OWNER'S MANUAL

FEATURES AND BENEFITS

On-Board Computer
Displays time, speed, distance, RPMs, workload, calories/hour, calories, heart rate, level.

Synchronized Arms
For a total body workout.

Foot Platform
Moves along with your natural foot motion.

Heavy Duty Construction
Institutional-quality construction stands up to the most intense workout environment.

Transport Wheels
Built-in transport wheels allow a single individual to easily move and position the bike across any flat surface.

Frame Stabilizers
Oversize frame stabilizers for added stability.

Belt Drive
For a smooth quiet ride.
Electromagnetic Braking
Contact-free resistance braking provides fast, fluid adjustability and long-lasting, reliable performance.

FEATURES

INTRODUCTION

CONGRATULATIONS!

Thank you for making the Schwinn 418/ 428p elliptical trainer a part of your exercise program. For many years to come, you will be able to rely on the quality of Schwinn's craftsmanship and durability. We have included some general fitness guidelines for your use and hope you will find the information valuable in assisting you in your pursuit of a healthy lifestyle.

The 418/ 428p elliptical trainer will enable you to customize and monitor your workouts to:

- ▲ **Increase your energy level**
- ▲ **Increase cardiovascular and aerobic fitness**
- ▲ **Increase lower and upper body muscle strength**
- ▼ **Decrease your overall percentage of body fat**

Whether you are just getting started in an exercise program or are already physically fit, the 418/ 428p is designed to be an efficient, easy and enjoyable way to achieve an improved level of fitness. You can exercise your way to a more fit and healthy body. The on-board digital computer enables you to accurately monitor your progress by tracking time, distance, speed, calories, and strides per minute.

This Owner's Manual contains all the information you need to operate and enjoy your 418/ 428p elliptical trainer. Please read the manual in its entirety before attempting to exercise on the 418/ 428p. Let's get started.

FITNESS SAFEGUARDS

Before starting any exercise program, consult with your physician or health professional. He or she can help establish the exercise frequency, intensity (target heart rate zone) and time appropriate for your particular age and condition. If you have any pain or tightness in your chest, an irregular heartbeat, shortness of breath, feel faint or have any discomfort while you exercise, STOP! Consult your physician before continuing.

OPERATION

HOW TO USE THE 418/ 428p ELLIPTICAL TRAINER

To start using the Schwinn elliptical simply stand on the foot pedals with the front of your shoes close to the front edge of the foot platform. Place your hands at a comfortable position on the upper body arms. Simply move your highest foot forward and follow the natural path of the machine.

Start on a level that is comfortable to familiarize yourself with the machine. Once you are comfortable start adjusting the level to achieve the workout desired.

■ Full Body/Lower Body

The Schwinn elliptical machine can either be used as a complete body workout or lower body only. If you choose not to use your arms, place them on the stationary handles in front of you. Remember the more muscles you use the more calories you burn.

■ Forward/Reverse

The 418/ 428p can be used in the forward and reverse direction to vary the muscles that you work out. This will also vary your workout helping you to stay motivated. To change directions, simply slow the pedals down until they stop and switch directions.

■ Resistance Control

The 418/ 428p resistance level can be changed at any time during your workout. Adjusting your level will allow you to increase or decrease your intensity level. The resistance is controlled with the console.

4.1.8 FUNCTIONS/FEATURES

Button Functions

START / Pause	Starts workout session, Pause temporarily pause the workout. While In Pause, the resistance is decreased.
ENTER	Used to enter Information, such as setting the Time, or choosing a program.
UP +	Adjusts data up
DOWN -	Adjusts data down
MODE	Changes the Display between CALORIES or WATTS and SPEED or RPM
Note:	To Reset the console, press and hold the Start / Pause button

Display Description:

SPEED	Displays the estimated current speed (miles / hour)
RPM	Displays the current pedal RPM (revolutions per minute)
TIME	Displays the workout time.
DISTANCE	Displays the estimated distance traveled.
WATTS / Workload	Displays the current power that the user is producing
CALORIES:	Displays the estimated Calories the user has burned during the exercise.
PULSE	Displays the users current heart rate (beats per minute.)

Operating Instructions for Console

Getting Started:

To turn on the computer either press any button or start pedaling.
Note: to "reset" the console at any time, press and hold the START / PAUSE key.

Quick Start:

By simply pressing the Start button, you can begin pedaling in the MANUAL program.

Resistance Control:

At any time during a workout you can control the resistance of the bike by using the UP and DOWN arrow buttons. You can increase the resistance by pressing the "+" or "-" buttons.

4.1.8 FUNCTIONS/FEATURES

Selecting a Profile Program:

Programs 2 - 12 are individually designed to provide a variety of workout options. Once the console is on, use the "+" or "-" buttons to select a program. You will be prompted to set ("+" "-" ") and enter (ENTER button) TIME. Now press START to begin the program. Once you are in the program, you can adjust the resistance level at any time by pressing the "+" or "-" buttons.

Heart Rate Control Programs (P11, and P12):

These programs will automatically adjust the resistance to bring your Heart Rate into a target zone. The target heart rate zone for P11 is 60% of your predicted maximum heart based on your age. This program is well suited for burning fat Calories. Recovery training (to be done the day after a particularly strenuous workout.) or training for those that are in the early stages of a long term workout program.

