## 1.0 SAFEGUARDS

#### General Safeguards

This section is written as a general guide for those having previous knowledge and experience with these kinds of equipment. It is not intended to contain a complete statement of all safety precautions, which should be observed by personnel using this or other electronic equipment.

To reduce the risk of fire or electric shock, do not expose this equipment to rain or moisture. Do not open the cabinet. Refer servicing to qualified personnel.

- 1. READ INSTRUCTIONS All safety, installation, and operating instructions should be read before the equipment is operated.
- 2. RETAIN INSTRUCTIONS The safety and operating instructions should be retained for future reference.
- 3. FOLLOW INSTRUCTIONS All safety, installation, and operating instructions should be followed.
- 4. GROUNDING AND POLARIZATION The TM-100 Modulator is equipped with a three prong grounded power plug. Do not remove the ground prong from the plug. Do not use an AC receptacle where the plug blades cannot be fully inserted.
- 5. SERVICING Do not attempt to service this equipment yourself as opening or removing covers may expose you to dangerous voltage or other hazards and will void the warranty. Refer all servicing to qualified service personnel.
- 6. DAMAGE REQUIRING SERVICE Unplug this equipment and refer servicing to qualified service personnel under the following conditions:
  - if the power cord or plug is damaged.
  - if liquid has been spilled or objects have fallen into the equipment.
  - if the equipment has been exposed to rain or water.
  - if the equipment does not operate normally by following the operating instructions. Adjust only those controls covered by the operating instructions. An improper adjustment may result in damage and will often require extensive work by a qualified technician to restore the equipment to its normal operation.
  - if the equipment has been dropped or the cabinet has been damaged.
  - if the equipment exhibits a distinct change in performance.

#### Safety and First Aid

Personnel engaged in the installation, operation, maintenance, or servicing of electronic equipment are exposed to the hazard of high voltage. It is imperative that all safety regulations and precautions are consistently observed. Knowledge of first aid procedures is recommended. The following information is presented as a reference only.

- At all times, avoid placing any part of the body in series between ground and circuit points, whether power is on or off.
- Dangerous voltage may be present in equipment even though power is off. Do not open the cabinet. Refer servicing to qualified service personnel.
- It is the duty of all personnel to be prepared to give adequate emergency first aid treatment and thereby prevent avoidable loss of life.
- There are three principle degrees of burns, recognizable as follows:
  - a first-degree burn reddens the skin.
  - a second-degree burn blisters the skin.
  - a third degree burn chars the flesh and frequently places the victim in a state of shock accompanied by respiratory paralysis.
- Respiratory paralysis can cause death by suffocation within seconds. It is imperative that the approved methods of artificial respiration are initiated immediately and continue until the victim's breathing is normal.
- A muscular spasm of unconsciousness may render the victim unable to break free of the electric power. If this is the case, turn the power off immediately.

DO NOT TOUCH THE VICTIM OR YOU MAY SHARE THE SAME PREDICAMENT.

- If the power cannot be turned off immediately, very carefully loop a dry rope, article of clothing, length of strong cloth or a rolled-up newspaper around the victim and pull the victim free of the power source. Carefully avoid touching the victim or clothing.
- Once free of the power source, the victim must be placed in a reclining position and covered with a blanket or newspapers to keep warm. At the first opportunity, enlist help in summoning a doctor. If a doctor cannot be summoned, transport the victim to the doctor or a hospital. Be sure the victim is kept well covered and warm while awaiting professional treatment.

## 2.0 WARRANTY

Technalogix Ltd. products have been completely tested and found to meet specifications and be in proper operating condition. They are warranted to be free from defects in materials and workmanship for a period of one year from the date of shipment.

Technalogix Ltd. will not be liable for damages of whatever nature arising out of or in connection with the equipment or its use thereof. Technalogix does not assume responsibility for injury or damage resulting from the practices of untrained or unqualified personnel in the handling of this equipment.

Technalogix Ltd. warranty does not include:

- misuse, neglect or accident.
- incorrect wiring and /or improper installation.
- unauthorized repairs, modifications or use in violation of instructions issued by Technalogix.
- incidental or consequential damages as a result of any defect.
- reshipment cost or insurance of the unit or replacement units or parts.
- acts of God.

Technalogix agrees, at our option, to remedy warranted defects or furnish a new part in exchange for any part of a unit which, under normal installation, use and service, becomes defective. The user will pay for transportation costs to and from the repair center.

