### **IMPORTANT INFORMATION**

#### FOR AVIONICS INSTALLATION FACILITIES

The NPX138N Series Panel Mount FM Transceivers are supplied without TSO certification, as no such standard presently exists for airborne VHF-FM radio transceivers. This equipment provides what is considered as "supplemental" communications, and can be installed in an aircraft on a "Non interference" basis. Installation should be performed using standard procedures applicable to aircraft radio installation, to ensure that the newly installed equipment does not interfere with any other equipment in the aircraft.

This device complies with Part 15 of the FCC Rules. Operation is subject to the condition that this device does not cause harmful interference

Prepared By: NAT 226	Checked By: NAT 284	NAT 255	Certification: NAT 502	Approved By: NAT 131

# **Section 1 Description**

#### 1.1 Introduction

Information in this section consists of product description, design features and specifications for the NPX138N Series Panel Mount FM transceiver, serial number 1238 and above. All derivative product information will be contained in the applicable manual supplement, which may be obtained from Northern Airborne Technology Ltd. as required.

Review all notes, warnings and cautions.

# 1.2 Product Description

The NPX138N Series incorporates Northern Airborne Technology Ltd's proven user-friendly operating system with on-line help, making it easy to program and use. The small size makes this radio ideal for airframes where size and weight are a factor.

The NPX138N Series panel mount FM transceiver is a stand-alone radio designed for the single mission user. It provides all the features needed to satisfy FM communications within the VHF-FM high band.

### 1.3 Design Features

The NPX138N Series covers a frequency range of 138.000 MHz to 173.995 MHz in 5.0/6.25 kHz increments. Each of the 100 available channels can include a receive frequency and CTCSS tone; transmit frequency and CTCSS tone, and an alpha/numeric identifier.

A SCAN function allows scanning of selected channels. Transmit power of either 1 watt or 10 watts is selectable from the front of the NPX138N. Simplex and semi-duplex operations are available. An optional guard receiver is available with some models.

DTMF encoding and direct keyboard entry can be effected by the use of the DTE12, an accessory available from Northern Airborne Technology Ltd.

Conveniently located beside the display are separate main volume, guard volume and transmit select switches. Easily identified along the bottom of the front panel are squelch test, channel up/down and display brightness controls. The aircraft dimmer buss provides control for the panel lighting.

Depending on model selected the NPX138N Series can provide wideband (± 5.0 kHz Rated System Deviation) and/or narrowband (± 2.5 kHz Rated System Deviation) by channel. Compensation circuitry ensures that the average receive audio level remains constant when the mode changes.

### 1.4 Specifications

### 1.4.1 Electrical Specifications

Input power 28 Vdc nominal

Current consumption 0.5 A receive/2.0 A transmit (typical)

0.8 A receive/3.0 A transmit (max.)

Panel lighting 28 Vdc, 14 Vdc or 5 Vdc dependent on model

Sidetone output 25 mW @ 600  $\Omega$ , adjustable.

Microphone Amplified Dynamic or equivalent, 150  $\Omega$ 

balanced/unbalanced

Frequency range 138.000 MHz to 173.995 MHz

Tone capability 38 standard CTCSS tones

Operating mode simplex or semi-duplex

### 1.4.1.1 Receiver

Channel increments 5 kHz/6.25 kHz

Audio output 100 mW @ 600 Ω Balanced/Unbalanced

Sensitivity

Spurious response rejection 70 dB

Adjacent channel rejection

Wideband 70 dB min.  $@ \pm 25 \text{ kHz}$ Narrowband 60 dB min.  $@ \pm 12.5 \text{ kHz}$ 

Intermodulation rejection 70 dB

Hum and Noise ratio

Unsquelched >50 dB Squelched <-80 dBw

Distortion <4% @ rated output

### 1.4.1.2 Transmitter

RF power output 1 W/10 W Selectable

RF input/output impedance 50  $\Omega$  nominal

Rated System Deviation

Wideband  $\pm$  5.0 kHz max, limited Narrowband  $\pm$  2.5 kHz max, limited

Microphone Audio Sensitivity 100 mVrms into 150  $\Omega$  for 60% of rated system deviation

Conducted spurious emissions

High power -64 dBc Low power -55 dBc

Carrier frequency stability  $\pm 0.0003 \%$  FM hum and noise ratio >40 dB AM hum and noise ratio >35 dB

Distortion <4 %

# 1.4.2 Physical Specifications

Height 1.88 inches (47.6 mm)

Overall depth 8.64 inches (219.5 mm)

Depth behind panel 7.66 inches (194.6 mm)

Width 5.75 inches (146.1 mm)

Weight 3.0 lbs. (1.4 kg)

Mounting Standard Dzus mounting (4 fasteners)

Connector type 25 pin D-subminiature male (pins)

Antenna connector BNC female

### 1.4.3 Environmental Specifications

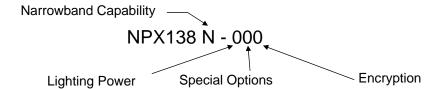

Operating temperature -30 C to +60 C
Altitude 25,000 feet

Humidity 95%

Vibration DO-160C Cat. M

#### 1.5 Unit Nomenclature

Variants of the NPX138N series radios are identified as follows:

1.5.1	Narrowband Capability	{tc "1.6.1	Narrowband Capability
	"}		

The letter N after the NPX138 designation indicates the capability for narrowband selection in addition to wideband. If this part of the name is blank, the unit has wideband capabilities only.

NPX138 N - 000

**N** = Wideband and Narrowband modulation

**Blank** = Wideband modulation only

1.5.2 Lighting Power {tc "1.6.2 Options "}

The digit in the first position of the unit suffix indicates the lighting power used.

NPX138 N - **0**00

**0** = 28 Vdc Lighting **1** = 14 Vdc Lighting

**2** = 28 Vdc NVG NVIS A Compliant

**5** = 5 Vdc Lighting

7 = 28 Vdc NVG Compatible Lighting 8 = 14 Vdc NVG Compatible Lighting 9 = 5 Vdc NVG Compatible Lighting

### 1.5.3 Special Options

The digit in the second position of the unit suffix indicates any special options installed.

NPX138 N - 0**0**0

0 = No Special options installed5 = USFS Standard Guard

6 = Custom Guard - consult factory for details

7 = Synthesized Guard

Other = Special options installed - consult factory for details

### 1.5.4 Voice-Inversion Encryption

The digit in the third position of the unit suffix indicates whether voice inversion encryption is installed.

NPX138 N - 00**0** 

0 = No Encryption1 = Encryption

#### Section 1 ends

#### Section 2 Installation

#### 2.1 Introduction

Information in this section consists of unpacking and inspection procedures, installation procedures, post-installation checks and installation drawings for the NPX138N Series Panel Mount FM Transceiver.

Review all notes, warnings and cautions.

# 2.2 Unpacking and Inspection

Unpack the equipment carefully and locate the warranty card. Inspect the unit visually for damage due to shipping and report all such claims immediately to the carrier involved. Check that all items listed below are present before proceeding and report any shortage immediately to your supplier:

- Warranty Card
- Operators Manual
- Certificate of Conformity or Release Certification

### 2.2.1 Warranty

All Northern Airborne Technology Ltd. products are warranted for 2 years from date of installation by an authorized Northern Airborne Technology Ltd. dealer, to be free of defects in workmanship or performance. This warranty covers all materials and labour, but is exclusive of any transport to deliver the defective unit to and from Northern Airborne Technology Ltd. or its designated warranty repair center, or any labour to remove or re-install the defective unit in the aircraft. Contact Northern Airborne Technology Ltd. for any questions regarding this warranty, its applicability to your units and/or for return authorization. Northern Airborne Technology Ltd. is the final arbitrator concerning warranty administration. Units which have been physically damaged, burned, immersed in water or otherwise abused beyond the scope of normal use will not be considered for warranty. WARRANTY IS VOID UNLESS THE PRODUCT IS INSTALLED BY AN AUTHORIZED NORTHERN AIRBORNE TECHNOLOGY LTD. DEALER. Product for which a warranty card is not returned shall be warranted from date of manufacture.