The target heart rate zone for P12 is 85% of your predicted maximum heart rate. This program is suited for strengthening of the cardiovascular system, or burning a maximum amount of calories in a shorter period.

Fitness Test (P6):

This test can be used as protocol for a "power increment" test in which one would be trying to determine their Lactate, or Anaerobic Threshold Heart Rate. Since this is a maximum effort test, it is recommended that this test be administered under the supervision of a qualified Sports Medicine Physiologist.

FITNESS SAFEGUARDS

- Failure to follow any of these safeguards may result in injury or serious health problems:
- Do not place fingers or any other objects into moving parts of the exercise equipment.
 - Keep children and pets away from the 418/428 elliptical while machine is in use. A child's curiosity may result in injury. Do not allow children to use the elliptical. The pedal travel ranges are designed and intended for adults, not children.
 - Never turn pedal crank arms by hand. To avoid entanglement and possible injury, do not expose hands or arms to the drive mechanism.
 - Do not dismount the elliptical until the pedals are at a complete STOP.
 - Warn bystanders to keep a safe distance. Do not allow anyone to touch the elliptical while it is in motion.
 - Setup and operate on solid level surface
 - Replace or tighten any worn or loose components before using
 - Do not wear loose or dangling clothing while exercising
 - Care should be taken when mounting and dismounting

USING THE 428P COMPUTER

FIG.3

■ **Using the 428p Computer**
 For added workout variety, the on-board computer features a selection of 5 preprograms as well as a manual mode program. The manual mode program can be easily accessed via pressing the Start button twice. (Fig.3)
 All other workout programs require you to input data. The computer also features multi-feedback functions and easy-to-read LED displays to keep track of your workout performance and progress. By taking a few moments to fully understand the computer operation and functions, you will get more pleasure, motivation and value from your 428p elliptical workouts. It's really very easy.

■ **Accessing the Computer Workout Programs**
 You have two options of accessing programs: 1. Utilize the "Quick Start" feature or 2. Program the computer by entering specific data as explained below.

■ **Quick Start**
 To utilize the Quick Start feature on the computer, simply begin pedaling. Press the "ENTER/START" button twice and the computer will begin immediately. The default setting for the quick start program is a manual program with a resistance level of three. You can easily change the resistance of three. Press "Reset" then "Enter/Start" while all lights are on. You can easily change the resistance level at any time by pushing the UP or DOWN buttons.

OPERATION

PROGRAMMING THE 428P COMPUTER

■ Programming the Computer

To activate the computer, plug your 428p into a 110V wall outlet. Then simply begin pedaling to turn your elliptical on.

You may choose between English and metric readings. (Press RESET; while in reset and all LED's are showing) Press + and - together and it will read english or metric. Use the + or - keys to choose English or metric using the ENTER key to confirm and save.

The quickest way to start a workout is to press the start button twice and the computer will start in a manual mode. In this mode the computer will count up and give you your results after you stop pedaling.

■ Selecting a program and entering user information

1. Select a PROGRAM by using the UP and DOWN arrow keys to scroll through the programs. The LED light beside the program names will light as you scroll to inform you of your selection. Press the START/ENTER button to select the program.
2. Enter your WEIGHT by using the UP and DOWN keys to reach the desired setting and press enter.
3. Select the LEVEL of the workout with the UP and DOWN keys and press Enter.
4. Enter the workout TIME with the UP and DOWN keys and press enter.
5. In HRC you must enter your TARGET HEART RATE. The computer will prompt you with a calculated estimate. You can adjust this target heart rate with the up and down arrow keys then press enter.

After entering all of the information simply keep pedaling to start the workout. At any time during the workout you can change the intensity using the up and down arrows to change the level.

■ Result mode

Either at the completion of the entered time or when you stop pedaling, the computer will go into a results mode. This mode will scroll through your workout average load, calories per hour, heart rate, speed, rpm, total calories, time and distance. If you are not finished with your workout simply start pedaling again and the workout will pick up where you left off.

PROGRAMMING THE 428P COMPUTER

Interval, Hills, Random, Summit Programs: These programs provide a continuously changing level of effort throughout the defined program time. These programs can add variety to your workout and can help you achieve a higher level of fitness by elevating your heart rate during specific intervals.

Heart Rate Control (HRC): This program is designed to provide enough resistance to keep your heart rate in the 65% range based on the average maximum heart rate of a person your age. Note that this program only functions when a telemetric heart rate chest strap is used properly.

FIG.4 ■ Other features of the 428p Computer

The bike computer keeps track of a variety of feedback functions. When a particular FUNCTION LED is on, that function readout will appear in the corresponding window.

■ Function window 1 (Fig. 4)

Load - The load feedback function keeps track of the approximate power required to pedal the machine. To change to the next function press the scan button.

Calories - The calories feedback function displays the approximate number of calories burned during your workout. To change to the next function press the scan button.

Cal/hour - The calorie per hour feedback function displays the approximate number of calories burned per hour of exercise at the given level. To change to the next function press the scan button.

Scan - The scan function will continuously rotate through the above feedback functions.

■ Function window 2 (Fig. 5)

Heart rate - If you are using a chest strap transmitter, the heart rate feedback function continuously displays your working heart rate in beats per minute. To change to the next function press the scan button.

