor to 83236 analyzer frequency and enter actual TX frequency. </td> </tr> </table>	<p>If using HP 83236A: Set channel number=<chan#>:</p> <ul style="list-style-type: none"> – Position cursor at Channel Number and select it. – Enter the <i>chan#</i> using the numeric keypad; press [Enter] and the screen will go blank. – When the screen reappears, the <i>chan#</i> will be displayed on the channel number line. 	<p>If using HP 83236B: Set channel frequency:</p> <ul style="list-style-type: none"> – Position cursor at Frequency Band and press Enter. – Select User Defined Frequency. – Go Back to Previous Menu. – Position the cursor to 83236 generator frequency and enter actual RX frequency. – Position the cursor to 83236 analyzer frequency and enter actual TX frequency.
<p>If using HP 83236A: Set channel number=<chan#>:</p> <ul style="list-style-type: none"> – Position cursor at Channel Number and select it. – Enter the <i>chan#</i> using the numeric keypad; press [Enter] and the screen will go blank. – When the screen reappears, the <i>chan#</i> will be displayed on the channel number line. 	<p>If using HP 83236B: Set channel frequency:</p> <ul style="list-style-type: none"> – Position cursor at Frequency Band and press Enter. – Select User Defined Frequency. – Go Back to Previous Menu. – Position the cursor to 83236 generator frequency and enter actual RX frequency. – Position the cursor to 83236 analyzer frequency and enter actual TX frequency. 		

. . . continued on next page

Manual Test Cable Setup – continued

Table F-9: Calibrating Test Cable Setup (using the HP PCS Interface)

Step	Action									
8	Set RF Generator level: <ul style="list-style-type: none"> – Position the cursor at RF Generator Level and select it. – Enter -10 using the numeric keypad; press [Enter] and the screen will go blank. – When the screen reappears, the value -10 dBm will be displayed on the RF Generator Level line. 									
9	Set the user fixed Attenuation Setting to 0 dBm : <ul style="list-style-type: none"> – Position cursor at Analyzer Attenuation and select it – Position cursor at User Fixed Atten Settings and select it. – Enter 0 (zero) using the numeric keypad and press [Enter]. 									
10	Select Back to Previous Menu .									
11	Record the HP83236 Generator Frequency Level: Record the HP83236B Generator Frequency Level: <ul style="list-style-type: none"> – Position cursor at Show Frequency and Level Details and select it. – Under HP83236 Frequencies and Levels, record the Generator Level. – Under HP83236B Frequencies and Levels, record the Generator Frequency Level (1850 – 1910 MHz). – Position cursor at Prev Menu and select it. 									
12	Click on Pause for Manual Measurement .									
13	Connect the power sensor directly to the <i>RF OUT ONLY</i> port of the PCS Interface.									
14	On the HP8921A, under To Screen , select CDMA GEN .									
15	Move the cursor to the Amplitude field and click on the Amplitude value.									
16	Increase the Amplitude value until the power meter reads 0 dBm ±0.2 dB . NOTE The Amplitude value can be increased coarsely until 0 dBm is reached; then fine tune the amplitude by adjusting the Increment Set to 0.1 dBm and targeting in on 0 dBm.									
17	Disconnect the power sensor from the <i>RF OUT ONLY</i> port of the PCS Interface. * IMPORTANT The Power Meter sensor's lower limit is -30 dBm. Thus, only components having losses ≤30 dB should be measured using this method. For further accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated. After connecting the power sensor to the component, record the calibrated loss immediately.									
18	Disconnect all components in the test setup and calibrate each one separately by connecting each component, one-at-a-time, between the <i>RF OUT ONLY PORT</i> and the power sensor. Record the calibrated loss value displayed on the power meter. <ul style="list-style-type: none"> • Example: <table style="margin-left: 20px; border: none;"> <tr> <td>(A) Test Cable(s)</td> <td>=</td> <td>-1.4 dB</td> </tr> <tr> <td>(B) 20 dB Attenuator</td> <td>=</td> <td>-20.1 dB</td> </tr> <tr> <td>(B) Directional Coupler</td> <td>=</td> <td>-29.8 dB</td> </tr> </table> 	(A) Test Cable(s)	=	-1.4 dB	(B) 20 dB Attenuator	=	-20.1 dB	(B) Directional Coupler	=	-29.8 dB
(A) Test Cable(s)	=	-1.4 dB								
(B) 20 dB Attenuator	=	-20.1 dB								
(B) Directional Coupler	=	-29.8 dB								

