66These odd things are skew gears... probably just like the ones in the car you drive! The one on your left is badly worn after testing with a top-selling 20W/50. Disturbing! The other is Greham Will only oil for me.99

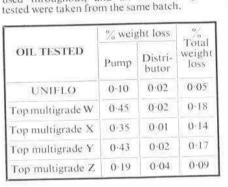

Esso scientists recently carried out systematic tests for skew gear wear. Here, for your guidance, are the results of those tests. SKEW GEAR WEAR TESTS

Some of the exhaustive tests carried out by

Esso-the world's largest oil research organisation-

that convinced Graham Hill that Uniflo gives better

Skew gears drive quietly and make a compact

unit. So engine designers, always seeking to

minimise external dimensions and noise level,

like to use skew gears when components have

to be driven at right-angles to the main drive,

and when the loading is not too high. Oil-

pump and distributor drives are typical

components. If the skew gear driving them is subject to wear, engine performance and

economy deteriorate rapidly, and the ignition

timing has to be corrected continuously to

maintain performance. What's more, the

butor drive - can damage other engine com-

ponents before it is filtered out of circulation.

The same well-known British engine was used throughout, and all the skew gears

metallic debris from a worn skew gear whether in the oil pump drive or the distri-

Distributors, in particular, are precision

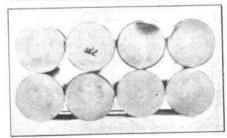

All the time your engine is running, it is wearing out; and the poorer the oil you use, the faster this happens, and the more money you throw away in avoidable servicing and needlessly high consumption of both oil and

Uniflo, for this reason, is the most economical oil you can use. More economical even than the best of the 20W/50 multigrades If you doubt this, here are some facts and figures that will change your mind as they changed Graham Hill's

#### Uniflo and stop-start driving

The great majority of cars spend most of their working life in city crawls and/or stopstart local driving - with the load-bearing components of the valve train constantly under maximum strain. Cams and tappets become subject to component fatigue; clearances widen, shock loads are consequently imposed on the valve gear, tappets become pitted and tiny bits of damaging metal are let loose in your oil. Take a look at these authentic photographs from the Esso research laboratories. Each set of tappets has undergone 150 hours of running at 2,000 rpm, at a controlled oil temperature of 95°C and a controlled water temperature of 80°C.

#### Uniflo on the open road

When an engine runs at high revs for sustained periods, the oil becomes hot and thin and, unless it retains its viscosity at an effective level, it is drawn past the valve guide seals and piston rings and out through the exhaust. It must also have low volatility, or further wasteful loss will occur through evaporation. Uniflo, a super multigrade oil, retains its viscosity better than any multigrade oil you can buy, Unifloalso has a low volatility, Both ways Uniflo cuts down on loss.

Uniflo also protects your engine better against the varnish and carbonaceous deposits that occur under hot-engine conditions; in fact, the new anti-oxidants and detergents in Uniflo's additive mix have set new standards in this area.

#### Uniflo when you start from cold

When an engine is running cold, water vapour and gaseous acids condense to cause rusting - on bores, valve stems, tappets, cams, etc. Uniflo neutralises dilute acids more efficiently, contains special additives which adsorb to metal surfaces, protecting them from attack by water, and also gives total lubricant 'cover' 21 times sooner from coldstart than the next fastest 20W/50 oil. So, here again, Uniflo out-performs all its competitors . . . as you can see.

COLD-STAR Uniflo against Time taken to cold start—I	three leading 2 achieve 100 %	0W/50 oils cover from
UNIFLO 40 secs	OIL A 100 secs	OIL B 207secs

Against every source of damage your engine is exposed to, Uniflo gives the fullest possible protection - and, in many instances, more protection than has ever been given

Uniflo gives better engine protection than anytop-selling20W/50

#### THE COMPLETE CAR AND HOME 8 TRACK STEREO SYSTEM

The most versatile 8 track stereo system vet built for the motorist !!!

MS 5 (A)

Every car eventually feels its age. Bore and ring wear take a growing toll of performance. Mounting petrol and oil consumption, sluggish throttle response, air polluting exhaust smoke. But is engine replacement always necessary? Emphatically-no!

A set of Cords Piston Rings, specially designed for your car model, can transform the engine. Restore compression and performance. Bring exhaust and smoke emissions back to acceptable levels. (All vehicles will shortly have to comply with smoke emission regulations.)

Cords engineers pioneered the multi-piece piston ring. Laminations, each with independent movement, give positive sealing to worn bores and piston grooves. No ordinary ring can achieve a positive seal in these conditions.

Cords Piston Rings, the practical solution at a fraction of the cost of

other methods. Sets for every car. Fit them yourself! Drop us a line today with a 3p stamp for details. We'll also mail you a copy.

Look for this sign and ask for Cords—by name.

Independently published reports all over the world have consistently found the system used by Ronson Electric Shavers to be a cut above the rest.

Now Ronson introduces the same system to battery shavers.

Because our battery shaver uses the same number of cutting strokes as the Ronson mains shaver, and the same micro-thin foil head, it provides you with the same close shave.
As an added bonus it's slim enough to slip

neatly into your pocket.

So now you can shave in the office; the bedroom; or even in the car. And give the family some elbowroom in the bathroom.

The Ronson Battery Shaver, £8-50.\*

# Using last year's maps on this year's roads?

Every motorist knows that Britain's road network changes more and more each year. But, surprisingly, many motorists go on using the same old maps. No wonder they miss the turnings on motorways. No wonder they get stuck in city traffic instead of cruising round the ring roads. No wonder they don't know where to make a Motorail connection.

Get yourself some new Ordnance Survey maps and you'll know exactly where you are. You can't beat Ordnance Survey maps for accuracy and detail...and they're regularly revised.

One inch to ten miles Route Planning maps are ideal if you're motoring long distances. Two sheets cover the whole of Great Britain, and they're revised every year to bring them right up to date. This year's edition shows new motorways, detailed close-ups of access points, the distances between towns, Motorail centres, telephone call boxes, heights above sea level, and all the information of earlier editions made even easier to read. The two maps come complete with a clear plastic gift wallet.

‡-inch and 1-inch to one mile maps are also regularly revised. These maps are really useful for choosing alternative routes to avoid traffic congestion. The One-inch maps are the best multi-purpose maps available. These scales are invaluable for navigators planning rally routes and the like.

Get the latest editions of these superb maps at your usual Ordnance Survey stockist. If you'd like this year's free catalogue, which includes information on our highly detailed 2½-inch to 1 mile maps, please write to:

Ordnance Survey, Dept. 73/A, Romsey Road, Maybush, Southampton.

# A moving experience.

The Gilbern Invader. A new experience in motoring.

### It's amazing what you can pick up with Blaupunkt!

Bosch have a passion for precision. That's why when you buy a Blaupunkt car radio you get precisely what you expect—unequalled quality of reproduction.

The Sandringham, for instance, could easily fool you into thinking you had the entire orchestra travelling with you—every instrument is so distinct, the pitch so perfect.

What comes out of your car radio depends on what goes into it. And, as far as Blaupunkt is concerned, that means years of experience, research and the

finest, most advanced equipment known to man. In fact, what Blaupunkt didn't put in isn't worth considering.

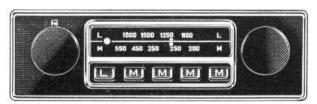

Get a Blaupunkt car radio from any Blaupunkt Dealer. He will not only fit it for you, but answer all your questions too. After all, it's up to him to look after you on our behalf, so we're as precise in choosing him as we are in making radios.

Come and sound us out. You'll soon discover that a Blaupunkt is the finest radio on four wheels!

#### The Blaupunkt Sandringham

Special features not generally available on other receivers enhance both sensitivity and selectivity. Five station push buttons, four medium and one long wave. Continuously variable tone control with bass cut facility for clearer speech at higher speeds as well as treble control. Four watt push-pull output stage giving robust power with low distortion and high quality. Three circuit permeability tuning for better reception of long distance stations. Special protection against high static charges on the aerial. 

Waveband indicator 9 transistors, 4 diodes, 8 circuits 2-stage automatic volume control Connections for car tape recorder and for additional speaker plus fader control Suitable for 12 volt negative earth electrical systems.

Blaupunkt Sandringham - recommended price £33.13

### SEBRING MACH 1. THE MOST COPIED WING MIRROR IN THE WORLD.

A great wing mirror, like any other outstanding product, is likely to have its imitators. Which, as Harry Moss says, is a great reflection on his Sebring Mach 1.

But imitations are never all they seem to be. Because patented features such as the Mach 1's ingenious mounting plate cannot be copied. The handsome shape is also a registered design.

But apart from the handsome shape, and the simple mounting, the Sebring Mach 1 has many

other qualities which make it unquestionably the world's leading, and most popular, streamlined mirror. Just look at any Formula One racing car-chances are it will be carrying a pair of Mach 1 mirrors. Then again this mirror is standard equipment on world famous cars such as Ferraris, Lambourghinis, Alfas, Lancias and Fiats.

The Mach 1 comes in many different styles. You can buy it in metal with a chrome finish, or in

one of many coloured plastic finishes. Choose a flat mirror or a convex one - plain or tinted glass. Recommended prices are modestly from £2.20 to £3.00. Get them through Halfords, good garages and accessory shops.

So even if you drive a copy of a Ferrari, there is no need to put up with a copy of its mirror. Just make sure the mirror you buy is a Sebring Mach 1 from Harry Moss.

Harry Moss (London) Limited, 424 Kingston Road, London, S.W.20.

Gunson's

#### **Exclusive** offers to 'MOTOR SPORT' readers this month

ROAD RUNNER SEATS ONLY £12.80

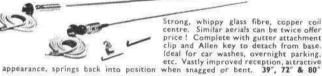

Brand new design offered way below normal list. Comparable quality would cost as much as £25 elsewhere. Strong frame, professionally trimmed in choice of black or tartan cloth. Padded back and sides in black Ambla.

Road Runner 1: Integral, anti whiplash, padded headrest. Road Runner 2: Bucket seat without headrest.

Road Runner 3: Bucket seat with detachable headrest.

SPECIAL PRICE TO 'MOTOR SPORT' READERS: Just £12.80 each !! Headrest £1.50 extra for Mk. 3 seat. Sub Frame £2.50. CARRIAGE FREE.

SKYSCRAPER Lightweight Aerials From £1.50 !!

rong, whippy glass fibre, copper coil intre. Similar aerials can be twice offer-ice! Complete with gutter attachment lip and Allen key to detach from base

SPECIAL OFFER TO 'MOTOR SPORT' READERS: 39" £1.50, 72" £1.99, 80" £2.30. Colours: Black, white, green, red, orange, yellow, blue.

#### PORTACASSETTE Tape Holders. Just £6.50!

Combines tape/cassette holder for in-car or portable use with attractive, padded centre armrest. Unique patented action raises centre rack for accessibility when lid is opened. Steel frame trimmed in padded leather cloth. Two models, Philips or Stereo 8. Simply fitted or removed. Colours red, black or tan.

SPECIAL OFFER TO 'MOTOR SPORT' READERS: £6.50 P. Tax paid. POST FREE.

one piece. Just 2 hours to install, no special tools or skill needed.

Small Cars: Escort, Mini, Imp, etc., £6.75.

Medium Cars: Cortina 1 & II, Marina, 1800, Rover 2000, Capri, Viva Victor, etc., £9.50.

Large Cars: Cortina 3, Hunter, Zephyr, etc., £10.75.

Specials: Rover 3500. Ventora, etc., £11.25.

If it's not listed, we can supply it! Please write.

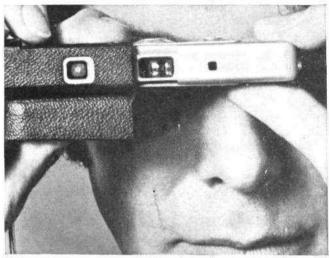

WE ALSO STOCK AN ENORMOUS RANGE OF GLASS-FIBRE PANELS, HARDTOPS & BONNETS. SEND 2×3p STAMPS FOR LEAFLETS

### blaze your own trail with Surfblazer

The looks are space-age with speeds to match.

Surfblazer travels up to 25 mph. Combining all the thrills of water ski-ing with the sheer exhilaration of power-boating.

And safe enough for a child to drive.

Big enough to seat an adult and child in complete comfort. And light enough to travel on top of your car. (only 138lb) Surfblazer.

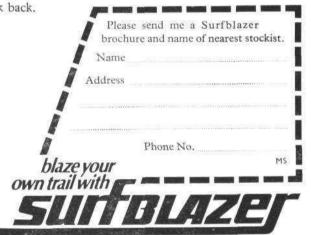

The unique form of family excitement. Put one through its paces.

On the open sea, or on rivers, lakes and waterways.

Feel the sun beating down - the wind in your hair.

You'll soon know what Surfblazer excitement is all about. Blaze your own trail. You'll never

look back.

...do KONI control the other 4?

The steering of your car is in your hands, but its roadgrip and stability is controlled by the suspension and the 4 road wheels. So, if your car tends to judder and bounce and develop a steering wobble, you can accurately diagnose you've got very sick suspension. For which the best cure is a set of powerful Koni shock absorbers.

Koni are best because every Koni is works tuned to give the correct damping force and smoothest ride to each car, and Koni incorporate such exclusive features as special shaft chroming, silent-action valves, patented seal system, constant viscosity oil. Koni are also adjustable.

Konis are made for almost every car. Available through your garage, or send coupon below to sole concessionaires.

#### MATTERS OF MOMENT

#### INDEPENDENT, OR NOT?

The heading applies, not to whether or not Britain should become a member of the EEC but to how long it will be before the live back axle, too lively on many cars, will become as much a museum-piece as the sprag and the low-tension (or for that matter high-tension) magneto. Some years ago Motor Sport was a strong advocate of cars without propeller shafts and campaigned strongly for independent rear suspension. While our enthusiasm for front-wheel-drive for all cars may have been a bit misplaced, the fact remains that more and more small cars, from the irrepressible Issigonis Mini onwards, have resorted to FWD, after a troublesome

period while universal couplings were being devised that would stand up to it. Today customers of BL. Auto Union, Citroën, Datsun, Fiat, Honda, Lancia, NSU, Peugeot, Renault, Saab, Simca, Triumph and Wartburg small and not so small cars have the benefits of being pulled along by the front wheels of their prop.-shaftless cars.

Less progress has been made towards

the elimination of the cross-beam live back axle and cart-type springs but i.r.s. must surely, in the end, oust a system unsuited to the application of power to the road. It may go as front drive takes over, or when design teams take a universal plunge towards the elimination of the old-fashioned back axle. We used to ask Chief Engineers of the great motor manufacturers why they eschewed i.r.s. and were inevitably told that there was no need for it except on the most extreme examples (this with noses in the air, as if evading an unpleasant odour) of high-performance cars; or, more honestly, that it was too costly to contemplate. This seems a line of thought which continues to prevail among the Big Three, except that Ford of Britain eventually got rid of conventional back axles on their largest (Zephyr and Zodiac) models and, in spite of roads tending to become straighter and smoother surfaced, have revised i.r.s. technicalities on their new Consul and Granada cars (Consul GT illustrated above).

All credit to Ford for this advance; BL, Chrysler UK and Vauxhall complacently go on using rigid back axles on their RWD cars, perhaps hoping that the straightening of main roads and the increased Motorway mileage may diminish the driving-time during which the full merits of i.r.s. are experienced. This is a fallacy, because the upward trend in car performance makes it ever more necessary to ensure that the increased power can be put on the road without promoting wheelspin which can upset stability or hold back the available acceleration, apart from the gains in road-

holding and comfort which should be an added bonus of a good i.r.s. layout.

These are simple facts which racing brought into focus, causing i.r.s. to dominate the GP scene after 1935. Indeed, the last Grand Prix to be won by a car with a live back axle was the 1935 German GP, but it took the virtuosity of Nuvolari to achieve this, and the P3 Alfa Romeo he drove had that ingenious dual propeller-shaft transmission whereby the usual half-shafts were eliminated and the differential transferred to the chassis, the considerable reduction in unsprung weight thus obtained contributing materially to better road-holding, in much the same way as the well-located, lightweight live axles of current production Alfa Romeos give such excellent results, albeit the P3's clever back axle did not give the full benefits of i.r.s. as one eminent engineer/journalist mistakenly thought at the time.

With the advent of the very powerful Mercedes-Benz and Auto-Union GP cars i.r.s. became virtually essential and was used at first in swing-axle form, with torsion bars as a later refinement in the suspension damping department. This gave rise to unwanted oversteer, which both makes eradicated by resorting to de Dion rear axles. The low unsprung weight and lack of torque reaction between the drive unit and the axle which is the merit of i.r.s. was retained but the wheels lost their

MATTERS OF MOMENT-continued from previous page

gyroscopic effect and could be located so as to promote understeer. which is also achieved by i.r.s. systems employing trailing arms and additional universal joints. It is significant that de Dion rear suspension has been used by Lancia and Maserati on production cars and is still favoured by Aston Martin, Iso, Monteverdi and Rover. (Incidentally, the Mercedes-Benz racing engineers soon eschewed sliding splines for the driving shafts in favour of de Dion-pattern universal joints, and in the modern Rovers a splined de Dion tube is used in conjunction with fixed-length-drive-shafts. Softer suspension and hydraulic dampers were another racing-car-fostered development at this time.)

Refraining from a long historical discourse about the evolution of i.r.s., and pausing only to pay homage to those pioneer layouts which come to mind, such as those of Rumpler in 1921, Mercedes-Benz in the early 1930s, W. O. Bentley's Lagonda after the war, Triumph's Herald in 1959 and Chevrolet's Corvair in 1960 we can now list those enlightened manufacturers who use i.r.s. on current catalogue Panhard-

FORD PROGRESS.—After beginning life with a live back axle, the Ford Zephyr was later provided with the i.r.s. system seen on the left. The new Ford Consul and Granada cars use a revised i.r.s. layout depicted in the sketch above.

layout cars (ignoring FWD designs in which the need for i.r.s. is materially lessened and rear-engined vehicles which are virtually forced to adopt it), as AC, Bentley, BMW, Chevrolet Corvette, DAF, Daimler, Datsun 240Z, Fairthorpe, Ferrari, Fiat 130 and Dino, Ford Consul and Granada, 3-litre Ginetta, Jaguar, Lamborghini, Lotus Elan, Mercedes-Benz, NSU Ro80, Peugeot 504, Renault 16, Rolls-Royce, Triumph and TVR.

It seems high time for others to follow suit! Ford of Britain are to be congratulated on using improved i.r.s. on their competitivelypriced Consul and Granada. Someone who had just sampled the 3-litre V6 version of the latter remarked to us that its handling reminded him of a Mercedes-Benz, the improved sense of control and higher cornering power having been achieved without recourse to a harsh ride. It will be interesting to assess the situation five years hence, when we shall expect more manufacturers to have gone over not only to i.r.s. but to self-levelling suspension systems as provided by Citroën from 1948, Packard in 1955 and by Citroën, Rolls-Royce and Mercedes-Benz

at the present state of play. As it is, much enlightenment has resulted since the last vintage year, when only 1.57% of cars on the British market had independent front suspension (today only the Range Rover employs a beam front axle) and leaf springs were almost universal. Forty years later a surprisingly large number of cars still resort to springing uncharged in principle since the era of donkey carts, but one must not be too critical, for even here advances have been made, in the use of single-leaf springs, etc., as no doubt Jonas Woodhead would be only too happy to point out. . . .

#### FORD'S SPLENDID SAFARI

Congratulations to Ford on not only winning outright the E. African Safari (report, page 470, pictures centre-section) as well as taking the important Team Prize, with their Escorts-thereby stemming the Japanese invasion of this toughest of "customer-relations" International Rallies, but to Mikkola and Palm for at last breaking the legend that non-residents cannot win the Safari. (Even if they did have fan-belt anxieties, which in vintage times the more enlightened designers obviated by using positive drives for fan, water pump and dynamo-one such car was the 12/20 Calthorpe and no doubt some of our readers could add others.)

We have long regarded Ford as the leading supplier of practical transport for the masses since 1908, the year the immortal Model-T was introduced, and more recently Ford has added sound sporting saloons for those who favour cars with a bit of beef.

General Motors, whose cars seem to us stodgy in comparison with those of the scripted four-letter make, do not officially condone competition work but it is significant that their Opels, which are the exception to the foregoing premise, have been doing well in the important rallies. Moreover, if we were Lord Stokes we would want to pit our advanced-engineering conceptions, from Minis to transverseengined-sixes, against the all-conquering Fords.

Meanwhile, salutations to Ford of Britain, not only for coming out top in the Easter Safari which eliminated 67 of those who started, but for releasing immediately afterwards realistic advertisements advising customers that Escorts can be seen and tried at Ford Showrooms. The Safari victory may not be apprehended by many thousands of Escort owners but a great many of them must have felt a justifiable glow of pride when the results came through and, although the Escorts you can buy are not exactly patterns of the Safari Ford as driven by Mikkola and Palm, the Company's engineering and organisation which enabled it to win the Safari must surely pay off in terms of good consumer

#### SCHRADER'S ENERGY SAVER

THE other day I came upon the Continental Correspondent standing by a four-cylinder car the engine of which sounded as if it was idling on two cylinders. "No, on three", he said, in reply to my look of alarm. It transpired that he was inflating the tyres of an older car from one of the cylinders of the engine I had heard, using a Scovil Schrader Spark Plug Air Pump.

There is nothing new in this, which is a simplification of those little inbuilt air-compressors incorporated in certain luxury cars such as the V8 De Dion Bouton, the big Packards, post-war 20 h.p. Wolseley, etc. I then remembered that last year we had been sent this Schrader Spark Plug Air Pump for test but I had discarded it as a gadget which would probably pump carbon and hot gases into the tyre it was blowing up. I should have known better of A. Schrader's Son, who have made such excellent tyre valves and such sensible valve caps for so many years. It was pointed out to me that an ingenious ball valve is used, which passes only fresh air as the immobilised cylinder into which it is screwed by hand, in lieu of the sparking plug, converts it into a miniature air-pump. There is a tube long enough for a car to inflate its own tyres or those of another car beside it. This clever air-pump is also a splendid energy saver for inflating rubber boats, tents, etc. The Type 8888R comes without a pressure gauge, in a light blue wallet. Type 8888RG incorporates a gauge and is packed in a black wallet. The respective prices are £1.99½ and £4.28, which is less expensive than buying a decent pump and a tyre gauge and much less exhausting to the user! The air-pump has three thread sizes, 18 mm., 14 mm. or compression-top diameter and it can be used for inflating liquid-filled tractor tyres providing the adapter is put on and taken off the tyre valve while the engine is running. The makers of this very worth-having accessory are A. Schrader's Son, 829 Tyburn Road, Erdington, Birmingham B24 9NZ.

#### AMERICAN COMMENT

May means Indianapolis

IN THE American World of motor racing the month of May means just one race-the Indianapolis 500-held on May 27th, with qualifying on the two previous weekends. Indiana's legendary "Brickyard" always attracts a huge crowd and this year looks like being no exception with an exciting line-up promised, and speeds higher than ever.

In tyre testing, early in April, Bobby Unser lapped his new Olsonite sponsored Eagle faster than anyone has ever circulated the 2½-mile oval track before. The turbocharged Offy powered machine stopped the watches at 47.176 sec., an average speed of 190.8 m.p.h. (last year 180 m.p.h. was topped for the first time) and had previously lapped the smoother and faster 21-mile Ontario Motor Speedway oval in 196.9 m.p.h. average. The latest Eagle has been proved in competition too for, in the opening round the USAC Championship at Phoenix, Arizona, Unser was the clear winner. Indianapolis is the third round in the 12-round USAC Championship but by far the most

Other drivers who have the latest 1972 Eagle chassis are equally delighted with the speeds being obtained. Jim Malloy, whose Eagle is known as a Thermo-King Special, was another to post good times during the Goodyear tyre sessions at Indianapolis. He did a 25-lap continuous run with a full fuel load to average 185.015 m.p.h. Unfortunately it seems that plans for Britain's David Hobbs to drive one of the new Eagles have fallen through.

While the high flying Eagles start favourite at the moment, no one is overlooking the Maurice Phillippe designed Viceroy Specials, which will be handled by Mario Andretti, Al Unser and Joe Leonard. The cars have a most unusual appearance with two side wings which are mounted at 45 degrees to the horizontal and contain within them the oil radiators. The car gives a very bulbous appearance with its side radiators fared completely into the sides of the monocoque and fed with air by large NACA ducts. Although some pictures of the car have been released not too much is known of the suspension yet but it is thought to be far from conventional. Phillipe, of course, was responsible for the torsion bar lay-out on the Lotus 72 Grand Prix cars.

Parnelli Jones, who team manages and masterminds the Viceroy effort, is maintaining a strict security about the project but early tests seem to be very satisfactory. Mario Andretti first drove his car at Ontario Motor Speedway just hours before he caught a Jumbo jet from Los Angeles for London so that he could take part in the BOAC 1000. At Brands Hatch he was very enthusiastic about the project. No doubt after a year with the rather uncompetitive McNamaras, from the STP team, Andretti is pleased to be back in a car with a chance of victory.

Last year it was the McLaren team from Colnbrook who set everyone talking and this year they have a development of the trend-setting M16 model. The works Gulf orange car of Peter Revson (who set pole position last year) plus the Penske prepared examples for Mark Donohue and Gerry Bettenhausen have not been in the news nearly so much this year but there is no doubt they will be amongst the front runners for the Memorial Day event.

Another British firm taking part at Indianapolis this year is Lola. They have an enviable Indianapolis record, including designing the winning car from Graham Hill in 1966, but last year they gave the race a miss. This year Eric Broadley says he just wants to keep a finger in the pie and has designed and built two cars to customer order. They will be powered by Ford V8 engine which are presently considered the underdogs compared with the timeless Offy units. But Broadley's cars have a knack of doing well at Indianapolis although it still hasn't been disclosed who the customers are. Best guess at the moment is that Andy Grantelli's STP outfit will be involved.

STP themselves have been very much quieter than usual about their Indianapolis programme, possibly because they have lost the services of Mario Andretti and their promising up-and-coming driver Steve Krisiloff. The latest story is that they will be providing a car for the New Zealand driver Graham McRae, who won the Tasman Series with his Leda F5000 painted in STP colours. There is also vague talk of them trying to tempt Ronnie Peterson into a car. It seems that McRae will drive one of last year's McNamaras while the second driver, be it Peterson or not, will be in one of the new Lolas.

Every year, quite a few British enthusiasts make the pilgrimage to see this race, and some years ago there was a direct telecast to some British cinemas. Unfortunately this idea was dropped but it should be possible to pick up commentary of the race on the AFN broadcasts from Germany .- A. R. M.

#### BOAC 1000

#### Third Successive Win for lckx and Andretti

A FEATURE of the BOAC 1000 was the tremendous efficiency of the Ferrari pit stops. Here Regazzoni runs back to the pit while Redman clambers aboard. A Firestone technician checks the tyre wear while Ferrari mechanics add fuel and check the oil level. Ferraris completed pit stops of this nature in little over 20 sec.

BRANDS HATCH, April 16th.

FERRARI'S complete domination of the first year of 3-litre prototype sports car racing continued in the BOAC 1000, Britain's single contribution to the World Manufacturers' Championship. The bumpy Brands Hatch Grand Prix circuit proved kind to the field and both Ferrari and Alfa Romeo brought home all three of their cars, although the three Cosworth V8-powered machines all faltered. It was the story very much as before with the well-established pairing of Ickx and Andretti scoring their third consecutive victory with Peterson/Schenken logging up a third consecutive second place. Again it was Redman and Regazzoni who ran into trouble, this time in the closing stages, when engine trouble dropped them from a secure second to a distant fifth place. The Alfa Romeos finished third, fourth and sixth.

The entry was confined solely to Group 5 cars in direct contrast to the two previous rounds of the Championship in Florida. There was only two classes; over 3-litres and 1,300-3,000 c.c. Ferrari started strong favourites and looked every inch the part with their team of three 312Ps. Ickx/Andretti had their Daytona winning car, Redman/ Regazzoni were also in their Daytona car while Schenken/Peterson were given a brand new machine (chassis 0894) which had not been raced previously, but was to exactly the same specification.

Carlo Chiti's Autodelta outfit came straight to Brands Hatch with their three Sebring race cars, all having been fitted with fresh engines which have been modified to give a better pick-up lower down. All the drivers seemed pleased with the modifications. De Adamich doesn't seem very keen on being half of an all-Italian driving duo any more, so an amendment to the published programme was that he was paired with Elford for this occasion. Thus Marko was to drive with Galli, while the Revson/Stommelen team remained unchanged. With Alfa Romeo only running three instead of their normal four cars, Hezemans was listed as a reserve but actually turned up in a 23litre car.

Ecurie Bonnier were back to two cars, fielding their regular Lola T280-Cosworths for the pairings, Craft/Larrousse and Wisell/Bonnier. Right from the beginning of practice the team looked patently unprepared for a 1000 km, and only an optimist would have expected the cars to last the distance. Although barely three months old they look as if they have led an incredibly hard life; such is their preparation.

Gulf Research Racing had whisked their Gulf-Mirage back from Sebring and had managed to fit in some testing at Goodwood prior to Brands Hatch. This had given them food for thought and various suspension problems, such as spring rates, still need sorting out properly. But at least the blue and orange machine looked well turned out for drivers Bell and van Lennep.

The 3-litre category was completed by two Porsche 908s, but not ones previously seen this year. The experienced German driver Jöst has acquired an ex-works Porsche 908/3, reputed to be the Nurburgring 1000-km.-winning car from last year, and still painted in JW colours. Jöst's co-driver was the experienced and wealthy Italian, Casoni. An older 908/2 was in the hands of two amateur Austrian drivers, Otto Stuppacher and Kurt Reider, and was entered by the Bosch Racing team, this being the car that Niki Lauda used

The 2-litre category was rather disappointing for the Red Rose Racing team, who did so well in Buenos Aires, had decided to give the race a miss as had various of the new 2-litre Lola T290s which are under Bonnier's wing in various guises. In fact only three of the 2-litre entries had come from abroad, making it more like a British National meeting. The Osella Abarth team brought along just one of their latest machines, now with a Hewland gearbox, for Merzario and Hezemans. A second Abarth was entered by Scuderia Brescia Corse for Franco Berutto/Mario Ilotte but, on inspection, this turned out to be a much older example with the engine hung behind the rear axle.

The majority of the remainder were either Lolas or Chevrons. By far the most professional of these was the entry made under the name Barclays International Racing with Lola Cars. This was a worksassisted Lola T290-FVC and regular driver Guy Edwards (who was responsible for persuading bankers Barclays International to sponsor his car) was partnered by the very experienced David Hobbs. The only other Lola was an older T212, with a BMW engine, entered by Dorset Racing Associates for Birchenhough/Joscelyne.

The Chevron contingent was stronger, with brand new B21s for the Swiss pair Peter Ettmuller/Walter Frey and Scotsman Andrew Fletcher who recruited Irish F2 driver, John Watson, as his co-driver at the last minute. In the similar looking but older Chevron B19s were John Lepp/John Burton, Brian Robinson/Francois Migault, John Bamford/Brendan McInerney, Peter Smith/David Welpton, Peter Humble/Nick May, and Peter Gaydon/John Gray.

The category was completed by near-specials like the perennial Dulon-Porsche for Martin Ridehalgh/Herve LeGuellec, a Gropa-BMW for Lanfranchi/Markey and a Daren-Lotus Vauxhall LV240 for Arthur Collier/Henry Clarke. Several other 2-litre cars were entered but failed to show up, although none looked likely to offer much of a challenge.

There were practice sessions on both Friday, in the afternoon, and on Saturday when the proceedings also provided a very exciting Formula Atlantic race. This was won by Vern Schuppan's March, after McLaren engine builder John Nicholson crashed heavily in the Lyncar, a new design from Martin Slater, who is now making his own cars.

Practice proved to serve little except the superiority of the Ferraris and the amazing speed of the 2-litre Abarth. As soon as practice started on Friday afternoon the Ferraris, Alfa Romeos and the Abarth, were circulating somewhat gingerly on the damp track while, in direct contrast, the Bonnier Lolas were far from ready, still having the new regulation rear mud flap extensions fitted to their bodywork. By the end of the session the track had dried out, and Ickx was the fastest of

the Ferrari drivers at 1 min. 28 sec. The Ferraris also filled the second two places and Alfas the next three with the Abarth of Merzario/ Hezemans seventh fastest ahead of the three Cosworth V8-powered

John Lepp crashed heavily in the Central Garage (Mirfield) Chevron and damaged it too badly to take any further part in the race while the Daren-Vauxhall also left the road.

Times fell on Saturday with Regazzoni the fastest in the morning session, at 1 min. 27.0 sec., while Revson showed some Alfa promise by recording second fastest time. However, the final session put everything in perspective with the Ferraris finishing up with the first three starting positions. Regazzoni was fastest of all with 1 min. 26.6 sec. while team-mate Redman did 1 min. 28.0 sec., Ickx and Andretti showed what a well-balanced team they are with Ickx lapping in 1 min. 26.8 sec. and his American partner in 1 min. 27.0 sec., Peterson and Schenken were not very happy about the handling of their new car and their respective times were 1 min, 27.4 sec, and 1 min, 29.2 sec. These compared with Regazzoni's pole position time in a Ferrari 512M last year, of 1 min. 27.4 sec.

The best Alfa Romeo time was recorded by Peter Revson, who finished up fourth quickest at 1 min. 28.1 sec. (Stommelen was 0.7 sec. slower), while the Bonnier Lolas started to show promise with fifth and sixth fastest times. Craft, in his last appearance for the team, lapped in 1 min. 28.3 sec. and Wisell in 1 min. 28.5 sec., although their respective co-drivers were somewhat slower. Seventh fastest overall was the 2-litre Abarth; Merzario lapped the impressive machine in 1 min. 28.6 sec., embarrassingly faster than either the de Adamich/Elford or Marko/ Galli Alfa Romeos. Completing the fastest ten was the Gulf-Mirage which was suffering from all kinds of handling problems mainly connected with unavailability of the correct springs-indeed some Porsche 917 coils were fitted on the rear.

With a minimum of National publicity the race failed to attract much of a crowd on the warm and sunny race day. The 12,000 spectators who turned up (compared with 17,000 for last year's wet race) were obviously the real enthusiasts. It was pleasing to see that two or three parties of British fans had made up "Lola for victory" signs, just like the Italian race fans, who can be seen at Monza, Monaco and elsewhere, with similar "Viva Ferrari" banners. But, for the British fans, theirs was something of an optimistic hope, a fact underlined when one looked at the preparations made in the pits for the routine stops. Ferrari, Alfa Romeo, Gulf and the Bonnier team all had pressurised refuelling equipment and Ferrari also had pressurised systems for topping up engine and gearbox oil. For the engine oil, each car had an oil level indicator on the side and the tanks had quick fill non-spill attachments, which have oil pumped in them from a tank carried on a mechanic's

back. Ferrari, along with Alfa and JW, also had compressed airoperated wheel-nut wrenches while Bonnier's team were relying on a good old, but slow, hammer method so they were obviously going to lose out in this respect.

The field was allowed several bedding-in laps before lining up behind a new Cortina for the rolling start. When the pace car, driven by the BRSCC's new executive director Peter Browning who had taken over from Nick Syrett, pulled into the pit road the two-two-two line up was fairly well behaved, although the Swiss-entered Chevron has failed to start with its wiring burned out. As the flag dropped the field accelerated away with the three Ferraris going immediately into the lead. Regazzoni headed the field, in front of Ickx, with Peterson third ahead of the Alfa Romeos, the Abarth and the Lolas which were all mixed up and jockeving for position. The Gulf-Mirage was well down the field, Bell looking most unhappy, and after only five laps the car made a pit stop with overheating. Even by then the two leading Ferraris had pulled out a gap over Peterson's car with Revson, in fourth place, coming under pressure from both Lolas with Craft leading Wisell.

The Mirage problem seemed fairly serious for the 12 series Cosworth engine, fitted overnight, seemed to be pressurising the water system and, when the radiator was bled, great jets of water and fountains of steam issued forth. The whole thing looked rather sorry and some wag suggested that the Gulf team never had these sort of problems with the Porsche 917s! Finally the car got going again but was soon back in the pits and the problem was not solved until the radiator was changed. By then the Mirage was miles behind with no chance of a placing.

