

Manual

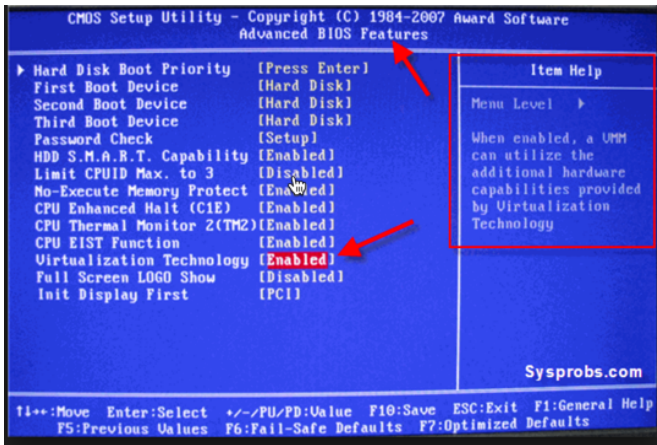

Install Docker Toolbox for Windows

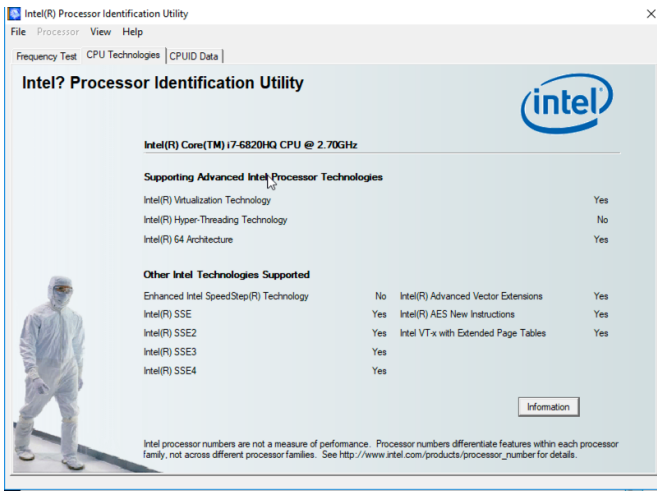

Prerequisite

Enable Virtualization Technology (vt-x/AMD-v) on BIOS:

Normally virtualization technology should be enable by default.

