Selecting Terminal Location

Use the following guidelines when selecting a location for your V^x670 terminal.

Environmental Factors

- The V^x670 is a portable terminal. Select a flat support surface, such as a countertop or table, to keep the terminal safe in between uses.

TERMINAL SETUP

Unpacking the Shipping Carton

- Do not use the terminal where there is high heat, dust, humidity, moisture, or caustic chemicals or oils.
- Keep the terminal away from direct sunlight and anything that radiates heat, such as a stove or motor.
- Do not use the terminal outdoors.

The terminal is not waterproof or dustproof, and is intended for indoor use only. Any damage to the unit from exposure to rain or dust may void any warranty.

Electrical Considerations

- Avoid using this product during electrical storms.
- Avoid locations near electrical appliances or other devices that cause excessive voltage fluctuations or emit electrical noise (for example, air conditioners, electric motors, neon signs, high-frequency or magnetic security devices, or computer equipment).
- Do not use the terminal near water or in moist conditions.

Unpacking the Shipping Carton

Open the shipping carton and carefully inspect its contents for possible tampering or shipping damage. The V^x670 is a secure product and any tampering may cause the terminal to cease to function properly.

To unpack the Shipping Carton

- 1 Remove and inspect the following items:
 - Terminal
 - Power pack
 - Telephone line cord
 - Power cord
 - Battery pack
 - Paper roll
- 2 Remove all plastic wrapping from the terminal and other components.

- 3 Remove the clear protective film from the LCD screen.

Do not use a terminal that has been damaged or tampered with. The V^x670 terminal comes equipped with tamper-evident labels. If a label or component appears damaged, please notify the shipping company and your VeriFone representative or service provider immediately.

- 4 Save the shipping carton and packing material for future repacking or moving the terminal.

Examining Terminal Features

Before you continue the installation process, notice the features of the V^x670 terminal (see Figure 2).

Figure 2 V^x670 Terminal Features (Front Panel)

Front Panel The front panel includes the following features:

- A **terminal display**, backlit LCD screen.
- Five types of keys:

- a A 12-key, **telephone-style keypad** (keypads may vary in style).
 - b Six **ATM-style function keys**, labeled F0 to F5, to the right of the LCD screen.
 - c Four **programmable function keys** above the keypad.
 - d Three **color-coded function keys** below the keypad (icons at right; from left to right: CANCEL, CLEAR, ENTER). 
 - e An **ALPHA key** centered at the top of the keypad.
- A **magnetic card reader**, built into the right side. Swipe the card using the proper direction, with the magnetic stripe down and facing inward, toward the keypad.
 - A green **indicator LED** indicates power is ON.
 - An **internal thermal printer** at the back of the terminal.
 - A **smart card reader**, built into the front of the terminal. For directions on how to use a smart card, see [Conducting Smart Card Transactions](#).
 - A **SAM (security access module) compartment**, built into the bottom of the terminal. The V^x670 terminal contains MSAM cardholders to support multiple stored-value card programs or other merchant card requirements.

NOTE

VeriFone ships variants of the V^x670 terminal for different markets. Your terminal may have a different configuration. The following devices may or may not be present: a smart card reader, or zero or three MSAM cardholders. However, the basic processes described in this guide remain the same, regardless of terminal configuration.

Examining Connection Ports

The V^x670 terminal has one primary port that supports different peripherals through the use of various cables.

Figure 3 The V^x670 Primary Port (Bottom View)

Power Adapter Cable Each V^x670 terminal comes with a power adapter cord (VPN 24224-01-R) that completes the connection between the power pack and the terminal.

Figure 4 Power Adapter Cable Connection to a V^x670 Terminal

USB Host Cable A 2-Wire USB Host port (VPN 24223-01-R) for external peripherals. A connector adaptor provides for standard USB host connection for the Modem Dongle or the RS232 UART Dongle.

Figure 5 USB Host Cable Connection to a V^x670 Terminal

Multiport Adapter A multiport adapter (VPN 24799-01-R) that provides connectivity for power, USB Host, USB Device, and COM1 (RS232 UART). This cable is used only for deployment or development purposes.

Figure 6 Multiport Adapter Connection to a Vx670 Terminal

Other cables are available for development purposes. Check with your local VeriFone representative for further information.