Level - Displays the current level of resistance or program level. If the heart rate is being used the level will display for 3 seconds when changed and then return to the heart rate display.

FIG.5

USING THE 428P COMPUTER

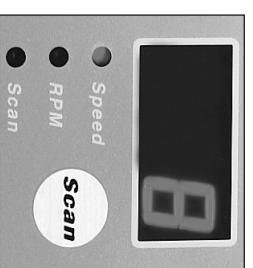

FIG. 6 ■ Function window 3 (Fig. 6)

Speed – the speed feedback function keeps track of your approximate mile per hour rate. To change to the next function press the scan button.

RPM – The rpm feedback function keeps track of your pedal speed in revolutions per minute. To change to the next function press the scan button.

Scan – The scan function will continuously rotate through the above feedback functions

FIG. 7 ■ Function window 4 (Fig. 7)

Time – If a workout time is entered the remaining time of your workout will be displayed. If there is no time entered the workout time will be displayed. To change to the next function press the scan button.

Distance – The distance feedback function keeps track of the approximate miles you've covered in your workout. To change to the next function press the scan button.

Scan – The scan function will continuously rotate the above feedback functions

USING THE 428P COMPUTER

■ Optional Wireless Heart Rate Monitoring

Achieving your personal fitness goals with the least effort and in the shortest amount of time, is best accomplished using positive feedback. Whether your goal is athletic performance, weight loss or good health, maximum benefits may be achieved when a heart rate monitoring system is used to control your exercise intensity to within predetermined heart rate goals. Schwinn heart rate monitors connect your body to your mind by accurately measuring and transmitting heart rate information from a lightweight chest strap transmitter to the display on the 428p computer console. By using the display readout along with the heart rate chart, you will then know whether to increase or decrease your exercise intensity to achieve maximum benefits from each workout. Important: Consult a physician regarding an appropriate target heart rate zone for your age and physical condition.

■ Using A Chest Strap Transmitter

The 428p elliptical computer has built-in wireless heart rate monitoring capability. When you wear a chest strap transmitter during your workout, the computer's heart rate display will continuously read your heart rate in beats per minute. HINT: For most effective transmission, wet the back of the chest strap (the side making contact with the skin) before putting it on.

OPERATION

MAINTENANCE OF YOUR SCHWINN ELLIPTICAL TRAINER

■ Moving your Schwinn elliptical trainer

To move the Schwinn elliptical trainer, carefully lift the rear end of the machine. Steer the machine to the desired location. Be gentle while moving the unit as any sharp impact directly or indirectly to the computer can affect computer operation. (Fig. 8)

■ Leveling your Schwinn elliptical trainer

The elliptical trainer can be leveled to compensate for uneven surfaces. To level the 418/428p, raise or lower the two leveling bolts located on the underside of the rear stabilizer by screwing them in or out as needed. (Fig. 9)

■ Maintenance

Use a damp cloth to wipe your Schwinn elliptical trainer and computer free of sweat. Avoid getting extra moisture on the computer. By keeping the computer face free of sweat, you can ensure a longer computer life.

IMPORTANT: To avoid damaging the finish on your Schwinn elliptical trainer and computer, never use a petroleum-based solvent when cleaning.

SCHWINN EXERCISE EQUIPMENT MANUAL

Edmund R. Burke, Ph.D.

■ Getting the Most Out of Your Home Fitness Program

The three main reasons for the increased popularity of home fitness gyms and exercise are convenience, convenience and convenience. For any fitness program to be successful, it must be done on a regular, sustained basis. With equipment in your home, you can roll out of bed, put on a pair of sweats, and start working out while the coffee is brewing.

For many, home workouts are easier to fit into their hectic schedules. No getting in the car and having to go to the health club. No standing in line to use the stair climber. Then there is the comfort and safety factor. Who wants to run outdoors during a raging blizzard. Or, who wants to ride a bike on busy city streets during rush hour in the heat of summer. It's much more comfortable to hop on your Schwinn home fitness equipment and exercise in the comfort and security of your air-conditioned room.

Privacy and cleanliness are also important. Many feel intimidated in a gym, especially if they are carrying around a few extra pounds. At home you can exercise without feeling as if you are being rushed or that anyone is looking at you. No more lying down on a sweaty bench or wondering if you'll catch athlete's foot in the shower.

Flexibility of time may be the biggest advantage. Work schedules vary for many people who work flex shifts or have a family that has different schedules. Parents with children soon discover that exercising at home turns out to be the only viable alternative if they want to stay fit. But parents and busy workers may not be the only ones who benefit from exercising at home.

■ The Stanford Home Exercise Study

Recently, researchers at Stanford University School of Medicine, conducted a year long study of over 350 individuals to examine the effectiveness and compliance of a group of supervised home exercisers versus a group of

individuals who reported for a group session at the university. The subject population included middle aged men and women and included fit individuals as well as individuals who were overweight and smoked.

Individuals in both the high intensity (three 40-minute sessions per week on the treadmill at a 73 to 88 percent of max heart rate) and low intensity group (five 30-minute sessions at 60-71 percent of max heart rate) reported significantly greater adherence than those in the university group based program.