To claim your rights under this warranty:

- Contact Technalogix and describe the problem in as much detail as possible. See troubleshooting section in this manual. If a solution cannot be found at this time, it may be determined that the unit will have to be returned to Technalogix for repair.
- Package equipment carefully for prepaid shipment to Technalogix. Include a written description of the problem experienced and a copy of the original invoice establishing warranty status.

Technalogix reserves the right to make revisions in current production of the equipment and assumes no obligation to incorporate these changes in earlier models.

## **3.0 DESCRIPTION AND SPECIFICATIONS**

#### **General Description**

The high output modulator eliminates the need for preamplifiers prior to the power amplifier system. The modulator processes baseband audio and video information to provide an IF output consisting of a visual IF carrier at 45.75 MHz, using amplitude modulation, and an aural IF carrier at 41.25 MHz, using frequency modulation. An internal upconverter translates the modulator circuitry's IF carriers to VHF and UHF television frequencies. All operating controls are located on the front panel, as described in a later section. An aural loop through is provided to properly set transmitter power.

#### Standard Features

- Totally microprocessor controlled with self-diagnostic monitoring.
- Selectable output channels:
  - Standard Broadcast VHF 2 13, UHF 14 60, T7 T13
  - HRC channels 1 through 118
  - ±10 kHz offsets
- SAW filtered IF designed for adjacent channel operation.
- + 60 dBmV output using low distortion hybrid amplifiers.
- Synthesized oscillators crystal referenced phase locked.
- Bar graph modulation and digital LED readout.
- Internal switch selects standard or HRC output.
- Surface mount technology construction.
- RF muted during tuning.
- Optional aural sub-carrier and baseband audio input
- Phase lock loop FM audio.
- BTSC stereo compatible.
- External separate audio/video and composite IF loop-through.
- RS-232 control option (daisy-chain capable)
- Sound carrier level adjustable -10 dB to -20 dB.
- Video delay predistortion network meets FCC 73.687.
- High stability TCXO, ± 250 Hz
- Non-volatile memory retains channel selection after power loss.
- Video Detection turns off carrier in event of loss of video.

#### Available Options

- 4.5 MHz sub carrier and baseband audio inputs.
- Dual RS-232 control with daisy chain capabilities that allow for remote control by PC workstation.

HRC Output Frequency Set:

This Technalogix frequency agile product can be set for HRC frequency output. This feature is controlled by an internal dip switch assembly, DS-1. The switch is located near the right front corner (with the panel facing you) between the test point and the output converter module. DS-1 is clearly marked on the PCB. Switch #3 placed in the OFF position switches the output frequency to HRC on all channels. The switch is normally set to ON at the factory.

#### **Specifications**

**RF** Characteristics

Frequency range	7 to 750 MHz
Frequency Response (one channel)	±0.5 dB
Frequency Stability	±250 Hz
RF Output Level	+60 dBmV max
Output Impedance	50 Ohms
Harmonics	> 60 dB below rated power
Predominant Intermodulation Distortion	dBc = decibels below visual carrier
+ 920 kHz	> -53 dBc
- 920 kHz	> -53 dBc
+ 2.66 MHz	> -53 dBc
- 2.66 MHz	> -53 dBc
+ 5.42 MHz	> -53 dBc
+ 7.16 MHz	> -53 dBc
3 <sup>rd</sup> Order Intermodulation Distortion	
+ 4.5 MHz	> -60 dBc
+ 9.0 MHz	> -60 dBc
All others	> -60 dBc
Spurious Emissions	> -60 dBc

#### NTSC Video Characteristics

Input	Level	to	modulator	(for	87.5%	1.0 V <sub>PP</sub>
modulat	tion)			-		
Differen	itial Pha	ase (a	at 87.5% mod	dulatio	n)	±2 Degrees
Differen	itial Gai	n (at	87.5% modu	lation)		2%
Group D	Delay					< ±40 nS
Video G	Group D	elay	Pre-emphas	is		Conforms to IC/FCC specifications
K-Facto	or					1.9% for 2T Pulse
Hum an	d Noise	Э				> 60 dB below rated power

