Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

Reorient or relocate the receiving antenna

Increase the separation between the equipment and receiver

Connect the equipment into an outlet on a circuit different from that to which the receiver is connected

Consult the dealer or an experienced radio/TV technician for help

FCC Caution:

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment. This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

(1) This device may not cause harmful interference, and

(2) this device must accept any interference received, including interference that may cause undesired operation.

IMPORTANT NOTE: FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter. The availability of some specific channels and/or operational frequency bands are country dependent and are firmware programmed at the factory to match the intended destination. The firmware setting is not accessible by the end user.

Wireless 5 GHz Band Statements:

As the Access Point can operate in the 5150-5250 MHz frequency band it is limited by the FCC to indoor use only so as to reduce the potential for harmful interference to co-channel Mobile Satellite systems.

High power radars are allocated as primary users (meaning they have priority) of the 5250-5350 MHz and 5650-5850 MHz bands. These radars could cause interference and /or damage to the access point when used in Canada.

IMPORTANT NOTE:

In the event that these conditions can not be met (for example certain laptop configurations or co-location with another transmitter), then the FCC authorization is no longer considered valid and the FCC ID can not be used on the final product. In these circumstances, the OEM integrator will be responsible for re-evaluating the end product (including the

transmitter) and obtaining a separate FCC authorization.

End Product Labeling

This transmitter module is authorized only for use in device where the antenna may be installed such that 20 cm may be maintained between the antenna and users. The final end product must be labeled in a visible area with the following:

“Contains FCC ID: NKR-DCMA86” .

Manual Information To the End User

The OEM integrator has to be aware not to provide information to the end user regarding how to install or remove this RF module in the user’ s manual of the end product which integrates this module. The end user manual shall include all required regulatory information/warning as show in this manual.

APPENDIX A: FAQ ABOUT WLAN 28

SPECIFICATIONS 30

1. Introduction

Thank you for purchasing the WLAN 802.11a mini-PCI Module

that provides the easiest way to wireless networking. This User

Manual contains detailed instructions in the operation of this

product. Please keep this manual for future reference.

▪ 1.1 System Requirements

- A laptop PC contains:
- 32 MB memory or greater
- 300 MHz processor or higher
- Microsoft® Win™ 2000/ME/98 Second Edition/XP

▪ 1.2 Features

- Mini-PCI adapter, half size design
- IEEE 802.11a compatible: allowing inter-operation among multiple vendors
- Support Atheros Super A/GTM Mode
- Provide seamless roaming within the IEEE 802.11 a WLAN infrastructure

Site survey function

2. Driver/Utility Installation / Uninstallation

2.1 Installation

Note! The Installation Section in this User Manual describes the first-time installation for Windows. To re-install the driver, please first uninstall the previously installed driver. See Chapter 2.3 “Uninstallation” in this User Manual.

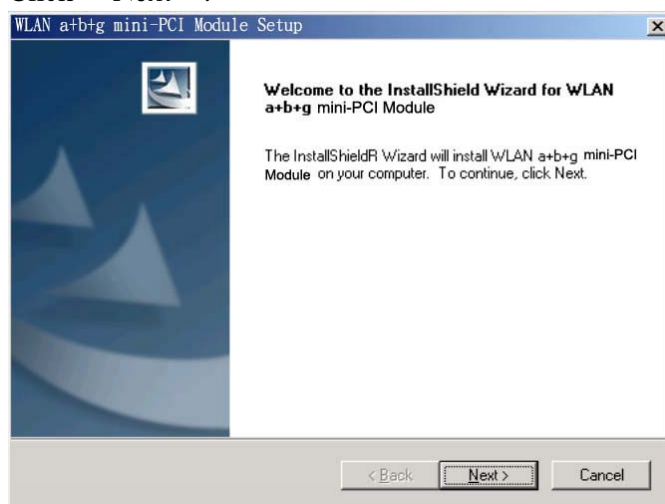

1. Follow the steps below to complete the driver/utility installation:

[1.2.](#)

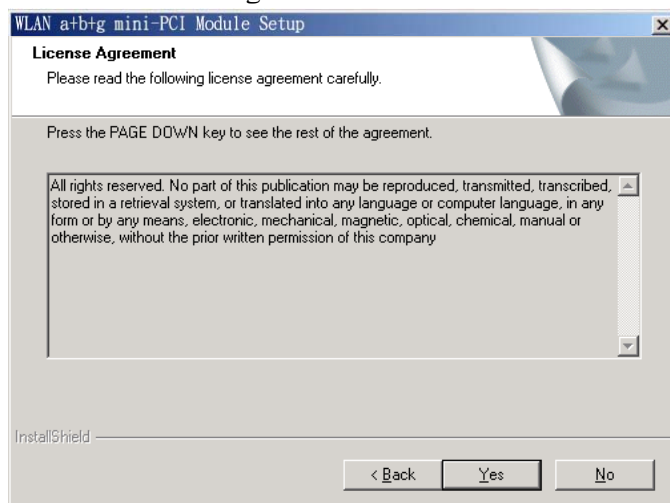

[2.3.](#) Insert the Installation Software CD into the CD-Rom Drive.

[2.4.](#)

Click “Next” .

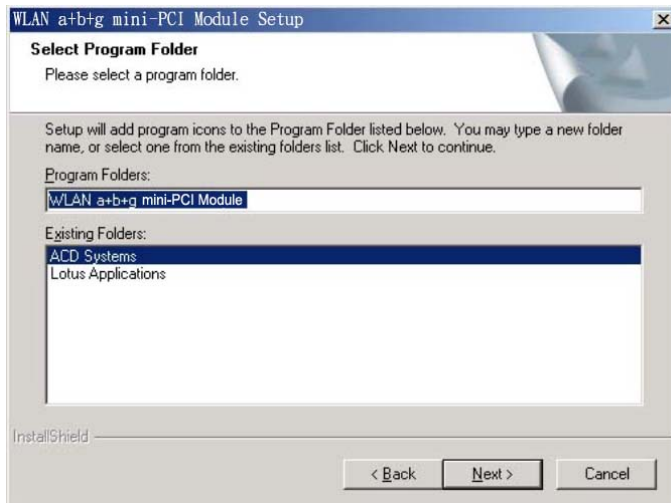

Read the License Agreement and click “Yes” .