### 2.3 Continued Airworthiness

Maintenance of the NPX138N Panel Mount FM Transceiver is 'on condition' only. Periodic maintenance of these products is not required.

# 2.4 Installation Procedures

#### Installation Notice

This product must be installed in accordance with the installation instructions provided in the latest issue of this Installation and Operation Manual. Check the Publication Index at www.northernairborne.com for the issue status of the manual. The latest issue of the manual may be downloaded from the same website. All risk associated with installation of this product contrary to these instructions shall be the responsibility of the installing agency.

### 2.4.1 Warnings

#### **WARNING:**

High volume settings can cause hearing damage.
Set the headset volume control to the minimum setting prior to conducting tests, and slowly increase the volume to a comfortable listening level.

#### 2.4.2 Cautions

#### **CAUTION:**

Do not bundle any lines from this unit with transmitter coax lines. Do not bundle any logic, audio, or DC power lines from this unit with 400 Hz synchro wiring or AC power lines. Do not position this unit next to any device with a strong alternating magnetic field such as an inverter or significant interference to operation will result. In all installations, use shielded cable exactly as shown and ground as indicated. Significant problems may result if these guidelines are not followed.

All audio installations can be severely degraded by incorrect wiring and shielding, and may result in much higher cross-talk, hum, and ground-loop interference. This should be considered when audio wiring to and from the radio installation is performed.

#### 2.4.3 Notes

The case of the NPX138N must be electrically grounded for maximum resistance to low frequency interference. A pin on the connector (Chassis ground) is provided and must be connected by a short wire to a clean ground, not jumpered to the power ground wire connection.

Refer to the aircraft structural repair manual and maintenance manual for instructions and information pertinent to this installation.

#### 2.4.4 Cabling and Wiring

All wire shall be selected in accordance with the original aircraft manufacturer's Maintenance Instructions or AC43.13-1B Change 1, Paragraphs 11-76 through 11-78. Unshielded wire types shall qualify to MIL-W-22759 as specified in AC43.13-1B Change 1, Paragraphs 11-85, 11-86, and listed in Table 11-11. For shielded wire applications, use Tefzel MIL-C-27500 shielded wire with solder sleeves (for shield terminations) to make the most compact and easily terminated interconnect. Follow the interconnect drawing in Section 2.5 as required.

Coaxial cable shall be selected in accordance with MIL-C-17 unless otherwise specified. Do not use coax cable with PVC insulation. Teflon dielectric cable is encouraged at or above VHF frequencies or where cable runs exceed 8 feet. Note that at VHF frequencies, cables losses due to long cable runs and tight bends may reduce the ERP (Effective Radiated Power) by greater than 50%.

Allow 3" from the end of the shielded wiring to the shield termination to allow the connector hood to be easily installed. Refer to the interconnect drawing in Section 2.5 for shield termination details. Note that the hood is a "clamshell" hood, and is installed after the wiring is complete. Aircraft harnessing shall

permit the unit to be removed from the panel for easy access to all side adjustments. Do NOT mount the unit until all adjustments have been performed.

Maintain wire segregation and route wiring in accordance with the original aircraft manufacturers Maintenance Instructions. Coaxial cables shall be routed separately from existing wire bundles in the aircraft to minimize electromagnetic coupling effects.

Unless otherwise noted, all wiring shall be a minimum of 22 AWG, except power and ground lines, which shall be a minimum of 20 AWG. Reference the Interconnect drawing for additional specifications. Check that the ground connection is clean and well secured, and that it shares no path with any electrically noisy aircraft accessories such as blowers, turn and bank instruments or similar loads. Power to this unit must be supplied from a separate circuit breaker or fuse (fast blow), and not attached to any other circuit breaker without additional protection. Verify that the selected circuit breaker size and wire gauge are adequate for the installation using the techniques specified in AC43.13-1B Change 1, Paragraphs 11-47 through 11-51 and 11-66 through 11-69.

#### 2.4.5 Antennas

Correct antenna placement and mounting is critical in order to achieve the best possible performance. In general, keep all antennas as widely separated as possible and clear of any large airframe obstructions.

Installation of the antenna should be in accordance with the original aircraft manufacturer's instructions for continued airworthiness or AC 43.13-1B Change 1, chapter 11, section 15 and AC 43.13-2A chapter 3. If possible, the antenna should be located a minimum of 12 ft from aircraft navigation receiver antennas and a minimum of 4 feet from aircraft communications and ELT antennas. Be careful not to choose separations that closely approximate ¼, ½ or whole-number multiples of the navigation or communications system wavelength.

Note: Avoid any placement that puts antennas of like frequencies close together.

Bottom mounted antennas will perform best in flight, but poorest on the ground during testing. Antennas may be severely degraded by 'masking' effects of the fuselage or stabilizers, and generally give best performance when bottom mounted.

To reduce interference from rotor modulation and other undesirable stimuli, any blade or whip antenna must be surrounded by a ground plane surface (metallic, grounded material) with a radius equal to or greater than the height of the antenna. Under the same conditions, the antenna is also much less likely to cause interference to other aircraft systems (e.g. coupling into audio system, fluctuations in instrumentation, etc.). Poor grounding will result in severe reflected power and high levels of RFI throughout the airframe.

Avoid antenna locations that will become fouled with oil, water, fuel or dirt, as this will degrade performance. Roof mounts (in close proximity to rotor blades) are permissible.

#### 2.4.6 Mechanical Mounting

Installation of the transceiver should be in accordance with the original aircraft manufacturer's instructions for continued airworthiness or AC 43.13-1B Change 1, chapter 7, sections 2 to 7 and AC 43.13-2A, chapter 2. Pr 35 Dzus rail or equivalent may be used.

Mounting the NPX138N requires a Dzus rail assembly with an opening width of 127 mm (5 inches) and a front clearance width of 146.1 mm (5.75 inches). Height requirement is 47.6 mm (1.875 inches). Refer to the mounting drawings and unit mechanical specifications to determine proper clearance dimensions. Be sure that adequate clearance is allowed for the cable connections to each unit.

#### 2.4.7 Post-Installation Checks

#### 2.4.7.1 Voltage/resistance checks

Do not attach the NPX138N until the following conditions are met.

Check the following:

- a) P101 pins <12> and <13> for +28 Vdc relative to ground.
- b) P101 pins  $\langle 22 \rangle$ ,  $\langle 23 \rangle$ ,  $\langle 24 \rangle$  and  $\langle 25 \rangle$  for continuity to ground (below 0.5  $\Omega$ ).
- c) Light voltage as listed in the table below.

	P101 Pin #	Voltage
28 Volt Models	11	28 Vdc
14 Volt Models	10	14 Vdc
5 Volt Models	10	5 Vdc

Light Voltage

Ensure that the antenna is disconnected for the following test or erroneous readings may be obtained.

d) Radio coax connector for continuity to the antenna coax connector (shield and center conductor), and for open circuit from the center conductor to ground and open circuit from the center conductor to the shield.

#### 2.4.7.2 Power On Checks

- a) Install the NPX138N and power up the ship's systems. Turn on the radio. Check the operation of all front panel controls. Adjust brightness and volume levels as required.
- b) Check all transmit and receive functions. Ensure the RX/TX status indicator lights green when the radio is keyed to transmit and amber when receiving.
- c) Check the SCAN function.

