WHAT IS TENS?

T.E.N.S stands for Transcutaneous Electrical Nerve Stimulation. For the past Thirty years, doctors have been prescribing TENS as an effective way to reduce or even eliminate pain. The iTENS communicates with your nerve endings to suppress pain via two theories:

- Gate Control Theory - overriding the nerve pain signals before they reach the brain
- Endorphin release theory - releasing the body's own natural pain fighting chemicals called endorphins.

DIGITAL HIGH VOLT PULSED GALVANIC STIMULATOR

Digital Galvanic Stimulation is most useful in acute injuries associated with major tissue trauma with bleeding or swelling. In contrast to TENS or IFC units, which apply alternating current, Galvanic Stimulators apply direct current. Direct current creates an electrical field over the treated area that, theoretically, changes blood flow and moves fluids. The positive pad behaves like ice, causing reduced circulation to the area under the pad and reduction in swelling. The negative pad behaves like heat, causing increased circulation, reportedly speeding healing.

Q LIGHT

The Qlight provides deep, infrared heat that can penetrate below the surface of the skin to produce a soothing, comforting effect upon the nerves. On a cellular level, an increase in heat above the cell's normal temperature causes an increase in the cell's metabolic rate. This increase is due to several events that occur simultaneously within and around the cell. The increased heat causes increased permeability of cellular membranes, which allows for greater exchange of the cell's cytoplasmic contents with its environment.

A longitudinal force to the axis of the spinal column is the definition of spinal traction. In other words, pulling parts of the spinal column in opposing directions to change or stabilize damaged spine positions.

The Theratrak is an easy to use, highly functional, and very effective lumbar traction device, giving the user the ability to treat their condition at the most comfortable clinic on earth...their home.

Theratrak utilizes pneumatic bladder technology giving it the unique ability to administer a moderate lumbar decompression stretch, to gently contour the innate spinal path.

DIGITAL SINE IFC

This type of stimulation is characterized by the crossing of two electrical medium, independent frequencies that work together to effectively stimulate large impulse fibers. These frequencies interfere with the transmission of pain messages at the spinal cord level. Because of the frequency, the Interferential wave meets low impedance when crossing the skin to enter the underlying tissue. This deep tissue penetration can be adjusted to stimulate parasympathetic nerve fibers for increased blood flow. Interferential Stimulation differs from TENS because it allows a deeper penetration of the tissue with more comfort (compliance) and increased circulation.