Many at the beginning of the study thought that the university based group would have a greater compliance rate than the home based group, because of the camaraderie of the group and the instruction given by the instructors. But the study found the opposite to be true. The group program was just too inconvenient over the 12 month period for the subjects to justify the benefits.

But the good news was that all three groups showed fitness improvements. With the individuals in the low intensity group achieving similar results as the high intensity group. Good news for those of you just starting out in a moderate exercise program.

Perhaps most importantly, research has also shown that it's never too late to start exercising... and experiencing the benefits. Studies conducted at Tufts University, for instance, show that even people in their 90's can significantly increase their strength as a result of following a moderate, strength training program.

Exercise is one of life's joys. It energizes—it gives you a sense of well-being and accomplishment and it keeps you healthy and fit. There is great pleasure in being able to set goals, accept your own challenges and push yourself to a better life of health and fitness.

Once you have made the commitment to get started in a home fitness program, here are some suggestions that you may want consider to help you

GUIDELINES

GUIDELINES

get off on the right foot and stay motivated. Realize that any new habit is difficult to establish at first, but it can be done. Follow these steps and you'll be on your way to establishing and using your home fitness center for improved health and fitness. Enjoy the journey!

✓ **Get a physical exam.** If you have been inactive for several years or new to an exercise program, be sure to consult with your family physician. Especially if you're over 35, have health problems or have a history of heart disease in your family.

✓ **Begin planning for your home fitness center.** Set aside a portion of a room in your house or apartment that is exclusively for fitness, and make sure that it is as comfortable as possible so you'll enjoy using it. If you like music or like to look outside while exercising, make sure these things are accessible. Do not force yourself to exercise in a part of the house that isn't comfortable, you will not feel motivated to exercise.

✓ **Do you need a companion?** If you prefer to exercise with someone, find a friend to train with who lives nearby. Encouraging your spouse or children to exercise with you is an excellent way to stay motivated and promote family unity.

✓ **Make fitness a part of your daily lifestyle.** Include it in your daily planner just as you would any other appointment. Keep the appointment; you'll be glad you did.

✓ **Use affirmations.** Affirmations will help you program your subconscious to accept new beliefs. They should be positive statements. "I am living a healthier lifestyle by exercising several times per week at home." Repeat your affirmations several times per week.

Over the last 25 years, ever since the introduction of Dr. Kenneth Cooper's book, *Aerobics*, many individuals have focused on walking, running, cycling, swimming, and other types of aerobic activity as their only means of exercise.

Unfortunately, this has led to many of these same people neglecting other key components of fitness, such as strength training, flexibility and body composition. Many of us lack the strength to carry a full back of groceries, or the flexibility to pick up our shoes without bending at the knees. In addition, as we have aged, we have replaced muscle tissue with fat tissue.

Continued work by Dr. Cooper at the Institute of Aerobics Research, is showing that in addition to the need to stress our cardiovascular system, that more attention needs to be placed on building stronger muscles and increasing joint flexibility. They are talking about the benefits of balanced fitness: regular physical activity that includes strength training and flexibility (stretching) in addition to aerobic conditioning.

For many years, "fitness" has been solely a measure of cardiovascular (aerobic) endurance. And, while aerobic fitness is the cornerstone for health and quality of life, there are two other components that are nearly as important. When developing your home fitness program it is only appropriate that you develop all three components in order to achieve balanced fitness, and thus optimal health and quality of life. The three components are:

— Muscle strength

— Cardiovascular fitness

— Flexibility

■ Balance Fitness

Many people considering beginning a balanced home fitness program still think "no pain, no gain." They usually think they have to cycle or lift weights until they are over-tired and their body aches. This idea of fitness is outdated. What they don't realize is that in a short time using proper guidelines, the initial tiredness or soreness will be replaced by increased energy for work and recreation and an increased sense of well-being.

Since 1978, the American College of Sports Medicine (ACSM) has had an influence on the medical and scientific communities with its position statement on "The Recommended Quantity and Quality of Exercise for Developing and Maintaining Fitness in Healthy Adults." For the first time since 1978 the ACSM has revised its recommendations on exercise for healthy adults. The new paper published in 1991 expands and revises advice on cardiovascular fitness and body composition, and now recommends that you add resistance training. This is new information to those of us who have only cycled, ran, swam, watched our body weight and controlled our diet to attempt to maintain fitness.

Balanced fitness can do more to ensure a long, healthy life than just about anything else known to the medical community today. It's never too late to start a fitness program but ideally, you should build strong muscles, flexibility and a strong cardiovascular system early in life and enter the later years with your physical potential at its maximum.

GUIDELINES

■ Muscular Strength

The new guidelines have added resistance training since the ACSM recognizes the increasing importance of maintaining strength as a health benefit as we get older. The rationale for the addition of strength training to the guidelines is a result of a ten year follow-up study on master runners (along with other studies). Those who continued to train aerobically without upper body exercise maintained their body's oxygen transporting capacity over the years, but lost about 4.5 pounds of lean body mass; those who included strength training in their program maintained their lean body mass along with their aerobic capacity after 10 years of aging.

The guidelines also show where consistent resistance training helps maintain bone and muscle mass as we get older. For women, strength training (along with the aerobic work) may also protect against post-menopausal bone loss and osteoporosis in their later years.