**Note:** It may not be possible to hear the received audio if the tones do not match those set in the radio. To avoid any confusion, tones should be set to **OFF** (via the status edit mode) during scanning so that all channels will be heard.

d) Check the antenna feedline at the R/T with a through-line wattmeter and suitable frequency elements to ensure correct antenna matching. Reflected power in excess of 25% represents a serious problem, and should be investigated carefully, or serious RFI and system interference as well as possible radio damage may result. A VSWR measurement over 3.0:1 represents a significant loss in signal power to the antenna. Check that forward power is to specifications over the frequency band of the radio.

Upon satisfactory completion of all performance checks, make all required log book entries, electrical load, weight and balance amendments and other documentation as required by your local regulatory agency before releasing the aircraft for service.

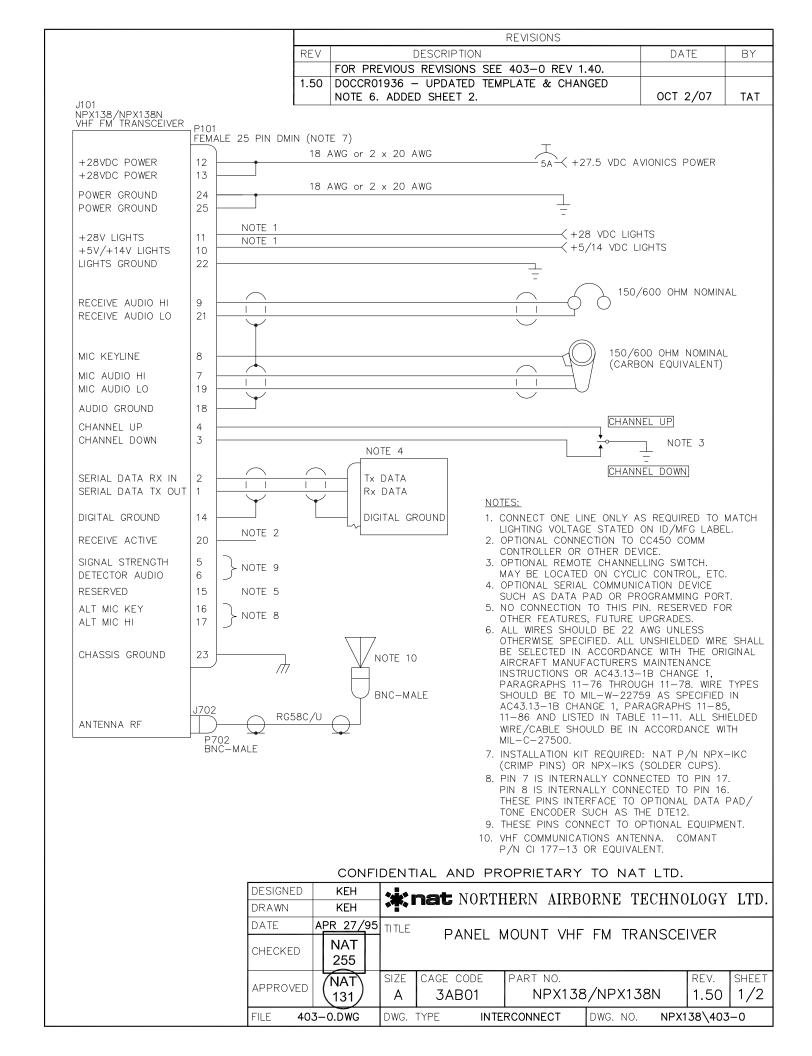

### 2.4.8 Post Installation EMI Test

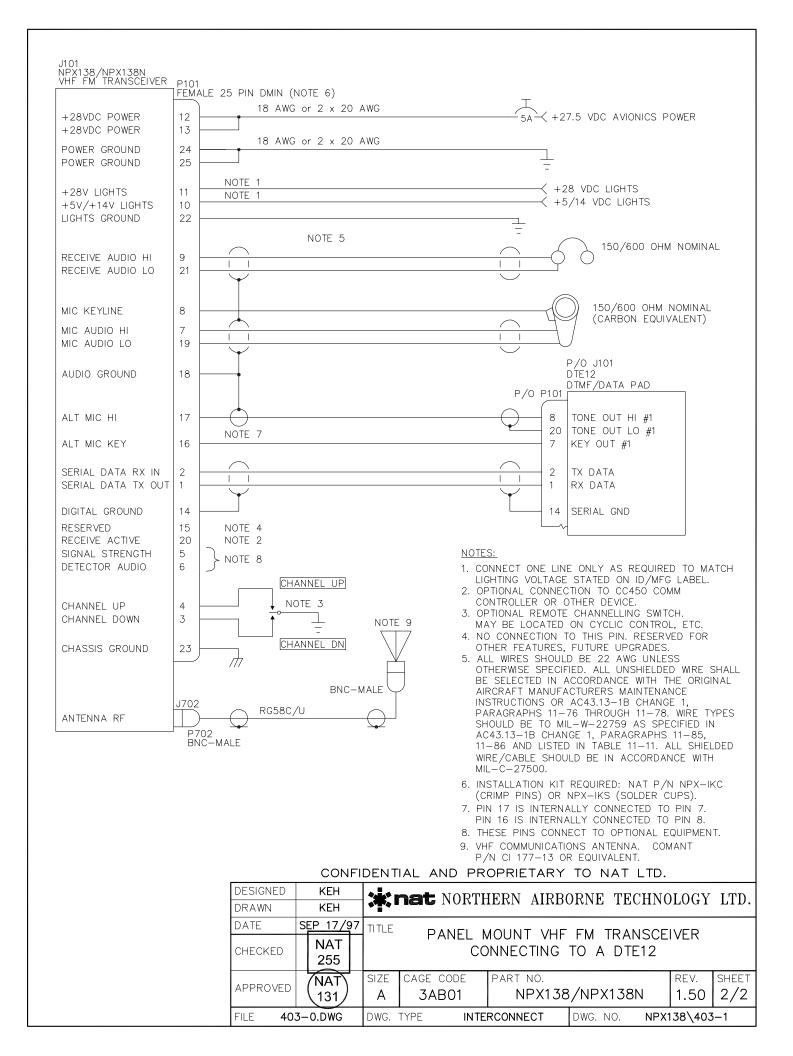

The purpose of this test is to identify any interference that the NPX138N may cause with existing aircraft systems. The NPX138N should be tested in accordance with the Installation Approval Test Procedure (see section 2.5), and the test results documented on the record sheets.

# INSTALLATION APPROVAL TEST PROCEDURE

NAT Part #: NPX138 Description: Panel Mount Radio

Document #: **NPX138\634-0** Rev: **1.10** 

### 1. Post Installation EMI Test

The purpose of this test is to identify any interference that the NPX138 may cause with existing aircraft systems.

### 2. Test Conditions

The NPX138 should be installed and function tested. The antenna VSWR should be checked. A forward/reverse power check with an in-line wattmeter should show no more than 10% reflected power. For the following tests, insure that the transmit power is set to HI.

# 3. Methodology

Most of the EMI tests can be accomplished on the ground. In some cases, flight testing is required or is easier. If the aircraft is approved for IFR operations, then it is mandatory that interference between the NPX138 and the approach aids be checked in flight.

The GPS should be operational and navigating with at least the minimum compliment of satellites. The VHF comm should be set to the frequencies indicated with the squelch open. VOR/ILS/GS receivers should be set to the frequencies indicated and selected for display. If possible, set up a VOR/ILS ramp test set on the frequencies indicated and adjust the output until the flags are out of view. The transponder and encoder should be monitored with ramp test equipment. If possible set the ADF to a nearby navigation station.