#### Aural Characteristics

Input: 50 Hz – 15 KHz	0 dBm (0.8V)
Impedance	600 ohms, balanced
Frequency Response	+/- 1.0 dB
Frequency Tolerance, +/- 500 Hz	4.5 MHz
Frequency Deviation	+/- 25 KHz
Harmonic Distortion	1% max
Preemphasis (mono)	75 μs
Internally Defeatable	

#### IF Section

Output Impedance	75 ohms, unbalanced
Video IF level	+ 37 dBmV, +97 dBμV
Audio IF Level	+22 dBmV
Adjustable	+82 dBµV
Return Loss	> 14 dB
IF Frequency, Video Carrier	45.75 MHz
IF Frequency, Audio Carrier	41.25 MHz
Video Sound Spacing	+ 4.5 MHz
Vestigial side-band width	0.05 MHz
Second IF Frequency	945.75 MHz

## **Physical Characteristics**

Power Requirements	100-130, 210-230 VAC, 50/60 Hz
Operating Temperature	0 - 50°C
Weight	12 lbs
Dimensions (modulator only)	W-19", D-14 ", H 1.75", 1U-high

#### Video Conditioning Module

The TM-100 modulator includes a separate circuit board called the Video Conditioning Module. The baseband video signal passes into the modulator, through a group delay filter, and onto the video conditioning Module circuit board. This module accomplishes two processes:

- Sync Stretch. Allows the user to adjust the sync level to maintain the proper level. Adjustment is made via potentionmeter VR2 and can be made through the ventilation holes in the modulator lid without having to remove the lid. Potentionmeter VR1 adjusts the video modulation level and must be made by either removing the lid and adjusting VR1 or by the Video Modulation adjust on the front panel of the modulator. The sync stretch is powered by +5Vdc brought in to the connector and -5Vdc, which is generated on board by U1.
- 2. Video Detect. Turns off the 24Vdc supply to the final amplifier in the TM-100 in the event of missing video input. The power supply for the final amplifier (+24Vdc) is routed through a relay on the circuit board. In the event of a missing video signal, the relay contact is opened and the +24Vdc is disconnected from the final amplifier.

The input and output impedance of the Video Conditioning Module is 75-ohms and video connections are made via RCA connectors. The video Conditioning Module can be bypassed, if necessary

## 4.0 INSTALLATION

This section contains installation recommendations, unpacking, inspection, and installation instructions for the Technalogix TM-100 Modulator. Carefully read all material in this section prior to installation. Also read and review operating procedures later in this section.

#### **Building Recommendations**

The quality of the building is of great importance if you are to expect long life and continued performance from the modulator. The building must be clean, dry, temperature controlled and secure. The modulator takes up a single 1-U high space on a 19" rack. Don't forget to allow space in the building for any additional racks to house test equipment, a workbench area, line regulating transformers, ladders, equipment and parts storage, first aid kit, emergency generator if used, as well as heating and cooling devices that may be unique to your installation. A sloping roof will tend to develop leaks less rapidly. The building should be well roofed with good material. The cooling load will be lowered with reflective or light colored roofing material.

#### Heating and Cooling Requirements

The environment's temperature will contribute greatly to the length of the modulator's life. Technalogix recommends that the building's filtered air intake must have capacity for all air-flow in the building plus an additional 20%. Keep the intake below the roofline to avoid intake of solar heated air. Please ensure that the intake and exhaust areas are on the same side of the building to avoid pressure differentials during windy conditions. Also, do not position intake near exhaust's preheated air. If air conditioning is required to cool the shelter, discuss the situation with a qualified HVAC technician. Under average conditions, 12,000 BTUs will cool approximately 500 square feet to a comfortable level.

#### Electrical Service Recommendations

Technalogix recommends that a qualified, licensed local electrician be consulted for the required electrical service. We suggest local electricians because:

- The personnel knows the local codes
- The personnel can be on site readily
- You are apt to get better overall support if you give what business you can to local suppliers

Technalogix recommends that proper AC line conditioning and surge suppression be provided on the primary AC input to the power amplifier. All electrical service should be installed with your national electrical code in your area, any applicable provincial or state codes, and good engineering practice. Special consideration should be given to lightning protection of all systems in view of the vulnerability of most transmitter sites to lightning. Lightning arrestors are recommended in the service entrance. Straight and short grounds are recommended. The dectrical serviced must be well grounded. Do not connect the unit to an open delta primary power supply, as voltage fluctuations could harm the unit. Branch your circuits. Do not allow your lights, your workbench plugs, and your transmitting or translating equipment off of one circuit breaker. Each transmitter should have its own circuit breaker, so a failure in one does not shut off the whole installation.