Regazzoni continued to hold the lead for a while but all the time had Ickx on his tail, and the Belgian slipped by on lap 41. Peterson was some five seconds in arrears and was having to drive hard to fend off the challenge from Wisell in the Lola. A couple of spins had dropped Craft down the field and then, with 35 laps completed, he trundled into the pits with the lower right rear wishbone fractured. This was quickly removed and then the shambolic Bonnier outfit realised that they did not have a spare. The car was wheeled out of the pits on a jack and later the wishbone was welded up and fitted back on the car, but only so it could be loaded on a transporter. The Abarth was another disappointingly early retirement. After worrying de Adamich for sixth place, Merzario missed a gear and over-revved the engine which immediately went sick and the car was retired.

On lap 50, with the Ferrari team poised to make their first refuelling stop, the order was Ickx, Regazzoni, Peterson, Wisell, Revson, de Adamich, Galli, Jöst and then Edwards in the 2-litre Lola. Peterson was the first Ferrari to stop, and took just over 20 sec. to take on fuel and switch drivers, but Regazzoni was the next and took longer as Redman's safety belts presented a problem. Finally Ickx came in on

THREE TIMES winner in long-distance racing already this season is the pairing of Jacky Ickx and Mario Andretti. Here is Andretti lifting the inside front wheel at Clearways.

lap 53 and thus Wisell moved into the lead with the yellow Bonnier Lola. Of course, the glory was only short-lived and, on lap 59, Wisell came in for his pit stop and Andretti took the car he was sharing with Ickx back into the lead. It turned out to be a lead that it was never to lose for the remainder of the race. Meanwhile, the Wisell pit stop was a disaster for it lasted over three minutes, as the team struggled with the re-fuelling equipment, and at one stage Bonnier got showered with fuel. In fact it was Larrousse who took over the car, rather than Bonnier who was scheduled to do so but, by then, the Lola had slipped down the field several places.

After these first pit stops the order settled down through to the 100 lap mark with Andretti/Ickx in the lead, by over half a minute, from Regazzoni/Redman, who now had Peterson/Schenken close behind them. One lap down was the Stommelen/Revson Alfa, followed by team-mates Elford/de Adamich, with the Wisell/Larrousse Lola sixth but on the point of pulling into the pits where the rear suspension was inspected. The Mirage had stopped out on the circuit and Bell sprinted back for another ignition box and finally got the car going again. It later spent another long period in the pits with gearbox and gearlinkage problems. So the challenge to the two Italian teams was completely exhausted by half distance, for the Lola was soon retired with a broken shock-absorber.

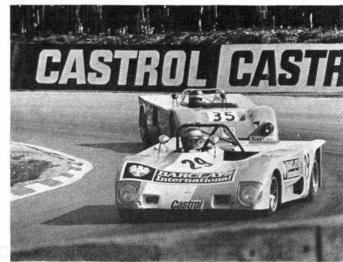

By the 150 lap mark the Ferraris were in a tremendously strong position, still running in the same order on the road, and on the same lap. At the second pit stop the Schenken/Peterson car had briefly moved up second place but this was reversed when they, themselves, stopped, the Ferrari pit stops again being a model of efficiency. The Revson/Stommelen, de Adamich/Elford and Galli/Marko Alfa Romeos were all running well and without problems but just lacked that extra

The Jöst/Casoni Porsche 908/3 had dropped out with a broken engine mount while the Barclays Lola T290 had lost some time with brake problems as soon as Hobbs had taken over from Edwards. Thus, they were now eighth, a couple of laps behind the smooth-running Chevron B19 of Robinson and French Formula Two driver, Migault. Two further Chevron B19s, those of Bamford/McInerney and Gaydon/Gray, filled the next two places although the latter car had lost considerable time with a jammed starter motor. The fast Fletcher/Watson Chevron had dropped out with a broken brake hose, soon after F2 man Watson had taken over and thus the car dropped from third in class.

With just under an hour remaining, and 200 of the 235 laps completed, the Ferraris had all made their third and final routine stop. Pit signals had beckoned the drivers to slacken their pace considerably and this they had done. Andretti/Ickx were still in the lead, with half a second over Redman/Regazzoni, and had just lapped the Schenken/Peterson car, so that the first and third cars were circulating in convoy. The Mirage was now running quite well and Bell was seen to overtake the Alfas, though many laps down. The Alfas, however, were firmly ensconced in the next three positions although Marko was running into brake problems.

The final hour produced some late excitement when Regazzoni suddenly made an unexpected pit stop, with a misfire and an oil leak from the gearbox. Three further stops followed, during which time a new coil was fitted and the electrics adjusted and, at one stop, there was a good deal of shouting by Ferrari personnel after a misunderstanding with a scrutineer over the oil leak. These stops dropped the Ferrari to seventh position. Marko was still troubled by brake trouble and lost time while the left caliper was removed and inspected.

Thus the race came to a close with the Andretti/Ickx and Schenken/ Peterson cars crossing the line side by side, although a lap apart. In the pits the Ferrari crew were actually ready to top up the second place car but this was not necessary. Only a lap behind Schenken/Peterson was

DAVID HOBBS is pictured in the Barclays International Lola T290 which he shared with regular driver Guy Edwards. They were delayed with brake problems but were awarded the 2-litre class victory after another car was disqualified. Following is the Chevron B21 of the Swiss drivers Ettmuller and Frey,

the Alfa, driven so well by Revson/Stommelen and, two laps behind that, was the similar Elford/de Adamich car. Although overshadowed the Alfas had shown their best form of the season.

Placed fifth was the consistently well driven and reliable Chevron of Robinson/Migault, which was just ahead of the ailing Regazzoni/ Redman Ferrari and the almost brakeless Marko/Galli Alfa Romeo. These three cars all finished with 220 laps to their credit, two more than the Hobbs/Edwards Lola which also finished the race without any brakes. Ninth was the Worcestershire Racing Association Chevron of Bamford/McInerney, well ahead of the reliable, but slow, Austrian Porsche of Stuppacher/Rieder. The Gray/Gaydon Chevron was next followed by that driven by Ettmuller/Frey, which would have been much higher had it not started half an hour late. The old Abarth staggered into the pits with the engine making terrible noises just before the end but was still classified 13th ahead of the Ridehalgh/LeGuellec Dulon-Porsche which sounded dreadful from early on. The final finisher was the Mirage but, with only 117 laps to its credit, it was not classified.

In post-race scrutineering the weight of the fifth place Chevron B19 was found to be 40 lb. under the limit for 2-litre cars. There was a possibility of the entrant only being fined for this breach but the matter was not helped when an attempt was made to smuggle some ballast into the car. Thus it was disqualified completely from the results and everyone behind moved up a position and the Edwards/Hobbs Lola inherited the 2-litre class victory.

For the first time in several years the lap times at the BOAC 1000 were recorded and, thus, we were given a new outright sports-car record of 1 min. 27.4 sec., which was credited to all three Ferraris. Merzario was also credited with a new 2-litre record set up in the early stages.

The BOAC 1000 of 1972 will not be remembered as a classic or exciting race (no cars retired following accidents) but just another chapter of the successful Ferrari onslaught of the 1972 World Manufacturers' Sports Car Championship.-A.R.M.

466 MOTOR SPORT, MAY 1972

#### LETTER FROM EUROPE

By means of which the Continental Correspondent, while he is motoring abroad, keeps in touch with the Editor.1

Dear W.B.,

Although it is now the month of May and this is the first Letter from Europe to appear in 1972 it is not because the sporting scene was slow to start, far from it, for it began in the middle of March, more of which anon, but the continual cry of the British worker for "more money and less work" caused the April Motor Sport to be closed for printing just as racing was getting under way.

There appears to be a continual feud going on between Brands Hatch and Le Mans, as if each is trying to prove who is the strongest, so that every year seems to start with a clash of fixtures. First it was the BOAC 1000 and the Le Mans Test-Weekend and this year it was the Test-Weekend and the Race of Champions, and this time they came out about equal, both fixtures being pretty mediocre. Ferrari, Matra and Alfa Romeo are taking Le Mans very seriously this year and were out all weekend testing cars and equipment in preparation for the 24-hour event in June, the first two firms considering the practice weekend to be more important to them than the Race of Champions, Ferrari in particular being a surprise in view of the fact that Regazzoni won the race in 1971 and both he and Ferrari are immensely popular with the English crowds at Brands Hatch. The Ferrari team manager expressed the view that they had more than enough to do without getting involved in racing at Brands Hatch, and as they had two 312P prototypes at Le Mans and even at that moment there were three more on their way to Sebring and the Grand Prix cars had just got back from testing at Jarama, in Spain, he was not exaggerating.

With only one Champion competing at Brands Hatch the name should have been changed to the Race of Debutantes, and anyway it sounded as though the event was merely a formal completion of the race that had to be abandoned last October. It was a very busy weekend to open the European season for apart from the two big events there was the first round in the European Mountain Championship, this time at a new hill at Ampus-Draguignan down in the Provence area. Although it was the first time it has been used as a Championship event it has been in use for many years as a French National event. At Montlhéry there was a French club meeting of short mixed races, and at Monza the annual 4-hour saloon-car race that starts off the European Touring Car Championship. My feeling is that too much started too early for the overall picture was one that cannot have given much encouragement to new spectators to the sport. Brands Hatch seems to have been a sea of officialdom and protests and disqualifications and re-instatements, and general confusion by all accounts, as for the RAC rule that requires Shell to say to the Texaco-fuelled F3 cars "If you don't wear our stickers you can't play". It was nearly as bad at Le Mans with Cevert having to put sticky tape over the ELF TEAM TYRRELL on his overalls before he could drive the Matra on Shell petrol.

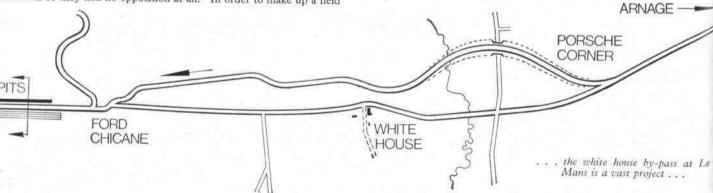

Having got the public (and there were a lot of them) to Le Mans the A.C. de l'Ouest felt they ought to give them something more than just allowing them to watch Ferrari, Matra and Alfa Romeo at work. Last year they organised a 3-hour race on the full circuit for the 24-hour competitors and it fell flat on its face. This year they extended it to 4 hours and it did the same thing from an even greater height. Bonnier and de Fierlant shared a tired Lola T280 that only lasted 4 hours because fuel starvation was keeping the revs down to 7-8,000 r.p.m. and even so they had no opposition at all. In order to make up a field

some local amateur drivers were allowed to join in and one was driving a Mazda saloon. Poor fellow, he could not keep up with the 911 Targa Porsche pace car on the warm-up lap, his car just was not fast enough down the Mulsanne straight. At Brands Hatch there were a couple of good races spoilt by rules and regulations, protests and scrutineering. As I said both meetings seem to have been pretty mediocre and at Monza the Touring Car Race was not much better, with no serious opposition to the German works Ford Capri. Looking back on it all I really began to think that the time had come to abandon motor racing altogether. If that weekend was the best we could do to open the European Season I thought "why don't we all give up and do something more useful," and sitting watching it all because Brands Hatch refused to pay him more than he was worth was Stewart the current World Champion, out of work for that weekend, but not on the dole I imagine.

In an article on circuit alterations last month, I said that the Le Mans club were once again going to show their strength with the by-passing of the White House ess-bend. Not only have they by-passed it, they have built an entirely new length of circuit that bears no relation to the White House bends, nor to the Le Mans circuit in general. There must be more than a mile of new road, laid out to the standard Autodrome specification as recommended by the CSI and running from the beginning of the slight slope after Arnage, to the middle of the "Ford Chicane" at the beginning of the pits. From the normal public road leaving Arnage you suddenly arrive on a vast open space with the new road sweeping off to the right onto an embankment. This bend has been named Porsche Corner and there is enough run-off area and catch nets to arrest a wayward 917 from 200 m.p.h. The new road then turns left on the high embankment and descends gently over a bridge crossing one of the internal roads, then turns right and left in a double ess, down a length of straight, to a "chicane" that feeds into the "Ford chicane," so that you arrive at the pits straight almost stationary from a very sudden left-right, left-right, series of sharp corners. The new road is wide and flat with white edges, a large flat earth area on each side and then the recommended double guard rails. The whole section is hygienic and clinical and could be Jarama, Paul Ricard, Nivelles, or Hockenheim, but at least it is on private ground so it is safe from interference, though closed to you and me in our private cars.

The work involved and the cost must have been astronomical and had the whole project been looped round into a continuous road it would have been acclaimed as a splendid new and safe Autodrome; as it is the whole affair merely removes the very fast White House ess-bend from the classic Le Mans circuit, and in the pits or public enclosures beyond the start you would not know it exists.

On the way to Le Mans I looked in at the fine circuit of Rouen-les-Essarts and a handful of workmen were busy building a new road through the paddock, behind the existing pits, thus solving the pit problem that has been worrying the Automobile Club of Normandy. The pits straight, on which the start and finish are situated, is a main road and a bit narrow for the speeds that can be attained on it and no one wants to slow it down for it leads to the splendid downhill series of swerves that run down to the Nouveau Monde hairpin. The faster you can go through the pit area the braver and more skilful you have to be to start the descent right, and keep it right all the way down to the bottom. This section of the circuit is an example of racing driving at its best and if you do away with it you might as well give up motor racing. As John Surtees said when there was some Fleet Street and Mass Media bleating about the motorcycle TT circuit in the IOM, "if you take the TT away from the Isle of Man you might as well give up motor cycle racing." At the top end of the Rouen-les-Essarts circuit a new Autoroute has cut completely across it, passing under the circuit

shortly before the pits straight and over it on the very fast back leg. This involved raising the old road and easing a curve at the first point, which was done last year, and the building of a concrete bridge over the circuit at the second point. All is nearly finished and the Autoroute should be open this summer, and while this has meant changes to the circuit they are for the good, for the public will be able to bowl happily on their way to the Normandy beaches, while racing is in progress, which should give the circuit a new lease of life against any opposition. This is very much the way in which the Autostrada in Sicily has helped the Targa Florio, for when completed it will solve the problem of the chaos caused by closing the main Palermo to Messina road when the

A little while ago I mentioned that Ferrari had built his own private test-track almost opposite the factory at Maranello and as a consequence the Modena scene had changed. It seems I was a little premature, for the Ferrari track has only just been opened so Spring-time in Modena saw no change from the usual scene. This was brought home by a letter from a friend who lives in Modena who wrote to say "... if you think Modena is getting duller you should have been here this week. Yesterday they weren't only standing on top of their lorries and sitting on the walls, they were climbing over the walls and fences. Ferrari Formula One, Filipinetti Fiats, motorcycles spilling oil all over the track and one that spilled its rider, aeroplanes and even a helicopter. Carabiniere Alfa Romeos also on the track. Confusion wasn't reigning, it was pouring, much of it due to this week's motor cycle races at the Autodromo; then I lost the keys to my VW..." You may recall this friend from Modena, he came to England some years ago to join us on a trip to the West Country in the Editorial 1924 Calthorpe and while we went indoors we left him outside with the vintage engine ticking over quietly to itself, with instructions to not touch anything but just keep an eye on things. As the engine had no television suppressor on it at the time a nearby TV set was having a touch of the colleywobbles unbeknown to us or the watchful friend, who knew nothing of TV suppressors anyway. After a while an irate man appeared in shirt sleeves and braces and shouted "Has that thing got a suppressor on it?" Our friend replied "Compressor? Oh no, it's a simple sidevalve engine with a single carburetter". When we reappeared he said "Some nut came and asked if your car was supercharged." What a pity it wasn't an Italian OM, there might have been more satisfaction all round.

At Easter I thought I would have a change from the big glamour race meetings and go to a small event at the Nurburgring, run by the Middle Rhein and Koblenz section of the ADAC. When I got there on practice day I could not get near my usual Nurburgring car park and there were 80,000 spectators milling about. There were 360 entries, the Grand Prix paddock was overflowing, extra paddocks had been created amongst the car parks and the whole thing was quite overwhelming. Not all of the 360 entries arrived, and some eliminated themselves in practice, but even so the size of the meeting was staggering. The main saloon car race had 90 entries, from Steyr-Puch tiddlers to Opel Commodores, the GT race had 77 entries, mostly Porsches, and the Formula 3 race had a poor entry of only 68! Once a race had got under way the Nurburgring looked like any main road out of London at holiday time. I still think we could enliven saloon car racing up a bit by sending a smaller group round in the opposite direction at the same time. The main attraction at this "little meeting" was the first Interserie race (see Continental Notes) and my particular interest was to have a look at the brand new Porsche 917/10 Spyder built for Kinnunen, to see how serious the Porsche Can-Am racing project is. This Interserie race was a try-out for Can-Am ideas, in particular the new engine enlarged to 5.4 litres, and later the exhaust turbo-charging. There is no doubt at all that the Research and Development department at Stuttgart is still very occupied with a dossier marked "Racing". There were enough parts, spares, equipment and know-how in the van attending Kinnunen's car to build a British Formula One "kit-car". As so often happens the might of Porsche fell by the wayside because the 5.4 litre flat-12 cylinder engine would never run on more than ten flat cylinders and the funny old BRM-Chevrolet V8 Can-Am car rumbled round and won, thanks to Ganley's brave wet-weather driving. When it rains at the Nurburgring it rains.-D.S.J.

#### WILLIAMSON TAKES EARLY LEAD

AFTER the first three rounds of Shell Super Oil Formula Three Championship, the qualifying races of which count for the Motor Sport Trophy at the end of the year, the situation is rather confusing. One of the stipulations of the Shell Championship is that all contestants display decals advertising the championship if they are to score points and collect the prize money. However, before this rule was anounced Team Lotus came to an agreement with their sponsors John Player Special, in which they agreed not to display any decals other than certain specified ones. Thus, in the early season races, the two exciting John Player Special Lotus Formula Three cars have not been displaying the decals and therefore have not been earning any points or money. However their number one driver, Tony Trimmer, has already finished fourth at the opening round at the Brands Hatch Race of Champions event and won the third round at Mallory Park.

Motor Sport does not wish to become involved in the politics and so is scoring, for the present, the points towards the Motor Sport Trophy on the basis of the Shell Championship rounds but counting everyone, whether they run the Shell stickers, or not. However the latest news is that John Player, Lotus, and Shell may come to an admirable compromise in the near future over the problem. If this is done it is not yet certain if Trimmer will receive all the points he has already scored. Thus, with a win at the Oulton Park round on Good Friday and placings at Mallory Park and Brands Hatch the present leader is Roger Williamson driving the Wheatcroft March 723. Trimmer, in the JPS Lotus shows up second with 12 points just 1 less than Williamson. Third at present is Barrie Maskell, the very experienced Northern driver, who is now racing one of last year's Lotus 69s for the Travisco team. However, becuase of the sticker problems, he actually leads the Shell points standings.

Roger Williamson, it will be remembered, won the premier Grovewood Award last year, finished second in the Shell F3 Championship and won the Lombard Championship. Although he leads the chase for

the MOTOR SPORT Trophy he is far from happy with the latest Wheatcroft Racing March 723, having used a March 713 last year. The latest news is that he will be swopping to a GRD for the remainder of the season's races.

One of the biggest surprises of the year has been the tremendous performance of the young Welsh driver Tom Pryce and the works Royale Formula Three. Pryce originally made his name by winning the Daily Express Crusader compeition in early 1970 and the Lola FF that went with it. By the end of the year he was recording some good results in Formula Ford and last season he switched to the now defunct Formula F100 and easily won the Tarmac Championship for these cars. At the end of the season he drove the new Royale in a couple of Formula Three races without showing at the front. However, at the Race of Champions F3 event he left the rest of the field standing and scored an easy win which was later disputed due to the weight of the car. But finally the result stood. At round two Pryce again rushed off into a strong lead but this time he spun away his chances. Now Pryce and the Royale car are regarded very highly by the other competitors and it will be interesting to see if he can repeat his early season form.

With three rounds gone the leading positions towards the MOTOR SPORT Trophy are as follows:

1:	st: Roger Williamson (March 723)	22	4.4		* *	13	
2	nd: Tony Trimmer (JPS Lotus)				**	12	
3	rd: Barrie Maskell (Lotus 69).,				* *	10	
4	th: Tom Pryce (Royale RP10)					9	
51	th: Peter Hull (Brabham BT38)	85		**		9	
6	th: Bob Evans (March 723)	825	0.515	**		6	
	James Hunt (March 723)	30.00	0.00	**	**	6	
	Mike Walker (Ensign F372)	8(8)	19030	5500	(6)63	6	

#### **Continental Notes**

#### Interserie

IN 1970 the Germans and neighbouring countries dreamed up a new form of racing modelled on the Canadian-American series that we know as Can-Am. This was for Group 7 cars, or two-seater racing cars, as they are described by the CSI. Six events were run in 1970 and they were called Interserie, the idea behind them being that Europe might enjoy the racing of 7 -or 8-litre Chevrolet-powered "specials" like McLarens, Lolas, etc. It was not too clear exactly who Interserie was supposed to appeal to, as regards competitors, and those organisers who were interested grasped at it in the hope that it would be cheaper to run than Formula One or sports cars, and more attractive to spectators than Formula Two. The 1970 events were run at Hockenheimring (two meetings), Norisring, Thruxton, Croft and Keimola in Finland which was not a very auspicious collection of events after the initial discussions. Competition came from private owners with Can-Am type cars that were obsolete for any other form of racing, and from people with sports cars who were getting nowhere in long-distance racing, or could not afford to go on with the classic events. The Interserie winner for 1970 was the German driver Jurgen Neuhaus driving a Porsche 917. In 1971 the Interserie continued and the glimmerings of an enthusiastic following began to show. Seven events were run, two at Hockenheimring, which was still the centre of Interserie, and two at Imola and single events at Zolder, Norisring and Keimola, the British opting out. The list of competitors improved, with Can-Am cars from BRM, March and McLaren while private Porsche 917s were modified into open cars devoid of all sports car equipment as was permitted in Group 7. This time the winner was Leo Kinnunen with an open, or spyder, Porsche 917 belonging to the Finnish Porsche importer Antti Aarnio Wihuri, using a full 5-litre flat-12-cylinder engine. Interserie definitely gained ground in 1971, filling in gaps in the International Calendar, allowing circuits that could not cope with Formula One to have fast cars competing, giving an opportunity for Can-Am cars to be tried out prior to going across the Atlantic, and letting Ferrari, Alfa Romeo and Porsche have a closer and practical look at Group 7, as well as affording an opportunity for private owners to go on racing their expensive but obsolete Group 5 sports cars.

This year Interserie has taken another step forward as Porsche have made it clear that they will support the races, either with factory cars or customer support, and will use the early events as a test programme for their Can-Am onslaught, in which they are co-operating with Penske Racing of Philadelphia, and Donohue. The first signs of Porsche participation were seen at the opening Interserie race at Nurburgring on Easter Monday when they produced a brand new 917 Spyder with 5.4-litre engine, new brakes, redesigned chassis and body and the very latest offerings from the design department of Dr. Porsche. The car was painted blue with white lining and entered by Wihuri's "Racing Team AAW" and driven by Kinnunen. The engine has been enlarged up from 5-litres to 5.4-litres by increasing the bore to 90 mm., that wellknown cylinder dimension that engine designers have arrived at since the early days of the internal combustion engine. This first appearance of the latest factory car was a disaster for it was beaten in practice by Kauhsen in the Can-Am 5-litre 917 that Siffert raced last year, and in the race the 5.4-litre engine never ran properly and Kinnunen could only finish 4th, behind Ganley with last year's BRM-Chevrolet V8, Kauhsen with the 5-litre 917 and Kelleners with a brand new McLaren-Chevrolet V8 M8F. Doubtless Porsche will get things sorted out, and they intend to make the 90-bore engine available to other Interserie competitors; meanwhile they are continuing work on an exhaust turbocharger layout for this new engine, which could give 800 b.h.p., this being destined for Donohue to drive in the Can-Am races to try and break the McLaren stranglehold. If work progresses according to plan the turbocharged unit could appear in the Interserie event due to be run at Silverstone on May 21st. While the series is showing signs of improvement as far as the mechanism is concerned it still needs some "Professional-professional" drivers to use these powerful cars, as 600 b.h.p. is beyond the ability of most of the "Amateur-professionals" who make up the field at present. In order to strengthen the field the Interserie is also open to Group 7 cars of under 2,500 c.c. who have their own race-within-a-race and this is the domain of Lola T210, T212 and T290, and Chevron B8, B19 and B21, as well as smaller makes like Daren and one-off 2-litre specials. This year there are nine events in the Interserie, with Silverstone, Osterreichring, and Nurburgring joining

Hockenheim, Imola, Keimola and Norisring, so it look as though this form of racing will gather momentum, and if the GPDA continue to cause the classic events to be cancelled then Interserie might well profit

#### BMW

Ever since the Munich firm of BMW introduced the 4-cylinder 1800 series and recovered their composure as motor car manufacturers they have gone from strength to strength. With this growth they have kept a small but active racing department going, competing in hill climbs, saloon car racing and Formula Two, their most successful outings being in saloon car racing. Shortly they are going to increase their racing activity and are setting up an independent racing department away from the main factory, but still in Munich, and intend to operate it in rather the way that Alfa Romeo in Milan support Autodelta. To run this activity BMW have entired Jochen Neerpasch away from Ford of Cologne, where he was competition manager, and he has taken others with him, from Ford and Porsche, to form the nucleus of this new BMW racing department. If all goes well this new move in Munich could enliven the European touring car racing scene.

#### Ferrari

Last year the Ferrari team dabbled in long-distance sports car racing with a single 312P prototype, powered by a 3-litre flat-12-cylinder engine as used in the Grand Prix cars. Throughout the season it went from one disaster to another, having accidents and mechanical setbacks, but while it was running it was much faster than the 3-litre Alfa Romeos and Matras, though no match for the 5-litre Porsches of the J.W. Gulf team or the Martini racing team. During the ups and downs of the 1971 season the Ferrari people kept saying that they did not mind the troubles as they were merely doing test runs in readiness for the 1972 season when they intended to make a complete onslaught on the Sports car scene, for from January 1st 1972 the 5-litre cars were to be banished from sports car racing. This they have done and they certainly seem to be dominating the scene, even though their troubles are by no means over. In the last round of the Manufacturers' Championship in Europe in 1971 the 312P began to show its potential and though it could not quite keep pace with the 5-litre 917 Porsches, it did not lose enough ground to allow the Porsches to make an extra pit stop for fuel. The 3-litre engine of the Ferrari was more economical than the 5-litre Porsche engine and in a 1,000-kilometre race it looked like making the distance with only three stops to the larger car's four stops. Just as the situation was getting interesting the rules were changed, but we must remember that if the rule changes had not been planned two years ago the 312P would never have been created and Ferrari would probably have gone on developing the V12-engined 512 car.

As so often happens when new rules are announced Ferrari gets on with the job and does not waste time bleating about the changes or trying to get them modified for some spurious reason, as a lot of people in racing do. He did this in 1951 when unsupercharged 2-litre cars

Continued on page 472

BRM are running regularly in the Interserie with a last year's P167 which is now sponsored by Alcan.

85 starters-18 finishers.

UNSOPHISTICATED, crude, rugged, sweaty, even primitive; these are adjectives which, on the face of it, can hardly be considered complimentary. Yet when they are applied to the East African Safari Rally there can be no person who has ever had anything to do with that event who would deny that they are applicable in the most complimentary sense possible. Some years ago we described that event as the toughest test of a motor car ever devised by man. After watching 85 cars whittling themselves down to 18 along an impossibly fast 6,000kilometre route through the East African bush at Easter time, we can only confirm that it has not outlived its reputation.

The Safari was started by a bunch of expatriate enthusiasts in Kenya who were seeking a means of celebrating the Coronation in 1953 in a manner which appealed to their sporting instincts. That appeal spread to rallying people in other continents and, when attempts to beat the local drivers failed year after year, it eventually became the event which the factory teams most wanted to win.

A myth was built up around this apparent supremacy of local drivers and it became popular to talk of the Safari as the one rally in which familiarity with the peculiar local conditions would always triumph over the professional abilities of experienced works teams.

Eastertime is the period when the long, dry summer gives way to the sudden, drenching rains which can turn dust bowls into vast glue pots in a matter of seconds and can so quickly send rivers cascading down their previously dry beds that bridges, and even roads themselves, can be washed away as easily as though a demolition crew had been at work. East African mud can be incredibly slippery (brown murram soil) or as sticky as a man-made adhesive (black cotton soil). The ability to distinguish between these properties, to drive quickly and safely on either, to read the signs which warn of sudden floods, to recognise the flick of a buck's tail as the prelude to a dash across the road, and to keep off any grass which might be hiding tyre-bursting thorn bushes is second nature to a practised bush traveller.

With these skills to add to their driving talents it was understandable that local drivers should be difficult to beat. Add to this the mystery and folklore of Africa and it's not difficult to understand why a myth should have been built up. But it was really only a matter of time before it was knocked down again, for there is no substitute after all for the combined skills and resources of a professional rally team. A privateer, however able, would stand as much chance against the might of factory teams in the Safari as he would armed with a fly swatter against a wave

This year a pair of outsiders won the rally for the first time. Hannu Mikkola, driving in his second Safari, and Gunnar Palm, in his eighth, drove their works Ford Escort RS 1800 to outright victory, backed by the powerful support of the factory. When works teams go on any rally their resources are usually the best possible, but where the Safari is concerned they have to put a veritable army into the field. More service cars, more mechanics, bigger supplies of spare parts, fuel supplies in desolate areas, using an aircraft as a mobile command post and linking the whole armada by two-way radio; these are things which have grown up around the Safari in recent years, and Ford utilised them all to good effect.

Last year, when an American tyre distributor financed several European teams in order to provide material for an advertising cam-

Boreham rally mechanics work side by side with Asian and African fundis at the temporary "competitions department" set up in an open-sided garage in Nairobi's industrial area.

paign in the Americas, there were more works teams than the Safari has ever seen. This year there were much fewer, so it is perhaps a little easier to talk about their respective fortunes.

Five works cars prepared at Boreham were entered in the Safari, two driven by local crews, two by Finnish/Swedish/English combinations and one by a former Kenya resident now settled in England. So it can be seen that even Ford was not really convinced that rally-hardened professionals could beat the wilv local drivers. They wanted the extra publicity which an overseas win would provide, but they insured against the chances of this not being possible by hiring some of Kenya's top rally people.

The cars were 210 b.h.p. versions of the Escort RS1600, with 1,798 c.c. engines. They were of all-steel construction, for lightness has to be sacrificed for strength in this particular event, and weighed almost a ton. They used ZF gearboxes, with first, second and third close together for maximum effectiveness on twisty, hilly roads, and a fairly large gap between those and the top two ratios so that there would be no undue strain on the engine on the many long, fast straights.

A car which could be driven at violently jarring speeds across 6,000 kilometres of African bush in the space of a long weekend without developing any faults would be a rarity indeed, so it is no real discredit to Ford's success that the Escorts needed attention quite frequently (though not as frequently as most others) during the trip. Makinen's car lost a rear wheel after its crew was obliged to tighten the nuts with a spanner after a puncture—there was no wheelbrace in the car—and recurring trouble took place after the damage which was caused when the studs sheared due to constant wear. The lock nuts on top of the front suspension struts began loosening on all the cars, perhaps because the spring rates were softer than normal to absorb the violent impacts or perhaps because the bumping was setting up a twisting action within the springs, causing the nuts to unscrew. This caused the retirement of Ford's Sikh crew, Joginder Singh and Harbhijan Sembi, when the peculiar handling sent the car off the road, bending the rear axle and breaking a driveshaft, but the mechanics were able to warn the other drivers by radio of the loosening nuts and both competitors and mechanics were able to tighten them regularly.

Fan belts, too, presented a problem for they were being shed quite frequently. Escort alternators are bush-mounted, and any degree of overtightening the belts tends to draw the pulleys out of line. In this respect we had the age-old cross-talk of mechanics blaming drivers and drivers blaming mechanics, but we will not take sides on that score.

Struts and fan belts were Ford's main attention centres, and additional supplies of these parts had to be brought out to Nairobi by a mechanic halfway through the rally after an SOS telephone call to

The Japanese team, with two outright victories immediately behind them, entered three of their powerful 240Z sports cars and one of their new 1800 SSS saloons. The latter car, which had to have its electronic fuel injection system replaced by carburetters after it had proved completely unreliable in the changing altitudes during practice, showed itself to be unready for such events and it gave constant trouble, breaking

suspensions, catching fire twice and even cracking its rear cross-member. The 240Zs ran into trouble in the very first competitive section of the rally, the only one, as it happened, which was wet. Water entered the clutch housings and from then on drivers had to put up with long periods with clutches which would not disengage. Furthermore, the engines appeared to consume petrol at a greater rate than the unusual feed system could supply it, and crews were obliged to rig up their own pipework contraptions to get the vital fluid through faster.

Peugeot

This French make is extremely popular in Africa and it has a reputation for being able to withstand considerable pounding even in standard form. Marshalls, the E.A. Peugeot distributors, set great store by Safari results as a sales aid (and rightly so) and they always put a strong team of experienced local crews into the event. They are not works cars by any means, for they are prepared in Africa, but the factory has been providing some degree of help in recent years.

Hopelessly under-powered compared with the Escorts and the Datsuns (110 b.h.p. matched against 210) the Peugeots cannot be considered ideal Safari cars in hard, dry conditions. Had it rained this year people like Shankland, Nowicki (both past winners), Lionnet and Harris would have stood a healthy chance of being among the winners, but the continuous high speed on dry, dusty roads was hardly what was needed for Peugeot success. Nevertheless, Harris managed to finish seventh and Shankland ninth, the former with suspension tied up with winches and rope after a violent encounter with a deep ditch and the latter after a variety of transmission troubles. Nowicki, a wily Polish expatriate who loves having plenty of mud to tackle, suffered gasket failure after a hard bang put the fan through the radiator.

Huschke von Hanstein used to excuse his company's non-participation in the Safari by "The Porsche is a sportwagen, not a Jeep". But that never stopped Sobieslaw Zasada persuading Stuttgart to lend him a car for the event; nor did it stop the entire works team taking part last year, financed by dollars from Sears Roebuck.

This year Zasada was a complete loner, with one of last year's team cars borrowed from the factory along with one mechanic. Helped by an assortment of amateurs, many of whom were fellow countrymen on holiday from Poland, Zasada drove magnificently, nursing his car on the rougher sections and using its power to the full on the smoother parts. The result was a virtually trouble-free run and a thoroughly deserved second place.

Apart from anything else, Zasada had to contend with team tactics from his opponents who were anxious not to allow his solitary Porsche to interfere with their chances of success. Zasada isn't the most popular of competitors for a variety of reasons-not the least of which is the conflict between himself and Waldegard last year which put the Swedish driver out of the rally when he was in the lead-but his ability on long events demanding stamina and tactics rather than sheer speed is of a high order.

#### Triumph

Although British Leyland were not participating as a team, they did send one Abingdon-prepared Triumph 2.5PI to Africa to be driven by their semi-retained driver Brian Culcheth, co-driven by Naixobi man Lofty Drews. Regrettably the car did not arrive until a few days before the start, giving the local distributors (who were to service the car during the event) no opportunity to carry out the additional items of preparation which were necessary. Furthermore, the sea air had taken its toll during the voyage and when the car came off the boat its clutch was rusted.

During the rally the car gave all manner of troubles too numerous to list, including a fuel injection fault and even body cracking. However, its crew struggled bravely to the finish and managed to get the car into thirteenth place, no mean achievement under the circumstances.

#### Fiat

Competitions Manager Maruffi has had his eye on the Safari for some time and this year he decided to send two 125S saloons to the event, not with any illusions about winning but with the idea of using it as a development exercise in preparation for a more comprehensive entry in the future. He sent Pinto and Biondi from Italy to drive one car and engaged two local men, Robin Ulyate and Ivan Smith for the other. Alas, both cars retired in the early stages of the event after damage caused in one case by hitting a ditch too hard and in the other by wrecking the steering against a rock. So the testing was not nearly as thorough as Fiat would have liked, but when we left East Africa the

question of leaving the cars in Nairobi for further testing in rallies throughout the year was being considered.