Modulate the NPX138 transmitter on the indicated frequencies for at least 20 seconds. Observe the GPS for any degradation in satellite status or availability or flags. Listen for any noise or detected audio signals on the VHF comm(s). Listen for any noise or detected audio signals on the VOR/LOC receiver audio; look for any movement of flags or needles on the VOR/LOC/GS navigation display(s).

List the power plant, fuel and other electric instruments in the chart provided and note any anomalies that occur while transmitting. Assess the results.

If the aircraft is equipped with an autopilot or a stability augmentation system, then test fly the aircraft and verify that the operation of the NPX138 transceiver does not have adverse effects on these systems. After checking for gross effects at a safe altitude, fly an approach with each of the different navigation systems coupled to the autopilot (ILS, GPS etc.) and look for any anomalies.

### Results

If the installed system passes all of the applicable EMI tests, then no further action is If interference is observed, then the interference must be assessed against the appropriate standards of airworthiness for the system in question. For example: it is permissible for a VFR certified GPS to lose navigation capability while the NPX138 is transmitting, providing that it recovers properly and promptly, but it is not permissible for an IFR Approach certified GPS to be affected in the same way. A complete discussion of all the standards of airworthiness to be applied in assessing EMI effects is beyond the scope of this document.

#### 5. **Procedure**

Α. Operate the NPX138 transmitter on the following frequencies for at least 20 seconds. Observe the GPS for any degradation in satellite status, or availability, or flags.

FREQUENCIES	GPS #1		GP	S #2
NPX138	PASS	FAIL	PASS	FAIL
143.2187 MHz				
143.2200 MHz				
153.4500 MHz				
157.5400 MHz				
157.5437 MHz				

Ν	OTES:					

B. Determine if the image frequency for the VHF Comm falls within the range of the NPX138 unit. If so, select a set of frequencies that will cause the NPX138 to be set as close as possible to the image frequency. Any one of the many possible sets will suffice. Record these values in the spaces provided in the following chart. Modulate the NPX138 transmitter on the following frequencies for at least 20 seconds. Listen for any noise or detected audio signals on the VHF comm.

Example - Bendix/King KY 196A:

The first IF frequency is 11.4 MHz. The L.O. is above the received frequency (high side injection), therefore the image frequency is 22.8 MHz above the selected frequency. Set the KY 196A to 120.000 MHz and the NPX138 to 142.8000 MHz.

F	REQUENCIES	RESI	JLTS
VHF #1	NPX138	PASS	FAIL
135.975	138.0000		
121.150	157.5000		
131.250	157.5000		
Image:			

FREQUENCIES		RES	RESULTS	
VHF #2	VHF #2 NPX138		FAIL	
135.975	138.0000			
121.150	157.5000			
131.250	157.5000			
Image:				

NOTES:			

Rev. 1.10 Apr 19, 2004 Page 3 of 7

C. Determine if the image frequency for the VOR/ILS Nav falls within the range of the NPX138 unit. If so, select two sets of frequencies that will cause the NPX138 to be set as close as possible to the image frequency. Choose one set in the localizer frequency range, and one in the VOR frequency range. Record these values in the spaces provided in the following chart. Modulate the NPX138 transmitter on the following frequencies for at least 20 seconds. Listen for any noise or detected audio signals on the receiver audio; look for any movement of flags or needles on the navigation display.

FREQUENCIES		RES	RESULTS	
VOR/ILS #1 NPX138		PASS	FAIL	
108.000	162.0000			
108.100	162.1500			
Image:				
Image:				

FREQUENCIES		RESI	RESULTS	
VOR/ILS #2 NPX138		PASS	FAIL	
108.000	162.0000			
108.100	162.1500			
Image:				
Image:				

NOTES:	

Rev. 1.10 Apr 19, 2004 Page 4 of 7

D. Modulate the NPX138 transmitter on the following frequencies for at least 20 seconds. Look for any movement of flags or needles on the navigation display.

FREQUENCIES		RESI	JLTS
G/S #1	NPX138	PASS	FAIL
334.7 (108.1) 167.3500			

FREQUENCIES		RESI	RESULTS	
G/S #2	PASS	FAIL		
334.7 (108.1) 167.3500				

S:
For the following tests, select frequencies at the top, middle and bottom of the range of the NPX138.
Frequency #1 Frequency #2
Frequency #3
At a safe altitude, engage the autopilot or stability augmentation system. Modulate the NPX138 transmitter on the above frequencies for at least 20 seconds. Observe any effect on the autopilot or stability augmentation system.
vations:

Rev. 1.10 Apr 19, 2004 Page 5 of 7

F. Perform a coupled ILS approach to the aircraft's certified limits. Modulate the NPX138 transmitter on the above frequencies for at least 20 seconds. Observe any effect on the autopilot. Repeat for each different system such as ILS #2, GPS, FMS etc.

Observations:			

G. List the power plant, fuel and other electric instruments in the chart provided and note any anomalies that occur while transmitting. Assess the results.

# Section 3 Operation

#### 3.1 Introduction

Information in this section consists of functional and operational procedures for the NPX138N Panel Mount FM Transceiver.

#### 3.2 General Information

In addition to the general functions that are available on other FM radios, the NPX138N has several features that extend its capability and make it easier to use. These features include alphanumeric channel labelling, built-in operator help, scanning, optional guard receiver, and numerous others.

For ease of use and operability, Northern Airborne Technology Ltd uses the same control layout and operating system in the NPX138N series of radios as it does in its popular Tac/Com family of radio control heads.

In addition to this manual, there is a help function built into the radio comprehensive sufficient to address most operational questions.

Many of the front panel controls have more than one function, dependent on the operating mode of the radio. For this reason, they have multiple labels. When the radio is in 'Normal' mode (EDIT switch in the center 'Off' position), use the top label and when the radio is in 'Edit' mode (either 'CH' or 'ST'), use the bottom label.

#### 3.3 Controls and Indicators

In addition to the general functions that are available on other FM radios, the NPX138N has several features that extend its capability and make it easier to use. These features include alphanumeric channel labelling, built-in operator help, scanning, optional guard receiver, and numerous others.

For ease of use and operability, Northern Airborne Technology Ltd uses the same control layout and operating system in the NPX138N series of radios as it does in its popular Tac/Com family of radio control heads.

In addition to this manual, there is a help function built into the radio comprehensive enough to address most operational questions.

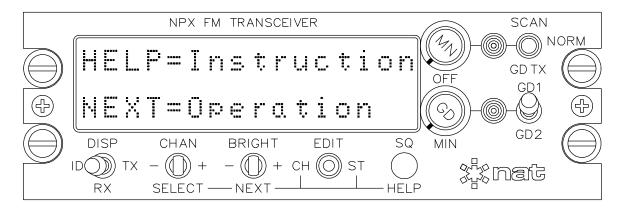

Many of the front panel controls have more than one function, dependent on the operating mode of the radio. For this reason, they have multiple labels. When the radio is in 'Normal' mode (EDIT switch in the center 'Off' position), use the top label; and when the radio is in 'Edit' mode (either 'CH' or 'ST') use the bottom label.

3.4 Initial Operation(tc "1.4.2 Initial Operation")

### 3.4.1 Power-up Help

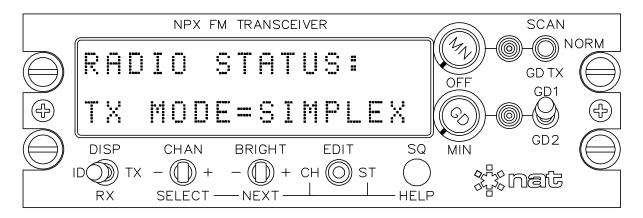

Turn the NPX138N on by rotating the main volume control clockwise, away from the 'Off' detent position. The software revision number will briefly display, followed by a screen presenting an option for use of the on-line Help system, as shown below.