... continued on next page

Manual Test Cable Setup – continued

Table F-9: Calibrating Test Cable Setup (using the HP PCS Interface)

Step	Action
19	After all components are calibrated, reassemble all components together and calculate the total test setup loss by adding up all the individual losses: <ul style="list-style-type: none"> • Example: Total test setup loss = $-1.4 -29.8 -20.1 = -51.3$ dB. This calculated value will be used in the next series of tests.
20	Under Screen Controls press the TESTS button to display the TESTS (Main Menu) screen.
21	Select Continue (K2) .
22	Select RF Generator Level and set to -119 dBm.
23	Click on Pause for Manual Measurement .
24	Verify the HP8921A Communication Analyzer/83203A CDMA interface setup is as follows (fields not indicated remain at default): <ul style="list-style-type: none"> • Verify the GPIB (HP-IB) address: <ul style="list-style-type: none"> – under To Screen, select More – select IO CONFIG – Set HP-IB Adrs to 18 – set Mode to Talk&Lstn • Verify the HP8921A is displaying frequency (instead of RF channel) <ul style="list-style-type: none"> – Press the blue [SHIFT] button, then press the Screen Control [DUPLEX] button; this switches to the CONFIG (CONFIGURE) screen. – Use the cursor control to set RF Display to Freq
25	Refer to Chapter 3 for assistance in setting the cable loss values into the LMF.

Manual Test Cable Setup – continued

Calibrating Test Cable Setup using Advantest R3465

NOTE

Be sure the GPIB Interface is OFF for this procedure.

Advantest R3465 Manual Test setup and calibration must be performed at both the TX and RX frequencies.

Table F-10: Procedure for Calibrating Test Cable Setup Using Advantest R3465

Step	Action
	<p>* IMPORTANT</p> <p>– This procedure can only be performed <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i>.</p>
1	Press the SHIFT and the PRESET keys located below the display
2	Press the ADVANCE key in the MEASUREMENT area of the control panel.
3	Select the CDMA Sig CRT menu key
4	Select the Setup CRT menu key
5	Using the vernier knob and the cursor keys set the following parameters
	<p>NOTE</p> <p>Fields not listed remain at default</p> <p>Generator Mode: SIGNAL</p> <p>Link: FORWARD</p> <p>Level Unit: dBm</p> <p>CalCorrection: ON</p> <p>Level Offset: OFF</p>
6	Select the return CRT menu key
7	Press FREQ key in the ENTRY area
8	Set the frequency to the desired value using the keypad entry keys
9	Verify that the Mod CRT menu key is highlighting OFF; if not, press the Mod key to toggle it OFF.
10	Verify that the Output CRT menu key is highlighting OFF; if not, press the Output key to toggle it OFF.
11	Press the LEVEL key in the ENTRY area.
12	Set the LEVEL to 0 dBm using the key pad entry keys.
13	Zero power meter. Next connect the power sensor directly to the “RF OUT” port on the R3561L CDMA Test Source Unit.
14	Press the Output CRT menu key to toggle Output to ON.
15	Record the power meter reading _____