Click “Next” to continue or click “Browse” to choose a destination folder.

Click “Next” .

Click “Yes” to create a shortcut icon on your desktop.

Click “Finish” .

You should now see a shortcut icon on your desktop.

2.2 Additional Setup Processes

1. During software installation procedure, each operating system may prompt different specific options:

2.2.

2.3. Windows 98SE: The system will request the original Windows CD during the installation process. When the installation is finished, you'll have to restart your computer.

2.4.

3.5. Windows Me: Please restart your computer when the installation is finished.

3.6.

Windows 2000/XP: Select "Install the software automatically" when the window with this option appears, and then click "Next" to continue installation.

2.3 Uninstallation

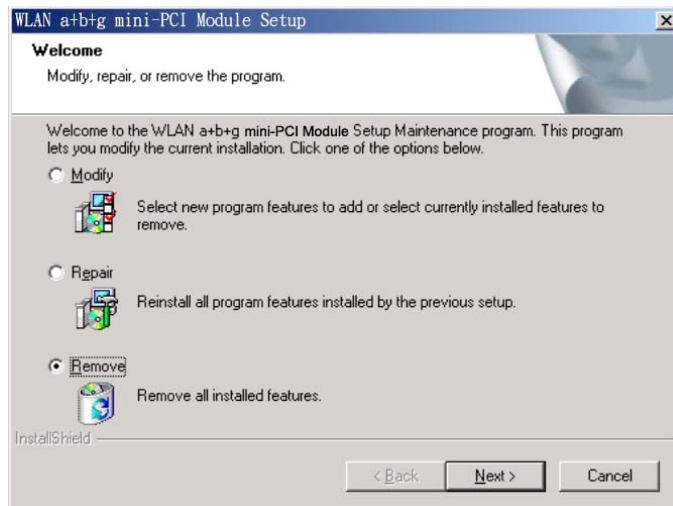

1. **Note!** Before uninstallation, please close all running programs.

2.

3. Click Start>Programs>WLAN a mini-PCI Module >UnInstall WLAN a mini-PCI Module.

4.

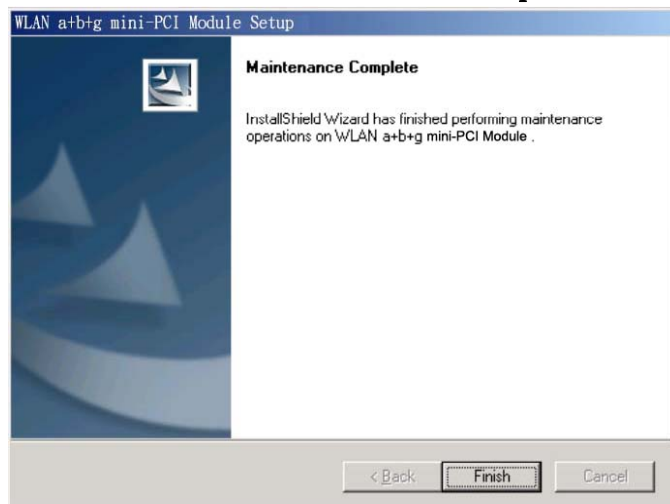

Choose “Remove” . Click “Next” .

Click “OK” to start Uninstall.

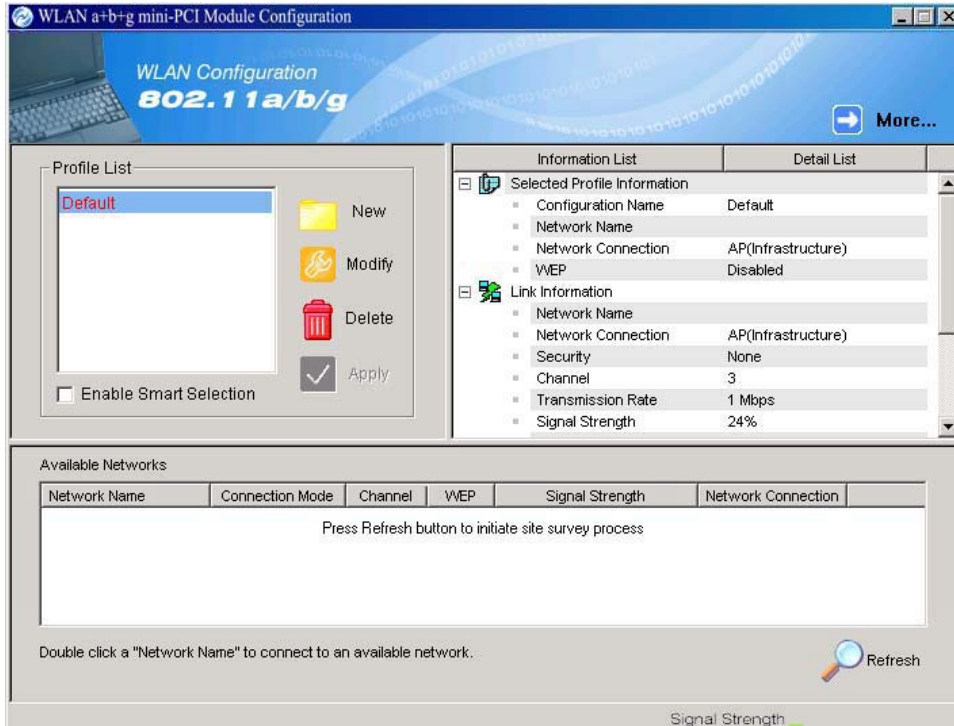

Click “Finish” . Uninstall is now completed.

