

Surface Automation Training Setup

Pre-Requisites

- Blue Prism installed locally (version 4.2 or greater)
- Valid Blue Prism license
- New Blue Prism database – This can be a local SQL Express DB or an SQL Server DB. It must not be a shared database and access must be for the trainee only.
- Blue Prism access credentials for the trainee. The trainee must have full privileges within Blue Prism. The default admin ID can be used.

Training Application

The introduction to surface automation course uses only windows calculator and hence, if only this course is required, then there is no need to install any training application.

The main Surface Automation training course uses a windows application. It doesn't need installing just save the application (Surface Automation Training.exe) and the data file (Data.xml) to the default path "C:\BluePrism\Training\Applications\Surface Automation Training".

The application can be saved to an alternative location but if doing so you must update the file location in application modeller. Do this by opening the object **Thin Client Application – Login**, accessing Application Modeller and providing the alternate file path.

Base Objects.

Finally you'll need to import the Blue Prism base objects as these are referenced throughout the training.

Import the release file **Surface Automation Training - Base Objects.bprelease** into Blue Prism via the File-Import menu.