Two 3-litre Holden Toranas were shipped from Australia, but these were completely private and it so happened that they lacked that extra preparation so necessary for the Safari.

So much for the more prominent entries. There were several first class local crews of course, many of whom made up in tenacity and general bushmanship what they lacked in their motor cars. To watch the progress of some East Africans, repairing and fettling their way through the Safari without any professional mechanics to look after them is an inspiring experience. One such crew, Pat Neylan and Simon Reynolds who are up-country farmers in Kenya, used a home-built Datsun 1600 nearly five years old and finished the rally, an achievement that most professional rally drivers would be hard-pressed to equal, let

Dust was a major problem this year, as it is whenever the weather is dry, but even more significant was the conflict of conditions when it came to choosing tyres. For the rough going chunky treads are necessary, but for the long straights they are quite unsuitable for the sustained high speeds which are necessary to stay within the tight schedules. Dunlop provided the best tread/compound combination they could muster for the works Fords, but even so there was the occasional blow out as a tread "chunked". Other mud-grip tyres were blowing out far more often, particularly the Japanese Dunlops used by the Datsuns and the standard Dunlops used by Zasada. One should realise, of course, that chunky-tread tyres are not intended for speeds well in excess of 100 m.p.h.

Finally a word about the organisation. This year the rally started and finished at Dar-es-Salaam, to comply with an agreement reached two years ago that it should be shared between the three East African capitals. Throughout the year the Safari headquarters are at Nairobi, and since overseas visitors always use the Kenya capital as a base this moving from place to place year by year stretched the organisation to the limit. Furthermore, there are political differences between the three countries which present difficulties, sometimes costly ones, to visiting crews. If only these could be ironed out the mechanics of taking part in the event would be rendered much smoother and it would become more attractive to overseas crews. Another point which the organisers ought to consider most carefully is the choosing of more realistic time schedules. Every year they allow themselves the privilege of increasing maximum permitted lateness should they consider it necessary. This is necessary because sudden rain can hold up competitors for hours. But in the ideal conditions which were experienced this year an increase should not have been necessary at all. The winners' penalty amounts to nearly ten hours, and yet it was necessary to increase the lateness

Setting lower averages is not going to slow competitors down, provided they aren't lowered too much, but it would result in a smoother timetable for the event, and in days of increasing traffic even in Africa that would not be a bad thing.-G.P.

#### CONTINENTAL NOTES—continued from page 470

were clearly going to be the thing in 1952; in 1953 he was already racing his 1954 Formula car; he had 3-litre V12 sports cars ready for Le Mans when that limit was imposed; he was first away with 1½-litre Grand Prix cars in 1961; and again with 3-litre Grand Prix cars in 1966; the GTO was right there in GT racing, as was the LM after it, and now the 312P is well away in the 1972 sports car racing. It wouldn't be a bad idea for some people in racing today to read up some Ferrari history in their spare time. Ferrari doesn't always win and is not always in the forefront, but he is always there, whatever form the racing takes, as long as it is important racing on the International plan. Only one other firm has been so consistent in racing as Ferrari, and that is BRM, who haven't missed a racing season since 1950, but it would be wiser not to read their history. The 1972 Ferrari sports car effort involves having two complete teams of cars and mechanics, and as one lot are returning to Maranello the other team is setting off for the next move in this big effort to win the Manufacturers' Championship. It is quite likely that the Ferrari effort in Formula One will suffer as a consequence of the sports car programme, it has happened before and can happen again.

#### "MOTOR SPORT" WORLD TOUR

A FANTASTIC opportunity for a world-wide motor racing trip is being offered exclusively to MOTOR SPORT readers in October by Worldmark Travel Ltd. An exciting itinerary covering six countries has been devised by the Motor Sport staff and will cover many different aspects of the sport as well as providing plenty of time for sightseeing

The trip, which will last a month, will start from London and the party will fly to New York and then onwards to Watkins Glen for the United States Grand Prix. After the race the party will travel to San Francisco where other forms of American racing, including a night drag meet, will be visited. The week in San Francisco will be concluded by a visit to the Laguna Seca Can-Am race. This fascinating course can always be relied upon to produce one of the most exciting races of the year

From the United States the World Tour will then fly to the Orient for a stay in Tokyo. Six days will be allowed in the Japanese capital and a visit to one of the major motor manufacturers will be organised. From Tokyo the party will move on for three days in Hong Kong and then on for a similar stay in Singapore. Flying from Singapore to Australia the party will pause for three days in Perth before leaving for Johannesburg, South Africa, for the final major sporting event of the tour-the Kvalami 9-Hours. This race, which finishes at night, has long been one of the most popular sports car races on the calendar.

The MOTOR SPORT party will leave London on Friday, October 6th and return on Monday November 6th. All flights will be on scheduled airline services, mainly Quantas, and first class hotel accommodation will be provided throughout as well as continental breakfast and some other meals. Also inclusive will be all excursions and tours, admittance to the various events and all airline and airport charges.

The departure of the tour will be dependent upon raising a party of 20 people. The cost for this once in a lifetime tour is £780. Further news and a more detailed itinerary will be published in Motor Sport next month but all enquiries regarding the tour should be direct to the organisers-Worldmark Travel Ltd, Wigmore House, 10 Duke Street, London W1M 6DP (Tel. 01-486 1961) who will be pleased to supply illustrated brochures. - A.R.M.

#### **OLYMPIC SURFBLAZER**

SURFBLAZER, in conjunction with Olympic Holidays, their Greek distributors, provided a small party of journalists with a three days' introduction to Springtime Greece. The main object was to demonstrate the Surfblazer motor boat in moderately warm water.

We were escorted via Gatwick-Athens-Corfu, to the Dassia Beach Hotel, and after a brief talk about the boat were let loose on the Ionean

The engine is a Japanese 225-c.c. air-cooled two-stroke, similar to the type used in chain saws, and making a similar noise.

Owing to the propeller being recessed in the hull, it is possible to drive the boat straight from the sea onto the beach and leave the propellers still running, quite safely.

There were three boats in operation. I chose mine and, after being assured I would not get wet, sat astride the motorbike-type seat, fully clothed. One pull on the starter cord and the engine was running. I leaped forward, and for the next 10-15 minutes had a most thrilling and entertaining time. The sea was fairly choppy and I found that I was bouncing along at around 25 m.p.h. The technique of handling these boats is similar to that of motorcycling, banking hard over on the turn. I think it is possible to turn them over but I and nobody else succeeded that day. The high speed of these boats is attained by planing over the water but anybody weighing over 16-17 stone would be out of luck, as one of our party discovered.

I do not know how this boat will appeal to the boating fraternity, but I, as a keen motorist, was completely sold on it.

The whole boat weighs about 138 lb. and two people should be able to lift it onto a car's roof rack, the width being 3 ft., length 8 ft. At £295 it seems a trifle expensive but appears to be of a durable construction. I think it should be noted that of the three test boats, only one remained functional at the day's end. One had a cracked petrol tank, the other a waterlogged engine.

The strength of the surviving boat was shown when an eight-yearold boy drove the boat flat out into the jetty. From the expressions of horror this was not a planned demonstration. He survived to

The Surfblazer factory is in Halstead, Essex, and their main office in Colchester, where any enquiries should be directed.—I.R.T.

#### VINTAGE LIGHT CARS INVADE CAMBRIA

SMALL cars were not unknown in Wales in the vintage years, what with things like the London-Holyhead Trial and the RAC Six Days Small Car Trial. They come again in modern times to take tea with the Editor, as members of the Light Car Section of the VSCC. This year (April 15/16th) 16 elected to make the journey but Tony Griffiths found water where his Austin 7 should keep its oil after a previous weekend's trial in Buxton, Townsend's Gwynne 8 was absent, so that Chinnery's conquest of 1924 Welsh nastinesses would not be represented, and Mrs. Bell's 10/23 Talbot nearly missed tea due to a blocked fuel filter en route.

However, four 9/20 Humbers, one a saloon, one a one-owner twoseater with an Austin 10/4 gearbox, installed after the original box had worn out at 300,000 miles, five Austin 7s, including a late-arriving immaculate Chummy, a r.w.b. Morris-Oxford two-seater, a Morris-Cowley and Riddle's i.o.e. GN were amongst those who turned up.

Driving frolics in the fields resulted in a win for Costigan's smart and original 1929 Austin 7 coupé, a car so low-built that one feels Sir Herbert, who liked people to be able to wear top hats in his carriages, must have been on holiday when this one was designed. Grey (Austin 7) and Wood in his 10.8 Riley all-weather with self-greasing spring shackles (in 1923!) tied for second prize, third place going to Rosemary Burke's surprisingly agile 1930 o.h.c. Morris Minor sun-roof saloon. After tea this cavalcade of motoring-for-the-millions followed the Editorial workaday Calthorpe to inspect, by courtesy of the Rads, & N. Brecs. Water Board (parking by courtesy of the Wales Gas Boardit's a free and easy country!), a huge Campbell anthracite-burning 125 r.p.m. gas-engine installed at Llandrindod Wells before the First World War

Sunday was devoted to scrambling about the damp glories of the Elan Valley .- W.B.

#### THE THINGS THEY SAY . . .

"Thruxton's not quite so demanding on brakes as Oulton Park, though when you use them use them hard, like anchoring for the tight chicane from the Brooklands straight where the Tii was indicating 120 m.p.h."-Roger Bell of Motor describing another Group 1 salooncar victory in the very effective BMW 2000 Tii.

"To a vintage car this part of the circuit appears straight, and it is certainly very fast, the 35B reaching over 120 m.p.h. there last autumn." -Bernard Kain describing in Bugantics what it is like to lap Thruxton in his Type 35B Bugatti.

"The cylinder head, too, is a six-cylinder version of the 1500 and 1750 heads (which are now identical) and incorporates the modifications to the porting and manifolds introduced at the time of the 1750 version" -Philip Turner describing the new E6-engined six-cylinder Austin/ Morris/Wolseley car in Motor.

"The E6 cylinder head design is likewise based on that of the Maxi 1500, which means that it lacks the improved breathing of the 1750."-J. R. Daniels, BSc, describing the new E6-engined six-cylinder Austin/ Morris/Wolseley cars in Autocar.

"Who am I to talk of scruffy workmanship [in the Ford Granada]? Ever since last Sunday I have been cut dead by the superior owners of superior Rovers. Of course these cars have leather upholstery and not, as I said, plastic."-Robert Glenton, writing in The Sunday Express. In fact, the Rover 3500 has leather but the Rover 3500S uses box-pleated Ambla upholstery, which holds you better but is not so

#### Ford Model-T Production

I feel I must write and correct a statement made on page 266 of March, 1972 Motor Sport leader "The First Issigonis Success", last paragraph you state Ford turned out a million Model-Ts by 1922. The correct figure was 6,953,070, which puts them way ahead of anyone else.

St. Albans.

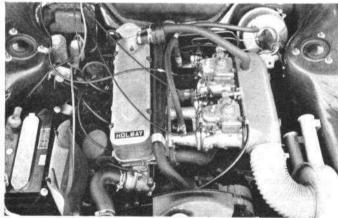

CHARLES PEARCE. Registrar Model-T Register.

#### **NEW CARS**

#### **A Spring Selection**

THE PAST couple of months have seen the introduction of new or revised models from all the Big Four in Britain, plus the Jensen Healey; while on the Continent, Fiat, Opel and Volkswagen have also introduced additions to their ranges. With all this activity we thought it worthwhile to re-cap on some of these models, while mention of others has been omitted due to lack of space and/or printing schedules

For instance, Chrysler (UK) announced several interesting changes to their range just before the end of last month. They held a two-tier press launch in which MOTOR SPORT came out as rather second grade citizens, being treated to a lunch and drive in the Sussex countryside, while other, more favoured journals and papers were put up for the night, with their wives, at a rather more luxurious establishment. Such is life! This aside, Chrysler introduced a new hot Hillman Hunter which is bound to appeal to the motorist who wants a sporting saloon car. This latest Hunter is rather confusingly called by the meaningless symbols GLS (although it is faster than the GT) and could well fill the niche left by the Lotus Cortina. The new Hunter, which also has revised frontal treatment, is powered by the Holbay-developed 1,725-c.c. aluminium headed engine, previously only seen in the Sunbeam Rapier H120. The engine makes an impressive sight when the bonnet is lifted with its twin Webers and smart alloy rocker cover. It gives 93 b.h.p. (DIN), 110 b.h.p. gross, which coupled to the Rapier's close-ratio box, gives it excellent performance and a top speed of fractionally over 100 m.p.h. One of the most attractive features of the car is its price for, at £1,261, it underprices all but the cheapest Cortina GT 4-door. Straight-line performance is certainly impressive but the car does give a somewhat taut ride and the handling is adequate rather than noteworthy. Nevertheless we commend Chrysler on this fastest ever Hillman.

HOT HILLMAN.—The twin Weber carburetter engine of the new Hillman Hunter GLS which, it is claimed, is the fastest Hillman ever built.

Anaounced at the same time was the Avenger Estate which comes in either 1,250 or 1,500-c.c. form and will attract sales from those after a reasonably small station wagon at attractive prices between £986 and £1,087 depending on engine size and trim. Other Chrysler news is that both the Sunbeam Alpine and the Rapier have uprated engines, and other detail changes including a revised interior layout which is also shared by the Rapier H120. The Humber Sceptre also has an uprated engine, trim changes and also the fitting of the closeratio gearbox, wider wheels and new fan.

Finally, Chrysler have also disclosed news of the hot Hillman Avenger to be known as the Tiger, named after the lamented sports cars of that name. The Tiger is not for general sale although a few may be available, and the car will possibly be made more easily obtainable if demand warrants it. The engine is the 1,498-c.c. unit as in the Avenger GT but with a modified cylinder head, twin Weber carburetters and special exhaust manifold. The suspension is lowered and stiffened, there are adjustable shock-absorbers at the rear and powerassisted brakes. The wheels are magnesium alloy, there is a "power" bulge in the bonnet and a gimmicky aerofoil on the boot lid, in addition to special seats, steering wheel and facia. Apparently there is a possibi-

NEW TIGER.—The latest car to be christened with the traditional name of Tiger is this tuned version of the Hillman Avenger GT.

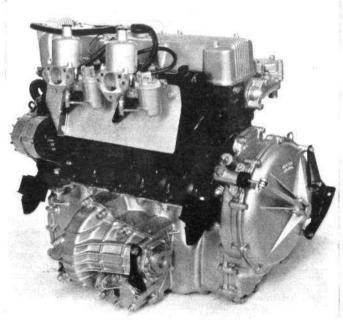

lity of making all the parts available through the Chrysler competition centre so that drivers can uprate their own Avengers.

#### New wine in old beetle from BL

British Leyland's two most recent offerings, the Triumph Dolomite and now the Austin, Morris and Wolseley 2200 range, are both exceptionally pleasant to drive. But both use totally out-dated body shells which are associated, in the minds of the masses, with cars from the mid-sixties. Particularly so the 2200, which is the brand new sixcylinder version of the faithful old 1800 range, first introduced in 1964. Sure enough such measures ensure maximum utilisation of incredibly costly dies and presses for body panels, but does it sell

Perhaps, because of the old-fashioned and well-known body shell which houses the components of the 2200, one is surprised at how well the car performs on the road. Basically what British Leyland have done is to take the 1800 in its latest well-developed and reasonably snagfree form, and power it by a six-cylinder version of the Austin Maxi overhead camshaft engine. By all accounts the six-cylinder engine was designed at the same time as the Maxi "4" and has been in use for some time in Australia in the Austin Kimberley. The new unit gives 110 b.h.p. from 2,227 c.c. and has exactly the same bore and stroke as the original four-cylinder 1,500-c.c. Maxi engine. On the road we found that it proved an excellent power unit giving plenty of low-down torque and good acceleration and top speed, without being at all fussy.

Unlike the 1800, the six-cylinder version has an electric fan for

NEW SIX-CYLINDER from British Leyland. Powering the new Austin Morris 2200 is the six-cylinder version of the Austin Maxi engine, shown here coupled to its east/west transmission.

the sealed-for-life front-mounted radiator. Transmission is taken through the same 1800, four-speed gearbox, with identical ratios which are changed through a larger 83 in. clutch by a new rod-operated, rather than cable, gear-shift. Larger brakes are also fitted, which help to bring the car down from its top speed of just over 100 m.p.h. The 2200, of course, retains all the assets of the 1800 including roominess, excellent handling and road-holding, from the front-wheel drive and hydrolastic suspension, and gains greatly from the increased power of the new engine. The car retails at just about £60 more than the old 1800S which is dropped. Badge engineering gives you the choice of Austin or Morris versions, while there is a more luxuriously appointed version called the Wolseley 6, complete with the traditional illuminated badge on the grille. We hope to try a 2200 over a greater mileage in the near future.

At the same time as British Leyland announced the 2200, they also told of various changes to the 1800 range which, apparently, sells on average at the rate of 40,000 a year. Mechanically the latest 1800 is unchanged save for a new rod-operated gear-shift. The interior has come in for something of a face lift, particularly the instruments, and there is a new grille and badges.

#### Vauxhall's Transcontinentals

Presently lying in an unhappy fourth place in Britain's big four motor manufacturers, Vauxhall are hoping that their new range of re-styled and engineered Victors will help a revival. The new cars have been grandiosely nick-named "the Transcontinentals" by General Motors' marketing people, which might suggest that the previous Victors were hardly suitable for travelling across the Continent-for that matter they may well be right. Undoubtedly the new range of Victors-encompassing the Victor, VX4/90, and Ventora-is a considerable improvement on the previous one.

The styling, for a start, is definitely a change for the better and there is even a hint, in the bonnet, of those famous Vauxhall flutes. The cars are basically larger having a 3 in, wheelbase increase and more room for the rear passengers. But the car is considerably heavier than the old model, the VX4/90 tipping the scales at almost 200 lb. more than the previous model. The interior of the Victors is nothing particular to write home about, the cheaper models having rubber floor

LATEST VICTOR.-Larger engines, a new body shape and better handling are features of the new Vauxhall Victor range.

Apart from the body shape, the other major change is to the cubic capacity of the four-cylinder engines. The 1,600-c.c. engine has been upped to 1,759 c.c., thanks to a new longer throw crankshaft and this gives 78 b.h.p. and powers the bottom of the range Victor De Luxe and an estate car version. The 1,975-c.c. engine, which could also be found in the Firenza, is now increased to 2,279 c.c., thanks to a bigger bore, and gives 101 b.h.p. (DIN). This powers the Victor SL and, in twin carburetter form, the VX4/90. For the Ventora, the 3.3-litre ageing straight-six design has been left alone.

On the suspension side it is largely the mixture as before with some subtle changes, including larger ball joints in the front suspension and slight geometry changes to multi-link rear, as well as the increased wheelbase and track. It is an improvement over the previous model but one could not say that the Vauxhall would out-corner a BMW or, for that matter, its German cousin-the Opel Rekord in 1972 form. Vauxhall have put a lot of time and effort into the safety aspects of the car both primary (new anti-burst locks) and preventive (tandem brake master cylinders). Automatic versions are available, and are fitted with the excellent boxes built by GM in Strasbourg, on which we have previously commented.

Of the range, the VX4/90 or 2300 would probably appeal to MOTOR SPORT readers rather than the other models but, basically, our opinion is that the cars do not break any new ground and are very much Vauxhalls. All models cost more than in their previous form.

Following the trend set by Ford, with their special slated window, orange Capris, Vauxhall have also announced a short-run special to be known as the Viva X14. In total 6,000 are being built, 1,000 with the new 1,800 c.c. engine and automatic transmission and the rest with the regular Viva 1,256-c.c. unit. The special equipment fitted to these cars includes Rostyle wheels, radial tyres, power-assisted brakes, heavy duty alternator and other "special" items the majority of which can be found on the cheapest Datsun (see Cherry report elsewhere). But the X14 comes in special metallic paint finishes, known as Golden Sunspot, Emerald Starmist and Sapphire Starmist complete with

#### New Opel Commodore

Following closely on the announcement of the new Rekord, comes news of the revised versions of Opel's big Commodore and Commodore GS, each available as either a four-door or a coupé. The new Commodore was another of the batch of new cars at the Geneva Show, but it will not be available in Britain until mid-May.

The Commodore continues to be powered by Opel's overhead camshaft, six-cylinder, 2.5-litre unit which gives 115 b.h.p. in standard form and 130 b.h.p. (DIN) as fitted to the GS. The Commodore GS Coupé is the fastest of the range having a top speed of 114 m.p.h. while others are a little slower.

The new body shapes fit in well with the trend established by the Ascona and Rekord and, at the same time, the suspension and steering have been improved. As was the case with the new Rekord, Opel engineers say the suspension geometry has been specially designed to suit radial tyres. Prices are not yet available.

• Two new Simeas. During April Chrysler France introduced two changes to their range—the Simca 1000 Special now has a 1,294-c.c. engine and the addition of the Simca Rallye I, which also has the 1,294-c.c. unit. The new engine, in the 1000 Special, replaces the earlier 1,118-c.c. version and gives 60 b.h.p. The car is available immediately, price £896. The Rallye I includes special seats, steering wheel, facia with a rev.-counter, sports wheels, black anti-glare bonnet and engine compartment stripes. All very racy and yours for £892.

Three-door 127. A three-door version of the Fiat 127 has just been put on the market in Italy and will be available in Britain later in the year when the price will be announced. The three-door 127 is virtually a little estate car, for the rear seats will fold forward to give plenty of luggage space. The mechanical specification remains unchanged as does the lively 903-c.c. engine.

• Ginetta move. The little Ginetta company, whose glassfibre machines continue to enjoy steady popularity, have recently moved to larger premises where they hope to go into full-scale production with the promising G21 while maintaining G15 production at the same level. The new address is Ginetta Cars Ltd., Edgworth Road, Sudbury, Suffolk (Tel.: Sudbury 4455). As Ginetta handle all sales direct, this is the place to contact for any further information.

Now available in Britain is the Lancia 2000 Sedan F.I. equipped as standard with Bosch fuel injection, five-speed gearbox, power steering and electrically operated windows. The price is £2,398-A. R. M.

HOT SIMCA.—Just introduced onto the British market is the Simca Rallye 1, which is powered by a 1,294 c.c. engine. This unit is also available for the Simca 1000 Special.

#### **FORMULA 2 REVIEW**

#### Why the new cars are unreliable

THE NEW SEASON of Formula Two racing has started with a bang -mainly in the engine compartments. The new year brought a change of regulations which increased the capacity limit from 1,600-c.c. to 2,000 c.c. but also made the use of homologated production cylinder heads mandatory. Previously only production blocks had to be used and the design of the head was left free. As is now history, Cosworth Engineering came up with the FVA engine, with its four-valve-percylinder lay-out and this amazing unit won the first 1,600-c.c. F2 race in 1967, the last in 1971 and the great majority in between as well.

Cosworth later produced a productionised version known as the BDA for use in the hot Escort RS1600 which retained the similar four-valve lay-out but much smaller valves were used and the camshafts, and other ancillaries, were driven by a toothed belt rather than a noisy train of gears. It is on this 1,601 c.c engine that the present F2 engines are based, although, in theory, blocks other than Ford could be used. But only Ford had the forethought to homologate, and put into production, a four valve engine of suitable capacity. The words 'suitable capacity" are something of a moot point for at 1,601 c.c. the engine falls well short of the 2,000 c.c. maximum. However, the rules allow the engine to be opened out and this is the cause of the unreliability of the units so far. To obtain the extra capacity one can either stroke or bore or a combination of the two. Unfortunately there is not sufficient metal to take the necessary re-bore while a long stroke gives problems regarding revs, or not enough of them. Ford themselves have helped by homologating some special siamesed blocks (no water passage between the bores) which helps and some of the smaller capacity engines being used, like the effective Brian Hart-tuned 1,850 c.c. engine. However, to get any larger capacity than that with an acceptable stroke, the engine builders have been completely re-building the inside of the blocks by welding in liners. This is all rather a "bodge" job but some seem to work quite effectively, but tend to be unreliable.

Cosworth themselves have built only four such engines, one each for March Engineering, Rondel Racing, McLaren and Lotus (who still haven't got an F2 car) but not Surtees, who feels rather left out of it and is naturally rather unhappy with the situation. These precious four units are definitely the most powerful in Formula Two at the moment and the liners are brazed rather than welded. Other firms including Race Engine Services, Racing Services (Engines) and Felday have also come up with re-worked block engines. Former BRM engine designer Aubrey Woods is now running a firm for Chris Amon and has entered this market but has plumped for a long stroke and unlinered block. So far his engines have not lasted long enough to actually get to a race.

A number of people are of the opinion that the smaller 1,850 c.c. engine is a better bet and the extra horse power, offered by the larger capacity, is no good if it isn't there at the end of the race. Hart, RES, David Wood Engineering and Broadspeed, as well as Cosworth, all produce such engines. A lot of the original development work for BDAs was, of course, done prior to the new Formula Two for use in

The whole thing, however, is only a stop gap until the linerless allaluminium Chevrolet Vega engine is homologated, which should be about June. Once this happens all the BDAs will be obsolete overnight for Cosworth already have a racing version, known as the EAA, designed and built and it was tried in a Chevron B19 sports car in the South African series. This is expected to produce somewhere in the region of 300 b.h.p. when fully developed while the best an enlarged BDA can reliably give is nearer 260 b.h.p. Perhaps the reason why Cosworth built some big BDAs themselves was an exercise to see if such an engine would or could constitute a challenge to the Vega based

However, Cosworth are not the only people who have an engine waiting for homologation which will be of use in Formula Two. The latest Lotus 16 valve engine, which we wrote about last month, obviously has the basis of a very good F2 unit. It is light, being allaluminium, has a strong bottom end and also has a four-valve head. Colin Chapman is fully aware of the possibilities although he has, so far, said that Lotus will not be producing racing versions. However, rumour has it that one of the Lotus Type 907 engines has already found its way down to the Italian tuners Novamotor, who on behalf of Lotus, are producing a racing version for Emerson Fittipaldi.

Add to all this news of the possibility of one or even two Japanese engines for the Formula next year and the possibility of Ford homologating an aluminium block for the BDA engine which would be of 2-litre capacity. This idea now seems to be rather less positive than before, although Brian Hart Ltd have made tests with such engines which were used to power various 2-litre sports cars last season.

However, all this is in the future, and so far this season we have had four races for the new Formula and every car has been powered by a Ford BDA engine. The first three events were all in Britain, at Mallory Park on March 12th, at Oulton Park on Good Friday and at Thruxton on Easter Monday. The Mallory and Thruxton races counted towards the important FIA European Formula Two Championship for non-graded drivers while all three rounds qualified for the John Player British F2 Championship.

The Mallory Park meeting produced a major surprise in the form of Formula Atlantic and ex-Formula Three driver, David Morgan. He was driving in his first ever Formula Two race in a last year's Brabham BT35 sponsored by Ed Reeves. In practice Morgan set everyone talking with second fastest time overall to Ronnie Peterson in the works STP-March. In the two part race he kept up this sensational form. Peterson retired early on in his heat with fuel injection trouble and crashed in the second. So in the first heat Morgan ran home the winner after Carlos Reutemann slowed his Brabham with tyre problems and Niki Lauda finished second in his March. In the second heat Morgan only had to keep the other two in sight and this he did although, on aggregate times, both Reutemann and Lauda came close to overtaking Morgan. But the final result was a win for Morgan, with Lauda second and Reutemann third. The young South African Jody Scheckter was fourth in his first-ever F2 race while Mike Hailwood finished fifth in his works Matchbox Surfees.

The Oulton Park race on Good Friday only had a small field as most competitors were conserving their cars for the more important Thruxton fixture, practice for which was the day after Oulton. Niki Lauda totally dominated the race which was held in the pouring rain and he came home a clear winner-his first ever victory in Formula Two. Second was Gerry Birrell, also in a March, after Tim Schenken slowed his Rondel Brabham BT38 with a puncture. Schenken had to be content with third place, while at the finish, only three other cars out of the 14 starters were circulating.

There was a very much larger turn out for the Thruxton meeting and again the weather was kind to this popular fixture organised by the BARC. The race was split into two 27 lap heats and a 50 lap final. Practice took its toll, for Carlos Reutemann's Rondel Brabham BT38 crashed when a rear hub sheared and it was decided to withdraw the other Rondel cars of Pescarolo and Schenken as well. Reutemann's accident looks as if it will put him out of racing for over two months.

The heats further reduced the field as the fragile engines blew up and both were won by the works STP-Marchs, Lauda winning one heat and Peterson the other. The final lacked the excitement usually seen at this meeting for Peterson soon disappeared into the distance and smashed the outright lap record on his way. Francois Cevert, who was driving a March 722 for John Coombs, held a steady second place while Lauda was happy in third position. This was the way it stayed while the others just dropped out like flies, almost all with engine problems. In the end, only five cars were running and fourth place went to the Pygmee of Patrick Dal Bo, son of the constructor/designer Marius Dal Bo from France. This was the best ever result for this marque and a reward for the excellent preparation of the newly formed BE Racing Team who are now running three such cars from Hambledon in Hampshire.

On April 16th the Formula Two circus moved onto the Continent for the first time this year, to the daunting high speed Hockenheim circuit. This race counted towards the European Championship and, as is often the case, at this circuit it provided a surprise result. After practice for this two heat affair the STP-March team looked strong favourites with Lauda fastest and Peterson's deputy, German saloon and F3 driver Jochen Mass, looking good in third fastest place. However, in the race both suffered mechanical failures and the eventual winner was the former French F3 Champion Jean-Pierre Jaussaud who has been around the F2 scene without much success for a couple of years. He was driving a new Brabham BT38 so the score so far is March 2-Brabham 2. Finishing second was Mike Beuttler in his March 722 ahead of Bob Wollek's Rondel Brabham and Swiss-privateer Xavier Pevrot with his March 722.—A.R.M.

No fiddle, no twiddle.

# New Philips car radio with Turnolock: one button gives you any one of six stations.

Turnolock is a new idea, exclusive to Philips. It makes tuning a car radio easier and safer than ever before.

Turnolock is a single-button tuning system. It outdates all the multiple push-button radios you're used to. It means you don't have to press any one of several push-buttons to find the station you want (perhaps taking your eyes off the road for a dangerous few seconds).

With Turnolock, you just press one button, and the tuning jumps from station to station till you find the sound you're waiting to hear.

Turnolock isn't the only thing that's different about Philips car radio. Because our radios are made almost without exception from our own compatible components, our quality control is unusually fine. And you will find, if you

check, that our production methods actually ensure higher specifications for your money than you might buy elsewhere. Your radio will be with you for as long as your car. It's worth making sure you get a good one.

Music on the move.

#### AROUND AND ABOUT

#### Comment on the Racing and Club Scene

#### What's happening in Formula Ford

FORMULA FORD, the category of racing introduced in 1967, continues to go from strength to strength and, if the early season races are anything to go by, 1972 could be the best year ever for these 1,600-c.c. skinny wheeled single-seaters. This season there are umpteen FF championships but the one everyone wants to win is that sponsored by British Oxygen. Each round so far has been over-subscribed with entries, while the BARC organised Sunbeam Electric and the Daily Express Championship at Silverstone have also got off to a good start.

Tim Schenken was, of course, the first big name to emerge from Formula Ford and since then he has been followed by Emerson Fittipaldi, with plenty of others in Formula Two and Formula Three on the way up. One of the attractions of Formula Ford is the fact that it is fiercely competitive, professional yet remains relatively inexpensive even for the best equipment. If you do not mind forgoing the big meetings and steer clear of the major championships then, if you have the talent, you can give a very good account of yourself in a three- or four-year-old car which can be picked up complete for £700-£800. For the man of lesser means there are Formula Fords available for half that price.

Schenken, it will be remembered, drove a Merlyn Mk. 11 in his tremendously successful period of Formula Ford and this firm, from near Colchester, still make one of, if not the, most competitive of all Formula Fords. The latest car is the Mk, 20 which still owes a good deal to the Mk. 11, particularly the chassis, which means the impecunious driver can pick up such a car and update without too much problem. A brand new car less engine sells at approx. £1,300.

Various different engine tuners have ruled the roost in Formula Ford but, so far this year, Scholar Racing Engines have had most things their way. This little firm is run by Doug and Alan Wardropper, a father and son combination who used to be top Stock Car drivers. Now they operate out of premises on Martlesham Heath near Ipswich, less than a mile from where F3 specialists Holbay live. A Scholar engine, ready to win, will give just over 100 b.h.p. and will cost in the region of £350. In FF a good engine in an average chassis is a lot more important than an average engine in a good chassis, if there is such a thing.

As mentioned earlier a Merlyn chassis is a good bet but so too seem to be the latest Hawkes, the Eldens the Titans, and in the rain at the Oulton Park Formula Two meeting, a last year's car from the little firm of Dulon left everyone in its spray. Lotus have dropped out of the market but their 69 chassis is still very competitive.

There are quite a few tricks of the trade in Formula Ford which the beginner may take a little time to find out. Tyres are a particularly important factor-road tyres have to be used of course. The "in' tyre for well over a year now has been the controversial Firestone Torino-controversial because you do not see very many road cars using them. The top line FF drivers know at exactly what tread depth the tyres give the best grip and carry a second set, in different condition, for when it rains.

Formula Ford is very much an international class of racing and gives plenty of chance for racing outside Britain although, sadly, the European Formula Ford Championship has been dropped this year in favour of a big race at Brands Hatch in October for the champions from many different countries. But, there are still plenty of FF races on the Continent open to British drivers, particularly in Sweden, Belgium, Austria and Italy. There has been a Brazilian FF series and for the past three years there has been the South African Sunshine Series, sponsored by BOAC, which accepts entries from Britain.

Undoubtedly Britain is the centre of this category of racing and drivers come from all over the World to race here. Last year South African Jody Scheckter won a trip here and was soon dusting up the FF brigade and now his brother, Ian, has come to do the same. Several Americans have also raced in Britain and of particular note is one currently resident-young David Loring. Last year he won the Canadian and American IMSA Championships and is now one of the leading contenders for the British. He, like so many others, hopes to be spotted in Britain and given his big chance.

Both Scheckter and Loring drive the latest Merlyns as do leading British drivers Bob Arnott and David Martell, as well as the Belgian Jim Russell and pupil Patrick Neve, who is showing a lot of promise. Tony Brise, now in Formula Three, put the Elden firm on the map and

FORMULA FORD IS CLOSE .- Side by side out of the Mallory Park hairpin battling for the lead of a BOC round are John Parsons in the oneoff Barney, Geoff Close, who has crumpled the nose of the Hawke DL9, and Mike Taylor in the George Best sponsored Palliser.

now his 18-year-old brother Tim is continuing to keep Elden in the news, having recently switched from a unique side-radiator Merlyn. Brise presently leads the British Oxygen Championship and is sponsored, along with Elden team-mate Mike Catlow, by Catnic Steel Lintels-whatever they might be.

Consistently one of the fastest drivers in the early season races has been a lanky lad by the name of Mike Taylor, son of Geoff Taylor, who designed the Alta engine. Taylor drives a two-year-old Palliser which is sponsored by none other than footballer George Best. Another Taylor in the news is Ian, no relation, a veteran of over three seasons of FF. He drives the Dulon mentioned earlier and looks, at long last, as if he has shaken off the misfortune that always seems to follow him. If he really has, then he could be the man to beat this year. The latest Hawkes from David Lazenby's firm are interesting because of their side radiator layout and certainly seem to work well. Geoff Close started the season in the works car but has now been replaced by veteran Sid Fox. Now that antique dealer John Trevelyan has retired from racing, no one seems to be giving an Irish Crossle much of a chance except in Ireland but Titan have staged something of a comeback and the Team Titan drivers, Ken Bailey and Derek Lawrence, have both stepped down from Formula Three and have bags of experience. There are literally dozens of others capable of winning Formula Ford races too.

However, any young aspiring Grand Prix driver will, I am sure, not be put off by the above. In a few months time you, too, could be mixing it with the top drivers in FF.