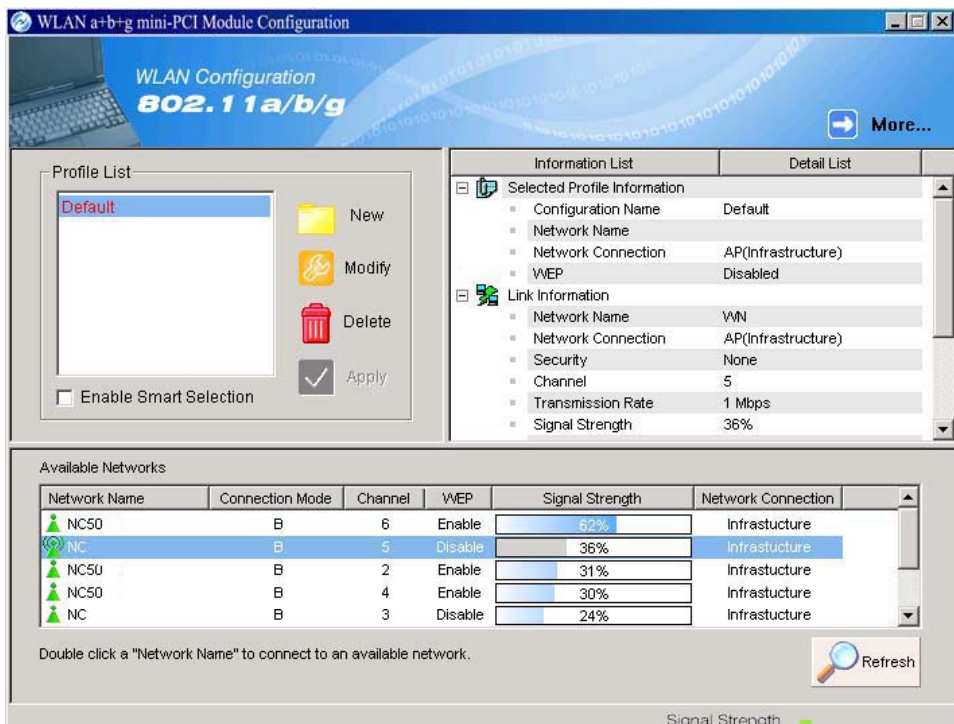

1.3. Connecting to an Existing Network

Double click the shortcut icon of WLAN a mini-PCI Module on the desktop, and the Configuration window appears.

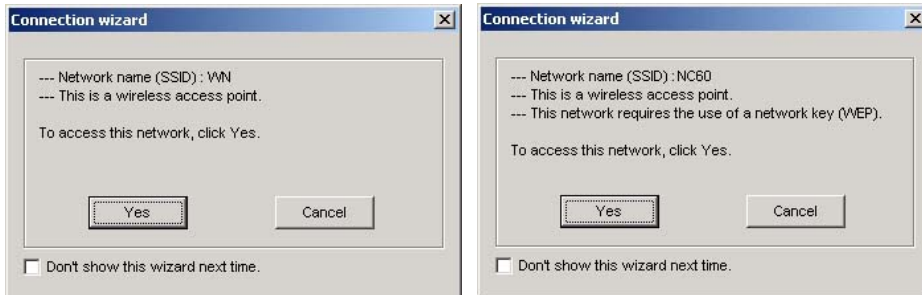

Click on the Refresh button to list all available networks.

3.2.Note! To automatically connect to the network with the strongest signal, select Enable Smart Selection. **Any displays in Profile List.**

3.

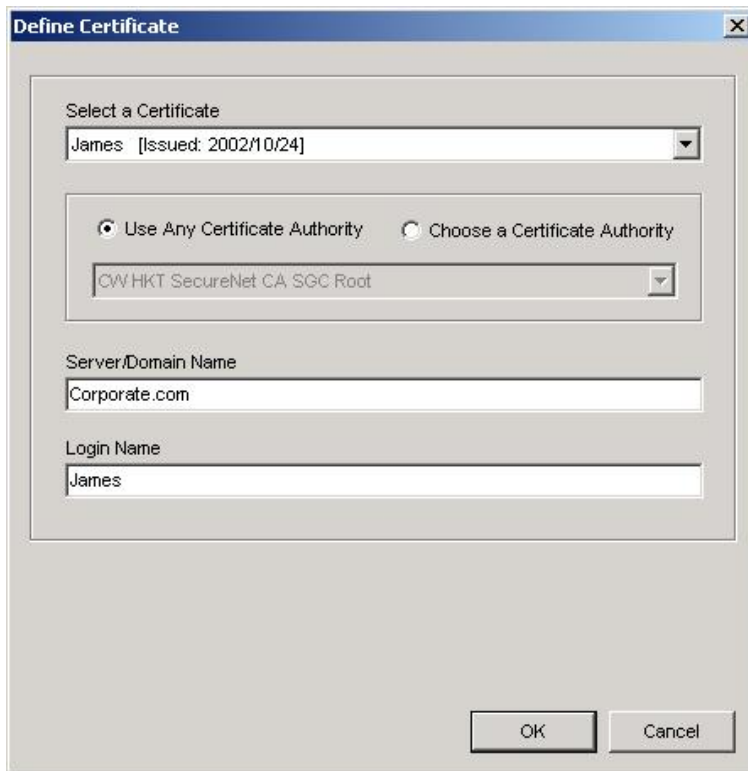

From the list of “Available Networks” , choose one network by double clicking the Network Name. One of the following dialog boxes appears. Click “Yes” to continue.

If the chosen network has security enabled, the Security tab displays. Select the security option used by the network. Contact the network administrator for the correct settings.

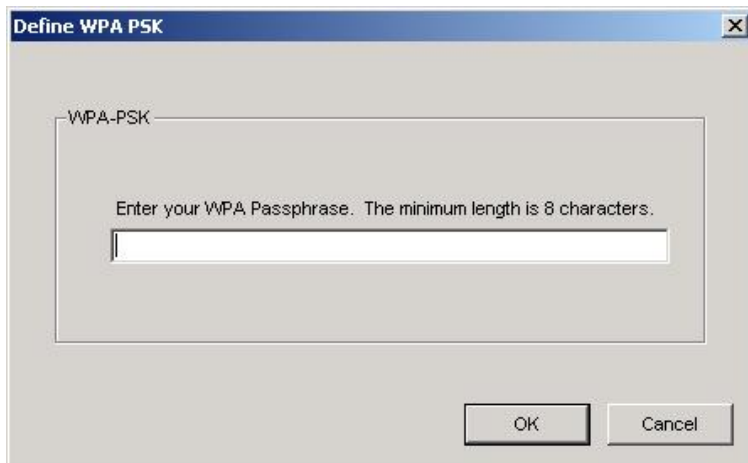

If selecting WPA or 802.1X, select the EAP type, then click on the Configure button to select the certificate.