USB Modem Dongle A modem in the form of a USB Modem Dongle may be provided with the Vx670 terminal. The M267-D10-00 USB Modem Dongle provides communication via a telephone line at speeds of up to 14,400 bps. It can also be connected to the full-feature Base Station when the terminal is in the station (see [Attaching the USB Dongles to the Base Station](#)).

USB Serial Dongle (RS232 UART) The USB Serial Dongle (VPN M267-D01-00) may be provided with the Vx670 terminal. It is designed to accommodate the RJ45 connector. The USB Serial Dongle can also be connected to the full-feature Base Station when the terminal is placed in the station (see [Attaching the USB Dongles to the Base Station](#)).

A Base Station may be provided with the Vx670 terminal. A full-feature Base Station has two USB host ports for external dongles as well as a battery charger slot for charging an extra lithium-ion battery pack. A standard Base Station does not have any USB ports and is capable of charging the terminal only and not the extra battery pack.

CAUTION  The Modem Dongle and Serial Dongle are intended for use with the Vx670 terminal and Base Station only. They should not be installed or used with any equipment other than the Vx670 terminal or Base Station.

Establishing Telephone Line Connections

To connect a telephone line:

- 1 Connect one end of the telephone cord to the USB Modem Dongle.
- 2 Connect the USB Modem Dongle to the terminal using the AVX Connector (VPN 24223-01-R).
- 3 Route the other end of the telephone cord directly to a telephone wall jack.

WARNING

To reduce the risk of fire, use only No. 26 AWG or larger UL Listed or CSA Certified Telecommunication Line Cord.

Figure 8 Vx670 USB Modem Dongle Connection

RJ-45 Socket

This would be used for connection to a LAN or ISDN.

TERMINAL SETUP

The base station's status is shown on its different LED indicators:

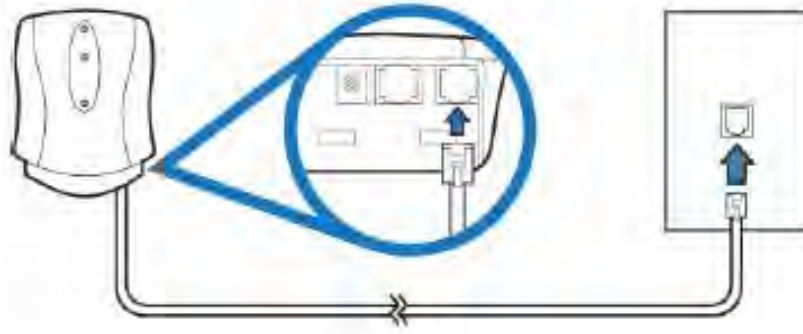

WARNING

Do not plug the power pack into an outdoor outlet or operate the terminal outdoors.

NOTE

To protect against possible damage caused by lightning strikes and electrical surges, consider installing a power surge protector.

- 2 Plug the modem cable directly to a telephone wall jack or use a 'T' connector if sharing the telephone line with other equipment.

Installing the Paper Roll

A fast, quiet thermal printer is built into the V^x670 terminal. Before you can process transactions that require a receipt or record, you *must* install a roll of thermal-sensitive paper in the printer.

The ITP uses a roll of single-ply, thermal-sensitive paper 57 millimeters (2.24 inches) wide and 38 millimeters in diameter. A pink *out-of-paper* indicator line appears on the edge of the paper approximately 18 inches before the end of the roll. After this line appears, there is enough paper remaining on the roll to conclude at least one transaction.

Poor-quality paper can jam the printer and create excessive paper dust. To order high-quality VeriFone paper, refer to [Accessories and Documentation](#).

Store thermal paper in a dry, dark area. Handle thermal paper carefully: impact, friction, temperature, humidity, and oils affect the color and storage characteristics of the paper.

Never load a roll of paper with folds, wrinkles, tears, or holes at the edges in the print area.

- To Install a Paper Roll**
- 1 Gently pull the latch located on the bottom of the terminal to unlock the paper roll cover.