#### Antenna and Tower Recommendations

Your preliminary engineering workgroup should establish your antenna and tower requirements, both for receiving and transmitting antennas. Construction of sturdy, high quality antenna/tower systems will pay off in terms of coverage of your service area, the overall quality and saleability of your radiated signal, and reduced maintenance expenses. Technalogix provides complete turnkey antenna systems if needed. Transmitting antennas can enhance or seriously impair the transmitter output. It is assumed that one has been selected prior to system installation, but the best-designed antenna system will function poorly if shortcuts and compromises are used during installation. Follow the manufacturer's instructions exactly, along with any engineering data prepared for the site.

The selection, routing, and length of coaxial cable is extremely important in the installation. If there is a 3 dB line loss in the cable between your unit's output and the transmitting antenna, a 500 watt unit will only deliver 250 watts to the antenna. Buy the best cable you can obtain, route it via the shortest way to the antenna, and keep it straight. Do not form it into sharp bends on its way. Do not use any more cable fittings for the installation than absolutely necessary. All cautions here apply equally to all coaxial cables in the system - input and output. The better known tower manufacturers offer complete technical and safety documentation with their towers. Be sure that you have this information as it regards wind loading, guying, etc. Be absolutely safe and certain about this aspect as human lives may be at stake.

#### Shelter Security

The FCC requires that the transmitter be secure from entry or control by unauthorized persons, and that any hazardous voltages or other dangers (including most tower bases) be protected by locks or fences as necessary to protect personnel and prevent unauthorized tampering or operation. Security of the building further implies that it be secure from wildlife. Use sturdy construction materials, including sheet metal if necessary. Holes around conduit, cable, and other similar entry points should be stuffed with steel wool and caulked to prevent entry of wildlife. Other features of security for your shelter may include its location with respect to the prevailing wind conditions. A location leeward of some natural topographical feature will prevent wind damage and snowdrifts. Check the soil runoff conditions that may slow or hasten wind or water erosion and other concerns that may be unique to your location.

#### Unpacking and Inspection

Check the outside of the container. Carefully open the container and remove the modulator. Retain all packing material that can be reassembled in the event that the equipment must be returned to the factory.

Exercise care in handling equipment during inspection to prevent damage due to rough or careless handling.

Visually inspect the enclosure of the modulator for damage that may have occurred during shipment. Check for evidence of water damage, bent or warped chassis, loose screws or nuts, or extraneous packing material in connectors. Inspect all connectors for bent connector pins. If the equipment is damaged, a claim should be filed with the carrier once the extent of the damage is assessed. Technalogix cannot stress too strongly the importance of immediate careful inspection of the equipment and subsequent immediate filing of the necessary claims against the carrier if necessary. If possible, inspect the equipment in the presence of the delivery person. If the equipment is damaged, the carrier is your first area of recourse. If the equipment is damaged and must be returned to the factory, phone for a return authorization. Claims for loss or damage may not be withheld pending the outcome thereof. Technalogix cannot guarantee the carrier's performance.

#### Location and Function of Controls and Connectors

The following illustrations depict the location of the installation connectors when installing the power amplifier with a modulator or processor.

#### FRONT

### BACK

*Audio Deviation* – Allows user to control extent of audio deviation. Original factory setting at 25 KHz deviation using standard pre-emphasis curve.

*Audio/Video Display Select* - Provides a graphical representation of audio deviation and visual modulation levels on an LED bar graph. The switch selects between audio deviation or visual modulation.

*Video Modulation --* Allows user to control extent of video modulation. Original factory setting at 87.5% video modulation with 1.0 Volt peak to peak baseband input video signal.

*Frequency* Offset Select – Toggles between +10 KHz, 0KHz, and –10 KHz frequency offset.

Aural Carrier Level - Allows user to set aural carrier level relative to visual carrier level. Modulator is factory tested at -10 dBc (decibels below visual carrier).

*Output Select* – Selects the desired channel of operation. If you require a lower channel than the one currently displayed, push the toggle switch down. The channels will change one at a time as many times as you press the switch. Holding the select switch in the up or down position will "scan" to the desired channel. It is normal for the frequency lock LED to turn off during and for a few seconds after, changing channels. The switch must be held up or down initially for three seconds. This helps to ensure that no accidental channel changes will occur.