The 'Define Certificate' dialog box contains the following fields and options:

- Select a Certificate:** A dropdown menu showing 'James [Issued: 2002/10/24]'.
- Certificate Authority:** Two radio buttons: 'Use Any Certificate Authority' (selected) and 'Choose a Certificate Authority'. Below them is a dropdown menu showing 'CW HKT SecureNet CA SGC Root'.
- Server/Domain Name:** A text input field containing 'Corporate.com'.
- Login Name:** A text input field containing 'James'.
- Buttons:** 'OK' and 'Cancel' buttons at the bottom right.

If selecting WPA-PSK, click on the Configure button to enter the PassPhrase.

The 'Define WPA PSK' dialog box contains the following elements:

- WPA-PSK:** A section header above a large text input area.
- Instruction:** The text 'Enter your WPA Passphrase. The minimum length is 8 characters.' is displayed above the input field.
- Input Field:** A single-line text input field for the passphrase.
- Buttons:** 'OK' and 'Cancel' buttons at the bottom right.

If selecting Pre-Shared Key, click on the Configure button to enter the correct Encryption Keys.

Key entry method:

a. 10 hex digits: User must enter 10 hexadecimal digits.

The hexadecimal define is "0-9" and "A-F".

ex: 123456abc

b. 5 chars: User must enter 5 characters. ex: ab3#@

c. 13 chars: User must enter 13 characters.

ex: ab3#@kf08&kdk

d. 16 chars: User must enter 16 characters.

ex: ab3#@kf08&kdk456

For WEP key, please contact with MIS administrator.

Define Pre-Shared Keys

Default Encryption Key:

Encryption Keys (Hex 0-9 A-F)

Key Length: 64 (40+24) 10 hex digits

Unique Key:

Shared

First: 64 (40+24) 10 hex digits

Second: 64 (40+24) 10 hex digits

Third: 64 (40+24) 10 hex digits

Fourth: 64 (40+24) 10 hex digits

First Key: Column 1, Length 0

OK Cancel

4. Click on **OK** (or **Apply** if using the other tabs) when done to save the settings.

5. Once connected (the icon  or  in front of the name of the Connected Network), you can check the signal strength from the icon  in the Windows System Tray.

Additional Note for Windows XP

In Windows XP, it is recommended that you use the WLAN a mini-PCI Module Configuration Utility. Before using the Utility, please follow the steps below to disable the Windows XP Zero Configuration:

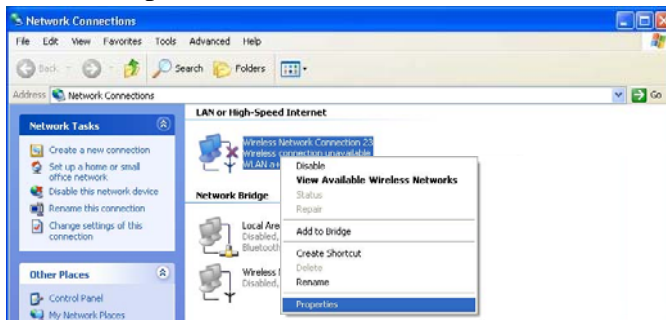

Option 1:

1. Double click the shortcut icon to open the Utility.
2. From the Windows System Tray, you should see the signal icon. Right-click it and select “Disable Zero-Configuration”.

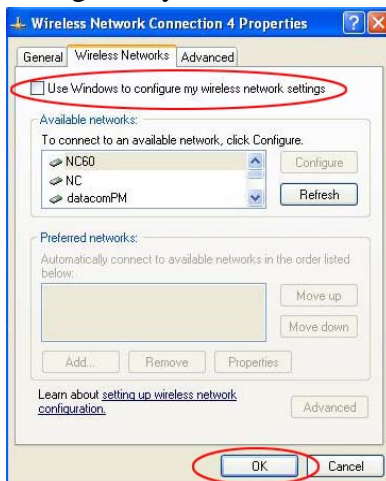

Option 2:

1. Go to “Control Panel” and double click “Network Connections”.
2. Right-click “Wireless Network Connection” of “WLAN a mini-PCI Module”, and select “Properties”.

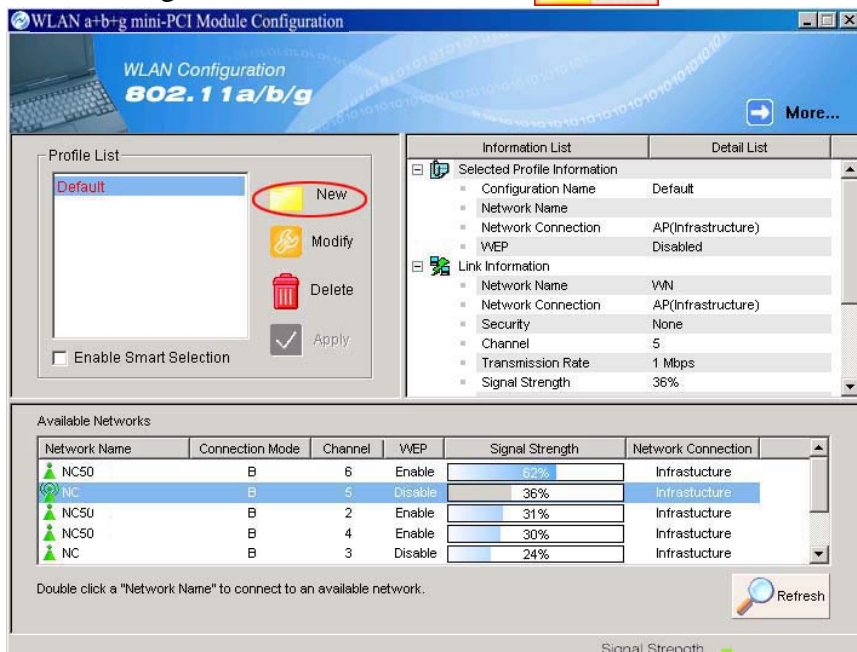

3. Select “Wireless Networks” tab, and uncheck the check box of “Use Windows to configure my wireless network settings”, and then click “OK”.