... continued on next page

Manual Test Cable Setup – continued

Table F-10: Procedure for Calibrating Test Cable Setup Using Advantest R3465

Step	Action
16	Disconnect the power meter sensor from the R3561L RF OUT jack. * IMPORTANT The Power Meter sensor's lower limit is -30 dBm. Thus, only components having losses ≤ 30 dB should be measured using this method. For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated. Then, after connecting the power sensor to the component, record the calibrated loss immediately.
17	Disconnect all components in the the test setup and calibrate each one separately. Connect each component one-at-a-time between the "RF OUT" port and the power sensor (see Figure F-6, "Setups A, B, and C"). Record the calibrated loss value displayed on the power meter for each connection. Example: (A) 1st Test Cable = -0.5 dB (B) 2nd Test Cable = -1.4 dB (C) 20 dB Attenuator = -20.1 dB (D) 30 dB Directional Coupler = -29.8 dB
18	Press the Output CRT menu key to toggle Output OFF.
19	Calculate the total test setup loss by adding up all the individual losses: Example: Total test setup loss = $0.5 + 1.4 + 20.1 + 29.8 = 51.8$ dB This calculated value will be used in the next series of tests.
20	Press the FREQ key in the ENTRY area
21	Using the keypad entry keys, set the test frequency to the RX frequency
22	Repeat steps 9 through 19 for the RX frequency.
23	Refer to Chapter 3 for assistance in setting the cable loss values into the LMF.

F

Calibrating HP 437 Power Meter

Precise transmit output power calibration measurements are made using a bolometer-type broadband power meter with a sensitive power sensor. Follow the steps outlined in Table F-11 to enter information unique to the power sensor before calibrating the test setup. Refer to Figure F-7 as required.

IMPORTANT

This procedure must be done *in conjunction with* the automated calibration to enter power sensor specific calibration values.

Figure F-7: Power Meter Detail

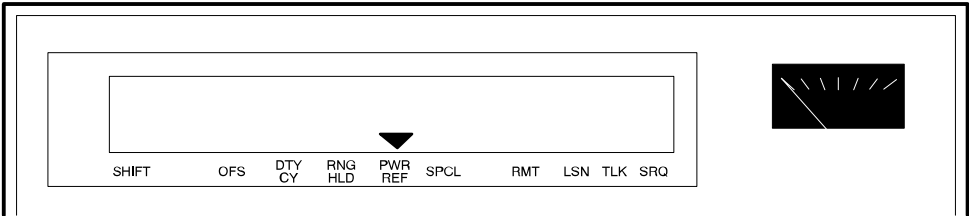

Table F-11: Power Meter Calibration Procedure

Step	Action
	<p>! CAUTION</p> <p>Do not connect/disconnect the power meter sensor cable with ac power applied to the meter. Disconnection could result in destruction of the sensing element or mis-calibration.</p>
1	<ul style="list-style-type: none"> – Make sure the power meter AC LINE pushbutton is OFF. – Connect the power sensor cable to the SENSOR input.
2	<p>Set the AC LINE pushbutton to ON.</p> <p>NOTE</p> <p>The calibration should be performed only after the power meter and sensor have been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i>.</p>
3	<p>Perform the following to set or verify the GPIB address:</p> <ul style="list-style-type: none"> – To enter the SPECIAL data entry function, press [SHIFT] then [PRESET]. – Use the [▲] or [▼] button to select HP-IB ADRS; then press [ENTER]. – Use the [▲] or [▼] button to select HP-IB ADRS 13; then press [ENTER]. – To EXIT the SPECIAL data entry function press [SHIFT] then [ENTER].

Appendix Content

Introduction	G-1
Purpose	G-1
Equipment Warm up	G-1
Power Delta Calibration	G-2
Power Delta Calibration Introduction	G-2
HP8921A Power Delta Calibration	G-2
Advantest R3465 Power Delta Calibration	G-4
HP8935 Power Delta Calibration	G-7
In-Service Calibration	G-10

Introduction

Purpose

This procedure is a guide to expanding your system with multiple carriers while the system remains in service. This procedure also allows you to perform on site maintenance (replace defective boards and recalibrate) while the remainder of the site stays in service.

Motorola recommends that you perform this procedure during a maintenance window.

This procedure cannot be performed on BTSs with 4-to-1 combiners. The procedure can only be performed on one side of the BTS at one time. That is, LPAs 1, 2, 3, 7, 8, 9 (feed antennas 1, 2, 3) can be calibrated while LPAs 6, 7, 8, 10, 11, 12 (feed antennas 4, 5, 6) remain in service and vice versa.