If the **HELP** button is pushed, the radio will present a tutorial on the operation of the radio. To advance through the tutorial, press **HELP** after reading each screen. To exit this initial **HELP** function at any time, move the **NEXT** switch momentarily left or right.

#### 3.4.2 Initial Operating Display

If 'Help' is declined (by using the **NEXT** switch as directed), the radio will display a summary of the installed functions and current settings (this feature can be disabled at installation for faster start-up). The radio is then ready for normal operation.

Display{tc "1.4.3 3.5 Display"} NPX FM TRANSCEIVER SCAN Channel NORM Info GD TX Status Info GD2 DISP BRIGHT CHAN EDIT SQ + CH (O) ST nat NEX HELP Brightness Control Channel Display Mode

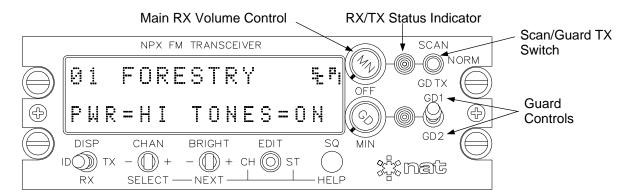

The diagram above shows a typical radio display in 'Normal' operating mode. The upper row of the display contains information related to the currently selected channel. The specific information displayed depends on the setting of the **DISP** (display) switch located in the bottom left hand corner of the front panel. When it is in the **ID** position (as shown above), the display shows the channel identifier or name. When it is in the **RX** or **TX** position, the display shows the respective receive or transmit information. See section 3.8 for further details on the Channel Display.

The lower row of the display contains information related to specific radio functions. Normally, it shows the settings for the power level and the CTCSS tones. However, entering the Status edit mode allows the display of other function settings. See section 3.10 for further details on displaying and changing Status information.

The **BRIGHT** switch controls the brightness of the display text. See section 3.7.2 for further details.

### 3.6 Function Controls{tc "1.4.4 Function Controls"}

The controls located to the right of the display are 'Function' controls. These controls access the radio functions most often used. Access to all other functions is via the status lines (see section 3.10 for further details on 'Status Editing').

# 3.6.1 Main RX (Receive) Volume Control

Set this rotary control to the furthest counterclockwise position (past the 'Off' detent) to turn 'off' the radio. Rotating it clockwise will turn 'on' the radio. To increase the volume of the main receiver, turn this knob clockwise; to decrease the volume turn this knob counterclockwise.

#### 3.6.2 RX/TX Status Indicator

Next to the main RX volume control is a bi-color LED indicator that displays the RX (Receive) status of the main receiver and the TX (Transmit) status of the radio. When the radio is transmitting the LED will light green. When the main receiver receives a signal, the LED will light amber. If the radio is idle (not receiving or transmitting), the LED will be dark. The color-coding used for these functions corresponds to standard aircraft FM radio conventions. It is worth noting that this is the reverse of standard vehicular conventions so may confuse some emergency services staff familiar with land mobile equipment.

The receive indicator (amber) informs the operator that the channel is active with radio traffic of some kind. A radio that is receiving may still not produce any audio if the tones present on the receive signal do not match the tones set in the radio. See section 3.11 for further details on how CTCSS tones work.

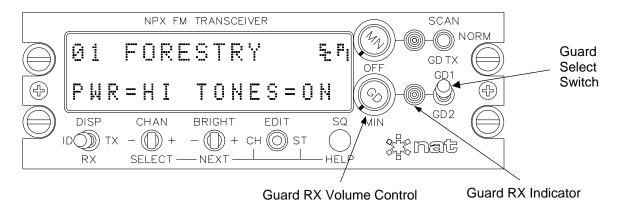

#### 3.6.3 Scan/Guard TX Switch

When this switch is in the **SCAN** position, the radio will begin scanning. See section 3.12 for further details on scanning.

When this switch is in the **GD TX** position, all radio transmissions will be on the guard transmit frequency instead of the transmit frequency of the current channel. The radio continues to receive on both the Guard and Main receivers. This function only applies to radios with the guard receiver option installed. If not, the radio will display 'GD NOT INSTALLED' on the upper line when the switch is set to the **GD TX** position.

Set this switch to the **NORM** position to disable scanning. All radio transmissions will use the transmit frequency of the current channel.

### 3.6.4 Guard Controls

The guard controls are functional only in radios with the optional guard receiver installed.

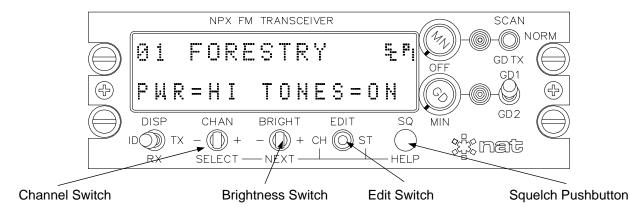

The rotary knob independently sets the guard RX volume. In most models, there is no 'Off' detent position. On most NPX138N models, even with the guard RX volume set completely counterclockwise, the operator will still hear activity on the guard channel (at the preset minimum level).

The Guard Select switch (marked **GD1/GD2** on the faceplate) selects the active guard channel. For standard guard receiver modules (-x5x), the first guard channel (GD1) has a receive frequency of 168.625 MHz and the second guard channel (GD2) has a receive frequency of 167.950 MHz, as specified by the USFS. Radios with custom guard receiver modules are available (-x6x). For radios with synthesized guard modules (-x7x), the receive frequencies for both the GD1 and GD2 channels are programmable via the front panel or serial load to any frequency in the range of 138.000 to 173.995 MHz in 5.0/6.25 kHz increments. The transmit frequencies of the guard channels are programmable. The Guard RX LED indicator lights amber when there is activity on the selected guard channel.

# 3.7 General Controls — Normal Operating Mode{tc "1.4.5 Controls — Normal Operating Mode"}

General

The General Controls are those labelled in the above diagram and affect the over-all operation of the radio. The position of the **EDIT** switch determines the operating mode of the radio. The other three controls (the two center-off momentary switches and the pushbutton) have dual functions, operating differently depending upon the selected operating mode.

When the **EDIT** switch is in the center position (as shown), the radio is in 'Normal' operating mode and the functions of the other switches are those of the upper label.

Lock the **EDIT** switch to either the left (**CH**) or right (**ST**) position, to set the radio in one of the two 'EDIT' modes. In both 'EDIT' modes, the functions of the other switches are those of the lower label. Engraved panel lines tie related Edit functions together. See sections 3.9 and 3.10 for further details on editing.

#### 3.7.1 Channel Switch

To scroll to the desired channel use the **CHAN** switch. Momentarily press it to the right '+' to increment by one channel and to the left '–' to decrement by one channel. Holding the switch in either the left or right position causes the radio to continue to change channels with increasing speed. This allows for quick selection of any channel.

**Note**: Remote channel selection is possible with the installation of an external switch.

# 3.7.2 Brightness Switch

The **BRIGHT** switch controls the brightness of the radio display. Momentarily press it to the right '+' to increment the display brightness by one level and to the left '–' to decrement by one level. There are seven brightness levels from which to select. The radio will retain the display brightness information when turned off, but on power up will limit brightness to a maximum of level five.

### 3.7.3 Squelch Pushbutton

Pressing the **SQ** (squelch) test button over-rides all squelch logic, and lets the radio's unsquelched audio receive signal pass to the aircraft's audio system. The squelch test function is useful for monitoring activity on the radio when tones prevent the squelch from opening, or to verify volume settings or radio function.

# 3.8 Channel Display{tc "1.4.6 Channel Display"}

For each channel stored in the radio, there are three data lines; the ID line, the RX line, and the TX line. Depending on the position of the **DISP** switch, one of these data lines will be shown on the top row of the display. Regardless of which of the three is being displayed, the channel number will always show on the far left hand side and RX/TX functions will be operational.