The guidelines recommend that two strength training sessions per week should be added to your workout schedule. We recommend three sessions a week during the off-season and two sessions a week for maintenance during the in-season. The new ACSM guidelines recommend one set of eight to 12 repetitions of eight to 10 strength exercises of your major muscle groups per session as the minimum requirement. A complete detailed strength training program will be outlined in a later section of this book. If weights or other resistance training devices are not available, add calisthenics to your program.

■ Cardiovascular Fitness

The new statement, published in 1991, repeats the four recommendations on duration, intensity, frequency and various modes of aerobic activity, with slight changes. The duration is now 20 to 60 minutes, versus a minimum of 15 minutes in the past.

Intensity of exercise can be determined by two methods. The first is the familiar use of target heart rate. The guidelines state that you should aim to work at 60 to 85 percent of your maximum heart rate (max HR = 220 - your age) or 50 to 85 percent of your maximal oxygen capacity (determined by doing a stress test on a bicycle ergometer or treadmill at a medical facility).

Duration is dependent upon the intensity of the activity; for those who like to work at a lower intensity they should work out longer. Low to moderate intensity cycling, stepping, walking, or cross-country skiing is best for most adults, because higher intensity workouts can lead to increased risk of injury and it is easier to adhere to the exercise routine. Beginners can achieve a significant training effect from low intensity workouts. If you're already fit and want to improve, gradually increase your intensity.

The type of activity, once again, should include anything that uses large muscle groups, and is rhythmic and aerobic in nature, such as cycling or running. Other activities could include stair climbing, cross-country skiing, walking, etc. These activities need to be carried out three to five days per week.

■ Training Effect

Duration, intensity and frequency of training stimulate the aerobic training effect. Any training done below the ACSM guidelines will not be sufficient enough to give you the aerobic training effect. If you are exercising more than the recommendations, it will not significantly increase the aerobic training effect, though athletes training for competition need to exercise more to be competitive. It is important to remember not to over do it; your body needs adequate recovery from a hard workout.

In general, endurance training for fewer than two days per week at less than 60 percent of maximal heart rate, for fewer than 20 minutes per day, and without a well-rounded resistance and flexibility program is inadequate for developing and maintaining fitness in healthy adults. It is just that simple.

IDENTIFYING YOUR BALANCED FITNESS GOALS

Keep in mind that the ACSM recommendations are guidelines for the average person, not a champion athlete training for the Olympic Games. An appropriate warm-up and cool-down, which would also include flexibility exercises, is also recommended. While many of you will need to train with more mileage and at a greater intensity to race competitively, the important factor to remember for most people is that if they follow the ACSM guidelines of physical activity they will attain increased physical and health benefits at the lowest risk. Below is a table outlining the guidelines (Table 1-1).

The ACSM guidelines, if followed, can result in permanent lifestyle changes for most individuals. The good news is that, with the right approach, exercising at home can and should be pleasant. You can combine strength training, aerobic exercise and flexibility activities that you enjoy and gain valuable health benefits.

Strength Training	Aerobic Exercise	Stretching
Frequency	2 to 3 times/week	3 to 5 times/week
Intensity	8-12 reps	60-90% of "easy"
		feeling until fatigue
Stretch Time	20-40 minutes	10 minutes
Type	10 exercises	20-60 minutes
		any rhythmic activity
		10 stretches

■ Flexibility

To be in total balance it is important to be flexible. While not part of the ACSM guidelines, flexibility is important for you to perform tasks that require reaching, twisting and turning your body. Hip flexibility, for example, is important to preventing lower back pain.

■ Exercise and Body Composition

Body composition is an important component of health-related fitness. Good body composition results from aerobic activity, strength training and proper diet.

Your everyday caloric balance will determine whether you will gain or lose weight from day-to-day. Caloric balance refers to the difference between the calories you take in from food eaten and caloric expenditure or the amount of energy you put out in daily activities, work or exercise.

Body weight is lost when caloric expenditure exceeds caloric intake or when caloric intake is less than caloric expenditure. It is a known physiological fact that one pound of fat is equal to 3500 calories of energy. Though it is predictable that shifts in caloric balance will be accompanied by changes in body weight, how your body loses weight varies on the various programs you may undertake to lose weight. For example, low calorie diets cause a substantial loss of water and lean body tissue, such as muscle. In contrast, an exercise-induced negative caloric balance results in a weight loss of primarily fat stores. If you were to add a resistant training component to your program, you may also see a slight increase in weight due to a gain in muscle mass, while an aerobic based program usually results in a maintenance of muscle mass. While both approaches to weight loss are effective, aerobic activity

is found to be very effective because metabolism stays sustained for longer periods of time and energy. Expenditure is greater with activities that use large muscle groups such as walking, cycling, cross-country skiing, etc.

Follow these guidelines when engaging in a weight loss program that combines exercise and caloric restriction:

- Ensure that you are consuming at least 1,200 calories per day in a balanced diet. You need to consume calories for everyday bodily, healthy functions.
- You should not exceed more than a 500 to 1,000 calories per day negative caloric balance, combining both caloric restriction and exercise. This will result in a gradual weight loss, without a loss of lean body weight (muscle). You should not lose more than 2 pounds per week on a diet.