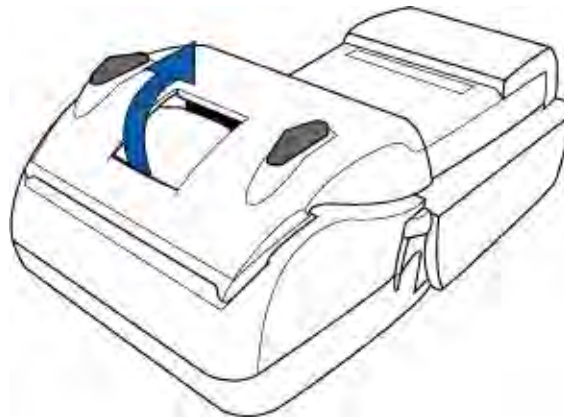

Figure 13 **Unlocking the Printer Cover**

- 2 Lift the printer cover up and back.

Figure 14 Opening the Printer Cover

- 3 Remove any partial roll of paper in the printer tray by lifting it up (see [Figure 15](#)).
- 4 Loosen the glued leading edge of the paper or remove the protective strip from the new roll of paper. Unwind the paper roll past any glue residue.

Figure 15 Removing Partial Paper Roll

- 5 Hold the roll so the paper feeds from the *bottom* of the roll when the terminal is inverted (see [Figure 16](#)).

- 6 Drop the paper roll into the printer tray.

Figure 16 Loading Paper Roll

- 7 Pull paper up past the glue residue on the paper roll.
- 8 Close the paper roll cover by gently pressing directly on the cover until it clicks shut, allowing a small amount of paper past the glue residue to extend outside the printer door.

To prevent damaging the print roller, always gently press down on the paper roll cover to close it.

Figure 17 Closing Paper Roll Cover

- 9 Tear the paper off against the serrated plastic strip in the printer.

Installing/ Replacing MSAM Cards

When you first receive your V^x670 terminal, you may need to install one or more MSAM cards or you may need to replace old cards.

CAUTION

Observe standard precautions when handling electrostatically sensitive devices. Electrostatic discharges can damage this equipment. VeriFone recommends using a grounded anti-static wrist strap.

**To Install/Replace
MSAMs**

- 1 Power off the terminal.

CAUTION

It is very important that the terminal is powered off before removing the battery.

- 2 Place the terminal upside down on a soft, clean surface to protect the display from scratches.

- 3 Remove the battery.

Figure 18 Removing the Smart Battery

- 4 After removing the battery, the MSAM compartments are exposed.
- 5 Remove any previously installed MSAM card by sliding the card from the MSAM cardholder.
- 6 Install an MSAM card by aligning the card and carefully sliding it within the guides on the cover until it is fully inserted (see [Figure 19](#)). The MSAM card holders are labeled MSAM1, MSAM2, and MSAM3.

Figure 19 Installing MSAM Card

NOTE

Before inserting the MSAM card, position it as shown in [Figure 19](#), with the card's gold contacts facing the smart card reader end of the terminal. The cardholder connector base has a set of contacts and a notch on one corner to ensure the MSAM card is positioned correctly. The MSAM card has a notch on one corner to ensure that it fits into the connector base in only one way. The MSAM compartment door will not close properly if the MSAM cards are installed incorrectly.

- 7 Install the battery (see [Figure 22](#)).

**Installing/
Replacing SIM
Card
(GSM/GPRS
Models Only)**

The Vx670 terminal supports the installation of a SIM (Subscriber Identity Module) card. Use the following procedure to replace or install a SIM card.

- 1 Place the terminal upside down on a soft, clean surface to protect the lens from scratches.
- 2 Remove the battery.

Figure 20 Removing the Smart Battery

- 3 After removing the battery, the SIM compartment is exposed. The SIM card holder is labeled RADIO SIM.
- 4 Insert the SIM into the cardholder.

There is only one SIM slot, but there are multiple SAM slots. Make sure you insert the SIM card into the SIM slot, as shown in [Figure 21](#).

Figure 21 Inserting SIM Card

- 5 Install the battery (see [Figure 22](#)).

Using the Smart Battery

The Vx670 terminal uses an Li-ion *smart* battery (see [Accessories and Documentation](#) for ordering information). The internal logic of the smart battery prevents both overcharging and undercharging (a fault condition in which the battery level goes well below the minimum acceptable charge and the battery becomes unusable).

NOTE

The Vx670 terminal will operate on battery power or on power pack power. The smart battery charger in the terminal will be active whenever the power pack is connected.

Smart Battery Features

The following are features of the smart battery:

- Two Li-ion cells
- A fuel gauge module that:
 - monitors state of charge (voltage and percentage of capacity),
 - communicates with the terminal (charge parameters and status),
 - determines full charge capacity (on charge cycle and uninterrupted discharge cycle), and
 - automatically shuts down when cell voltage is extremely low.
- A safety circuit that:
 - prevents cell damage from overcharge, over-discharge, or overheating, and
 - activates when the battery is left in an unused terminal for extended periods.