Equipment Warm up

IMPORTANT

Calibration of the communications test set (or equivalent test equipment) *must be* performed at the site before calibrating the overall test set. Calibrate the test equipment *after* it has been allowed to warm-up and stabilize for a *minimum of 60 minutes*.

CAUTION

If any piece of test equipment (i.e., test cable, RF adapter) has been replaced, re-calibration must be performed. Failure to do so could introduce measurement errors, causing incorrect measurements and degradation to system performance.

G

Power Delta Calibration

Power Delta Calibration Introduction

The In-service calibration procedure has several differences from a normal calibration procedure. One of these is the use of a spectrum analyzer instead of a power meter to measure power. Power meters are broadband measurement devices and cannot be used to measure power during In-service Calibration since other carriers are operating. A spectrum analyzer can be used because it measures power at a given frequency. However, measuring power using a spectrum analyzer is less accurate than using a power meter. Therefore, you must compensate for the difference (delta) between the power meter and the spectrum analyzer.

HP8921A Power Delta Calibration

Use the HP8921A Spectrum Analyzer to measure power during In-Service Calibration for 800 MHz systems. After the offset value has been calculated, add it to the TX cable loss value.

Follow the procedure in Table G-1 to perform the HP8921A Power Delta Calibration procedure.

NOTE

This procedure requires two HP8921As.

Table G-1: HP8921A Power Delta Calibration Procedure

Step	Action
	* IMPORTANT Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> .
1	Connect a short RF cable between the HP8921A Duplex Out port and the HP437B power sensor (see Figure G-1).
2	Set the HP8921A signal source as follows: <ul style="list-style-type: none">– Measure mode to CDMA Generator– Frequency to the CDMA Calibration target frequency– CW RF Path to IQ– Output Port to Dupl– Data Source to Random– Amplitude to 0 dBm
3	Measure and record the power value reading on the HP437B Power Meter.
4	Record the Power Meter reading as result A _____.

. . . continued on next page

Power Delta Calibration – continued

Table G-1: HP8921A Power Delta Calibration Procedure	
Step	Action
5	Turn off the source HP8921A signal output, and disconnect the HP437B. NOTE Leave the settings on the source HP8921A for convenience in the following steps.
6	Connect the short RF cable between the source HP8921A Duplex Out port and the measuring HP8921A RF-IN port (see Figure G-2).
7	Ensure that the source HP8921A settings are the same as in Step 2.
8	Set the measuring HP8921A as follows: <ul style="list-style-type: none"> – Measure mode to CDMA Anl – Frequency to the CDMA calibration target frequency – Input Attenuation to 0 dB – Input port to RF-IN – Gain to Auto – Analyzer Direction to Fwd
9	Turn on the source HP8921A signal output.
10	Measure and record the channel power reading on the measuring HP8921A as result B _____.
11	Turn off the source HP8921A signal output and disconnect the equipment.
12	Compute the delta between HP437B and HP8921A using the following formula: <p style="text-align: center;">Delta = A – B</p> <p style="text-align: center;">Example: Delta = –0.70 dBm – (–1.25 dBm) = 0.55 dBm</p> <p style="text-align: center;">Example: Delta = 0.26 dBm – 0.55 dBm = –0.29 dBm</p> <p>These examples are included to show the mathematics and do not represent actual readings.</p> <p>NOTE Add this delta value to the TX Cable Loss value during In–Service Calibration (see Step 4 in Table G-4).</p>

Advantest R3465 Power Delta Calibration

Follow the procedure in Table G-2 to perform the Advantest 3465 Power Delta Calibration procedure.

Table G-2: Advantest Power Delta Calibration Procedure

Step	Action
	<p>* IMPORTANT</p> <p>Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i>.</p>
On the Advantest R3465:	
1	Press the SHIFT and the PRESET keys located below the CRT display.
2	Press the ADVANCE key in the Measurement area of the control panel.
3	Press the CDMA Sig CRT menu key.
4	Press the FREQ key in the Entry area of the control panel.