IDENTIFYING YOUR BALANCED FITNESS GOALS

- Include an exercise program that provides at least 300 calories or more of activity per day. This is best accomplished with exercise of low intensity and long duration. Many pieces of home fitness equipment give estimates of calories burned while exercising. Remember these are approximate calories burned, exact amounts will depend on type of exercise, your body size, intensity and duration.
- Add resistance training to your program to add muscle mass. Muscle cells are more active than fat cells and will help you burn more calories per day.
- Include use of behavior modification techniques to identify and eliminate bad diet and eating habits.

You should strive to burn between 300 to 500 calories per exercise session and 1000 to 2000 calories per week in exercise. Remember that sustained aerobic activities that use large muscle group will cause the greatest energy expenditure.

If overweight or obese, you may want to keep the intensity even lower than 60 percent of maximum heart rate to keep the risk of orthopedic injuries at a minimum. Nonweight-bearing activities such as stationary cycling may be considered for this group, or for those who suffer from orthopedic or arthritis problems.

■ A Balanced Workout

All of your balanced home workouts should include three parts:

- Warm-up
- The main aerobic and/or strength routine
- Cool-down

Together, exercise and recovery comprise fitness conditioning: deny either and you invite injury and minimize benefits. Our bodies and minds become stronger and more efficient in response to their use and exercise. Overuse and overload will cause breakdown. You don't want too much, but just enough.

The secret is to know when you are pushing too much or too little. Monitoring your heart rate tells you how much to exercise and when to rest.

■ Warm-up

A good warm-up will help you perform better and will decrease the aches and pains most people experience. The warm-up prepares your muscles for exercise and allows your oxygen supply to ready itself for what's to come. Studies show that muscles perform best when they're warmer than normal body temperatures. Warm-up exercises include cycling, walking, skiing slowly until you begin to break a light sweat. This normally takes about 5 to 10 minutes. If using a heart rate monitor, raise your heart rate to about 110 to 120 beats per minute during your warm-up.

Stretching before and after exercise also serves many purposes. By promoting flexibility, it decreases the risk of injury and soreness. It also enhances physical performance by allowing you to maintain a comfortable position on the bicycle longer. Take a few minutes to stretch your legs, shoulders and lower back before you get on your home equipment.

■ Aerobic/Strength Exercise

Vigorous aerobic exercise is the core of your workout program. The intensity of your exercise must be strenuous enough to raise your heart rate into your target zone. This is usually between 60 and 90% of your maximum heart rate. Cycling, or any exercise done in this range, is usually called aerobic exercise. It means your body, your heart, and the various exercising muscles are working at a level at which oxygen can be utilized. Exercising with a heart rate monitor allows you to constantly receive visible feedback (and on some

models audible feedback) as to what your heart rate is while exercising, and allows you to stay within your selected target heart rate zone.

In addition to aerobic exercise, the ACSM recommends that healthy adults perform a minimum of 8 to 10 strength exercises involving the major muscle groups a minimum of two times per week. At least one set of 8 to 12 repetitions to near-fatigue should be completed during each session. These recommendations are based on two factors:

- Most people aren't likely to adhere to workout sessions that last more than 60 minutes. The regimen outlined above can be completed in 30 minutes or less, and when combined with 30 minutes of aerobic activity and flexibility gives you a balanced workout.
- While more frequent and intense training is likely to build greater strength, the difference is usually very small.

■ Cool-Down

The cool-down enables your body's cardiovascular system to gradually return to normal, preferably over a 5 to 10 minute period. Bringing your workout to an abrupt halt can cause light-headedness, since blood will pool in your legs if you abruptly stop working. Lower your exercise intensity gradually over a period of a few minutes. When your heart rate has returned to below 110 beats per minute you can stop exercising on whatever piece of equipment you are on.

Always keep in mind that warm-up and cool-down are just as important as the activity phase. Both can prevent many common injuries from occurring.

■ How To Determine Your Maximum Heart Rate

The best way to determine your maximal heart rate is to calculate your target heart rate zones. Simply record your heart rate several times when you are putting out a maximal effort, such as when you are going all out on a stationary bicycle, or during a hard session of stair climbing.

The easiest option is to estimate your maximum heart rate based on a formula which has been well-established for reliability: take the number 220, and subtract your age. For example, a 45 year old would have an estimated maximum heart rate of 175 (220 - 45 = 175). The target heart rate zone for aerobic training would be 105 to 149 beats per minute (60 to 80 percent of the maximum).

■ Target Heart Rate Training Zones

There are three primary heart rate training zones. The first is often referred to as the "fat burning zone". Because the intensity is moderate enough to require your body to primarily use fat as the fuel source for the exercise, you should exercise at 50 to 65 % of your maximal heart rate to achieve this level of intensity. While you workout in this and the other zones, your heart rate should fall somewhere between these two figures. People just starting out on an exercise program or who want to lose weight should concentrate on maintaining their heart rate in this zone for 20 to 30 minutes per day, 3 to 5 days per week.

The second zone discussed above is known as the "aerobic exercise zone" or is shown on many charts as the "target heart rate zone." In this zone you should exercise at 60 to 85% of your maximal heart rate. Training in this zone helps you build aerobic endurance and constructs a base upon which you can progressively add more demanding workouts as your cardiovascular fitness increases.