NOTE

- Lithium-ion batteries are not affected by shallow charging. Furthermore, when the terminal has no external power source or smart battery, the coin cell battery provides power to the security circuit.
- Uninstalling the battery and unplugging the terminal power pack reduce the life of the coin cell battery, which does not recharge and must be replaced if drained.
- Conserve battery power by turning the Vx670 terminal off when not in use. If the terminal is not to be used for an extended period of time, keep the Lithium-ion battery inserted in the terminal, and power up the terminal periodically to check the battery charge. Do not let the battery charge fall below 10% for extended periods of time as this may permanently diminish the battery capacity. Recharge the battery by attaching the power cord to the terminal and plugging the power pack into a wall outlet.

Battery Behavior (No Power Cord)

If you connect the V^x670 to a non-battery power source, the terminal shifts to corded power mode and starts up automatically, regardless of the battery charge state.

Manual Startup Hold the green key down for about 4 seconds until the terminal displays the startup screen.

NOTE

The 4-second power-up delay is for preventing terminal startup if the green key is accidentally held down. The time required to hold the green key down to power up the terminal is configurable (for more information, see the V^x670 Reference Manual – VPN 24004).

When the terminal has power, the terminal lights are activated and the green LED indicator remains lit.

NOTE

If an application is loaded in the terminal, it starts after the initial VeriFone copyright screen and usually displays a unique copyright screen. If no application is loaded in the terminal, **DOWNLOAD NEEDED** appears on screen after the initial VeriFone copyright screen.

Manual Shutdown Hold the red key down for about 4 seconds until the terminal displays the shutdown verification screen. Keep holding the red key until the V^x670 terminal shuts down.

NOTE

- The 4-second shutdown delay is for preventing terminal shutdown if the red key is accidentally held down. The time required to hold the red key down to shut down the terminal is configurable (for more information, see the V^x670 Reference Manual – VPN 24004).
 - When the terminal has no power, the screen is blank and the green LED indicator is not lit.
-

Installing the Smart Battery

The V×670 smart battery fits in a slot on the back of the V×670 terminal, as shown in Figure 22. The locking tab clicks when the battery is in place. The slot is *keyed*, so that there is only one way to insert the battery.

Figure 22 Installing the Smart Battery

Removal To remove the V×670 smart battery, press the locking tab and pull the smart battery from its slot.

Figure 23 Detaching the Smart Battery from the V×670 Terminal

Connecting the Terminal Power Pack

When you have finished installing the smart battery, you are ready to connect the V×670 terminal to the provided power source for initial charging.

Using an incorrectly rated power supply may damage the terminal or cause it not to work as specified. Before troubleshooting, ensure that the power supply being used to power the terminal matches the requirements specified on the bottom of the terminal. (See [Chapter 3, Specifications](#), for detailed power supply specifications.) Obtain the appropriately rated power supply before continuing with troubleshooting.

The Vx670 unit comes with a universal input power pack capable of operating from voltages of 100VAC to 240VAC.

To Connect the Terminal Power Pack

- 1 Insert the round barrel connector into the power port in the connector, as shown in Figure 24.

Figure 24 Vx670 Power Pack Connection

- 2 Insert the AC power cord into the power pack.
- 3 Plug the AC power cord into a wall outlet or powered surge protector.

WARNING

Do not plug the power pack into an outdoor outlet or operate the terminal outdoors.

During a transaction, disconnecting the power by removing the battery or unplugging the terminal from a wall power while at very low battery charge may cause transaction data files not yet stored in the terminal memory to be lost.

NOTE

To protect against possible damage caused by lightning strikes and electrical surges, consider installing a power surge protector.

When the terminal has power, the terminal lights are activated and the LED indicator remains lit.

If an application is loaded in the terminal, it starts after the initial VeriFone copyright screen and usually displays a unique copyright screen. If no application is loaded in the terminal, **DOWNLOAD NEEDED** appears on screen after the initial VeriFone copyright screen.

Charging the Smart Battery

After unpacking your Vx670 terminal, install the battery and connect the power pack to the unit for 6 hours or until fully charged.