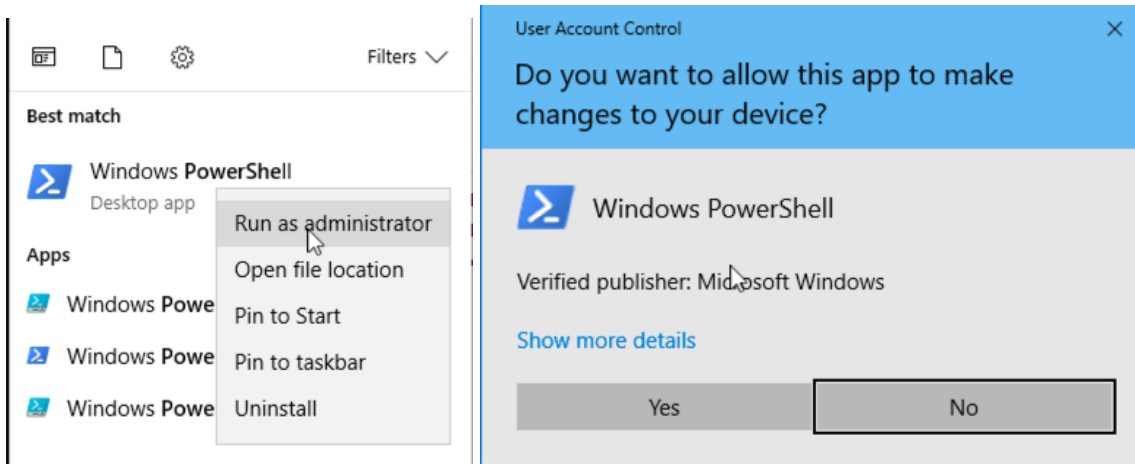

Checking Feature via Utility Tools

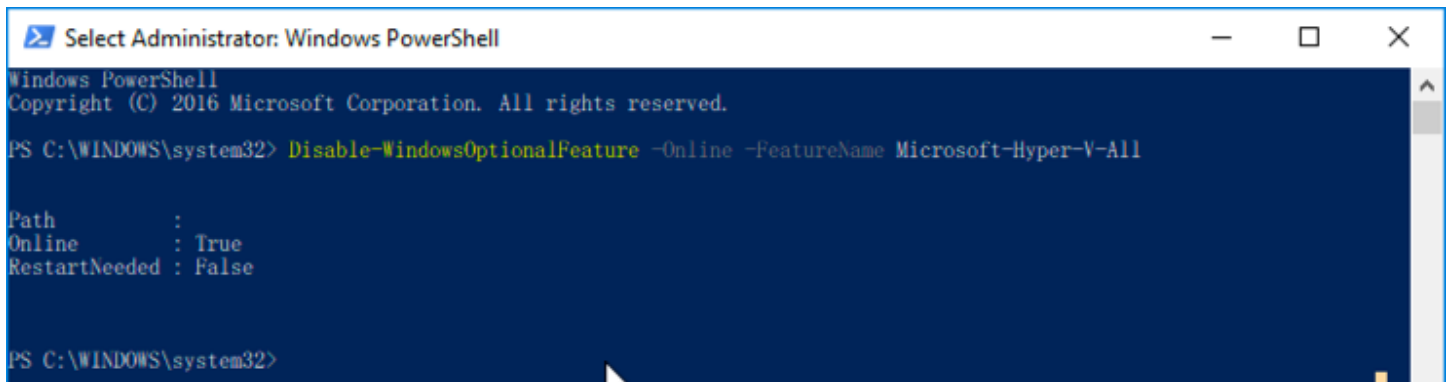

Install Docker Toolbox

1. Open PowerShell by "select windows powershell" and run as administrator

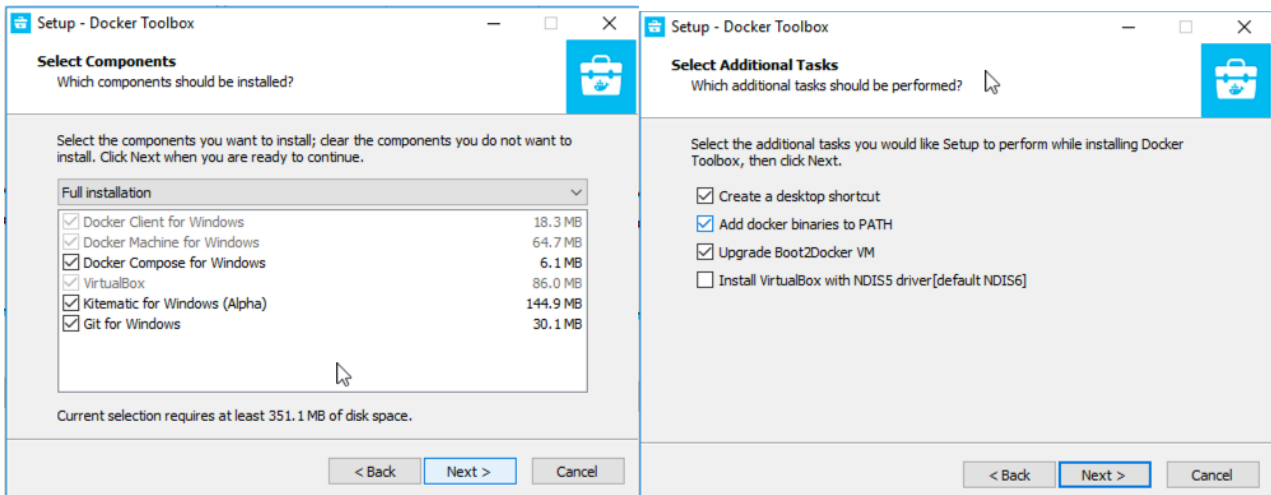

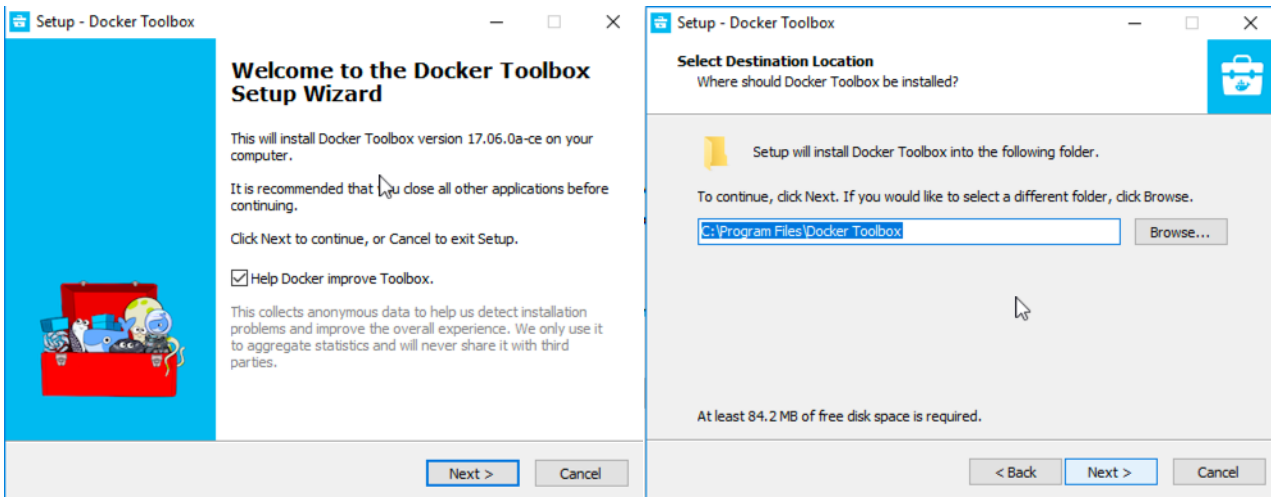

2. Run command "Disable-WindowsOptionalFeature -Online -FeatureName Microsoft-Hyper-V-All"

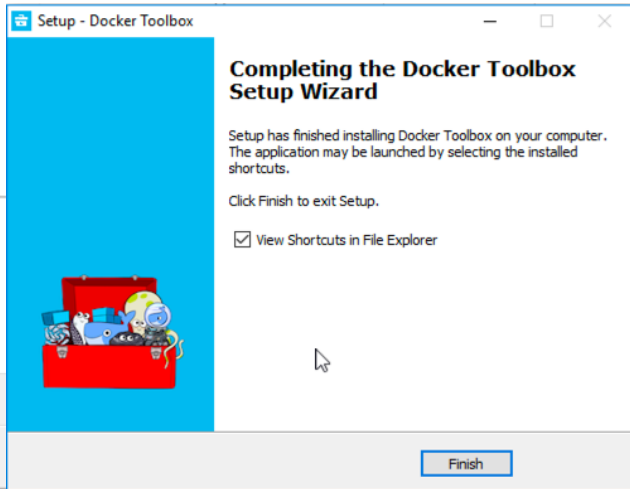

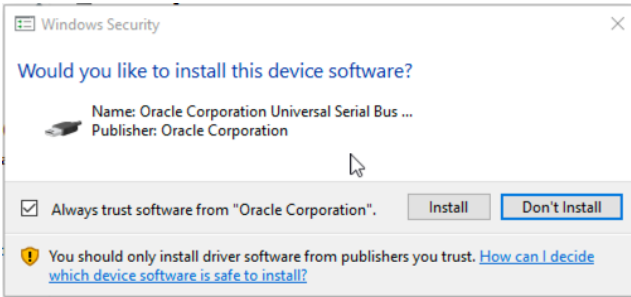

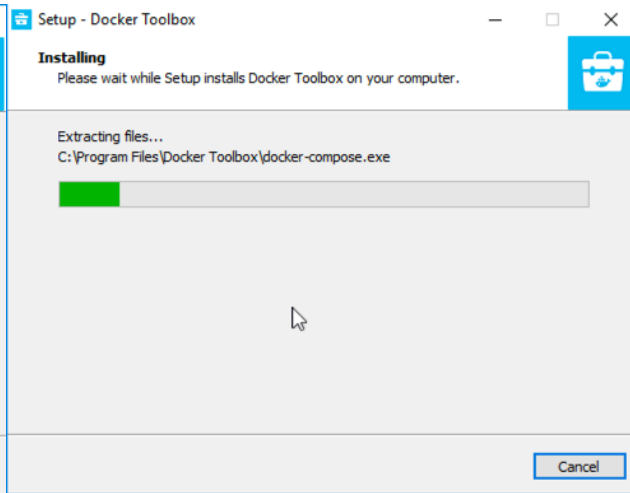

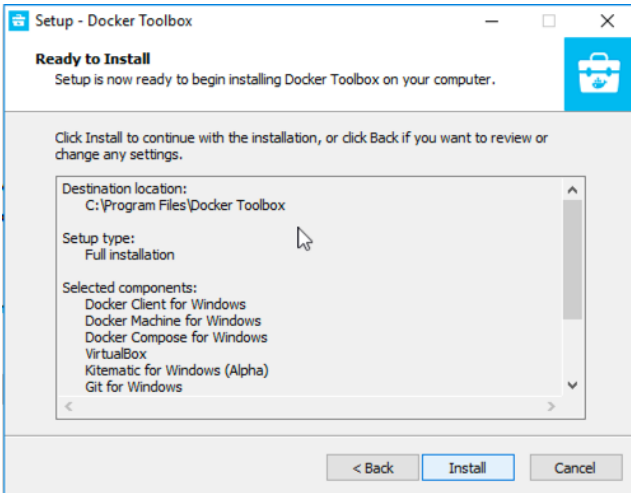

3. Right Click and "Run as administrator" on "DockerToolbox" and confirm "yes" on user account control.

4. Following screen for setup

5. Open command prompt (Run as Administrator) and check version of docker by "docker version"

```
Administrator: Command Prompt
Microsoft Windows [Version 10.0.15063]
(c) 2017 Microsoft Corporation. All rights reserved.