#### Rondel Racing to turn constructor

One of the motor racing success stories of 1971 was the way that two former Brabham Formula One mechanics, Ron Dennis and Neil Trundle, set up their own Formula Two racing team, found the necessary financial support and went motor racing in a thoroughly professional and business-like manner. They ran Brabham BT36s for Graham Hill, Tim Schenken and promising Frenchman, Bob Wollek, a former ski-ing champion. There were disappointments, like when Hill and Schenken ran into each other at Albi and thus lost the race, and at Jarama where Schenken's engine blew up a couple of laps from the end. But there were the high spots like Hill's Thruxton win and Schenken's first ever F2 victory in the last race of the 1,600-c.c.

Bigger plans were made for 1972, again in F2, but this time with a four-car team of Brabhams for Schenken, Wollek, Carlos Reutemann and Henri Pescarolo. Sponsorship was obtained from the French Motul oil company, and from other sources including Radio Luxembourg and the power-tool firm of Broome and Wade. As you will read elsewhere the team suffered an early set-back at Thruxton in practice when Reutemann's new Brabham crashed but it will only be a temporary one for during the Easter week-end big plans for Rondel were announced.

Basically the plot is that Rondel have joined forces with Denvs Dobbie, the wealthy Scottish enthusiast, to design, build and race their own Formula One and Two cars. Dobbie, it will be remembered, sponsored his own two-car Chevron B19 sports car team last year known as DART and, at the original announcement, said he intended to be in Formula One within three years. His sports car team cost a lot of money but John Miles did collect the RAC Sportscar Cham-

pionship for him. Over the winter there seemed to be so many changes of plan, first an F2 team for the Fittipaldis, then a Lola T280 sports car for Miles, that DART became nicknamed the Doubtful Automobile Racing Team. In the end it looked as if Dobbie was going to drop out of racing altogether but, just at the right moment, switched-on Rondel Racing made a proposal to him about assisting their intended, and highly secret plans to become constructors in their own right. Dobbie accepted and now Ron Dennis and his team have the finance available and the cars will be called Rondel Dart.

Details of the car's designer, and whether the team will build both F1 and F2 for 1973, are to be announced in the future although the first car is promised for September. I could be wrong but I personally reckon that the designer will not be the obvious possibility-former Brabham boss Ron Tauranac-but could well be one of the present Brabham design team. Undoubtedly the team have the knowhow as well as the facility-an excellent and spacious workshop in Old Windsor-to make good as a constructor. Dobbie, Dennis and Trundle form the board of the new Rondel Dart Ltd. while shipping man, and sometime commentator, Tony Vlassopulos, who gave Rondel so much help in the early stages, continues as chairman of Rondel Racing Ltd. Naturally the team will continue to run their smart red, yellow and blue F2 Brabham BT38s for the remainder of this season.

#### The fire hazard

The one good thing that came out of Jo Siffert's tragic death at Brands Hatch last October was a much greater awareness that the fire fighting facilities at a number of circuits are totally inadequate and out of date. Thus, since the accident, we have heard of various schemes, from helicopters to 100 m.p.h. fire engines, to tackle the problem. At Brands Hatch recently there was a practical and more down to earth demonstration of fire fighting, which was organised by the RAC and, in particular, their Deputy Motor Sporting Director Basil Tye. Mr. Tye had arranged for a team from Pyrene to show how a racing car fire could be extinguished without the use of sophisticated helicopters but simply by three experienced men each using a portable extinguisher of some 48 lb, weight containing some 20 lb, of the latest Pyrene powder. Present regulations call for only two extinguishers at each

The Pyrene team, led by their resident expert, Frank Dew, set themselves an extremely difficult task. A crashed March 721 monocoque, fitted with some makeshift tanks, was filled with 40 gallons of fuel while a further 20 gallons were slopped in trays around the car, as it might do in real life, and the whole lot was set ablaze. After it had been burning a few seconds Mr. Dew's team started to run from 40 yards away with their extinguishers and attempted to put the fire out by attacking it in the best manner. After about twenty seconds they seemed to be on top of the fire, when it flashed back and they had to use three new extinguishers and finally had the blaze out in just under a minute. A second attempt proved even less successful and a fire truck with light water was called.

However, after the first attempt the well-known circuit medical officer, Doctor Ken Walker, said that, in his opinion, the driver's life would have been saved because the team had managed to keep the flames away from the cockpit. This is food for thought as the fire was as intense as Siffert's BRM in the opening stages of that inferno. The demonstration served to point out that three well-trained men with good and modern extinguishers do have a chance of putting out a vicious fire of this nature.

ALMOST OUT.— The three Pyrene fire fighters almost got the burning March chassis out in a few seconds but immediately after this photograph was taken the fire flared up again.

Obviously the real answer to this problem is to make the cars even safer. Recently there has been news of a completely new non-ruptureable tank successfully developed in the USA, for helicopters by the Uniroyal company, who are now being approached to develop a racing tank to a similar specification. This, by all accounts, could be a very big step forward. Obviously it will be a long time before such tanks are used in club racing cars and as Mr. Tye said at the Brands demonstration: "It must be stressed that the problems of racing car fires is not only confined to a handful of International events-the safety of a youngster in his first season of Formula Ford is just as important as that of an experienced International driver". Thus the training of fire marshals and the use of the best available extinguishers is exceptionally important.

#### Pit Stops

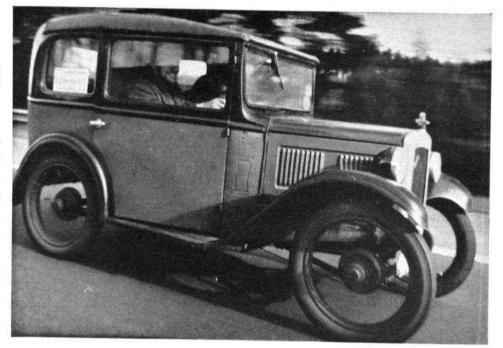

- The continued production of Lotus 7s has been somewhat in doubt since the closure, just under a year ago, of Lotus Racing Ltd., the subsidiary which made the cars. Now we are told 7s are being built in the main assembly factory of Lotus Cars. The Super 7, fitted with the big valve twin-cam engine, has been reduced in price to £1,195 in component form while, with the other engine option, the X-flow 1,300-c.c. Ford, the car continues to sell at £997. Further information from Caterham Car Sales Ltd. (Tel.: Caterham 46666). Also of interest to Lotus 7 owners is a revival of the somewhat dormant Club Lotus. The secretary is now Sandy Fowler, 14 Recreation Walk, Ramsden Heath, Essex and we understand the club would like to hear from any 7 owners interested in a trip to Le Mans in June. A National Rally is being planned for early September.
- Ocolonel Charles Barker has retired as General Secretary of the London Car Club and his place is being taken by Nigel Goode who can be contacted at 103 Elstree Road, Bushey Heath, Herts. (Tel.: 01-950 2096). The club's Oxfam race meeting at Brands Hatch on Iune 4th will feature a unique long distance multi-pit stop saloon car
- Following our article last month, "How do you become a Racing Car Designer?" and the several references to the 750 Motor Club, vice-chairman Jeff Ward has written to tell us that aspiring teenage special builders can become Junior Members of the club for just £1. Further details from the club's General Secretary, David Bradley, 16 Woodstock Road, Witney, Oxon. (Tel.: Witney 2285).
- Wallace Windscreens, who have been making and fitting windscreens since 1920, and have given excellent service to staff members, have now formed a company called Acerace to carry out work on competition cars. They have also moved into the world of Formula Ford and are sponsoring an Elden Mk. 8 to be shared by Ray Spring and John Brick. Wallace Windscreens, who specialise in laminated glass, can be found at 98 Webber Street, London SE1 (Tel.: 01-928
- World Championship engine constructors Cosworth have recently extended their premises at St. James Mill Road in Northampton, and have moved into a new building across the road. At the same time they have re-arranged the company structure so that Cosworth Engineering Ltd. deals with components and spares for engines which are not in current production while Cosworth Research & Development deals with complete engines, rebuilds and spares for current engines.
- The Jim Russell International Racing Drivers School, who operate racing driver training schemes from both Snetterton and Mallory Park, have now moved into the Hotel business. The school has purchased the Bunwell Manor Hotel, in the village of Bunwell, near Attleborough, Norfolk which is within easy reach of Snetterton. The school has a busy programme of pupils' races again this yea, at both Mallory and Snetterton. Further details of the training scheme from Jim Russell at Snetterton Circuit, Norwich NOR 1OX, Norfolk (Tel.: Quidenham 451).
- Ford will be running another series of rally schools in association with Dunlop in May this year. This time the tour will cover Tunbridge Wells, Cambridge, Learnington Spa, Barnsley and Hull between May 1st and May 5th. As before the schools wil consist of day-long classroom sessions with Timo Makinen, Henry Liddon and Ford Competition staff on hand as the lecturers. In the evening there will be forums where questions can be put to a panel of experts including Jackie Stewart, Graham Hill and the lady driver Gill Fortescue-Thomas.

#### VETERAN -EDWARDIAN -

#### A Section Devoted to **Old-Car Matters**

LAND'S END TO JOHN O'GROATS BY AUSTIN SEVEN.—At Easter 83 Austin 7s undertook to try to drive from end-to-end of this little island, just for the fun of it, remembering that this is the Jubilee Year of this great little British baby car. Apparently 65 accomplished this self-imposed task, from out of 72 starters, four of them covering the 881 miles in less than 24 hours. All were, of course, built before the war. This was by no means a race, but the 1931 saloon in the picture, with side-draught S.U. carburetter and Ruby head, did the journey in 21 hrs. 19 min. How much nicer than keeping such cars out of sight, in cotton wool, while pondering what they will fetch at the next auction sale! But for how much longer will fun and freedom of this kind, innocuous as it is, remain legal on the roads of Europe?

[Photo by Evening Gazette Teesside]

#### THE BEGINNING OF THE END?

THE VINTAGE and veteran pastime seems, on the face of it, never to have been in a stronger position. It has more followers than ever, more clubs catering for the older cars. A great many events, charity and otherwise, cater for pre-war vehicles of all kinds. The VSCC and VCC thrive. Tim Carson, M.B.E., until recently the extremely popular Secretary of the former, was recognised in the New Year's Honours List and the general public loves old motor cars, drawn to them by the appearance of such things in full-length films and TV plays and commercials.

The outlook, you might think, is set-fair and the long-distance forecast a glorious never-ending vintage summer. The older cars, even undesirable just-pre-war pedestrian tin saloons and unrestored, or only partially complete vintage machinery, fetch ridiculously lofty prices, it is true, but this has to be accepted as the penalty of popularity for which the pioneer old-car clubs and Motor Sport are as much to blame as anyone. It is becoming more and more difficult to maintain pre-war cars, because items like taper-pins, castellated nuts, magnetos, whittle belting, single-pole bulbs, cotter-pins, timing chains, etc., are becoming ever scarcer, if they are obtainable at all, and where would we be for tyres of 17 in. and larger, if it were not for the co-operation of Fort Dunlop ?

The MoT tests do not make life any easier, although most vintage cars can be made to pass without too much difficulty and some muchappreciated concessions in respect of braking efficiency, lighting and other requirements are extended to them. Rumour has hinted at a Government-staffed range of testing stations to replace garages doing vehicle testing, financed by a well-known food combine, which, if it happened, could make life for the old-car owner more difficult, but confirmation of this has not been obtained.

Now, however, a cloud, tiny at present, has been seen on the vintage horizon, which could build up to the storm which will ultimately sink the good ship Vintage Hobby. I refer to a clause in the regulations governing our entry into the European Economic Community which bans cars of more than 15 years of age from being used freely on public roads. This, naturally, was spotted by a reader of Motor Sport, a lady who enjoys driving a 1935 Singer Le Mans as everyday transport and does not wish this kind of motoring to terminate if we go into the

The exact wording of the clause has not been established but there is seldom smoke without a fire and when this lady drew Lord Montagu's attention to this possible, very serious, restriction to our enjoyment of the older cars his Lordship replied that the matter had been taken up with Mr. Michael Heseltine, the then Parliamentary Under-Secretary of State at the Department of Environment, who said, in effect, that it is not envisaged that Britain would conform to this type of Continental motoring regulation, and that as far as he is aware the clause will not

apply, an answer which at least seems to confirm the existence of this shattering and unpalatable clause.

As our lady reader remarks, this is all very fine but she would like to know definitely whether the ban will or whether it will not be a condition of our entry into the EEC. It is hard to imagine politicians bothering to defend the vintage and pre-war car movement when so many big and vital issues arise whenever Common Market matters are debated.

Lord Montagu, it is said, will no doubt pursue the point in the House of Lords, if necessary when the EEC regulations are debated, and we have drawn the attention of A. S. Heal, who up to 1971 so ably chaired the annual Veteran & Vintage Clubs Conference, to this vital matter. That the HVJC "is already watching very closely our interests with regard to possible changes due to the Common Market (early vehicles in certain European countries do not enjoy the same freedom they do here)", according to a report on the AGM of the National Traction Engine Club in the March issue of Steaming, shows this is no time for taking a complacent, ostrich-head-in-sand attitude. Remembering, too, the fable of the stable door which was shut after the horse had bolted, we can understand our reader's concern. Moreover, it should be remembered that the excellent concessions which the Historical Vehicle Clubs Joint Committee has obtained on behalf of the movement apply, in the main, and quite rightly, to pre-1931 cars, whereas the EEC issue seems to concern the possible banning from normal usage of any cars built more than 15 years ago. Like our lady reader's Singer, which she has been using as regular transport for the past 13 years.

Quite what is the origin of the ban or how the disturbing clause is worded is obscure at the time of writing but the message on the wall may not seem so far-fetched when you reflect on the hampering conditions which already prevail in Germany so far as old vehicles are concerned, if the story we hear is true of someone rebuilding a vintage car who had to endow it with a dual braking system, covers over its eared hub-caps, and so on, before it was possible to use it. And complacency should go overboard when it is realised that a ban on all open cars is contemplated in America . . . Someone who is normally the exact opposite of a pessimist, when we were discussing this cloud on the vintage horizon with him, told us that he considers we have ten more years in which to enjoy vintage motoring as we know it here at present, if we have as long.

We have always been rather frightened of those people who advocate special licences for old cars, enabling them to be taxed for very short periods and/or for reduced fees, because this seems to us to pave an easy path to the banning from normal use of the older cars, perhaps restricting them to rallies only, from which it is but a short step to saying "rallies on private ground", to which they could be trailered. This would be a very severe blow to many of us and particularly to owners

of 1930s to 1950s vehicles, which constitute perfectly practical and enjoyable everyday transport-as do, of course, many vintage cars, although these are less frequently employed in this way. The alternative scheme, already announced by the tax authorities, whereby it will be possible to tax all cars for periods of a day or days, over-the-counter at Post Offices, instead of for a minimum of four months with no rebate of less than one month, which would suit the owners of old cars admirably, is said to be coming into operation when the Cardiff computers are ready-and in Wales the "drwydded" has for some time been printed with the expiry date expressed as the last day of the month in figures, ready for the scheme when it happens-but the GPO seems to be taking an unconscionable time to get its electronics going on our behalf, in this computer-age. Perhaps the idea has been

What the outcome will be is not clear at the moment. Most certainly the matter needs careful attention by every interested body (which includes the writer), with vehement action should the need arise. Quite how confirmation of such a calamitous ban would immediately affect the movement it is impossible to foresee. You could argue that if time Or you could say what Charlies people are who pay the astronomical prices asked these days for almost every kind of pre-1960 vehicle, come rust, essential restoration, missing parts, absence even of bodywork and what have you, especially as the European ban could well put pre-1960 cars off public roads for good. The little cloud which has floated up has not yet obliterated the sun but those about to part with lots of hard-earned lolly on some not very distinguished neo-vintage car may well pause to see how the EEC clause affecting their hobby will go. We can expect to see a fall in the prices of the more ordinary postvintage saloons, some of which have mostly only age to recommend them until the position is fully clarified. The sooner this is done, by the custodians of the vintage movement, the happier all of us will be who value our motoring freedom, especially that enjoyed in the older kinds of cars. Tim Carson's M.B.E. was splendid; let us hope it does not represent a golden handshake from a Government in respect of a way of motoring life it will not be prepared to sanction for very much longer -W B

is short vintage cars must be urgently acquired while they can still

be enjoyed on normal roads and journeys, no matter how high the price.

#### MUSEUMS

LORD MONTAGU'S National Motor Museum will be opened on July 4th, when the new Beaulieu by-pass and improved road system, opened by the Secretary of State for the Environment on March 24th, will facilitate the traffic flow. Meanwhile, lesser museums seem to be flourishing. A catalogue issued by the Myreton Motor Museum at Aberlady, East Lothian, Scotland, where none of the exhibits are "fenced off" from the public, lists 56 cars and 34 motorcycle exhibits, apart from bicycles and smaller items, the last-named including the engine from a 1927 Grainger light aeroplane.

Some of the cars are interesting and the number which were apparently in use in Scotland until quite recently is intriguing. For instance, there is one of the 1935 TT Singers, AVC 483, which must be the fourth car which escaped the fate of those referred to on pages 494/5 and was raced at Silverstone in the 1950s. The 1921 Lanchester 40 Gill limousine is presumably the ex-Hutton-Stott car, a 1920 Armstrong Siddeley 30 Burlington tourer is ex-Sword and surely one of the very few survivors of its type, and another rare one is the Gordon England-bodied 15/40 Darracq owned by Sir Francis Samuelson from 1927. It has run at the Doune hill-climb.

Mention of a 1923 20/30 Peugeot limousine suggests that the example once driven by Barry Clarke may have vanished not to America, but to Scotland, but perhaps not, as this one was in France until 1950. A 1925 Type SW Series 1 Morris Commercial six-wheeler with a later shooting brake body by Morgan of Leighton Buzzard had spent all its life on a Scottish estate until retired in 1969 and its companion is a Citroën Kegresse used in a more rugged estate further north, until retired in favour of a Snocat; it has never been licensed or used on a public road.

A 1923 Buick hearse was in use in Oban until 1952, a 1919 Ford charabanc was found in a collapsed bothy after its days carrying holiday visitors to a Cairnbaan hotel had long since ended, but a 1923 Renault 9/15 was used all his life by the Scottish architect, the late Sir Ian Lindsey. Another Model-T Ford, a 1924 van, was used by a North Berwick baker until it crashed in 1931; it was discovered in an ironmonger's shop in Dunbar and the pieces removed by wheelbarrow. Many of the cars have appeared in films like "Dr. Finlay's Casebook" and "The Prime of Miss Jean Brody", but a 1929 Hillman Safety Fourteen was in use in North Aberdeenshire until recently and a 1931 Morris 8 was rescued from a scrapheap by a boy of ten, who saved £2.50 of his pocket money over six months. A 1925 Morris-Oxford had been in demand in Edinburgh in 1951, there is a one-ladyowner Armstrong Siddeley Twelve, found in her garage in Edinburgh after her death, a 1926 15.9 Humber used on the Countess of Seafield's estate, a 1922 Jowett found in a New Calder blacksmith's, an Aero Minx, a 1928 Willys-Knight endowed by a lady owner with a body from her older Rover, the ex-Major Cadbury Speed Six Bentley, a 3-litre Bentley, a P1 Park Ward Rolls-Royce used in 1953 as a chicken roost, a Clyno found in Wales, a 1929 Morgan, crashed in 1930 and discovered in 1965, a 2-litre Lagonda driven, in poor condition, up from London for rebuilding (it needs a supercharger), a 16/80 Lagonda crashed in 1964 at Bedford but since rebuilt, a 1936 Humber originally owned by Earl Haig, then by Sir Victor Sassoon but which ended its active life as a hay-rake, and a 1932 Dennis fire-engine, ex-Belfast Fire Brigade. The oldest car seems to be a 1912 De Dion Bouton twin and racing cars are represented by a Cooper-Norton 500 and the ex-Sowrey Cooper 1100 sprint car.

Scottish cars comprise a 1923 Type-D Arrol-Johnston, a 1927 Galloway and a 1928 Arrol-Aster, the sole surviving 17/50, found with a holed sump and minus a sleeve. There are several MGs and a 1924 duck's-back 12/50 Alvis which covered some 3,000 miles last vear.-W. B.

#### VMCC BANBURY RUN

THIS year's Vintage MCC Banbury Run takes place on June 18th, starting from Banbury (Castle Gardens car park) at 10.30 a.m. Entries close on May 15th, but are open only to paid-up VMCC members. There are four classes, for machines of prior to 1909, 1910-1914, 1915-1924, and 1925-1930, with respective average speeds of 12, 18, 20 and 24 m.p.h. over routes 22, 40, 50 and 70 miles, respectively. The awards are particularly generous and the spectators get very good value —but please give the riders an uninterrupted passage and don't congest the start and finish area. A new Hudson three-wheeler is expected to figure in the very large and comprehensive entry list.-W.B.

#### THE SHUTTLEWORTH TRUST

THE next fixture will be a special Flying Day to commemorate the formation in 1912 of the RFC. Weather permitting, a 1909 Bleriot, 1910 Boxkite, 1915 Avro 504K, 1916 Sopwith Pup, 1917 Bristol Fighter, 1917 SE5a, 1916 Fokker and 1917 LVG C VI will be flown, as representative of the formative and fighting years of the RFC. The Army Aviation Centre's Blue Eagles helicopter team are to call a modern note. Gates open 11 a.m., flying to begin, God willing, at 2.30 p.m. Admission is 50p per adult, 25p per child, car park until filled. The aerodrome is at Old Warden, near Biggleswade, Beds. If you miss this, on the Sunday after VSCC Oulton Park, there is to be a DH Moth and Light Plane Day at Old Warden on June 25th.-W.B.

V.E.V. Odds and Ends-Apart from the London Transport 1930 AEC 'bus now operating in London on a special service, as reported last month, an ex-Paris Renault 'bus was used recently to promote the sale of French apples, being driven across France and round England. Traction-engine rallies are too numerous to list here but we recommend to those interested a comprehensive fixture list of approved events from May to October, which appeared in the March issue of Steaming, Journal of the NTEC, whose Membership Secretary is C. C. Aves, Milking Pen Lane, Old Basing, Basingstoke, Hampshire. A horsedrawn International Harvester with a 4-ft, cut, which was adapted to an old Morris-Cowley chassis in the mid-1930s and last used in the 1950s, still exists in the West Country.

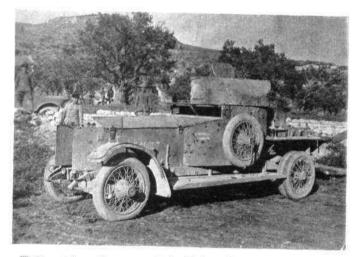

M. J. Banfield, chairman of the HCVC, has acquired the Daimler 'bus chassis mentioned in this column last year, as being derelict in the Pennines. A building had to be removed before it could be extracted. A tenuous but interesting link with motor racing, to which a lady reader has drawn our attention, concerns a dogs' drinking fountain, still to be seen in Cambridge, where it was erected in the late 1920's in memory of his dog Tony, by HRH Prince Chula of Siam. The ABC Register's annual rally takes place this year at Hoar Cross Hall, Staffs, on September 10th.

#### VINTAGE POSTBAG

Rolls-Royce Armoured Cars

Sir,

Noting the interest in Vintage Postbag of First War vehicles, I am enclosing a photograph taken by a captured German Officer, showing one of our Rolls-Royce armoured cars in the hands of the Turks on the Palestine front in 1917.

This may have been one of the Duke of Westminster's squadron that made the 150-mile dash to Siwa in the Libyan desert to rescue some of the crew who were prisoners of the Senussi tribe after their ship the "Tara" was torpedoed by an Austrian submarine in 1916.

Much Birch.

PERCY PRITCHARD, A.R.P.S.

Sir.

In 1942 whilst serving in the R.A.F. at Kilo 8 just outside Heliopolis we found an armoured Rolls-Royce covered with an old tarpaulin in the desert. After uncovering it and having to retreat from thousands of ladybirds we got it going and had lots of fun until the powers that be found out. I well remember driving it and as it had no floorboards it was quite a thrill to see the sand flashing past one's feet. Thank you for the only real motor magazine published and let's have more articles, like "Cars I Have Owned", etc.

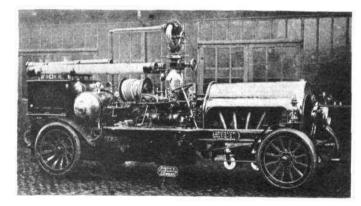

Newbury.

Anthony E. Aldworth.

What Is It?

Sir,

While reading through the March MOTOR SPORT one particular photograph caught my eye. The reason for this being it was taken outside my house, a now disused fire station. I showed this to my father, who had recently taken a copy of the picture from an original print and also one other.

The other picture shows that the machine was designed and built in 1906 at a cost of £3,000 by J. Zwicky of Tottenham with a 100-h.p. engine. As far as we can find out the machine was supplied in that year to the Tottenham Borough Council.

Tottenham.

M. R. GRAY.

Crossley Bugattis

Sir,

I was very interested in Mr. Greaves' letter in the March issue, Although I cannot add any information on the Willys-Overland "kit car", I am prompted to write about the Bugattis which he mentions were made in the same works.

Automobiles Bugatti (Molsheim) gave sanction for 500 standard Type 22, 16-valve Bugattis to be built by Crossley Motors under licence. Contemporary accounts have it that the cars were produced in two bays set aside in the Crossley works at Gorton. As Stockport and Gorton are very near each other I take this to be works referred to by Mr. Greaves.

Due to demand for their own cars, Crossley never went into full production on the Bugattis. In fact only 25 are reputed to have been completed, their chassis numbers ranging from 1600 to 1625. The cars were asembled from parts imported from France, some of which were in the rough state. It is interesting to note that the castings were machined to Imperial dimensions and BSF threads were substituted for metric sizes.

Three Crossley/Bugattis competed successfully in the "Fifteen Hundred" trophy race at the 1922 TT event on the Isle of Man, finishing third, fourth and sixth in the hands of Maury, Vizcaya and Marshall. Photographs of these cars show them to be of the short wheelbase Type-13 variety.

I have a shortened Bugatti chassis bearing chassis No. 1622, which falls within the range reputed to have been assembled by Crossley. The front right-hand dumb iron bears the stamping BC 23 which, much as I would like to believe means the car is 1,985 years old, I can only interpret as indicating "Bugatti/Crossley" Type-23. Type-23 is the number allocated to the long-chassis 16-valve Bugatti.

If my interpretation is correct then Crossley must have produced the full range of chains from T13, T22 and T23 of 2.0, 2.4 and 2.55 metres wheelbase respectively.

I would be interested to learn if any other readers could shed any more light on these obscure cars, particularly on the body styles fitted.

Thank you for maintaining the high quality of MOTOR SPORT. Minety.

RODNEY MANNERS.

The Sheffield-Simplex

Sir,

Further to your article on the Sheffield-Simplex, the Works are unaltered today, but for the name over the door. Fitzwilliam Works is owned by Balfour Darwin Ltd. and they have recently acquired a late-model Ner-a-Car, now displayed in the Reception office. This vehicle has a 350-c.c. engine and chain drive to the rear wheel, not a friction drive as stated in your article. [It could have both.—Ep.] Mr. Stanley, the Works Director, told me that those who have ridden the Ner-a-car say it handles very badly due to the length and the "drag link" steering. There is in the Chairman's office a painting of a 1913 30-h.p. car outside the works; this was done from a photo, of which Balfour have a number. Are there any Sheffield-Simplex cars in this country? I gather Balfours traced one in Australia and another in the States.

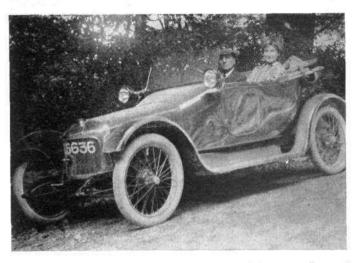

The present Earl Fitzwilliam lives near Peterborough at Milton Park,
Sheffield.

R. Chapman.

Douglas Memories

ir,

My father has unearthed a photograph of his parents in their 1913 Douglas car, AE 5636. This was in no sense a cyclecar but was fully equipped in every way. The specification included a three-speed and reverse gearbox, shaft drive and a live rear axle with differential. The engine derived from the well-known Douglas motorcycle; it was a horizontally opposed two-cylinder rated at 10 h.p., the bore and stroke were 88 mm. and it was fixed transversely across the frame. It had a Zenith carburetter, Bosch magneto and a starting handle working through a hole in the middle of the radiator.

The original cost was £200 and it gave very satisfactory service until my grandfather sold it in 1919. It was replaced by another Douglas costing £500 which was not so satisfactory and gave continuous mechanical trouble, repeatedly breaking the tie rods connecting the back axle to the frame. This car had a slightly larger engine (92-mm. bore and stroke, 10.5 h.p.) and had the radiator raised so that the starting handle could pass below it. A self-starter was introduced in 1920, as Percy Douglas put it, "for lazy people". The rear-suspension was unusual, it consisted of transverse coil springs operating through bell-crank levers.

At about this time Douglas experimented with racing cars, using the 10.5-h.p. engine as a basis but employing push-rod-operated overhead valves and a raised compression ratio.

A watercooled version of the 8-h.p. engine was used in the Williamson three-wheel cyclecar. This engine was fitted longitudinally with the flywheel on the off-side so that it "ran backwards". It drove the single rear wheel via a three-speed gearbox using chains to transmit the power both to and from the gearbox. However these chains were too long and noisy and gave constant trouble, being later replaced by a JAP V-twin engine and shaft and bevel drive.

Ornington.

JOHN SPOOR (DR.).

\* \* \*
"On Top—Napier or Rolls-Royce"

Sir

In your well-argued piece in the April number, "On Top—Napier or Rolls-Royce", you suggest that I was "less than fair" to Napier in "The Rolls-Royce Motor Car". If the book gives this impression it certainly was not intentional, and I started from a slightly anti-Rolls-Royce position believing the marque to have been very much over-praised from time to time. I suppose, however, that the effect of reading reams (as it seems) of Edge's questionable and tendentious Napier-boosting effusions may have brought on slight Napier-nausea, which showed.

On the question of which was "on top", I think neither was. Both Napier and Rolls-Royce produced outstandingly good motor cars by the standards of their time, and their less good models, the first six-cylinder Napiers and the 30-h.p. Rolls-Royce (both bedevilled by torsional crankshaft vibration) were still better than most of their contemporaries. Both firms also dropped similar clangers with their "bonnetless town carriage" types, which were non-starters commercially.

Judgement is influenced by one's personal tastes. For example, very broadly, I find Napiers have a pleasanter gear-change than Rolls-Royces (though the top-gear-anywhere caper makes the question a bit academic), but I found the steering of the 40 h.p. 1907 Napier very much less acceptable than that of a Silver Ghost. It would be possible to advance other pros and cons. Napiers were probably the more adventurous firm both in technical innovations and, as you say, in their attitude to racing and speed trials. This doubtless reflects the personal tastes of S. F. Edge, the sportsman, and Claude Johnson, who was primarily interested in reliability and refinement. For the reason you quote I find the big Napiers less pleasing aesthetically than Rolls-Royces, and I think no one will deny that the Silver Ghost wins over its nearest counterpart from Acton for quietness and refinement, and possibly for longevity.

On the specific question of Rolls-Royce versus Napier in the RACobserved top-gear-only-cum-fuel-consumption-cum-maximum-speed demonstration I hope there is no unfair inference in my book. I quoted the figures there which are repeated in your article, so the reader can seen how small was the difference between the two cars.

Certainly, on the 1911 occasion the Rolls-Royce showed a remarkably large margin over the Napier's remarkably economical fuel consumption: 24.32 m.p.g. against 19.35. A New Zealand correspondent has recently questioned this figure and writes that he, and some others, find it so remarkable as to make them suspicious of jiggery-pokery. The RAC observation of these trials was so strict that I am sure the figures must be accepted without reservation, but there is no doubt the cars were driven very carefully, not exceeding the legal maximum pace of 20 m.p.h., with the drivers using every trick in the book to conserve petrol. My New Zealand correspondent suggests that "tyres pumped up iron hard" were part of the repertoire, but I am able to refute this as far as R-R are concerned. Nevertheless, the fuel consumption figures are a little unrealistic as far as the ordinary driver is concerned.

I suppose it could be argued that the relatively lesser commercial success of Napier Ltd., reflected in their production figures, arose from the common mistake of trying to make too many models. Conversely one could say they were wrong to eschew four-cylinder cars for so long whilst Edge was conducting the "battle of the cylinders" with such bombastic fervour from so wide a variety of wrong premises. I am sure you are right to conclude that it was fear of a resurgent Napier which drove Rolls-Royce Ltd. to snatch Bentley Motors away from

Potbridge.

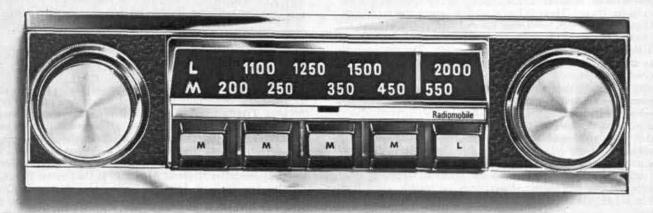

ANTHONY RIPD

V-E-V Miscellany.—A Morris Commercial platform truck, apparently in restorable condition, is reported from Scotland. The popular Andover Traction Engine Rally takes place this year on June 3rd and 4th, at a new venue, Church Farm, Longparish, six miles East of Andover, half-a-mile from the A303. There is usually support from vintage cars and events commence on both days at 2 p.m. The organiser is J. Field, 2 Lansdowne Avenue, Andover, Hants. "Alvis Days" this year comprises National Alvis Day at the Crystal Palace, London, on May 7th, Midland Alvis Day at the Alvis factory in Coventry on July 2nd, with driving tests at Fort Dunlop, the Scottish fixture at Bush House, Peniouik on September 3rd and the Northern event at the Mooreside Hotel, High Disley, Cheshire on September 17th. Details from R. A. Cox, Alvis OC, 23 Westgate Terrace, London, SW10.

A restored 1925 Dennis pneumatic-tyred, open-top omnibus, ex-Dominion and LGOC, is scheduled to undertake a 1,500-mile round England tour on behalf of the English Tourist Board, vide the newsworthy News-Letter of the HCVC, whose Brighton Run happens on May 7th. The Triple-M Register of the MGCC, which concentrates on o.h.c. MG Midgets, Magnas and Magnettes of the 1929-1936 period, tells us, arising out of the MOTOR SPORT interview with George Harvey Noble (March issue) that his famous R-type is now in S. F. Beer's collection and that the 1933 TT-winning K3 Magnette, and the Hamilton J4 which it narrowly beat in that race, are both being rebuilt and should be running again next year. The Secretary of the Triple-M Register is now Colin Butchers, 21 Hill Farm Way, Southwick, Sussex and the former Secretary, M. Allison, has become the Register's Historian.

On the subject of ancient boats, an Austin 7-engined launch is reported to be in a London boatyard, an Austin 7 marine engine is for sale, and a vintage river launch, once Coventry-Simplex-powered, a 1924 Gaines marine engine and an old lifeboat once powered by a converted Model-B Ford engine and Joes marine gearbox are reported from Surrey. A circa-1914 Sunbeam 12/16 tourer, laid up from 1930 until 1942, but stranded at Leyburn, in the floods of 1947 when being towed to a new owner for restoration, should soon be on the road again. It is now in Yorkshire and its owner had his first motorcycle in 1923; his first family car was a chain-drive Sunbeam, followed by a 1913 Rover and his grandfather had "a very delightful" 1911 Arrol Johnston landaulette. Incidentally, Wilkinson of Derby "were apparently the only people with the drawings and ability to make a hood frame" for the Sunbeam being rebuilt and they also upholstered it and made it a hood. D. B. Tubbs hopes to have his Bamford and Martin Aston Martin on the road this summer using a 12/50 Alvis engine and a replica body. A derelict chassis, probably a Rolls-Royce, has been found in a Hampshire scrapyard.

# Radiomobile plays the Minute Waltz at top speed. Surrounds you with sound!

There's something missing about a car without a radio. It keeps you happily alert to the demands of driving for a start, and when it's a Radiomobile," does so much more. The sheer quality of Radiomobile performance is a revelation in itself. One very good reason is that Radiomobile design radios for cars and nothing else. With all the power you need for superb sound reproduction -

from pianissimo to fortissimo.