NOTE

The Vx670 terminal's smart battery is also charged when the terminal is in the Base Station. For more information, see [Placing the Terminal Onto the Base Station](#).

The smart battery has a safety circuit to protect the Li-ion cells from overcharging and over-discharging. If the battery is over-discharged, the safety circuit shuts down the battery. The battery must then be recharged to restore operation.

NOTE The V^x670 terminal automatically shuts off when the smart battery reaches the *critically low* charge state. If this occurs, the smart battery must be recharged for a minimum of 1/2 hour before it can power the terminal. *It may take several recharge attempts to reset the safety circuit* when charging a smart battery that has been discharged below this critical state.

Battery Life The V^x670 smart battery can be charged and discharged hundreds of times, but will eventually wear out. When operating times are noticeably shorter than usual, it is time to buy a new battery (see [Accessories and Documentation](#) for ordering information).

WARNING Do not dispose of batteries in a fire. Li-ion batteries must be recycled or disposed of properly. Do not dispose of Li-ion batteries in municipal waste sites.

Using the Base Station

The primary purpose of the Base Station is to charge the terminal battery and provide a docking station for the terminal after being used in pay-at-table environments. The Base Station can be positioned on a countertop or mounted to the wall.

There are two types of Base Stations, the standard model and the full-feature model.

Standard Base Station

The standard Base Station can charge the Vx670 terminal. However, it does not have any external ports and has a single LCD to indicate power status.

Figure 25 The Vx670 Standard Base Station

Full-Feature Base Station

The full-feature Base Station can charge the Vx670 terminal while charging an extra battery pack. In addition, it has two USB ports for external dongles, together with one LED for power indication and another LED for the charger status.

Figure 26 The Vx670 Full-Feature Base Station

For more information on charging the spare battery on the full-feature Base Station and connecting external dongles to the USB ports, see [Charging the Spare Battery on the Base Station](#) and [Attaching the USB Dongles to the Base Station](#).

Powering Up the Base Station

Use the procedure in this section to connect the V×670 Base Station to a power source.

- 1 Insert the round barrel connector of the power pack into the power port at the back of the Base Station.

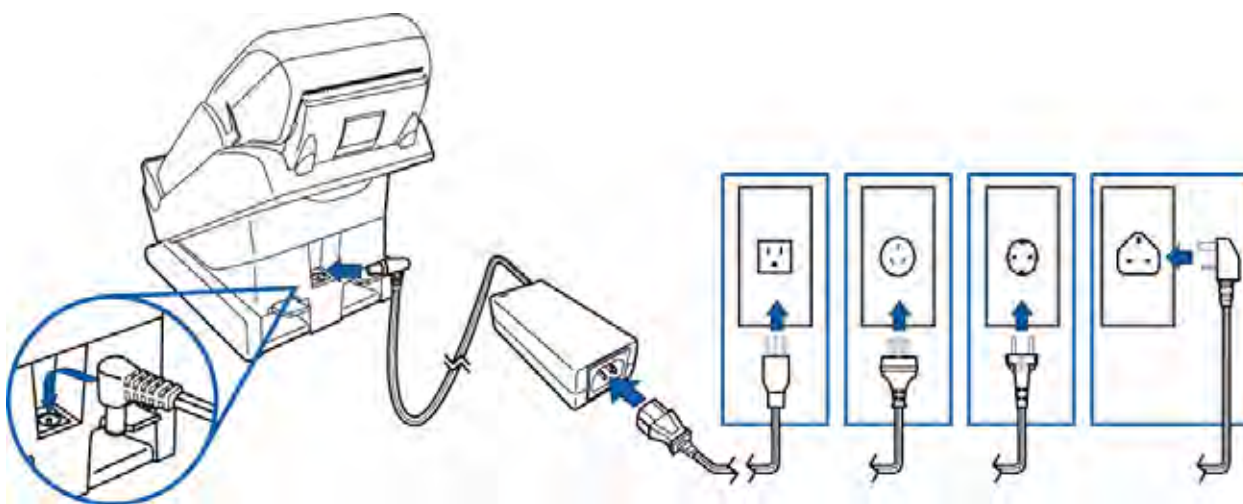

Figure 27 Connecting the Base Station to a Power Source

- 2 Insert the AC power cord into the power pack.
- 3 Plug the AC power cord into a wall outlet or power surge protector.
- 4 Confirm that the Base Station is powered up as indicated by the solid green LED.