... continued on next page

Power Delta Calibration – continued

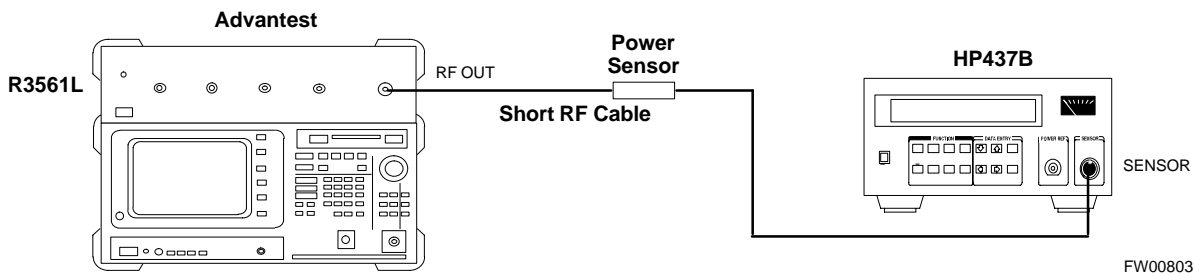

Table G-2: Advantest Power Delta Calibration Procedure	
Step	Action
5	Set the frequency to the desired value using the keypad entry keys.
6	Press the LEVEL key in the Entry area of the control panel.
7	Set the LEVEL to 0 dBm using the keypad entry keys.
8	Verify the Mod CRT menu key is highlighting OFF , if not press the Mod key to toggle it OFF .
9	Verify the Output CRT menu key is highlighting OFF , if not press the Output key to toggle it OFF .
On the HP 437 Power Meter:	
10	Zero the Power Meter prior to connecting the power sensor to the RF cable from the signal generator. * IMPORTANT For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated.
11	Connect the RF cable from the R3561L CDMA Test Source Unit RF OUT port to the power sensor, refer to Figure G-3.
12	Press the Output CRT menu key to toggle the Output to ON .
13	Record the Power Meter reading as result A _____.
14	Press the Output CRT menu key to toggle the Output to OFF .
15	Connect the RF cable from the R3561L CDMA Test Source Unit RF OUT port to the Spectrum Analyzer INPUT Port, refer to Figure G-4.
16	Press the Output CRT menu key to change the Output to ON .
17	Press the CW key in the Measurement area of the control panel.
18	Press the LEVEL key in the Entry area of the control panel.
19	Set the REF LEVEL to 10 dBm using the keypad entry keys.
20	Press the dB/div CRT menu key.
21	Press the 10 dB/div CRT menu key.
22	Press the FREQ key in Entry area of the control panel.
23	Set the frequency to the desired value using the keypad entry keys.
24	Press the more 1/2 CRT menu key.
25	Press the Preselector CRT menu key to highlight 3.0G .
26	Press the FORMAT key in the Display Control area of the control panel.
27	Press the TRACE CRT menu key.
28	Press the AVG A CRT menu key.
29	Set AVG to 20 using keypad entry keys.

In-Service Calibration

IMPORTANT

This feature does NOT have fault tolerance at this time. The system has no safe-guards to stop you from doing something that will take the BTS out of service. If possible, perform this procedure during a maintenance window.

Follow the procedures in this section precisely, otherwise the entire BTS will most likely go OUT OF SERVICE.

At the CBSC, only perform operations on expansion hardware when it is in the OOS_MANUAL state.

The operator must be trained in the LMF operation prior to performing this procedure.

Prerequisites

- Expansion hardware has been added in the CBSC database, and the CDF file has been generated.
- The expansion devices have been inserted into the C-CCP cage and are in the OOS_MANUAL state at the CBSC.
- The site specific cdf (with the expansion hardware) and cal files have been loaded onto the LMF.
- The LMF has the same code and dds files as the CBSC to download.

IMPORTANT

Do not download code or data to any cards other than those you are working on. Downloading code or data to other cards will take the site OUT OF SERVICE.

The code file version numbers must match the version numbers on the other cards in the frame. If the numbers do not match, the site may go OUT OF SERVICE.

The BTS-#.cdf, CBSC-#.cdf, and CAL files for this BTS must have come from the CBSC.