There's a whole range to be heard at your local Car Dealer's - seven models in all.

Radios, stereo tape players and the two combined. And the right aerial for your radio too.

You can't beat Radiomobile quality. Radiomobile is built to stand the pace.

Send for a free illustrated brochure.

#### NON-CHAMPIONSHIP FORMULA ONE RACING

#### Fittipaldi at Brands Hatch—Reutemann at Interlagos

IN THE lull between the South African and Spanish Grands Prix, two non-championship Formula One races were held, one at Brands Hatch and the other out in Brazil as a warmer to a full-championship race next year. Both races were dominated by Emerson Fittipaldi driving for John Player-Team Lotus. At Brands he scored a convincing win but at the Interlagos track he was robbed of victory by a rearsuspension failure and thus handed first place to Carlos Reutemannthe Argentinian's first Formula One win.

#### RACE OF CHAMPIONS (March 19th)

Neither race attracted full fields and, particularly at Brands Hatch, where Brabham, Tyrrell, Ferrari and Matra were not represented there was considerable hysterical and adverse publicity about this in national newspapers and on the radio. This centred mainly around the fact that reigning World Champion Jackie Stewart and former Champion Graham Hill were not entered in what was, in fact, the Race of Champions. Small fields are nothing new at early season Formula One races and promoter John Webb of Brands Hatch was probably laughing all the way to the bank as the only effect the publicity had was to encourage a huge crowd to turn up in beautiful weather.

There was a field of twelve Formula Ones for the event further bolstered by some of the better Formula 5000 cars which, the previous day, had taken part in a race of their own. This was won by Graham McRae's Leda, straight from the Tasman Series, but he was disqualified for overtaking under a yellow flag which was being shown for oil in accordance with the new ruling (since rescinded) abolishing the yellow and red oil flag. Passing under this flag was allowed. All this left a nasty taste in the mouth and the unfortunate McRae decided not to start on Sunday.

Fastest in practice was Fittipaldi, in his regular Lotus 72D, and he recorded 1 min. 23.9 sec. to better his own lap record by 0.1 sec. Gethin, who was fending off Fittipaldi before the premature halt of the October Non-Championship F1 meeting, was second fastest and Hailwood in his Surtees completed row one-all three lapping within one-fifth of a second of each other. Row two was filled by the Yardley McLarens of Hulme and Revson with identical times. On the third row were flat mates Ganley (BRM) and Schenken (Surtees) plus Peterson, who was driving a brand new March to a new design. Designated the 721X, this will be Peterson's regular car in place of the conventional 721, previously seen in the two earlier Grands Prix. The new car is interesting because it has a March designed "reverse" gearbox with all the ratios, which are of Autodelta manufacture, in front of the c.w.p. The gears, and part of the casing, are exactly as those on the Alfa TT33. Designer Robin Herd was not claiming this to be revolutionary for he knew ATS tried it ten years earlier but he was hoping that the polar moment of inertia would be reduced. The rear-suspension was inboard by a rather similar method to that used on the Ferrari B2 last year. The general appearance was rather similar to the 721 although a different full-width nose was being tried but the large engine cover cum air ram box is retained. The monocoque is somewhat squarer than the two previous March F1s and has a much sturdier roll cage but retains the inboard front suspension. The car raced by Peterson at Brands will be taken over by Lauda and the Swede will have a lighter version with several titanium parts which prompted the Daily Express to state it was the most expensive Grand Prix car ever built!

On row four of the grid were Beltoise and Walker, in BRM and Lotus respectively, and row five had the conventional March 711/721 of Beuttler and the unimpressive Eifelland modified version for Stommelen. Dutchman Gijs van Lennep was the fastest F5000 competitor with his new Surtees, in the absence of McRae.

When the flag dropped Gethin made the best start and surely thought he had the lead into Paddock Bend but Fittipaldi came elbowing through on the inside. The Brazilian took the lead and that was about the last anyone saw of him. However, Gethin proved reluctant to give way to anyone else and after a few laps he had Hulme, Hailwood and Revson all queuing up behind. Hailwood managed to get by Hulme after nine of the 40 laps but it was not until after half distance

that Hailwood finally passed Gethin. By then Fittipaldi had a healthy lead and though Hailwood tried his hardest to reduce it there was still a gap of 13.4 sec. at the finish. Hulme also passed Gethin when his former McLaren team-mate missed a gear at South Bank Bend and these two, with Schenken and Beltoise closing fast, finished almost nose to tail with only 1.5 sec. separating all four. Revson dropped back to eighth place behind Ganley, having lost the visor for his helmet and most of the brakes on the McLaren.

Walker went steadily, still feeling his way in Formula One and finished in ninth place, a lap behind his team mate, but ahead of the leading Formula 5000 which was the Lola T300 of Rollinson. The Lola driver had fought off a challenge from Redman's McLaren M10B (a two-year-old car entered as a stop-gap until a new Chevron is finished) but he spun and was unable to re-start the stalled engine. So eleventh was Stommelen followed by Peterson who had made a pit-stop in answer to his mechanic's signal. Officials had thought the March was losing a wheel but had mixed it up with van Lennep's Surtees which was trundling to the pits with a snapped top link. In fact, Peterson had various new car problems and the 721X was not really given a proper chance to show how competitive it will be. The Belgian driver Pilette, in a McLaren M18-Chev, completed the finishers, Beuttler having retired after only three laps following engine problems.

A Formula Three race, won very conclusively by Pryce in a Royale, developed into a farce at post-race scrutineering when it was found that, according to the Brands weighbridge, the first four cars were all considerably under the weight limit. At first they were fined £25 each (the price for cheating?) but later the bridge was declared unreliable. An exciting saloon event was just won by Gardner's new 1972 Camaro.

#### STP RACE OF CHAMPIONS—Brands Hatch—Formula One and Formula 5000—40 laps—170.58 kilometres

1st : E. Fittipaldi (Lotus 72D-Cosworth V8) 2nd : M. Hailwood (Surfees TS9B-Cosworth V8) 3rd : D. Hulme (McLaren M19A-Cosworth V8) 4th : P. Gethin (BRM P160 V12) 5th : T. Schenken (Surfees TS9B-Cosworth V8) 6th : J-P. Beltoise (BRM P160 V12) 7th : H. Ganley (BRM P160 V12) 8th : P. Revson (McLaren M19A-Cosworth V8) 9th : D. Walker (Lotus 72D-Cosworth V8) 10th : A. Rollinson (Lola T300-Chevrolet V8)* 11th : R. Stommelen (Eifelland 21-Cosworth V8) 12th : R. Peterson (March 721X-Cosworth V8) 13th : T. F5000 BATTLE.—During Saturday there was a separate race for Formula 5000 cars which was won by Graham McRae in the Leda. Here he leads Gijs van Lennep's new Surtees TS11 and Alan Rollinson's Lola T300. McRae was subsequently disqualified

#### A BIT OF HISTORY - from a photo collection

A READER loaned us an interesting collection of photographs from the archives of the Ulster Transport Museum in Belfast taken by a staff photographer of the Bangor Spectator and they included some rare and unusual ones of the 1932 RAC Tourist Trophy race on the splendid Ards circuit to the east of Belfast. From 1928 to 1936 this annual event represented road racing at its best, on a circuit the equal of anything in Europe at the time. The only drawbacks to the series were the insistence of the RAC running the event as a handicap, and a pretty complicated one at that, and the banning of supercharged cars in the last three years of the races on the Ards circuit. The handicapping invariably favoured small-engined cars so that MG and Riley were always to the fore and the larger cars could be driven in heroic fashion, as they often were, and never hope to achieve higher than second place.

In the 1932 event C. R. Whitcroft was the winner with a 1087-c.c. Riley and from the collection on loan we have taken some rare photographs. The first shows the two Alfa Romeos of Sir Henry Birkin and Lord Howe in close company, these being 2.3-litre supercharged straight-eight Le Mans cars. Until 1934 the cars in the TT, which had to be sports cars, could run stripped of road equipment and it is interesting that the Alfa-Romeos kept the right-hand front mudguard

in place in an attempt to stop road dirt and stones flying up in the driver's face. Further, it is interesting that Birkin wore a linen helmet and his riding mechanics a crash-hat, while Howe wore a crash-hat and his riding mechanic wore a linen helmet. The second picture shows the Hon. Brian Lewis looking at the broken rear-hub of the Fox and Nicholl Talbot 105 number GO52, while Arthur Fox the owner is walking away. This incident occurred during practice when Lewis was taking Fox for his annual ride in one of the racing cars. They had just started their third lap when the hub sheared at its root and wheel and hub flew off into the hedge. It was at Quarry Corner and Lewis had quite a busy time bringing the car to rest on three

wheels and a brake drum. This incident is fully described and fully illustrated, even with a photo of the wheel in mid-air, in the magnificent one-make history book by Anthony Blight, "Georges Roesch and the Invincible Talbot", Grenville Publishing Company Ltd., £5.25.

In the Blight Bible the two photographs show first the wheel coming off and then Lewis and Fox examining the broken hub. The photograph reproduced here was taken between the two in Blight's book, after Fox had got out of the car but before Lewis had done so. It would be interesting to know where Fox was going in this picture and what he did between this moment and the Blight photograph where he had returned to the car and Lewis had got out and lit a cigarette.

The third photograph is really a tribute to a very promising Irish driver and to MG Midgets that went so well in Ulster. Car number 30 is a supercharged 750-c.c. MG with H. C. Hamilton at the wheel. His performances round the Ards circuit were meteoric and sometimes over enthusiastic, and this was one occasion. He is seen about to start practice during which he went incredibly fast and then crashed, wrecking the car and injuring himself slightly but sufficiently to put him out of the race. A point of interest on the car is that they did not use aero-screens but instead had large cowlings, as used on the 1922 TT Vauxhalls, to deflect the wind off the driver and mechanic

The last photograph come under the "believe it or not" category for it shows an 1100-c.c. Alta car number 26 driven by J. L. Ford, about to start practice. If I was asked if an Alta ever took part in the TT I would have said no, but here is proof. It started in the race and contemporary reports merely say "the Alta retired".-D. S. J.

# SMITHS Instruments range far and wide

They tell you exactly what's happening to your car, with superb accuracy. In the four types of instruments shown here you're sure to find the ones best suited to

your style and your price. They not only add up to extra safety on the road, they increase the value of your car, too! 'SMITHS' Instruments best of all ...

vity 'SMITHS' Grant Prix range consists of seven instruments. starting with the Integrated Circuit Tachometer

This has an adjustable red danger zone on a movable bezel, suitable for 4, 6 or 8 cylinders it's the best of its kind available ICT £15.50

Water Temperature Gauge. Indicates faulty water pump, blocked or leaking radiator, faulty head gasket, faults GTB £5-35

Oil Pressure Gauge. Indicates low oil level, pressure release valve worn rings, blocked oil pipe, faulty oil pump, lost sump drainplug. Essential for the sporting driver. GPB £5.35

**Battery Condition** Indicator. This indicates state of battery chargetells whether charging voltage is too high or too low, fault in veltage regulator, defective GBC £3.95

Ammeter. This indicates faulty generator or alternator. battery not holding charge, broken or loose fan belt. 30 or 50 amns GAB (30A) £3-00 GABA (50A) £4.35

Ammeter, Indicates that attery is being properly TPA £2.50

Oil Pressure Gauge, Gives continuous and consistent information indicating low oil level in sump, blocked oil filter. worn bearings, blocked or TDP £4.75

Water Temperature Gauge instrument that's missing on TDT £4.75

**Battery Condition Indicator** Shows at a glance the state of the battery-with or without TDB £3-25

Top Dash is an entirely new range of instruments designed to fit on top of the fascia, directly in your line of vision. They are particularly suited to cars whose instrument panels have no room for additional dials, or whose style demands extra instrumentation up to this design standard. The range is easily fitted and comes complete with fitting instructions.

Impulse Tachometer. Gives you engine revs at a glance, for best engine performance right ST4 £12-83

Smiths Industries comprehensive and inexpensive range of instruments-invaluable for telling you what's happening in time to prevent things going seriously wrong. As well as temperature gauges, ammeters and so on, it includes the following ...

Air Temperature Gauge. tanger of ice on roads-it's ATC £5-67

GPF £5-60

XEATE LANE LUNDON NW2

#### AN ELAN WITH A **DIFFERENCE**

#### -170 bhp **Broadspeed BDA** under the bonnet

Nobody short of an experienced competitive driver would be likely to describe the production Elan as anything less than downright exciting anyway. As it emerges from Hethel the Sprint will run from 0-60 m.p.h. in approximately seven seconds and cover nearly 120 m.p.h., thus any effective conversion, especially one employing a BDA transplant, should certainly result in entertaining transport.

In fact the converted Elan emerged as a very hot piece of machinery indeed. We picked the car up at the close of a Brands Hatch club race meeting and were immediately reminded that this was no ordinary docile sports car by the injunction "slide the clutch out slowly, keep the revs above 3,000 and I bet you stall it!" As it was wet, and the only way out of the car park was uphill, it seemed extremely likely that it would shudder to an ungainly halt-especially as that high first gear will comfortably allow over 50 m.p.h. with little thought to how the driver covers the first 10 m.p.h. of his forward progress!

When we were instructed that the r.p.m. limit was "7,000, but you can use 7,500 r.p.m. if you really must" it seemed fairly certain that this would indeed be an exciting test, even if only for the number of summonses attracted by an exhaust note that gives away little to the BDA-powered F2 and F/Atlantic single-seaters. The oil pressure gauge needle wound itself round to the stop beyond 60 lb. per sq. in.; we were told to keep an extremely watchful eye on the sump level because the engine had covered only 350 miles. The unit had been built up along racing principles, and thus we could use our full quota of engine r.p.m. immediately.

The basis of the conversion was a new Elan soft-top Sprint, though it was intended to install a hardtop shortly after our test, when I believe the car was up for sale at £2,500. Following the removal of the Twin Cam unit the Broadspeed staff, already working midst a cacophony of power-drills and muffled curses to complete seven racing Escorts on schedule, begun building up a BDA. The engine is essentially similar to those sold by Broadspeed for F/Atlantic, the major differences being the standard wet sump lubrication system. bigger inlet valves (not permitted in that particular MCD-backed class of single-seater), a Tuftrided crankshaft and the adoption of roadworthy Broadspeed BD2 camshafts; their profile provides peak power at 6,200 r.p.m. Maximum torque of 125.8 lb. ft. will be found at 5,500 r.p.m.

The unit stayed at the production capacity of 1,601 c.c., but a complete rebuild included such items as a £200 cylinder head with handworked inlet and exhaust ports, 10.5:1 compression ratio, eight of

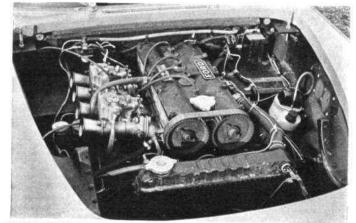

those new inlet valves and a pair of the £62 BD2 camshafts. That is the trouble with BDAs, there are so many parts to modify with double overhead camshafts and 16 valves popping up and down! All new reciprocating components were balanced, lightened where appropriate and shot peened, which includes a lighter flywheel.

Exterior modifications to go with the new engine include re-jetted and choked Weber 45 DCOE carburetters, internally polished inlet manifold, and tubular steel exhaust manifolding leading into a single large bore tailpipe. A reshaped crossmember is necessary to clear the Cosworth-based engine's sump, while the water radiator is moved slightly further forward and a Serck oil-cooler added.

The transmission changes are pretty radical too. The gearbox was completely rebuilt to utilise needle roller bearings and new ratios to give those impressive gear speeds. The end result is pretty similar to a four-speed Group 2 touring car gearbox, with beautifully chosen ratios for someone in a real hurry. The independent rear-end retained the standard 3.77-to-1 final drive and incorporated a Salisbury limited slip differential.

An equally comprehensive conversion programme was followed to make the car stop and handle in keeping with its racing heritage. To begin with the rack and pinion steering received new steering arms and a new home on the crossmember to cut out bump steer. The four standard coil springs were replaced by shorter springs giving a ride height reduced by an inch, whilst Bilstein gas-filled shockabsorbers do an able job of keeping some of the production vehicle's excellent riding qualities. Excellent ride characteristics by sporting standards that is, Citroën drivers probably wouldn't recognise that this Elan had any shock-absorbers at all. Anti-fade disc pads and revised brake balance to increase the proportion of effort applied to the front

THE DIFFERENCE.—Nestling snugly in the engine compartment of the Elan is a tuned 170-b.h.p. Broadspeed BDA engine which replaces the requ-

NO! J.W. has not just run over an unfortunate cyclist. The Elan-BDA pictured with the fifth wheel timing device rigged up. Unfortunately during the test runs the car suffered from a cam seizing in its carrier and so we were not able to obtain what surely would have been some of our most impressive acceleration figures ever.

From an onlooker's viewpoint there's no mistaking this Broadspeed job as a sheep in wolf's clothing; it's a wolf, and frankly its orange paintwork, obese wheel-arches and matching Minilites leave nobody in any doubt as to its intended purpose.

For the record, it is worth recording that the specially made up glassfibre air dam (not the one used on the same company's Capris) and 195 GP Goodyears are extremely effective in allowing straight forward progress, though I must confess that the "wing" only seems to make a difference under motorway crosswind conditions.

The step-up in size from 40 to 45 DCOEs makes the usual prompt dab, dab, and start routine even faster than usual, but they soon belch forth protest if you try and accelerate hard from less than 2,000 r.p.m. in third or fourth. Because it was wet when we picked the car up, the hood was raised, but after it tried to blow clear of the windscreen three times the following day, we lowered the PVC and left the car in a garage overnight. In turn this meant that we enjoyed the car as it is meant to be enjoyed-wind in the hair and plenty of speed.

In fact the Broadspeed Elan would work quite satisfactorily around town, when the knack of dribbling in revs to 1200 r.p.m. or so had been mastered in conjunction with slow clutch release. The water temperature would rise to 90-degrees under these circumstances, but the electric fan would reduce the coolant heat level to 85-degrees given a long iam to do its work in. Despite those wide wheels, the Lotus steering seemed as light as ever whilst the gear-change was phenomenally efficient, but I found the clutch rather heavy when dragging through London from east to west.

Under wet conditions the Elan is not at its best, though the handling and braking still provide generous margins of safety. Obviously, if the car is provoked by a flat-out throttle opening in low gear during the negotiation of a tight curve, then the driver will be presented with no grip at one end or the other, always the rear, providing sufficient power is applied. At first we could not imagine any driver hurling the Broadspeeded device about with abandon on a wet day, but with practice one finds that the limited slip differential will find a way to transmit some horsepower to a slippery surface. Those with problems that cannot be solved by the application of power-such as the strong understeer that almost any car will suffer if it is put into a slippery corner too fast-need not apply for compensation.

Whatever the prevalent weather the modified Elan's real party-piece is in the deadly efficient manner in which it can cover British roads. Just in the same way that I found myself unable to stay indoors when we had the RS1600, or the Lotus 7, or the Else converted Europa, or even such diverse vehicles as the AMC Javelin V8 or the beautiful BMW 3.0 CS, and the Alfa Romeo 1750 Duetto/GTV, I found there was a vague feeling of unhappiness until I had taken the Elan out for a brisk airing. In the largely pampered past six years or so that I have been lucky enough to use (mainly) spotless cars provided by other people in search of publicity for their wares, I've never enjoyed a trip more than the one I took in the Elan overnight to the country and back to town in the early morning.

It was only under such artificial conditions that I could understand why the owner of this car had sacrificed some everyday motoring manners on the altar of honest performance in all departments. The

trouble at present is that such performance is frowned on and I can see why one eminent journalist once advised me, "never write about anything you enjoy-somebody, somewhere, will put a stop to whatever it is!" It is easy to see his point where any sort of road is concerned, for publicity draws crowds, and lots of people always seem to bring lots of problems with them.

As the Elan swooped along country lanes I reflected how much we miss inside an ordinary saloon. Would that it was practical for everyone to enjoy the thrills of extracting perfect unison from engine, brakes and gearbox, as is possible with this Elan. There's even enough power to set the car up accurately for almost any corner at any speed up to 90 m.p.h.; it is just over this speed that one has to change out of third gear if one is imposing the normal 6,500 limit. In the lower gears 6,500 translates as 52 and 68 m.p.h., whilst in top gear I never exceeded an indicated 120 m.p.h. with the hood down. However, this really misses the point for it is the sheer verve with which the car responds that endears it to the driver, especially on the sort of switch back represented by an 80 m.p.h. crest followed by a downhill 60 m.p.h. left-hander, 70 m.p.h. right, bumpy 110 m.p.h. straight and 30 m.p.h. downhill hairpin. To follow that sort of terrain you need the Elan's red hot needle performance package; even then you'll actually experience the joys of drifting with little need to do more than ease the steering onto corrective lock.

We took the car to our normal track for performance tests, but after 12 not very satisfactory runs a camshaft seized in its carrier, a problem that will be familiar to W.B. from his spell with the RS1600. The only other problem that presented itself was oil surge that materialised if the car was anything less than bung-full according to the dipstick. After the Elan was returned, I did idly wonder if the dipstick markings were correct, for such things have been known to happen before.

To my eyes the Elan represented a very healthy diversion for a wealthy man who wanted a sophisticated Lotus Seven, for it is unbelievably rapid in the sort of situations that a skilled driver could enjoy, whilst offering all the creature comforts when required, for even the electric windows worked throughout our tenure!-- J. W.

Overall fuel consumption: 17-22 m.p.g. Price of engine (including £500 for production RS1600 unit): £957. Converters: Broadspeed Ltd., Banbury Road, Southam, Warks.

THE ELAN-BDA looked impressive with its fat tyres on some excellent Minibite rims and the bulging wheel arches to accommodate them.

- In a recent article on modified Cortinas, J.W. said that the lights on a Mk. 3 Cortina remained on the sidelight position only on one side and criticised the car on this point. The Ford press office naturally told us that this was because we had been using the parking light control, which was true, but did not account for a simple bulb failure of a front sidelight, which added to our reporter's confusion.
- Jaguar enthusiasts will be interested to learn that Warren Pearce is now trading under the name Lawrence Pearce from premises at 186 Cambridge Road, Kingston, Surrey (Tel.: 01-549 1992). Although his workshops are mainly filled with quality maintenance work these days (a Facel Vega and BMW 2002 were undergoing surgery when we called) Pearce is still offering a number of Jaguar performance improvement items, especially with regard to braking and suspension modifications. His current pride and joy is an XJ6 which apparently accelerates and corners in a way that pleases this former Jaguar E-type racing driver, now happily fully recovered from the serious injuries he incurred at Castle Combe in 1970.

#### **Ferraris dominate Sebring**

SEBRING, March 25th.

IT IS A strange quirk of the International calendar that two of the World Manufacturers Championship events for sports cars happen within just over a month of each other in the same state of the USA. The state is, of course, Florida and this year the second of the two races came as a welcome relief after the State Primary for the Presidential election. Indeed, the papers had been full of little else for weeks and the victor, Senator George Wallace, had his campaign managed by Bill France Snr., who owns Daytona. This is the circuit that had hosted the sports car circus a few weeks earlier and, when it moved across the State to the old airfield circuit of Sebring, the entry was much the same but with the interesting addition of the new Len Bailey designed Mirage M6-Cosworth from the Gulf Research Racing (formerly IW Automotive Engineering) team.

Ferrari, winners of the two previous rounds, arrived looking stronger than ever, with three of their impressive 312Ps for the regular driver line-up of Ickx/Andretti, Redman/Regazzoni, Peterson/Schenken. These were the three cars raced at Buenos Aires (Chassis 082, 084, 086) and completely re-built at the factory since then while the Daytona cars were back in Italy receiving the same treatment in readiness for the BOAC 1000. The Sebring cars were fitted with larger rear-brake calipers and all had the later gearbox which enabled quick gear ratio changes, which previously had only been tried on one car. Ferrari are now the only major sports car team running on Firestone

Autodelta hoped to come to terms with their Italian rivals by weight of numbers for the Alfa Romeo racing division had brought along six of their tubular steel chassis TT33 models, two as spares. Three of these cars were fitted with re-located radiators mounted much lower and fed with air from side rather than top ducts. Revson/ Stommelen and Elford/Marko were in their Daytona cars, modified to the new specification, while there was a completely new car for de Adamich/Hezemans. A fourth unmodified car was entrusted to Galli/Vaccarella, this being the machine Galli had put into the wall at Daytona in practice and subsequently re-built. The lowering of the radiators enabled a lower frontal area and Autodelta technicians were claiming a 6-mile increase on top speed. All the Alfas were now running on Goodyear tyres.

The opposition to the two Italian teams was sparse indeed. Equipe Bonnier failed to come to a financial settlement for both their Lola T280-Cosworth V8 and thus brought along just the later of the two cars to be shared by Wissell, Larrousse and Bonnier himself, Britain's Chris Craft having to stand down on this occasion. The car was little changed since Daytona although some bodywork modifications had been made. The Bonnier team do not appear to have sufficient funds to really challenge the might of Ferrari, which is hardly surprising, although with the right organisation and back-up the British car is obviously capable of doing so. But Ferrari have such an impressive sports car effort in terms of machinery and personnel it seems unlikely that anyone can compete at present, let alone a private team with

The long awaited Gulf Research Racing team (formerly JW Automotive Engineering) made their welcome return to the sports car scene but it was not on the scale of their previous Porsche 917 effort. They brought just the single new Gulf-Mirage M6 for drivers Bell/ van Lennep. The fine team of mechanics built up last season have largely disbanded, one going to the Ferrari sports car team, another to Tyrrell, another to McLaren and so on and, of course, team manager David Yorke is now with the slow to start Tecno Grand Prix effort. Now John Horsman is in overall comand and it will be interesting to see if the Gulf team can re-capture some of their former glory.

The Gulf-Mirage only just made it to Sebring in time having very little prior testing in England before being shipped to Florida. The M6 has been designed to accept either the Cosworth V8 or the new 3-litre Weslake V12 engine which is presently being developed. Externally the distinguishing feature of the car is the rear aerofoil, beneath which is a specially shaped engine cowl and this arrangement is said to give very good high speed stability. The wing is adjustable to suit different circuit conditions.

The chassis is a monocoque section in 18-gauge L72 aluminium alloy sheet reinforced by mild steel sub-structures. The length of the projected V12 engine is such that, in order to accommodate the driver, a conventional front bulkhead cannot be used. Thus mild steel fabrications drilled for lightness tie the side pontoons together. The monocoque terminates behind the driver although the side pontoons are extended to provide mounting for ancillary equipment. The rear bulkhead is of 20-gauge steel. At present a Cosworth engine is fitted and a 6 in. spacer fitted between the engine, clutch assembly and the Hewland DG300 gearbox, makes up for the difference in length between this and the V12. The team have two entries at Le Mans so, presumably, will build a second car and by then the V12 should be operational. Suspension is "British Standard Formula One", uses Koni dampers and 13 in, diameter wheels front and rear. Unlike the other major contenders, the Mirage has a front-mounted water

The only other car in the 3-litre Group 5 category was an old Porsche 910 with a 2.3-litre engine but in the 2-litre category there were three Chevron B19s and a pair of Lola T212s, all but one powered by Cosworth FVC engines. The fast 2-litre Abarth had returned to Italy. In addition there were classes for GT cars, and various saloons, some only conforming to SCAA rather than International regulations. Of the GT cars there were four Ferrari GTB4s including cars for David Hobbs/Skip Scott and Posey/ Adamowicz and there were also several less sophisticated but more powerful Corvettes.

Ferrari had practice well sewn-up while all the challengers suffered set-backs. Two of the Alfas were involved in minor accidents, as was the sole Lola, while the Mirage had various "new car" problems particularly with the fuel system. Stommelen just averted a complete Ferrari 1-2-3 in practice by putting his Alfa Romeo in third fastest position behind Ickx/Andretti (2m. 31.44 sec.) and Regazzoni/Redman (2 min. 33.04 sec.). The Stommelen/Revson car was 0.8 slower while Peterson/Schenken, being new to Sebring, lapped in 2 min. 35.37 sec. Then came two more Alfas, the Mirage which was nine seconds off pole position time, and then the Lola which had done very little practice. Rounding off the top ten was the final Alfa and the Chevron of the Mexicans Junco/van Beuren which was fitted with a Hart aluminium block BDA engine.

The race attracted a large crowd who spilled onto the track just before 11 a.m. as the 61-car field set off, two by two on the pace lap and they all had to go around again before the marshals got everything under control. When the green flag came out Stommelen made a spirited attempt to lead the Ferraris, but with a lap gone and 12-hours to go, the top sports car team in the world were in a one-two-three formation in the order Andretti, Regazzoni, Peterson. Behind came Stommelen, Elford, de Adamich, then Larousse, Bell and Vacarrella. After only two laps Larrousse slowed in the Lola and was soon in the pits where the right rear lower wishbone was broken, the legacy of the practice incident and a part which should have been discovered as faulty before the race. The Lola returned to the race, after half an hour, in last place. Soon the Ferraris had pulled away from the rest but, at least, there was some spirited racing amongst the 2-litre cars.

The Gulf-Mirage debut did not prove particularly auspicious for Bell soon brought the car into the pits, from eighth place, complaining of a bad rear-end and vibration. After several more pit stops, and suggestions it was out of balance rear wheels, a shattered flywheel was diagnosed and the Gulf mechanics set about replacing it and the clutch, a task accomplished in just under three hours. With the first hour still not over the leading Alfa of Stommelen slowed, and then stopped, with a faulty mechanical fuel pump which was replaced. After an hour and a quarter the first routine stops were made which gave Ferrari an even greater advantage with their slick stops. Then the flagging Alfa team suffered another setback when two of their cars were black flagged for allegedly passing under a yellow flag. Both Revson and Galli were reprimanded by the Chief Steward, and something of a comedy situation ensued in which Revson tipped the gentleman's hat off and Galli was reprimanded through an interpreter, although he speaks better English than many Americans. At the end of the second hour the Ferrari demonstration looked as impressive as ever, the three cars running only seconds apart. The Marko/Elford and Hezemans/Vacarrella Alfas were fourth and fifth, while two Chevrons contested sixth place. The de Adamich Alfa was out of the running after Galli, who had switched to this car after practice, crashed with a puncture. De Adamich then joined Stommelen taking over Revson's place as the American had been disqualified from the meeting for the

With three-hours gone, all three Ferraris were still in the same order and on the same lap but, in the fourth hour, the Ferraris started to experience trouble as Peterson ran out of fuel on the circuit due to Continued on page 493

# One good reason for buying Motorcraft Tune-up Kits?

#### -Here's six!

Mister Motorcraft provides Tune-up Kits to suit most popular makes of car. In it, you'll find everything you need to give your engine a real professional tune up, whether it be a Ford, British Leyland, Vauxhall, Chrysler or almost any other popular make. And should you have an ignition failure far

from home, a spare Tune-up Kit in the boot could prove invaluable

So call on Mister Motorcraft soon. His complete range of quality parts is at garages, service stations, Ford dealers and accessory shops. We've got good reasons to think that you'll be more than satisfied.

Bulbs Radiator and

Quality parts to make cars run better

### ROVER 3500S

The 31-litre Rover with its light-alloy V8 engine was for many years available only with automatic transmission, for which the intake behind the number plate in the picture supplies air to the gearbox oil-cooler. Since last October a manual gearbox 3500S version has also been available, to which the test report refers.

HAVING WAITED to try the manual-gearbox version of Peter Wilks' high-performance Rover V8 since it was introduced at the London Motor Show last October, I went through much the same phases as the boy on the Fry's chocolate label, who was there when I was a youngster and who is still there today-those of DESPERA-TION, PACIFICATION, EXPECTATION, ACCLAMATION and REALISATION-IT'S A ROVER.

After five years of excellent service from the Editorial Rover 2000TC, during which I became a considerable enthusiast for these cars, the acclamation when the 3500S eventually arrived at the Motor Sport offices was tempered by a degree of disappointment. To me Rover implies dignity and the garish trims on the V8's bolt-on wheels, intended to make them resemble "boy-racer" magnesium-alloy ones, the trim-line along the body sides, the too-obvious type-badges and ROVER name on body and boot, the substitution of pleated Ambla upholstery for hide (which is available as an extra) and the grained plastic stuck on the steel roof did not seem in keeping with the best Solihull tradition. The last-named is permissible for distinguishing from the common run of little saloons the middle-class models, but a Rover should not require such embellishment. The plated Smiths Radiomobile radio is larger than the one in the 2000TC and the new nest-of-boxes radiator grille is not altogether acceptable.

There was also the realisation of the obvious, namely that the almost unchanged body shell (now vented through the rear quarters) means that this 120-plus m.p.h. 3½-litre saloon will accommodate only four people with elbows-in and legs (for those in the back seat) drawn up and very little luggage in a small boot which is now occupied by the Exide Supreme battery as well as the spare wheel, both covered over, but the latter lying unsecured on the boot floor, horizontally, on the test car. (It can, I know, be mounted on the lid of the boot but this is untidy and in the long run cannot, I imagine, do the lid much good.) The bonnet panel now has two unacceptable "power bulges" on it, seemingly to accommodate the cam-covers of the push-rod o.h.v. vee engine but in fact are merely stiffeners, as the underface of the panel is flat; these were not deemed necessary on the four-cylinder cars. The driver's door tended to try to jump open, perhaps due to a Pyrene fire-extinguisher on the door sill.

The dated body design entails front quarter-windows, these now being closed by knurled knobs instead of rather undurable catches, which would be an improvement if the new curved door-grips, below which the press-up internal handles are placed, did not impede the hand that seeks to turn the knobs. The compact interior of the body renders door pockets out of the question, so the lockable knee-level bins, the lids of which act as safety pads, are retained, and I have no grumbles about that. The sill internal door locks stick up higher than those on the 2000TC and the instrumentation has been changed, to eliminate the old ribbon speedometer, which I had come to accept. There is now a set of rather flat-faced but very clearly and finelycalibrated instruments with white digits before the driver, under a common sheet of plastic, consisting of ammeter/oil gauge (40 lb./sq. in.), tachometer, 140-m.p.h. speedometer, and fuel/temperature gauge (75°C), and the Kienzle clock is retained. Neat oblong windows in this instrument panel house the brake-on/low fluid level, oil, high-beam, ignition, choke ready to go off (a nice Rover refinement), and turnindicator warning lights, and a hazard-warning has been added. All very neat, but the vanity mirrors have been deleted from the vizors. At last, however, that dangerous "vanishing" rear-view mirror has been replaced by a normal one, with neat lever-movement for the anti-dazzle setting.

The minor controls have been revised, neat rotary facia switches. very clearly labelled, for map and roof lamps, side and headlampscum-parking and fog lamps (if fitted) and wipers-cum-washers, replacing the old toggle switches. The two-speed wipers have a delay setting and the former heater controls, easy to understand, are still used, as are a manual choke and fuel-reserve. However, the layout and appearance of minor controls and instruments is somewhat retrograde, and the change cannot be on safety grounds alone, because fleshtearing protrusions still exist. Indeed, in all other respects the Rover 3500S is like the older models, even to openable side rear windows, adiustable steering-column rake, stalk controls (dip and flash, l.h.; turn-indicators and horn, r.h.), strip facia fresh-air vents, visible sidelamp tell-tales, well-placed ash-trays, pendant pedals with the accelerator rather biased to the o/s, rheostat facia lighting which shows up the aforementioned rotary switches, lockable quick-action fuel filler, quietly shutting boot, friction-lock seat-squab adjustment, accurate speedometer and mileometers, and all the other Rover commendables. Incidentally, an old Rover trait of having a clutch pedal return spring so placed that the toe of the driver's left foot very occasionally fouls it is part of the 3500S. More disturbing is the fact that whereas the 2000TC was almost uncanny in its disinterest in engine oil, the 3500S consumed lubricant at the rate of about 500 m.p.p. The dip-stick, after the bonnet has been propped open, is supremely easy to withdraw; the oil filler is on the opposite side of the engine, on the o/s rocker cover. There is now a steering lock, a baulk-type starter key with four positions replacing the former nicer 3-position key, and the over-facia shelf has that non-slip matting I was never able to obtain for the 2000TC.