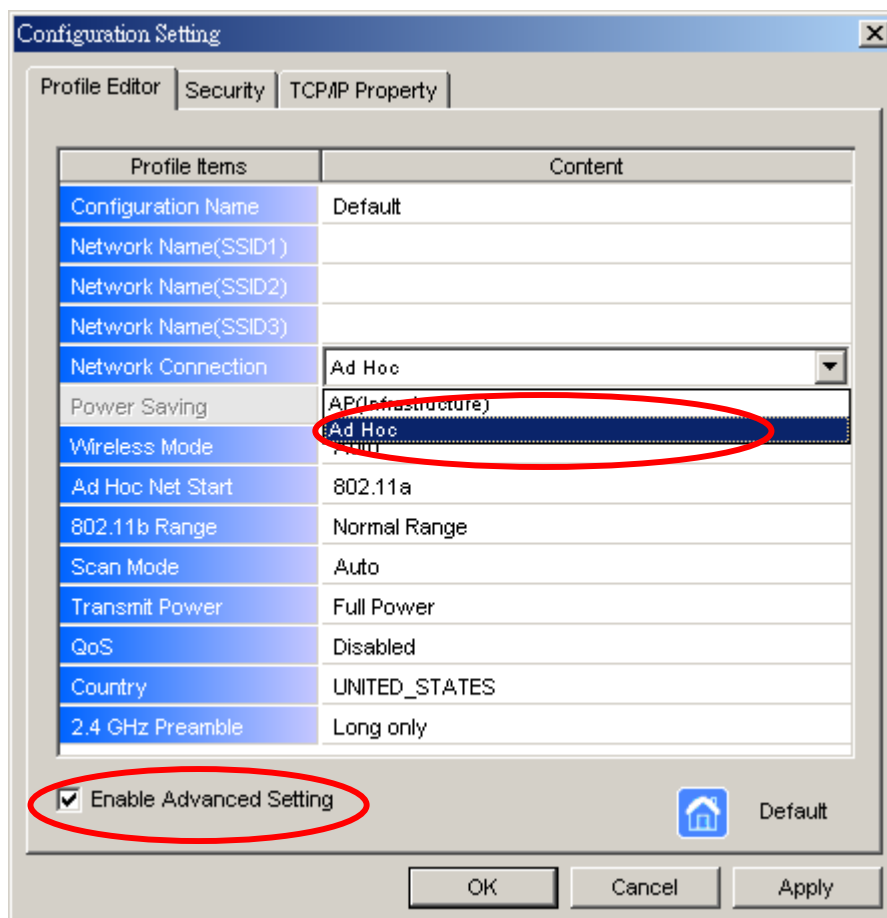

4. Creating an Ad Hoc New Network

1. In the Configuration window, click **New** 

2. Select the "Profile Editor" tab.

3. Choose the check box of **Enable Advanced Setting** to edit all settings.
4. If joining or creating an Ad-Hoc network, choose **Ad Hoc**.
5. If the correct country is not selected, select the country where the computer is located.

ALERT! Different countries have different regulations that affect which channels can be used. You should always choose the country where you are physically located to avoid using an illegal channel.

6. Click **OK** (or **Apply** if using the other tabs) to save the settings.
For details of each setting, refer to [Modifying a Wireless Network on page 20](#).
7. Click the **Security** tab. If not using security, select **None**.

8. If security is used, select **Pre-Shared Key** and click on the **Configure** button.

9. Enter an encryption key in the **Shared: First** field.

The image shows a dialog box titled "Define Pre-Shared Keys". At the top, there is a "Default Encryption Key:" dropdown menu. Below this is a section titled "Encryption Keys (Hex 0-9 A-F)". Inside this section, there is a "Key Length" dropdown menu set to "64 (40+24) 10 hex digits". Underneath, there are four rows for "Shared" keys: "First:", "Second:", "Third:", and "Fourth:". Each row has a text input field and a "Key Length" dropdown menu. The "First:" text input field is circled in red. At the bottom of the dialog box, there are "OK" and "Cancel" buttons. A status bar at the bottom left reads "First Key: Column 1, Length 0".

10. Click **OK** (or **Apply** if using the other tabs) to save the settings. The new **Network Name** is listed in the **Profile List**.

The driver does not allow channel selection in Ad-Hoc mode. Instead, the driver starts with an initial channel then checks channel status. If the channel is busy, the driver automatically uses a different channel.

For details of each setting, please see chapter 5.

5. Modifying a Wireless Network

5.1 Infrastructure Mode and Ad Hoc Mode

You can set the Wireless Network Adapter to work in either **Infrastructure mode** or **Ad Hoc mode**.

Infrastructure Mode

In infrastructure mode, devices communicate with each other by first going through an Access Point (AP). Wireless devices can communicate with each other or can communicate with a wired network. When one AP is connected to wired network and a set of wireless stations, it is referred to as a BSS (Basic Service Set).

Ad Hoc Mode

Ad-hoc mode is also called “peer-to-peer mode” or “Independent Basic Service Set (IBSS)”. In ad hoc mode, devices communicate directly with each other without using an Access Point (AP).

