# WHOOPER ALARM KIT

# **MODEL K-24**

**Assembly and Instruction Manual** 

# Elenco Electronics, Inc.

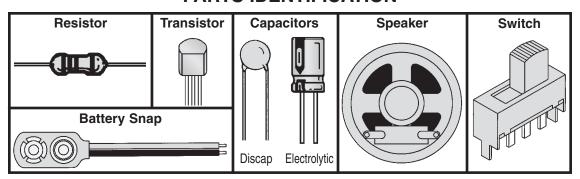

### **PARTS LIST**

If you are a student, and any parts are missing or damaged, please see instructor or bookstore.

If you purchased this whooper alarm kit from a distributor, catalog, etc., please contact Elenco Electronics (address/phone/e-mail is at the back of this manual) for additional assistance, if needed.

			RESISTORS	
Qty.	Symbol	Description	Color Code	Part #
□ 1	R8	100Ω 5% 1/4W	brown-black-brown-gold	131000
_ · □ 2	R3, R6	1kΩ 5% 1/4W	brown-black-red-gold	141000
_ <u>_</u>	R2	2.2kΩ 5% 1/4W	red-red-gold	142200
 □ <b>1</b>	R5	6.8kΩ 5% 1/4W	blue-gray-red-gold	146800
□ 2	R1, R9	15kΩ 5% 1/4W	brown-green-orange-gold	151500
□ <b>1</b>	R4	22kΩ 5% 1/4W	red-red-orange-gold	152200
□ 1	R7	27kΩ 5% 1/4W	red-violet-orange-gold	152700
			CAPACITORS	
Qty.	Symbol	Value	Description	Part #

# **PARTS IDENTIFICATION**

#### **IDENTIFYING RESISTOR VALUES**

Use the following information as a guide in properly identifying the value of resistors.

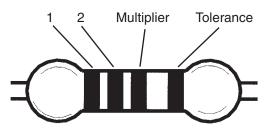

BAND 1				
1st Digit				
Color	Digit			
Black	0			
Brown	1			
Red	2			
Orange	3			
Yellow	4			
Green	5			
Blue	6			
Violet	7			
Gray	8			
White	9			

BAND 2				
2nd Digit				
Color	Digit			
Black	0			
Brown	1			
Red	2			
Orange	3			
Yellow	4			
Green	5			
Blue	6			
Violet	7			
Gray	8			
White	9			

Multiplier			
Multiplier

1,000,000			
0.01			
0.1			

Resistance				
Tolerance				
Color	Tolerance			
Silver	<u>+</u> 10%			
Gold	<u>+</u> 5%			
Brown	<u>+</u> 1%			
Red	<u>+</u> 2%			
Orange	<u>+</u> 3%			
Green	<u>+</u> .5%			
Blue	<u>+</u> .25%			
Violet	<u>+</u> .1%			

#### **BANDS**

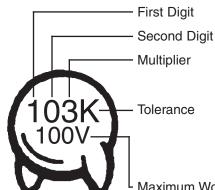

#### **IDENTIFYING CAPACITOR VALUES**

Capacitors will be identified by their capacitance value in pF (picofarads), nF (nanofarads), or  $\mu$ F (microfarads). Most capacitors will have their actual value printed on them. Some capacitors may have their value printed in the following manner. The maximum operating voltage may also be printed on the capacitor.

Multiplier	For the No.	0	1	2	3	4	5	8	9
Multiplie	Multiply By	1	10	100	1k	10k	100k	.01	0.1

Note: The letter "R" may be used at times to signify a decimal point; as in 3R3 = 3.3

The letter M indicates a tolerance of  $\pm 20\%$ The letter K indicates a tolerance of  $\pm 10\%$ The letter J indicates a tolerance of  $\pm 5\%$ 

Maximum Working Voltage

The value is  $10 \times 1,000 = 10,000 \text{pF} \text{ or } .01 \mu \text{F} 100 \text{V}$ 

#### **METRIC UNITS AND CONVERSIONS**

Abbreviation	Means	Multiply Unit By	Or
р	Pico	.00000000001	10-12
n	nano	.00000001	10-9
μ	micro	.000001	10-6
m	milli	.001	10 <sup>-3</sup>
-	unit	1	10°
k	kilo	1,000	10³
M	mega	1,000,000	10 <sup>6</sup>