### 3.8.1 ID Display Line

The ID line includes the channel number, the channel label or name, the scan list flag, and the priority scan channel flag. A typical ID display line might look like this:

Channel	Label	Scan Flags
01	FORESTRY	s <sub>c</sub> p <sub>1</sub>

The label for each channel is an alphanumeric name that may be up to 10 characters long. The channel name has no effect on radio operation, and is provided for operator convenience in identifying the selected channel.

The scan list flag indicates whether or not the radio monitors the channel during scanning. The 'Sc' character means that the channel is in the scan list. A dash '-' indicates the channel is not in the scan list. The 'P1' character means that the channel is the priority scan channel. A dash '-' indicates the channel is not selected as a priority channel.

If the radio is a NPX138N, there will also be a bandwidth flag displayed on the ID line. A typical NPX138N ID line might look like this:

01FORESTRY	$\overline{\underline{n}}$ $s_{C}$ $p_{1}$
Channel Label	Bandwidth Scan Flags

The bandwidth flag indicates the current modulation acceptance and transmit deviation mode. A ' $\overline{\underline{\mathbf{w}}}$ ' character indicates that the channel is operating in wide-band ( $\pm$  5.0 kHz Rated System Deviation) mode. An ' $\overline{\underline{\mathbf{u}}}$ ' character indicates that the channel is operating in narrow-band ( $\pm$  2.5 kHz Rated System Deviation) mode (refer to section 3.13).

# 3.8.2 RX Display Line

The RX line includes the channel number, the receive frequency and the receive tone. A typical RX line might look like this:

Channel	RX Freq.	RX Tone	
01	156.8750r	91	

The radio will receive incoming FM signals that have a carrier frequency equal to that of the receive frequency of the displayed channel.

If the display shows the RX frequency as \*\*\*\*, it means the programmed frequency is invalid. See section 3.9 for details on how to change it to a valid value. The small 'r' indicates that the data displayed is 'Receive' data. If the radio is in 'Simplex' mode, an 's' will replace the 'r'. In 'Simplex' or 'Direct' operation, the radio's TX data matches the RX data. This permits talk-around operation on repeaters. The programmed TX data remains in the radio, but is unused until the operator returns the radio to duplex mode.

The last three positions (far right hand side) on the RX line display an optional CTCSS (sub-audible) tone used for repeater or squelch control. The radio has several different methods by which to display the tone. See section 3.11 for further details on tones.

### 3.8.3 TX Display Line

The TX line includes the channel number, the transmit frequency and the transmit tone. A typical TX line might look like this:

01	156.8750t	91	

Channel TX Freq. TX Tone

When the microphone is keyed, the radio will transmit an FM signal that has a carrier frequency equal to that of the transmit frequency of the displayed channel.

If the display shows the TX frequency as \*\*\*\*\*\*, it means the programmed frequency is invalid. See section 3.9 for details on how to change it to a valid value. The small 't' indicates that the data displayed is 'Transmit' data. If the radio is in Simplex mode, an 's' will replace the 't'. In 'Simplex' or 'Direct' operation, the radio's TX data matches the RX data. This permits talk-around operation on repeaters. The programmed TX data remains in the radio, but is unused until the operator returns the radio to duplex mode.

The last three positions (far right hand side) on the TX line display an optional CTCSS (sub-audible) tone used for repeater or squelch control. The radio has several different methods by which to display the tone. See section 3.11 for further details on tones.

# 3.9 Channel Editing{tc "1.4.7 Channel Editing"}

Editing is the general term for changing any information stored in the NPX138N radio. There are two basic types of editing, all selectable from the front panel of the radio. These are 'Channel editing' (**CH**) and 'Status editing' (**ST**). The labels below the general controls (connected by lines) represent the functions of those switches during editing.

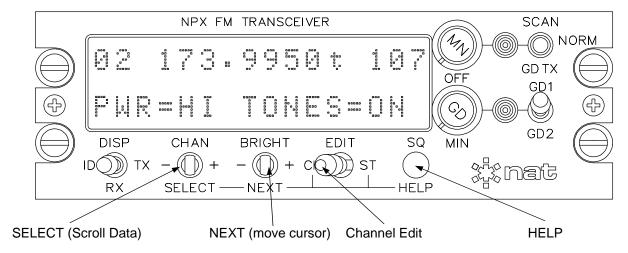

As the name implies, the channel editing feature, when enabled, permits the operator to change channel data. This data includes channel names, transmit and receive frequencies and tones, and list scan flags.

For models with synthesized guard modules (-x7x), the guard receive frequencies may be edited when the SCAN/NORM/GD TX switch is in the GD TX position, and the radio is in the 'Channel Edit' mode. For all other models, editing of guard receive frequencies is not possible.

Only those frequencies the radio recognizes as 'valid' are enterable, and only in the fractional multiples allowed.

To edit channel information, use the **DISP** switch to select the required data line for editing (**ID**, **RX** or **TX**), and then enter 'Channel Edit' mode.

To enter 'Channel Edit' mode, pull and lock the **EDIT** switch to the left (**CH**). The position or character to be edited will blink. This blinking character (editing cursor) indicates the data selected for editing.

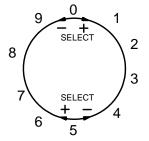

When channel editing of data is in progress, the radio suspends normal operation and the dual function controls work as described in the following sections.

#### 3.9.1 SELECT Switch

The **SELECT** switch steps the data entry up or down (+or –). The radio only permits a valid choice for each position selected for editing. This is to aid operators in reducing entry mistakes, particularly when busy with other flight procedures.

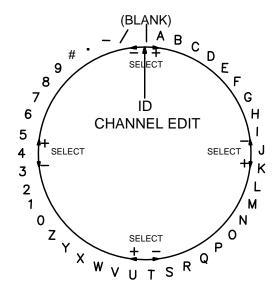

FREQUENCY EDITING WHILE IN CHANNEL EDIT

The selection choices string together as if in a circle, and the operator moves through this circle with the **SELECT** switch. Depending on which way the operator sets the **SELECT** switch (+ or –), the editor will move around the circle in either direction.

When editing frequency, (TX or RX) the editor removes numbers from this circle that do not apply to the particular cursor position. For example, most NPX138N radios can only have a 3, 4, 5, 6 or 7 in the 10's of MHz position, so the editor does not permit any other numbers during editing from the front panel.

When editing a channel ID label, the editor adds the alphabetic characters and frequently used symbols to this circle that apply. For example, the blank (visible as a flashing underline '\_' to show the cursor location), the slash (/) and the number sign (#).

# 3.9.2 NEXT Switch

The **NEXT** switch moves the editing cursor one position to the right if momentarily set to '+' and one position to the left if momentarily set to '-'. The cursor will wrap around when it reaches either end of the line. The editor will change what choices are valid as the cursor moves from one character to the next. Sometimes, more than one character will flash. This is because the only valid choices involve multiple characters, such as the fractional kHz entry for a channel frequency. This is also true for tone code entries. The **SELECT** switch will slew through the available entries from an internal table.

#### 3.9.3 EDIT Switch

This locking, center-off switch selects the operating mode of the radio. For normal radio operation set the **EDIT** switch to the center or 'Off' position. Edited data stores automatically when changed so when editing is complete, the operator need only set the **EDIT** switch back to 'Off'.

#### 3.9.4 HELP Switch

General operation help can be accessed from the initial power-up screen (see section 3.4.1). If basic help is required when the NPX138N radio is already on, cycle the radio off and then back on again (using the volume control or the external breaker). The option for comprehensive help will reappear.