A higher level of training can help increase both your speed and tolerance for the buildup of lactic acid, the primary waste product of anaerobic metabolism in your muscles. This type of workout from 85 to 100% of maximum heart rate usually consists of short, hard sprints or repeated hill running and is referred to as "anaerobic training."

GUIDELINES

TABLE 1 EXERCISE FITNESS GUIDELINES

Varied training in all three of these zones will add to increased levels of fitness and improved performance and add more energy to your life. "Most training programs use a combination of training intensities to increase performance capacity," according to J. I. Keadney, Ph.D., Senior Exercise Physiologist at the U. S. Olympic Training Center in Colorado Springs. Keadney suggests that it is important for individuals to monitor intensity. "There are many different ways to monitor training but monitoring heart rate response is the simplest, most convenient and least expensive physiological method for monitoring training," Keadney says.

■ **Predicted Target Heart Rate Zones for Different Ages**

Age	Maximum Predicted Heart Rate	Aerobic Target Zone: 60-85 %
20	200	120-170
25	195	117-166
30	190	114-162
35	185	111-157
40	180	108-153
45	175	105-149
50	170	102-145
55	165	99-140
60	160	96-136

After several weeks of "aerobic conditioning," certain changes become apparent. What was a barely attainable level of exercise before, now becomes quite easy. Whereas cycling or running at a certain pace or speed may have previously caused your heart rate to go up to 135 beats per minute, that pace can now be achieved at a lower heart rate. In short, your heart is becoming stronger, larger and more efficient, and your body is able to do the same work with less strain.

Regardless of your maximum average heart rate or your target heart rate, you should consult with your physician or with a sports medical expert to establish, with precision, the rates that are right for you, your age and your medical and physical condition. This is especially important if you are over the age of 35, been sedentary for several years, overweight or have a history of heart disease in your family.

■ **Beating The Dropout Odds: Jump Start Your Fitness Program**

You already know you need to exercise. And you're probably trying – at least a little. But let's get serious: If you don't add regular exercise to your life, you're missing out on a sure bet. This is one area where medical research all points in the same direction.

"Starting to exercise is comparable, from a health benefit standpoint, to quitting smoking," says the recently released Surgeon's General Report on Physical Activity and Health.

■ **To sum up the recent report:**

- Regular physical activity offers substantial improvements in health and well-being for the majority of Americans.
- If you exercise regularly, the reports show, you'll reduce your risk of heart attack, cancer, diabetes, high blood pressure, osteoporosis, and even the common cold.
- Regular exercise, regardless of the intensity, can help you control stress, sleep problems, and depression.

But even with all this evidence, only 22 percent of Americans engage in exercise for 20 minutes a day. And even among individuals who begin exercise programs, the dropout rate is about 50 percent. So if the Surgeon

General's findings are not convincing evidence enough to keep most us exercising on a consistent basis, what is?

Scientists are finding that the process of beginning, increasing and ultimately sticking to an exercise program is a combination of two elements: finding the right incentives and building a habit. And, as we will see, these two motivational factors are connected, but distinct.

Focusing on the positive is one of the best incentives to exercise. Avoid looking at exercise as a way to fix something that's wrong with your body. Instead, focus on your successes. Pat yourself on the back each time you've made it through a workout. Thrive on the energy that exercising gives you. Reward yourself with a dinner out, after you have reached a certain weight loss goal, or buy yourself a new workout outfit. With these rewards, you'll go back for more, and your body will show results.

Don't view exercise as punishment. Don't look at exercise as something that has to be tackled because you are out of shape. Think of exercise as an investment in your health, your physical looks and your mental outlook. As you run, walk or lift weights, concentrate on the positive energy being generated within your body and the renewed sense of life and wellness you feel.

The basics of any fitness program are planning and setting goals. Goal setting and formulating a plan are the most clear ways of establishing a consistent program of exercise: they are also a powerful form of direction and motivation. Take some time to think about what will help you begin your exercise program. Write these down in your daily planner or diary. Goals provide a sense of purpose and incentive that can drive you to your intended destination. However, for goals to be effective they need to be realistic. Motivation will be strengthened only if it's possible to reach your objectives.

Consider this: Your mind and body will respond better to exercise if you start with 20-minute sessions, three times a week, rather than an hour session four times per week. Once the sessions become a routine, aim for 30 minutes, then increase from there.

The most important thing in any exercise program is to do your best to keep progressing, backsliding as little as possible and getting back on the horse just as fast as possible if you fall off. Try to anticipate lapses: If a crazy workday looms, get up early and squeeze in a short ride on a stationary bicycle so that you've achieved something even if it isn't your regular workout routine. When on a business trip, stay in a hotel that has an onsite workout facility.

Exercise is one of life's joys. It energizes – giving you a sense of well-being and accomplishment and keeps you healthy and fit. There is great pleasure in being able to set goals, accept challenges, and push yourself to a better lifestyle of health and fitness. No matter what your reason for exercising – to lose weight, to get fit, or to feel better – motivating yourself to exercise on a regular basis requires changing your behavior.