*Output Level* – Sets visual carrier output level.

*RF Out Test Point* – Provides a sample of the RF output level which is 20 dB below the actual value. RF test point is only a relative indicator of the actual RF output level and may vary. All RF operating measurements should be made at the RF output of the unit.

*RF Output* - Modulated Audio/ Video output capable of +60 dBmV levels using built in low distortion hybrid amplifiers.

RS-232 Ports – Set up for optional RS-232 control option.

*Combined IF Input/ Output* – 45.75 MHz visual carrier and 41.25 MHz audio carrier intermediate frequency signal loop.

*Audio Input/ Ouput Loop* – Available for baseband audio processing.

*Video Input/ Output Loop* - Available for baseband video processing.

*Video In* – Connection for 1.0 Volt peak to peak video source.

Balanced Baseband Audio In – Used to connect a 1 Volt peak to peak baseband audio signal. For balanced input connection, connect 1 audio input lead to the left terminal on the connector and the other audio input lead to the right terminal. For an unbalanced input connection, connect one audio input lead to the left terminal on the connector and the other audio input lead to the centre terminal. Center terminal is chassis ground.

## 5.0 OPERATING PROCEDURE

#### Preliminary Hook-up

- 1. Terminate modulator into a 50 ohm load before applying power.
- 2. Connect the power cord of the Technalogix TM-100 agile modulator to a proper electrical source as indicated on the back of the unit
- 3. Observe the front panel. If power is applied and present, the red power LED will illuminate. Also, all the elements of the displays behind the display readout window will illuminate momentarily as a display test.
- 4. Observe the numbers displayed behind the display readout window after the test. They will indicate:
  - Microprocessor software version;
  - Internal option dipswitch settings;
  - RS-232 unit ID (if so equipped); and
  - Last tuned channel.
- 5. After a moment, the Lock Detect LED will illuminate.

#### Setup and Operation

- A. Output level and channel selection; connecting monitor.
- Connect a spectrum analyzer, or a field strength meter tuned to the frequency of the video RF carrier of the desired channel, to the RF OUTPUT jack on the rear panel of the unit. Alternatively, connect a spectrum analyzer or a field strength meter to the –20dB TEST POINT on the front panel of the unit.
- 2. Select the desired output channel using the CHANNEL SELECT paddle switch on the front panel.
  - Hold the CHANNEL SELECT switch in the up- or down-position for approximately 3 seconds to activate the channel-select circuit;
  - Toggle the CHANNEL SELECT switch up to select a higher channel or toggle it down to select a lower channel. The switch may be held in the up- or down-position for rapid channel switching.

- 3. Observe the output on the spectrum analyzer, or the field strength meter. If measuring from the rear panel RF OUTPUT jack, adjust the front panel OUTPUT LEVEL potentiometer for an output level between +55dBmV and +60dBmV. If measuring from the front panel –20dB TEST POINT, ensure that the rear panel RF OUTPUT jack is terminated into a 50 $\Omega$  load, then adjust the front panel OUTPUT LEVEL potentiometer for an output level between +35dBmV and +40dBmV.
- 4. If using a field strength meter, retune the meter to the frequency of the audio RF Carrier.
- 5. Still observing the output on the spectrum analyzer, or the field strength meter (now tuned to the frequency of the audio RF carrier), adjust the front panel AURAL CARRIER potentiometer for an output level 10-13dB lower than that at which the video RF Carrier is set.
- Remove the spectrum analyzer, or field strength meter from the unit. If available, connect a television/monitor to the front panel –20dB TEST POINT, apply power to the television/monitor and tune to the selected output channel of the Technalogix TM-100 modulator.
- B. VIDEO input connection and adjustment.
- 1. Connect a  $1.0V_{P-P}$  video source to the VIDEO IN jack on the rear panel.
- 2. Adjust the front panel VIDEO MODULATION control for 87.5% modulation.
  - Set the front panel DISPLAY SELECT switch to VIDEO (down) position;
  - Observe front panel LED bargraph behind front panel display readout window.
  - First RED LED will begin illumination at approximately 87.5% modulation; or
  - Observe TV monitor for good visual image.