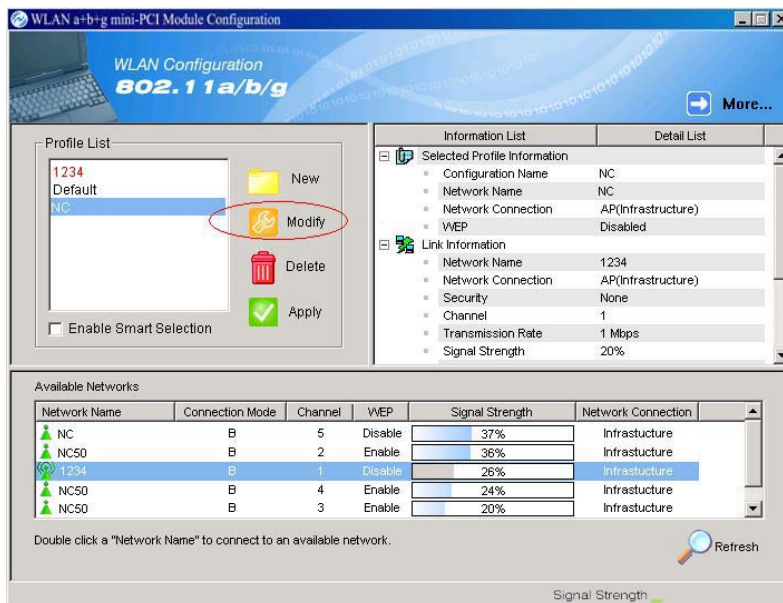

5.2 Modifying a Wireless Network

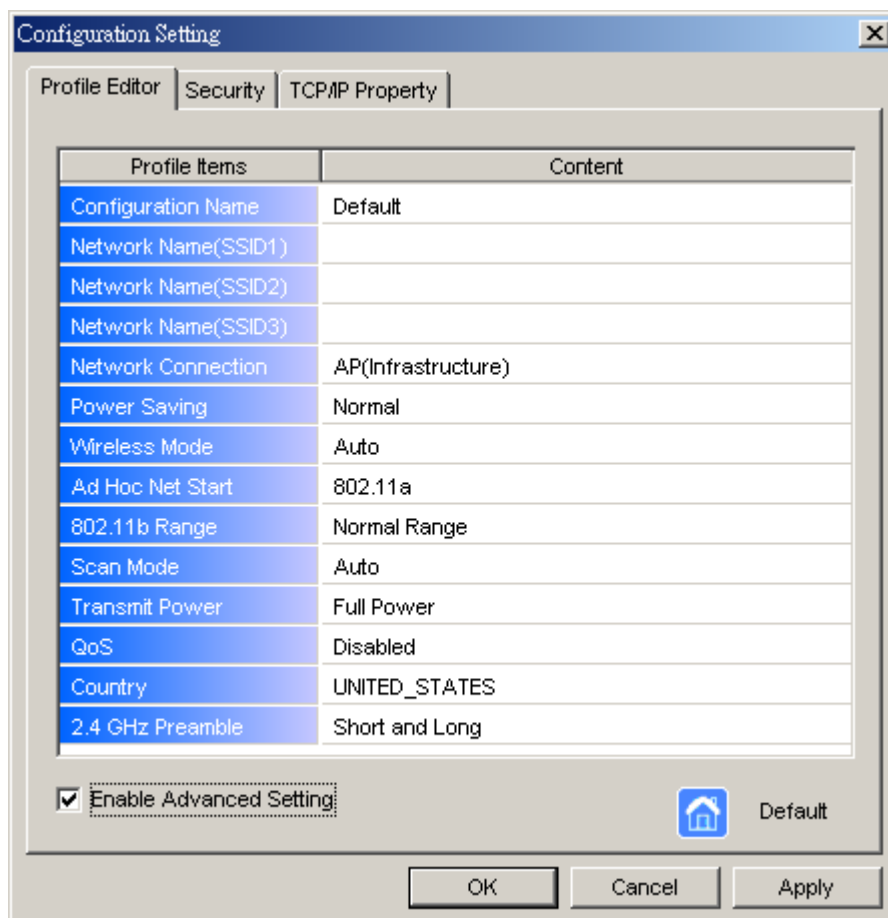

1. Open “WLAN a mini-PCI Module Configuration” by double clicking the shortcut icon on the desktop.

Note! If there’s no network name listed in the “Profile List”, click **Refresh** button and double click a Network Name from **Available Networks**. The chosen Network Name is listed in the Profile List.

2. From the Profile List, select one Profile and click **Modify** button

3. Select **Profile Editor** tab and edit the settings. Click **OK** to save the modifications.

- **Configuration Name:** This name identifies the configuration. This name should be unique.
- **Network Name (SSID1) (SSID2) (SSID3):** The name of the wireless network. This name cannot be longer than 32 characters. If the field is set to be “ANY” or is left blank, your computer will connect to an AP with the best signal strength.
- **Network Connection:** Specifies the mode of the network. Two options are “Infrastructure” and “Ad Hoc”.
- **Power Saving:** Minimizes power consumption while maintaining network connectivity and high data transfer performance. In **Ad Hoc** mode, **Power Savings** function cannot be enabled. The power management options are:
 - **Off:** PC Card is powered up at all times.
 - **Normal:** PC Card sleeps less often and stays asleep for a shorter period.
 - **Maximum:** PC Card sleeps more frequently and stays asleep as much as possible.
- **Wireless Mode:** Three options are, “802.11a”, “Super A” or “Auto”.

“Auto” allows the use of 802.11a mode.

- **Ad Hoc Net Start:** Specifies a band to establish an Ad Hoc network if no matching SSID is found. Four options are available: 802.11a, 802.11aTurbo.
- **Scan Mode:** Options are **Active Scan**, **Passive Scan** and **Auto**. In Active Scan, the driver sends out the probe request frames from each channel and collects the response frames from the responding. In Passive Scan, the driver scan each requested channel, listening the beacons on each channel.
- **Transmit Power:** This setting allows you to change the output power of the PC Card to increase or decrease the coverage area.
- **QoS:** Disables or enables the PC Card to cooperate in a network using QoS (Quality of Service).

4. Select **Security** tab and choose the security mode.

Note! Check with your Network Administrator for the security features supported by your AP.

- **WPA:** Enables the use of WiFi protected Access (WPA). This option requires IT administration.
 - a) Select **WPA** to open the WPA EAP drop-down menu. The options includes TLS and PEAP.
 - b) Click on the **Configure** button and complete the configuration information in the Define Certificate dialog.
- **WPA-PSK:** Enables the WPA-Pre Shared Key (PSK). Click on the **Configure** button and complete the configuration information in the WPA Passphrase dialog.
- **802.1x:** Enables 802.1x security. This option requires IT administration.
 - a) Select **802.1x** to open the 802.1x EAP drop-down menu. The options include TLS and PEAP.
 - b) Click on the **Configure** button and complete the configuration information in the Define Certificate dialog.

- **Pre-Shared Key:** Enables the use of pre-shared keys that are defined on the AP and the station.
 - a) Select the **Pre-Shared Key** radio button.
 - b) Click on the **Configure** button and complete the configuration information in the Define Certificate dialog.
- **None:** No security.