1. 1,000 լ	pico units	=	1	nano unit
2. 1,000 ı	nano units	=	1	micro unit
3. 1,000 ı	micro units	=	1	milli unit
4. 1,000 ı	milli units	=	1	unit
5. 1,000 ເ	units =	1	ki	lo unit
6. 1,000 l	kilo units=	1	m	ega unit

#### MINIATURE RADIO TRANSMITTER

The Whooper Alarm puts out a wavering sound that is sure to startle an intruder. It can be used independently or as an accessory to the Burglar Alarm Kit K-23.

The Whooper Alarm circuit consists of two oscillators, a low frequency oscillator which drives a higher frequency unit at a predetermined rate. The high frequency oscillator drives an output transistor which powers the speaker.

#### **CIRCUIT OPERATION**

Figure 1 shows the circuits of the low frequency oscillator. When the power is first applied to this circuit, transistors Q1 and Q2 will not conduct. This is because the base of transistor Q2 is about 5.4V while the emitter is at zero volts.

A current is flowing in resistor R2 charging capacitor C1. When the voltage across C1 reaches 6V, transistor Q2 starts sending a current in the collector of Q1. The current in the collector of Q1 is mulitplied by the gain of transistor Q1 and this rapidly turns on transistor Q2. Capacitor C1 quickly discharges through resistor R8 as shown in Figure 2. Note that C1 charges through a  $2200\Omega$  resistor R2, but discharges through a  $100\Omega$  resistor R8. Thus, the charge to discharge ratio is 22:1. When C1 is discharged, Q1 and Q2 turn off and the whole cycle repeats itself.

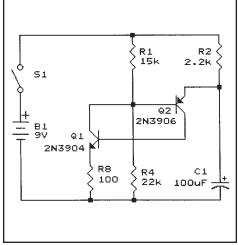

Figure 1

#### HIGH FREQUENCY OSCILLATOR

The circuit of the high frequency oscillator is shown in Figure 3. Transistors Q3 and Q4 are wired as amplifier stages. The bias for these amplifiers are controlled by the sawtooth of Figure 2. These amplifiers normally would amplify the low frequency pulses, except for the addition of capacitor C3. This capacitor takes the output of Q4 and feeds it in phase to the input of Q3. This causes the circuit to oscillate. The frequency of oscillation is controlled by the RC time constants of C3 and R6. The frequency of oscillation is about 1,000 cycles per second. This frequency is modulated with the low frequency oscillations to produce the Whooper Alarm sounds. Transistor Q5 further amplifies the signals and drives the speaker.

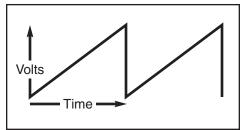

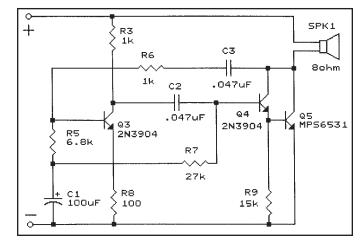

Figure 2

#### CONSTRUCTION

#### Introduction

The most important factor in assembling your K-24 Whooper Alarm Kit is good soldering techniques. Using the proper soldering iron is of prime importance. A small pencil type soldering iron of 25 - 40 watts is recommended. The tip of the iron must be kept clean at all times and well tinned.

#### **Safety Procedures**

- Wear eye protection when soldering.
- Locate soldering iron in an area where you do not have to go around it or reach over it.
- **Do not hold solder in your mouth.** Solder contains lead and is a toxic substance. Wash your hands thoroughly after handling solder.
- Be sure that there is adequate ventilation present.

#### **Assemble Components**

In all of the following assembly steps, the components must be installed on the top side of the PC board unless otherwise indicated. The top legend shows where each component goes. The leads pass through the corresponding holes in the board and are soldered on the foil side.

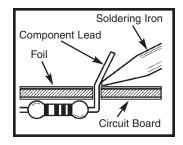

Use only rosin core solder of 63/37 alloy.