As to how this very fast and accelerative Rover V8 goes, when it was introduced over six months ago opinions about it varied, some testers writing of wind noise, yaw and dead brakes, others of low wind noise, stable running and progressive braking, etc. My impression was that the wander when driving in side winds was far worse in the V8 than in the 2000TC, that there was some wind noise, and that the servo, all-disc brakes, typically Rover in feel, were not particularly convincing until used as if for a demonstration stop, when they gather power somewhat better.

The gearbox is that of the 2000 models, always a bit of an Achilles' heel, but with a finned casing, increased oil capacity, a layshaft-driven pump to lubricate the mainshaft gears and bearings, tapered-roller in place of ball and needle-roller layshaft bearings, shot-peened gear teeth and a lever mounted on a casing extension instead of on the transmission tunnel. There is the same nice little stubby, short-travel lever, with its lift-up slide to mask reverse, but the action, though improved, is baulky, although quite nice if not hurried, and some critics point out that the lower gears whine slightly on the over-run, as if to remind one that this overdue manual transmission is but a Wilks' adaptation to meet requirements as economically as possible as is the engine, adapted from an ancient Buick/Oldsmobile light-alloy V8 concept. But the whine is not pronounced, so this is hair-splitting comment.

On the manual gearbox car slightly larger exhaust off-take pipes are possible and power output is up to a net 152 b.h.p. at 5,000 r.p.m. The SU carburetters are of the more stable HIF6 type. There is no denying the impressiveness of the performance, for a top speed of over 122 m.p.h., a 0-to-60 m.p.h. time of 9.2 sec., and a s.s. 1-mile in 17.1 sec. from a car costing £2,088.41 with extras as tested, is not to be scorned. Surprisingly, the 3500S weighs only 7 lb. (3 kg.) less than the 3500, although the latter has a Borg Warner gearbox with oil-cooler, so the better performance of the manual-gearbox model is due to the slight improvement in power output. On the road, however, I felt no very great improvement over a 2000TC until the lower gears were stirred about to keep the engine turning at over 4,000 to 4,500 r.p.m. (it gets to the red at 5,200 r.p.m.), when it remains very smooth but hums in a subdued fashion. The high axle-ratio of 3.08 to 1 (24 m.p.h. per 1,000 r.p.m.) precludes quite the V8 top-gear crawl away from walking pace which might be expected, although the engine will pull from 500 r.p.m. in the highest ratio and smooths out completely above 1,200 r.p.m., power beginning at about 36 m.p.h., nor is there any "wuffle-wuffle" from the single exhaust tail-pipe.

This Rover 3500S is a compact saloon of sporting demeanour, yet very quiet at high cruising speeds. The test car was on (14 in. × 5½J) Dunlop SP Sport radial-ply tyres which gave good grip and did not protest under the sort of roll-around-fast-corners which the race-bred de Dion back-end encourages. The car I tried also had manual

steering, low geared at just under four turns, lock-to-lock, plus a lot of sponge. It is heavy, and the understeer remains, changing to oversteer under power. But a quality car of this very competitive price which could be wound up to 34, 57 and 88 m.p.h. in its indirect gears, returned 22.1 m.p.g. (of five-star petrol due to a c.r. of 10½ to 1 in the alloy heads), against 26 to 27 m.p.g. from the 2000TC, and ran more than 256 miles on a tankful of fuel before the 21-gallon reserve supply was required (and this supply took me 54 miles, whereas I never went more than 14 miles on the 2000TC's reserve supply) is a good proposition, in spite of the above-emphasised drawbacks. It still comes with a plastic holder containing a good manual, service folder, a reassuringly comprehensive list of Distributors and Dealers, and a sachet of Clearalex windscreen cleaner, etc. Servicing intervals are every 6,000 miles; presumably the unusual front suspension will cause the front tyres to wear unevenly, as it did the Dunlops and Pirellis on our 2000TC. The test car was in a nice shade of green and if I could have one with the old wheel nave plates, which had a suggestion of wire spoking about them instead of the bogus sporty ones of the 3500S and some of the maker's embellishments removed, I could be happy in this very fast V8 Rover if it did not yaw so much and had more convincing brakes. The yaw, like that of a small boat in a moderate sea, was sufficiently pronounced to make three people, including the driver, who are not normally car-sick, feel ill and one other to be actually sick. The V8 is a much faster car than the 2000TC but whether the vaw is due to the fact that it is driven harder, the suspension rates have been changed, or the weight distribution has altered, only the Rover engineers can know. The new Ambla seats with heavily ribbed cushions hold the driver like a vice but I would demand real leather.-W.B.

#### BMW-A CORRECTION

IN THE article "First Impressions of the BMW 2500" last month I referred to this excellent car having "the old-fangled dimensions of a stroke longer than its bore". Almost immediately after MOTOR SPORT was published irate BMW enthusiasts were on the telephone demanding my entrails, because, in fact, the BMW 2500's o.h.c. power unit conforms to present-day practice, with dimensions of 86 × 71.6 mm. My excuse for linking it with long-stroke engines as still used by the 1750 Alfa Romeo, Austin Maxi and 1800, the Jaguar XJ6 and Daimler Sovereign, Mercedes-Benz 220, the Spridgets, the M.G.-B. the Renault 4 and others of long standing is that BMW quote the stroke before the bore in their handbook, contrary to normal practice, and I was thus misled when running my finger down the page for the figures. I apologise-and would add that all BMWs from the 1602 to the 3.0CS

have a bore bigger than the strokes are long. I am also told the headlamps of the 2500 will be perfectly satisfactory after adjustment, which I will report on when the long-term test of the car is resumed.—W.B.

#### WE TAKE A LONG TIME TO LEARN

"IN the Saturday practice Noel Carr broke a drive-shaft . . . . This is not a quote from a current Grand Prix race report, or the recent Sebring 12-hour sports car race, as might be imagined, but is taken from the report in MOTOR SPORT of the Castletown Trophy race in the Isle of Man in 1948. The car in question was an allindependently sprung Alta from pre-war times, using exposed driveshafts to the rear wheels with universal joints at the ends like any "modern" Formula car. They broke then and they are still breaking today, and racing is supposed to "improve the breed".

#### SEBRING 12 HOURS—continued from page 490

a faulty collector tank and all three cars seemed to be losing oil. Ickx then made an unscheduled stop to complain of his car weaving on the straight and a punctured tyre was replaced which put Redman/ Regazzoni into the lead, while the Schenken/Peterson car lost time with a broken brake pipe and dropped several places down the field. With six hours gone, Ferrari still looked good with Regazzoni/Redman leading Andretti/Ickx by two laps, while the Elford/Marko and Hezemans/Vacarrella Alfas held the next two places ahead of the third Ferrari. The third Alfa had now dropped out with clutch failure, the Lola was still running in fits and starts, the rough and rustic old Sebring track playing havoc with the chassis, while the Mirage finally retired with a damaged differential.

Redman/Regazzoni further increased their lead over their teammates when Ickx brought the car in with a burned-out battery lead which took time to replace. The Alfa ranks were reduced to one when the Elford/Marko car blew its engine and by now the faster Corvettes and Porsche 911s were showing well in the results, as all the 2-litre cars were out of the running.

With ten hours gone there was excitement when Regazzoni passed the pits with flames licking from the back and he stopped and abandoned the car further down the track where it really blazed fiercely. The Sebring fire-fighters did little to stop the whole car burning out. This put the oily Ickx/Andretti car back in the lead while Schenken/Peterson had now moved up to second and the pair were intent on taking the lead, but Team Manager Schetty gave them slow down instructions which they rather reluctantly accepted reckoning that they had been robbed of victory at Daytona. Thus Ickx/Andretti cruised home to a second successive victory keeping their fingers crossed in the closing stages that the oilleak would get no worse. Peterson/Schenken took their second successive second place, just two laps down, while the Hezemans/Vacarrella Alfa struggled home to third position despite various troubles in the closing stages after nightfall. Fourth place went to the Heinz/Johnson Corvette and fifth to the Haywood/Gregg Porsche 911S, both of which had already shown good long distance form at Daytona. The Lola managed to make it to the end, finishing in sixth spot and on the same lap the Minter/Pechman Porsche 910 while a NART Ferrari GTB4 finished eighth.

#### THE **ADVENTURE** OF THE ILL-FATED **SINGERS**

ILL-FATED.-Singer No. 37 driven by S. C. H. Davis crashes into Norman Black's team car during the 1935 Ulster TT. Both were eliminated by steering ball-joint failure, but on different laps, and previously A. H. Langley's Singer, in the same team, had crashed for the same reason—the fourth Singer was then withdrawn. Davis was wearing a crash-hat but it was wrenched off in this remarkable accident.

IN THE nineteen-thirties the Singer Nine took its place, with the MG Midget and other small sports models, as a successful competition car. Looking back, it is rather remarkable which cars did, in fact, constitute competition jobs in those days. Even the great races, such as Le Mans, included things like a Chummy Austin 7, four-seater Singer Nines and a Ford Ten tourer of the "blancmange-mould" pattern.

The 972 c.c. Singer, having inherited an overhead-camshaft engine from the Singer Junior of 1927 (which, it may be recalled, combatted the overwhelming success of the side-valve Austin 7 in this baby-car field by this more efficient valve gear, rather as the Triumph Super Seven did by reason of a centre support for its crankshaft and hydraulic four-wheel-brakes) formed a reasonable basis for a small sports model and soon appeared in Le Mans four-seater, slab-tank two-seater and coupé versions.

In 1935 Singer enthusiasts were intrigued to learn that a new Super Sports edition of the Le Mans Nine was not only to compete in the celebrated 24-hour race at Le Mans, in which four of this Coventry make had run the previous year, but that these would be available to such customers as could afford them. The new model was announced in July, when its specification was seen to be decidedly exciting. Weight had been drastically saved and an attractive pointed-tail two-seater body was fitted. The engine was the same 60 x 86 mm. Singer Nine unit with a single overhead camshaft driven by roller chain and the slightly-inclined valves operated through tappet fingers. It had twin SU carburetters, a Scintilla vertical magneto, and although the twobearing crankshaft was retained, it could be taken up to 5,500 r.p.m., which was quite something 37 years ago, although in the TT a limit of 4,800 r.p.m. was imposed. Fuel was contained in a very light 15gallon tank in the tail, provided with two quick-action fillers and emptied by two SU electric pumps with dual supply pipes, arranged so that either pump could feed any of the four (two main, two reserve) pipes.

That these Le Mans Singer Nines were intended for racing rather than trials was emphasised by the gear ratios, which were 10.25, 7.15, 5.36 and 4.77 to 1. Weight was saved in the back axle, the bonnet and hinged-tail gave good access to the tank, spare wheel and the mechanism generally, and hydraulic brakes were used. Wire wheels with knock-off hub caps were not so unusual in 1935, nor was a foldflat windscreen with two supplementary aero-screens, but the whole demeanour of this new Singer was that of a car intended for serious racing. Power output was 41 b.h.p. at peak revs. and the speeds in the gears were 90, 80, 62 and 45 m.p.h., respectively, compared to 76, 56, 35 and 18 m.p.h. available from the Le Mans Special Speed Model which sold in 1935 for £225, and had, on the face of it, the same engine. The wheelbase was 7 ft. 7 in., the tyre size 4.50 x 18 in.

The chassis price was £425, the complete car in catalogue form

£525, whereas the ordinary Le Mans Singer sold for £215, the PB MG Midget for £222. Clearly this competition Singer was something quite out of the ordinary run of small sports carts, although the three which the factory entered for Le Mans, out of a total of eight Singers that ran, were not particularly outstanding, startermotor failure eliminating two of them and the third car being hampered by a leaking fuel tank, although for some time it contested the Index of Performance part of the race with a Riley and an Aston Martin, eventually to finish third, driven by F. S. Barnes and A. H. Langley, winning its class, if only 16th in overall classification. Singers, incidentally, came home 16th, 17th, 19th, 20th, 22nd and 23rd at Le Mans in 1935, ahead of the MGs.

Singers now looked to the TT for a better performance, entering four cars, to be driven by Norman Black, S. C. H. Davis, J. D. Barnes and A. H. Langley, with F. S. Barnes as reserve driver. They were in the 1,100-c.c. class with three Fiat Balillas, three Adlers and a Riley. Alas, in the race all of them disappeared before the finish . . . .

A tremendous Fiat/Singer battle had developed, ffrench-Davis' Italian car leading the Singers of Black, Davis and Langley, with A. C. Dobson's Fiat ahead of Barnes' Singer, followed by Austin Dobson's Fiat, blue flags fluttering all round the Ards circuit. Past the grandstands the Fiat was in front, but at other places the three green cars went ahead, only to be repassed. Until, that is, 12 laps had been covered, when Langley's Singer vanished. Its steering had failed coming down Bradshaw's Bray and a crash was inevitable; Langley escaped unhurt. Three laps later, in much the same place, Black's Singer crashed, from exactly the same cause. Then, seven laps later, the very same thing happened to Sammy Davis-the steering went, causing his Singer to run uncontrollably up the bank at Bradshaw's Bray and overturn on top of Black's car, which had been left on the pavement, its nearside front wheel bent under it, rendering it difficult to move. Black, too, was unhurt and so was Davis, Brian de Grineau, the artist, who had been sitting a few feet from Black's derelict car, leaping up in some haste as Davis' car came over the top of it; it was de Grineau who helped Davis to his feet . . . .

The Singers had been leading their class, but the three cases of steering failure at last roused the officials, as well as Stanley Barnes, who was managing the team, and a couple of laps later J. D. Barnes was flagged in. It seems incredible that after two cars had crashed with completely inoperative steering the others had been permitted to continue. But in those days motor racing was an adventurous sport. It was even reported that a horse on the circuit caused J. D. Barnes to stop, on one lap! Writing in The Autocar, Davis passed this extraordinary matter off by remarking about "a small and unintentional mistake in the heat treatment of a bar of steel , . . one bar seems to have received the wrong heat treatment . . . out of that one bar, by a chance in a thousand, the steering ball joints of the cars of my team

were made, and at the point of maximum stress . . . the steering gear of all three ceased to function, and that was that . . . . ". He tried to draw a parallel with what befell the Fiats in the 1922 French GP, although in that case a design gamble to reduce weight to a minimum may have been the cause and in any case there should surely have been some metallurgical advance in 13 years? It seems that the offending ball joints were those on the drop-arms, allowing the drag links to trail on the road. It seems that three of the Singers in the TT were those which had run at Le Mans (and perhaps in the Relay Race as well) and that all of them used the horrid transverse steering drag links which were a legacy from the original Singer Junior. This was regarded as unsatisfactory for serious racing and a conventional layout, with a side drop-arm and fore-and-aft drag link was designed prior to the TT but could not be homologated in time for the race. This steering layout, coupled to the strain of three of the cars having done a complete Le Mans race, could well have contributed to the failures during the TT. Fore-and-aft steering was used on Davis' rebuilt Shelsley Walsh Singer.

This unfortunate happening seems to some extent to have sullied the reputation of those Singers, but, stripped of road equipment and with radiators cowled, three of them teamed-up to win the 1935 LCC Relay Race at 85.15 m.p.h., driven by J. D. Barnes, A. H. Langley and R. A. Bicknell, and following the TT debacle, S. C. H. Davis drove one, his TT car with another body and different-type steering, similarly stripped but without the frontal cowlings, at Shelsley Walsh. Never again, however, did the factory enter a team, although the cars were run later by the Barnes brothers as the Auto-Sports team; they made unsuccessful onslaughts on Le Mans up to the war and won their class in the 1937 TT at Donington, when J. D. Barnes averaged 57.8 m.p.h. I have never much cared for Singers, although I had fun up Exeter Trial hills while road-testing a 13-litre Roadster in 1954. However, racing cars of any make and period are not to be denied and, after nearly acquiring the bulbous-bodied Singer Nine single-seater which had been raced before the war by Carr and Hodge (I think David Scott-Moncrieff may remember it), only to have it sold over my head, I was interested when a report came in that four Singers, believed to be team cars, had been hidden away in a country barn where they had languished since before the war, although one was reported to have been renovated and disposed of around 1954, and is probably the one now in a Scottish museum.

It did seem likely, however, that the cars which had vanished so dramatically from the TT might be the same cars said to have

#### speculation age. If anyone can offer any clues as to the whereabouts of these missing Singers there may yet, "My dear Watson", be a sequel to the

singular adventure of the ill-fated Singers.-W. B.

If it is true that three of the 1935 Team Singers have gone to ground, this seems to be the one which escaped. It is in the Myreton Museum in Scotland

#### BIG BROTHER

ACCORDING to the Daily Express, Bedfordshire's Chief Constable, Mr. Anthony Armstrong, has set up a special "spy squad" whose job it is to keep watch on disqualified drivers seven-days-a-week, so that anyone who drives while disqualified can be apprehended. While we are entirely against disqualified drivers flouting the penalty imposed on them, it is significant that whereas other classes of offender often involved in violence, petty theft or causing disturbances, are exonerated from punishment and permitted, after a lecture, to leave court without a stain on their character, at the discretion of the Magistrates, the car owner is once again to pay an extra penalty. A driver disqualified for having three licence endorsements, perhaps for nothing more criminal than parking, speed-limit or other technical offences, can now, under Mr. Armstrong's jurisdiction, be under continual police observation and full details of his or her affairs-place of residence and employment, types of vehicle owned, etc. according to the newspaper reportwill be ledged with the Bedfordshire spy-squad. In Luton, it seems, two officers have been put on this full-time spy work; it was incidental that in two months they also caught a drug pedlar, a burglar and a car thief. Criminals have more freedom than Bedfordshire's disqualified drivers and the ratepayers who urgently need police help and protection may well ponder on this new spy system.-W. B.

#### FAREWELL!

LAST YEAR one of the magazines I enjoyed so much before the war, C. G. Grey's inimitable weekly The Aeroplane, became the eventual victim of take-over deals and quickly faded out. Now The Automobile Engineer has gone, its title above remaining, incorporated with that of IPC's Engineering Materials & Design. The erudite companion to The Autocar first appeared around 1910. I remember nearly going insane at the age of 14 (going?) when trying to understand one of the articles in a 1927 issue, about the virtues of turbulence versus

squig and flame-front propagation in the cylinder heads of internalcombustion engines, debated by Whatnough, Ricardo and other eminent authorities; I cannot recall whether Weslake joined in at that date. Later I used to accumulate pocket-money to spend on those exciting Extra Motor Show issues, with their clear photographs of different engine and chassis components and, for those days, quite critical treatment of those designs and details which the journal considered ineffective. In those days The Automobile Engineer was edited by W. L. Fisher and was notable for very detailed illustrated descriptions of all kinds of chassis, apart from the learned coverage of production techniques and design matters. Later, like The Aeroplane after C. G. Grey abandoned it, the style deteriorated, but, it's a pity that this famous journal has succumbed .- W. B.

#### CANADIAN REGISTRATIONS

STATISTICS received from a reader show how the Japanese are getting to grips with the Canadian market. Last year AMC sold 15,271, Chrysler 135,377, Ford 160,610 and General Motors 240,496 private cars. Of these AMC were down but the others showed an increase over the 1970 outputs. Of imported cars, Toyota sold 50,076, compared to 28,336 in 1970, Nissan/Datsun 45,100 against 32,086 in 1970, and Mazda 8,451, whereas in 1970 they sold 5,147 cars. British Leyland fell from 10,706 in 1970 to 9,412 last year, Ford Cortina sales fell from 11,277 to 6,867 but they sold 4,633 Capris in 1971, Vauxhall sales were slightly increased, to 4,797, and Simca were up, as were BMW, Citroen, Fiat, Opel, Volvo and Mercedes-Benz, but Peugeot and Renault sales fell slightly and VW lost 1,950 sales, although out-selling all but the most-successful Japanese makes, with 30,435 cars in 1971. Canada took a total last year of 748,026 cars, of which 175,500, or 23.6% were imports. Most popular GM model was Chevrolet, followed by Oldsmobile, Pontiac and Buick but the most popular single model was the Chrysler Valiant.

#### SMALL CAR TOPICS

(Concerning cars of under 1,000 c.c.)

#### **DRIVING THE FIAT 127**

AT TIMES, when the Continental Correspondent and I have been motoring together in one or other of our more staid vintage cars, we have remarked on the lack of stress and strain which this form of driving encompasses, for the simple reason that you progress at a sedate pace, overtaking presenting no anxieties because it so seldom arises and thus the need to anticipate circumstances ahead of one and judge when to pull out and accelerate is left to others. Driving a modern small car often implies just the opposite, minimal acceleration and no great top speed increasing rather than diminishing the strain of driving

This is far less true of the latest Turin number, the Fiat 127, because this rather remarkable and very acceptable little car, in spite of having only a 903-c.c. push-rod o.h.v. engine under its bonnet, will cruise at an indicated 70 to 75 m.p.h. and also possesses very reasonable pick-up, going from 30 to 50 m.p.h. in 7.4 seconds in third gear, and managing 60 m.p.h. from being stationary in a matter of less than 15½ seconds.

For a very considerable time-span Fiat have been making some most effective small cars—the staunch little petrol-preserving 500, the nowdefunct, refined 600, the now obsolete 850 range and the more recent Fiat 128. Now Turin has excelled itself, in this field, with the 127.

This splendid little car follows the Issigonis concept of transverse engine and front-wheel-drive-which Fiat will declare they got onto paper first-but it also utilises MacPherson coil-spring struts all round and a wheelbase of 7 ft. 3½ in., so that its spacious interior, into which five not-too-bulky adults can sit, is on a par with that of 1,100-c.c. class cars with even more impressive performance. It is thus that the 127's price of £811.15 should be evaluated, with a look inside its very roomy boot while thus assessing it.

I found, on exchanging the Fiat 124 Special-T reviewed in MOTOR Sport last month for this 127, that two surprises were in store. The first concerned the considerable quantity of luggage and oddments we stowed so easily in this 11 ft. 9\{\} in. \times 5 ft. vehicle. The second was the ease with which the 127 got along at the legal maximum, so that apart from a frenzied sewing-machine noise from its Fiat 850-type 85 × 88-mm. engine, which gives 47 (DIN) b.h.p. at 6,200 r.p.m., it was not all that tedious in spite of coming along for appraisal immediately after its very quick and desirable larger model and the new Ford Consuls and Granadas. The road-holding, you see, is in keeping although rather severe understeer is promoted by entering acute bends at speed, and the rack-and-pinion steering and disc/drum brakes are so effective as not to call for comment, although the steering is rather low-geared for parking.

The Fiat 127 is sensibly contrived in so many ways. It is a two-door, four/five-seater saloon with adequate, p.v.c.-covered seats, 1-lights, opening rear side-windows, a self-locking boot and, on the test car, 135SR-13 Pirelli Cinturato CN45s. The matt-black and simulated wood facia has cold/hot-air vents and speedometer with matching dial for fuel contents and engine temperature, generator and oil-pressure alarm lights, and an insufficiently bright low fuel level light. The Fiat triple stalk-controls flank the steering wheel (but with separate washer button so that you tend to signal with the wipers), and a long central gear-lever controls a baulky gear-change. The by-roads ride is quite choppy and the open under-facia oddments well, before the front-seat passenger, is too deep and narrow for easy extraction of small objects. The left foot has to be parked under the clutch pedal but need not come into contact with the exposed steering column universal joint. In more than 1,000 miles the only defect was a loose driver's anti-dazzle visor.

The three-bearing engine springs to life immediately from cold if the simple choke control is pulled out and although it is running audibly fast at cruising speed, its oil consumption was 1,000 m.p.p. The fuel tank, with again a typically Fiat screw-on cap, gave a range of 266 miles, driving fast, and the overall consumption of four-star petrol came out at 41.8 m.p.g. with cold starts, quick cruising and commuting along the lanes combined. The self-propping front-hinged bonnet lifts to reveal a very accessible Magnet Marelli battery and distributor cap but well-buried plugs and a rather fumbly dip-stick. The spare wheel is instantly available, from its horizontal perch on the n/s above the engine, but the efficient bonnet-release is on the left side in RHD cars. Tightening down the head and adjusting the tappets after 500 initial miles takes half-a-day and is a chargeable item, incidentally.

Fiat have had ample experience of all the permutations—air-cooling/ water cooling, front drive/rear drive, front engine/rear engine, with

A long way from Turin-the Fiat 127 is an ideal car for shopping and driving in country lanes

prior use of the Issigonis layout on the popular 128. It is comforting, too, to know that, although located across the car, the 127 uses basically the great Fiat 850 coupé engine, with alloy head, thermostatically controlled cooling-fan, and single Weber carburetter. It will get up to nearly 84 m.p.h. in top, 67 m.p.h. in third gear, if extended, but the noise it makes can cause the driver to feel for a fifth gear. The gearbox, being conventional, is, however, commendably quiet, in contrast to a Mini's whining in-sump gear train. A rubber-bushed tie-rod between engine and bulkhead effectively damps out torque reaction when opening the throttle. The appearance is not particularly praiseworthy but this did not matter, as I am one of those peculiar persons who sees cars mainly from within, and does not bother overmuch with this aspect.

I thought I had grown out of very small cars for long, hurried journeys but the Fiat 127 nearly changed my views about this; it is a most excellent shopping and pottering car. It is well endowed with coathooks, roof-grabs, pull-out inside door handles, sill locks, visors, concealed ash-trays, etc. Moreover, just when I was thinking that a three-door 127 would be useful, the versatile Fiat Company announced just such a model, although it will not be available here for some considerable time.—W.B.

#### DATSUN CHERRY

FOLLOWING our recent experiences with the Datsuri 240Z and the 1200 saloon we were invited back to Worthing to borrow one of the interesting little Cherry models, have a run round in the just introduced, big, 240C saloon and look around the spares facility on the Trading Estate at Lancing. We took the Cherry away for a full week's driving in which time this little 998-c.c., 59-b.h.p., Japanese saloon was made to work very hard for its living.

The Cherry is the Japanese answer to the Mini, with its transverselymounted engine driving through a pleasant four-speed gearbox, and, has all independent suspension. We tried the four-door model but twodoor and Estate versions are also available. At just under £800 it is £50 more expensive than the Mini 1000 but does boast of an excellent specification including hazard warning lights, two-speed wipers and Continued on page 520

#### **BOOK REVIEWS**

"Motormania", by W. A. McKenzie. 248 pp. 8\[ \frac{3}{4} \] in. \times 5\[ \frac{1}{2} \] in. Cassell & Co. Ltd., 35, Red Lion Square, London, WC2 4SJ. £3.00.)

The reminiscences of those who have been associated with motoring, especially competition motoring, over a long span of years are usually irresistible. W. A. McKenzie was known to be writing his memoirs, of the times during which he was a newspaper motoring correspondent, from 1925, when he filled that role on the now defunct Westminster Gazette, down the years in which, from 1950 to 1965, he was Motoring Correspondent of the Daily Telegraph. That is a considerable span of time and the author is thus able to portray the vast changes which have taken place since he bought his first car, a used 10.4-h.p. Citroën tourer bought in 1925 for £100-McKenzie recalls that it was only capable of 38 m.p.h., compared to a friend's Swift, which cruised at 48 m.p.h. He is also able to provide on-the-spot accounts of most of the great motoring and aviation events which he reported on, from 1925 to the present day, commencing with Land Speed Record bids by Campbell, Parry Thomas and Segrave, the R101 disaster, racing at Brooklands and Le Mans, etc., and rallies and Continental road races, including the 1936 Monte Carlo Rally in which McKenzie competed with a very fine straight-eight Daimler but lost the Grand Prix d'Honneur to Sammy Davis' Wolseley, although the author obviously thinks there was a fiddle. He went with Mavrogordato in a Morris Eight through the 1939 Monte Carlo Rally, with Dudley Noble on his Balkan adventure in a Humber, took a Sunbeam-Talbot on the 1952 Monte Carlo, as well as doing the Alpine Trial in an XK120 Jaguar, Hillman Minx, Riley Nine, 11-litre Riley, 21-litre Riley and Ford

All this makes for interesting reading but I found the detail lacking, perhaps because McKenzie had a great number of experiences to describe in one book. There are also a few items which do not ring true, such as details of Thomas' burial, the colour of Birkin's lap-record blower Bentley single-seater being recorded as green when it was red, or blue, according to period, a Bristol F2B being confused with the later Bulldog on page 79, Segrave being quoted as receiving his Knighthood for his 200-m.p.h. LSR, whereas this honour was bestowed after he had achieved 231 m.p.h. with the Golden Arrow in 1929, an ERA being given a synchromesh gearbox when preselector is intended, etc. On the whole, however, this is a nostalgic glimpse of the past, not omitting references to flying adventures. But it could do with more pictures.—W.B.

"The Leyland Papers", by Graham Turner. 216 pp. 8\frac{3}{4} in. \times 5\frac{3}{2} in. (Eyre & Spottiswoode Ltd., 11, New Fetter Lane, London, EC4. \(\frac{1}{2}.75.\))

Having established his reputation as an investigator and fearless writer with his book "The Car Makers", Graham Turner has done it again with this very frank look at how Leyland Motors took over all but the smallest of the British motor manufacturers. This is also a close, cruel and critical analysis of BL's own mistakes, and it shows up in an unpleasant light the intrigue, skulduggery and ruthlessness of big business dealing in the Motor Industry. How Mr. Turner was able to gain access to all the office minutes and Company documents which enabled him to give us this enthralling insight into the vast BMC and Leyland take-over bids I cannot tell you, nor can I understand why Lord Stokes permitted this book, which is not exactly complimentary to the motor tycoons, to be published.

I commend this as compelling reading matter for all those concerned with the financial and investment side of the Motor Industry but will refrain from writing a lengthy review because the book came to us very late, in spite of numerous requests, and then with some vital pages missing.—W.B.

"Wheels", by Arthur Hailey. 422 pp. 83 in. × 51 in. (Michael Joseph Ltd., 52, Bedford Square, London, WC1. £2.25.)

This is a long novel by the celebrated Arthur Hailey, author of the similar books about the hotel industry and an international airport, both of which I enjoyed—I was too squeamish to read his novel about a great hospital. Hailey's novels are not only compelling but they take apart the American concerns with which they deal. In this latest book Hailey uncovers the motor manufacturers, in a book ugly and disturbing in comparison with his descriptions of a fictional airport and hotel.

He follows his usual theme, of a blue-eyed hero in difficulties, this one a product development engineer with GM, whose sex-starved second wife resorts to shoplifting, of the toughness of work in the factories, as Foreman, Assistant Plant Manager or worker, of the colour problem and the influence of the Mafia as these affect the Motor Industry of America, of unscrupulous dealers and the high stakes of motor racing —he leaves very little out, although the PR aspect might have been covered more fully. But a Hailey novel is irresistible, even if you may not have the stamina to enjoy it to the bitter-sweet end.—W.B.

"Automobile Year—1971/72." Edited by Douglas Armstrong. 248 pp. 12\frac{3}{4} in. \times 9\frac{3}{4} in. (PSL Ltd., 9, Ely Place, London, EC1N 6SQ. £5.00.)

The 19th edition of this glossy annual from Switzerland is now with us. It covers in text, copious black-and-white illustrations and excellent colour the World Championship F1 races of 1971, written up by Douglas Armstrong, who also contributes a Day-by-Day résumé of last year in the motoring world, has a statistical analysis of the 1971 racing season by Jacques Ickx, and deals, as usual, with last year's new cars and contains two feature articles, one on the coachwork of the house of Labourdette, the other on "Cars for Connoisseurs" by Ami Guichard, the publisher of "Automobile Year", which he lists as the Mercedes-Benz 350SL, the Monteverdi HAI, the Citroën SM and the Fiat 130 coupé. There is also a useful tabulated list of the outcome of the more important 1971 races and rallies.—W.B.

"Mechanical Technology for Higher Engineering Technicians", by Peter Black. 344 pp. 10 in. × 7 in. (Pergamon Press, Headington Hill Hall, Oxford. £6.50.)

Out of the run of motor sporting books we have received a serious engineering text book for the student aiming at achieving the new Higher National Certificate in Mechanical Engineering, or for that matter anyone interested in a sound basic knowledge of engineering principles, which is something many people in motor racing could do with. This weighty tome deals with everything from torsion and bending to heat transfer and vibration, is very clearly laid out and has numerous test examples at the end of each chapter. The author, Peter Black, is Senior Lecturer in Mechanical Engineering at the Mid-Essex Technical College at Chelmsford, but apart from that he is an avid reader of Motor Sport of long standing, an Alvis enthusiast to the extent of owning at least six, and is currently rebuilding a 1928 Amilcar. In short, one of us.—D.S.J.

"The Mercedes-Benz Racing Cars", by Karl Ludvigsen. 260 pp. 11 in. × 8½ in. (Bond/Parkhurst Books, Newport Beach, California, 25 dollars.)

A very great deal has been published about the long history of Benz and Daimler, which in 1926 merged as Daimler-Benz, and the very successful and impressive racing and competition history of these two companies.

Consequently, when a copy of the well-known American journalist's work "The Mercedes-Benz Racing Cars" finally came into my hands after delays occasioned by the American dock strikes, I glanced at it quickly and tended to scepticism, because almost all the excellent illustrations I had seen previously, these coming mainly from the Daimler-Benz archives, and I thought this could be a repetitive history of that already written by S. C. H. Davis, George Monkhouse, Scott-Moncrieff, Kenneth Ullyett and others.

Further study revealed this to be an all-embracing and entirely fascinating complete account of Mercedes-Benz in motor racing, with chapters on the pioneer days, the GB and GP, the Blitzen Benz, the single o.h.c. Mercedes racing cars, the supercharged cars from Stuttgart, the Benz Tropfenwagen, Porsche's ill-fated straight-eight, the sports Mercedes-Benz from K to SSKL, the great Grand Prix cars of 1934 onwards, the record cars, right on through 300SL and the post-war racing Mercedes.

Denis Jenkinson has told the intimate story of the W125 GP Mercedes-Benz (Leventhal, 1970), which is so enthralling that I have read and re-read it. Ludvigsen's book is rather like an expanded version, and consequently extremely interesting and informative, although there is a trace of American journalese in the writing of it which I could do without.

As to the accuracy of this large and so copiously illustrated book, its delayed arrival has precluded careful study of it but if the chapter on the Blitzen Benz sets the standard I shall have no cause for complaint, because in this the author goes into commendable detail and clears up the mystery surrounding these cars, and, I am gratified to see, agrees with me that the Zborowski Benz was the original, Hemery Blitzen, and that Burman's Brooklands Benz was a replica which is now in the Mercedes-Benz Museum—although he does not dwell on its present, presumably changed, engine number!

Although the mass of pictures, some drawings, some colour plates, have been seen before, this painstaking and factual chronological study of the competition career of one of Europe's greatest motor-car manufacturers should prove of immense interest to all racing historians and must surely become the bible of all Mercedes-Benz worshippers.

"Grand Prix Chronology", by S. Hirst. 240 pp.  $7\frac{9}{5}$  in.  $\times$   $4\frac{1}{2}$  in., soft covers. (Ian Allan, Terminal House, Shepperton, Middlesex. £1.60.)

This bulky paperback sets out to provide statistics of all the World Championship F1 races from 1950 to 1971. Each season is briefly described, each race has grid, results, retirements and date, distance and circuit data about it. There are circuit maps and Introductions by Stirling Moss and Raymond Mays. While the accuracy of the retirement causes will depend on the author's sources of reference, this book, which is unillustrated and pretends to be nothing more than a reference work, will be of inestimable value to many people in the world of modern motor racing.—W.B.

"Save Money on Your Car", by Stuart Bladon (142 pp.,  $7\frac{2}{5}$  in.  $\times$   $4\frac{1}{2}$  in.), is a useful paperback for novice maintainers and restorers. It even has colour illustrations of how to do body repairs with glassfibre. Bladon enlivens the text with personal anecdote and Gordon Horner drawings, referring to how well a properly-maintained Vauxhall Velox coped with 80,000 miles, of a Ford Transit which sheared its oil-pump drive, a Daimler Conquest which put its fan through the radiator, of a Morris 1100 which developed ignition trouble on the M1, a Rover 3-litre 1800 which was no good for a Mobil Economy Run on its well-worn Avon tyres, and so on. This bright and informative little book is published by Stanley Paul & Co. Ltd., 3, Fitzroy Square, London, W1, for 50p, but Holt's Products are behind it.—W.B.