Placing the Terminal Onto the Base Station

The V^x670 terminal can be placed on the Base Station when not in use for continuous charging of its battery. External peripherals can also be attached to the terminal via USB dongles while it is on the Base Station (see [Attaching the USB Dongles to the Base Station](#)).

Figure 28 Placing the V^x670 onto the Base Station

NOTE

The full-feature Base Station can also charge a spare battery while it charges the battery attached to the terminal (see [Charging the Spare Battery on the Base Station](#)).

To protect against possible damage caused by lightning strikes and electrical surges, consider installing a power surge protector.

WARNING

Do not plug the power pack into an outdoor outlet or operate the terminal outdoors.

Disconnecting the power during a transaction may cause transaction data files not yet stored in terminal memory to be lost.

Attaching the USB Dongles to the Base Station

While the V^x670 terminal is resting on the Base Station, you can drive external peripherals through the use of USB dongles. Only one Modem Dongle and one Serial Dongle can be connected to the Base Station. A second Modem Dongle or a second Serial Dongle will be ignored by the terminal.

NOTE

The full-feature Base Station has USB ports for two external dongles. The standard Base Station does not have USB ports.

- 1 Insert the USB dongle into the USB port located at the back of the Base Station.

Figure 29 Inserting External Dongle Into USB Port

- 2 After inserting the external dongle into the USB port, place the V^x670 terminal onto the Base Station (see [Powering Up the Base Station](#)).
- 3 Connect the peripheral to the external dongle.

Charging the Spare Battery on the Base Station

The full-feature Base Station can charge the V^x670 terminal while charging an extra battery pack.

- 1 Connect the Base Station to a power source (see [Powering Up the Base Station](#))
- 2 Place the spare battery pack onto the Base Station as shown in [Figure 30](#).

Figure 30 Putting Spare Battery Pack Into the Base Station

- 3 Place the V^x670 terminal onto the Base Station to charge both the spare and installed battery packs at the same time.

Conducting Wireless Transactions

To conduct a wireless transaction:

- Ensure the terminal is in an optimal position for transmitting.
- Follow the on-screen instructions provided with your application.

Conducting Smart Card Transactions

The smart card transaction procedure may vary from one application to another. Verify the procedure with your application provider before performing a smart card transaction.

To Conduct a Smart Card Transaction

- 1 Position a smart card with the contacts facing upward (see [Figure 32](#)).
- 2 Insert the smart card into the smart card reader slot in a smooth, continuous motion until it seats firmly.

- 3 Remove the card only when the application indicates the transaction is complete.

Figure 32 Inserting a Smart Card

Leave the smart card in the card reader until the transaction is complete. Premature card removal will invalidate the transaction.

Using the Magnetic Card Reader

The V*670 terminal supports credit/debit card transactions.

To Conduct a Credit/ Debit Card Transaction

- 1 Position a magnetic card with the stripe in the card reader and facing inward, toward the keypad.
- 2 To ensure a proper read of the magnetic swipe card, the user should insert the magnetic card from the top of the unit, as shown in Figure 33.

- 3 Swipe the card through the magnetic card reader.

Maintenance

The V^x670 terminal and base stations have no user-maintainable parts.

Cleaning the Terminal

To clean the terminal and base station, use a clean cloth slightly dampened with water and a drop or two of mild soap. For stubborn stains, use alcohol or an alcohol-based cleaner.

Never use thinner, trichloroethylene, or ketone-based solvents – they may cause deterioration of plastic or rubber parts.

Do not spray cleaners or other solutions directly onto the keypad or terminal display.

Terminal Contacts

Gently swab the contacts with alcohol or contact cleaner to remove the dirt. It is important that the exposed contacts of the V^x670 battery stay clean and unbent.

Avoid touching the contacts of the V^x670 battery and the recessed area on the terminal. Finger oils tarnish contacts, causing bad connections. When operating on battery power and experiencing a high occurrence of bad or incomplete data transfers, clean the contacts.

Smart Card Reader

Do not attempt to clean the smart card reader. Doing so may void any warranty. For smart card reader service, contact your VeriFone distributor or service provider.

Returning a Terminal or Smart Battery for Service

Before returning a V^x670 terminal, smart battery, or base station to VeriFone, you must obtain an MRA number. The following procedure describes how to return one or more V^x670 terminals, smart batteries, or base stations for repair or replacement (U.S. customers only).