C:\WINDOWS\system32>docker version
Client:
 Version:      17.06.0-ce
 API version:  1.30
 Go version:   gol.8.3
 Git commit:   02c1d87
 Built:        Fri Jun 23 21:30:30 2017
 OS/Arch:     windows/amd64
error during connect: Get http://pipe/docker engine/v1.30/version: open //pipe/docker engine: The system cannot find the file specified. In the default daemon configuration on Windows, the docker client must be run elevated to connect. This error may also indicate that the docker daemon is not running.

C:\WINDOWS\system32>
```

6. Create virtual machine for run as "Docker Server" by command:

docker-machine create --driver=virtualbox --virtualbox-memory "1024" labdocker

```
Administrator: Command Prompt - docker-machine create --driver=virtualbox --virtualbox-memory "1024" labdocker

C:\WINDOWS\system32>docker-machine create --driver=virtualbox --virtualbox-memory "1024" labdocker

Docker is up and running!
To see how to connect your Docker Client to the Docker Engine running on this virtual machine, run: docker-machine env labdocker

C:\WINDOWS\system32>docker-mach
```

g. Test run first container by command: docker run hello-world

```
192.168.99.100 - PuTTY
docker@labdocker:~$ docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
b04784fba78d: Pull complete
Digest: sha256:f3b3b28a45160805bb16542c9531888519430e9e6d6ffc09d72261b0d26ff74f
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
 1. The Docker client contacted the Docker daemon.
 2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
 3. The Docker daemon created a new container from that image which runs the
    executable that produces the output you are currently reading.
 4. The Docker daemon streamed that output to the Docker client, which sent it
    to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