5. Define the Certificate.

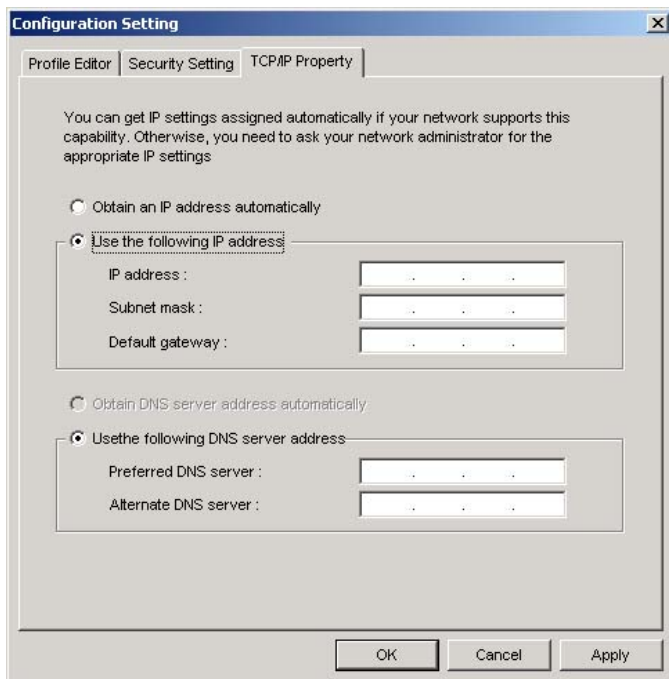

- **Select a Certificate:** Select the Certificate to Authenticate to the RADIUS server from the drop-down menu.
- **Use any Certificate Authority:** The Default Setting. Select this radio button to use any Certificate Authority (CA) for authentication.
- **Choose a Certificate Authority:** Select this radio button to choose the desired Certificate Authority for authentication from the drop-down menu.
- **Server/Domain Name:** The the RADIUS server name or the domain name used for the network access.
- **Login Name:** The username used to log into the server or domain.
- **Define User Information (PEAP):** Click on the **Define User Information** button and complete the configuration information in the Define User Information dialog.

6. If selecting **WPA-PSK**, click on the **Configure** button to enter the PassPhrase. The PassPhrase must be a minimum of 8 printable ASCII characters. The PassPhrase should be at least 20 characters to make it more difficult for an attacker to decipher the key.
7. If selecting **Pre-Shared Key**, click on the **Configure** button to enter the Encryption Keys. When finished, click **OK**. For WEP key, please contact with MIS administrator.

- **Key Entry Method:** Determines the entry method for the key. Hexadecimal (0-9, A-F) or ASCII text (all keyboard characters).
- **Default Encryption Key:** Allows you to choose one encryption key (First, Second, Third, or Fourth) as the transmit key, which encrypts transmissions from the PC Card.
- **Unique Key:** Defines the per-session encryption key for the current network configuration. Not used in Ad-Hoc mode.
- **Shared Keys:** Use these fields to enter the wireless network's encryption keys. The keys must be in the correct position (First, Second, Third, or Fourth).
- **Key Length:** Defines the length of each encryption key.
 - o For 40/64 bit (enter 10 digits for hexadecimal or 5 characters for ASCII)
 - o For 104/128 bit (Enter 26 digits for hexadecimal or 13 characters for ASCII)

When the length is changed, the number of available characters in the field automatically changes. If a previously entered key is too long, the key is automatically truncated to fit. If the key length is increased again, the key does not update to the previous value.

8. Click **OK** to save the settings.
9. Select “TCP/IP Property” tab. Enter the settings and click “OK” to save the settings.

- If the network uses DHCP server, choose **Obtain an IP address automatically**.
- If the network does not use DHCP server, choose **Use the following IP address** to set the relative settings. For the IP configuration information, please contact the network administrator.

5.3 Default Settings Windows XP Zero-Configuration

You may also choose the default parameters and directly proceed to Windows XP zero-configuration through the steps below:

1. Go to “Control Panel” and open “Network Connections”.
2. Right-click the Wireless Network Connection of “WLAN a mini-PCI Module”, and make sure this connection is **Enabled**.
3. Right-click the Wireless Network Connection of “WLAN a mini-PCI Module”, and then click “Properties”.
4. Select “Wireless Networks” tab and select “Use Windows to configure my wireless network settings” check box.

Note! Clear the check box of “Use Windows to configure my wireless network settings” will disable automatic wireless network configuration.

Appendix A: FAQ about WLAN

1. Can I run an application from a remote computer over the wireless network?

This will depend on whether or not the application is designed to be used over a network. Consult the application's user guide to determine whether it supports operation over a network.

2. Can I play computer games with other members of the wireless network?

Yes, as long as the game supports multiple players over a LAN (local area network). Refer to the game's user guide for more information.

3. What is Spread Spectrum?

Spread Spectrum technology is a wideband radio frequency technique developed by the military for use in reliable, secure, mission-critical communications systems. It is designed to trade off bandwidth efficiency for reliability, integrity, and security. In other words, more bandwidth is consumed than in the case of narrowband transmission, but the trade-off produces a signal that is, in effect, louder and thus easier to detect, provided that the receiver knows the parameters of the spread-spectrum signal being broadcast. If a receiver is not tuned to the right frequency, a spread-spectrum signal looks like background noise. There are two main alternatives, Direct Sequence Spread Spectrum (DSSS) and Frequency Hopping Spread Spectrum (FHSS).

4. What is DSSS? What is FHSS? And what are their differences?

Frequency-Hopping Spread-Spectrum (FHSS) uses a narrowband carrier that changes frequency in a pattern that is known to both transmitter and receiver. Properly synchronized, the net effect is to maintain a single logical channel. To an unintended receiver, FHSS appears to be short-duration impulse noise. Direct-Sequence Spread-Spectrum (DSSS) generates a redundant bit pattern for each bit to be transmitted. This bit pattern is called a chip (or chipping code). The longer the chip, the greater the probability that the original data can be recovered. Even if one or more bits in the chip are damaged during transmission, statistical techniques embedded in the radio can recover the original data without the need for retransmission. To an unintended receiver, DSSS appears as low power wideband noise and is rejected (ignored) by most narrowband receivers.