■ **Make Exercise A Habit**

The key to a successful fitness program is getting your body to do what your mind knows it should. Here are six mental strategies to help keep you focused on your fitness goals.

1. Clarify why you want to exercise. If you want to gain strength – is it to swim more laps, or to tone-up your body. By understanding and detailing your goals, you will be better able to stay motivated.
2. Vary your workout. To make your routine more enjoyable, vary it once in a while. Supplement your indoor cycling with outdoor cycling and strength training. These activities make exercise more interesting and increase your fitness level by making you utilize different muscle groups.
3. Focus on the positive. Avoid looking at your exercise program as a way to fix something that's wrong with your body. Instead focus on your successes. Congratulate yourself after each workout. Thrive on the energy that exercising gives you.

GUIDELINES

4. Develop a constructive attitude. Do not focus on what you are giving up to exercise on a regular basis, but on what new options you'll have after you become fit.
5. Engage your body and mind. Connect on a deeper level, you'll be more likely to stay with your routine. If your exercise time on a stationary bike is your 30-minutes away from work or a time for reflection, you're much more likely to stick with it. Individuals claim to experience an increased sense of creativity and an enhanced thought process due to a regular exercise program.
6. Consider many of the physiological benefits. If a strong and fit body isn't enough to keep you motivated, consider some of the hidden benefits of exercise: lower blood pressure, stronger heart, more efficient pulmonary system, lower risk of osteoporosis and stress reduction.

■ It's Never Too Late . . . for Fitness

Most of us have very busy schedules and to keep our fitness level intact we have to be extremely efficient. These three words, efficiency of effort, form the core of creating your own home fitness center. Efficiency of effort means producing maximum gains with minimal time spent; this is the goal of most of us when designing our home fitness program.

The bottom line is you must be creative and innovative to get the best results. With this book and your own creativity a great workout is only a few moments away: a different grip on the multi-gym, a varied stepping rhythm on the stepper, a new intensity on the stationary wind-load simulator or a more rapid stroke rate on the rower. By varying your workouts you'll create maximum gains in the shortest time frames.

As you will see, your home fitness equipment will allow you to reach your fitness goals and prepare properly for a healthier lifestyle. Anyone who is serious about fitness – or for that matter just improving their overall fitness – should have a few basic pieces of home fitness equipment. It makes no difference if you are a competitive cyclist or triathlete, an executive or someone trying to tone their muscles, the home fitness center is the most efficient way to help you reach your physical potential.

SCHWINN FITNESS INC. LIMITED WARRANTY FOR EXERCISE PRODUCTS

All Schwinn exercise products are warranted to the retail purchaser to be free from defects in materials and workmanship.

Warranty coverage valid to the original purchaser only and proof of purchase will be required. Any product sold or placed in an application not recommended by Schwinn Fitness will void any warranty coverage set forth by Schwinn Fitness warranty policies and procedures.

TIME PERIOD 428P

Residential Environment: 30 years on frame. Parts are covered for 3 years. Electronics are covered for 2 years. Labor is covered for one year from date of original purchase.

TIME PERIOD 418

Residential Environment: 30 years on frame. Parts are covered for 2 years. Electronics are covered for 1 year. Labor is covered for 6 months from date of original purchase.

This warranty excludes wear items that need to be replaced due to normal wear and tear.

THIS WARRANTY DOES NOT COVER

1. Any component on original equipment which carries a separate consumer warranty of the parts supplier.
2. Normal wear and tear.
3. Any damage, failure or loss caused by accident, misuse, neglect, abuse, improper assembly, improper maintenance, or failure to follow instructions or warnings in Owner's Manual.
4. Use of products in a manner or environment for which they were not designed.

LIMITATIONS

The foregoing warranties are in lieu of and exclude all other warranties not expressly set forth herein, whether express or implied by operation of law or otherwise, including, but not limited to, warranties of merchantability or fitness for a particular purpose. Schwinn shall in no event be liable for incidental or consequential losses, damages or expenses in connection

with its exercise products. Schwinn's liability hereunder is expressly limited to the replacement of goods not complying with this warranty or, at Schwinn's election, to the repayment of an amount of the purchase price of the exercise product in question. Some states do not permit the exclusion or limitation of implied warranties or incidental or consequential damages, so the preceding limitations and exclusions may not apply to you.

PROCEDURES

Warranty service will be performed by Schwinn or an authorized Schwinn Fitness Dealer. The original purchaser must provide proof of purchase. Service calls and/or transportation to and from the Authorized Schwinn Dealer is the responsibility of the purchaser.

1. Schwinn will have the option to repair or replace any exercise product(s), which require warranty service.
2. Schwinn will replace any equipment frame that is structurally defective with a new frame or replace the unit with a unit of equal value. Schwinn is not responsible for labor charges in replacing defective frames.
3. In the event a product cannot be repaired, Schwinn will apply a limited credit reimbursement toward another Schwinn exercise product of equal or greater value.
4. Schwinn is not responsible for dealer labor charges for component changeovers completed after the labor-related warranty period(s) stated herein.
5. If you elect to repair an exercise product or part yourself, using the services of someone other than an Authorized Schwinn Fitness Dealer, or use a replacement part not supplied by Schwinn, Schwinn shall not be liable for any cost, damage, failure or loss caused by the use of such unauthorized service or parts.