"United States Military Aircraft since 1908" by Gordon Swanborough and Peter M. Bowers is a revised version of the book published by Putnam & Co. Ltd., 9, Bow Street, London, WC2E 7AL in 1963, taking the history from 1909. It has been revised to commence a year earlier and extended to include the aeroplanes involved in the Vietnam war. With more than 130 new pictures in a total of 600 and produced to Putnam's well-known high standards, this completed up-dated edition, running to 675 8½" × 5½" art pages, sells for £6.50 in the UK. It includes a total of 150 g.a. drawings by L. E. Bradford, 45 of which are new.—W.B.

#### CARS IN BOOKS

NOTHING MUCH this time under this heading, except that in that most interesting book "The Great Air Race", by Arthur Swinson (Cassell, 1968), which should have been sent to us for review when new, but wasn't, which describes in some detail the Macpherson Robertson England to Australia Air Race of 1934, which was won by Scott and Black in a DH Comet, pursued by Parmentier and Moll in a KLM Douglas DC2, there are excellent pictures which show that the triumphant Scott and Black were driven through Melbourne in an open Vauxhall, Reg. No. 195 62S. There is another picture, also featured as a dust jacket drawing, showing Gaumont British's Vauxhall (Camera-van and Paramount's American wooden-wheeled camera-van (UU 9853) filming the race, the latter, with its horizontal bonnet louvres and somewhat Rover-like radiator, posing an interesting problem of make identification.

#### RUMBLINGS

LONGEVITY.—We would not like to take bets on how long a car which is correctly serviced and carefully driven can be made to run. In general, the edge seems to go all too often from mass-produced vehicles after about 10,000 miles and the quality jobs go much the same way after some 40,000 miles. Advertisers of pre-war cars seem to think a big mileage on the odometer enhances their value but we have never been able to fathom this and some of the loudly proclaimed elapsed distances seem to us detrimental to a sale and cause us to smile.

From Canada comes news of a 1957 Chevrolet Belair which had been driven for 432,107.7 (we like the 0.7) miles at the time when it got into the papers, without accident, by its owner, a hardware salesman. This gentleman used to trade his cars in every three years, until he thought about the huge profits car manufacturers make. So, taking delivery of a new six-cylinder, four-door Chevrolet in January 1957, he was determined to make it last for at least 500,000 miles. He had the car serviced by an independent garage, greased every 1,000 miles, and he and they kept a careful mileage check.

In a mileage during which he would normally have had five cars and be on his sixth, this light blue Belair has its original engine, transmission and paint job but has had fresh seat covers every three years. It is said to still be free of rattles and squeaks and to have an inaudible engine. Fuel consumption has been some 21,200 gallons, or 25 m.p.g., some 145 gallons of oil and 60 tyres (no punctures) have been consumed. The owner of this long-lived Chevrolet, which seems to endorse Stanley Sedgwick's belief in American cars as well as Bentleys, says the secret has been to buy the best-selling model of a medium-price range, seek a quality make, find a conscientious mechanic who is a good diagnostician and stick to him, never skip or skimp a service schedule and "use commonsense for the first 250,000 miles".

Would it work with European cars?

THE EDSEL.—A reader is puzzled by the reference to the Ford Edsel as "The jinx car that nearly bust Ford". There could well be other readers who have not heard of the Edsel, so we will elucidate. It arises from a feature in the *Bedfordshire Times* about one of these cars, said to be the only one in England, bought by its present owner, a scrap dealer, in 1967. At the time the only other one here was the Duke of Bedford's, which is why the scrap-dealer sometimes got an unexpected Police escort through Bedford!

His Edsel has only got 13,000 miles on it and he has been able to obtain what spares were needed from America. Undecided whether or not to sell it, it is nice to learn that the owner would like it to stay in England and does not value it at a ridiculous price; if he disposes of it he may go for a Rover.

The Edsel, named after Henry Ford's second son, lost out on its flambouyant styling. It also had push-buttons on the steering wheel for changing gear and in its most powerful form, is the V8 6.7-litre Edsel Citation, described 345 b.h.p. Its frontal styling has been likened to a lavatory seat, a man sucking a lemon or a sex symbol, but Pontiac copied it pretty closely in 1968/69. The Edsel was designed because J. F. Reith wanted a car in the price range between the Mercury and the Lincoln. The Ford Thunderbird, intended merely to compete with the Chevrolet Corvette, had become the most successful car of 1954.

Perhaps Ford became too confident. The E-car was launched for 1958, with a projected sales figure of 200,000 minimum in the first year. Twenty-six months later less than half that number had been sold, admittedly in a period of recession. The Edsel cost Ford a bomb—estimates range from 20-million dollars up to third-of-a-billion. Say between £12-million and £14-million. It was discontinued in November 1949. Ford recovered, although Reith soon left them. Today no tears are spilt over the Edsel fiasco and Ford, especially Ford of Britain, are on top and forging ahead.

This is just a scrap of history, because Motor Sport readers are unlikely to crave Edsels. But in America there are Edsel Clubs and more than 43,000 were in use there up to two years or so ago.

#### FORMULA ONE RACING—Continued from page 485

#### BRAZILIAN GP (March 31st)

Only 12 Formula One cars were attracted to the impressive 5-mile circuit of Interlagos near the large Brazilian City of Sao Paulo. The race was organised by the same team who efficiently ran the Formula Two series at the end of last year but, even so, the race did seem to be in doubt in some quarters until only days beforehand. John Player-Team Lotus, with the top Brazilian driver on their strength had to take the race seriously and they used it as a test for a brand new Lotus 72D which has been built up during the past couple of months. Numbered 72D/R7, the car was similar to those already raced and if there were any differences they were not noticeable and no one was telling. This was to be driven by Fittipaldi while the team also had R6 for Walker.

The Brabham team brought along their regular two cars, BT34/1 for regular driver Carlos Reutemann from neighbouring Argentina, and BT 33/3 for Emerson Fittipaldi's older brother, Wilson, who was replacing Graham Hill for this occasion. It was not W. Fittipaldi's first Formula One race for it will be remembered he drove an elderly Lotus 49 in the non-championship Argentine GP in 1970. March Engineering brought along their older type 721 for Peterson plus the car that Beuttler drove at Brands, for local top sports car driver, Luiz Bueno who raced in British Formula Ford in 1969.

Marlboro-BRM turned up with a full complement of four cars, P160s for Beltoise, Gethin and Marko plus an older P153 for Soler-Roig, who was having his first F1 race since the Argentine GP. The field was completed by the Frank Williams team, who brought along their March 721 and 711 for Pescarolo and Pace. Thus, four of the twelve drivers were Brazilians. There was talk of Williams also running a borrowed Surtees for de Adamich but it did not materialise although the driver did.

Fittipaldi soon came to terms with his new Lotus and at the end of practice had lapped the twisty circuit in 2 min. 32.4 sec., a full two seconds faster than his nearest rival, Reutemann. On row two of the two-two grid was Peterson, just a fifth of a second slower, alongside W. Fittipaldi who was a full 3.9 sec, slower than his brother. Walker and Beltoise were on row three while the Williams team occupied row four with Pace, in only his second Formula One race, faster than team mate Pescarolo. Bueno, and the three other BRMs, completed the sparse field. Several "big noises" from Marlboro Europe were present and one presumes they weren't too impressed with the performance of the third of the field occupied by their red and white

They were unhappier still when their only possible contender, Beltoise, was unable to start when his car's engine died in the paddock while being warmed up before the race and could not be coaxed back to life. So when the flag dropped, only eleven cars left the grid with W. Fittipaldi sneaking through to take the lead much to the delight of the large and partisan crowd. His more experienced brother was forced into second place while a great cloud of dust and grit greeted the rest of the field. This was promptly gathered by the BRM of Gethin and the two Williams' cars which ground to a halt with jammed throttles and took no further part in the proceedings. This left eight

INTERLAGOS START.—Two brothers on the front row of any starting grid let alone one for a Formula One race is a rare sight. Emerson Fittipaldi (left) and Wilson Fittipaldi (right) are separated by eventual winner Carlos Reutemann in a Brabham BT34.

FORMULA ONE DEBUT for the Brazilian driver Luiz Bueno who hired a works March 711 for the Interlagos race. He finished in sixth place, two laps behind the winner.

cars with W. Fittipaldi holding off E. Fittipaldi until lap three. Once the Player Lotus was ahead it pulled out a big lead while the older Fittipaldi dropped to fourth place behind the battle between Reutemann and Peterson. The March driver was hampered somewhat by no clutch and a deflating front tyre, and finally had to make a pit-stop to have it changed. This dropped him behind W. Fittipaldi but he soon regained his place. With 32 of the 37 laps complete the leader suddenly spun wildly and just missed the armco barrier. A lug in the bottom of the fabricated rear upright had pulled adrift and Fittipaldi motored back to the pits to retire. This put Reutemann into a conclusive lead which he retained until the end, finishing almost 1½ minutes in front of Peterson. Making it a good day for Brabham was Wilson Fittipaldi who finished third with Marko fourth for BRM, but lapped. Fifth was Walker and sixth was Bueno, while Soler-Roig retired early with electrical problems, from the back of the field.

So Reutemann won his first ever Formula One race in what he admitted was a somewhat lucky fashion, a fact he had plenty of time to ponder on in the following weeks. Two days later he was most unfortunate to fracture an ankle while practising for the Thruxton F2 race, when the right-rear-hub of his Rondel Brabham broke in a fast corner and he crashed heavily .- A. R. M.

#### BRAZILIAN GRAND PRIX—Interlagos—Formula One— 37 laps—294.5 kilometres

1st: C. Reutemann (Brabham BT34-Cosworth V8) 2nd: R. Peterson (March 721-Cosworth V8) 3rd: W. Fittipaldi (Brabham BT33-Cosworth	1 hr. 37 min. 16. 25 sec.—181.7 k.p.h. 1 hr. 38 min. 43. 9 sec.
V8) 4th: H. Marko (BRM P160 V12) 5th: D. Walker (Lotus 72D-Cosworth V8) 6th: L. Bueno (March 711-Cosworth V8)	1 hr. 39 min. 19.6 sec. 36 laps 36 laps 35 laps
Fastest Lap: E. Fittipaldi (Lotus 72D-Cosworti	h V8), 2 min. 35.2 sec,-192.7 k.p.h.

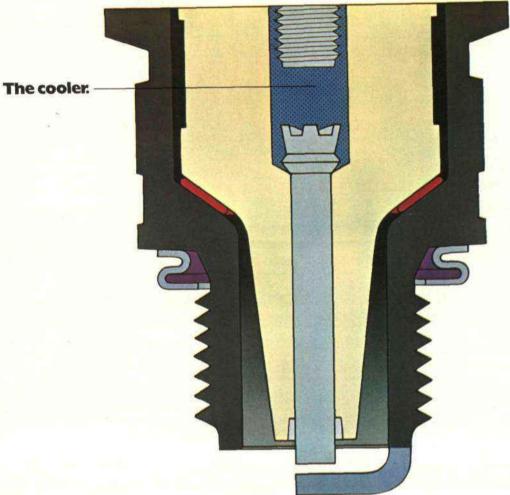

#### MORGAN THREE-WHEELER CLUB

THE new secretary of the Morgan Three-Wheeler Club, who was introduced to "Morgan-mania", for which there is no known cure, by MOTOR SPORT some seven years ago, is N. H. Lear, Banyon House, 191 Wells Road, Glastonbury, Somerset. The Club publishes a monthly printed Bulletin and organises many sporting and social fixtures during the year.

#### SPECIAL ROOF RACK

SPECIALISED Mouldings Ltd., better known for their racing car bodies, have entered the luggage business with some special glassfibre cases which fit on the roof of a car on a special custom-made plinth. This plinth is moulded to fit the contours of several popular models and the cases are not only lockable in themselves but also lock directly onto the plinth. The cases are fully water-proofed and as no air can pass under the plinth it is quieter that a normal roof rack and because of the aerodynamic shape, less wind resistant. The system has two cases, total volume 3 cu. ft. each and the cost with the plinth is £29.45p. It is available from Gordon Spice (Ashford) Ltd., 1 Fir Tree Place, Church Road, Ashford, Middlesex.

# The plug with the built-in cooling system.

As heat builds up at the tip of a plug, sometimes up to 900° centigrade, it must be dissipated or overheating and pre-ignition occurs.

That's the reason AC designed

It's part of an overall cooling system no other plug has. As heat flows

up the centre electrode, a unique glass/metal seal helps disperse it through the pure ceramic wall of the plug.

So you get the hot spark combustion you need, without overheating and burning out your plugs.

A small thing, but it makes a big difference to the performance of your car.

A spark of genius from AC-Delco

### The fantastic new Firenza Sport SL. Twin carbs. Overhead camshaft. 122 bhp at 5500 rpm.

#### New Firenza Sport SL.

The Exciting Far-Reaching Facts.
Firenza SSL. That means Sport Super
Luxury. Add Vauxhall's latest and greatest 2300 twin carb engine and you've got a very impressive car indeed. So much for the feel. Now for the features:

First the outside: long, low and zesty, pacey style. On good looking Rostyle wheels and radial tyres.

Inside an enthusiast's dream: sports 7-dial instrumentation, console control switches, sports steering wheel, reclining front seats, two-speed wipers/electric screen wash, dipping rear-view mirror, twin windtone horns, upholstery patterns unique to the SSL. And a cigar lighter!

Under the bonnet - a 2300 powerhouse. with a power-to-weight ratio of around 135 bhp/ton. A heavy duty clutch,

gearbox and back axle. Servo-assisted brakes with front discs and tandem master cylinder for extra safety. Front and rear anti-roll bars, for sure predictable handling. All this and a 12 gallon fuel tank. The very impressive Firenza SSL. We would like you to test-drive it.

#### FIRENZA SPORT SL See your Vauxhall dealer now. Price £1261 (ex factory inc. P.T.) Price correct at time of going to press.

### RACE OF CHAMPIONS FITTIPALDI'S SECOND.—The early season Brands Hatch Formula One race was notable for two reasons. First, the young Brazilian driver Emerson Fittipaldi scored the second Formula One win of his career and the first for Lotus since the cars have been sprayed black and gold. Fittipaldi's win was completely unchallenged although neither Tyrrell nor Ferrari was hardly race ready and Peterson was never amongst the front runners. Note the inboard rear suspension and new nose. There were three BRM P160s in the race and, below, Ganley chases team-mate Beltoise,

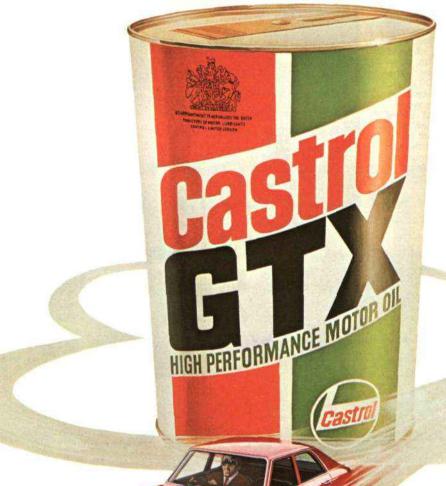

CROWD THRILLER.—The first round of the Wiggins Teape Paper Chase saloon car championship kept the crowd on their toes. Frank Gardner's brand new Chevrolet Camaro belches smoke at the close following Escort RS of David Matthews. Gardner won after ignoring a black flag.

# Put heart in your car with Castrol GTX.

The heart of your car is its engine.
If it doesn't keep going, then you don't keep going. It's as simple as that.

And really there's no better reason for using Castrol GTX.

You see, GTX is made to keep going under the toughest conditions you can find for it. And when all the tests and graphs and tables are done with,

it just boils down to one thing.
However old your car, it'll stay young at heart with Castrol GTX.
And that's all that matters.

So now you know.

You won't find a better oil than Castrol GTX. It's the result of years of continuous research. And since oil's the heart of our business, you can be sure of one thing:

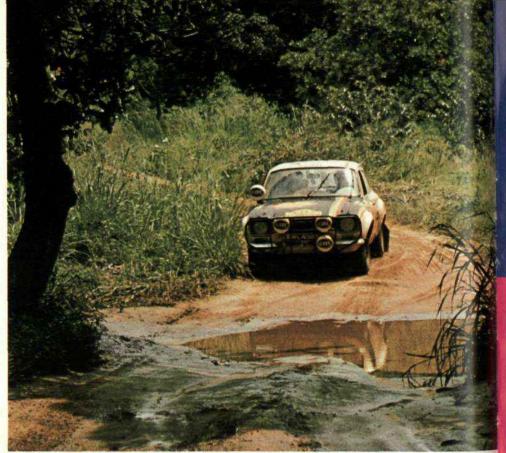

Castrol keeps the pressure up.

Castrol GTX

The high performer

#### EAST AFRICAN SAFARI RALLY

THE LOCAL DOMINATION of the East African Safari came to an end over Easter when Hannu Mikkola and Gunnar Palm became the first overseas crew to win the event in 20 years. Mikkola/Palm were driving a works Ford Escort RS1600 (below) and had an excellent run to finish 19 minutes ahead of the secondplaced Sobieslaw Zasada/Marien Bien in a Porsche 911S. Ford also won the coveted team award on this year's Safari with three other Escorts finishing in the first ten. The highest placed of these was the RS1600 of Vic Preston Jnr/Bev Smith (right) which came in The Annabell's-entered but worksprepared Escort of Robin Hillyar/Mark Birley was fourth, whilst the other works car of Timo Makinen/Henry Liddon finished eighth after losing a wheel early in the event. Of the 85 starters only 19 finished the 3,750-mile route.

# BRAKE CENTRE

#### The motorist's new way to safe braking

NOW-at garages, motorists shops,-you'll be seeing this new Girling Brake Centre. It's loaded with genuine Girling replacement parts for popular cars. Components attractively skin-wrapped with full instructions and detailed applications on every card. And the Girling Identicode listing makes it easy to find the right part.

Simple. And safe. Because you know you're getting replacement parts identical to the original equipment. There are special Girling tools, as well, to help you do the job with professional ease.

On Girling systems use only Girling genuine parts-from the new quick-serve Girling Brake Centre.

LOOK FOR THIS SPECIAL BOOK "Motorists' Guide to Brake Servicing" Written by Girling experts to help you keep your car's braking system in super-safe condition. Available from GIRLING BRAKE CENTRES everywhere. Recommended price 15p.

Any garages and motorists' shops without a Brake Centre should contact their nearest Girling distributor-NOW I

## EASTER FORMULA TWO MEETINGS

FORMULA TWO racing, to the new 2-litre regulations, was seen at both Oulton Park and Thruxton over the Easter holiday. Both races were won convincingly by the works STP-March team. At Oulton Park the race was held in the pouring rain and, as it did not count towards the European Championship, only attracted a small field. Above, splashing his way to his first ever F2 victory, is the young Austrian driver Niki Lauda. The Rondel Brabham team had an unhappy weekend for, at Thruxton in practice, Carlos Reutemann's new Brabham BT38 had a rear hub failure and crashed heavily. However, at Oulton, Tim Schenken (left—car 25) gave the team a third place, despite a deflating rear tyre. At Thruxton the weather was much kinder, as can be seen in the lower two photographs. Second place in the final was claimed by Francois Cevert who was driving yet another March 722, this one entered and prepared by John Coombs. Surprise of the meeting was the performance of the latest in the line of French-built Pygmees, which are now entered and prepared by the BE Racing Team. Carlos Pace (car No. 47) led his heat conclusively until a fuel pump gave trouble, while team-mate Patrick Dal Bo finished fourth in the final.

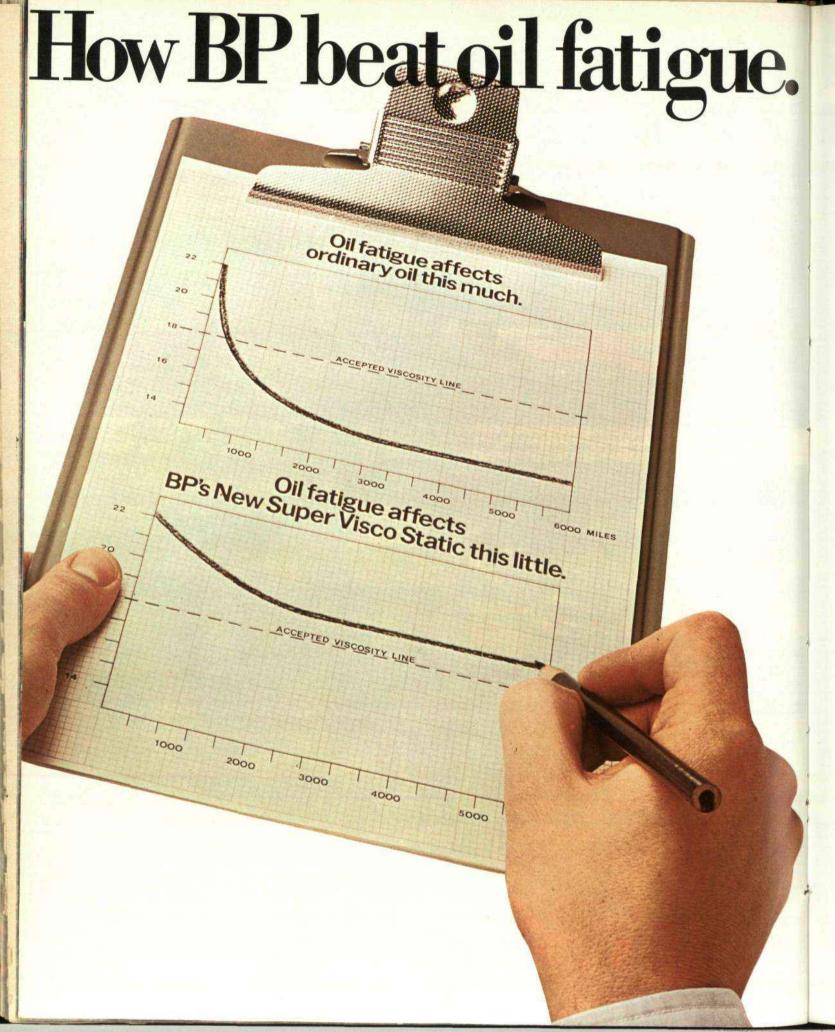

STILL THE MAN to beat in Formula Two is Ronnie Peterson who was the most successful driver in this category last year. The Swede took his STP March 722 to an unchallenged victory, lapping everyone except second man, and set up a new outright lap record.

FORMULA ONE CONSTRUCTORS Surtees and McLaren have both moved into Formula Two this season and are running works cars. The Surtees team are running two cars under Matchbox sponsorship but were out of luck at Thruxton. Above John Surtees leads the new Brabham of Richard Scott. Below is the young South African, Jody Scheckter, who is representing McLaren. He suffered, like so many others, with engine trouble but until he retired, was the leading non-March in the final. Here he is followed by Jean-Pierre Jarrier's March and Graham Hill who was driving a 1971 model Brabham.

Other oil companies never talk about oil fatigue. If we were in their shoes, neither would we. The facts are these:

#### When oil breaks down.

Only a few hundred miles after a complete oil change, even high performance oils begin to deteriorate.

You won't notice anything dramatic. Perhaps the only clue you'll have is an increase in oil consumption.

But under the bonnet, a battle is being fought. The losers are your oil, and ultimately your engine.

This is what happens.

#### The mincer in your engine.

When multi-grade oil is new, it has a thick, protective 'body' because of the polymeric viscosity improvers in it.

When the engine gets hot, these tiny molecules expand to slow down the thinning rate of the oil. (As you know, the thinner oil gets, the less it protects and the more you use.)

Up till now, though, these viscosity improvers have been minced up very early on in life by the chopping action of your engine.

And when that happens, there's nothing to stop your oil getting thinner and thinner. So what was a 20–50 oil when it went into your engine may quickly become a 20–40, or even a 20–30.

#### Improved improvers.

For the last 18 months, research teams have been looking for ways to stop this thinning process and beat oil fatigue.

Now we've done it, thanks to a new type

of viscosity index improver.

It makes Super Visco-Static much tougher than ordinary oil, and much more resilient. Instead of being cut to pieces by the chopping action of your engine, it actually bounces back and doesn't drop below grade.

This means that Super Visco-Static stays full-bodied, and 'in grade'. Not just for 200

miles. Not just for 2,000 miles. But from one oil change to the next.

How can we say things like that? Because we've proved our new oil in a series of extensive road tests.

#### Still in grade between oil changes.

The tests were observed by the RAC. We used a wide range of cars, but in each case the result was the same.

New Super Visco-Static stayed in its 20-50 grade for the whole period between

recommended oil changes.

What it comes down to is this. With this oil in your car, you'll get all the strength of a new oil. All the economy of a new oil. Not just for a few hundred miles. But for the whole period between recommended oil changes.

Oil fatigue is a thing of the past.

New Super Visco-Static. It beats oil fatigue.

## India GT Radials: The trouble-shooters

# The toughest test Silverstone... a Formula 1 Surtees TS9... Duckhams Q20-50

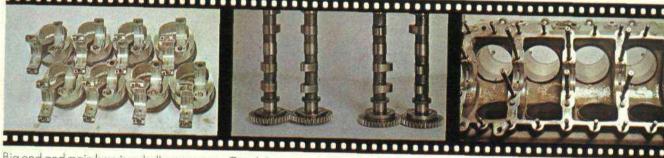

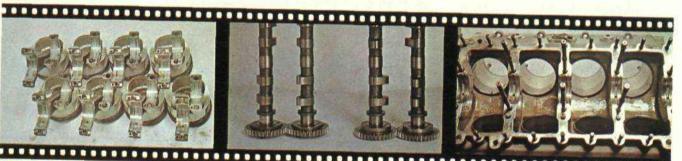

20 pints of Duckhams Q20-50 bought by an R.A.C. observer are poured into a Formula 1TS9. It's the same oil the makers recommend for your car.

For 200 miles Alan Rollinson laps at an average speed of 123.87 m.p.h. Revs up to 10,000. Conditions far tougher than anything you could meet on the road.

After the test the engine is stripped and examined by Race Engine Services Ltd. They report: piston rings were free, clean

Big end and main bearing shells were very Cam lobes were polished with no scuffing good with no pitting or scoring. Pistons were in perfect condition with no sign of pick up or excessive heat

or pitting. There was no wear, scuffing or pitting on contact faces of valve stems.

Main bearings and crank pin were in perfect condition with no wear. The engine was in first class condition and in our view the test was therefore completely Signed: A. J. R. SHORT Managing Director.

The Formula 1 Test is the latest and toughest challenge for Duckhams Q20-50.

In the world's hardest and fastest motor sport events, Britain's best selling motor oil has been proving itself for years.

With Duckhams Q20-50 in your engine, you can depend on the oil which has proved it will stand up to anything.

**DUCKHAMS** One oil. Whatever you drive.

## LETTERS FROM READERS

N.B.-Opinions expressed are those of our Correspondents and MOTOR SPORT does not necessarily associate itself with them.-ED

#### THE ANSWER TO INFLATION

I wonder if you will allow me to give Mr. P. E. Porrett the answer to his problem of disaffection with the AA and the increase of sub-

The answer is, RESIGN-it's as simple as that.

It is a great pity that the majority of the British people will not fight back, against increased prices and charges in particular, and the dictums of "Authority" in general. This failing, I regret to say, seems to manifest itself more among motorists than some other sections of

What persuaded Mr. Porrett that he needed the AA in his life, in the first place, I cannot imagine, because although the AA may have had good intentions of becoming the motorists' "watchdog" and champion, in its early formative years, I cannot remember a single instance (in my over forty years of motoring) when the AA have successfully opposed any Government anti-motorist legislation whatever. And there has certainly been plenty of that.

Their only claim to fame, so far as I can see, is to have become the owners of some very valuable blocks of property, built, no doubt, with

the proceeds of their ever-increasing charges.

Had the AA been doing the job over the past forty years for which it was originally formed, and had it given its members value for money, there would have been no surplus funds for building palatial offices, and the motorists' lot today might be a much happier one than it is.

The answer in respect of Esso road maps is of course equally simple-don't buy them. Finally, I would like to assure any readers who may be interested, that it IS possible to go motoring without the AA and Esso road maps, I know-I've done it!

Chapel en le Frith.

#### MOVE OVER, ROVER!

We have long tolerated the middle-of-the-road driver, but now it appears British Leyland advocate drivers of Rover 2000s should drive in the third lane of an otherwise desolate motorway, or are we to imagine that there are two slower moving vehicles off the bottom of the page? I always enjoy your excellent magazine and appreciate the full-page colour adverts, but . . . . J. A. TOWNEND.

[We agree that the driver in the very effective advertisement appears to be setting a bad example, but you do not really know that the inner lanes of the M62 were not blocked just ahead of the speeding Rover, do you Mr. Townend? And now I suppose we shall have Sir Alfred McAlpine pointing out that if it was so blocked, it wasn't due to surface repairs or anything of that kind. But you have a sharp brain, Mr. Townend!-Ep.1

#### NO CARS?

Putting the current issue of your excellent magazine on one side the other evening to catch up with world events in the other press, my eyes soon alighted on a two-page spread in a weekly colour supplement which extolled the virtues of the new Victor Transcontinental Estate

What immediately struck me, and also my non-motoring wife when I raised the point, was that in all the press announcements and advertisements not a single actual photograph of any of the new range of Vauxhall has been shown.

From recent scandals regarding artists' impressions of Spanish hotels in travel agents' brochures which have been incompleted before arrivals by un-suspecting holiday-makers are we therefore to assume that no new Victor exists at present, but some are planned for the coming season?

R. W. POWELL.

[And this reader has sharp eyes!-Ep.]

#### MOTORWAY MADNESS

In "Matters of Moment" in the January edition, you found a new meaning of the expression "Motorway Madness". I believe that I have discovered yet another meaning.

My brother and I were going from St. Andrews to Edinburgh, by way of the M90. At the time there was a dense fog-we couldn't see 100 yards ahead of us-but none of the fog-warning lights were on! I have heard it said that sometimes these lights are used when they are not needed, and therefore some motorists do not pay proper attention to them when they are needed, but surely, when visibility is down to less than 100 yards, the lights should be switched on! This is certainly the worst case of "Motorway Madness" I have ever come across. ALAN LUCAS.

#### ARMCO AND RACING MOTORCYCLISTS

When reading about the hyper concern of the Grand Prix Drivers' Association for the safety of its members on almost every circuit in every country, one can't help being astonished that one fact has been consistently overlooked from the start because the Grand Prix drivers aren't the only people who compete on the circuits concerned.

My older son is a professional racing motorcyclist contracted to a leading factory and I feel that it could interest the Grand Prix drivers to know that, however much more safe an Armco barrier may make a circuit for them, it constitutes one more appalling hazard for the racing

One can hardly open a motoring paper now, without reading of the latest whim of the current Grand Prix drivers-a poor bunch if ever there was one-and one can't help wondering whether they or their doting fans do realise that motorcycle races and Grands Prix are frequently run on the same circuits. It wouldn't be so bad if the current GP drivers were of the calibre of Caracciola, Fangio or Nuvolari-but none of them are. They can, if they like, counter by saying that their opposite numbers don't include any Surtees or Hailwoods. True, but while the circuits are being made steadily more dangerous for them, they are the chaps who aren't complaining.

Even past Grand Prix drivers, who accepted natural hazards-and who were far better than this lot-weren't called upon to accept

And anyone who has seen, as I have myself, a racing motorcyclist collide with an Armco barrier, would be up in arms with the GPDA

Ewhurst.

CHARLES MORTIMER (SNR.).

#### ABOUT ALFA ROMEOS

May I, through your columns, pass on the following information to owners of Alfa Romeo cars.

Having recently bought an Alfa requiring minor repairs and replacement parts, I, naturally enough, contacted the local agents for parts and was absolutely amazed at the prices of such parts. However, on noticing an advertisement in your publication, I contacted Messrs. E. B. Spares of Bradford-on-Avon, Wilts, and in many cases, the prices of the parts which I required were as much as 50% less than locally. Well, so far so good, I obtained the parts by return of post and was all ready to commence the repairs. Here is where I needed some assistance (much as I hate to admit it, I just don't understand the mechanics of a car). Here I was with all the necessary parts and not a clue how to fit them. In desperation, I phoned E. B. Spares for advice which was readily given in detail and in just six days I had phoned them some nine times for advice and nothing else. I began to feel that any moment the voice on the other end would tell me to take the car to a local garage and stop bothering him. Not at all, on every occasion I received nothing but kind, courteous and considerate service. So unusual is such service in this day and age that I feel it should not be allowed to drift away without praise. To E. B. Spares, thanks!

to Alfa owners, I would not deal elsewhere now and sincerely recommend E. B. Spares for all your Alfa requirements. (Including advice).

Finally, I would point out that I had never heard of this firm prior to reading their advertisement in MOTOR SPORT. Stony Stratford. LAWRENCE P. BUTLER.

Having noted with interest the recent correspondence from Alfa Romeo owners I should like to comment on what, I think, is the nicest looking Alfa produced since the war, namely the Giulietta Sprint.

My own Giulietta, a 1962 1290 model, started life in these parts and is still running remarkably well in the damp air of England.

With all the talk of reliability and otherwise, let it be known that this genuine little Gran Turismo car has only this year had to have new valves and pistons-readily supplied by E. B. Spares, of Bradford on Avon. Petrol consumption is around the 30-32 m.p.g. mark-something that certain popular firms in England might strive for with similar performance.

Certainly I think a Giulietta a more exotic buy than an old MG-B -and more reliable having an extremely tough and long living engine. However, anyone considering buying a Giulietta should take special notice of the body which is very prone to damp weather. The chassis seems to be strong enough, but front wings are just not up to 10 years of English salted roads.

My own Giulietta, which cost a mere £190, has a fair number of years to go. A specification designed in 1952 which is still modern, a beautiful 1950's Bertone body, seems to me, at any rate, to be far superior to the hardly designed BLMC MG-B GT which could be classed as its competitor.

Naturally my next car, if I can resist the temptation of a Lancia Aurelia GT 2500, will be a Giulia Sprint GT, but what a pity Alfa Romeo dropped the old Bertone GT body. Thanks for the most interesting motor magazine in Europe which once every month livens up the most badly cooked pasta!

Como, Italy, KERRY GILL. \* 4

FOR AND AGAINST THE RELIANT SCIMITAR

Mr. Stone's letter "Scimitar sorrows" in your March edition prompts me to write to you, echoing his sentiments. Although the Scimitar is not the worst car I have ever bought, it is certainly very far from being the best, although (by quite a bit) the most expensive. Like Mr. Stone, I too have (1) replaced my driver's seat; (2) I am still waiting on door hinges; (3) cannot demist the windscreen due to a "design fault" in the heater blower; (4) find the general finish of the interior very cheap; (5) cannot, despite all possible adjustments, make myself comfortable in the driving seat.

However, the car goes very fast and holds the road well and I suppose I must be thankful for that, Stirling.

D. R. CHRISTIE.

You were kind enough to allow me space in your April 1965 issue to say how satisfied I was with my 1600 Alfa Romeo Spider and to compare it favourably over the equivalent Lotus Elan, the bodywork of which was less waterproof and the final transmission was far less satisfactory. I still have the Alfa with its original hood and this is sufficient comment. I must now take up the cudgels on behalf of the Reliant Scimitar GTE. I have owned my present one for 3 years, and my son-in-law is on his second. I have been more than satisfied with the machine-the gearbox is not Reliant's fault-and the only inconvenience I have suffered was the earthing strap which worked loose in a thunderstorm. The rear side window leaked and this was dealt with by Reliants, who also fitted modified dampers. The delivery griver spun the car off and it arrived with a flat tyre, the track awry, and clods of earth trapped between tyre and rim. Reliants gave me a new Pirelli. I had a blown cylinder head gasket, replaced at no cost to myself, and a new front wheel bearing at 30,000 miles.

I would have no hesitation in ordering "the same again" but at the moment I see no need to replace a most satisfactory and relaxing form of transport which continues to please both my wife and myself. We do not always travel on smooth roads having to traverse Welsh farm tracks and minor roads at least once a month.

My sympathy must go to Mr. Stone in his ill-luck.