NOTE

Customers outside the United States are advised to contact their local VeriFone representative for assistance regarding service, return, or replacement of terminals or batteries.

To Return a Terminal for Service

- 1 Get the following information from the printed labels on the bottom of *each* V^x670 terminal, smart battery, or sled module to be returned:
 - Product ID, including the model and part number. For example, "V^x670" and "M267-XXX-XXX-xxx."
 - Serial number (S/N nnn-nnn-nnn)
- 2 Obtain the MRA number(s) by completing one of the following:
 - a Call VeriFone toll-free within the United States at 1-800-VeriFone and follow the automated menu
 - Select the MRA from the automated message. The MRA department is open Monday to Friday, 8 A.M.–8 P.M., Eastern Time.
 - Give the MRA representative the information you gathered in Step 1. If the list of serial numbers is long, you can fax the list, along with the information gathered in Step 1, to the MRA department at 727-953-4172 (U.S.).
 - b Address a fax to "VeriFone MRA Dept." with the model and part number(s)
 - Include a telephone number where you can be reached and your fax number.

- c Complete the Inquiry Contact Form at http://www.verifone.com/aboutus/contact/contact_form.cfm.
 - Address the Subject box with to “VeriFone MRA Dept.”
 - Reference the model and part number in the Note box.

One MRA number must be issued for each V^x670 terminal you return to VeriFone, even if you are returning several of the same model.

- 3 Describe the problem(s).
- 4 Provide the shipping address where the repaired or replacement unit must be returned.
- 5 Keep a record of the following items:
 - Assigned MRA number(s).
 - VeriFone serial number assigned to the V^x670 terminal, smart battery, or base station you are returning for service or repair (terminal serial numbers are located on the bottom of the unit).
 - Shipping documentation, such as air bill numbers used to trace the shipment.
 - Model(s) returned (model numbers are located on the VeriFone label on the bottom of the V^x670 terminal).

Troubleshooting Guidelines

The troubleshooting guidelines provided in the following section are included to help you install and configure your V^x670 terminal successfully. Typical examples of malfunction you may encounter while operating your V^x670 terminal and steps you can take to resolve them are listed in this chapter.

If the problem persists even after performing the outlined guidelines or if the problem is not described below, contact your local VeriFone representative for assistance.

NOTE

The V^x670 terminal comes equipped with tamper-evident labels. The V^x670 unit contains no user serviceable parts. Do not, under any circumstance, attempt to disassemble the terminal. Perform only those adjustments or repairs specified in this guide. For all other services, contact your local VeriFone service provider. Service conducted by parties other than authorized VeriFone representatives may void any warranty.

CAUTION

Use only a VeriFone-supplied power pack. Using an incorrectly rated power supply may damage the terminal or cause it not to work as specified. Before troubleshooting, ensure that the power supply being used to power the terminal matches the requirements specified on the bottom of the terminal. (See [Chapter 3, Specifications](#), for detailed power supply specifications.) Obtain the appropriately rated power supply before continuing with troubleshooting.

Terminal Does Not Start

- Ensure that the smart battery charge state is not below the critically low level.
- Recharge or replace the smart battery.
- Ensure that you pressed the green ENTER/ON key for approximately 4 seconds, until the unit lights up.

Terminal Display Does not Show Correct/Readable Info

- Recharge or replace the battery.
- Connect the V^x670 terminal into a known-good power supply (if you have one) to see if this clears the problem.
- If the problem persists, contact your local VeriFone representative for assistance.

Smart Battery Will Not Charge

The V^x670 smart battery must initially receive a full charge to ensure proper operation.

NOTE

- Allow the V^x670 terminal to remain connected to the power pack for 6 hours to ensure the battery receives a full charge.
- Lithium-ion batteries are not affected by shallow charging. Furthermore, when the terminal has no external power source or battery the coin cell battery provides power to the security circuit.
- Uninstalling the battery and unplugging the terminal power pack reduce the life of the coin cell battery, which does not recharge and must be replaced if drained.
- Conserve battery power by turning the V^x670 terminal off when not in use. If the terminal will not be used for an extended period of time, keep the Lithium-ion battery inserted in the terminal, and power up the terminal periodically to check the battery charge. Do not let the battery charge fall below 10% for extended periods of time as this may permanently diminish the battery capacity. Recharge the battery by attaching the power cord to the terminal and plugging the power pack into a wall outlet.
- The V^x670 terminal automatically shuts off when the smart battery reaches the *critically low* charge state. If this occurs, the smart battery must recharge a minimum of 1/2 hour before it can power the terminal. *It may take several recharge attempts to reset the safety circuit* when charging a smart battery that has been discharged below this critical state.