#### DO NOT USE ACID CORE SOLDER!

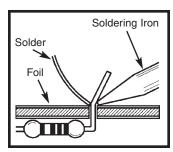

#### What Good Soldering Looks Like

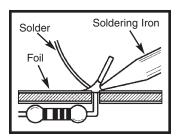

A good solder connection should be bright, shiny, smooth, and uniformly flowed over all surfaces.

 Solder all components from the copper foil side only. Push the soldering iron tip against both the lead and the circuit board foil.

- Apply a small amount of solder to the iron tip. This allows the heat to leave the iron and onto the foil. Immediately apply solder to the opposite side of the connection, away from the iron. Allow the heated component and the circuit foil to melt the solder.
- 3. Allow the solder to flow around the connection. Then, remove the solder and the iron and let the connection cool. The solder should have flowed smoothly and not lump around the wire lead.
- 4. Here is what a good solder connection looks like.

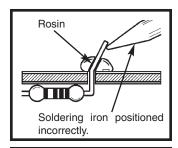

#### **Types of Poor Soldering Connections**

 Insufficient heat - the solder will not flow onto the lead as shown.

 Insufficient solder - let the solder flow over the connection until it is covered. Use just enough solder to cover the connection.

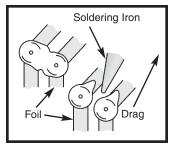

Solder

 Excessive solder - could make connections that you did not intend to between adjacent foil areas or terminals.

4. Solder bridges - occur when solder runs between circuit paths and creates a short circuit. This is usually caused by using too much solder. To correct this, simply drag your soldering iron across the solder bridge as shown.

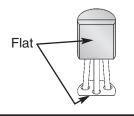

#### ASSEMBLE COMPONENTS TO THE PC BOARD

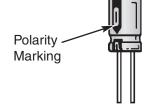

#### Figure A

Mount the transistor with the flat side in the same direction as shown on the PC board. Solder and cut off the excess leads.

### Figure B

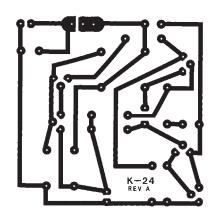

Electrolytic capacitors have polarity. Be sure to mount them with the negative (–) lead (marked on side) in the correct hole.

#### Figure C

Use a discarded resistor lead to form a jumper wire.

Foil Side of PC Board

#### TROUBLESHOOTING

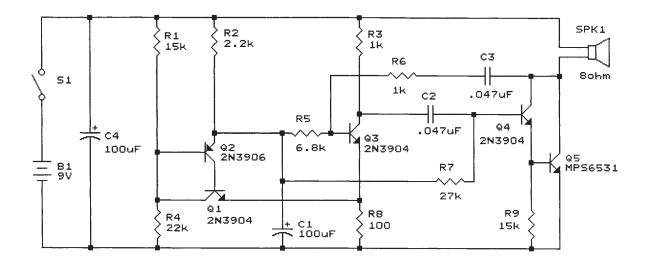

Consult your instructor or contact Elenco Electronics if you have any problems. **DO NOT** contact your place of purchase as they will not be able to help you.

- 1. One of the most frequently occurring problems is poor solder connections.
  - a) Tug slightly on all parts to make sure that they are indeed soldered.
  - b) All solder connections should be shiny. Resolder any that are not.
  - c) Solder should flow into a smooth puddle rather than a round ball. Resolder any connection that has formed into a ball.
  - d) Have any solder bridges formed? A solder bridge may occur if you accidentally touch an adjacent foil by using too much solder or by dragging the soldering iron across adjacent foils. Break the bridge with your soldering iron.

#### COMPONENT CHECK

- 1. Be sure that all of the components have been mounted in their correct places.
- Be sure that the electrolytic capacitors C1 and C4 have been installed correctly. These capacitors have polarity, the negative and positive leads must be in the correct holes, as shown on the top legend of the PC board.
- 3. Be sure that transistors Q1 Q5 have been installed correctly. The flat side should be in the same direction as shown on the top legend.
- 4. Use a fresh 9 volt battery.
- 5. Read the circuit operation lesson manual to familiarize yourself with the workings of the circuit.