- Test equipment has been configured per Figure G-7 or Figure G-8.
- An RFDS (or at a minimum a directional coupler), whose loss is already known, must be in line to perform the in-service calibration.
- Test equipment has been calibrated after 1 hour warm up.
- A short RF cable and two BNC-N adapters are available to perform Cable Calibration.

. . . continued on next page

- The Power Delta Calibration has been performed (see Table G-1, Table G-2, or Table G-3).

Figure G-7: Optimization/ATP Test Setup Using Directional Coupler

In-Service Calibration – continued

Follow the procedure in Table G-4 to perform the In-Service Calibration.

Table G-4: In-Service Calibration	
Step	Action
	<p>* IMPORTANT</p> <p>Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i>.</p>
1	<p>Set up the LMF for In-Service Calibration:</p> <ul style="list-style-type: none"> – Start the LMF by double-clicking the LMF icon on the Windows desktop. – Click Options>LMF Options from the menu bar at the login screen. – Check only the applicable spectrum analyzer check box on the Test Equipment tab. Ensure that the GPIB address is 18. – Uncheck any other other equipment that is selected. – Click the Apply button. – Select the BTS Options tab in the LMF Option window. – Check the In-Service Calibration check box. – Click the Apply button. – Click the Dismiss button to close the LMF Option window.
2	<p>Login to the target BTS:</p> <ul style="list-style-type: none"> – Select the target BTS icon. – Click the Login button at the login screen.
3	<p>Measure the Cable Loss using the Cable Calibration function:</p> <ul style="list-style-type: none"> – Click Util>Cable Calibration from the menu bar at the main window. – Set the desired channel(s) and select TX and RX CABLE CAL at the cable calibration pop up window. – Click the OK button to perform cable calibration. – Follow the on-screen instructions to complete the cable loss measurement. <p>NOTE</p> <ul style="list-style-type: none"> – The measured value is input automatically to the cable loss file. – To view the cable loss file, click Util>Examine>Cable Loss.

. . . continued on next page

Table G-4: In-Service Calibration

Step	Action
4	<p>Add the spectrum analyzer power delta to the Cable Loss.</p> <ul style="list-style-type: none"> – To view the cable loss file, click Util>Examine>Cable Loss. – Add the value computed in Table G-1, Table G-2, or Table G-3 to the TX Cable Loss. <p>NOTE</p> <p>Be sure to include the sign of the value. The following examples are included to show the mathematics and do not represent actual readings:</p> <ul style="list-style-type: none"> – Example: 5.65 dBm + 0.55 dBm = 6.20 dBm – Example: 5.65 dBm + (–0.29 dBm) = 5.36 dBm – Example: –5.65 dBm + 0.55 dBm = –5.10 dBm – Example: –5.65 dBm + (–0.29 dBm) = –5.94 dBm
5	<p>Input the Coupler Loss for the TX tests:</p> <ul style="list-style-type: none"> – Click Util>Edit>TX Coupler Loss from the menu bar at the main window. – Input the appropriate coupler loss for the target carrier(s) by referring to the information taken at the time of BTS installation. – Click the Save button. – Click the Dismiss button to close the window. – To view the coupler loss file, click Util>Examine>TX Coupler Loss.
6	<p>Input the Coupler Loss for the RX tests:</p> <ul style="list-style-type: none"> – Click Util>Edit>Cable Loss from the menu bar at the main window. – Add the appropriate coupler loss to the cable loss for the target carrier(s) by referring to the information taken at the time of BTS installation and input this value in the Cable Loss field. – Click the Save button. – Click the Dismiss button to close the window. – To view the cable loss file, click Util>Examine>Cable Loss.
7	<p>Have the CBSC operator put the redundant BBX2 OOS_MANUAL.</p>
	<p>! CAUTION</p> <p>Be sure to download OOS devices only. Loading in-service devices takes them OUT OF SERVICE and can result in dropped calls.</p> <p>The code file version numbers must match the version numbers on the other cards in the frame. If the numbers do not match, the site may go OUT OF SERVICE.</p> <p>NOTE</p> <p>Be sure to include the redundant BBX2 in steps 8, 9, and 10.</p>