Spare Battery in Base Station Will Not Charge

When the spare battery is installed in the base for charging, the Base LED will flash amber if the battery is charging, or stay solid green if the battery is fully charged. If the battery is not charged and the LED does not flash amber, check the contacts on the battery and in the terminal base to make sure they are clean. Also, try charging a known good battery to see if the problem is with the base or with the battery. If the problem persists, contact your local VeriFone representative.

Blank Display

When the V×670 terminal display screen does not show correct or clearly readable information:

- The battery pack may not be connected properly. Remove and reinstall the battery pack.
- Check terminal power connection.
- Remove and reapply power to the terminal.
- If the problem persists, contact your local VeriFone service provider.

Terminal Does Not Dial Out

If the terminal does not dial out:

- Check the telephone line connections.
- Check that the telephone line is working by plugging it into a working telephone and listening for a dial tone.
- Replace the telephone cable that connects the terminal with a cable you know is working correctly.
- If the problem persists, contact your local VeriFone service provider.

Printer Does Not Print

If the printer does not work properly:

- Make sure the battery is properly installed in the terminal. The printer will not print if there is no battery in the terminal.
- Check battery status or terminal power connection. The printer will not print if there is an insufficient charge remaining in the battery to complete the print operation.
- Check if the printer is out of paper (slow red blinking light) and that the roll is properly installed. Open the paper roll cover and install a new roll of printer paper or ensure that the roll is feeding correctly. A solid red indicator light indicates a printer error.
- Verify that the printer door is properly latched.
- If the problem persists, contact your VeriFone distributor or service provider.

Printer Paper Jam

If paper jams inside the printer:

- Press the button at the bottom of the terminal to unlatch the paper roll cover, then open the cover.
- Remove the damaged paper from the paper roll and clear the feed mechanism.
- Install a roll of printer paper, as described in [Installing the Paper Roll](#).

- If the problem persists, it may be due to poor paper quality. Install a new roll of higher-quality paper.

Poor-quality paper may jam the printer. To order high-quality VeriFone paper, refer to [Accessories and Documentation](#).

Keypad Does Not Respond

If the keypad does not respond properly:

- Check the terminal display. If it displays the wrong character or nothing at all when you press a key, follow the steps outlined in [Transactions Fail To Process](#).
- If pressing a function key does not perform the expected action, refer to the user documentation for that application to ensure you are entering data correctly.
- If the problem persists, contact your local VeriFone representative.

Transactions Fail To Process

There are several reasons why the terminal may not be processing transactions. Use the following steps to troubleshoot failures.

Check the Magnetic Card Reader

- Perform a test transaction using one or more different magnetic stripe cards to ensure the problem is not a defective card.
- Ensure that you are swiping cards properly. With the V^x670 card reader, the black magnetic stripe on the card should face down and inward, toward the keypad and must be inserted from the top of the terminal (see [Figure 33](#)).
- Process a transaction manually, using the keypad instead of the card reader. If the manual transaction works, the problem may be a defective card reader.
- Contact your VeriFone distributor or service provider.
- If the manual transaction does not work, proceed to [Check the Telephone Line](#).

Check the Smart Card Reader

- Perform a test transaction using several different smart cards to ensure the problem is not a defective card.
- Ensure that the card is inserted correctly and that the card is not removed prematurely.
- Ensure the MSAM cards are properly inserted in the cardholders and that the cardholders are properly secured (see [Installing/Replacing MSAM Cards](#)).
- Contact your VeriFone distributor or service provider.
- If the manual transaction does not process, proceed to [Check the Telephone Line](#).

Check the Telephone Line

- Disconnect the telephone line from the V*670 terminal and connect it to a working telephone to check for a dial tone. If there is no dial tone, replace the telephone cable.
- If the problem appears to be with the telephone line, check with the party you are trying to call to see if their system is operational. If they are not experiencing difficulties with their line, contact the telephone company and have your line checked.
- If the telephone line works, contact your local VeriFone representative for assistance.
