

PC INTERFACE ADDENDUM

Operating Uniden SportCat SC150 Scanner with Add-on PC Interface

The modified SportCat with PC interface has been enhanced by the addition of an add-in board that manages the PC to Scanner connection. This interface along with appropriate PC software allows all 100 memories of the SC150 to be programmed or re-programmed as desired.

The add-in board has two modes of operation. When the scanner is turned on with a cable connected between the scanner and PC the add-in board enters **PROGRAMMING MODE** and the PC interface circuitry remains active allowing the scanner to be programmed from the PC. If the scanner is turned with no cable PC interface cable attached the add-in board enters **POWER SAVE MODE**, which turns off the PC interface circuitry to conserve battery power.

PROGRAMMING THE SCANNER USING THE PC INTERFACE

- **Turn Scanner OFF.**
- **Connect PC interface cable between scanner and PC's serial port.**
- **Turn scanner ON.**
- **Select 'HOLD' mode on scanner using the keypad.**
- **Select 'BANK' mode on the scanner using the keypad.**
- **Follow instructions included with your software to program the scanner.**
- **Turn scanner OFF.**
- **Disconnect PC interface cable.**

IMPORTANT:

After programming the radio using the PC interface the scanner should be turned OFF and the cable disconnected before using. This will return the add-in board to POWER SAVE MODE.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