5. Would the information be intercepted while transmitting on air?

WLAN features two-fold protection in security. On the hardware side, as with Direct

Sequence Spread Spectrum technology, it has the inherent security feature of scrambling. On the software side, WLAN offers the encryption function (WEP) to enhance security and access control.

6. What is WEP?

WEP is Wired Equivalent Privacy, a data privacy mechanism based on a 64-bit or 128-bit shared key algorithm, as described in the IEEE 802.11 standard.

7. What is infrastructure mode?

When a wireless network is set to infrastructure mode, the wireless network is configured to communicate with a wired network through a wireless access point.

8. What is roaming?

Roaming is the ability of a portable computer user to communicate continuously while moving freely throughout an area greater than that covered by a single access point. Before using the roaming function, the workstation must make sure that it is the same channel number with the access point of dedicated coverage area.

To achieve true seamless connectivity, the wireless LAN must incorporate a number of different functions. Each node and access point, for example, must always acknowledge receipt of each message. Each node must maintain contact with the wireless network even when not actually transmitting data. Achieving these functions simultaneously requires a dynamic RF networking technology that links access points and nodes. In such a system, the user's end node undertakes a search for the best possible access to the system. First, it evaluates such factors as signal strength and quality, as well as the message load currently being carried by each access point and the distance of each access point to the wired backbone. Based on that information, the node next selects the right access point and registers its address. Communications between end node and host computer can then be transmitted up and down the backbone. As the user moves on, the end node's RF transmitter regularly checks the system to determine whether it is in touch with the original access point or whether it should seek a new one. When a node no longer receives acknowledgment from its original access point, it undertakes a new search. Upon finding a new access point, it then re-registers, and the communication process continues.

Market Specifications for model DCMA-86 High Power, Industry

WLAN 802.11a Mini-PCI Adapter (MMCX)

Revision History

Edition #	Reason for revision	Issue date	Author
1.0	● Initial Draft Document	2009/1/30	Ken Liu

Feature List

1. High Power Design, peak power up to 30dBm
2. RoHS compliant product
3. Atheros AR5414A, MAC/BB/Radio single chip solution supports super mode
4. RF connector: 2*MMCX or 2*F.UL
5. Heat sink design provide reliable high power RF performance
6. Screw hole reserved for assembly with AP main board for AP application
7. High speed for wireless LAN connection: IEEE802.11a 54Mbps data rate

with Orthogonal Frequency Division Multiplexing (OFDM) and up to 108Mbps with Turbo mode; Provide seamless roaming within the IEEE 802.11a WLAN infrastructure

- 8. IEEE 802.11a compatible: allowing inter-operation among multiple vendors**
- 9. Support Atheros Super A™ Mode**
- 10. Provide seamless roaming within the IEEE 802.11 a WLAN infrastructure**
- 11. Site survey function**
- 12. Support MicroSoft Windows XP, 2000**
- 13. Interoperability – Complying with WiFi**
- 14. Extended range supporting**
- 15. Support 802.1x, AES-CCM & TKIP, Power Saving Mode**
- 16. 64/128/152-bit WEP Encryption**
- 17. 802.11e standard compatible bursting**
- 18. Wireless multimedia enhancements quality of service support (QoS)**
- 19. Support for IEEE 802.11e,h,I and j standards**

DCMA-86 Market Product Specification, WLAN 802.11a® Mini-PCI Adapter

Item	Key specifications
Main Chipset	➤ DCMA-86, AR5414 BGA Single Chip (with Super AG function)
Frequency Band	➤ A Mode: 5.15~5.35 & 5.47~5.725&5.725~ 5.85 GHz for US
Modulation technique	➤ 802.11 a DSSS (DBPSK, DQPSK, CCK) OFDM (BPSK,QPSK, 16-QAM, 64-QAM)
Host interface	➤ Mini-PCI form factor; Mini-PCI Version 1.0 type 3A
Channels support	➤ 802.11a 1). US/Canada: 8 non-overlapping channels (5.15~5.35 & 5.47~5.725&5.725~ 5.85 GHz)
Operation voltage	➤ 3.3V +/- 10%
Power consumption	➤ A Mode: Cont. Tx: 1100mA (typical)~1300mA (max) Cont. Rx: 250mA (typical)~270mA (max) Stand by: 280mA (typical)~290mA (max) ➤ Power saving: 40mA (typical)
Output power	➤ A Mode: +22.5dBm at 6, 9, 12, 18Mbps +21.5dBm at 36Mbps +19dBm at 48Mbps +18dBm at 54Mbps
Operation distance	➤ 802.11a Outdoor: 85m@54Mbps, 350m@6Mbps Indoor: 25m@54Mbps, 60m@6Mbps
Operation System supported	➤ Windows® 98SE, ME, 2K, XP, NT4.0
Dimension	➤ 59.6mm(L) * 50.8mm (W) * 7.5mm (H)
Security	➤ 64-bit,128-bit, 152-bit WEP Encryption ➤ 802.1x Authentication ➤ AES-CCM & TKIP Encryption
Operation mode	➤ Infrastructure & Ad-hoc mode

Transfer data rate	<ul style="list-style-type: none"> ➤ 802.11a (Normal mode) 54, 48, 36, 24, 18, 12, 9, 6Mbps, auto-fallback ➤ 802.11a (Super mode) 108,96,72,54, 48,36,24,18,12 Mbps, auto-fallback
Operation temperature	➤ -40° ~ 80° C (Industrial Grade); 0~70°C (Commercial grade)
Storage temperature	➤ --40° ~ 80° C (Industrial Grade); -10° ~ 80° C (Comercial Grade)
Wi-Fi® Alliance	➤ WECA Compliant
WHQL	➤ Microsoft® 2K, XP Complaint
FAA	➤ S/W radio On/Off support
EMC certificate	<ul style="list-style-type: none"> ➤ FCC part 15 (USA) ➤ ETSI, EN301893, EN60950 (Europe)
Media access protocol	➤ CSMA/CA with ACK architecture 32-bit MAC
Advance Function	<ul style="list-style-type: none"> ➤ Super A ➤ Extended Range ➤ Support JumpStart V1.0 on Microsoft® 2K, XP
Antenna connector	➤ 1 x DIP MMCX connectors