LEWIN T. SPITTLE. 难 非 #

VW SORROWS

Yes of course! I am old enough to know better but I suppose after two decades of absorbing every word of praise in MOTOR SPORT and admiring every compelling syllable of VW advertisements, there appeared only one answer. For our second car we required three qualities-mechanical reliability; an ability to withstand outdoor treatment; and a high re-sale value. Everything pointed to a VW. So in December we purchased from the distributors a new 1300 Beetle with the special metallic paint finish. The list price of this car on the

Within a month or so it had covered about 600 miles and was due for its first free service. By this time unusual noises were coming from the transmission and the paint on both front wings had begun to blister. The distributors lent us free of charge another 1300 while they repaired our car and repainted the wings. It took three weeks by which time I had completely lost confidence in the car so I asked the distributors either to exchange the car for another new one or to refund my money. When they refused both requests I asked them how much they were prepared to offer me for the car as it stood, one month old and under 700 miles. Before me I have their quotation-£800. If this rate of depreciation were constant the car would be a complete write-off in six months!

The full page advertisements for VW headed "A few old reasons for buying a new one" which extols the resale values and "the car with the built-in garage" I find amusing enough but the latest one which finishes "and why no one's laughing louder than the man who buys one" just creases me.

Could this decline of standards coincide with the falling demand for the Beetle and for the encouraging figures from British Leyland? E. W. B. THOMAS.

> \* \* \* AGAINST A JAGUAR MONOPOLY

I must take exception to the remarks of your correspondent Mr. Reddie, expressed in the March issue, regarding Rover drivers. Over a period of years I have owned a number of elderly Rover cars, the present one being a 1959 105 "S" model. All of these vehicles have given endless pleasure and the quality of their construction has endeared me to the marque to the exclusion of all else.

The 2000 and 3500 V8 range will continue to be beyond my means for at least the foreseeable future and whilst I feel that there has been some decline in standards of construction, that does not, I feel, detract from the vehicles' other qualities. Surely Mr. Reddie cannot consider the Jaguar 420G a more sporting vehicle than the 3500 "S"?

These observations however are incidental to the main point, which appears to be the basic difference between Jaguar and Rover owners. Both are quality cars, but that I would suggest is the only basis for comparison and the choice of prospective owners depends more upon personal characteristics rather than the qualities of the respective marques. Whilst in no way wishing to detract from Jaguar, particularly the splendid, but long awaited V12 E-type, it appears that on occasions owners feel a need to justify themselves and their choice of vehicle, a phenomenon I have not observed in Rover owners.

As regards Motor Sport, I have not noted any preference for any particular marque, in fact it appears that any motor car deserving of comment, be it praiseworthy or adverse, receives its due. Therefore, let the format remain unchanged, as continued reporting on the somewhat limited Jaguar range would I suggest quickly result in complaint and accusations of bias. Shifnal

ALAN LOWE.

There is quite enough space devoted to Jaguars in Motor Sport already. What with your Continental Correspondent's addiction to the marque, E-types are overrated! As for describing the (Jaguar) 420 as a "Sporting Saloon"-well!!

Your balance between Veteran, Vintage and Sports articles is fine, please keep producing the best motoring magazine! H. EDWARDS (911S). Buntingford.

I write in defence of Ford Escort owners and other owners of "lesser cars" referred to in G. Reddies' letter in your March 1972

Perhaps he is unaware that the majority of your readers are not Jaguar owners and never will be (mainly due to lack of finance). Please continue with your existing choice of cars for road tests, etc.

Perhaps Mr. Reddie is envious of Ford's participation in motoring sport in general (I too would like to see Jaguar return to racing to compete with Ferrari, Alfa Romeo, etc!). G. M. PROCTOR.

Bathwick.

. . . THE HOLDEN

I have recently received, by grace of God and the Watersiders' Unions, the December 1971 issue in which W.B. states that he has not yet had the opportunity to drive a Holden. May W.B. indulge in a quick resumé of his blessings!

General Motors/Holden must surely lead the world in the production of agricultural camions. Holden performance is mediocre; handling can only be described as surprising; gear changes are generally effected by a three-speed "column shift" which evokes the sensation of stirring one's finger in a tin of baked beans, and general finish is a tribute to the wonders of the world of plastics.

The "bread and butter" model of Holden would better be described as "ship's biscuit and dripping"; and the more exotic models appear to be designed upon the American presumption that sexuality is directly proportional to size and vulgarity. In accordance with this precept, the greater the number of letters denoting the model type, then obviously the greater the virility of the driver. The epitome of this is the automotive misfortune known as the Holden Torana GTR-XU1.

However, many exciting conversions can be wrought upon the Holden. Imitation stick-on racing stripes are available, and even greater increases in performance are achieved by lowering the door handles and planing 10 thou, off the dipstick.

A final affront in the senses and blow against good taste was observed in the display window of a local purveyor of fine machinery: An Aston Martin DBS V8, an Aston DB6, Lotus Elan, Lotus Elan Sprint, Lotus Elan +2, and a Nausea Purple Holden Torana.

Please, W.B., spare yourself the trouble, and forget the truly unforgettable Holden. K. MACD. HUNTER. Dunedin, New Zealand.

[I have, but my assistant didn't-and seems to have become Holden orientated. See p. 137, February issue.-Ep.]

> \* \* \* FERRARI EXPERIENCES

For the past eighteen months I have been running a 1964 330 GT 2 + 2 Ferrari. I bought the car from Maranello Concessionaires, who had serviced it throughout its life with two previous owners. It had 49,000 odd miles on the clock, and the clutch had been renewed a few months previously.

It is an extraordinary car. One expects it to go, handle, and stop, all of which it does splendidly. The docility, reliability and lack of temperament are more surprising. The 330 engine is very similar to the 275, being of just under four-litres, and fed by three twin-choke Webers. Soon after I got the car a plug oiled; with some foreboding I replaced it, and since then the plugs have only been touched at routine servicing, every 3,000 miles.

All too much of my motoring is just pottering around locally; usually I use the DAF, an ideal practice car, but my wife has first call on this, so then I use the Ferrari, the only snag being the large turning circle. It never gets hot. Indeed, when I first got it I thought the electric fans must be faulty, and when they did not cut in in the traffic jam after Daily Express Silverstone I was sure of it; however, half-anhour at a fast tickover with the bonnet covered eventually got the thermometer high enough, and all three fans started to work. The next time they did so was on a hot June day stuck for a couple of hours in a fiesta in Granada, and then it was only for a moment, and the engine opened up absolutely cleanly as soon as we got clear of

Soon after I got the car a rear-spring leaf was found to be broken. It was removed locally, and a new one made by a specialist firm, and has proved entirely satisfactory. The gear lever suddenly came loose in my hand, due to a small bolt shearing, but a call at Egham for a new one, which was instantly forthcoming, had the car mobile the next day. The overdrive refused to stay engaged, but this was an electrical fault remedied in a few minutes. The brakes have had new rubbers throughout, and the front exhaust pipes have been patched to take me through the winter, when new ones will have to be fitted.

This is the sum of repairs done. The car now has just under 60,000 miles behind it, and goes as well as ever. Fuel consumption varies with use, 14 or so in town, though after three hundred miles up to Scotland in 5½ hours, only 15 gallons filled the tank again. In 2,500 miles last summer through France, Spain and Portugal I just used up a gallon

Yes, Mr. Thomas, I am sure you would enjoy a Ferrari, and you would probably find it reasonable to run. However, I suppose it is unwise to run any second-hand car that one could not afford to run when new. Any major work must be expensive, tyres cost a lot, insurance is heavy, and if you want to respray the car, a first-class job is essential, and so on. But then Life would be very dull if we only did the wise things!

In conclusion, may I say how much I enjoy Motor Sport. Apart from the War, I have hardly missed a copy for over forty years. Good luck to you, and thanks for all the pleasure you have given me. G. E. PINKERTON, (DR.). Dunstable

Having owned two 250 GT Ferraris in recent years, I was puzzled by Mr. I. L. M. Cotter's story of a 275 GT-B (closely related to the 250) which constantly oiled-up its plugs: this is something that a properly-set-up GT Ferrari virtually never does. Mr. Cotter suggests that the trouble may have been connected with his six-carburetter version of the engine, but I should have thought that this was very unlikely and would bet strongly on the fault having been somewhere in the ignition department. This is not to cast any slur on the excellent Marelli ignition equipment.

I bought my first 250 GT when it was seven-years-old, and it provided many thousands of miles of trouble-free motoring on long journeys across Europe and shorter traffic-clogged ones in UK. Except for the fault I mention below, the only plug trouble it ever gave was on one occasion when a contact breaker gap started to closeup due to my foolishly having allowed the cam lubrication pad to get dry. My present car, a 1960 short-wheelbase Berlinetta of more or less "competition" specification, is again entirely free from plug trouble: after ticking over or inching forward in prolonged traffic jams, it gathers way without even a perfunctory cough when asked to do so. Both cars, however, gave quite a lot of plug trouble when I first acquired them, and in each case this was due to electrical leakage, particularly in damp conditions, through the perished insulation of the plug leads which run in metal conduits. Once new leads had been fitted in an open harness and the conduits thrown away (which Ferrari and most other makers have now done) all plug trouble ceased. Perhaps this was one of the gremlins in Mr. Cotter's car?

CLAUD POWELL. Kingston-upon-Thames.

A belated contribution to the discussion of used Ferraris.

I bought my 1963 250 GTE from the estate of its elderly first owner (less than 14,000 miles in 5 years, much of it in traffic). I added another 4,000 miles, mostly long high-speed drives to remote spots like Sun Valley, Idaho, with the needle often 100-120 m.p.h. One day the bottom of the radiator split open (too little solder, apparently) and while I switched off before seize-up, two pistons (5 and 6) had started

The engine was rebuilt by a mechanic who had never seen a Ferrari before but had rebuilt Alfa's, Porsche and even an Aston (which he considered the Ferrari engine far surpassed). New bearings from

Vandervell, two pistons, all new rings were fitted. We found the clutch badly worn; also the tappet adjusters and the stem tips of some valves had suffered from being run too loose.

Two lessons emerged. The price of parts in the U.S. (and in England) is more than double the retail price in Italy. A gasket set cost about £20 in Italy, £45 in New York. It is worth waiting until friends can pick things up. Secondly, information is hard to come by and often inaccurate. No workshop manual in available. Different distributors have different numbers for torques. It took several months before the engine was reassembled and replaced. The exercise cost about £400. I believe it would have been twice as much (including freight) if shipped to an authorised repair place.

Subsequent to re-build the car has done another 3,000 miles and runs excellently. It has never oiled a plug (NKG's are fitted). Top speed is 130 at 5,000 ft. above sea-level. Since power drops 2-3% per 1,000 this seems to coincide with the 143 mentioned in the instruction book.

I would hesitate to buy a new 12-cylinder Ferrari (should it be possible) because I suspect that outrageous repair costs are a deliberate policy to keep the car a status symbol of the rich. I am also discouraged by a factory which would not answer my request for torque information but sent instead the name of a non-existent dealer 2,000 miles away. Finally I suspect new Ferraris are more temperamental than the well-tried 3-litre engine, which has given me no trouble.

On the other hand I get more pleasure driving the Ferrari than any other sports car. Everything is exactly right about it-sound, smell, feel and looks. It satisfies every emotion. My Gullwing Mercedes was a more efficient car, but I always had to check the speedometer before approaching a corner because one couldn't judge the speed. With the Ferrari you always know the speed without looking-just like a Vincent Black Shadow.

For everyday family use there is nothing in my view to beat a Mercedes, particularly the carburetter 280. It is the only make, of very many owned, that can only be replaced with another of the same. Calgary, Canada. RODNEY TOUCHE

A LOTUS S2 EUROPA IN CANADA

I notice that Lotus has not been mentioned in your correspondence columns for some time and I thought you may be interested in my experiences of two years with an S2 Europa in this isolated area of Canada. The car has been in daily use in my practice and I find it an extremely rapid means of transport on house calls! I have now completed almost 21,000 miles of very enjoyable and reliable motoring.

I must say I am amused sometimes to read the problems some of your correspondents have with British cars in England. Here, my nearest Lotus dealer is in Winnipeg, 450 miles away to the west and the main distributor is in Toronto-950 miles to the East. The Toronto company is Sportscars Unlimited and the Winnipeg firm-Burnell Motors. On the rare occasions that I have needed their assistance the service has been tremendous. A phone call and a part has been on the plane either the same day or the next.

Fortunately I have an excellent mechanic in the town who does routine servicing and repairs for me and the car has run excellently in the time that I have had it.

Our winters here are long from December through to April, and in January and February temperatures may drop to 20 or 30° below zero. On occasions with the wind drill factor this can be equivalent to 50 or 60° below zero. The car is fitted with a block heater and, of course is "plugged in" overnight in these conditions, but it has never failed to start and is used daily all through the winter.

In the time I have had the car the following repairs have been required: the bracket supporting the gearshift linkage re-welded twice, the second time considerably beefed up and adjusted properly, since then no problems and once set up properly the gear changing is not difficult. Anti-roll bar replaced and mountings beefed up-it broke twice at attachment points after fitting Koni shocks, and one new battery. These are all the problems I have had with the car, which in my opinion is excellent. Fortunately both times the gearshift failed I was in town and it was repaired the same day. I have used the car on long journeys of over 2,000 miles and I find it most restful over 600-700 miles a day-figures easily achieved on our traffic free roads in this part of the world.

I have only two complaints, in the winter the heater keeps the windshield defrosted and thats about all. Secondly, there is a dreadful draught that comes in around the accelerator pedal and in spite of closing off every orifice that I have been able to find, I have been unable to cure this. I am sure you realise the affects of this when driving in the winter.

If you or your readers have any answers to these two problems I would really appreciate hearing from them. Thunder Bay, Canada. ROBERT E. WALKER.

M.B., B.S., C.C.F.P.(C.)

DATSUN CHERRY-continued from page 496

electric washer, heater, steering lock, reversing light, electric fan, sealed in anti-freeze and an alternator.

Our car was also fitted with the optional disc brakes which are probably to be recommended as one tends to drive the little Cherry with the same verve and enthusiasm as one would a Mini. The engine works hard and Datsun claim a top speed of 87 m.p.h. We did not fit a fifth wheel, so do not know the accuracy of the speedometer, but we did see 100 m.p.h. downhill with the wind behind us. Considering this is the cheapest car in the Datsun range we were impressed with the general finish of the car and, under the bonnet, the engineering looked very sound and accessibility was good.

Like the Fiat 127, mentioned above, the Datsun Cherry is a very interesting addition to the Mini market and should appeal to British motorists considering cheap and reliable transport.—A. R. M.

#### Ford 100E Owners Club

This club has created an Associate Membership category open to owners of all side-valve Fords, to supplement the main membership of 100E and 107E Fords, the last SV model. Thus owners of Ford E93As, 103Es, V8 Pilots, Y-types and SV specials, etc. can join. It would seem that post-war side valves are the cars mainly in mind. Following last year's well-supported National Ford Sidevalve Day at Twickenham, a more ambitious rally on the same lines will be held at Beaulieu on August 5th. Details from the Membership Secretary at 14 Sutherland Grove, Southfields, London SW18.

#### NEW SPORTS CAR CENTRE

MRS. GOLDIE GARDNER, whose late husband broke Class G records in 1939 driving an MG, was guest of honour at a recent reception to mark the opening of the L. F. Dove (M. & R.) Ltd., Sports Car Centre in Croydon, Surrey.

Goldie Gardner's record-breaking K model MG was on display together with the one-off McLaren M6 GT and other well-known models, and to announce the winner of a customer competition was Tecno F1 and sports car ace Derek Bell. The Sports Car Centre is situated at No. 1 Brighton Road, Croydon, Surrey, telephone number 01-688 3656.—H. G.

#### J. M. ACCESSORIES — The Daimler SP250 "Dart" Specialists

From time to time we have complete cars for sale.

the car stereo

revolution!

This car is not for sale — it is our own concours-winning example. However, we stock a full range of spares for this classic sports car. We have recently purchased many parts from Daimler and are currently manufacturing a number of others. From stock we can supply: RADIO kits, headlight conversions, wiring looms, all body repairs including ACCIDENT damage, windscreens and all glass (tinted and ordinary), ALL rubbers. We also stock special from and root supply: windscreens and all glass (tinted and ordinary), ALL rubbers. We also stock special front and rear suspension parts, uprated rear and front spring sets, rearlight trims in alloy or brass on chrome, complete exhaust systems, hard-and soft-tops in stock and a limited number of frames, all instruments. Clutch parts ex stock, wide-rim wheels and \(\frac{1}{2}\) price tyres. Alloy header tanks, alloy gear-knobs, front and rear brake parts, ex-stock; front and rear suspension parts ex-stock; steering parts — everything ex-stock; body panels ex-stock. Water pump repair and exchange service, gearbox repaired and exchange, back axles repaired and exchange, engine ex-stock exchanged. We do any job on this car immediately — try us for price. 15% DISCOUNT ON ALL PARTS TO DAIMLER CLUB MEMBERS

#### **WE BRITISHERS ARE NOTED FOR OUR COOL**

driven, Kenlowe Fans are controlled by the Kenlowe Variamatic' Dial Control which automatically switches the Kenlowe off when the engine is running at its perfect operating temperature, and only switches on again when the temperature rises— which is about 5 times on a normal 200 miles drive. Electric Kenlowe Fans need no engine power whatsoever, and they save up to 9% bhp to enable the motorist to enjoy the optimum road performance of his car (the ordinary mechanical engine cooling fan absorbs up to 9% bhp from the engine to drive it). And when the extra power is not required, a saving of up to 9% petrol is made because the pre-Kenlowe performance of the engine is obtained for a smaller throttle opening. Kenlowe Fans are easy to fit without drilling holes in radiator, or any modification to cooling system. They also eliminate fan noise, give greater heater output, and double fan belt life. Guaranteed 12 months. Prices from £16, direct from manufacturer or from garages, service

ROYAL COLLEGE OF ART - LONDON SW7

#### ADVANCED STUDENTSHIPS IN AUTOMOTIVE INDUSTRIAL DESIGN

Two of the major motor vehicle manufacturers in this country are each sponsoring two 2-year advanced studentships in Automotive Industrial Design at the Royal College of Art. Applicants should normally have completed, or be in the final year of a DipAD course in Industrial Design(Engineering), or a post graduate course at the Royal College of Art, or a degree course in Engineering. Particular attention will be paid to evidence of creative styling ability.

The course will commence on 2 October 1972, and will be run on the sandwich course principle, the students spending part of the time with the appropriate motor company. On completion of the course, students will be eligible for the Diploma in Automotive Design and those whose qualifications comply with the College regulations will be eligible for the award of the College Master's Degree (RCA).

Successful applicants for the studentships will be awarded bursaries by the appropriate motor company of £700 pa plus an allowance for the purchase of equipment.

Further particulars and application forms can be obtained from the Registrar, Royal College of Art, Kensington Gore, London SW7 2EU, to whom completed forms should be returned by 28 April 1972.

## NSURANCE

Why pay inflated premiums when we can offer secure cover at low rates? Special attention given to sports car owners, drivers with adverse records and young drivers.

#### LONDON'S MORGAN DISTRIBUTORS

The Stapleton Brothers, in the month of May, are decidedly short of their favourite breakfast cereal. At the moment in the bowl we have the following: 1969 Morgan. +8 finished in red with black trim, mag. wheels and tonneau cover, and we hope that by the time this is published to have a 1970. +8 in blue. A 1970. 4/4 in yellow with wire wheels, black interior, heater and luggage rack. A 1970. 4/4. 4-seater supplied by us from new in really immaculate condition with wire wheels and leather interior. A 1970. 4/4 in flame red, black leather interior. 4-seater. Finished in green, we have a 1967. 4/4 with the 1500 engine. A 1967. +4.4-seater in really dark blue with 72-spoke wire wheels, heater and tonneau. And also a 1969. 4/4 in green with wire wheels, heater and tonneau. A 1954. M.G. TF, recently resprayed but still needs the interior sorting out. Might also have a new 4/4 if the owner doesn't show up shortly but we will have to wait and see. Desperately short of Morgans we appeal to you all to at least give us a ring and hear what fantastic prices we are paying at the moment.

Runway 17" and another one saying "I work for Ford Motor Co so shall require at least 12½% discount", I realise that the shortage of new Morgans is not generally understood. Frankly, chaps, they're like gold dust. You must try and order as far ahead as possible, even though we do try to keep some stock orders in the pipeline. We only promise not to juggle with orders to suit our own dastardly ends, and would be very happy to consult with you. We have some cheap 165-14 Dunlop SP68s, wings and bonnet lid off Arkleyed Midgets, a slightly nibbled Arkley front end (not off a Midgeted Arkley). Must sell my C-Craft inflatable plus Brit. Anzani any time after May 17th, no reasonable . . We require a sports car odd-job man, handy with the polish and rags, must be able to drive. Also a fully skilled mechanic. Open to 7pm, closed Sundays. Sending our man over to the next page to find out what's going on; let you know next month!

## of the future for the engine of today!

#### Now available for the first time in quantity

The modern engine demands higher efficiency from piston rings to cope with the increased speeds of the shorter and lighter pistons now in common use. Coupled with possible bore wear or distortion, the ordinary onepiece ring, having a variable radial pressure pattern around its circumference, may not, under adverse conditions function efficiently.

The new Cordsflex principle produces an oil control ring with a greater degree of conformability by the use of a circumferential abutment expander with suitable lugs positioned at the peak of each convolution (see illustration). These impart an outward radial load to the inner periphery of the 2 semi-inert cupped rails, giving a controlled and even pressure pattern.

The result of this even distribution of radial pressure is a greater sealing effect and an improvement in performance,

together with efficient oil control under extreme conditions.

To ensure efficient life, the expanders are manufactured from a specially selected stainless steel to withstand temperature and corrosion and the cupped rails are chrome plated for long life and to reduce friction to a

Cords Piston Rings are available from a network of stockists and distributors throughout the country. Send 3p stamp today for details of our products and a copy of our new leaflet.

CORDS PISTON RING COMPANY LTD., 75 Scrubs Lane, London, NW10 6RG. Telephone 01-969 7019 Look for this sign and ask for CORDS by name.

## **VINTAGE COACHWORKS**

Coachcraft (Egham)

WE BUILD, RE-TRIM, RE-SPRAY, OVERHAUL & SELL VINTAGE CARS

N'e employ men who have dedicated their life-time efforts to this type of work. This organisation is based on their knowledge . first-hand knowledge that is gotten over 30 years' experience with the choicest Coach Builders . . like James Young . Where the Nitty Gritty of high quality and perfection was hammered cut-now just because you know "A" from "B" does not cut any mustard with us-know how to work and having Craftsmen to work with . . . That's where cur manacement comes in—we have a good share of the work in progress. If you are in the area and need a face lift for your Vintage car—stop in and say hello to the kind of service you always hoped you would find—don't let the distance bother you—we can arrange for inspection and an estimate—on your Door Step.

WE ALSO OPERATE A HIRE-PURCHASE SCHEME AND DEFERRED PAYMENT ON RESTORATION WORK

> 11, Mill Hill Estate, Alton, Hants Tel.: Alton 83672

JACK BOND (of Vintage Autos Ltd. DARES you to spend a weekend or holiday at his Horrible Haunted Historic Coaching Inn (recently featured on BBC TV, Radio Tibet and in

(recently featured on BBC TV, Radio Tibet and in the "Sex for Over 70s" weekly and many old horror movies). It is situated in the glorious Cotswolds, with panoramic views in every direction (not that you will see any, as all the windows have been boarded up to keep out the mice). It must be the most unluxurious hotel in

mice). It must be the most unluxurious hotel in England, the bedrooms have not been decorated since the hotel was built, but we do change the sheets every six months (when available). As the bedrooms are unheated (we can supply Long Johns if required) it is advisable to bring sleepinn bags, and when wet, as the roof leaks, umbrellas and ground sheets. What few staff we have are both as nutty as a fruit cake and usually walk ous every-other week, so do be prepared to clean every-other week, so do be prepared to clean

both as nutry as a truit cake and usually walk ous every-other week, so do be prepared to clean your room (mops and cleaning material supplied). Pornardi, our temperamental 97-year-old trainee chef (late of Alf's Café, Bermondsey), is now thinking of packing the job in to get married and join the cast of 'Oh Calcutta', so be prepared to cook your own food, and we can now supply a primy steer for several property of the cast of the case of the cas

and we can now supply a primus stove for every bedroom. As long as you don't expect 5- or even ½-star hotel comforts, I think you will like it, as have over 7,000 other guests; many return-

ing time and time again. Dress as you like, drink all hight if you wish, get up as late as you like and breakfast in bed at no extra charge, where else

can you get such good value as our package week-end at under a fiver a head, which includes supper Saturday night, bed, breakfast, Sunday lunch and admission to the discotheque. 64.95 single, £9.50 double, bed/breakfast only £2.50

each, Monday/Thursday £2.10. Any guests that are dissatisfied are advised to contact our Complaints Manager (he's stone deaf and can't

read or write).

Come and expect the worst, and you might have a happy surprise. Like many, many satisfied clients have had.

No 1 No 2 No 3 No 4 No 5 No No 6 No 7 No 8 No 9 No 10 No ADDRESS

#### Starting with GCE-how far can you go? This officer was 19 when he joined the RAF. Now, after flying training and 3 years as a co-Pilot, he is captain of a tactical transport aircraft and he's flown all over the world. In a short time, he's gone The RAF is a professional organisation where sheer ability and nothing else can get you to the top. And, if you earn it, progress can be rapid. Judge from the pay: at 20, you could be on £2,110; by 24, as a Flight Lieutenant, it could be £2,895. There are good prospects of promotion to Squadron Leader (£3,617-£4,048) and Wing Commander (£4,567-£4,979). Do you want a humdrum, closed-in, ordinary life? Or will you try for the sort of job where people have to be hand-picked? Could you be an aircrew officer? This is where you start finding out. This coupon will bring you more information, you can either take it to your nearest RAF Careers

Rolls-Royce Bentley

## MIKE R. BERRY

01-235 4613 (office)

Vintage and Sportscar Specialists Restorations and Repairs 01-445 1869 (evenings) 2 Chester Close, Chester Street, London, S.W.I

BENTLEY, 1953, 'R'-type, manual shift with Continental styled 2-door coachwork by Abbott. Finished in sand and sable with tan hide trim, nice example of this

ROLLS-ROYCE, 1958, Silver Cloud I, high-compression engine, power steering. Two owners from new and recorded mileage of only 76,000. Virtually unmarked throughout in suede over sage green with deep velvet green hide trim. Just fully serviced and undoubtedly ready for some superb motoring by the meticulous per-son wanting an outstanding specimen of this series.

ROLLS-ROYCE, 1958, Silver Cloud I, high-compression series with power steering. Virtually a one-owner specimen with extensive Hythe Road history. Painted in sand over sable with natural tan hide trim. Just fully serviced and in excellent all round condition

LANCIA, 1967, Flavia coupé, pretty open 2-door 4-seater sports roadster with economical 1,800-c.c. fuel-injected 4-cylinder engine. Recorded mileage 42,000, two owners. Finished in Arctic ivory with red trim, radio, hard- and soft-tops, Cinturato tyres, wood-rim wheel. Ideal family car ready for luxury open summer motoring.

MATCHLESS, 1925, 1,000-c.c. V-twin, nicely restored. Painted in olive green, new tyres, etc.

MATCHLESS, 1937, 250-c.c. sports single with upswept exhaust, good original order.
VINCENT, 1950, 500-c.c. Comet, engine rebuilt,
excellent all round condition.
SCOTTS. Choice of several. All in restored condition.
ROLLS-ROYCE, 1935, 20/25 4-door close-coupled

sports saloon with very rakish Park Ward coachwork. Very good interior with sound and tidy coachwork. Mechanically quite good although stored for many years.

BENTLEY, 1956, SI Automatic sports saloon, two owners, recorded mileage only 50,000. Exceptional coachwork in silver grey and astral blue with grey hide trim, fully fitted lambswool rugs, tinted screen, full Webasto sun-roof and just fully serviced. A rare opportunity to acquire a magnificent low-mileage example of this popular and economical model.

ROLLS-ROYCE, 1949, Silver Wraith, owner-driver, close-coupled touring saloon with elegantly propor-tioned coachwork by Park Ward, recorded mileage of only 55,000 by two owners; superb duot-tone pearl over storm grey cellulose with impeccable tan hide interior rim, all original tools, radio, etc. Just completely serviced potentially a concours winner in all respects and eminently suitable for the most fastidious perfectionist.

LANCIA, 1956, Appia Series II, 4-door pillarless sports saloon, superbly restored regardless of cost finished in Lancia blue with black trim.

ALWAYS A SELECTION OF SEVERAL VINTAGE AND CLASSIC MOTORCYCLES IN STOCK

HITCHIN 3444

#### C. J. BENDALL LTD. FOR UNUSUAL AUTOMOBILES

HITCHIN 3445

(Left) BENTLEY S Series Continental by Park Ward, 1956, automatic, dark blue with grey interior, indicated mileage approx. 118,000 believed genuine, supplied by us 4 years ago; repainted approx. 2 years ago and has been well maintained and is an excellent specimen. £2,275 (Right) BENTLEY R'-Type, manual change, Oct. 1952, black and golden sand, new clutch just fitted, exhaust and brake overhaul, etc., new tyres, very sound mechanically, present paintwork fairly recent and quite good but there are blemishes, nevertheless altogether an above average car for its year. £790 are blemishes, nevertheless altogether an above average car for its year.

(Left) Remarkable REO Flying Cloud, 4½-litre 6-cylinder f.h.d. sedan, 1928, completely original as to lights, equipment, etc., nicely restored coachwork smoke blue with grey leather interior, all plating renewed etc., mechanically very sound and ready to drive away.

(Right) A more remarkable ROLLS-ROYCE Silver Ghost hearse, 1923 series, with full R.R. f.w.b. equipment, all original lamps, instruments, straight-sided tyres, etc., 1 private owner until 1932 when fitted with present body by Woodall Nicholson; this can truly be called elegant with its claborate etched glass, curved rear doors, interior ornaments, etc., virtually stored since 1938, it would appear to have covered a comparatively low mileage.

ROLLS-ROYCE 20/25 Barker sloping-tail sedanca, GOH Series late 1935, highly original car with a genuine mileage believed to be approx. 100,000 and believed only two owners. In store since 1959, considerable mechanical work done by us and the coachwork renovations including repainting, retrimming where required, replating, etc., are expected to be completed by mid-May. The colour is ivory with black waist-band and the completed price will be approximately

ROLLS-ROYCE 25/30, 1936, in good running order with excellent hearse coachwork highly suitable for conversion to estate or caravan, on good tyres and ready to drive away.

6550

BENTLEY S.1, 1953, automatic, power-steering, sand and sable, serviced by us over

BENTLEY S.1, 1958, automatic, power-steering, sand and sable, serviced by us over past 3 years, in very sound mechanical order and we are doing necessary coachwork renovations. Completed price will be approximately

£1,200
GORDON-KEEBLE, 1965 series, Reg. Nov. 1964, metallic ice-blue, two private owners, 68,000 miles recorded, bills for over £700 in past year including clutch, brake and suspension overhaul; tremendous performance and remarkable condition for its year—may well become a collector's piece in a few years' time and exceptional value for £1,195 (For photograph see last month).

Very rare LANCIA Aurelia Spyder GT, 1956, red with dark red trim, indicated mileage 55,000 and considerable mechanical and coachwork repairs have now been completed; this car is most attractive both to look at and to drive, and is certainly unusual. £675

Very rare motor-cycle—1925 F.N., 4-cylinder unit gear box, chain drive, requires minor

We are offering on behalf of a client, a most exceptional veteran—1906/7 HUMBER 16 h.p. tourer, original paintwork in dark green with yellow stripes which has responded to varnishing, retrimmed in black leather, new tyres. Much work has been done mechanically and the car is believed very sound indeed.

A charming small French veteran, circa 1912, HURTU 1600 c.c., 4-cylinder, nicely restored, completely overhauled engine, rebuilt wheels, new tyres, etc. Royal blue lined yellow and blue trim. Ready to drive away. (For photograph see last month).

We are currently completely rebuilding a very early (1912) Model-T FORD with the early 4-seater 2-door touring body. Completion in approximately two months. Colour and trim at this stage could be to a customer's choice,

Immediate Hire Purchase and Insurance facilities can be arranged.

All types of part-exchange considered.

PAYNES PARK, HITCHIN, HERTFORDSHIRE

#### DAVID SCOTT-MONCRIEFF & SON LTD.

Purveyors of Horseless Carriages to the Nobility and Gentry since 1927

1929 PHANTOM II, chassis No. 33XJ. These very early models are extremely rare. Fitted with immense and most elegant eight-passenger coachwork. This car is mechanically excellent and has just had its rear compartment trimmed throughout in finest Bedford Cord. It has spent most of its life in store in Holland, and during the German occupation is reputed to have been bricked up like

Choice of two ROLLS-ROYCE Cloud I. A 1956 model in velvet green with deep green leather upholstery and matching carpets. Almost unmarked, £1,675. A 1957 model with power-assisted steering, red. red hide trim. Equally sparkling condition. £1,775.

1940 WRAITH. This is no ordinary tired-out hire car, but a privately owned car which has just had large sums spent on it for a promotional project. Owing to a change of plans, we have been able to buy this very reasonably and can offer it, resplendent in plum and black with rear compartment newly upholstered in plum velvet, for only £1.475.

"R"-Type BENTLEY, choice of three very good standard steel saloons. Manual and Automatic gearboxes. Finished in regal red. saloons. Manual and Automatic gearboxes. navy blue and black. Prices £645 to £795.

WE HAVE SEVERAL SPARE SECONDHAND PARTS FOR BOTH PRE-WAR AND POST-WAR ROLLS-ROYCE AND BENTLEYS

We urgently require all models of Rolls-Royce and Bentleys from 1910 to 1965 13-15 HOLBEIN PLACE, SLOANE SQUARE, LONDON, S.W.I

## Summer's coming. Your engine is in for more than the usual thrashing. Give your oil the strength to take it-add STP.

Spring and summer motoring are really tough on your engine and your oil. Trips to the coast, traffic jams, long hot runs, summer dust and dirt - oil becomes acid, gummy. Give it the strength to cope, add STP Oil Treatment when you change your worn out winter oil, or next time you top up.

How STP Oil Treatment works.

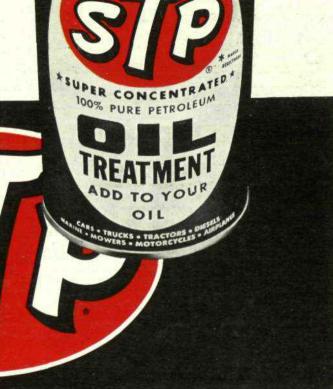

STP Oil Treatment is a special petroleum polymer that makes your oil slipperier, tougher. So it clings better in spite of punishing pressures and temperatures - reduces friction, releasing more power.

For new or old cars. STP Oil Treatment keeps new cars in peak condition, especially during the

first 2,000 miles when wear is greatest. Older cars can be powerfully restored as friction is reduced, ring seal and compression improved. STP Oil Treatment mixes with any petroleum based oil, is safe for any car.

Money back guarantee. "I guarantee you'll be satisfied or your money back without question" promises Andy Granatelli, President of the STP Corporation. Ask for STP at Halfords, your garage or local accessory shop. For more information write to Link Hampson Limited (STP Division) Monotype House, 43 Fetter Lane, London EC4A 1BD.

The racer's edge.

# Fast & Furious Slow and easy...

## You'll be better off with Michelin radials

Think of all the different kinds of roads there are. Everything from M-ways to cart-tracks.

Think of all the different kinds of car there are. Sports, saloons, G.T.'s, estates.

Think of all the different kinds of drivers there are. And different kinds of driving.

Think about weather. How it changes from day to day, how it can change from minute to minute.

Put all that together and you've

got several pretty good reasons for fitting Michelin radials.

The need for sure, safe grip on all roads, in all conditions.

The need for wet-weather cornering power and crisp, responsive braking.

The need for tough tyres that can take the rough with the smooth and more than adequately cope.

We purpose build our radials to do all that and give you real performance value for money into the bargain.

Like we said, you'll be better off on Michelin radials.

In more ways than one.

For further information on Michelin radials – the ZX, the XAS, XVR and XM+S write to: Technical Information, Michelin Tyre Co. Ltd., 81 Fulham Road, London SW3 6RD.