#### C. AUDIO input connection and adjustment – BASEBAND AUDIO

- 1. If your Technalogix TM-100 agile modulator is equipped with a 4.5MHz sub-carrier input option, ensure that the rear-panel AUDIO SELECT switch is in the BASEBAND position.
- 2. Connect a 1V<sub>PP</sub> baseband audio signal to the rear panel baseband audio connector as follows:
  - For balanced input connection, connect one audio input lead to the left terminal on the connector and the other audio input lead to the right terminal.
  - For unbalanced input connection, connect one audio input lead to the left terminal on the connector and the other audio input lead to the center terminal.
  - Center terminal is chassis ground.
  - Insert the terminal into the connector on the rear panel of the TM-100.
- 3. Adjust the front panel AUDIO MODULATION control for 100% modulation.
  - Set the front panel DISPLAY SELECT switch to AUDIO (up) position.
  - Observe front panel LED bargraph behind front panel display readout window.
  - First RED LED will begin illumination at approximately 95% modulation; or
  - Adjust for ±25KHz deviation using a spectrum analyzer; or
  - Listen to the audio output from TV monitor and setting the loudness equal to that of an off-air channel carried on your system.
- D. AUDIO input connection and adjustment 4.5MHz Subcarrier input
- 1. Set the rear panel AUDIO SELECT switch in the 4.5 position.
- 2. Connect a modulated 4.5MHz subcarrier signal to the rear panel 4.5MHz input F-connector jack.
- 3. Inject a minimum +36dBmV (-12.75dBm) 4.5MHz RF carrier into the unit.
- 4. Using the setup in Step A.5., measure the audio RF carrier output level at the rear panel RF OUTPUT jack. Level should be within ±2dB of the measurement taken in Step A.5.

#### Important

Technalogix power supplies are designed so that under certain power line or heat buildup conditions, the unit shuts off. An indicator would be no RF output, but the POWER LED remains on. If this occurs, unplug the power cord and wait two minutes before re-powering. Upon applying power, you should again have RF output. If not, or should the unit return to shutdown mode, please contact Technalogix for assistance. Technalogix highly recommends a 1.75 inch air circulation space between any rack mounted equipment.

#### **Transmitter Hookup**

- 1. Connect modulated video from TM-100 RF OUT to the Technalogix power amplifier.
- 2. Turn down RF level on TM-100 all the way.
- 3. Ensure that IF OUT is connected to IF IN on the TM-100 modulator using the loop F to F cable supplied.
- 4. Connect the transmitting antenna cable to the RF output connector on the power amplifier. It is recommended that a quality through line wattmeter be installed in this same line.
- 5. Verify that all signal and RF cables are connected properly.
- 6. After following proper installation procedures outlined in the power amplifier manual, plug the power amplifier's power cords into an appropriate electrical outlet.

Output power should be adjusted with a sync and blanking signal only with the aural carrier removed. This is simply done by disconnecting one end of the audio carrier loop found on the back panel of the TM-100.

## 6.0 PROBLEM TROUBLESHOOTING GUIDE

The guide below covers some typical symptoms, possible associated causes and suggested actions to follow before returning the unit for repair. It is not meant to be all-inclusive.

Symptom	Possible Cause	Suggested Action
No output Weak output	Unit tuned to output channel different from desired (this occurs particularly on the units which have green LED on the front panel to indicate "T" channels and channels above 99)	Ensure selected output channel is desired channel
	Input signal is too weak	Ensure input signal strength is 1V peak to peak
	IF loop cable on rear of unit loose/disconnected	Check IF loop cable is securely attached
	Unit not plugged in or not getting power	Check power cord and power source, fuse
Excessive noise Spurious signals	Output level above rated maximum (most often occurs when changing from high-number channel to	Measure RF output from rear panel jack and adjust front panel
1 C	low-number channel, especially to the "T" channels)	OUTPUT LEVEL control as required
	IF level too high (most often occurs when routing IF through scrambler or other external device)	Measure normal IF output level for applied CW/unmodulated input carrier and ensure same level is returned to unit after external processing
	Input signal too strong or no input signal at all	Measure video level and pad to within specified input levels.
Bad/noisy video	Aural carrier interfering with video carrier	Measure Aural Carrier level and/or adjust AURAL CARRIER LEVEL control on front panel
Channels do not change	Delay feature active	Hold channel change switch in raised/lowered position for at least three seconds