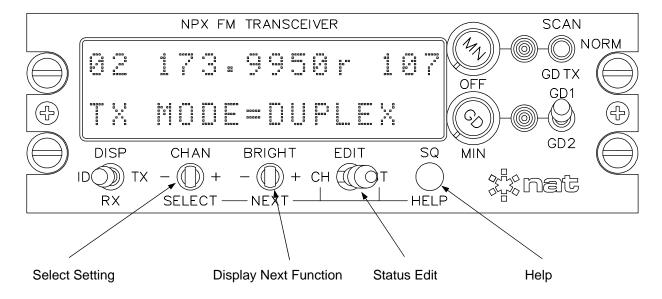

### 3.10 Status Editing{tc "1.4.8 Status Editing"}

There is simply not enough room on the compact front panel of the NPX138N radio to fit a switch for every radio function. The solution for this is the use of status lines to display and control features that do not require immediate accessibility via the front panel.

As when editing channel data, the display shows only allowable options. This mode can also display the status of the radio quickly, without editing any data. The Status editing process is identical to the channel editing process only the select switch does not change any information.

To edit status line data, pull and lock the **EDIT** switch to the right (ST).

### 3.10.1 NEXT and SELECT Switch Use

Toggling **SELECT** will step to the previous/next available setting for the current function.

To advance to the next function, toggle **NEXT**. Use the **SELECT** switch to again choose the desired setting, and continue in this manner until all the radio status lines contain desired information.

When editing is finished, simply return the **EDIT** switch to 'Off' (center position) to store the information. Exit at any time; it is not necessary to go through the entire status listing.

#### 3.10.2 Status Edit Features

The STATUS EDIT features currently implemented in NPX138N are as follows:

#### TX MODE

There are two modes possible: DUPLEX (repeater) operation, and SIMPLEX (direct) operation. Duplex means that the radio uses both the RX and TX frequencies programmed into the selected channel. Simplex means that the radio uses the RX frequency programmed into the selected channel for both RX and TX purposes. The programmed TX data remains in the radio, but is unused until the operator returns the radio to duplex mode.

#### POWER

The NPX138N radio can transmit at either a HI (10 watt) or LO (1 watt) power setting. Many radio station licenses have power restrictions at altitude, and must be set to low TX power above 5,000 feet for legal operation. This feature also helps prevent repeater interference at altitude and permit secure operations.

#### TONES

Radio tones are selectable to ON, OFF, or TX ONLY, thus enabling or disabling any tones set on a per channel basis through channel editing. TX ONLY enables only the transmit tone, but not the receive one. See section 3.9 for further details on tones.

#### TONE DISP

The radio permits the user to define the tone presentation to suit local operations. This selection can be for the tone frequency itself (truncated to whole Hz), referred to as FREQ, or it can be one of several codes. The sequential numbers for the EIA tones are 1-38. The alphanumeric Motorola codes are referred to as MCODES. The shifted octal codes used by Wulfsberg are referred to as WCODES. See section 3.9 for further details on tones.

#### • SCAN

There are three scanning modes available for selection: LIST, PRIORITY, and LIST+PRI. See section 3.10 for further details on scanning.

#### • P1

This is the Priority channel used in Priority and List+Priority Scanning. It can be set to any valid channel number, or if not required, can be set to NONE. When the SCAN option is selected to LIST, the priority channels are not active but are retained in memory. See section 3.10 for further details on scanning.

#### PWR-UP HELP

The display of the HELP screen at power up can be selected on or off.

#### PWR-UP CHAN

This is the channel the radio will go to when powered up. The operator can select a specific channel or set this option to PDC (Power-Down Channel). PDC will cause the radio to power up on the last used channel.

3.11 Tones{tc "1.4.9 Tones"}

#### **3.11.1 General**

The tone system used by the NPX138N radio is a Continuous Tone-Coded Squelch System (CTCSS), as defined by an Electronic Industries Association (EIA) standard. The radio adds these tones to the normal signal modulation (such as voice) to uniquely identify or select a particular radio or group of users.

More commonly, these tones are referred to as sub-audible tones. This is because the filtering action of the radio eliminates them from the received audio. Therefore neither the sending nor receiving party will hear them. These tones are also sometimes referred to as Private Line (PL) tones.

#### 3.11.2 Tone Display and Selection

The NPX138N radio displays the tones for the selected channel on the last three positions (far right hand side) of the RX and TX lines. Use the Channel Edit mode to select and store the appropriate tones for each channel. The operator can set different tones for receive and transmit. Select '–' if no tone is required.

By editing the TONE DISP status line, the operator can configure the radio to display the tones using one of four different methods. The four tone display modes are:

### • Tone Frequency (FREQ):

This is the actual frequency of the tone, measured in Hertz (cycles/second). There are only three digits available on the radio to display this data, so the radio truncates any decimal fraction on the display (i.e. 103.5 Hz becomes 103). Although not displayed, the radio uses the exact frequency.

### EIA Codes (1-38):

This is a number from 1-38 that identifies the tone in sequential order from lowest (67.0 Hz) to highest (250.3 Hz)

### Wulfsberg Codes (WCODES):

These are sequential shifted OCTAL codes based on the thumbwheel design of the Wulfsberg C-1000 control. Because they are missing numbers ending in 0 & 9, they can be confusing, especially to those familiar with the straight sequential number of the EIA codes.

### Motorola Codes (MCODES):

These are alphanumeric codes that often appear in the land mobile business, especially if Motorola equipment is used.

Table 1 below shows the four different display options for each of the available tones.

Tone Frequency (Hz)	1-38	WCODE	MCODE
67.0	1	01	XZ
71.9	2	02	XA
74.4	3	03	WA
77.0	4	04	ХВ
79.7	5	05	SP
82.5	6	06	YZ
85.4	7	07	YA
88.5	8	08	YB
91.5	9	11	ZZ
94.8	10	12	ZA
97.4	11	13	ZB
100.0	12	14	1Z
103.5	13	15	1A
107.2	14	16	1B
110.9	15	17	2Z
114.8	16	18	2A
118.8	17	21	2B
123.0	18	22	3Z
127.3	19	23	3A
131.8	20	24	3B
136.5	21	25	4Z
141.3	22	26	4A
146.2	23	27	4B
151.4	24	28	5Z
156.7	25	31	5A
162.2	26	32	5B
167.9	27	33	6Z
173.8	28	34	6A
179.9	29	35	6B
186.2	30	36	7Z
192.8	31	37	7A
203.5	32	38	M1
210.7	33	41	M2
218.1	34	42	M3
225.7	35	43	M4
233.6	36	44	M5
241.8	37	45	M6
250.3	38	46	M7

Display Options - Table 1

### 3.11.3 Turning Tones On and Off

The NPX138N radio also has the capability to have tones enabled or disabled globally. By editing the TONES status line, the operator can set all the tones ON, OFF or to TX ONLY.

TONES=ON enables all the tones programmed into the individual channels. (Remember that some channels may have no tones programmed.) Both the frequency and tone of incoming signals must be correct to hear the receive audio. If the incoming frequency is correct, but the incoming tone does not match the tone set in the radio, the radio will not produce any audio. The RX indicator lights whether the logic is correct for audio or not, to warn the operator that the channel is active with radio traffic of some kind.

TONES=OFF disables all tones. The radio will still display the individual tones on the RX and TX channel display lines, but only for reference purposes. All incoming transmissions on the RX frequency will be heard.

TONES=TX ONLY enables all transmit tones but disables all receive tones. This is used on U.S. Forest Service contracts, for example, where the tones are needed only to open the repeater and serve no RX squelch function.

3.12 Scanning{tc "1.4.10 Scanning"}

#### **3.12.1 General**

Scanning is an automatic internal function that rapidly samples a selected group of channels. It is very useful for checking radio traffic on one or more channels, while still working a 'home' or monitor channel.

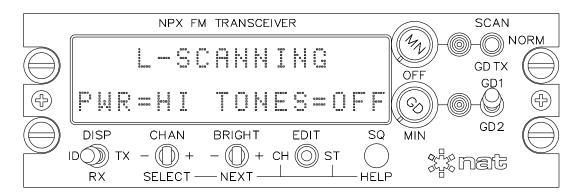

When scanning is active, the radio ignores all CTCSS/Sub-audible Tones. It does not test for these conditions when determining whether or not to lock on to a channel (although tones do remain active for squelch control). This is because the delay to test for tones is so long (compared to the channel lock-up time), that it would seriously compromise scanning. It takes almost half a second to provide tone decoding, which would result in virtually useless scanning of 2 channels per second.

The radio will stop on any flagged channel that has a correct RF signal present, but there may be no audible signal if the tones do not match those set in the radio. To avoid any confusion, set tones to OFF (via the status edit mode) during scanning so that all channels will be audible.

In order to be detected properly, a signal needs to be slightly stronger when the radio is scanning than when the radio is in 'Normal' operating mode.

### 3.12.2 Scan Operation

Activate scanning by moving the **SCAN/NORM/GD TX** toggle switch to the **SCAN** position. The 'home' channel is the channel that the radio was on before scanning was activated.

The radio scans the home channel and all channels on the 'scan list' at a maximum rate of 30 channels per second.

When the radio is actively scanning, a SCANNING message will appear on the upper row of the display. When the radio has found and locked onto an active channel, the display will show the correct channel data corresponding to the display mode selected (ID, RX or TX).

If the operator keys the transceiver while the radio is actively scanning, the radio will be re-channelled to the 'home' channel for transmission. If the radio is locked onto a channel, transmission will occur on that channel.

From the SCAN status line, the operator may select one of several pre-defined modes that control how the radio will carry out the scanning function. They are described in the following section.

#### 3.12.3 Scan Modes

Any NPX138N channel can be designated as a PRIORITY channel and/or a LIST channel. The appropriate scan flags will appear after the channel name on the ID line (P1 and/or Sc). Any or all of the channels can be in the scan list for LIST SCANNING, but only one channel can have the Priority designation.

Use the status edit mode to select both the priority channel and the SCAN MODE. Use the channel edit mode to tag channels for list scanning. The three scan modes are as follows:

#### LIST Scanning

The second last space on each channel ID line indicates whether that channel is in the scan list or not. If it displays a dash '–', the channel is not in the list. If the channel is in the list it displays the scan flag (sc). Use the channel edit mode to change the scan list status for each channel. Any number of channels may be placed in the scan list; but for effective scanning operation, the number should be kept to a minimum.

Once scanning is activated (using the front panel SCAN switch), the radio will move through all the flagged channels in consecutive order until it detects a carrier. It will remain on that channel until traffic

stops, and then wait for a 2-3 second latency period to permit the operator to reply. If there is no further activity, the radio will continue through the list, and then start over. When scanning is turned off, the radio resumes normal operation on the home channel (the one set before scanning began).

During List scanning, the operator can use the front panel CHAN switch to delete 'nuisance' channels. If the radio locks onto a channel, and the operator does not want to monitor that channel, the CHAN switch may be moved to the left '-' to temporarily delete that channel from the scan list. That channel will remain out of the scan list until the operator disables the scan mode (either by moving the scan switch back to NORM or by turning off the radio).

### PRIORITY Scanning

The radio scans the home channel plus one priority channel. It will continue scanning the priority channel if it finds an active channel.

To avoid accidental duplication, use the Status Edit mode to set the priority channel. 'P1' designates the priority channel; the lowest priority is the home channel. The 'P1' flag will appear on the last space of the ID line of the appropriate channel.

If the radio receives a transmission on the home channel, it will continue to check 'P1'. The check during priority scan is very fast, about every 1/3 second, and will sound like a faint tick when occurring during other reception. If there is activity on the designated 'P1' channel, the radio will re-channel to that frequency, regardless of activity on other channels.

The radio will return to the home channel 2-3 seconds after activity on the priority channel has ceased.

#### LIST+PRIORITY Scanning

In this mode, both LIST and PRIORITY features are combined, so that the radio checks 'list' while still periodically testing for activity on the priority channel. In this case, list channels have a lower priority than the home channel, and are scanned only when there is no activity on the other two.

# 3.13 Wideband/Narrowband Operation{tc "1.4.11 Wideband/Narrowband Operation"}

The NPX138N is capable of operating in either a wideband mode (± 5.0 kHz Rated System Deviation) or narrowband mode (± 2.5 kHz Rated System Deviation).

### 3.13.1 Editing Wideband/Narrowband Flag

To edit the Wideband/Narrowband channel characteristic, place the **DISP** switch to the **ID** position and place the radio into channel edit mode. Use the **NEXT** switch to place the EDIT CURSOR in the correct display position, marked by the current flag setting (Note: the character should be flashing). To change this selection use the '+' or '-' **SELECT** switch. The channel data will save automatically when exiting 'Edit' mode.

The ID line displays a ' $\overline{\underline{w}}$ ' character when the radio is in 'Wideband' mode. The ID line displays an ' $\overline{\underline{n}}$ ' when the radio is in 'Narrowband' mode (refer to section 3.8.1).

# 3.14 Configuration Mode{tc "1.4.12 Configuration Mode"}

This mode of operation is not required for normal operation and is intended to aid in servicing and radio set-up.

Various firmware functions of the radio can be set via this mode.

Entering this mode requires a special code and switch sequence, and should be USED ONLY AT THE FACTORY OR BY QUALIFIED SERVICE PERSONNEL.

### 3.14.1 Using Configuration Mode

#### CAUTION:

Incorrect use of this mode may render the radio inoperable.

Use this function with extreme care.

If you have any questions, please call Northern Airborne Technology Ltd prior to use.

To enter this mode, do the following, **EXACTLY AS DESCRIBED:** 

- a) With the power turned off, lock the **EDIT** switch into the **CH** position.
- b) Turn on the radio. The 'Lock EDIT switch OFF for Norm OP' message should appear.
- c) Press the **HELP** button. The '...PASSWORD:' message should appear.
- d) Although there is no cursor on the screen, use the **SELECT** and **NEXT** controls to enter the configuration mode password, which is **IAC**. Be sure to use the **NEXT** switch after entering the last character. The 'Config Mode...' screen should appear.
- e) Depending on the style of radio and the options selected, the information on this and subsequent screens will vary.

**Note:** Some of the features listed in the following table may not be displayed.

- f) Using the normal editing procedure (**SELECT/NEXT**), select a valid option for each feature presented.
- g) **It is up to the operator** to ensure that the selected options are compatible with each other, and with the hardware being used. If they are not, the radio may not operate correctly.

Read the following table carefully and ensure that all configuration options are completely understood.

# 3.14.2 Configuration Option Table

FEATURE	VALID OPTIONS	COMMENTS
STATUS DISPLAY ON POWER-UP	ON, OFF	Determines whether or not the radio status lines are displayed on power-up.
EXT. DATA PAD	ON, OFF	Determines whether or not the radio will accept data from an external data entry pad.
LOWEST FREQ.	138, 150	Sets the lower limit (in MHz) for frequency editing. All NPX138N radios can be selected to either option.
CHANS. INST.	20, 40, 60, 80, 100	The number of channels available in the radio.  Does NOT include guard channels.
TX TIME OUT	000, 030, 060, 090, 240	The time, in seconds, the Transmitter is allowed to be active for one continuous period. Intended to prevent 'stuck mic' conditions from damaging the equipment.
GD RX EDIT (-x7x models only)	ON, OFF	Determines whether or not the guard channels are editable from the front panel.

Configuration Options - Table 2
